Manuel B. Aalbers, University of Amsterdam, AMIDSt. Email: m.b.aalbers@gmail.com; *How and why is geographical access to mortgage loans in different countries?*

What depends on local context, what on national context, and what is taking place all-over the globe? It is obvious that access to mortgage loans is differs per country as different countries have different mortgage markets. Yet, empirical research from Italy and the Netherlands, and a literature review on the US, demonstrate that redlining - the refusal of mortgage loans based on location? is a mechanism operating in all three countries, but not in all cities. It is argued that through the globalization of the regulation of mortgage markets, the same mechanisms may be operating in widely different contexts, but that the ways in which these mechanisms operate are highly dependent not only on different national systems but also on the different metropolitan areas. To explain why the differences between cities in one country can be bigger than the differences between two cities in two very different countries, we need to pay attention not only to local contingencies, but also and equally important, to national differences in the design and operation of mortgage markets. Although redlining is only observable at the urban level, it is constituted through processes and institutions located at different scales.

Justin Abart, University Of Memphis. Email: ; Thad Wasklewicz, University of Memphis. Email: ; *Spatial Patterns of Talus Cone Surface Complexity, Arapahoe Basin, Colorado, USA*

Alpine talus cones in the Colorado Front Range exhibit topographic variability related to the spatial distribution of geomorphic processes. Field reconnaissance and past research indicate the form of alpine talus cones varies in both longitudinal profile and latitudinal cross-section. This research utilizes traditional profile measurements combined with regularly spaced cross-sections to analyze talus cone form. The profiles and cross-sections map detrended elevation data derived from Airborne Laser Swath Mapping (ALSM) sources. These data produce a quantitative elevation surface at a much finer spatial resolution than traditional surveying methods. The inclusion of these high resolution data allow for the analysis of talus cone form at previously unattainable scales for a large sample population. Spatial patterns of topographic variability at several spatial scales are identifiable from these data. Fine scale patterns are attributed to the forms produced by individual processes. Broader scale patterns reflect the legacy of the numerous processes responsible for talus cone evolution. Comparing the characteristics of fine scale topographic complexity and coarse-scale asymmetry allows for improved conceptual models of the evolution of talus cone form, and the feedbacks between geomorphic process and surface topography.

Keywords: geomorphology, DEM, mountain, GIS, talus

Charles W. Abbott, University of Iowa. Email: abbott.charles@gmail.com; *African Immigrant Associations in North America: Current Patterns, Future Hopes*

Most African immigration to North America has occurred in the last 30 years, and the volume of migration is increasing. African immigration provides a window for examining issues related to economic development, associational life, identity, and racial/ethnic relations. First, African immigration to North America typically involves an element of 'brain drain,' in which educated and skilled professionals migrate to portions of the rich, stable, OECD world. Second, many Africans have a tradition of forming migrant associations within Africa itself (and often within their own country). Thus many Africans in North America have brought with them pre-existing traditions for uniting for mutual aid and collective endeavors, including the maintenance of links between migrants and their home community. Third, many Africans have various layers of identity on which to base organizations: town of origin, ethnicity, language, religion, sect, and home country. Fourth, many African immigrants are phenotypically not easily distinguishable from African-Americans, though they may be culturally distinct. This "Black" - "African" difference permits opportunities for cross-cultural understanding or misunderstanding between African-Americans (or African-Canadians) and newly arrived Africans. As African immigration unfolds, organization of migrant groups in North America is aided by technologies such as the internet; links to home are promoted by phone, email, and transatlantic air travel. Examples of Nigerian, Kenyan, Sudanese, and Ghanaian associations in North America are provided. The paper concludes with a list of "natural experiments" currently proceeding as immigration to North America continues, and an agenda for further research.

J Anthony Abbott, Ph.D., Stetson University. Email: tabbott@stetson.edu; *Wind Blown Landscapes of Conservation, Production, and Leisure: Wind Power Development in the Kittitas Valley of Washington*

Wind power, now the fastest growing source of energy in the United States and the world is often considered an environmentally desirable technology insofar as it offsets demand for fossil fuel and other polluting forms of energy production. Despite such benefits, wind power has been criticized as a detrimental with regard to corruption of the natural environment. Impacts on wildlife including migrating birds, raptors, bats, and grazers such as deer and elk have been cited as a serious concern among biologists. Of recent interest has been the groundswell of protest against the construction of windmills based on their visual impact upon pristine and natural landscapes. Thus landscapes of conservation in areas with sufficient wind density suffer the tensions of defining best use inherent with multiple use areas. In Kittitas County, Washington, efforts to develop wind power facilities have given rise to conflicts regarding the best kind of conservation for potential wind power development areas. While concerns with wildlife conservation are shared universally among those debating construction of windmills, lay opponents exhibit such concern less when windmills are erected in remote, unseen, wild landscapes. When windmills are not seen, wildlife (and other) concerns diminish and the rhetoric of global conservation and alternative energy holds sway. This brings into question the legitimacy of visual impact as a conservation metric for natural areas. Visual impact concerns simply echo the changing priorities for multiple use landscapes towards those of leisure enjoyment rather than a burgeoning concern with wild areas and wildlife per se.

Patrick Abbott, Kansas State University. Email: pka54@hotmail.com; *United Caliphates of Europe: A Geographical Look at Sharia Microstates*

The latter half of the twentieth century saw a large rise in Muslim migration into Western and Central Europe. Originally, Europeans assumed that only a small number of immigrants would arrive and that they would assimilate. However, the promise of Europe attracted a larger than expected number of migrants. At the same time, immigrants interpreted European promises of "human rights" to mean that cultural assimilation would not be necessary. Now original misunderstandings have led to societal conflict, and have helped create spaces where regular law enforcement is nominal at best. Not falling into anarchy, these spaces have instead become microstates under improvised Sharia law. These microstates have similar demographic, infrastructural, and spatial qualities with each other and are each a part of a larger communicative network.

Teresa Vita Abbruzzese, York University. Email: teresa@yorku.ca; *The Circus of Globalization: Tracing transient livelihoods and transnational mobility in an era of late capitalism*

This paper examines the production of marginality and the blurred boundaries between the formal and informal processes of everyday carnival life in the Puglia region of southern Italy. This study particularly investigates the ways in which the "magical" world of the fairground can be seen as a prism to examine larger global processes, such as regional economic restructuring, and the reconfiguration of difference and the division of labour that (re)produces systemic forms of globalized capitalist exploitation. For nine months of the year, national and transnational fairground travellers follow a pre-planned route in their caravans coordinating days and nights with mainly religious festivals and observances, such as town celebrations of patron saints and local Madonnas. This specific form of itinerant work is rooted in place, historical practices and meanings that are connected to worship and ritual. These practices and transient ways of living blur dominant conceptions of space, time, regulated and unregulated economies and labour. It is quite peculiar to unearth in this carnival landscape another landscape of modern day globalized nomadic identities-transnational labour migrants, that overlays the existing locale to produce an unusual landscape of juxtaposed marginality. This contradiction highlights double itinerant processes occurring: one internal or regional (national Italian carnival workers), and the other transnational (specialized migrant workers) metaphorically joining the 'circus of globalization'. My research will be informed by various ethnographic methods, mainly participant observation (my point of entry into itinerant fairgrounds is through my kinship networks), and semi-structured interviews with fairground travelers and labour migrants.

Keywords: circus, globalization, transient livelihoods, transnational labor migration

Osama Abdelgadier, Ph.D, Framingham State College. Email: oabdel@frc.mass.edu; Sudan: A Pariah State? The Challenges of Peace and National Unity.

Is Sudan a pariah state? How did it get to that situation? Is this western-based conceptual notion of a particular type of state useful or applicable to understanding the turmoil that has been occurring in Sudan? Should Sudan hold together or split into newly independent states along religious and ethnic lines? To investigate and analyze the challenges of peace and national unity in Sudan we need to look at local, regional, and global factors of conflict. Locally, exclusion and unequal development are the root causes of conflict. Regionally, border communities and neighboring countries do affect conflict in Sudan. Globally, Sudan has become caught in a global geo-politics as a significant player in an ideological war of ideas (religion) and resources (oil).

Keywords: Sudan, conflict, peace

Elvira Abdrazakova, . Email: era81@tomsk.gov.ru; Siberia and Transportation of Nature Resources

Transport complex of a region plays an extremely important role in its development. Western Siberia in the line of latitude is crossed by some big trunk-railways, besides new railroads were constructed to the northern parts of the region, where oil and gas, and wood is produced. River transport is developed; and sea transport is developed in the North. Motor transport is especially important for southern regions. Pipeline transportation is extremely important as well. In the North development of the natural resources is impossible without aviation. In this article I argue that the regions of Asian Russia (namely, Western Siberia) have bad infrastructure and transportation conditions. The transport system that exists in Asian Russia is the main factor that restrains the development of the region and of the economy of the whole country. Bad transportation aggravates small population of the region. My research shows that Western Siberia transport complex has many problems and should be developed. The projects of new transport systems could help to reach this goal. I also claim that Siberian natural resource base is very important for further improvement of transport system. I state that the projects of new transport systems (TRACECA, Eastern Siberia - Pacific Ocean pipeline and others) provides an opportunity for further development of integration with neighbor countries. The report clarifies that the transport system of Western Siberia is still being developed, the potential is very big. In the conclusion I name some further steps to promote development.

Keywords: transportation complex, Russia, Siberia

Majd Abdulla, . Email: majd@iastate.edu; Land Ownership and Sustainable Agriculture

Land in Iowa is characterized by aging owners. Based on the results of surveys conducted in 2006, 49% of landowners are over 65 years old. Furthermore, absentee landownership is increasing. By investigating the differences in agricultural practices between owner/operators and owner/absentees, this first part of the article examines the following questions: What is the impact of aging farmers as landowners on agriculture? What is the impact of the absentee owners on adopting sustainable agricultural practices such as conservation practices? The second part of the paper will answer the following concerns: Can new young farmers access the land market and practice agriculture? What are the difficulties facing new young farmers? Do young farmers have alternative to be involved in agriculture other than owning land? Are these alternatives affordable for them and economically viable? What is the government's role in helping the new and beginning farmers? Preliminary answers to these questions suggest that aged owners affect the future of agriculture by increasing the probability of using agricultural land for purposes other than agriculture, such as industrial or commercial uses. Preliminary results also show that absenteeism affects land management practices that impact conservation practices use as a tool to sustain the agricultural land and natural resources, consequently the future of agriculture in Iowa. Furthermore, it is expected that young farmers still face various obstacles toward working in agriculture in spite of the existence of some programs to facilitate this process for them.

Tsion Abebe, California State University, Los Angeles. Email: bone_tsion@yahoo.com; An Examination of the Push Factors Affecting African Emigration to the United States from 1989 to 2004

The number of migrants worldwide (people living outside their country of origin) more than doubled in the 35 years leading up to 2005, reaching an estimated total of more than 185-192 million in 2005 (Optimum Population Trust). The United States is one of the most developed countries in the world and migrants from all over the world, including Africa, choose the United States as their destination. The increasing African presence in the United States may be attributed to a number of "push and pull" factors. Numerous studies have determined that the three main push factors in Africa are economic, educational, and political. This paper examines which economic and demographic push

factors affect the emigration from Africa to the United States from 1989 to 2004. This paper examines African emigration to the United States on the macro level and the outcome of the study indicates patterns of African emigration and provides regional generalizations. This paper also examines whether the economic and demographic push factors produce a regional or temporal variation. By using data from the CIA World Factbook and Office of Immigration Statistics and by utilizing a quantitative analysis, this study sheds some light on how significant a particular factor is on African emigration by examining the temporal and spatial variation in the emigration of Africans to the United States.

Keywords: Africa, Emigration

Jeremy W Aber, Kansas State University. Email: aber@ksu.edu; The Video Arcade in Memoriam: California Extreme and Place Attachment

The California Extreme (CAX) is an arcade expo organized by dedicated arcade collectors every summer in San Jose. The 2006 show was the tenth year and consisted of more than 400 individual games that were played by more than a thousand visitors on the weekend of July 8th-9th. Not all attendees were arcade collectors, but a large percentage of the visitors fell into this category. Although every collector has their own reasons for being involved in the hobby, a shared reason exists: a strong place attachment to the video arcade of the late 70's and early 80's. This attachment is a driving force behind the desire to collect video arcade games in the home, and sharing in the attachment to place is a driving force behind the organization of the CAX show. The show's impetus was a desire for collectors to interact and share their love of the video arcade. It has evolved over the years into a large scale ephemeral museum for non-collectors, in addition to being a venue for collectors to interact.

Dilumie Saumedaka Abeyisirigunawardena, Student (PhD Candidate). Email: dilumie@uvic.ca; Atmospheric and Sea level responses to Climate Variability and associated impacts on a low lying coastal system in Northern British Columbia

Atmospheric and sea level responses to climatic variability signals at multiple temporal scales (inter-decadal to monthly) are examined using long-term meteorological and tide gauge records on the north coast of BC. Relations between sea levels wind and climatic variability indices are explored to identify potential controls of climatic variability phenomena (e.g., ENSO, PDO) on regional winds and sea level trends. In addition, potential changes to local scale morphodynamics (via altered wave forcing) resulting from climatic variability and climate change, is modeled for a low lying coastal system in Northern BC. This study adopts, wave transformation modeling, linear and non-linear statistical methods including: correlation, multiple regression, Cumulative Sum (CumSum) analysis, Superposed Epoch Analysis (SEA). Results suggest that climatic variability signals such as ENSO and PDO forcing, acting on decadal to inter decadal temporal scales exerts significant influence on regional winds and sea level fluctuations. These shorter-term fluctuations are significantly greater than longer-term sea-level responses, by as much as an order of magnitude and with trends over 2x that of Mean Sea level. Results also demonstrate the need to reduce the spatial scale of climate variability induced atmospheric and oceanic forcing from regional to local scale, to better predict the potentially damaging climate variability impacts along a coastal margin. Overall conclusion of this study is that the shorter-term climatic variability impacts, though related to climate change, pose greater hazard than eustatic mean sea level trends and thus, should be of more immediate focus for the development of coastal adaptation strategies.

Christian Abizaid, McGill University. Email: christian.abizaid@mail.mcgill.ca, cabiza@yahoo.com; River channel dynamics, land use change and agricultural markets in the Peruvian Amazon: lessons from a meander cut-off along the Central Ucayali River

This paper reports on a study of the evolution of land use patterns and agricultural markets in relation to a large meander cut-off on a major Amazon tributary in Peru. This cut-off, which occurred in 1997, effectively reduced the length of the Ucayali River near Pucallpa, from 71 kilometers to roughly one-tenth of its former distance on the same reach in 1981. The shortening of the channel altered local flooding patterns along nearby upstream and downstream reaches, affected river travel between rural villages and the city, and opened up new areas for agricultural use. A combination of data collected in 2003, through field observations and a household survey in three villages affected by the cut-off, and secondary data on crop prices and agricultural output in the region provide the base for this study. These data are used to examine how this abrupt change in the course of the river modified the spatial distribution of crop production and land use patterns in the region and led to changes in regional agricultural markets.

Findings from this study offer important insights into the nature of land use change along dynamic rivers and the economic implications of rapid environmental change.

Joseph Scott Abraham, Ph.D., U.S. Environmental Protection Agency. Email: abraham.joe@epa.gov; *Rural Arizona Community Water Systems, Shortages and Vulnerability: Drought Impacts or Socially Constructed Water Scarcity?*

This paper examines local and regional drivers of water shortage vulnerability of community water systems in rural Arizona. A comparative case study examines two proximate communities in rural Arizona that have experienced water shortages in recent years blamed, in part, on the indirect impacts of record drought conditions. In contrast to official and mainstream analyses of the causes of the water shortages, the study examines the effectiveness of state and local regulations, and historical patterns of local and regional population growth and land and water development. In doing so, the water shortages are contextualized as symptoms of broader unsustainable nature-society relationships in central Arizona taking place during the second half of the 20th century. Using statewide data, the case study is then extrapolated to identify other areas of rural Arizona where community water systems may be (or become) vulnerable to water shortages as a result of similar trends in population growth and land and water development.

Gregory Lawrence Acciaoli, PhD (Anthropology, ANU), University of Western Australia. Email: acciaiol@cyllene.uwa.edu.au; *'Palm Oil Fever': Plantation Proliferation and Problems of Indigenous Resistance in Central Kalimantan, Indonesia*

This paper examines the social consequences of the proliferation of oil palm plantations in Central Kalimantan, Indonesia. It documents the rise of oil palm plantations as a consequence of the heightened demands from regency governments for local revenue as a consequence of regional autonomy laws in Indonesia. The paper documents instances of the granting of oil palm concessions in both customary land and national park land for oil palm plantation concessions. It examines how various communities have attempted to resist the appropriation of their land and examines the reasons for their failures. In particular, it concentrates upon the case study of the communities around Lake Sembuluh in Seruyan Regency. Muslim migrants in Sembuluh I and Sembuluh II villages find themselves in a bind because they do not subscribe to the customs of the surrounding Dayak relating to land tenure, which have become the standard used by oil palm companies for compensation. Local disputes over compensation claims have been increasing in frequency, as some villagers attempt to claim compensation on the basis of Dayak land tenure norms based on right of first clearance not endorsed by village headmen, while others find they have no recognised basis for their competing claims. This local situation is then placed in the national context of the ways in which the indigenous people's movement has been attempting to assist communities in their claims against encroaching oil palm plantations.

Keywords: indigenous peoples, resistance, plantations, land tenure, Indonesia

Robert Acker, University of California. Email: bobbie@uclink4.berkeley.edu; *Water Table Depth and Centers of Settlement in Medieval Cambodia*

Angkor was the earliest, largest and richest state in medieval Southeast Asia. Attempts to account for its prosperity have been based on its ability to feed a population large enough to maintain its army and build its cities. The first comprehensive theory of Angkor's historical trajectory posited that irrigation from large reservoirs or baray around the capital city permitted the irrigation of downslope land, allowing a second rice crop to be cultivated, doubling Angkor's agricultural production and so supporting its urban workforce and army. This thesis was, however, never quantified. Recent measurements have shown that the water retained in the baray would have sufficed to grow enough rice to have fed a minuscule percentage of Angkor's population, an amount too small to have been the decisive factor in its historical trajectory. In 1998, I suggested that Angkor's agronomy was based on Cambodia's very high water table. In 2005, I generated a data set measuring the depth of the water table at over 800 points, which shows that the first Angkorian capital was in a region approximately five km in diameter with a very high water table, and that the second, much larger capital was in the center of a region 30 km in diameter in which the water table was similarly within two meters of the surface. These spatial correlations corroborate the thesis that Angkorian agronomy and settlement were based on those regions of the country with near-surface water resources available for rice cultivation.

Keywords: Water, rice, Angkor, historical geography, GIS

William V. Ackerman, Ohio State University. Email: ackerman.37@osu.edu; *South Lima: Residential Decay, Crime Hot Spots, and Neighborhoods in Transition*

Lima, Ohio, not unlike a number of smaller urban places, has experienced substantial blight in older neighborhoods. These areas have become the repositories of concentrated poverty, crime, and racial minorities. This research evaluates the likelihood that the construction in 2005 of sixty new single-family homes in South Lima will achieve the necessary threshold of new investment to stimulate economic and social recovery throughout that part of the city. It is hypothesized that success will require building some critical mass of new housing that will alter the economic climate in South Lima and stimulate additional investment. Recent research for several U.S. cities indicates that new or improved housing has served as a neighborhood catalyst to spur further revitalization and growth. The potential for success of this project is analyzed by mapping the location of the new homes and analyzing their proximity to existing low quality housing, crime hot spots, suitable open space for additional new construction, the proximity to three new schools constructed in South Lima, occupancy, rates and property maintenance. Each of the sixty new homes is currently occupied and the properties are being well-maintained. Major crime hot spots are several blocks removed, and attractive open space exists for additional construction. In addition, twelve new single-family homes are under construction in South Lima and another builder has proposed a two-phase, 101 single family home development to replace old and severely blighted multi-family low-income housing. Results to date suggest a positive outlook for improved neighborhood viability.

Keywords: Urban Blight, Urban Renewal

Jessica Acosta, Pennsylvania State University. Email: jza119@psu.edu; Robert P. Brooks, Ph.D., Pennsylvania State University. Email: rpb2@psu.edu; William A. Gould, Ph.D., USDA-Forest Service. Email: wgould@fs.fed.us; *Geographic analysis of habitat change for endemic animal species of Puerto Rico*

Puerto Rico has long been recognized as a hotspot (high concentration of species) for animal species diversity and endemism. Changes in land cover in the last centuries have dramatically affected habitat distributions, with a shift from a forested landscape, to a nearly deforested agricultural landscape, to a very fragmented landscape of secondary forest, agriculture, and urban development. This paper examines the spatial and temporal changes of the geographic distributions of 56 vertebrate terrestrial endemic species using geospatial data from the Puerto Rico Gap Analysis Program. We created species habitat models and predicted habitat extent for the years 1977, 1991, and 2003 using Geographic Information Systems and land cover maps. We evaluated the habitat change for each species, as measured by land cover change, and determined what species are most vulnerable to change over time. We used landscape pattern analysis to quantify the differences in available habitat on unprotected and protected areas for each year. There was an overall increase in habitat for most of the species from 1977 to 2003 due to the recovery of secondary forests on abandoned agricultural land during the second half of the twentieth century. Landscape metrics showed variations in this pattern, which we interpreted in terms of the habitat requirements of particular species and taxonomic. This research will enhance ongoing conservation efforts, such as prioritizing the restoration of endemic species on the island. This will be useful for preserving the species from extinction and keeping what is part of Puerto Rico's natural heritage.

Keywords: habitat change, endemic animal species, species habitat models, landscape pattern analysis, Gap Analysis Program, Puerto Rico, biodiversity conservation

Iddrisu Adam, PhD, University of Wisconsin - Marshfield Campus. Email: iddi.adam@uwv.edu; *Migration and HIV Spread - The case of temporary migrant girls in Accra, Ghana*

Every year, thousands of young men and women leave the country side and move to the city with the hope of improving their lot in life. All too often, the dream of a better dream is never realised. Instead, the migrant young men and women find themselves confronted with numerous real problems in the city, and often, when they return to their villages. This paper examines the situation of young girls and women who temporarily migrant from the Nanumba District of Northern Ghana to Accra to make some money in order to buy "basic necessities" in preparation for marriage. These girls often contract various diseases, included sexually transmitted diseases like HIV/AIDS. They often come home without realising that they are carriers and pass on the disease to their spouses and children. Strategies for reducing and combating this problem are also offered.

Maria Adames, Virginia Tech, . Email: madames@vt.edu; *Neighborhood Revitalization in the Historic District of San Felipe de Neri, Panama*

Residents in historic districts in Latin America are challenged by revitalization and gentrification, especially in World Heritage Sites. Increase in rents and taxes, land speculation, and residential displacement often follow. Furthermore, revitalization efforts may not always consider residents' interests. As a result, there is a disruption in the social structure and linkages that residents have cultivated for years. This paper assess residential perceptions about the physical, economic, and social changes that revitalization and gentrification unleashed in the World heritage historic district of San Felipe de Neri in Panama. I surveyed 205 households and conducted in-depth interviews with current residents and displaced residents of San Felipe de Neri. The study shows that residents are still finding spaces within their political and social networking to fight for what they call their "rights to live" in a place in which they have resided for many years. Their struggle reveals how they strive to compromise with authorities and property owners in order to continue residing there.

Keywords: Revitalization, gentrification, tourism, Latin America, neighborhood, perception, World Heritage Site.

Ellen E. Adams, College Of William and Mary. Email: eadam@wm.edu; *The Handmaiden of History?: Ellen Churchill Semple and American Geography*

This paper looks at the Conference on the Relation of Geography and History held at the 1907 meeting of the American Historical Association in Madison, Wisconsin, at which Ellen Churchill Semple presented a paper, "Geographical Location as a Factor in History." While Semple and the session's chair, Frederick Jackson Turner, agreed that environment played a critical role in determining historical events, another participant, George Burr, professor of history at Cornell, argued that geography was only one factor in history, and by attributing too much power to the environment, one risked reducing or even eliminating the role of human agency. Questions about the relationship between geography and history are perpetual; is geography, as Herodotus said, "the handmaiden of history"? Or is it true that "history lies not near but in nature," as Carl Ritter claimed? This issue achieved particular importance among American geographers and historians at the turn of the twentieth century. In part this was because of their sense that they were living in a time and place where the effects of the environment were especially visible. But such questions were also asked because they related to some of the most important issues of the day: the effects of the closing of the frontier, questions about overseas expansion, and perhaps most importantly, the relationship between heredity and environment. Ellen Churchill Semple, who was trained in both history and geography, was well suited to try to answer these questions.

Joy K. Adams, Humboldt State University. Email: joy@humboldt.edu; *Conjunto culture: Celebration and racialization in the German-Texan "border-lands"*

Continued migration of Hispanics and Anglos into Texas's "German belt" has contributed to a significant decline in the proportion of Central Texans claiming German ancestry. Under these circumstances, ethnic festivals are playing an increasingly important role in maintaining the German-American identity of many of the region's people and places. Organizers and participants frequently tout the events' inclusiveness, claiming that anyone can temporarily cross ethnic boundaries to become "German for a day" within the festival context. However, surveys and interviews with festival participants and local residents in three historically German-American communities (Brenham, Fredericksburg, and New Braunfels) suggest that ethnic-themed events mirror processes of racialization that have persisted in the region for more than 150 years. In this paper, I argue that, in helping to construct "German" identities for the region's people and places, German-themed events in Central Texas are implicitly involved in the construction of "non-German" and, by extension "non-white," ethnic identities. Further, event participation patterns reflect a long-standing black-white racial dichotomy in the region. Within this ethnoracial hierarchy, Hispanics have long occupied a liminal status that is illustrated by their involvement in the production and consumption of German-themed events. Thus, in adopting a symbolic, Germanized ethnic identity during these events, Hispanic Texans are able to claim some privileges of "whiteness." Although black Texans continue to be underrepresented in these activities today, increased black participation in German-themed events may, over time, pose a challenge to the persistence of the color line within Central Texas.

Keywords: Texas, ethnic festivals, German Americans, racialization

Paul C. Adams, Ph.D., University of Texas at Austin. Email: paul.adams@mail.utexas.edu; *Ground-Truthing Code*

The process of encoding employs a set of operations that can be observed in a wide range of encodings: subdivision, generalization/classification, sequentialization, and transformation/condensation. A simple environmental

observation can be encoded in image form, in spoken words, or in a wide range of systems that concretize words in various ways. The basic set of coding operations is the same whether we encode a representation of our environment in pixels, vectors, spoken words, hieroglyphs, tokens, quipu, an alphabet, an abjad, or an abugida. While every coding operation is a human construction, inextricable from social power relations, the end result is not as arbitrary as we are often led to believe. We can see through our codes to levels of reality that lie below them—subjective, intersubjective and objective. Science and daily life both depend on the possibility of "ground-truthing" our codes and our commitment to this reality-defining task.

Keywords: representation, reality, code, symbolism

Simon Addison, Senior Research Officer, Refugee Studies Centre, University of Oxford. Email: simon.addison@qeh.ox.ac.uk; *Force-Full Bodies: On Power and the Production of Socio-nature(s)*

This paper seeks explicitly to articulate historical materialist approaches to the 'production' of socio-nature with Michel Foucault's conceptualisations of power and history via a consideration of the notions of 'force' and 'energy'. In their analyses of the production of both bodies and spaces these notions are presented by Michel Foucault and Henri Lefebvre respectively as being fundamental to the processes by which socio-nature, as the metabolic field of relations that exist between human and non-human bodies and things, is produced. For Foucault, the body and its milieu are formed and re-formed perpetually through the exercise of power relations which are conceived of in terms of the deployment of 'force'. For Lefebvre, 'production' is the mobilisation of 'energies' which effect a transformation in the material, social and discursive constitution of bodies, spaces and things. This paper investigates the extent to which these two notions of 'force' and 'energy' may be reconciled and articulated to provide a more comprehensive understanding of the operations of power in the production of socio-nature. The paper suggests that while Foucault and Lefebvre mobilise these notions with particular respect to the operations and production of the body and of space specifically, that Foucault's notions of the milieu and of the operation of biopolitics allow a broadening of the analytical field to incorporate a consideration of the significance of force/energy as critical concepts for the analysis of the (re)production of socio-nature at the scales of environment, population, species-body and globe.

Keywords: Foucault, Lefebvre, Socio-nature, Body, Force, Energy, Production

Peter Nicholas Adey, Keele University. Email: p.adey@esci.keele.ac.uk; *'The air is our concern': mobility, character and the airminded body*

This paper examines how a form of British identity became tied to the mobile technology of aircraft, its spaces, and the promises and possibilities it afforded. In questioning the tendency to see airmindedness - a kind of aerial enthusiasm - as an abstract concept circulated by discourse and propaganda, this paper explores how young people were made airminded by being encouraged to act and move in particular ways and in specific geographical contexts. It was understood that these bodily mobilities would have certain benefits for the development of identity, citizenship and character.

Maro Adjemian, MA Student, McGill University (student). Email: maroita@gmail.com; *Medicine from the forest: the impact of deforestation on medicinal plant availability and use in the Chikanta region of southern Zambia*

Medicinal plants collected from the forest are widely used in the Chikanta region of southern Zambia. Not only is traditional medicine based on medicinal plants an integral part of culture and indigenous knowledge, it is also the most economically feasible and accessible healthcare option for people in this area, as in most of the developing world. However, rapid deforestation has recently begun to threaten these resources. The Chikanta region borders Kafue national park. In

1979, the state handed over control and ownership of this plateau region, formally a protected area, to local Tonga chiefs. Since that time, there has been significant migration into the area. Deforestation has quickly become a problem: the total area of cleared agricultural land in this region more than doubled between 1986 and 2000 according to recent remote sensing data. Drawing on analysis of quantitative and qualitative research carried out in the area by the Gwembe Tonga Research Project, a social science study in southern Zambia that has continued from 1956 to the present, I discuss rates of deforestation in this region and its impacts on medicinal plant use and availability. The Chikanta region is an ideal site for a case-study on the impact of deforestation on medicinal plant use and availability, due to existing background data, recorded rapid rates of deforestation, and extensive local use of medicinal plants.

Adriana Elisa Adriana Elisa, Graduate Geography Group, University of California Davis. Email: aeparra@ucdavis.edu; Place-based Identity Building in Colombia

The discussion of power and empowerment has increasingly entered the pages of development and feminist scholars (Rowlands 1997). Some have criticized the focus on the local in this discussion as having “profound limitations”. They state that ignoring global and national forces “encourages a rather romantic equation between empowerment, inclusion and voice” (Parpart, Rai and Staudt 2002). The Ruta Pacifica de las Mujeres para la Resolucion Negociada del Conflicto en Colombia offers an example of a coordinated national movement connecting the local to the national and beyond. Through physical and symbolic acts of sisterhood, especially massive mobilizations of women to the most conflictive corners of Colombia, the Ruta Pacifica has put a human face to the victims of the armed conflict and forced displacement. Its interaction with these communities and ethnic groups has contributed to a growing understanding of the strong relationship between identity and place. The Ruta Pacifica has shown how institutional organizations at the national level can generate power through the development of core values such as courage, joyfulness, independent vision, and constancy. The coherence of these values from the local to the national level requires a clear sense of place for all of the actors. While phenomena such as the Ruta Pacifica may be more visible in the margins of the state, they have serious implications for those searching for alternatives to a hegemonic and placeless globalization (Hunt 2006; Das and Poole 2004).

Keywords: power, gender, place, movement

Julia Affolderbach, Simon Fraser University. Email: jaffolde@sfu.ca; Environmental governance: the case of the Great Bear Rainforest

This paper focuses on British Columbia's Great Bear Rainforest to illustrate the role environmental groups play in forest conflicts. After many years of conflict, and opposition to large-scale industrial forestry, in February 2006 an agreement was reached that ‘remapped’ the region to privilege environmental values. The agreement is considered to be a major victory for the environmental movement. Based on a growing literature and fieldwork conducted in 2006 this paper examines the strategies and campaigns of the main environmental groups and the relationships between actors as the conflict evolved, especially since the late 1990s. The analysis seeks to reveal the basis for the bargaining strength of the environmental movement and the extent to which environmental groups achieved their goals.

Keywords: economic geography, environment, forestry, British Columbia

Jytte Agergaard, Department of Geography, University of Copenhagen. Email: ja@geogr.ku.dk; Global-local interactions: Socio-economic and spatial dynamics in Vietnamese frontiers

The traditional concept of ‘frontier’ is linked to the notion of virgin land being transformed by settlers who build up new livelihoods in the frontier region. Settler activities often involve confrontation with indigenous population groups who have exploited the natural resources for generations. We maintain that the frontier concept can also be a useful analytical category for regions characterised by rapid changes in demographic structure, occupational possibilities and land use. These frontier regions typically experience high immigration rates and changing livelihood opportunities including the establishment of new commercial activities. Previously stagnating economic activities are being replaced by new activities, predominantly the production of export-oriented commodities, which are experiencing increasing demand on the global market. In this broader sense, frontiers are ideal locations for studies that aim to understand regional socio-economic and spatial dynamics resulting from local-global processes, in particular the interaction between local livelihoods and world markets. This paper elaborates on the frontier concept and maps out its analytical strengths in terms of bridging two previously isolated approaches, livelihood analysis and global value chain analysis. The analytical approach is then applied to an exploration of three Vietnamese frontiers with distinct and relatively recently established

‘commodity’ connections to the world market: the Red River Delta (handicrafts), the Central Highlands (coffee) and the Mekong Delta (fruit).

Keywords: Livelihoods, global value chains, frontiers, Vietnam

Sunil Aggarwal, PhC, University of Washington. Email: sunila@u.washington.edu; Medical Cannabis Cost-effectiveness and Death Penalty Apportionment for a Germplasm-linked Group of Qualifying Patients in Washington State: the Political Ecology of Botanical Medicine Delivery and of Being and Becoming High

Human-environment relationships between people and as few as ten banned psychoactive botanical biota take place on contested and hysteria-laden grounds and have significant influence on human health, morbidity, and mortality globally. Here I propose a medical geographical framework to interrogate a subgroup of these relationships in the local environment surrounding a single, continuously cultivated germplasm line of *Cannabis sativa* L., the highly globally-distributed, yet nearly globally banned, botanical. Human orientation towards this *Cannabis* germplasm line will be looked at through two American policies that embody diametrically opposed viewpoints on the human-*Cannabis* relationship of germplasm cultivation: RCW69.51a and 18 U.S.C. 3591(b). The former, a Washington state policy, regards qualified *Cannabis* cultivation practices as botanical medicine production intended for therapeutic consumption, and the latter, a U.S. federal policy, regards without exception the cultivation of 60,000 *Cannabis* plants (~12 acres with 3-ft crop spacing) as grounds for the imposition of a sentence of death. This study, whose progress will be reported on, examines the medical geography of the implementation of these two policies for a qualifying patient group in Washington State who have obtained some medical amnesty protections for *Cannabis* consumption and who rely on botanical medicine produced from a shared germplasm line. Using a political ecology of health approach which quantifies and qualifies medical cannabis cost-effectiveness by measuring subjective health-related quality of life as a function of dosing, a group cost-effectiveness germplasm branching diagram will be mapped that takes into account *Cannabis* delivery costs, related health care cost savings, and death threats.

John A. Agnew, University of California - Los Angeles. Email: jagnew@geog.ucla.edu; The Small-Nation Journal in a World of International Specialization: The Past and Future of the Scottish Geographical Journal

General purpose journals can be accused of an eclecticism that is out of date in an academic world increasingly characterized by narrow specialization. Journals such as the *Annals* and *Geographical Review* in the US and the *Transactions* in Britain find themselves of importance as outlets for younger scholars before tenure or trying to establish their careers but they then fade from sight as more specialized journals assume greater importance. Do general journals have a future? Here I want to make a case for what I call the “small nation” journal that provides a range of geographical papers but does so without the immediate problem of the “intellectual imperialism” that can be seen as afflicting the major US and British journals. I argue that such journals can in fact assume greater significance as geography becomes relatively more integrated as a field and more general audiences grow alongside this trend. The heyday of the *Scottish Geographical Magazine* in the late 19th century may not be recuperable but a more humble but vital role is now more possible than even just a few years ago.

Keywords: Journals, Geography, Scotland, Small nations

Luis LM Aguiar, PhD, Sociology, University of British Columbia - Okanagan. Email: luis.aguiar@ubc.ca; “Is the Justice for Janitors the Model of Global Unionism for the 21st Century?”

This presentation seeks to discuss the following question: Is the Justice for Janitors model a new form of global unionism for the 21st century? The JfJ model is being exported by the Service Employees International Union (SEIU) to Africa, Asia and Western and Eastern Europe to organize building cleaners who work for globalized cleaning firms, and are simultaneously unprotected by governments and marginalized by a changing industry. At the same time, labour movements everywhere are searching for ways to recover the losses in membership, social position, and respond to global capital and are therefore experimenting with various models of organizing to capture new workers in the expanding service sectors of the post-industrial economy. The JfJ is attractive to the global labour movement because of its impressive successes in organizing building cleaners in the United States; these workers are largely visible minorities, immigrants and women - the new working class of the global service economy. Using material from Canada and Australia, I try to develop a preliminary assessment of the progress of the JfJ outside the US.

Alexis Aguilar, Ph.D., Salisbury University. Email: atolchuco@yahoo.com; *Disturbance and Forest Succession in the Coastal Mountains of Honduras*

High-resolution Ikonos imagery, historical Landsat images and ground data were used to evaluate the response of various forest types to human disturbance at the landscape level. The study area, Cusuco National Park and surrounding areas in northern Honduras, encompasses elevations ranging from sea level to 2300 m and climate conditions ranging from wet Caribbean slopes, to cool/windy highlands, to semi-arid leeward slopes. Detailed forest structure and floristic composition data were collected across a gradient of elevation and precipitation. Various forest types were identified including lowland humid forest, montane deciduous forest, cloud forest, dwarf forest, and semi-arid pine forest. This study examines the relationship between the rate of successional development of various types of secondary forest and physical variables (i.e., elevation and precipitation), proximity to anthropogenically-disturbed areas, and proximity to mature forests.

Keywords: Forest succession, montane tropical forests, protected areas, Honduras

Julian Agyeman, Tufts University. Email: julian.agyeman@tufts.edu; Karen Bickerstaff, University of Durham. Email: k.j.bickerstaff@durham.ac.uk; *(Dis)assembling environmental justice: developing cross-national comparisons*

The Environmental Justice (EJ) movement in the US has been a bottom-up discourse of community outrage against the siting of locally unwanted land uses in disadvantaged and specifically minority ethnic neighbourhoods. In neither the UK nor Europe more widely is there a discourse seeking to empower and mobilise minority (ethnic) groups to compare with that of the US. In the UK context(s) we arguably see a more top-down and less coherent or universal framing of EJ, with links being made to a diffuse set of particular public policy agendas to include sustainability, social inclusion, access to green space and participation in environmental decision-making. Taking the cue of authors such as Latour (2005) and Law (2003) - who have argued that the world is a hybrid assemblage of objects, people and ideas - we seek to build a picture of the actors, resources, relations and tactics that are (being) collectively assembled to constitute these different environmental justice 'infrastructures'. Here we ground our account in the place-specific contexts of North East England and North Eastern United States. These case studies offer different entry points for thinking through the socio-spatial dynamics of EJ assemblages as well as their political agency. Our purpose is therefore to begin to develop, through cross-national comparison, an understanding of how certain configurations of environmental justice come to be, their capacity to draw sympathy, support and solidarity with groups and individuals beyond the local, and more broadly to consider what constitutes resilient or vulnerable EJ infrastructures.

Keywords: Environmental justice, infrastructure, resilience, USA, UK

Ola Ahlqvist, The Ohio State University. Email: ahlqvist.1@osu.edu; *Categorical Measurement Semantics - A Second Space for Geography*

Categorically measured data often portray each category as separate from other categories with no inherent ordering. Contrary to this understanding and the perception that categorical data offer limited analytical capabilities, I examine the basis for rethinking categorical measurements in terms of a second conceptual space for mapping out categorical semantics. An inherent ordering of nominal categories can be described through this space that provides a transformation into a numerical measurement domain. Semantic variograms and two-space clustering visually illustrate the analytical potentials of this extension to categorical data as it relates to simultaneous autocorrelation in feature and geographic space. The deep semantics captured by nominal variables suggest that these provide a richer information source than any individual measurement variable albeit with a larger degree of uncertainty.

Keywords: semantic visualization, representation,

Rafique Ahmed, Prof., University Of Wisconsin La Crosse. Email: ahmed.rafi@uwlax.edu; *Tropical Cyclones in Bangladesh*

Bangladesh is one of the most cyclone-prone countries in the world. Statistical analyses of tropical cyclone occurrences in Bangladesh from 1960 through 2004 are presented in this paper. A total of 22 cyclones hit the coastal areas of Bangladesh during this period. There were 2-3 cyclones in some years, and there were several years in a row without any cyclones. Of the 22 cyclones during the study period, 6 were Category-1, 9 were Category-2, 3 were Category-3, 3 were Category-4, and 1 was Category-5 cyclone. To determine the regional variation of cyclone occurrences, coastal area of Bangladesh has been divided into five zones (from west): (a) Zone-1: from Hariabhanga River at the western border to Haringhata River, (b) Zone-2: Haringhata River to Meghna River, (c) Zone-3: Meghna River to Feni River, (d) Zone-4: Feni River to Karnaphuli River, and (e) Zone-5: Karnaphuli River to the southeast corner of Bangladesh.

Of the 22 cyclones, 2 made landfall in Zone-1; 2 in Zone-2; 3 in Zone-3; 8 in Zone-4; and 7 in Zone-5. It appears that coastal Zones 4 and 5 are the most cyclone-prone regions in the country, with 68% of cyclone occurrences.

Keywords: Bangladesh, tropical cyclones, cyclone category, cyclone frequency, cyclone zones

Waquar Ahmed, Clark University. Email: wahmed@clarku.edu; *Global Discourses and Local Politics in the production of Power Policy in India*

This paper examines the evolution of electric-power policy in India and its relation to dominant discourses on development and internal contradictions within the Indian society. I have used a relational view, a network analysis, as a methodology for analyzing the heterogeneously constituted economy, state, and society in understanding the dynamic nature of India's power policy. In order to understand the exercise of power within this network, I have examined the state's institutional forms, including the government; oppositional movements inside and outside the government; and relations with civil society institutions. In addition, I have examined the power exercised by mobile global capital on national governments on account of its ability to dictate terms for locating at specific places as national governments have to constantly attempt at attracting FDI and synthesizing economic growth with development. I have also examined how the civil society, by using electoral democracy to its advantage, ensures that state policy also represents the interest of its citizens. The study looks at India's policy transition through the lens of the former Enron subsidiary, the Dabhol Power Corporation, using the case of a failed power project in Maharashtra, India. The paper is based on primary and secondary data and employs a combination of quantitative and qualitative techniques in analyzing that data. Primary data has been generated by interviewing resource persons working in US corporations, political and bureaucratic agents in India, and representatives of civil society groups in India.

Akile Ahmet, BA (hons), MSc, Queen Mary, University of London. Email: a.ahmet@qmul.ac.uk; *Balanced Upbringings: Cultural, religious and ethnic identities within the space of the home for young men of mixed descent*

This paper addresses the multi-layered identities embodied by young men of mixed descent in relation to their ideas and lived experiences of home. Previous research on mixed descent and the home has located people of mixed descent as 'homeless' (see Ifekwuingwe, 1999, Garimara, 2002 and Carton, 2004). I will suggest that for mixed descent young men (aged 16-19) the space of the home becomes a cultural site of their own identities and their family identities. Religious and cultural identities both via material possessions and emotional signifiers influence the identity of these young men and their definitions and experiences of home. This paper seeks to address the multiple web of identity which these young men embody via their religion, culture, ethnicity, and in some cases language. I move beyond the location of mixed race households to address the multiple webs of identity these young men embody via their religion, culture, ethnicity and in some cases language.

Keywords: Mixed descent, Home, Masculinities and Youth Geographies

Kyung Ju Ahn, Syracuse University, Anthropology. Email: kahn01@maxwell.syr.edu; *Seoul to Syracuse, Transnational Korean Family's Education Project*

Since the middle of the 1990s, the Korean transnational family or "multinational household," otherwise known as "Geese Families" or Gi-ruh-gi, consists of a father who remains in Korea as financial support, while the mother and elementary, middle, or high school-aged children stay in the U.S. for the sake of the children's education. Different from the labor migration, Korean transmigration for education purposes has brought reversed capital flow from the third to the first world; the risks to the transnational Korean family often happen in combination with split households. This demographically is a very important phenomenon in the light of understanding the socio-cultural aspects of Korea. My aim in this study is to investigate how each family member in a transnational household experiences cultural norms and differences in values in his or her trans-local everyday life with the Rashomon effect, and how these factors contribute to the production of emerging norms. Through the ethnography of twenty transnational Korean families which consist of a mother and children in Syracuse and a father in Korea. I will investigate the contested relations of culture, place, and identity by gender within the context of transnationalism. I also expect to modify the ethnographic method with an attempt to connect two national trans-local research areas.

Keywords: Transnational Family, Transmigration,

Hisatoshi Ai, The University of Tokyo. Email: hisaai@ua.t.u-tokyo.ac.jp; Atsuyuki Okabe, The University of Tokyo. Email: ; Yukio Sadahiro, The University of Tokyo. Email: ; A New Framework to Classify and Distinguish Spatio-temporal Analysis Methods

This paper proposes a framework of spatio-temporal analysis based on the classification of entities and their analytical methods. A final goal is to construct a matrix that shows both characteristics of methods and linkages between methods. First, entities in the real world are classified by their spatial and temporal properties such as dimension, connectivity, topology, and so forth. The product of spatial and temporal properties gives a matrix of entities and applicable analysis methods classified by their spatio-temporal properties. Each cell in a matrix contains a set of entities and methods that share the same properties. They can be further classified by considering the detail properties of entities in both spatial and temporal dimension. For instance, some entities can even change their spatial dimension while others have to preserve their shape and size. Various changes such as appearance, disappearance, translation, rotation, and scaling are considered. Second, for each cell in the matrix, methods of analyzing entities are discussed. Each type of entities may have a number of analytical methods with different approaches. The methods are similarly examined from various points of view and then systematically classified in the form of table. The table shows the characteristics of the methods that are helpful to detect similar methods in different study fields.

Keywords: Spatio-temporal analysis, framework of spatio-temporal analysis, concepts for spatio-temporal analysis

Danielle Aiello, Ohio University. Email: da278705@ohio.edu; Coast to Coral: Evaluating Terrestrial Development's relationship to Coral Ecosystem Condition in Roatán, Honduras

The island of Roatán, Honduras has an extensive coral reef system which is part of the Meso-American Caribbean reef. Roatán's economy relies on the condition of this keystone habitat for their fishery and tourism industries. During the past several decades, there has been a noted decline in coral reef health across the planet. Coral reefs are one of the most important ecosystems in the world in terms of biodiversity and providing economic viability for millions of people worldwide. The connection between coral condition and human development in the terrestrial zone of Roatán has received little attention, although it has increasingly been cited as a potential cause for coral degradation. This study examines the relationship between terrestrial development within Roatán's watersheds and their associated coral reef habit adjacent to shore through the use of remote sensing and in situ coral surveying methods. Two satellite images are used to determine the amount of change in human development from 1985-2001. Reef locations were randomly selected and evaluated by recording coral condition data utilizing SCUBA techniques. The land cover change and coral condition data are then combined utilizing GIS methods to produce a spatial risk map identifying threatened reef areas. Preliminary results indicate that human development is expanding on the island, changing the landscape and its interactions with the marine environment. The results provide a way to determine terrestrial development's impact on coral reef condition. Additionally, it will provide a flexible tool which conservationists and government officials can use to help manage this key resource.

Keywords: coastal and marine geography, coral reef, land cover, coastal management

Charles S. Aiken, University of Tennessee. Email: csaiken@utk.edu; The Past is a Distant Land: Fact, Fiction, and Remembrance in Faulkner's Mississippi

William Faulkner, a distinguished writer of the twentieth century, set most of his short stories in fictional Jefferson and Yoknapatawpha County, Mississippi. Critics have long argued over the relationship between Faulkner's fiction and fact. The purpose of this paper is to show how Faulkner used and influenced local history. He was not overly concerned with what was true and what was false. Faulkner used certain myths and avoided particular truths. He was aided by the history's of Lafayette County and Oxford seeming ancient, even though when he began his Yoknapatawpha County stories in 1929, the county and the town were less than 100 years old. To evaluate the relationship between fact and fiction, three brief statements concerning the history of Oxford and Lafayette County are examined: the state historical marker for the town and county, a summary of Oxford's history on a plaque at city hall, and a paragraph in the Works Progress Administration's Federal Writer's Guide, Mississippi (Viking 1938). Faulkner wrote his most innovative short stories and novels during the 1930s. Without intention, he altered what became accepted as local history. By the late 1930s, certain aspects of local history were false remembrances based on Faulkner's stories. This was possible, in part, because the past seemed ancient and distant.

Rabah Aissaoui, University of Leicester. Email: rabah.aissaoui@leicester.ac.uk; Class, Ethnicity and the Political Mobilization of North African Migrants in 1970s France: The Case of the Mouvement des Travailleurs Arabes (MTA)

The 1970s were a decade marked by heightened racist tensions, segregation and numerous aggressions against migrant workers in France. It was within this context that the Mouvement des Travailleurs Arabes (Arab Workers Movement / MTA), a social movement born within the North African migrant population, grew to become the one of the strongest autonomous political voices of North African immigrants in France during those years. Understanding this movement, it could be argued, is important as it highlights the long-standing tradition of political activism among North Africans in France. It formed a link between earlier North African nationalist movements such as the political organisations led by Messali Hadj from the inter-war period to Algerian independence, and the so-called "Second Generation" anti-racist protest movements in the 1980s. This paper explores some key aspects of the actions and discourses of the Arab Workers Movement - a revolutionary political organization established by North African immigrants in 1970s France - against racism, capitalism and the French authorities immigration policies. It looks at some of the ways in which the MTA's political mobilization and discourse on the workplace, the foyers and on illegal immigrants' rights were constructed. Secondly, it examines the cross-ethnic links of solidarity that this movement established with other immigrants' groups and organizations in France and with the catholic and protestant priests in its struggle for immigrants' rights in France. Finally, the paper looks at the often antagonistic, but sometimes close relationship between the movement and the French trade unions.

Keywords: migration, politics, France

Btihad Ajana, London School of Economics. Email: b.ajana@lse.ac.uk; Homo Carded: Exception and ID Cards

The field of global governance and policing has been centred in recent years around the development of modes of surveillance and control. Technologies of identification in particular, such as biometric identity cards are now firmly placed on the security agenda of many countries. As these technologies increase in proliferation, so too does the logic underpinning the state of exception whereby identity, citizenship, politics, etc. are reconfigured in the name of risk and security. Drawing upon the work of Giorgio Agamben, the paper will seek to examine the relationship between biometric ID cards and the state of exception. In doing so, specific examples will be used to elucidate the ways in which what was once confined to the realm of exception (criminal justice, immigration and asylum policy, border control, etc.) is now in the process of becoming a normative and all-encompassing practice. The aim of drawing such a parallel is to examine and understand the biopolitical stakes behind the adoption of this technology- specifically vis-à-vis the (dis)articulation and management of identity.

Keywords: Agamben; biometrics; biopolitics; exception; identity

Clark Akatiff, . Email: cakatiff@sbcglobal.net; The Roots of Radical Geography: AAG Convention, San Francisco 1970: A Personal Account

Using collected documents and ephemera from the period, the paper address the social and political maelstrom surrounding the beginnings of Radical Geography. Focus will be on the 1970 AAG Convention in San Francisco and how that event crystallized the radical thoughts and behaviors of the time in both their strengths and weaknesses. Specific emphasis is placed on "People's Geographical Expeditions" student rebellion, psychedelic consciousness, and shifting paradigms in Academic Geography. It is submitted as a flawed but critical step in the eventual establishment of radical or socialist geography, which — though the consequences for most of the principals involved were personally mixed or negative—none the less provided a jumping off point for subsequent development. It is based on the author's knowledge of the events as a participant and as an observer.

Ezgi Akpinar, University of Cincinnati. Email: akpinar@email.uc.edu; Nicholas P. Dunning, University of Cincinnati. Email: nicholas.dunning@uc.edu; John G. Jones, Washington State University. Email: jonesjg@wsu.edu; Aguadas of the Pre-Hispanic Maya Lowlands as Paleoenvironmental Sources

Water availability has been an ever important source of concern for the inhabitants of the karstic landscape of the Yucatan Peninsula. Maya peoples were no exception to this. As a part of its climatic regime, the Yucatan Peninsula experiences a highly seasonal distribution of rainfall. As a result, it is necessary to capture and store rainfall for later uses. Aguadas served this purpose for the Maya in many areas, and the ubiquity of these features around ancient settlements demonstrates their significance. The study of aguadas is also valuable for

understanding the paleoenvironment of the pre-Hispanic Maya Lowlands. The authors analyzed sediments from three urban and four rural aguadas from the Preclassic and Classic Maya periods. Dating with AMS and standard radiocarbon methods along with palynological analysis were undertaken where was possible. The systematic study of the sediments from these aguadas helps establish the archaeological record of aguada construction and their use, Maya settlement history, agricultural practices, and general paleoenvironmental reconstruction.

Bhuiyan M Alam, University of Toledo. Email: bhuiyan.alam@utoledo.edu; Md M Islam, Principal Scientific Officer (Ex), RRI, Ministry of Water Resources, Associate Specialist, Institute of Water Modelling, Bangladesh. Email: mresj04@gmail.com; Trans-Boundary River Water Sharing To Meet The Local Fresh Water Demand: A Regional Approach

Fresh water sharing of common rivers or water bodies like like/reservoir among the concerned countries are always a critical issue worldwide and requires rigorous information based analysis to reach a common and acceptable agreement. In the context of trans-boundary river, situation of Bangladesh is unique. Being a small country (area of about 144,000 sq km), it contains 57 trans-boundary rivers out of which 54 are along the India-Bangladesh border and the rest three are flowing along Myanmar-Bangladesh border. Most part of the fresh water flow in the major rivers are from the contribution of watersheds lying out side Bangladesh. Fresh water flow in the trans-boundary rivers vary greatly from almost zero in dry season to about 80000 cumecs in monsoon. During monsoon tremendous amount of fresh water passes over the country; on the contrary, the flow during the dry season is very low, which causes recurrent flood-drought cycle, depletion of groundwater table, contamination of groundwater, saline water ingress, sedimentation in the tide influenced rivers resulting reduction/damage to agricultural and fisheries productivity, choking of the distributaries and tidal rivers, water logging and drainage congestion, environmental degradation, loss of domestic animals, trees and plants, health hazard and loss of livelihoods. Reduction of fresh water supply in the dry season causes chronic economic, social and environmental hazards in the lower riparian region which results indescribable distress to the people. This paper will discuss the needs and sharing issues/strategy of fresh water in the trans-boundary river systems along Indo-Bangladesh boarders.

Keywords: Fresh Water Sharing, Politics of Water, Indo-Bangla Rivers, Ganges, Local Water Demand

Undala Alam, PhD, Cranfield University. Email: u.z.alam@cranfield.ac.uk; Paul Jeffrey, PhD, Cranfield University. Email: u.z.alam@cranfield.ac.uk; Facing scarcity in international river basins

International basins supply sixty percent of the world's freshwater. With water availability diminishing, how countries respond to the scarcity is influenced by their sanctioned discourse. Thus, most countries rely on unilateral development of a shared resource, which perpetuates a zero-sum game because it can conflict with other countries' national plans. An alternative approach is to develop the services needed from water in optimal locations across the whole basin, and share those. This approach is termed the benefit-sharing principle and we compare its relevance to two case study basins in this paper. To meet increasing water demand, Spain and Portugal have both developed the Guadiana river independently of each other, pursuing a sanctioned discourse of unilateral control. The result has been decreasing water availability and water quality. By contrast, despite greater poverty and climatic challenges the Senegal basin countries are jointly developing the river according to the benefit-sharing principle. The consequence is greater access to key services such as irrigated agriculture and electricity.

Keywords: Guadiana basin, Senegal basin, cooperation, water allocation

Samer N. Alatout, Ph.D., University of Wisconsin-Madison. Email: snalatout@wisc.edu; Bio-territorial power and bio-territorial in/securities: Israel during the 1950s

In/security has often been addressed through a territorial framework that is linked to Weberian notions of the state and, more recently, through a quality of life framework linked to Foucault's notion of governmentality. In a recent work of mine (Alatout 2006) I was critical of the singular focus on territory in state theory and on populations in theories of governmentality and attributed those to their very singular conceptions of power, territorial-power and bio-power, respectively. I developed a third framework of power, bio-territorial, and argued that rather than focusing on the distinction of territory from population as the main framework of power, we need to focus on what links together, articulates categories of population with categories of territory: power, in this case, becomes about the construction of, articulation with one another, and distribution of

categories of people and of territories. In this paper, I use this framework to understand Israel in the 1950s and discuss the implications of such a framework of power for understanding and dealing with different kinds of in-securities. Specifically, I discuss attempts at constructing and articulating together different categories of territory (empty, insecure, infertile, arable, border towns, desert) and of population (immigrants and non-immigrants, lazy, courageous, Yemenites, Sabras, Ashkenazim, Mizrachim). I also discuss the in/securities that emerge from these practices. Here, in/securities do not start, for example, from the moment of a territorial invasion or an epidemic, but long before?in the very discursive, ideological, and institutional acts of constructing and articulating together categories of territory and of population.

Keywords: power, state theory, governmentality, insecurity, Israel, bio-territoriality

Heike C Alberts, University of Wisconsin-Oshkosh. Email: alberts@uwosh.edu; Berlin's Quest to Host the Olympic Games

The Olympic Games have now become the largest and most important international sports competition. Due to the prestige associated with staging the event, as well as the hopes for tangible benefits for the host city such as the realization of major infrastructure projects, bidding for the Olympic Games has become intense. Potential host cities now have to submit sophisticated application materials, requiring them to design a comprehensive urban development plan as well as to realize some projects before applying to strengthen their bid. Because of these investments, even an unsuccessful bid for the Olympic Games can have far-reaching impacts on a city. Berlin, wanting to showcase its new role in the reunited Germany, competed for the 2000 Summer Games, but was unsuccessful. Several large-scale urban projects have now been realized, as the two halves of the city are growing together and Berlin has assumed the role of the seat of the German government. However, another sports mega-event, the FIFA Soccer World Cup in 2006, also provided Berlin with an improved infrastructure. For example, the Olympic Stadium, originally built for the Games in 1936, was completely renovated to host the final match. From this strengthened position, Berlin is now preparing to bid for the Olympic Summer Games in 2016. This paper chronicles Berlin's quest to host the Olympic Games, based on an analysis of bidding materials, newspaper articles and interviews with people preparing Berlin's application, and discusses the costs and benefits of hosting such a mega-event.

Cidell, California State University, San Bernardino. Email: jcidell@csusb.edu; The Restructuring of Berlin's Airport System and the City's Position in International Airline Networks

After its unique history as a divided city, Berlin was expected to become a major world city after reunification. While the city has grown in terms of investment and social capital, it has not attained the preeminent status on the global stage that was expected. One important reason for this is Berlin's failure to unite its three separate airports into one major facility capable of functioning as an intercontinental gateway to Europe. In this paper, we trace the history of airports in Berlin, including the long planning process for Berlin Brandenburg International Airport. We further demonstrate that it is not just the unique history of this place, but larger economic and political forces affecting all airports, that have led to Berlin's continuing marginalization within the European airline network.

Jochen Albrecht, Hunter College CUNY. Email: jochen@hunter.cuny.edu; The Changing Looks of NORCs

The study of naturally occurring retirement communities (NORCs) has a long tradition in New York State, where they were first "discovered" as village-sized aging high rises in New York City. With the revitalization of inner cities and the trend towards second homes in rural fringes, traditional NORCs are disappearing. At the same time, diverse groups of former immigrants are now bringing their elderly relatives to the country and create new types of NORCs especially in Asian communities. Established policies of facilities planning for existing and prospective NORCs have to adjust the changing demographics of NORCs themselves. This paper discusses a methodology to determine the needs of prospective NORCs in New York. The methodology combines predictions for the location of future NORCs with measures of relative well-being in these areas to provide the information necessary for the allocation of funds that help to balance service disparities for the elderly. NORCs have traditionally been perceived as areas of special needs. Our work turns this perspective around by pointing out why elderly choose to age in place. The very same reasons that cause senior citizens to live within their community rather than to move into a nursing home (or in the New York case to Florida) make many NORCs proto-

typical examples of healthy communities. Our GIS- and spatial analysis-based study looks at what are the characteristics of successful NORCs and creates a typology of NORCs along many dimensions.

Dynamics of Table Mountain Pine Forests in the Central Appalachian Moun-
tains

Fire exerts a strong influence on vegetation patterns and ecosystem function. It is a key process in some ecosystems, where periodic burning is essential for the long-term maintenance of vegetation structure and species composition. In much of the U.S., fire exclusion over the twentieth century contributed to declines in the abundance of fire-associated vegetation. Pine (*Pinus L.*) forests that cover the dry uplands of the central Appalachian Mountains are thought to have developed under a regime of frequent burning. Currently, following several decades of fire exclusion, the dominant species in these ecosystems are declining in abundance, and fire-sensitive trees and shrubs are encroaching. Little is known about past fire regimes of the Appalachian Mountains or about the consequences of altered fire regimes for vegetation change. The purpose of this research is to (1) characterize past and present fire regimes (i.e., frequency, severity, and seasonality of fire) in xeric pine-dominated stands located on a ridge (Kelly Mountain, Virginia) in the central Appalachian Mountains, (2) evaluate current age structure of the stands to assess potential links between fire and species establishment and (3) assess the successional trajectory of the stands in the absence of fire. We expect the results of this study will highlight the historic role fire has played in the development of Table Mountain pine stands and to provide ecological information crucial for the successful management of fire-dependent forests in the Appalachians.

the South of Pará, Brazil

The region of the eastern Brazilian Amazon known as the South of Pará has long been the location of contentious relationships over land resources. While the ongoing "land war" has, over the past 300 years, drastically reshaped the environment in this location, land conflict rapidly increased during the late 1980s through the 1990s and has further altered the landscape in the region. The awakening of Brazilian civil society after the opening of national politics in the 1980s has led to a strong set of social movements focused on forcing the government's hand in long promised but largely unrealized land reform. This paper will show, through the use of a spatial regression model, the forest cover impacts of the more recent, social-movement driven, fight for land in the South of Pará using land conflict data provided by the CPT and INCRA as well as Landsat imagery spanning the years from 1984 to 2003.

An Incremental Knox Test for the Determination of the Serial Interval between
Successive Cases of an Infectious Disease

An estimate of the interval between successive infections is essential for surveillance, control, and modeling of infectious diseases. This paper proposes a method for determining the serial interval when the location and time of onset of illness are known. The theoretical underpinning of this method is the intrinsically spatial nature of disease transmission. Successive infections tend to be closer than unrelated cases of disease and, therefore, exhibit spatial clustering. An incremental Knox type analysis of cases is introduced. Cases occurring at a range of time intervals are examined to determine the serial interval. The significance of clustering is determined using a permutation approach under the null hypothesis of space-time independence. The power of this method is evaluated using an individual level, spatially explicit epidemic simulation. The time increment Knox test is robust to multiple introductions and incomplete sampling. Finally, the increment Knox statistic is used to analyze an outbreak of dengue fever in the city of Florida, Puerto Rico during 1991. Results indicate that

the likely interval between successive cases during this outbreak is at least 18-19 days.

Using GIS to Propose Satisfactory Transportation Paths between the West Bank
and Gaza Strip

Contiguity of West Bank and Gaza Strip is a critical factor to promote the Palestinian prospected State's success. Such contiguity cannot be guaranteed without providing Palestinians with a transportation path or "a corridor" through Israel that includes roads, a rail link, and infrastructure. The Palestinian Ministry of Planning needs a flexible process modeling tool to propose a range of acceptable ground based transportation paths between the two territories. The flexibility will be utilized in the future to modify the weights of each criterion so as to adapt to the requirements of negotiations with the Israeli side. This paper describes how to use the Multi-Criteria Evaluation with Weighted Linear Combination to create a map of suitability, then how this map can be used as friction surface of cost to calculate the least cost pathways between Gaza main cross points and West Bank major roads. This paper reflects Palestinian recommended criteria which take into account: 1) Israeli city centers that limit where pathways can run, 2) topographical realities for environmental and technical considerations, 3) existing Palestinian main roads network for financial considerations, and 4) existing and planned Israeli routes to minimize number of intersections with longitudinal Israeli routes. Results show that there are four possible solutions that satisfy all the criteria; the lowest cost is a path runs south east from Erez crossing point of Gaza to Beit Awwa village near Hebron city in the south west of the West Bank.

Embodiment of Fear in Fenham?

The demonisation of Muslims within many national discourses is the result of a 'moral panic', further fuelled by unsavoury media representations, which would have us believe that deep rooted Islamophobia epitomises the UK today. Yet my own research with disadvantaged urban youth has thrown up ambiguities in the ways in which young people interpret Muslims on a personal everyday basis, (which sometimes contrasts with their personal racist views in regards to national security). As such, the literature does not devote enough explicit attention to the ways in which different aspects of young people's identities such as fears, prejudices and intolerances are developed and formed alongside compassion, understanding and acceptance of difference, and the ways in which these intersect and interact within their everyday urban lives. This paper will discuss the ways in which young people negotiate local urban spaces, focussing specifically upon how fear of 'the other' mediates and shapes their personal opinions and beliefs. It considers the highly specific social context of Fenham in Newcastle upon Tyne, to understand how young people may read Muslims as 'risky' bodies and the meanings they attach to groups of 'feared others' - while at the same time they may themselves be resisting widespread national demonisation at a local level - through their friendship groups and daily encounters. Thus the paper questions how young people encounter such ambiguities emotionally, and finally how they might seek to manage these complex hopes and fears.

Melinda Alexander, Arizona State University. Email:
Melinda.Alexander@asu.edu; Imagine That: Performing an Artistic Sense of
Place in Downtown Phoenix

The transition from an industrial and service to a knowledge economy, emphasizing the economic potential of information and creativity, is taking place across the United States. This paper examines the momentum of the grassroots arts community in downtown Phoenix, and the popularity of the monthly artwalk events, which draw thousands of visitors to the downtown on a regular basis. This burgeoning arts scene takes place at the same time as massive investment in downtown revitalization, to an extent representing bottom-up versus top-down growth. This paper is a narrative study of place-making accentuating political and personal implications of affect, and the experience of place and self through art. Three themes or critical constellations are illuminated: contestation, performance, and imagination. The political process in Phoenix seems relatively open; though not successful in all their aims, activist groups have established a presence at City Hall, and in many cases maintain participation and input. A challenge facing Phoenix is the sense of isolation and placelessness expressed by loose social networks, a result of the transient nature of the population, coupled with the far-flung spatial pattern of development. Socially performative events like the artwalks, with their open access and free

flowing atmosphere, act as an arena for personal and interactive experience, and are crucial in engaging awareness and care for place.

Email: Dongmei.Wang@Dartmouth.edu; Tracy Onega, Dartmouth College. Email: tracy.onega@dartmouth.edu; Assess the Access to Cancer Care Facilities in the US

This research aims at characterizing the spatial variation of the accessibility of cancer care facilities in the US, based on which potentially under-served areas and under-served demographic groups can be identified. The cancer care facilities considered include the National Cancer Institute (NCI) centers and the academic medical centers (AMC) throughout the contiguous US. Service areas are created around these centers using travel times from 30 min to 4 hrs, using a 30 min interval. The inverse of the population-at-risk, within the 4-hr service area, is used to estimate the service density of a center. The service received at a given location is the accumulation of the service densities from all centers. When doing the accumulation, the service density is adjusted by the distance between the given location and the center. The service received at a location is then divided by the population-at-risk at that location for identifying areas that are under-served but have big populations. These areas should be given high priorities when planning new centers. Demographic analyses can be applied to these areas to reveal potential social-justice issues. The population-at-risk is estimated through an integration of LandScan data and US Census data.

Katie Algeo, Western Kentucky University. Email: katie.algeo@wku.edu; Present at the Creation: Negotiating Nature and Culture in the Early Years of Mammoth Cave National Park

This paper examines the dichotomy of policy and action governing the social construction of nature during the establishment of Mammoth Cave National Park from the 1920s through its official dedication in 1941. In formally articulated statements, nature and culture were frequently construed not only as discrete ontological categories, but opposing ones, such that the presence of one threatened the existence of the other. Land management practices, however, embodied a subtler, if unacknowledged, interplay between the two. In this paper, I explore the praxis of these contradictory approaches to the nature-culture relationship. The divide was most sharply delineated through the clearance of some 500 families during the land acquisition phase of park creation. Concurrently, however, the nature-culture boundaries were being obscured by Park Service practices that altered the landscape to make the park's "wilderness" more accessible to visitors. Both approaches contributed to the production of a landscape conceptualized as and now commonly perceived as wild.

Assaf A Alhawas, King Saud University. Email: alhawas@ksu.edu.sa; Regional Flood Frequency Curve for Some Internal Wadis in Saudi Arabia

Saudi Arabia is covering vast area in the southwest Asia. It extends between latitudes 16°-33° N, and between longitudes 34°-56° E. Seldom-rainy events in Saudi Arabia, are driven by three mechanisms. Uncertainty associated with rainy events is intensified when reflected on ephemeral stream runoffs in the country. That is because runoff is not only dependent on rain incidents but on their anomalous magnitudes and intensities. In a rapidly growing country like Saudi Arabia flood data are essential for decision makers, following the vast horizontal growth of major cities and villages to cover areas that have never been populated before. It is also important for the increasing number of road building projects. For sustainable development, the need is certain for a fast and reliable method of estimating drainage basin runoff for un-gauged stations based on available data. As a step into that direction this paper's aim is developing flood regional curves for internal wadis of Saudi Arabia utilizing the available runoff records and using the standard procedures used by USGS, as outlined in Bulletin 17B of Interagency committee on water resources. Five catchments for which systematic flood records were available for more than twenty years are investigated. A representative regional curve was developed, after checking for homogeneity, and correcting for outliers and zero values. The slope coefficient of the relationship between drainage area and mean annual flood was estimated to be 0.335.

Email: mianse@utu.fi; Characteristics of the Future Flooding Problems in Finland: Flood Scenario Studies in SW Finland

Floods in Finland are usually related to snow melt, ice jamming, torrential rain events and prolonged rain events. These phenomena follow a typical seasonal cycle, and have a characteristic regional occurrence. The most widespread floods take place in the spring during the snowmelt season. Recently, however, spring floods have been less pronounced in southern Finland as a consequence of repeated snowmelts during winter. Special characteristics of Finland in future flooding include land uplift caused by postglacial rebounding. Channel gradients will decrease significantly, as uneven land uplift will change relative elevations in Finland. The coastal areas of Western Finland will have the highest land uplift rate (up to 90 cm/100a) and this change will also affect estuary formations in combination with erosion-transportation-sedimentation processes. In this paper, we present flood scenarios in the city of Salo and in the city of Pori, SW Finland in year 2100 including effects of climate change, erosion-transportation-sedimentation processes and land uplift. Future discharge estimations have been undertaken with Watershed Simulation and Forecast System (WSFS) with HQ1/100a & HQ1/250a for next 100 years time period. Utilized input climate data (HadAM3H & ECHAM4/OPYC3 scenarios with A2 & B2 emission scenarios) was down-scaled with the Swedish regional climate model RCAO. WSFS simulated 20-24% increase in HQ 1/100a & 1/250a discharges for Salo and Pori by year 2100. The enlarged flood inundations were simulated with 2D-hydraulic model (Enhanced RMA). These results indicate more severe flooding and the altered flow conditions in SW Finland in the future.

S. Harris Ali, York University. Email: hali@yorku.ca; Roger Keil, York University. Email: rkeil@yorku.ca; Multiculturalism, Racism and Infectious Disease in the Global City: The Experience of the SARS Outbreaks in Toronto

The SARS outbreak in Toronto, which killed 44 and made hundreds sick, tested the common multicultural model, which is often described as the reason for making this a livable global metropolis. Billed as the 'Chinese disease', SARS, on one hand, connected seamlessly and traditionally with previous periods of racialization of disease assumed to originate from migrants and foreigners in North America. Yet when restaurants in the city's three Chinatowns remained empty for weeks and close contact with Chinese citizens was avoided by others in public, the dynamics that unfolded also tied in with a new development in Toronto: the formation of the global city. As news on the SARS outbreak spread and the intricate details of travel patterns and infection-pathways became clearer, the relationships of Toronto diaspora communities and business ties with other globalizing cities like Hong Kong, Guangzhou and Singapore became obvious and Toronto's vulnerability in the network of global flows of finance, culture, commodities and people was exposed. Our paper will provide a narrative of the racialization of infectious disease in the context of Toronto's multiculturalism and the region's formation as a major global city. We will provide evidence of racialization in public discourse, everyday practices and institutional policies. We will advance the hypothesis that the SARS outbreak strained the usually happy appearance of this particular multicultural urban fabric of diversity.

Keywords: racialization of disease, multiculturalism, SARS,

Saleem H Ali, Associate Professor, University of Vermont. Email: saleem@alum.mit.edu; Ganlin Huang, Ph.D. candidate, University of Vermont. Email: Ganlin.Huang@uvm.edu; Spatial Analysis of Tourism versus Mining in Yunnan, China: Comparing economic and environmental impacts

Tourism, a service sector, is often promoted as a more suitable alternative to extractive economics, such as mining. Yet few studies have compared their environmental impacts and contributions to the regional economy. This study fills the gap in the context of Yunnan, southwest China where tourism and mining (coal and gold) have been growing at a rate of 20-30% since 1998 and competing with the landscape and pristine communities. The province is the fourth-poorest province in China while also providing habitat for 59.4% of all protected animals in the country. Yunnan is also home to twenty-five ethnic groups which necessitates a path to economic growth that could conserve ancient cultures as well as natural resources. Geographic Information Systems (GIS) and statistics techniques were used to quantitatively analyze the correlations among four data sets - tourism, mining, economy and environment, and their spatial patterns at prefecture level (the administrative unit under province). Four prefectures were selected to conduct the same analysis at the county level. The

results showed that 1) both mining and tourism had positive spatial relationships with the environment degradation; 2) both the tourism income and the number of mines were strongly correlated to local GDP; and 3) although both having the tendency to aggregate in the areas with higher GDP, tourism dispersed more to the peripheral area than mining. Contrary to popular perception the study reveals that sectoral differences between extractive industries and service sector economies may have little impact on sustainability performance.

Alison Hope Alkon, Abd, University of California, Davis. Email: ahalkon@ucdavis.edu; *Constructing Community through Farmers Markets: The (in)visibility of race*

Farmers markets are more than just a place to buy vegetables. Often, they are intended by managers, farmers and shoppers to create a sense of community, by both connecting consumers to producers and creating vibrant public spaces. My research looks at the social construction of community in two very different Bay Area farmers markets, one in an affluent, largely white neighborhood known for gourmet food and the other in a food-insecure, largely African American area. Various notions of blackness are essential to the discourse concerning community at the second market. However, notions of race and class privilege subtly inform the former. This paper looks at the consequences of this social construction for who does and does not participate in the alternative food systems.

Keywords: food, community, race, urban

John All, JD, PhD, Western Kentucky University. Email: john.all@wku.edu; *Overlap between the Clean Water Act and Safe Drinking Water Act in Karst Water Stormwater Management*

Bowling Green and other small municipalities are in the early phases of implementing subject to Clean Water Act (CWA) Phase II permit requirements for stormwater discharges. New management plans are being considered as these areas move into compliance. However, there is an important legal/hydrologic issue that has been overlooked that could penalize small karst municipalities during future CWA enforcement activities. Generally, one of the simplest ways to manage stormwater nationwide is to force it to infiltrate into the ground. Infiltration will reduce the volume of water potentially available to contribute to flooding and will help cleanse water of contaminants. However, class V injection wells (dry wells) are often used in karst and they don't have soil to absorb water and pollutants. These wells are regulated under the Safe Drinking Water Act and there is a conflict/overlap with CWA jurisdiction. Under the CWA, a 'point source' is a specific location (like a pipe) that directly contributes pollution into a river, lake or stream. An injection well in a karst landscape could thus be considered a 'point source' subject to monitoring and regulation because of its 'direct' connection to waterways via springs. If the EPA would adopt this definition, it would create major new requirements for karst municipalities. As stormwater options are considered by a multitude of smaller karst municipalities, this issue must be addressed early in the planning process or major costs could result later as additional infrastructure is required.

James P. Allen, California State University - Northridge. Email: james.allen@csun.edu; Eugene Turner, California State University - Northridge. Email: eturner@csun.edu; *Income Levels in Ethnic Residential Concentrations*

Are residents of concentrated ethnic settlements necessarily poor? Immigrant Spatial Assimilation Theory and the experiences of immigrants and their children a century or so ago suggest that residents of such ethnic concentrations should have low incomes. We tested this notion with household income data from Census 2000 for Asians and Latinos in the New York, Los Angeles, and San Francisco Consolidated Metropolitan Statistical Areas (CMSAs). Concentrations were defined as census tracts in which the ethnic group comprised at least 40 percent of the total tract population. While very low incomes characterized many ethnic concentrations, the median incomes of 11 percent of Latino households in concentrated tracts and 57 percent of Asian households in concentrated tracts were above the metropolitan medians for all households. Moreover, 18 percent of residentially concentrated Asians lived in tracts in which median Asian household incomes were at least 50 percent above the metropolitan medians for all households. Thus, in contrast to expectations, the evidence indicates that many residents of ethnic residential concentrations have moderate or high incomes. Mapping demonstrates that larger ethnic concentrations commonly contained tracts with substantial variations in median income.

Jeannette Allen, MA, SSAI at NASA Goddard Space Flight Center. Email: Jeannette_Allen@ssaihq.com; *Integrating Remote Sensing with Geography Education*

Integrating space-based remote sensing technology with geography for two-year college, middle and high school students has become an area of fertile ground for geospatial education and workforce training. NASA and other federal agencies' remote sensing data and images of the Earth's land, water, life, air, and ice have become much more accessible to educators, and they apply to a myriad of societal problems over the last several years. They can be used to full advantage in the geography classroom, not only for K-14 students but also for professional development of people already in the workforce. This paper will explain the intersection between remote sensing and geography education, and will provide specific sources of NASA data and images, tutorials, and lesson plans that can be applied in the classroom. It will also point to exemplary existing education products and programs that explicitly integrate geography and remote sensing, and to sources of information on careers in geospatial technology.

Jonnell Allen, Syracuse University. Email: jdallen@maxwell.syr.edu; *Using Geographic Information Systems to Evaluate Neighborhood Patterns of Adolescent Childbearing in Onondaga County, New York*

Adolescent pregnancy and childbearing are important public health concerns in much of Onondaga County, and Syracuse City in particular. Despite an overall decline in adolescent childbearing, birth rates in Onondaga County for 10-17 year-olds are the highest in the region and higher than the New York State average. Similarly, the incidence of sexually transmitted infections (STIs), including Gonorrhea and Chlamydia, are alarmingly high among adolescents. The reported Gonorrhea rate for Onondaga County is more than twice as high as the regional rate and nearly double the state rate. Numerous pregnancy/STI prevention and parenting services for the adolescent population exist, but little is known about the geographic relationship between service availability and at-risk adolescents. In an effort to elucidate geographic clusters of adolescent childbearing and service accessibility, a Geographic Information System (GIS) was used. This talk highlights the processes and findings of a community-integrated GIS analysis of adolescent births and STI infection incidence for adolescents, ages 10-19, residing in Onondaga County. The study utilizes a participatory process, involving pregnancy prevention stakeholders from the nonprofit sector, the Public Health Department and Syracuse University. GIS is used to map residential addresses from birth certificates of adolescent mothers during the period January 1, 2002 to December 31, 2005 and incidence of STIs for adolescents during the same time period. Spatial statistical methods are used to evaluate the geographic patterning and clustering of adolescent childbearing, adverse birth outcomes, and STI incidence.

Keywords: GIS, Community-integrated GIS, adolescents, adolescent childbearing, service accessibility

Thomas Richard Allen, East Carolina University. Email: allenth@ecu.edu; George Oertel, Old Dominion University. Email: goertel@odu.edu; George McLeod, Old Dominion University. Email: gmcLeod@odu.edu; *Analysis of Tidal Flushing Using Multitemporal ASTER Thermal Data and a Tidal Repletion Model, Chincoteague Inlet, Virginia*

Chincoteague Bay is a thirty-three thousand hectare coastal lagoon located on the Atlantic shore of the Delmarva Peninsula of the United States, with a total lagoon volume of about 4×10^8 cu m. The lagoon has a hydraulic turnover time of about four tidal cycles. During the ebb, the water surface falls over the entire basin surface leaving a "void prism" in the upper part of the basin that has a volume equivalent to the tidal prism. However, the actual water mass exchanged during each tidal cycle is not the void prism. Tidal channels cover a small percentage of the surface hypsometry yet contain a large volume of water and are important pathways where exchange occurs at rates 2-5 times greater than shallow environments. This project constructs a spatial repletion model of Chincoteague Inlet using subtidal hydraulic depth and plane-jet hydraulics. These data were used to estimate repletion zones and define portions of the outer lagoon with the appropriate tide-equivalent volume for the repletion-water mass. Multitemporal thermal IR ASTER satellite data were separately analyzed at different tidal phases and seasons in 2004-2005. At-satellite radiances were transformed to derive skin surface temperatures and differentiate flood tidal penetration and ebb flow. Remotely sensed and modeled tidal repletion zones are intersected with the tidal prism to measure and compare volumes. These parallel analyses provide spatial characterization of flushing and potential water residence time, an important factor in eutrophication and water quality.

Nasser A Alsaaran, King Saud University. Email: alsaaran@ksu.edu.sa; Artificial neural networks pedotransfer function for water-retention of arid soils

Soil water retention curve (SWRC) is required for quantifying water flow and solute transport within unsaturated soils. Because direct measurements of SWRCs are very laborious, time-consuming and expensive, they are commonly estimated rather than measured. Estimates of SWRC from available and/or more easily measurable basic soil physical properties are routinely obtained by empirical pedotransfer functions (PTFs). This paper presents an artificial neural network PTF for estimating van Genuchten SWRC parameters for arid soils from soil texture and bulk density data. The PTF was developed and tested using datasets from arid central and eastern Saudi Arabia. The PTF was calibrated using a data set of 100 samples and its validity was evaluated using an independent data set of 45 samples. Uncertainty estimates of the predicted parameters were obtained by combining the artificial neural networks with the bootstrap method. Performance of the PTF were quantified and compared with the performance of two well-documented and widely-used published PTFs of similar input requirements, namely Rosetta and NeuroTheta. Validation results show that the current PTF has mean errors and root mean squared errors between observed and estimated volumetric water contents of -0.0004 and 0.04, respectively, compared to -0.026 and 0.063 for Rosetta and -0.068 and 0.088 for NeuroTheta, respectively. These statistics indicate that the current PTF is more accurate and less biased than Rosetta and NeuroTheta in predicting water retention parameters of arid soils.

Kristin J. Alvarez, Keene State College. Email: kalvarez@keene.edu; A Geospatial Technologies Course Designed for Pre-service Teachers

Inclusion of GIS and other geospatial technologies in the K-12 classroom has become an important priority among the geographic education community. Progress is being made in this effort, but little attention is given at the undergraduate level to equip teacher candidates with the skills and pedagogy needed to incorporate geospatial technologies in the K-12 environment. The Geography Department at Keene State College in New Hampshire has addressed this critical need by creating a new course just offered for the first time this year entitled Geospatial Technologies for Teachers. The primary focus of this course is the acquisition of GIS skills and the associated, relevant pedagogy for K-12 classroom settings. Also included in the course is work with GPS, remote sensing, and web-based geospatial technologies. The presentation will provide an overview of the course as well as activities and projects the pre-service teachers will take into their future classrooms.

Keywords: geospatial technologies, K-12 education, teacher preparation

John A. Alwin, Central Washington University. Email: alwinj@cwu.edu; Derelict Landscapes of Decline: Detroit's Unwitting Autobiography

Detroit, Michigan, of a half-century ago was a city with almost two million residents and a reputation as a wealthy, muscular, and industrial city synonymous with the American automobile industry. "Detroit" still is a shorthand for the country's auto industry. But, it now has one of the nation's highest urban poverty rates and, over the last 50 years, has lost most of its industrial base, almost half its population, and devolved into an icon of urban decay. Its derelict landscapes of abandoned and dilapidated factories and other structures, deserted and leveled neighborhoods replaced by urban prairies, and even portions of its CBD in ruin are part of the landscape legacy of a yet unsuccessful transition of Detroit to successful, postindustrial city. This study documents the cultural landscapes of Detroit's devolution and examines such spatial forces as globalization, decentralization, and sprawl that help to explain its derelict landscapes. Efforts and ideas on revitalization also are presented, including the proposal for a 12-square block "skyscraper ruins park", an American Acropolis, in its downtown area.

Keywords: cultural landscape, derelict landscape, globalization

Shrinidhi S. Ambinakudige, Mississippi State University. Email: ssa60@msstate.edu; Integrating Ethnography And Remote Sensing To Study Cultural Landscapes: A Case Study In The Western Ghats Of India

Remote sensing techniques have been used in the study of the land use and land cover change in different parts of the world for last several decades. Even though these land use and land cover changes are cultural landscapes influenced by the socio-economic, political, and cultural factors acting at various spatial and temporal scales, studies have seldom tried to integrate the ethnographic analysis and remote sensing analysis. This study makes an effort to interpret the land use and land cover change in the Western Ghats of India in the broader context of social, cultural and political change, and economic modernization. Results showed that the global coffee market fluctuations over the last century had significant influence on the local livelihood outcomes. These impacts are scripted on the landscapes of the villages in terms of land use and land cover change.

Email: hsseguya@iastate.edu; Delineating the Multifunctional Roles of Agroecology for Smallholder Farmer Livelihoods: Toward Sustainable Agriculture Development in Developing Countries

In developing countries there are still many rural areas where food security and sustainable livelihoods are at a critical stake. Agroecology has increasingly been recognized in development circles as one of the major alternatives that could ensure rural people's basic needs while enhancing the ecological capacities grounding their livelihoods. This article explores the multifaceted dimensions of agroecology that could potentially address the compelling livelihood necessities of less advantaged smallholder farmers in developing countries by introducing the concept of agricultural multifunctionality. It is expected that the concept will help address the existing biases in agroecology toward ecological and agronomic approaches and thus serve to overcome the conventional chasm between ecological research and social realities in agroecology-based development. The article also proposes the use of an adjusted version of the sustainable livelihoods (SL) framework that will provide better analytical scopes into the theoretical perspective of the multifunctionality of agroecology.

More than one-third of the land in Bangladesh is classified as freshwater wetlands. Located in the northeastern part, Tanguar haor is one of the largest natural freshwater wetland of the country. It occupies an area of 10,000 hectares with forty-six villages scattered in surrounding private lands. This haor is extremely important for its large and diverse waterfowl populations and other biological resources. To preserve the diverse biological resources of the haor, especially the large number of waterfowl species, it has been declared as the second "Ramsar Site" of the country in 2000, and was made off-limits for public use and exploitation of resources. Results from the field surveys show that most of the villagers depend on the haor for fishing, grazing, farming, and wetland vegetation for fuel. Most importantly, the haor is also used for rice (staple food) cultivation during the winter flood-free season. Total exclusion of local people from the current management practices greatly impacted the local people whose livelihood depends on the resources of the haor. The present study focuses on the nature and extent of dependence of the local people on the haor, and examines the significance of their involvement in sustainable management of these

resources. The study is based on information collected through field observations, household questionnaire surveys, key informant interviews, informal group discussions, and secondary sources.

Abigail Amissah-Arthur, Dr., Slippery Rock University. Email: abigail.arthur@sru.edu; Intensification of croplands and the extent of land degradation

A population-agriculture and environmental nexus may exist in Africa. Over the past few decades evidence suggests that rapid human and livestock population growth, intensification of cultivation, declining rainfall including drought have increased the pressure on natural resources in the arid/semi-arid zones. The paper identifies thresholds of factors depicting human disturbance in the Sahel through spatial domain translations to derive quantitative indicators of landscape degradation. Three levels of agricultural land use intensification are identified expansion, early and late phases. The characteristics of the areas under each phase is examined and linked with the population carrying capacity to explain the nature of the land degradation observed in the Sahel.

Keywords: Cropland, intensification, degradation, population

Potter Amy, Louisiana State University. Email: amyepotter@gmail.com; Haiti's Identity Crisis: Representation in U.S. Newspaper Coverage

Most newspaper articles in the United States paint a picture of Haiti as a failed state, the poorest country in the Western Hemisphere. These articles place the blame of the country's problems entirely on Haiti itself, with little regard for the outside forces that brought the country to its present day state. This study is a critical geopolitical analysis of Haitian representation in U.S. newspapers. I will empirically examine a year's worth of articles from 2004 written on Haiti in five major U.S. newspapers. From these articles I will analyze both the words used to describe Haiti and the emerging media frame. I will then compare the repetition of words and frame to scholarly sources on Haitian history. Critical media studies have shown that representation in the media can greatly impact the conventional wisdom surrounding a place and legitimize social inequalities. Through understanding the images used to describe Haiti, I hope to develop a means through which to redirect popular perceptions of it. I argue that it is only then that the problems of Haiti might be more effectively addressed and a new dialogue created, one that encompasses the entire story of this Caribbean country.

Roe Amy, University of Delaware. Email: amyroe@udel.edu; When Sustainability is an Afterthought, Fishing Communities in the Susquehanna River Basin and the End of the Great Shad Migration

Historical fishing communities along the Susquehanna offer insight into changing views towards sustainability over time. This study follows the rise and fall of shad fishing along the Susquehanna River from the point of view of community fishing. Special emphasis is placed on the technologies of fishing as portals for understanding the relationship between communities and natural resources, concerns about resource sustainability, and the local knowledge of shad fishing within the greater context of life on the Susquehanna. Environmental sustainability becomes contextualized in this longitudinal analysis of natural resource extraction.

Keywords: Sustainability, community, fishing

Li An, San Diego State University. Email: lan@mail.sdsu.edu; Daniel Brown, University of Michigan. Email: danbrown@umich.edu; Effect of sampling strategy on the inference of land-change processes: Role of uncertainties in spatio-temporal processes

When land-change scientists seek to infer micro-level processes from land-change data collected longitudinally over time, or sampled over space, they face several fundamental scientific questions that have been rarely, if ever, addressed: Within how large a geographic region, for how long, and at what time intervals, should the researcher collect her data? In a computer-based artificial "world", we controlled land-change processes by designing inputs (e.g., algorithms, parameters) and generating emergent spatial patterns that are observable over time. Taking samples from such generated patterns, with variations in geographic size, time lengths, and sampling intervals, we analyzed model output data using various statistical models (e.g., ordinary least-square regression, logistic regression, and survival analysis) and compared the corresponding results across a range of inputs to answer the above questions. This paper addresses fundamental questions relevant to many scientific investigations that use sampled data, and help researchers to develop a scientifically sound and economically feasible sampling strategy in consideration of uncertainties in spatio-temporal processes.

Kevin J Anchukaitis, The University of Arizona. Email: kanchuka@lrr.arizona.edu; Michael N Evans, The University of Arizona. Email: ; High resolution isotope dendroclimatology in montane cloud forest trees from Costa Rica

In temperate regions, networks of tree-ring chronologies provide proxies for paleoclimatic analysis. Many tropical trees do not form reliably annual rings, making it difficult to develop chronologies in these regions. In the mountains of Costa Rica, where anthropogenic climate change may already be influencing regional hydroclimatology and tropical forest ecology, we seek to establish high-resolution proxy paleoclimate records from trees without rings using stable isotope dendroclimatology. Species of Sapotaceae and Podocarpaceae provide the potential for century-long records of changes in local climate, which may reflect broad-scale ocean-atmosphere forcing. Our approach uses microsampling, rapid cellulose preparation, and CFIRMS to identify isotope cycles in wood which are associated with the change in the $\delta 18O$ of water sources used by trees over a year. Isotope measurements reveal annual oxygen isotope cycles which provide chronological control in the absence of rings. Climate variability during the 20th century is evaluated using the isotope signal from multiple trees in the Monteverde Cloud Forest, using calibration with local meteorological data, forward modeling, and analysis of the relationship of the regional variability in the context of large scale dynamics and change.

Delphine Ancien, The Ohio State University. Email: ancien.1@osu.edu; Urban and Regional Development in the Paris and London Metropolitan Areas and the Difference the State Makes

A distinctive feature of post-World-War-II urban politics in most advanced capitalist societies, particularly in Western Europe, is the emergence and development of large metropolitan regions as integrated production spaces. These areas benefit from agglomeration economies and are conceived as areas requiring integrated approaches to the governance of their further economic development. In Western Europe, Paris and London are two examples of these world city-regions, which present an interesting common peculiarity: in both cases, central governments continue to play a major role in their development, both as key orchestrators and as implementers of new projects. They do so through a distinctive politics that is in response to problems specifically related to these city-regions and their global-city economies. The fact that both instances occur within the context of unitary states is not coincidental. For instance, the absence of incentives for local governments to handle the housing crisis linked to regional growth in both cases - and the related non-existence of any coherent governance body encompassing the greater Southeast in Britain ? can be explained to a great extent by the unitary form of the central state and leads to a peculiar politics of scale. However, in this paper I will argue that beyond their common unitary form, the British and the French central governments remain unique and adapt to global changes in distinctive ways, and their different regulations and strategies of economic development can explain variations in the ways different agents handle regional growth and its contradictions in these capital city-regions.

Kristina Vaarst Andersen, Copenhagen Business School. Email: kva.ivs@cbs.dk; Mark Lorenzen, Copenhagen Business School. Email: mark@cbs.dk; Creative Get Creativer? A Power Law Analysis of the Geography of the European Creative Class

Using novel statistical data, the paper analyzes the geographical distribution of Richard Florida's creative class among 815 European cities. First, the paper demonstrates that the distribution of the European creative class approximates a power law, albeit with a higher exponent (i.e., a higher inequality) than the distribution of the overall population. This signifies that in general, size matters in the distribution of the creative class, i.e. that cities with a high proportion of creative class tend to get creativer through attraction of still more creative labour. Second, the paper analyzes the geographical distribution's deviations from a perfect power law. For the smallest (and some extent also the largest) European cities, the proportion of creative class is lower than predicted by a power law, and for the middle-sized cities, the proportion is slightly higher. This leads us to conclude that the attractiveness to the creative class of a European city is a product of both its size and fitness. Such fitness may be predominantly negative for small cities, positive for middle-sized cities, and slightly negative for large cities. Through comparisons among 8 European countries and case studies of cities, the paper then proceeds to discussing the nature of this size-fitness product of cities with respect to attracting the creative class.

Ben Anderson, Dr, Durham University. Email:
ben.anderson@durham.ac.uk; *Geopolitics and the Excess of Affect*

Attending to the excess of affect seems to offer much to critical work on contemporary politics - promising new ways of attending to events, fostering a sensitivity to the affective genesis and maintenance of the political, and calling forth inventive habits of thought, for example. How, though, to encounter techniques where it is precisely the excess of affect, its autonomy or capacity to exceed determination, that is fostered as part of processes of governance? The paper works through this unsettling question by encountering two Cold War events in which the excess of affect is fostered as part of the development of novel military techniques. First, the emphasis on the intensity of experience, and thus the problem of boredom, during the emergence of 'war gaming' in the RAND corporation during the 1960s. Second, the development by the CIA in the early 1960s of 'non-coercive' and 'coercive' interrogation techniques that attempted to induce boredom. The paper concludes with some reflections on the ethos of engagement appropriate to such events in the context of the embedding of these and other techniques in the affective geographies of the latest 'War on Terror'.

Brett Anderson, University of Kansas. Email: sanjuan@ku.edu; *The Historical Origins of Oklahoma's Negative Image*

It is widely accepted that Oklahoma has a largely negative image in the national consciousness. Although Oklahoma is devoid of large, well-known cities with cosmopolitan reputations or awe-inspiring physical landscapes such as snow-capped mountains or beaches that create positive impressions, other states share these qualities, yet Oklahomans are continually stereotyped as poor, uneducated, and generally unprogressive in television shows and movies in a manner worse than the portrayal of residents of most other states that are similar. This paper attempts to gain a greater understanding of Oklahoma's contemporary negative image by examining the following questions: When did Oklahoma first begin to be perceived negatively? Has Oklahoma always suffered from a negative image, or is this a recent phenomenon? What historical events, if any, created Oklahoma's image? To answer these questions, I trace the history of Oklahoma's image through the use of historical literature including articles, editorials, and cartoons in national publications from the late 1800s and the early decades of the 1900s.

Keywords: Oklahoma, image

j.j.anderson@qmul.ac.uk; *Giant steps or stepping stones? Making the terrain for transnational union organisation*

Global strategies are widely considered indispensable for the rehabilitation of the labour movement. It is also widely held that these strategies will germinate most successfully in the non-mobile service sector. This paper compares two such sectors - hotels and transport - where unions are making concrete investments in transnational organising initiatives. Three arguments are made. Firstly, unions are gradually finding a firmer footing in the transnational terrain as they experiment with an array of transnational leverage mechanisms. Secondly, the differential investments being made in the two initiatives illustrate the complex web of power relations and embedded national practices that shape emerging transnational strategies. Thirdly, I argue that there is a latent willingness to act transnationally at the grass roots, but only if mechanisms for transnational participation can be constructed.

Jon Anderson, Cardiff University. Email: AndersonJ@cardiff.ac.uk; *Living with Fragmented Identities and Ecological Aspirations in an Industrial World*

This paper examines the tensions between the principles and practices of environmentalism. It focuses particularly on the level of the individual and how aspirations to be 'green' come into conflict with the everyday realities of inhabiting industrial society. Drawing on research undertaken on the identity-management practices of volunteers and employees at the Centre for Alternative Technology, Machynlleth, UK, the paper seeks to draw a constructive alignment between discourses of environmentalism and sustainability on one hand, and notions of fragmented and malleable identities on the other. It does so in order to work towards a vocabulary of theory and practice that is sensitive to hybridity and contradiction, whilst retaining the utopian stimuli of essentialist categories such as 'environmentalist'.

Kate Anderson, LSIT, San Francisco State University. Email:
katesal@yahoo.com; *Mapping Historical Boundaries in San Francisco*

Historical land ownership and use in California has changed considerably relative to the government in power. The city of San Francisco was first settled under Spanish rule and therefore consisted of a Presidio, Pueblo and Mission, with all land held in common. Under Mexican rule, large private land grants in the form of Ranchos were made for the purpose of cattle ranching. Once California came under the rule of the United States, Land Surveyors began mapping and subdividing much of the city, spreading westerly and southerly from the original Pueblo. An investigation of this spread involves analyzing how the physical structure of the city influenced the placement of man-made boundaries and the original sites of growth in San Francisco. My research is analyzing historical maps in San Francisco between 1835 and 1920 to discern the affect of the physical environment as a determinant for human settlement patterns. Historical boundaries of Ranchos, waterways, and subdivisions are mapped using data on file with the county. Mapping applications that incorporate Geographic Information Systems (GIS) are utilized to create a visual timeline of the spread of population throughout the city. While physical parameters are an essential part of early land division and ownership, they appear to play a less significant role in later divisions. The results provide a visual account of land subdivisions depictive of population dispersal that are increasingly independent of physical parameters in San Francisco during its early development.

Kristy Michele Anderson, BA in 2007, University of California Los Angeles. Email: kristyan@ucla.edu; *The Geography of Factory Farming*

Since the industrial revolution agriculture has seen a major shift in livestock management which has come to be known as the "factory farming" model of agriculture. This model uses Concentrated Animal Feedlot Operations along with modern technology and is the most widely used method of raising and slaughtering livestock today. This model has spread globally while the space allocated to the animals exploited in this type of farming has at the same time, significantly decreased. This model continues to spread from industrialized nations to developing nations as they become more technologically advanced. This paper examines the key driving factors and government policies that made this model possible and also reviews the geographic trend of its global distribution noting both the gain in its popularity as a viable farming method as well as its need for less land space due to the increase in intensive animal confinement. Research methods employed include a comprehensive review of historical and current statistical land use information, government policy and technological advances.

Matthew Anderson, Northeastern Illinois University. Email:
Apollo5710@yahoo.com; *Place Making and Suburban Culture - Transformations over the Past Three Decades*

North American metropolitan regions have experienced major restructuring over the past three decades. Cities are continuing to expand, experiencing further investment in the built environment with the creation of a new form of suburbia. With all the transformations that characterize the past three decades, how has the shape of suburbia changed? We are witnessing yet another major wave of urban dispersion similar in scale to the great outward movements of the 1920's and 1950's. However, suburbia is now different in form and place than in previous eras. It seems to exist more as an image or perception, evolving and changing through time. What can explain these differences and similarities from past forms of suburbia? The suburban image today features a new form of themed residential subdivisions increasingly acting as a new place of suburban identity within an otherwise chaotic mosaic of almost meaningless political boundaries and visual monotony. While using Kendall County, Illinois as a case study, I will focus my attention on the emergence of a cultural economy and the production of the residential subdivision as a representative place of local identity, and suburban culture. I will also comment on the current role of suburbanization within the greater structure of the economy, and its evolution over the past three decades.

Richard Anderson, York University. Email: anderson@yorku.ca; For the "little shaver who needs a spell of good air": The Toronto Star Fresh Air Fund and the bourgeois reclamation of street children

The Toronto Star initiated its now centennial reform project to expose under-privileged children to "fresh" rural air in 1901. Motivated by the movement toward pure air, the increase of air pollution and smoke "nuisances" and, we argue, a stout belief in the efficacy of environmental determinism Toronto's reformers, in league with The Toronto Star, raised funds to provide the city's tenement children a literal breath of country air. As honourable as this sounds, we contend that bourgeois reformers were motivated to reclaim street children using salutary rural air for reasons that now strike us as less commendable. Despisers of immigrants and the immigrant city, environmentalist reformers held that exposing children to nature would alter their social behaviour and outlook. The regular removal of children from immigrant neighbourhoods to Toronto's countryside may well have had tangible health benefits. It also allowed "nature" to change the anti-bourgeois behaviour of impressionable street children into the moral-aesthetic world-view of Toronto's white Anglo-Canadian social "superiors." Thus, the Fresh Air Fund was as much about social geographical salvation as philanthropy.

Keywords: Toronto, children, pollution, bourgeoisie

Sharolyn Anderson, PhD, University of Denver. Email: sander24@du.edu; Claudio Delrieux, PhD, Universidad Nacional del Sur. Email: cad@uns.edu.ar; Fractal Modeling Of Urban Morphology

Understanding urban morphology using mathematical techniques applied to remotely sensed data is essential in modeling urban growth patterns. This work is aimed to provide a new analytical approach for assessing urban morphology and growth models using fractal and multifractal estimators. We derived indicators of the growth patterns over three distinct locations. Urban morphology attributes are derived using ten years of DMSP-OLS composite nighttime lights imagery, over urban areas in the United States, Mexico, and Argentina. Two analytical methodologies were applied to these data. First, the contour of the light imaginary is regarded as an indirect measure of the border of the urban settlements. The shapes of the contours for the series of images are analyzed using monofractal dimension estimation for several luminance thresholds. Second, the light map itself can be regarded as an indirect estimation of the 2D population density function. Over this map we performed multifractal analysis using the of fractal dimension technique. The conclusion of this analysis shows different estimation parameters for each of the urban areas under study, while the parameters at each location show similar results along the ten years of data.

Tessa Anderson, Dr, Department of Geography, University of Canterbury. Email: tessa.anderson@canterbury.ac.uk; Geodemographics and public service delivery: a case study of vulnerable road users

Applications of geodemographics to public service delivery have been prolific in the UK in recent years. This paper seeks to firstly review how geodemographics has been integrated into the public agenda by providing a brief review of geodemographics in the UK and international arena. Increasingly academics and researchers alike place a great deal of emphasis on the use of a predominantly private sector marketing tool for determining public agenda. It attempts to explain the policy shift in which the use of geodemographics has integrated the public service sphere and gives a critical appraisal of these trends. The second part of the paper focuses on a case study of road collisions in London

and how the use of geodemographics can assist to identify vulnerable road users, and therefore potentially policy development in this area. The nature of this case study also explores the theme of risk and geodemographics, specifically applied to, in the context of road collisions, but also its use in crime and health applications of geodemographics. By questioning the quantification of risk in this nature and how this can be effectively applied to public service agenda, this paper aims to critically appraise geodemographics, using empirical evidence.

Keywords: Geodemographics, GIS, risk, collisions

Thomas K Anderson, University of Illinois. Email: tanders9@uiuc.edu; Containerization and the Quality of Life of Merchant Seafarers

Today's container ships are designed to be loaded and unloaded quickly. Over the past 30 years, containerization and other advances in transportation technology have steadily decreased turnaround times in port. These technological advances have had a direct impact on the working conditions of merchant seafarers. The objective of this study was to examine factors that impact the quality of life of seafarers in the context of intensified globalization. In March 2006, eighteen seafarers took part in face-to-face, semi-structured in-depth interviews. The subjects were selected among seafarers visiting Port Newark located in Newark, New Jersey. Findings indicate that rapid turnaround times have eroded the amount of shore leave available to merchant seafarers. Each of the seafarers participating in the study cited insufficient time for shore leave as the most pressing issue impacting the quality of their lives while at sea. The rapid turnaround times associated with the loading and unloading of container ships along with an increased workload while in port were the two most important factors contributing to the lack of time for shore leave. Post 9/11 security measures, transportation costs, and transportation times to and from the port further constricted shore leave. The frequency and duration of shore leave was also found to be contingent upon the occupational specialty of seafarers. Unlike workers in most other professions, seafarers experience long periods of separation from their shore-based families and friends. Findings indicate that shore leave plays a critical role in maintaining contact with family members.

A multi-year geoarchaeology project in the Pictured Rocks National Lakeshore (PIRO), Michigan, is working toward identifying, mapping, and when possible, dating paleoshorelines that have potential to contain significant evidence of prehistoric archaeological occupations. Professional archeological research in PIRO began in 1968 and has continued intermittently until the present. To date, only 35 archaeological sites have been identified within the Lakeshore with the majority of these being historic Euro-American occupations. The prehistoric Native American occupation of PIRO is far less well-known. However, the presence of considerable ground cover and biomass has hindered archaeological inventory at Pictured Rocks. Archaeological survey must be accomplished with labor-intensive (and therefore expensive) close-interval shovel testing in order to expose surface and subsurface prehistoric materials. The potential to miss evidence of small prehistoric occupations is considerable. Analysis of remote sensing imagery, topographic maps, and soil maps has identified several ancient shorelines, which previous studies in the region have identified as high probability areas for archaeological sites. An initial GIS model of site location predictions, generated using shoreline mapping and other data sets, will be useful for accurate archeological survey at PIRO by focusing efforts on components of the prehistoric landscape that actually have potential to contain intact evidence of early human occupation and use of the Lake Superior shore. When completed, this study will enable future archeological research in the Lakeshore to better understand and focus upon those specific areas of the Pictured Rocks that have actual potential to contain intact prehistoric data.

Renata M. T. Andrade-Downs, PhD, University of California at Berkeley. Email: renataad@calmail.berkeley.edu; Fishing citizenship: Empowering fishing communities from Bairro Vermelho, São Francisco River, Northeast Brazil 1970-2002

Fishing communities living on the lower São Francisco River, Brazil have suffered physical and livelihood displacements since the construction of large water projects upstream their towns since the 1970s. This paper looks at how those changes challenged concepts of place, citizenship and identity for an artisanal fishing community living at the Bairro Vermelho in the town of Penedo, on the left bank of the river. The main argument of this paper is that this fishing

community, rather than creating a static and fixed relationship with the São Francisco river, is actually crafting fluid forms of relationships with its landscape to overcome environmental and social-economic struggles. This work presents an in-depth ethnographic examination of events and subjects involved in the formation of local leadership and representation around the fishing community movement for citizenship and environmental justice. The emergence of a local fisherfolk representation in the late 1970s in the Bairro Vermelho to fight for fisherfolk's rights illuminates how fisherfolk leaders have weaved an important cooperation and coalition network during and after the military regime. Those network strategies created new forms of identity formation on multiple scales of representation and of social mobilization. Those representations reiterated Bairro Vermelho fisherfolk leaders' claims of access to citizenship: social benefits rights and labor recognition; and to their fishing territories, with the creation of environmental protected swamps and campaigns to "save the river", as part of securing the ecology of the river estuary and their own cultural survival.

Physical Processes that Control the Development of the Great Sand Dunes
Aeolian System, Colorado, USA and their role in the management of Great Sand Dunes National Park.

Great Sand Dunes, Colorado (GRSA) is a geographic wonderland with varied aeolian deposits that respond to modern processes and critical land management issues generated by the desire to protect natural processes. GRSA is the site of an aeolian system that transitions along a topographic gradient from a sabkha, to a sandsheet, to a dunefield, and ends in sand ramps juxtaposition to fault block mountains. Dune types also vary along that gradient. The variation in sand deposits and dune types result from the interaction of 5 geologic processes that are fundamental to the development of the aeolian system. These processes are: crustal rifting, sand transport related to wind regime, sand transport by stream flow, sand stabilization by vegetation growth and sand cementation by evaporite minerals. Rifting creates a depositional environment that allows sand to accumulate. Wind regime controls dune type and behavior. Streams modify the perimeter of the dunefield. Vegetation has stabilized surfaces. Other areas have been hardened by evaporite minerals. The National Park Service (NPS) has managed GRSA since 1932. Initially, the management focus was on visitor services, but a proposed water development project adjacent to the dunes exposed the lack of scientific knowledge. That began an effort to better understand the area's natural system, leading to the geologic process model described above. The NPS has used the geologic process model to interpret the dunes to visitors, evaluate potential threats, protect park resources, and to justify a boundary expansion to manage a larger portion of the aeolian system.

Governance as Discourse: Setting Energy Targets in New Jersey

This paper documents a process of analytic deliberation on the future of the energy economy of New Jersey. It describes the deliberative process and its associated analytics, and offers an evaluation of the project's success. The central question of the paper is whether possible to set meaningful performance targets in a policy domain where responsibility is widely distributed. The approach adopted to answer this question is a case study based on participant observation. In 2005, under the author's direction, the New Jersey Sustainable State Institute (NJSSI) launched a project to create long-term targets for the performance of New Jersey's energy sector. The targets were intended to provide a simple, credible way for New Jerseyans to understand their evolving patterns of energy consumption and production and whether the energy economy is likely to support their quality of life for the long term. To provide a rigorous framework for long-term projections and tradeoff analysis, the project employed an econometric model of the New Jersey economy. The scope of the analytic work encompassed the full New Jersey energy economy 30 years out, while acknowledging the state's myriad economic, social, and environmental interconnections with the outside world. Demand-side elements included transportation, buildings, and commercial/industrial energy uses, including expected technological improvements in efficiency and behavioral choices in conservation. Supply side elements included electricity and its associated primary energy sources (nuclear, coal, oil, natural gas, biomass, solar, wind), oil, natural gas, and the spectrum of renewables. This work successfully advanced public discourse on state-level energy policy.

Clio Andris, MS Candidate, University of South Carolina, Columbia.
Email: clio.andris@gmail.com; *The Marketable Identities of Major American Cities*

How do American cities give themselves a marketable character? Why is identity creation important for American cities? This paper explores why cities create a visible identity and processes and controversies involved in creating and marketing an identity. Studies in geography and destination marketing describe how a city can project an identity to attract visitors and differentiate a city from its urban peers. For this study, I looked at twenty-two cities in the continental United States within the population range of New York to Pittsburgh. I used Visitor's Convention Bureau literature, advertisements, neighborhood atmosphere observations, visits to highlighted tourist attractions, and cultural landscape accounts to extract tokens of marketable identity in these major American cities. My research concludes that cities use various tactics to create marketable identities where some are used in many cities, while others emphasize the culture of a specific city. My case study cities use lighting, waterfront revitalization, sports franchise infrastructure, historical attractions, masculinity, neighborhood character, cuisine, conference hosting, ethnic diversity, and commercialism as icons and images to represent themselves. These findings are significant not only because they illustrate place promotion, advertisement and destination marketing, but because they reflect the ways in which American cities differentiate themselves from one another through marketing identity.

How Certain Are We With Geospatial Technology?

In the last decade Geographic Information Systems (GIS) technology has become a central element of modern spatial information and analysis system. While using Geospatial technology for modeling and analysis, the emerging geospatial analysis community acknowledged uncertainty and spatial errors as an inherent problem in spatial analysis. Uniqueness of geographic data, impossibility of reaching the accuracy of every feature at every location has to be recognized while using geographic data for spatial analysis and predictive modeling. Application spatially-error-overloaded geographic data for precise geospatial modeling can lead to improper results and conclusions. However, while spatial uncertainties are commonly accepted by the scientific community, the geospatial users' community still does not pay too much attention to the spatial uncertainties and errors analysis considering geographic data as free of errors and uncertainties, and using it "as it is" in various operations. In this presentation the importance of applying accurate, relevant datasets of high quality, as well as consideration of internal data uncertainties while doing spatial prediction and modeling is analyzed. The demonstration of how the uncertainties and errors can change the final model outcome is presented. The study is based on the application of GIS and its components that were incorporated into creating a complex analytical geospatial-modeling tool to predict the best route for autonomous navigation system at the "DARPA Challenge".

Circuits of Whiteness: Emotional Geographies of Return Migration to South Africa

In this paper I examine the strategic deployment of emotion by voluntary sector organizations in South Africa encouraging the return migration of white expatriates living primarily in the UK. Drawing on recent literature highlighting the rise of emotivist regimes of governance, I look at the way in which expatriates' whiteness is, literally, mobilized through tropes of feeling, in order to achieve the ends of the neoliberalizing South African state problematically committed to a strategy of redistribution-through-growth, and thus reliant on the return of skilled white bodies to the country.

Keywords: South Africa, return migration, whiteness, emotion

Community Recovery from Hurricanes

Recent hurricanes have emphasized the difficulties that communities face when recovering from a devastating event. However, there is limited research into how governments, infrastructural service providers (e.g., electricity, water/sewer, hospitals), and other community groups respond both to their own organization's problems as well as to the problems faced by the community as a whole. This talk will present an analysis of data collected among coastal communities south of Interstate-10 between Pensacola and New Orleans that focuses on the obstacles, priorities, and difficulties that these groups face during response and recovery activities.

Zlatina E Anguelova, San Diego State University. Email: zuziea@gmail.com; Integrating Fire Behavior and Pedestrian Trafficability Models to Assess Fire Danger Within the San Diego-Mexico Border Zone

The objective of this study is to develop tools and procedures for better assessing the danger of wildfire to pedestrians in rural areas. Furthermore, the main goal is to better understand the combined behavior of fire and pedestrian mobility in order to predict evacuation timing in wildland areas. The study involves the integration of a pedestrian trafficability and the Wildland Urban Interface Evacuation (WUIVAC) models to determine zones of high fire danger during extreme fire season weather conditions within the San Diego-Mexico border region. A three step analysis approach will be used to test two scenarios. The first scenario involves a person (e.g. illegal crosser) moving in a northward direction on a trail toward a major road. For the second scenario, a person (e.g. border patrol officer) will be located in thick vegetation, away from roads and safety zones walking toward an evacuation vehicle. The first step identifies areas furthest away from roads and safety zones. In the second step, estimates of travel time are calculated considering terrain and vegetation constraints to movement. In step three, Evacuation Trigger Buffers (ETB) are generated by WUIVAC based on the pedestrian travel paths. Preliminary results show that the evacuation travel times calculated by the trafficability model are highly effected by the terrain and vegetation characteristics of the study site, while the ETB extents are mostly influenced by the wind speed and direction parameters. The integrated models estimate a moderate fire danger to pedestrians in the most remote wildland locations of the study area.

Keywords: Key Words: wildfire, evacuation modeling, pedestrian movement, WUIVAC

Jonathan Shapiro Anjaria, UC Santa Cruz. Email: janjaria@ucsc.edu; On street life and urban disasters: Lessons from Mumbai

One month prior to Hurricane Katrina, the city of Mumbai, India, experienced similar unprecedented and disastrous flooding. Yet, in contrast to New Orleans, the aftermath of the Mumbai floods was not marked by stories of panic, social disorder, violence or looting but by stories of widespread acts of generosity, selflessness and kindness. This was especially remarkable considering the conventional rhetoric that constructs Mumbai as a paradigmatic dystopic Third World city, marked by underdevelopment, infrastructural failure, squalor and despair. In this paper, I argue that, paradoxically, it was the very resistance of Mumbai's open spaces to modernist ideals of city planning that prevented it from experiencing the chaos and social breakdown witnessed in New Orleans. This was, in part, due to the fact that during and following the Mumbai floods it was the 'unruly' crowds?those who, much to the frustration of city planners and civic activists, engage in multifarious uses of open spaces?who took on the social responsibility abdicated by the state. I propose that a study of the lived experience of cities in the global south, including the lived experience of urban disasters, outside developmentalist or apocalyptic narratives might serve to disrupt the continued one-way travel of urban theory by providing crucial lessons not only for the future of the Third World city, but for cities in the United States and Europe as well.

Luc Anselin, University of Illinois. Email: anselin@uiuc.edu; Spatial Econometrics, Retrospect and Prospect

This paper reviews the stages of development of spatial econometrics since its inception in the early 1970s and reflects on promising future directions. Spatial econometrics is situated as a subdiscipline of econometrics with great relevance to quantitative geography and spatial analysis. Its evolution is categorized into three distinct periods: the preconditions for growth (early 1970s to late 1980s), the take off (1990s) and the steady state (post 2000). Each of these is characterized by a change in focus of interest, an evolution of the disciplinary mix of scholars involved in the field, and a diversification of publication outlets. This brief historical overview is followed by some speculations about future directions in the field, organized around the four driving forces of theory, data, methods and computation.

Keywords: spatial econometrics, spatial analysis, geocomputation

Nicola Ansell, Brunel University. Email: nicola.ansell@brunel.ac.uk; Producing Interventions for AIDS-Affected Young People in Lesotho's Schools: Scalar Politics, Sectoral Blurring and the Role of AIDS Activists

Children and youth are the focus of many, often controversial, interventions aimed at addressing southern Africa's AIDS pandemic. These interventions are most frequently implemented through schools, and are often complex products of negotiation (or lack of negotiation) between a range of actors from national governments and international donors, to NGOs and local activist groups, to individual teachers and community members. Focusing in particular on the constraints and opportunities available to AIDS activists initiating, enacting or merely influencing interventions in Lesotho's schools, this paper examines

scalar politics and sectoral blurring in the production of new initiatives to address the needs of AIDS-affected young people.

Liisa Antilla, University of London (King's College London) and University of Washington. Email: liisa_antilla@hotmail.com; US Climate News: False Negative on Positive Feedbacks

Public perception of climate change as a problem for current society is shaped by media constructions of scientific knowledge. Prior research has "mapped" contrasting press representations of global warming found across cultures and time. Many US "hard news" outlets still confuse audiences by "balancing" climate stories with commentary from fringe contrarians and by dwelling on unknown factors. Outside this country, a distinctly different story is told. Non-US media have largely moved beyond abstract treatment of global warming as well as the phoney controversy manufactured by the climate countermovement. Reporters outside the US are much more likely to frame their stories as consensus-based and science-driven. What is more, non-US journalists are more prone to report on studies relating to positive feedback mechanisms (such as thawing tundra and melting Arctic ice) in the context of "tipping points." This paper is based on a content analysis of one year of media coverage on the non-political tipping points of global warming. Data was collected from the database LexisNexis and internet news sources. The sample was drawn from newspapers, wire services, and web-based stories. Results indicate that non-US news outlets, especially those in the United Kingdom, are at the forefront of the discourse on positive feedbacks. Poor US press coverage of these dangerous thresholds results in a "false negative." The failure to publicly recognize these self-reinforcing ecological dynamics leaves citizens and policymakers uninformed on this developing but critical knowledge.

Keywords: climate change, global warming, positive feedback, tipping point, media, framing

Camille Antinori, University Of California, Berkeley. Email: antinori@are.berkeley.edu; Chantal Ruppert, Albert-Ludwigs-Universität Freiburg Germany, Institute of Forestry Economics. Email: ch.ruppert@ife.uni-freiburg.de; A Comparative Analysis of Community Forestry Sectors: The Cases of Mexico and Germany

How should the institutional setting be arranged to manage community forests in a sustainable and efficient way that takes into account local needs? This question has become one of the focal points in the politics and economics of global environmental change. Both Germany and Mexico, distinct in location and culture, have had a tradition of community-owned forests and have strengthened the rights of local communities to exercise control over management of their forests. But while in Mexico the communities are predominantly autonomous in managing their forest, in Germany the state still controls most of the community forests. In addition to conservation, people in both countries recognize the potential role of forests in generating revenues? as a way to alleviate poverty in Mexico and as a way to reduce financial deficits in Germany. This paper has two aims. First, it defines and compares the community forestry sectors in each country. Second, it shows that, although large differences exist between the countries, each can learn from the other because of shared characteristics of resource use over time? like the high social value placed on forests - as well as the system of collective action at the local level. Agency theory provides a framework for assessing how each country has dealt with monitoring and accountability issues common to contracting with non-owner managers. We conclude by suggesting recommendations for better arrangements to diminish moral hazards in both countries - emphasizing contractual relations, control mechanisms, and the merging of responsibilities among the actors.

Maurizio Antoninetti, San Diego State University/UC Santa Barbara. Email: mantonin@mail.sdsu.edu; Mixing methodologies to understand everyday life in urban neighborhoods

The aim of my research was to produce a form of comprehensive knowledge useful in understanding the dynamic and coconstitutive relations existing between socio-physical characteristics of residential neighborhoods and the activities of everyday life of a group of recent retirees. For this, I employed an alternative approach based on fine-grained, subjective experiences within a framework of objective reality. I designed my study around a multi-methodological approach ('bricolage') that combines in-depth interviews with GIS-driven spatial explorations. What I have achieved is to understand the city through the experiences of its inhabitants and, equally, to understand the daily activities of a selected group of city dwellers as they navigate and cobuild the physical and social attributes of an urban environment.

This paper describes teaching, studying, and eLearning approaches in geography education in senior high school and teacher education. The discussion is based on case studies from the senior high school of Oulun Lyseon Lukio, and Department of Educational Sciences and Teacher Education in University of Oulu (UO). The topic starts with the following questions: Which kinds of conceptions do students and student teachers have about eLearning in general, eLearning's geographical content, learning methods, and evaluation? Which kinds of practical skills do students and student teachers have with eLearning equipment? Which kinds of readiness do students and student teachers expect teachers to have? What are the pros and cons of eLearning? How do the conceptions of students and student teachers differ from each other? How are the Finnish local and national curricula related to a common Nordic framework and to the framework of European Union? The first part of data is based on questionnaires; the second part on the texts of the Finnish national and local core curricula for senior high schools and the curricula for class-teacher and subject teacher education in the UO. The data are analyzed quantitatively and qualitatively using both deductive and inductive methods. In conclusion, conceptions of students and student teachers about eLearning relating to the statements in national and in local curricula, and eLearning guidelines in European Union are discussed. In addition, we present some suggestions on how teaching by eLearning could be developed using the thoughts of students and student teachers.

Yuko Aoyama, Clark University. Email: yaoyama@clarku.edu; Dominic J. Power, University of Uppsala. Email: dominic.power@kultgeog.uu.se; Consumption and Economic Geography

It is undeniable that in the past few decades the dominant theoretical frameworks in Economic Geography have been oriented toward production, while neglecting consumption. A decade after the alleged 'cultural turn', which contributed to a development of empirically-driven research on the consumer economy, we still lack analytical tools to begin conceptualizing and successfully incorporating consumption in the mainstream of economic geography. In this paper we seek to address how economic geographers can begin to engage with research on consumption, and focus on methodological and empirical issues the discipline may face in this quest. We explore how existing literature can be used as foundations to begin engaging with consumption and consumers, and develop research agenda that address economic/geographic dimensions of consumption.

Philippe Apparicio, . Email: Philippe_Apparicio@ucs.inrs.ca; Anne-Marie Séguin, INRS-UCS (University of Quebec). Email: Anne-Marie_Seguin@ucs.inrs.ca; The quality of the urban environment around public housing buildings in Montréal, Canada: an approach based on GIS

The way in which public housing is embedded in the urban environment has often been studied, but more often from the perspective of the social, than of the physical environment. The accessibility of services and public amenities to public housing residents has rarely been a focus of interest. In order to qualify the immediate surroundings of Montréal's public housing buildings in its multidimensionality, we propose a GIS approach which combines data from a variety of sources: 1) individual Census records for the Montreal CMA in 2001; 2) satellite imagery; 3) land-use map; 4) information on the location of different services and public infrastructure. These data enable us to identify several combinations of characteristics of the urban environments in which public housing buildings are located, along three dimensions: 1) socio-economic environment; 2) physical environment; and 3) accessibility to services and amenities. Our results show that only a very small proportion (7 %) of public housing residents are located in "residual spaces", the less attractive areas of Montréal, which we define as areas combining a variety of handicaps: low grade physical environment, high level of social deprivation, and bad accessibility to amenities.

Keywords: Public housing, urban environment, urban quality of life, Montréal, GIS

Hannah Appel, Stanford University - CASA. Email: happel@stanford.edu; Crude Fictions: Regulation in the Shadow of Inaccessibility

Since its independence in 1968, Equatorial Guinea has been treated?literally and figuratively?as "inaccessible." Foreign governments, nongovernmental and multilateral organizations, private capital, media, academics, and many of the country's own citizens have stayed away or been kept away. But with large oil

deposits discovered offshore in the late 1990s, the micro-state sitting at the heart of the petroleum industry's 'new Persian Gulf' now boasts the fastest growing economy in the world, and is the third-largest oil exporter in Africa. Direct weekly flights from Houston to the capital city and an infamous thwarted coup attempt involving Mark Thatcher and novelist Frederick Forsyth suggest that the terrain of access has changed. Based on preliminary fieldwork in Equatorial Guinea, this paper explores the country's post-independence record of inaccessibility, and the implications and consequences of that history for the recent, drastic changes in economic and geopolitical interests in the region.

Keywords: oil, geopolitical economy, access, Africa

Lorna Z. Apper, McNair Scholar, Wasserman Scholar, UCLA. Email: lapper@ucla.edu; California Native Grass Cultivation, Restoration and Distribution in Los Angeles County

California native grasslands have long been an endangered ecosystem; finding ways to successfully cultivate and restore this biome is essential to its survival. This research tracks the cultivation and restoration of nine southern California native grass species planted at nine sites in Los Angeles County. The grasses were cultivated and restored over two growing seasons, from winter 2005 through winter 2007. During the first growing season four species were cultivated and during the second, five different species were added to total nine. The native grasses were restored from plugs and seeds. One ounce of seeds was planted for each species except in two cases where they were cultivated from two specimens each, due to the lack of a seed and plant bank. The current and past distributions of these grasslands in Los Angeles County are analyzed via Geographic Information Systems and Remote Sensing maps. Sites that are suitable for habitat restoration are mapped. An examination of why native grass cultivation is relevant to bioresource managers and policy makers is argued through an analysis of the policies that are governing California native grasslands today. Native grasses are useful for conservation and habitat restoration, oakland, woodland, prairie, rangeland, wetland and grassland management, post fire seeding, alternatives to non-native agricultural species, and as vegetation options for landscape architects. The nine species used were: *Achnatherum hymenoides*, *Elymus condensatus*, *Elymus glaucus*, *Elymus triticoides*, *Hordeum brachyantherum*, *Muhlenbergia rigens*, *Nassella cernua*, *Nassella lepida*, *Nassella pulchra*.

Keywords: California, natives, grasslands, rangelands, oaklands, post fire seeding, management, agriculture, conservation, restoration, distribution, habitats, policies, GIS, Remote Sensing

Seth Appiah-Opoku, University Of Alabama. Email: sappiah@bama.ua.edu; Ecotourism in Protected Areas: The Case of Kakum National Park in Ghana

The involuntary restriction of access to legally designated parks and protected areas often have adverse impacts on local livelihoods. This seems to be the situation in villages surrounding the Kakum National Park (KNP) in Ghana. The KNP project relied on the idea of a protected natural area as a context for ecotourism but failed to successfully incorporate local concerns and requirements. Yet, the need to incorporate local people's concerns and requirements in protected areas management and ecotourism has been recognized by governments, environmentalists, conservation NGOs, and international organizations. For instance, Agenda 21 of the Earth's Summit advocates that conservation of biodiversity should be linked with the quality of life of local people. This requires the incorporation of local people's expertise, hopes, fears and aspirations in protected areas management and ecotourism plans. The paper discusses avenues for local participation in the KNP project.

Keywords: Ecotourism, Protected Areas, local livelihoods

Michael Applegarth, Shippensburg University. Email: mtappl@ship.edu; Growth and Land Use Change in Mohave County, Arizona

Many cities in the western United States have experienced significant population increases and urban growth for decades. In particular, various cities within the desert southwest states of Arizona and Nevada grew significantly in population and size during the 1990s. This paper examines the development of one municipality, Kingman, Arizona, and its surroundings as an example of such growth for this region during the 1990s. Kingman is located in Mohave County in northwestern Arizona and is within the Las Vegas, Nevada and Phoenix, Arizona corridor placing it in a unique position in the state as well as the region. This paper indicates land use change and residential growth in the Arizona and southern Nevada region by using methods that employ satellite imagery from 1990 and 2000 to provide a small snapshot of regional change. Growth here has occurred in terms of population, residential development expansion, and accompanying infrastructure increases such as roads and highways. Moreover, growth in this area has continued since 2000 and indications suggest that this will continue. Results also further confirm that the use of moderate resolution

remotely-sensed data continues to be a valuable asset in monitoring and assessing land use change and urban development.

Keywords: Arizona, Land Use

Toby Applegate, Rutgers, The State University of New Jersey. Email: tapplega@eden.rutgers.edu; *Where are the renters? Developing a real estate market in post-socialist Slovenia*

Slovenia's post-socialist experience is typified by a slow, but steady acceptance of economic reforms in order to gain accession to the European Union. After the break up of the former Yugoslavia, "social housing," or housing owned by the government or state-run enterprises, went through a process of privatization that created real estate markets where, officially, there were none. Many occupants of flats in Ljubljana converted their homes from socialist housing regimes to private ownership, while other purchased flats that were not converted by occupants and became landlords. At the time of this conversion process, the Slovene government rendered it impossible, via regulation, for the Slovene Statistical Office to ask whether or not a property was rented, thereby creating it a statistical vacuum within their housing numbers. Statisticians cannot directly ask the data provided by Slovenia the question: "Who are the renters?" If Slovenia is to develop a contemporary real estate market, one component of that market should be a fully accounted rental segment. The effect of this situation is two-fold. Either regulatory schemes change to allow full accounting or the market develops, such as black-market rentals, in ways that do not fit into a classically defined real estate market. This poster presents preliminary findings from research conducted in Slovenia and examination of Slovene housing market data.

Alan F. Arbogast, Michigan State. Email: dunes@msu.edu; *A Potential Classification System for Coastal Dunes Along Lake Michigan*

The sand dunes along the eastern shore of Lake Michigan may be the most impressive body of freshwater coastal dunes in the world. Many dunes are massive landforms that are up to 60-m high. In northwest Lower Michigan these large dunes tend to occur in isolated fields that mantle high bluffs. South of Manistee they cover topographically low lake planes and occur in semi-continuous fields that line the shore for many kilometers. Although the evolution of these dunes is now better understood, confusion remains with respect to their classification. The term perched dunes is usually associated with the more northerly dunes, whereas dunes to the south have been called a variety of things, including high dunes, cliffed dunes, and barrier dunes. Regardless of the terminology, all large dunes commonly share 1) a parabolic form, 2) transgression across older geomorphic surfaces, and 3) appear to have grown mostly during high lake stages as per the perched dune model. In an effort to simplify classification, all large dunes could be included within a single category of transgressive dunes that is further subdivided into two categories: 1) high perched dunes and 2) low perched dunes.

Keywords: Lake Michigan, sand dunes

Emma R. Archer, University of the Witwatersrand. Email: archere@geoarc.wits.ac.za; Mark A Tadross, Climate System Analysis Group, University of Cape Town. Email: mtadross@egs.uct.ac.za; *Climate change and its implications for livestock farming in a semi-arid environment, South Africa*

The semi-arid eastern Karoo, South Africa, has been the site of significant land use change in the past few decades, including changes to commercial stock farming systems. Such changes include major transformation in rangeland management (often inter-generational), new production and non-agricultural income earning options, and a switch to various types of game production. Climate stress may impact significantly on livestock, both directly (heat stress, water shortages) and indirectly (pests and pathogens). Climate change projections for this area show that certain types of climate stress of particular concern to livestock farming may increase in the future. Work undertaken elsewhere on climate change and agriculture shows that different farming systems can differ greatly in resilience under conditions of climate stress. This study, focusing on the Graaff Reinet district and surrounds, investigates the vulnerability of different farm systems and the extent to which they can or cannot adapt under climate change.

John Clark Archer, University of Nebraska. Email: jarcher@unlserve.unl.edu; Stephen J Lavin, University of Nebraska. Email: ; Kenneth C Martis, West Virginia University. Email: ; Fred M Shelley, University of Oklahoma. Email: ; *Creating an Historical Atlas of Presidential Elections*

This poster presentation summarizes the stages involved in the preparation and production of the "Historical Atlas of U.S. Presidential Elections, 1788-

2004" (CQ Press, 2006). This is the first modern atlas to cartographically portray the county-level popular outcomes and state-level electoral college outcomes of every U.S. presidential election from the very first in 1788-89 to the most recent in 2004. Important issues addressed from early on in the production phase included the essential role of color and the need for an adequate scale of map reproduction. Major components of the final drafting phase included historical-geographical research on contemporary county, state and territorial boundaries at the time of each election, and historical-political research on county-level popular election outcomes involving overall voter participation and also voter support for every candidate who received at least 2% of the national popular vote. Preliminary maps drafted using Atlas*GIS were carefully examined for errors or omissions by all authors and several research assistants, often detecting mistakes and leading to additional historical-geographical boundary or election research. Final publication quality maps were created using Adobe Illustrator to refine the visually "rough" GIS maps and to meet the submission criteria required by the publisher. Many years of effort were finally rewarded by the publication of the "Historical Atlas of U.S. Presidential Elections, 1788-2004" in late 2006.

Keywords: Electoral geography, cartography, atlases, United States

Reginald S. Archer, University of California, Santa Barbara. Email: rarcher@umail.ucsb.edu; *Modeling the Impacts of Housing Policies on Affordable Housing for Poor Blacks in the Post-Katrina Tulane/Gravier Neighborhood*

Although many communities were affected by Hurricane Katrina, poor Blacks in the New Orleans, LA area were disproportionately impacted by the storm. In the wake of Katrina, the potential need to rapidly rebuild damaged communities may leave New Orleans at risk of losing over 50% of its black population due to lack of affordable housing. This study explores the use of geospatial information (GIS) and spatial modeling to analyze and interpret neighborhood housing data to determine the impacts of current policies on affordable housing in the Tulane-Gravier (TG) neighborhood. About 80% of TG residents rented their homes which were lost to flooding. Most of the properties in the area will not benefit from current state-funded recovery programs since they do not compensate rental property owners. In addition, initial research indicates that many of the neighborhood rentals are owned by black middle class New Orleanians who lost their primary homes during the flood. GIS will be used to examine the spatial relations among housing, population, income, and land use to identify at-risk properties. Spatial modeling techniques will be implemented to assess the impact of proposed development in TG and forecast spatial patterns of home ownership. The proposed results will provide a framework for equitable decision making based on current, accurate, and more complete information for long term planning. The forecasted model will apply spatial simulations based on neighborhood based strategies to promote homeownership for low income blacks in a mixed income neighborhood.

Raffael Argioli, Radboud University Nijmegen. Email: r.argioli@fm.ru.nl; Rob Van der Heijden, Professor, Radboud university Nijmegen. Email: r.vanderheijden@fm.ru.nl; Vincent Marchau, associate professor, TU Delft. Email: ; *ITS and office location preferences: a validation study*

This paper describes a validation study for a model about the effect of three Intelligent Transport Systems (ITS)-related transport concepts on location preferences of office-keeping organisations in urbanised areas. In past research a Stated Preference experiment was conducted, which showed that ITS concepts contributed significantly to the accessibility of office locations therewith influencing office location behaviour. Since the experiment was based on hypothetical locations an additional validation study was necessary. The validation of the outcomes of the Stated Preference study was performed by using four, more realistic, scenarios for two small cities in the Netherlands. One scenario focused on a status quo situation, the other three illustrated a possible implementation of an ITS transport concept. For each scenario office keeping organisations were asked to rate five different office locations, comparable to the descriptions of the office locations used in the Stated Preference study. Three aspects of validation were tested. At first the scores for the office locations were tested on significant differences as compared to the Stated Preference model predictions. Secondly, it was tested whether locations that lie close to an ITS concept were rated higher/lower than the same locations in the status quo situation. Thirdly, office keeping organisations were asked to rank the five locations in each scenario. Based on one hundred organisations it was concluded that, with difference in strength, all three validation tests show that implementation of ITS concepts change office location preferences in urbanized regions.

Brittina A. Argow, PhD, Wellesley College. Email: bargow@wellesley.edu; Seasonal, latitudinal and geomorphic variation in suspended sediment deposition across three New England marshes.

Back-barrier salt marshes are among the first coastal environments to react to changes in relative sea level. Marshes geomorphologically respond to rising sea level through a complex interaction between tidal inundation and duration, bioproductivity, and mineral sediment influx. In many marshes, tidal deposition of suspended sediment is believed to be the dominant source of inorganic sedimentation. This study examines spatial and seasonal patterns of tidal sedimentation across three representative New England back-barrier salt marshes. Sedimentation is strongly seasonal, with maxima occurring during the summer and minima in the fall. Patterns of tidal sedimentation also have a spatial component: winter sedimentation is greatest in the back-marsh, while sedimentation in the summer and fall is more closely related to the proximity of tidal creeks and the leading edge of the marsh. Within the marsh, total annual tidal sedimentation is positively correlated to depth of tidal inundation; however when comparing mean net sedimentation and inundation between New England marshes a negative correlation is observed. Tidally deposited sediment is a key contributor to net vertical accretion on New England marshes, but this process alone can not account for measured marsh surface sediment, and the missing sediment input vector may be ice-rafting. Tidal inorganic sediment accumulation is not only a useful standard of comparison between salt marshes, but can also be used as a yardstick against which other sediment influxes can be measured.

Eugenio Y. Arima, Dr., Hobart and William Smith Colleges. Email: arima@hws.edu; Robert T Walker, Dr., Michigan State University. Email: rwalker@msu.edu; Alex Pfaff, Columbia University. Email: ap196@columbia.edu; Deforestation in the Amazon: modeling the impact of policies

This paper implements a spatially explicit probit Bayesian regression model to estimate the probability of deforestation in the Brazilian Amazon. We innovate by using variables that enable policy relevant analysis such as the impact of road paving, cattle exports, soybean exports, and conservation area designation on deforestation. We discuss the results of the simulations in the development vs. environmental conservation context of President Lula's reelection.

Godwin Arku, Wilfrid Laurier University. Email: garku@wlu.ca; Catherine Oosterbaan, Department of Psychology, Wilfrid Laurier University, Waterloo, ON, Canada, N2L 3C5.. Email: oost1970@wlu.ca; Examining the Economic Development Strategies of three Cities: Kitchener, Waterloo, and Cambridge

In a competitive global economy, economic development more than ever before has become a major item on the policy agenda of cities. In this paper, we examine the economic development strategies and policies being pursued by three cities located within the Waterloo Region, namely Kitchener, Cambridge, and Waterloo. Specifically, we look at the economic strategies that are being adopted, the goals, the determinants, and outcomes of these policies. In addition to published documents, information has been collected primarily through interviews with city officials and high ranking managers of regional development institutions involved in the promotion of economic development in the three cities. Our findings indicate that four major strategies are currently being pursued; (i) the attraction of firms located elsewhere; (ii) the provision of infrastructure and land development incentives (e.g. industrial parks, serviced industrial lands); (iii) the attraction of labour; and (iv) the marketing and promotional activities (e.g. site promotion, trade shows, visits to businesses). Our findings also indicate that government restrictions on development as well as a lack of available land have compelled policymakers to pursue intensification and revitalization projects, especially in the city centers.

Stacey Armstrong, Missouri State University. Email: stacey01@missouristate.edu; Human Transformation of a Karst Catchment in Springfield, Missouri

The Ward Branch Watershed on the southern edge of Springfield, Missouri has experienced rapid urbanization over the past decades. During this period one of its tributaries (2 km²) has encountered severe erosion and flooding causing concern by local property owners. Evidence for both stability and disturbance presently exists in the channel system. This study examines the influence of land use and related drainage network changes on stream morphology and stability in an urbanized Ozark tributary. Historical analysis is based on a government land ordinance survey in 1838 and historical aerial photography for 1936, 1953, 1975, 1982, 1990, 1996 and 2005. Field methods included using a total station,

GIS and differential GPS to collect a detailed longitudinal profile, cross-sectional profiles, pebble counts and fluvial disturbance indicators. In addition, interviews with local residents are used to provide personal accounts of geomorphic changes. Land use analysis from 1936-2005 indicates that the landscape has been transformed from pasture to urban. Preliminary results indicate that the upper portion of the catchment has been de-coupled from the middle and lower reaches by artificial means. Channel head-cutting in the middle reach is releasing sediment and destabilizing the channel. However, bedrock control limits the response of the lower reaches except where sedimentation is occurring when slope breaks at the confluence with the Ward Branch. Human actions increase the resistance of the channel to erosion through landscaping, sediment grading and local grade controls. A channel evolution model for the catchment is proposed and its implications for management discussed.

BJ Arnold, Kent State University. Email: bjarnold@kent.edu; Using a GeoScape garden to teach an inquiry-based 8th grade earth science unit

As part of the NSF-funded GK-12 project, the GeoScape garden was developed in conjunction with Alliance Middle School, Stark Co., Ohio. It has been designed and installed as part of Kent State University's NEOGEO (Northeast Ohio Geoscience Educational Outreach) program. This collaborative project involves the creation of six outdoor stations at the school within an approximately 10-m² area and has brought together GK-12 fellows as well as Alliance Middle School students, teachers and administrators. The stations are framed, concrete slabs painted to depict normal, reverse and thrust faults, an anticline and syncline fold, as well as a geologic cross section. The GeoScape design is modular and scalable, which allows it to be replicated in parts, or as a whole in other schools/educational settings. Igneous, metamorphic, and sedimentary boulders donated by a local gravel quarry are also placed throughout the GeoScape garden. The GeoScape project is used in conjunction with a two-week inquiry-based curriculum aligned with the state of Ohio Academic Content Standards and is designed to help students in the comprehension and application of a variety of earth science concepts. These concepts include geologic time and relative dating techniques such as the principles of superposition, original horizontality, crosscutting relationships, inclusion and faunal succession. This unit also helps students to understand why relative dating and the sedimentary rock record are essential to the study of historical geology and also to develop such skills as observation, oral explanation, inference, sequencing, and interpretation.

Dennis Arnold, PhD Candidate, University of North Carolina at Chapel Hill. Email: arnoldd@email.unc.edu; Burmese Migrant Workers in Thailand: Exploitation in Border Development

This paper examines the political-economy of mobile capital and labor migration. The focal point is migrant workers from Burma in Thailand who work for (Taiwanese) capital that is mobile and in search for more flexible labor, avoiding workers that are better positioned to assert their rights. The state often facilitates mobile capital while portraying itself as the nationalist protector of the Thai people, despite the social and economic reality that the Thai state encourages the exploitation of workers regardless of nationality. As Thailand and neighboring countries take further steps to increase border development, labor standards are being pushed down both directly for the migrant workers employed in border industries, and often for domestic workers who are often accepting lower standards rather than job loss.

Keywords: Labor migration, Burmese migrant worker, Border Development

Colin A Arrowsmith, RMIT University. Email: colin.arrowsmith@rmit.edu.au; David F Fraser, RMIT University. Email: david.fraser@rmit.edu.au; The International Field Work Experience: A Case Study In The South Pacific

Education for the 21st century needs to be global and relevant in its outlook as well as being exciting and engaging. This is particularly so for tertiary education in the geographical sciences where the very nature of what we study is global in context. At RMIT, geography is taught as a series of services courses within the geospatial science discipline. The university has stated as its core mission, to make RMIT global, urban, work relevant and focussed on excellence in research. As part of our undergraduate teaching in geospatial science students are expected to participate in one field trip in second year. This has traditionally been undertaken at various locations throughout Victoria, Australia. However this year a group of students undertook their field exercises in Fiji. The rationale behind this was to internationalise our undergraduate learning experiences by enabling them to undertake a series of field exercises in Fiji as well as participate in a joint seminar series with students from the University of the South Pacific in Suva, Fiji. This paper will present our objectives, rationale and approach to

internationalising our undergraduate fieldwork and will conclude with an overview of the outcomes and a model for incorporating international field work in the undergraduate curriculum.

Email: ; *Optimal allocation of AED's by maximization of supply effect on demand density*

A probability density function of demand for automated external defibrillators (AED's), which is based on the distribution of demand points by kernel density estimation method, is estimated from the data on occurrences of cardiopulmonary arrests. The probability that someone can be saved by AED's is formulated using probability of survival to hospital discharge. "Supply effect" is expressed as demand density multiplied by this probability of saving, and the locations of AED's are optimized by maximizing supply effect in the entire region. The results show that optimal locations tend to cover the center of the city and that the supply effect is approximately proportional to the number of AED's.

Sosina B Asfaw, University of Illinois. Email: basosna@gmail.com; Socio-spatial Dynamics of Herd Mobility in Booranaland, Southern Ethiopia

The Booran of southern Ethiopia in general divide their grazing areas into wet and dry season areas. The dry season grazing areas are located near clan managed deep wells, where villages and settlements are also found. In the 1960s, the Ethiopian government established a number of ponds in mainly wet season grazing areas in order to reduce heavy grazing around these deep wells. The availability of water in the form of big and small ponds altered the spatial organization of herd movements. The emergence of villages near ponds gradually changed the designation of grazing areas. Villages are also becoming more and more involved in the management of range resources. The paper examines the complex interplay between institutions and emerging influential groups in socio-spatial settings such as villages. It closely looks at the meshwork of institutions, actors, and influential groups that define and redefine the rules of access and use of range resources. Using data collected in one settlement, Did hara, the paper shows that the village becomes a contested socio-spatial unit whereby influential groups employ existing institutions and emerging meshworks to influence herd mobility and other land use practices. Understanding the politics of resource use provides an interesting socio-spatial dimension to the herd mobility paradigm.

Bjorn T. Asheim, Lund University, Sweden. Email: Bjorn.Asheim@keg.lu.se; F2F, Buzz and Proximity in Producer-User Interactions: A Knowledge Base Approach

Storper and Venables (2004) argue that face-to-face interactions represent the most fundamental aspect of proximity that favours urban concentrations and agglomerations. In contrast to this generalized argument, we shall maintain that the 'classical' face-to-face situation is found in 'user-producer' relationships in clusters of small and medium sized manufacturing firms building on a synthetic (engineering) knowledge base, where tacit knowledge plays an important role. Such activity does not favour urban locations and agglomerations per se. Of course buzz also exists in such environments as part of the informal interactions on and outside job situations. But in these contexts it is more a mode of information exchange instead of knowledge exchange for learning and innovation. Furthermore, it is reasonable to assume that in high-tech industries based on an analytical knowledge base knowledge is not exchanged in informal buzz situations. Here face-to-face interactions take place when (spatial and relational) proximity to the diversity of formal, codified knowledge and expertise of top researchers found in leading universities and research centres is exploited. Such facilities are most commonly found in city regions. The only group that may exchange knowledge in buzz situations (and not only information), are people employed in creative industries (media, film, advertisement, fashion etc.), which draw on a symbolic knowledge base. The highest concentration of such activities is found in the large city regions. In such occupations, as with jobs in research, knowledge is highly individualised, and, thus social capital and collective learning is of less importance.

Kiran Asher, Clark University, IDCE. Email: kasher@clarku.edu; Spatializing power by (re) ordering space: Ordenamiento Territorial (OT), territorial zoning in Colombia

Since its independence from Spain, the legitimacy of the Colombian state has been dubious and its credentials as a "modern" nation-state questionable. The former because large parts of the population are excluded from its oligarchical democratic politics and highly central bureaucratic institutions. The latter because it faces challenges from many sides - left-wing guerillas, drug-traffickers, counterinsurgent paramilitary forces. In 1991, Colombians adopted a new Constitution which aims to expand democratic participation, strengthen civil society, and promote socio-economic development to foster Colombia's status as modern nation. Among the many principles in the 1991 constitution was the notion of Ordenamiento Territorial (OT), territorial zoning, defined as "a state policy and planning instrument that allows for an appropriate political-administrative organization of the Nation, and the spatial projection of the social development, economic, environmental and cultural policies of [Colombian] society, [that] guarantees an adequate quality of life for the people and the conservation of the environment." This paper examines how the policies of OT create a new "order" by redefining and reclassifying national space (for exploration, conservation and economic production) and populations ("marginal", "indigenous", "traditional"). The authors argue that this technique serves to increase the presence and role of the state and functions as a mode of governmentality to define new terrains for the exercise of power.

Louise Emily Ashley, Postgraduate, University of Oxford. Email: lashley@ouce.ox.ac.uk; Work-Life Balance in the UK's Leading Law Firms: Delivering Diversity without Equality?

When considering London's position as a Global City, a number of theorists have pointed to the rapid expansion of high-status, well-paid jobs. Lawyers and partners at leading-edge, international law firms are key examples of the small number of increasingly affluent professionals working within the 'urban glamour zone' of the City (Sassen, 2001; 275). Today, more women than men enter the elite tiers of this profession at trainee level. However, optimism that these women would quickly experience more equal opportunities - and outcomes - compared to their male peers appears misplaced. The UK's top 100 law firms (by turnover) have on average just 17% female partners, and remain under significant pressure to improve their record in this respect. The difficulty of achieving an appropriate work-life balance (WLB) is the most common explanation for this imbalance. Part-time or flexible working arrangements have been introduced to facilitate change. Research conducted at five of the UK's leading law firms demonstrates that, whilst these policies have helped some workers ? usually female ? reconcile the conflicting demands of production and reproduction, many barriers to their widespread adoption remain. This paper examines those barriers, as well as the gendering of WLB policies, their impact on individual versus collective agency in the workplace, and their likely efficacy in the face of a new gender conservatism amongst younger professional women. It concludes by suggesting that whilst WLB policies and practices may allow for greater workplace diversity, their impact on gender equality appears limited.

Sharon Ashley, Northern Illinois University. Email: sashley@niu.edu; *Flood Casualties in the United States*

This study compiles a nationwide database of flood fatalities and injuries for all contiguous states of the U.S. from 1959-2005. Such information as location of casualty, age and gender of victim, activity and/or location of casualty, and type of flood event is included for each casualty report. Analysis of the data reveals that the majority of fatalities are caused by flash floods. People between the ages of 10-29 and the elderly (> 60 years old) are found to be more vulnerable to floods. A large percentage of children (< 13 years old) perish in floods while either playing in-and-around the flood waters or when they are driven into the flood waters by their guardian or parent. Findings suggest that human behavior is integral in causing flood fatalities. These results also reveal that future structural modifications of flood control designs (e.g., culverts and bridges) may not reduce the number of fatalities nationwide. Spatially, flood casualties are distributed across the U.S. with clusters of high fatalities observable along the Interstate 95 corridor in the Northeast, in the Ohio River Valley, and along the Balcones Escarpment in south-central Texas. These distributions are likely driven by both physical vulnerabilities to flooding (e.g., high vertical relief from topography, close proximity to flood control structure) as well as the social vulnerabilities (percent males, age).

Walker S. Ashley, Northern Illinois University. Email: washley@niu.edu; *The Geography of Tornado Fatalities in the United States*

This study assesses, both spatially and temporally, the fatalities produced by tornadoes in the U.S. since 1880. Results highlight the particular vulnerabilities and impacts associated with killer tornadoes that have affected the nation over this 126-year period. Specifically, analyses evaluate the unique distribution of killer tornadoes that tend to focus on the southern-tier of the U.S. - outside of traditional "tornado alley." The study examines the specific causes for this distribution, including mobile home density, population density, land cover type, event frequency, seasonality, and time of day. In addition, results reveal a unique vulnerability to both the middle age and elderly. A more complete analysis of the geographic patterns associated with tornado fatalities is essential to improving education and mitigation efforts concerning these deadly hazards.

Ishan Ashutosh, Syracuse University. Email: iashutos@maxwell.syr.edu; *Representing the "Other" in "our" midst: Post- September 11th National Security Hysteria*

The representations of Muslim migrants in the aftermath of September 11th were possible only through tropes that utilized the imaginative geographies of U.S. geopolitical interests that existed before the "war on terror." While the mediascapes of this current war perpetuate notions of "the Arab street," "the Muslim world," and the more recent "Islamic fascist," these discourses are re-inscribed onto the Muslim migrant. Migration programs instituted after the shift to the Department of Homeland Security, targeted migrants from "select countries" that allegedly present a national security concern to the United States. Given the long tradition of Orientalist images of "the Muslim World" it is perhaps unsurprising that these designated countries are, with the exception of North Korea, majority Muslim nation-states. In recasting these images onto the migrant, claims are not only made on belonging to the nation-state, but that simultaneously prohibit affiliations that encompass "Other" forms of belonging. In doing so, the heterogeneous transnational ties and affiliations of Muslims are homogenized until the individual can be recast as a Muslim terrorist. Post-September 11th migration policy therefore not only extends established representations of Muslims, but views the maintained transnational connections of Muslim migrants as a threat to U.S. national security policy. I consider how the recent discursive constructions of the Muslim migrant reflect the nation-state's attempt to restrict transnational forms of belonging that are central to the lives of migrants.

Louise Askew, University of Newcastle, Australia. Email: louise.askew@studentmail.newcastle.edu.au; *Enacting interagency human service programmes: the importance of institutional practices and politics in state agencies*

Interagency working is commonly understood as an established technique of current social governing: as part of a post-neoliberal, or recent 'roll-out' form of neoliberalism (Peck and Tickell 2002, Larner and Craig 2005). Much geographical research reveals the ways in which interagency working has been rescripted under this form of neoliberal social governing as a means of achieving both increased efficiency of service delivery (eg cost-effectiveness through pooling of agency resources), and the effectiveness of services (eg 'joined-up working for joined-up problems'). Whilst this approach exposes recent governmental shifts, there is a tendency to situate interagency working as solely neoliberal, thus

reinforcing notions of an all-conquering neoliberal project. I suggest that such accounts may be enhanced through an open and contingent perspective of interagency working: allowing for distinct, enduring and productive possibilities of social governing that may be other-than-neoliberal. The paper focuses on the enactments of state workers in an Australian interagency social service programme who describe a range of more influential understandings and practices than that of post-neoliberalism. For example, workers within the programme frequently associated the performances of interagencies with institutional practices inherent to state structures and cultures (eg shifting political motivations, expedient programmatic responses, and short election cycles). The aim of the paper is to expose the influence of state institutional practices by adopting an ethnographic perspective of an interagency setting, exposing post-neoliberalism as a never solitary rationality that is understood, translated and frequently absent in the institutions in which state workers are engaged.

Keywords: Interagency, state, institutions, neoliberalism

Kye Askins, Northumbria University. Email: kye.asksins@unn.ac.uk; *Towards new negotiations: rethinking nationality, ethnicity and belonging in England.*

Drawing on my PhD research exploring the perceptions and use of the English countryside among people of Asian and African Caribbean backgrounds, and thinking through current longitudinal research with African refugees in inner city Newcastle, this paper evaluates the potential of taking an agonistic approach to reconceptualising ethnic inclusions/exclusions as caught up in notions of national identity and citizenship. Agonistic politics acknowledge the aim of consensus within democratic debate but without the expectation of ultimate agreement or of a universal value system - placing an emphasis on always working towards accord/compromise while recognising discord may also remain (Mouffe, 1993). Such an approach can be developed, I argue, within a 'sustainable multiculturalism', drawing on theory that works with a model of society as a rights-based political community (after Parekh, 2000), while also mindful that ethnic, cultural and religious communities who adopt a range of territory restricting and restrictive discourses - play a strong role in identity construction. 'Sustainable multiculturalism', then, should constantly be a process of negotiation around 'integration', national identity, citizenship, etc., that endeavours to move beyond the pitfalls of fixed/essentialising ideologies and 'norms' but crucially, at the same time, working with the ways in which such ideologies play out in everyday spaces and lives.

Keywords: ethnicity, multiculturalism, national identity, belonging

Nurcan Atalan-Helicke, Ohio State University. Email: atalan-helicke.1@osu.edu; *Anti-GMOs Movement in Turkey: Links to Global Agrarian Development*

This paper addresses the development of the anti-GMOs (genetically modified organisms) movement in Turkey by considering the conditions under which social movements have rallied against GMOs, methods of anti-GMOs activism, and the limits of such movements. The agricultural sector in Turkey has been transforming parallel to changes in the global economy, in particular response to neoliberal pressures to open markets to seeds, crops, and food. Turkey's failure to adopt legislation conforming to the Cartagena Biosafety Protocol gave rise to the reaction of an autonomous, pluralistic movement: the No to GMOs Platform. An analysis of the Platform's declaration, its members, and its campaign reveals similarities with other social movements in the developing world in terms of its demands and its organization. The Platform's discourse is also similar to that of anti-corporate movements and consumer protests. However, it also differs significantly in that, like other environmental movements in Turkey, it links its priorities to the development agenda of the state and follows a populist discourse. Rather than merely emphasizing the need to conserve biodiversity, the Platform has become successful in creating awareness and disseminating information on the risks of GMOs to a wider audience. However, the movement has had limited success in bringing about biosafety legislation in Turkey.

The study identifies the determinants of intra-urban variation in ambient concentrations of sulphur dioxide (SO₂) and nitrogen dioxide (NO₂) and develops a model to predict SO₂ and NO₂ in the city Sarnia, Ontario, Canada. With one of the largest concentration of chemical industries in Canada, Sarnia is one of the

highly polluted areas in the Great Lakes and it is generally known as the 'Chemical Valley'. Recently, Health Canada has called Sarnia and other regions along the St. Clare River as 'Areas of Concern' based on a hypothesis that environmental pollution negatively affects health. As part of a larger research program to study the environmental health determinants in designated 'Area of concern', we monitored 39 locations for SO₂ and NO₂ for 2 weeks. This presentation discusses the results of land use regression (LUR) modeling to determine intra-urban variation of ambient SO₂ and NO₂. The results from this analysis will be spatially related to surveyed data of the larger health study. Multivariate analysis will be used to determine the relationship of the estimated air pollution and self reported environmental health concerns and perceived risks.

Keywords: Spatial variability, sulphur dioxide, Nitrogen dioxide, Land use regression, exposure, GIS, Sarnia, Ontario, 'Chemical Valley', 'Area of Concern'

Stephen Atherton, University of Wales: Aberystwyth. Email: sja01@aber.ac.uk; *Domesticating Masculinity: Place, Performance and the Negotiation of Identity*

This paper analyses the particular domestication of masculinity that occurs within the armed forces in the UK, and the transitions that take place upon re-entry into civilian life. Through interviews and oral accounts this paper highlights how these men renegotiate their identity within the 'home' and within 'society' and seeks to add to the debate on how we analyse a cultural repertoire of masculinities that are appropriate to particular places and particular contexts. In particular, I draw out: (1) how a domesticated body fit for the purpose is created and maintained with the armed forces; (2) how and with what effect an embodied routine and self-discipline is transferred into a home environment; (3) the inculcation of domestic skills and emotional attachment to people and place suitable for home making; and (4) the re-imaging of home life through the performance of these masculine identities.

Carol Atkinson-Palombo, Arizona State University. Email: carol.palombo@asu.edu; *Location Theory for the Contemporary City*

In this paper, I present a hybrid theoretical framework and theory of location in contemporary cities that allows investigation of how economic factors and the political economy of place intersect to create neighborhood change. The research has been motivated by a mismatch that currently exists between our understanding of the processes by which new urbanist policies such as Light-Rail Transit (LRT) create neighborhood change, and the traditional theories of location and transportation that are used to measure its impact on market conditions and land use. LRT is implemented alongside a battery of supportive public policies such as density waivers, overlay zoning, and financial incentives that change market conditions and land use possibilities. Traditional theories suggest that any change in market conditions and land use around station areas results from change in accessibility, and ignore the influence of additional policies that affect market conditions, and the fact that places are "re-imagineered" to provide an amenity-rich urban lifestyle. In this hybrid theoretical framework, accessibility and public policies act in concert to change market conditions and land use in different spatial submarkets. Location decisions are a trade-off between a location's status, based on lifestyle, and building quality. Locations with existing amenities attract more amenities because of forces of agglomeration, those seeking an amenity-rich urban lifestyle, and highly mobile knowledge sector capital. The framework offers a forum for quantifying how various factors shape uneven development and a way to foreground the critical social issues associated with uneven development in quantitative analysis.

Hauge Atle, Uppsala University. Email: atle.hauge@kultgeog.uu.se; *The Production of Cool*

Fashion has both a material and immaterial dimension: it relates to clothing, design, textile and quality, but also to consumers' subjective feelings and attitudes towards the clothes and their brands. This paper argues that both the material and immaterial dimensions of fashion are governed by systemic production processes; i.e. processes rooted in systems of interrelated actors within specific socio-institutional contexts. One often neglected and overlooked, but nevertheless vital actor in this production process is the consumer. Fashion is both a result of economic actors' conscious work to try to shape our consumption patterns, but also a result of individual consumers cognisant fashion choices. In other words fashion is not produced by corporate forces alone, but is socially negotiated through reciprocal, socially embedded processes. This paper analyses a segment of the fashion market where the companies' competitive resources are associated with their sense of "cool". The paper focuses on some of the mechanisms behind the production processes of immateriality, how these mechanisms materialise, and what the socio-economic relations behind the production of cool are. The production of cool is analysed in terms of relationships between fashion companies and other key actors. The paper challenges the idea that consumers are mere recipients of fashion and shows how user/consumer-led innovation is a key feature of the fashion industry. The paper ends by suggesting that the importance of such relationships have important implications for how we understand and analyse innovation geographies.

Roger F. Auch, United States Geological Survey (SAIC, contractor to USGS EROS). Email: auch@edcmail.cr.usgs.gov; *Land Cover and Land Use Change in the Northern Glaciated Plains Ecoregion, 1973-2000*

The U.S. Geological Survey's Land Cover Trends project is documenting land cover and land use change that occurred in the conterminous United States between 1973 and 2000. We are using the U.S. Environmental Protection Agency's Level III (1999) ecoregions as the spatial framework of inquiry. Our methodology uses random probability sampling, in which a pre-determined number of 10 x 10 kilometer blocks are selected. Land cover and land use within the sample blocks are interpreted from remotely sensed imagery for five dates to detect change. Analysis has been completed for the Northern Glaciated Plains ecoregion, which includes north-central and eastern North Dakota (excluding the Lake Agassiz Plain), eastern South Dakota, and parts of west-central Minnesota. Land cover and land use change was moderate and had low variability across the ecoregion until the 1992 to 2000 time interval, when sub-regional flooding caused an expansion of persistent water and wetland. Change was slower during the first two time intervals (1973 to 1980 and 1980 to 1986, with approximately 0.2 percent annual change) than during the later intervals (1986 to 1992 and 1992 to 2000, with approximately 0.4 percent and 0.5 percent annual change respectively). Leading types of land cover change were related to cyclic wetland and water fluxes, with more water present in 2000, and flooded agricultural land changing to either wetland or water. Other leading changes included shifts between agricultural and grassland covers types, that were encouraged by the 1985 Conservation Reserve Program and other changes in agricultural policy and production.

Babette Audant, CUNY Graduate Center. Email: baudant@kingsborough.edu; *Urban Grazing: The Politics of Food, Identity and Public Space*

Urban parks are both constitutive of and constituted by their users and producers, dynamic landscapes that reflect social relations outside their bounds; they also provide spaces in which those relations can be redefined, however temporarily. This multi-sited ethnography focuses on two sites in New York City: the Red Hook Park food stalls, and the Union Square Greenmarket. Each of these sites is a regularly occurring, seasonal event at which food plays either a central, or a strongly supportive role. Food draws lines between outsiders and insiders; the ability and willingness to traverse those bounds is often steeped in neo-colonialist adventuring and a search for the "authentic." It also provides opportunities for the "other" to translate—or not—their cultural practices. The scale of identity produced in these spaces ranges from the local (neighborhood) to the national (re-inscribing a rural-to-urban narrative at the Greenmarket) to the international (a pan-Latino identity in Red Hook). Various city agencies regulate and define these public spaces—how are they institutionalized, formalized, valued and protected? Although each space has at least three decades' history, only the Greenmarket has achieved iconic status. In contrast, the Red Hook food stalls were "discovered" by the mainstream press several years ago, spurring the issuing of permits—a turn that appears to have been welcomed by vendors weary of

operating informally. Whether gentrification will challenge the Latino claim to the park as an extension of their neighborhood remains to be seen.

aaugus4@lsu.edu; *Diurnal Variation of Tropospheric Ozone: A Case Study*

During the spring of 2006, a series of ozonesondes was launched over Baton Rouge, Louisiana. The purpose was to assess the vertical distribution of tropospheric ozone within the vicinity. The diurnal variation of the vertical distribution was identified by launching ozonesondes in the afternoon and morning on consecutive days. Results from this preliminary investigation suggest that a strong subsidence inversion with abundant ozone above it may lead to enhanced mixing of tropospheric ozone between the surface and the base of the inversion. If the subsidence inversion layer is weak enough, strong updrafts may allow for the layer to be punctured and mix with higher-level ozone. This relationship could enhance the ability to forecast days when a federal ozone exceedance may occur.

Based on industrial archaeology, archival research and fieldwork, this paper attempts to reconstruct the environmental history of the mining district of Real del Catorce, in northern San Luis Potosí State, Mexico, from the 18th to the 19th century. To do so, this paper takes into account technological change, "industrial metabolism" -financial, materials, energy and information flows-, and the influence of these factors on the environmental transformation of this mining district. Industrial archaeological research allowed reconstructing the inputs-outputs of the whole mining process, which includes chemical materials involved, tailing composition, spatial location of mining facilities, raw materials and energy supply networks, and local environmental impact patterns. Further, fieldwork validated archival and ethnohistorical accounts and added more details to environmental history reconstruction. In addition, preliminary findings suggest that mining operations concurred with severe droughts and intense rainfall periods that somehow gave rise or worsened preexisting environmental problems. Mining and metallurgic enterprises got adapted to diverse physical and socioeconomic conditions and formed a complex fabric woven with social, economic and political factors that defined their specific profile. Finally, the paper shows that during the studied period regional ecosystems were highly disturbed and environmental problems worsened: pollution, deforestation, soil erosion, and biodiversity loss, problems that outlived the colonial stage and survive until these days.

Clare Averill, BSci, Raytheon / Jet Propulsion Laboratory. Email: caverill@sdsio.jpl.nasa.gov; *Geography as unifier in the effort to perform triple-bottom-line analysis of global change: the Australian climate*

Although in 2006 the Australian Government had not ratified the Kyoto Protocol to the United Nations Framework Convention on Climate Change, a good effort to account for Australia's carbon emissions and to cost potential carbon savings has begun. These efforts include quantification of fossil fuel emissions and potential savings from the electricity, transportation and housing sectors, estimation of vegetative carbon storage (through remote sensing and on-ground measurements), and appraisal of the economic aspects and cultural context associated with emissions trading. Opportunities and challenges presented by the economic and cultural climate of Australia will be reviewed. Since these analyses take place within individual disciplines, and must also expand across mainstream communication channels, a strategy for geographers to bring the leading strands and important details from the various efforts into synthesis will be presented for discussion.

Katia R. Avilés-Vázquez, University of Texas - Austin. Email: kr.avivaz@gmail.com; *Migratory trends in Puerto Rico as a way to analyze differentiated "social" mobility of the Dominican diaspora*

Dominican migration to Puerto Rico started as a bridge to move onwards to New York. However, Dominicans started staying in Puerto Rico, using established migratory networks that have led to further increase in migration, both because of the many obstacles to continuing the voyage to the United States, as well as the benefits of staying in an area with the same language, similar cultural traditions and semi-peripheral economic conditions. The increased migration and concentration of Dominican migrants, and the "presumed" similarities among the two island cultures have led to discriminatory practices to curb the

cultural influence of Dominicans in Puerto Rico. Because the Puerto Rican economy serves as a semi-periphery for the US, reasons for migration to Puerto Rico, and labor opportunities that are geographically separated within the island offer distinct social mobility to migrants. In this paper I will present a brief overview of current migration laws, how they are enforced in Puerto Rico, and how the island's economy and geographical economic differentiation influence the Dominican migrant's social mobility. Preliminary analysis of published studies and census data seem to suggest that labor location plays a significant role for Dominicans and their incorporation process into Puerto Rico's economy, showing a significant role of place in the assimilation trajectory for Dominicans in Puerto Rico.

April Avnayim, U.S. Bureau Of the Census. Email:

april.l.avnayim@census.gov; Michael Ratcliffe, U.S. Bureau Of the Census. Email: michael.r.ratcliffe@census.gov; *Census Designated Places and Their Role in Data Tabulation, Analysis, and Place-Based Programs*

Census Designated Places (CDPs) provide place-level statistics for locally known, unincorporated communities. The numbers and distribution of CDPs varies from state-to-state depending on laws governing incorporation and annexation, as well as local communities' attitudes regarding the need for and importance of municipal incorporation. Since the 1950 decennial census, CDPs have been the statistical equivalents of incorporated places, but because of they lacked legally described boundaries and governmental functions, they have been something of a statistical stepchild, brought out for some tabulation programs, but generally kept in the shadows. Published studies highlighting large CDPs (see for instance Lang and Dhavale, 2003); plans to tabulate American Community Survey data for CDPs; and the inclusion of CDPs in various federal agency place-based programs have brought these statistical places out of the shadows and into greater prominence. As such, geographers need to be more aware of the existence and nature of CDPs and the way in which they represent communities statistically. In this presentation, we discuss the nature of CDPs and unincorporated communities in general; the numbers and distribution of CDPs; and plans for defining and updating CDPs for Census 2010 and beyond.

Email: tkeitt@mail.utexas.edu; *Multiproxy Evidence of Natural and Anthropogenic Sources of Environmental Change over the past 1400 years on Ometepe Island, Lake Nicaragua*

This project examines the relationship between short-term climate variability, paleo-fires, and anthropogenic sources of environmental change over the past 1400 years on Ometepe Island, located within the largest freshwater lake in Central America (Lake Nicaragua). Macroscopic charcoal, loss-on-ignition (LOI), and magnetic susceptibility (MS) records were reconstructed from lake sediment cores extracted from two lacustrine sites. Statistical wavelet analyses were performed on the proxy records to extricate natural from anthropogenic sources of environmental change evidenced in the time series data. Periods of high wavelet power at decadal and sub-decadal scales throughout each core suggest natural forcing mechanisms (e.g., El Niño and sunspot cycles), while periods of low wavelet power coincident with significant fluctuations in the time series data may indicate anthropogenic sources of landscape modification. The paleoenvironmental histories from each core are expected to demonstrate varying degrees of natural versus human-induced environmental change due to the historically different microclimates and land use practices present at each study site.

Keywords: charcoal, fire history, paleoenvironmental change, wavelets

Gillian AvRuskin, BioMedware, Inc.. Email: avruskin@biomedware.com; Jaymie Meliker, BioMedware, Inc.. Email: meliker@biomedware.com; *Validation of self reported proximity to a farm in a bladder cancer case-control study.*

Exposure misclassification is a major concern in epidemiologic studies. The opportunity for misclassification becomes even more sensitive when participants are asked to recall historical information. Yet, historical information is especially important in cancer studies where the disease often has a long latency period. Self-reported proximity to a farm is a common exposure metric in environmental epidemiologic studies, however accuracy of recall has not been validated. Geographic Information Systems (GIS) have the potential to shed light on the accuracy of this exposure metric, and therefore reduce exposure misclassification. As part of a large bladder cancer case-control study in Michigan, participants were asked whether they lived on a farm, or within a distance of 0.25 miles, 0.25-1 miles, 1-5 miles, or greater than 5 miles from a farm for each residence, over their entire lives. Responses from 531 participants over three time periods -

1978, 1991, and 2001 ? were investigated. Self reported proximity to farm was compared against a 'gold standard' derived from Michigan land cover files for the same three time periods. We investigated differential reporting by gender, age, length of time at residence, education, and cancer status. Kappa statistics and correlation coefficients were calculated and results will be presented.

Augustine Avwunudiogba, Oklahoma State University, Stillwater OK. Email: avwunud@okstate.edu; Paul F Hudson, Department of Geography, University of Texas, Austin TX. Email: pfhudson@mail.utexas.edu; Rainfall events, Land Cover, and Soil erosion under Slash-and-Burn cultivation, Sierra Madre Oriental, eastern Mexico

This study investigates soil erosion response to rainfall events, and land cover types on hillslopes used for traditional slash-and-burn agriculture in the Sierra Madre Oriental, eastern Mexico. The study was designed to achieve two main objectives: (1) quantify soil erosion for different land cover types associated with slash-and-burn agriculture, and (2) assess the role of rainfall (events and quantities) on the dynamics of soil erosion for the different land cover types. Soil erosion and runoff were monitored for different land use cover associated with slash-and-burn cultivation over two wet seasons using bounded runoff plots. Rainfall (event sequence and quantities such as intensity) was monitored with a rain gauge connected to a data logger through out the duration of the study.

Louis Awanyo, University of Regina. Email: louis.awanyo@uregina.ca; Exploring the connections in Ghana: land tenure and biodiversity

The goal of assisting farmers in rehabilitating forest biodiversity remains elusive in a world biodiversity hotspot in the Gyamfiase-Adenya-Obom cluster of villages in Ghana. This paper provides a nuanced understanding of the local social and ecological conditions which are shaping local farmers' participation in the practices of tree biodiversity rehabilitation. The discussion specifically focuses on two themes. First, it outlines the little explored effects of social institutions and social processes of land tenure on tree biodiversity-friendly practices by socially-differentiated farmers. Second, it demonstrates how the effects of land tenure security on biodiversity rehabilitation are obfuscated by the agency of local ecological conditions, of which a central player is the *Chromolaena odorata* herbaceous species. The discussion concludes by reiterating the symmetrical agency of humans/society and ecology/nature in nature-society relations, which in this study is centered on human-assisted biodiversity rehabilitation.

Yasser M. Ayad, Ph.D., Clarion University of Pennsylvania. Email: yayad@clarion.edu; Patrick McGreevy, Ph.D., American University of Beirut. Email: pm07@aub.edu.lb; Methods for Manipulating GIS Data for Historical Representations

In order to reconstruct the historical topography of a site that was later greatly altered by human action, one must make a number of assumptions. This paper, a collaboration between a geographic information scientist and a historical geographer, reports on methods that were used to create such a reconstructed landscape. This was the first step necessary in order to create a series of maps showing later alterations. The site was the crucial Deep Cut section of the Erie Canal, the last and most difficult part of the canal which was completed between 1821 and 1825. A Digital Elevation Model (DEM) of the study area was altered in order to reflect the state before the excavation of the canal. Also historical maps were geo-referenced to fit a current topographic map and then overlaid with the altered DEM in order to facilitate the positioning of the construction lines during different periods of excavation.

Alexander Aylett, PhD Candidate, UBC. Email: alexander.aylett@mail.mcgill.ca; Inter-Urban Environmental Coalitions and the Re-Scaling of Climate Change and Climate Change Policy

Transnational urban environmental organizations are circumventing the gridlock of international Climate Change policy and enabling member cities to develop and implement programs that far exceed the Kyoto Protocol's emissions reduction targets. Representing the early stages of a larger project into the role of cities in addressing climate change, this paper will use a qualitative analysis of policy documents and case studies produced by the International Council for Local Environmental Initiatives (ICLEI) and the International Coalition for Sustainable Cities (ICSC) to ground a reexamination of the place of locality within models of national and international political power. It will interrogate the tactics and processes through which cities use membership in these organization to mobilize multi-scalar support for local, regional and federal climate change policy. In so doing it will look at the ways in which urban governance must be re-

theorized to include these trans-urban coalitions. Coalitions that do not fit the circumscribed hierarchies and networks of exchange established by the accepted discourses of "world cities" and globalization. It will elaborate on the ways that this collaborative linking of diverse local practices - separated by social, cultural and political boundaries - prompts a re-imagining of accepted definitions of "power," "agency," "local" and "global." A re-imagining that blurs accepted visions of climate change and climate change policy, proposes new ways of articulating them with issues of national sovereignty, trans-national collaboration, economic growth and environmental responsibility, and makes room for notions of a situated cosmopolitanism with the potential to promote international respect and collaboration.

Bharati Ayyalasomayajula. Email: bharatiayyala@yahoo.com; Modeling Monsoon Rainfall

This research attempts to predict the rainfall pattern in India by using onset dates of the southwest monsoon. Onset dates of 21 major cities over the past 30 years are the main input parameters. This study will also depict the spatial and geographical distribution of rainfall patterns in India. The model proposed in this study will forecast the rainfall pattern for the entire country and will provide a general idea of how much annual rainfall is expected. Wet monsoon annual rainfall data set is used for all analysis. The rainfall figures predicted at each major station are used to predict the rainfall pattern for the entire country using spatial interpolation technique such as Kriging.

Maoz Azaryahu, Professor, Haifa University, Israel. Email: azaryahu@geo.haifa.ac.il; Stanley Waterman, Professor, Haifa University, Israel. Email: waterman@geo.haifa.ac.il; Memory and Place: The Case of Anniversaries

When celebrated as public events, anniversary commemorations integrate cyclic notions of time into the texture of communal life, transforming history into collective memory. Common but non-obligatory, anniversaries adopting an institutionalized celebration of the founding of a place invest the foundation with an aura of 'sacred history' and evince a sense of historical continuity that affirms the place as an independent entity that transcends changes over the course of history. In their commemorative capacity, place-anniversaries conflate history and contemporary contingencies. Though celebrating the past and often offering future projection, they are expressive of current needs and the interests of local and national elites. Though speaking the language of unity, they clearly demonstrate political and geographical hierarchies. Their official rhetoric conveys the notion of place as a project shared by its past and present residents. However the politics of place-anniversaries also evince power relations and structures of authority within local, national and global reference frameworks. Local and national elites in both democratic and totalitarian contexts use place-anniversaries to assert the ideological underpinnings of the ruling order. This paper examines several different and differing issues of place-anniversaries celebrated by cities, including their character, the political dimensions and propaganda, publicity and marketing values assigned to them, differences between totalitarian celebrations and festivities in free societies, and the positioning of the celebrations and celebrant cities within their local, national and international contexts. Among examples examined are Berlin, Moscow, St. Petersburg, Tel Aviv, Jerusalem and Dublin, some of which have celebrated their foundation more than once.

Victoria Maclean Babbit, MA, University of Washington. Email: vmb2@u.washington.edu; Sex and the Citizen: Morality and deviance in Sweden

In recent years, European countries have witnessed a large influx of immigrant populations transforming the cultural, political and economic landscape. Of all the Scandinavian countries, immigrant populations have demographically transformed Sweden to the greatest degree with foreign born residents representing 12% of the entire population. Concurrently, many national and international NGO's and government officials have drawn attention to the rising human trafficking crisis. In the context of Sweden, the government has dedicated substantial resources and attention to the issue, bringing together both conservative political actors and feminist. Much of the discourse on trafficking can be traced back to the 1998 Kvinnofrid legislation which criminalized the procurement of sex while decriminalizing the actual act of providing sexual services. This paper attempts to bring together these various elements to look at how a state-led initiative-the campaign against prostitution and trafficking-works as a catalyst for exclusionary practices and discourses towards immigrant populations. Specifically, I am interested in untangling the discourses of gender equality, multiculturalism and deviance which are operational in the

criminalization of immigrant groups. The product of these campaigns is not necessarily a decline in prostitution or trafficking, but rather the construction of moral borders within the nation built upon the notion of Sweden as the progressive, egalitarian state. Yet it is at the nexus between political project and transforming cultural landscape that the progressive increasingly become the conservative, constrictive, and exclusionary.

Keywords: Trafficking, prostitution, Sweden, immigration, morality, governance

After more than ten years of planning, the removal of two dams on the Elwha River is scheduled to begin in 2009. With \$182 million of federal funds committed, the Elwha River Restoration Project is the largest dam removal and river restoration project ever attempted. When the dams are removed, 10 anadromous fish stocks are expected to return to 70 miles of river from which they've been excluded for a century. Dam removals are increasingly viewed as a means of restoring riverine ecosystems. The Elwha dams will not only be the largest ones ever removed, but due to the protection of the watershed in Olympic National Park, this case provides a study site for testing hypotheses related to river restoration under ideal conditions. If the trajectories of ecosystem effects after dam removal are beneficial here, they could be applied in other similar cases. If salmon restoration is unsuccessful under these ideal conditions, the implications for other rivers are dire. Individuals from a wide variety of organizations are collaborating through the Elwha River Consortium to help ensure that research and education efforts associated with the Elwha River Restoration Project are efficient and productive, and in hopes of combining or linking projects to gain additional value-added support or new grant funding. The overall goal of these efforts will be to answer questions central to river restoration and management while providing scientific training opportunities for students and educational opportunities for the general public.

Keywords: ecosystem restoration, dams, Elwha River, Washington

Robin Bachin, University of Miami. Email: rbachin@miami.edu; Radicalism Revisited: The Haymarket Martyrs Monument in History and Memory

This paper will address the process of designating the Haymarket Martyrs Monument as a National Historic Landmark. Historians consider Haymarket one of the seminal events in the history of American labor. On May 4, 1886, a meeting organized to protest police brutality in Chicago ended with an unknown assailant throwing a bomb into the crowd, killing and wounding several police officers and protesters. Police apprehended eight anarchists on charges of conspiracy to commit murder. All were tried and convicted although no evidence linked them to the bomb. The trial and subsequent execution of four of the defendants became an example for many supporters of labor of the injustices of American capitalism at the end of the nineteenth century. The event also became a rallying point for labor and radical groups worldwide, who used the event as a vehicle for organizing. The National Park Service Labor History Theme Study that dedicated the Haymarket site helped negotiate the terrain between preservation, memory, labor history, and public space. It also exposed some of the limitations in traditional notions of what is worthy of preserving, and what kinds of spaces can best commemorate tragic moments in American history. The attempt to find a suitable site in Chicago for recognizing the national significance of the Haymarket incident offers an instructive example of the difficulties in bridging this gap, but also in how doing so may help us broaden our understanding of memory, history, and authenticity.

Michael Bacon, RTI International. Email: mbacon@rti.org; Crime Mapping and Spatial Statistics: Taking the Next Step

Law enforcement agencies have adopted many methods of illuminating spatial trends in arrest and incident data, including basic GIS mapping techniques as well as some hot spot analysis and other basic spatial statistics. More advanced spatial statistical techniques developed in the past decade may provide additional tools for finding spatial and temporal trends within data already available to law enforcement agencies. However, many of these techniques have considerable data preparation requirements, or may require advanced knowledge to implement. We examine a range of techniques recently developed within geography as well as epidemiology, including LISA and scan statistics. We attempt firstly to identify those which may produce results most useful to law enforcement personnel, and secondly to establish a set of best practices for implementing these statistics using incident and arrest data.

Dominique Badariotti, Pau University - SET laboratory / France. Email: dominique.badariotti@univ-pau.fr; Vincent Laperrière, Pau University - SET laboratory / France. Email: vincent_laperriere@yahoo.fr; Humans, rats and fleas : agent-based approach of the transmission and diffusion of plague in Madagascar

Today the world has to face up to a new threat : emerging and re-emerging infectious diseases. Indeed, the World Health Organization (WHO, 2006) estimates that one billion people are affected by 13 such "neglected" diseases. Some of these diseases (such as tuberculosis, cholera or plague) were thought to be under control but are reappearing in long-forgotten places : Madagascar is among them. Many emerging or re-emerging diseases are vector-borne, as for plague. Since European settlers brought plague to Madagascar, research on this particular epidemiologic case has been focusing upon this disease's transmission process-between the main host, rats, and the secondary one, humans, via a vector, fleas. Epidemiologists' research based on experimental method has achieved a fair knowledge of the transmission process. However, because of the complexity of spatio-temporal patterns at the population level, the question of the control and reduction of plague is far from being solved. For vector-borne diseases as plague, transmission hinges on complex relationships between vectors, hosts and their environment. Indeed, the daily routines of human groups, the vectors' and hosts' behavior and the pathogen's characteristics, all related to environmental/spatial/geographic conditions, combine to create the conditions under which a disease might emerge or re-emerge. Nowadays, research aims to a better control of plague, studying its behavior by the way it reappears, remains and spreads in its environment. This new purpose may be fulfilled with agent based approaches. This paper introduces SIMPEST, a prototype developed under the platform NetLogo, and exposes and discusses some preliminary results.

Medea Badashvili, Tbilisi State University. Email: mbadashvili@yahoo.com; Medea Givi Badashvili, Tbilisi State University. Email: mbadashvili@yahoo.com; "Gender relations in family of multiethnic society" (case study - Georgia)

Extensive socio-economic transformation experienced by Georgia over the last fifteen years has substantially affected not only the structure of economy and living standards of the population, but also prevailing role and meaning of gender as in the society, so in family. Collapse of the old system has to a considerable degree affected families and gender relations, and it has affected men and women differently. Gender inequality in a number of areas in a problem,

family is one of them. Families are important everywhere, regardless of family living arrangements and differences. Families all over the globe are facing many similar changes and difficulties as they attempt to adjust to the forces of modern life. The society in Georgia places an extremely high value on family, and it presses women in particular to get married. The majority of families are extended, comprising several generations, in urban areas this to certain extent strengthened by the scarcity of accommodation options and the childcare facilities. The Caucasian tradition calls for a woman to leave her place of residence and move to with her husband's parental house upon marriage. In my article I would like to concentrate on the research conducted by me in different regions of Georgia, in urban and rural areas, studying families belonging to different religions and having different customs and traditions. The existing situation shows how gender roles in families have been changing over the last decade. Patriarchal family structure remains the dominant paradigm.

Gruia Badescu. Email: gbadescu@middlebury.edu; *Post Second World War City Reconstruction and Germany's Shifting Identities*

Its cities devastated by the Allied bombing and its conscience shattered by Nazism, post Second World War Germany had to rebuild itself on all levels. Most major German cities have lost more than fifty percent of their buildings as a result of the war and policy makers were faced with the choice between exact reconstruction of prewar architecture and starting anew. However, rebuilding in the traditional way in the context of Germany's tortuous confrontation with the past proved to be problematic. This paper will explore the connections between Germany's post-Second World War city reconstruction and the shifts of the discourse on national identity. What is the place of urban planning and city architecture in rebuilding identities? What are the repercussions of urban reconstruction on the sense of place of city dwellers and their identities? By deconstructing the city reconstruction plans of the late 1940s and early 1950s we will explore the intricate connections between these aspects. The attitudes on reconstruction depended on local factors but also on the symbolic meaning of places. However, several cities have found their identities completely transformed and the senses of places alienated as a result of this process.

Forest fires phenomenon affects many Mediterranean climate regions. This problem has been aggravated by the acceleration of the urbanization process in the Wildland Urban Interface (WUI). This new model of urban growth forces to reframe the forest fires prevention policies. With this intention the objective of this article is: to define a forest fire model that allows making future diagnosis. This model can be useful to prioritize specific prevention policies in places where has been possible to hierarchize risk of fire. Although it is not possible to predict fires in absolute way, there are some techniques that allow predicting with a probability margin, when, where and how a fire appears and develops. A method that has been effective in the determination of the ignition probability has been the logistic regression model. This method, combined with the spatial analysis tools that offer GIS, allows us to determine the fire occurrence from the presence or absence of each fire location. In this sense, we have three specific objectives: a) to prevent those fires that are originated for avoidable causes, b) to prepare the forest surroundings to make difficult to begin and propagate fires, c) to plan a fire detection system that allows arriving quickly at the place of the fire. This research has been developed in an area with an important growth of urbanization in WUI: it is the area of influence of an important natural park located near the metropolitan area of Barcelona (Catalonia).

Hunter, Appalachian State University. Email: lh47603@appstate.edu; *Towards Expert Systems to Support Viticulture in Western North Carolina.*

Scientific assessment of terroir has been undertaken in many states in order to more rapidly close the knowledge gap between viticultural practice and wine quality. For example, the environmental component of terroir can be scientifically assessed based on the physical characteristics of a region through development of geospatial models that identify ideal locations for vineyards. The

western region of North Carolina has recently developed a rapidly expanding viticulture industry led by the Yadkin Valley AVA. An overview of three primary areas the GIScience component of the Appalachian State Enology Group is currently working on to enhance viticulture in the region is provided: site-suitability modeling of Surry County in the Yadkin Valley to support vineyard development, the development of an expert system model to enhance productivity at a large vineyard in Buncombe County, and analysis of the potential of mountain and steep-slope viticulture in Avery and Ashe Counties, including microscale climatic variability due to thermal belts. We conclude with a review of how expert systems comprised of GIS, customized weather forecast data, a vineyard weather station, and 'smart dust' sensors can be effectively utilized in a region of North Carolina where high altitude viticulture is more susceptible to regional weather conditions.

Guy Baeten, University of Lund. Email: guy.baeten@keg.lu.se; *The Injustice of Sustainability*

This paper argues that 'sustainability' has become a hegemonic discourse that supports the narrow interests of a white western elite. The starting point is that the hegemonic nature of sustainability rhetoric has generated a 'political closure' in mainstream environmental debate, and inserted environmental debate in the sphere of the 'post-political'. The paper will try to lay bare the mechanisms behind the depoliticization of environmental injustice and the repoliticization of environmental issues through the hegemonic discourse of 'sustainability'. Six mechanisms will be explored: the unification of humankind across class, gender, racial and ethnic divides against the threat of imminent environmental apocalypse; the focus on intergenerational rather than intragenerational environmental solidarity; changing class relations in the post-industrial world; the appropriation of the environmental agenda by global elites; the ecological turn of capitalism; and the compliance of fund-seeking academics. The paper stresses the need for unraveling the class politics behind 'sustainability' as well as the need to repoliticize nature through alternative frames of thought.

Thomas Baginski, Lawrence Livermore National Laboratory. Email: baginski3@llnl.gov; *Developing a Web-GIS Tool for Renewable Resource Analysis in California*

Promoting the use of renewable resources has tremendous environmental and economic benefit. However if the resources are not properly integrated in the energy system, they can have adverse impacts. A consolidated platform to access the latest renewable resource information, to track development trends, and to perform analysis of various renewable resources is needed to help the California Energy Commission, the renewable energy industry, and other decision makers. We are developing an interactive web-based capability that consolidates available renewable energy data and allows integrated renewable energy siting and planning analysis within California. A pilot project produced a web GIS that consolidated wind energy data and provided the capability to extract data for wind energy resource planning, siting, and repowering needs. Our current effort expands on the pilot project to include other renewable resources. The project will create an analytical, web-GIS decision tool to evaluate critical resource issues in the areas of wind, geothermal, biomass, solar and hydro-power resources. Our goal is to provide a one-stop decision tool for developers, industry, and decision makers to analyze data and issues related to renewable energy in California. The presentation will provide an overview of the web-GIS capability, review our experience building the tools, and discuss our current and future efforts.

Keywords: web-gis, renewable resource, California

Azmi A Baharom, Student. Email: azmiabaharom@gmail.com; *Hazard preparedness in Malaysia via telegeoinformation system*

Natural hazards occur with limit sign within the community affected. In the last several years, Malaysia has experienced several natural hazards at limited scales inclusive of slope failure and atmospheric turbulence. Indian Ocean tsunami in December 2004, is the biggest shock to Malaysian population who hardly hear and understand the danger of tectonic. Several other earthquakes in the following years increase concern among the population. Use of telecommunication system to detect underwater and surface water movement and vibration has been identified the best possible source for surveillance system. However, the relay mechanism within the system reduce the warning system to the lesser impact of the actual potential population exposed to the danger. Using integrated surveillance and early warning system, various clusters of coastal population can be alerted. Data collected through this system in the ocean via the satellite communication system will be passed to various agencies involved in early warning and later for search and rescue operation. However, geographical locations within the coastal areas limit the actual action for warning and rescue

activities. In this paper the discussion will discuss increasing tectonic activities within the eastern Indian Ocean plate require greater dissemination of the danger among the coastal population.

Ian Bailey, Ba Hons, MSc, PhD, School of Geography, University of Plymouth. Email: ibailey@plymouth.ac.uk; Rob Hopkins, Ba, Msc, School of Geography, University of Plymouth. Email: rhopkins@plymouth.ac.uk; *Rethinking the Seven Wedges for Peak Oil*

The 'Seven Wedges' have gained considerable notoriety in recent years as a way of conceptualising the actions needed to stabilise atmospheric greenhouse gases. For some they offer an acknowledgment that no single 'silver bullet' exists to mitigate global climate change; for others, they perpetuate a misplaced faith in technological solutions to environmental and social problems. But how do these wedges assist (and hinder) understandings of the sister challenge to climate change, the hypothesised peaking of world oil production in the early twenty-first century and its consequences for carbon-dependent economies? This paper examines the translation of the seven wedges to peak oil and explores their capacity to inform the future transitions in social and economic organisation needed to cope with diminishing supplies of fossil fuels.

Keywords: climate change, peak oil, seven wedges, technocentrism, relocation

Joshua Bailey, Texas State University - San Marcos. Email: jlbailey@txstate.edu; *Rock Glacier Inventory and Analysis in the Douglas Mountain Area of Montana*

Determining the exact locations of rock glaciers is important to studies of permafrost, treeline, hydrology, and other alpine topics. These lithological structures are an alpine feature of rock and soil debris coalesced into a formation by an internal ice structure and exhibit gradual, down slope deformation. Simple classification of rock glaciers is difficult, as they typically do not significantly differ in surface material from the surrounding rock. This research predicts and identifies rock glacier locations in the central Rocky Mountains of Montana utilizing aerial imagery, elevation, climatological, and hydrological data. An object oriented classification technique allows detecting the characteristics of the flow lobes, vegetation impact, spatial parameters, and hydrological contribution of rock glaciers. Once identified, the locations are integrated in a GIS with 1/3 arc-second USGS National Elevation Dataset, USGS land cover, and meteorological data from NOAA, NRCS, and Montana Natural Resource Information Service. A logistic regression of variables at sites selected by random point sampling verifies the validity of the observation and allows predicting additional rock glacier activities.

Keywords: rock glacier, cryosphere, gis, remote sensing, rocky mountain, alpine

Keiron Bailey, University of Arizona. Email: kbailey@email.arizona.edu; "Double Anchorage, Double Newark" and the "Denpasar Turn": ethnographic reflections on an actor-network investigation of the geographies of mileage runners

My research employs an actor-network framework (Callon 1985, Latour 1987) to characterize the remarkable geographies of a subset of elite frequent fliers, mileage and segment runners, and to understand how these and geographies are imagined, understood and produced. Earlier work (Bailey 2006) shows how these dialectical interactions produce unanticipated and unique geographies of business and leisure travel in locations all over the world including Iceland, Singapore, Anchorage, Bali and Fiji. In this presentation I reflect on three years of ethnography among these communities, including participant observation and interviews with actors including operations staff, flight crews, reservation agents and elite tier fliers. This ethnography investigates the role of expert internet sites such as Flyertalk forums on webflyer.com, the yield and revenue management departments of major airlines, informal secret societies and elite flier lounge meetings and expert knowledge production through seminars. This ethnography reveals how actors triangulate their activities including mileage and segment runs and exploitation of no-cost fares through their knowledge and production of cyber-hybridspaces, their creation and use of expert knowledge and Internet resources, and through subterranean networks and privileged expert knowledge dissemination. I discuss how such nonconventional research requires negotiation of ethnographic refusal and data gathering challenges, including the secrecy of major airline yield and revenue management departments, consideration of informant confidentiality, initiation knowledge barriers, and a host of other ethical and practical matters.

Keywords: mileage run, frequent flier program, actor-network, cyberhybridspace, ethnography

Robert G. Bailey, US Forest Service. Email: rgbailey@fs.fed.us; *A Genetic Approach to Mapping Ecosystems*

Criteria for delineating ecosystems on a scale-related basis are presented, based on the processes that operate to cause the spatial distribution of ecosystems from the regional scale (ecoregion) to the local, site scale. The units derived from this approach are termed genetic, in that they are predicated upon an understanding of the causal processes that control the pattern of ecosystems. Understanding spatial relationships between causal mechanisms and resultant patterns is a key to understanding ecosystem dynamics and how they respond to management.

Keywords: ecosystem mapping, ecosystem geography, ecosystem dynamics, patterns, genetic, scale

Robert Bailis, Yale University. Email: robert.bailis@yale.edu; *This is Not a Forest: the Political Ecology of Charcoal Production in Narok, Kenya*

This paper explores the political-ecological conditions that have converged to make Narok district one of Kenya's primary charcoal production areas. In Kenya, charcoal production accounts for nearly 40 percent of the nation's primary energy supply and constitutes one of the country's largest uses of harvested wood. Consequently, the perceived threat of charcoal production to the nation's forests is an important driver of environmental policy. However, current policies reflect neither the biophysical potential of the nation's woodlands to supply charcoal nor the demand for charcoal among consumers. Rather, regulations have been arbitrary attempts to limit production in certain localities and have been undermined by weak enforcement and outright corruption. Narok's charcoal trade emerged recently, enabled by a series of changes in land tenure rooted in the early years of colonial rule and leading to the privatization of huge tracts of formerly communal grazing lands. Across this newly privatized landscape, charcoal production has contributed to the loss of forest cover, but not in the forested highlands that regulations attempt to preserve. This reflects a disconnect between policy and practice. In this paper I explore the interrelationships between land tenure change and the charcoal trade as well as the contribution of each to diversified livelihoods and environmental change in Narok. I also examine the disparity between the complex social-ecological forces and the popular discourses of deforestation that form the basis of the country's environmental policies.

Alison L. Bain, York University. Email: abain@yorku.ca; *The new creative edge: contemporary cultural production in Canadian suburbs*

This paper argues that the rapidly expanding suburban periphery has been largely neglected in scholarly studies of urban cultural practice, which focus predominantly on city centres. In public and private imagination, artistic creativity is often associated with the energy and intensity of 'authentic' places in the centres of large cities. Yet, as scholarly studies and reports commissioned by arts organizations document, the process of gentrification is steadily erasing spaces of cultural production and displacing artists from downtown artistic neighbourhoods to suburban locations. However, these same studies offer minimal discussion of how artists function as cultural workers on the suburban periphery. Traditionally, as some geographers have documented, the suburbs have been seen by cultural workers as too standardized, homogeneous, conformist, patriarchal, and heterosexual. However, in-depth, semi-structured interviews with arts practitioners and arts administrators in the Toronto suburbs of Etobicoke and Mississauga demonstrate that many cultural workers value the creative possibilities of the suburbs as uncharted, untamed cultural territory awaiting discovery. This paper critically examines how Canadian suburban cultural workers relate to the suburbs as place, but also as expressions of lifestyle and values.

Keywords: artists, cultural production, creativity, suburbs, Canada

Timothy D. Baird, University of North Carolina - Chapel Hill. Email: tbaird@unc.edu; *The effect of conservation on local risk perception and behavioral response*

During the past 20 years, land-use outside Tarangire National Park in northern Tanzania has changed dramatically. Driven by population increase, environmental variability, and land-use restrictions indigenous groups now farm to mitigate the risks associated with strict herding. This situation threatens both the integrity of the Tarangire ecosystem and the economic viability of nearby households. The purpose of this study is to examine the effect that the park has on local indigenous perceptions of risk and how these perceptions inform behavioral responses. Data were collected through household surveys (n=240) and Participatory Risk Mapping (PRM) in 8 villages on Tarangire's eastern border in 2004-05. By identifying and rank-ordering respondents' perceived risks, PRM enhances understanding of the nature and variation of risks faced within a population by distinguishing between the incidence and severity of subjective risk perceptions. Standard survey techniques were used to collect economic, demo-

graphic and behavioral response information. In addition to PRM, simple multivariate statistics are utilized to examine the effects of household size, wealth, wealth composition, and village location on risk perception. Results indicate that proximity to the park has a strong effect on the type and severity of perceived risks. Within villages close to the park, however, behavioral response to perceived risks varies considerably. This study sheds light on how behavioral response to environmental and socio-economic factors is mediated through human perception.

Keywords: Africa, cultural ecology, indigenous groups, environmental perception, conservation

Andrew James Baker, University of Tennessee. Email: andybaker79@hotmail.com; *Urban Realms in Metropolitan Knoxville, Tennessee: An Analysis of Intra-Metropolitan Commuting Patterns*

During the late 20th Century, residents and jobs moved out of the Knoxville central city into multiple centers in suburban areas. This paper provides support for James Vance's "urban realms" model of urban form and structure, arguing that metropolitan Knoxville is comprised of self-sufficient regions or realms with residents commuting to nearby employment centers rather than workplaces downtown or scattered in other areas of the region. Simple statistics and visual interpretation of choropleth maps show a distance-decay function between a commuter's residence and workplace. This analysis utilizes the Census Transportation Planning Package 3, which shows place-of-residence based, journey-to-work data at the traffic analysis zone and block group levels for all counties in census-defined, metropolitan Knoxville.

Keywords: urban form, commuting, urban realms

J. Mark Baker, Humboldt State University. Email: j.mark.baker@humboldt.edu; *The Kuhls of Kangra: A Critical Analysis of Enduring Community-Based Irrigation Regimes in the Western Himalaya*

In the Kangra Valley of India's western Himalaya, farmers have for centuries relied on community-managed kuhl systems - intricate networks of collectively built and maintained irrigation channels for their rice and wheat farming. Over the years, earthquakes and floods have repeatedly destroyed villagers' kuhls. More recently, increasing nonfarm employment has drawn labor away from kuhl maintenance and from farming itself. Under these circumstances, and contrary to prevailing theories of common property resource management, most kuhl regimes have transformed and remain in active use. Understanding the durability of the kuhls of Kangra involves interrogating the ways in which they constitute sites for the consolidation of political authority and for creating and contesting community through the mutual constitution of landscape and culture. It also entails investigation of the ways in which kuhl regimes reflect and reproduce key characteristics of regionality, and how networks of interdependence contribute to regime resilience and persistence. This situated analysis of enduring community-based natural resource regimes under conditions of recurring environmental shocks and socio-economic change identifies key themes of general significance concerning currently proliferating programs and policies promoting community natural resource management. Some of these themes include the relevance of statemaking processes, the effects of regionality, the ways in which landscapes encode culture, and the constituent elements of regime resilience. Taken together, these themes identify a theoretical landscape on which to place and through which to understand community natural resource management.

Keywords: community-based natural resource management, irrigation, India, common property, statemaking, regionality, resilience

Jay Baker, Florida State. Email: jbakker@garnet.acns.fsu.edu; *Disaster Preparedness by Florida Households*

Telephone interviews were conducted with 1200 Florida residents in April of 2006 about their level of current household preparedness for disasters and their level of preparedness for recent hurricanes that affected the state. Most preparedness indicators were related to having at least three days of various supplies such as water, food, medicine, and batteries. Current preparedness was related to the following variables in order of importance: income, home ownership, race, age, type of housing, education, region of state, children in the household, living alone, and years lived in current home. Current preparedness was not related to living in an evacuation zone, years lived in Florida, or gender. Preparedness for recent hurricanes was related to age, income, type of housing, race, home ownership, living alone, education, years lived in Florida, and region of the state. Preparedness for recent hurricanes was not related to living in an evacuation zone, years lived in current home, children in the home, or gender. Forty-three percent of respondents said it would be reasonable to expect disaster relief within 24 hours of a hurricane, but only 11% said they expected it that quickly. Almost half said they would prepare better if they knew for certain that government assistance would not arrive for at least three days.

Keywords: hurricane, disaster, Florida

Ruth E. Baker, Doctoral Candidate, University of Minnesota - Minneapolis. Email: ruth_e_baker@hotmail.com; Kurt F. Kipfmuehler, Assistant Professor, University of Minnesota - Minneapolis. Email: kurt@umn.edu; *Snow Season Length in the Upper Midwestern US, 1948-2000*.

We examined snow season characteristics for the Upper Midwestern U.S. from 1948-2000. We used daily snowfall records from 142 stations obtained from the National Climatic Data Center's Historical Climatology Network (HCN). We defined the snowfall season begin and end dates by the first and last day with 2.54 cm of snowfall in each winter season. Trend analysis reveals a slight decrease in snow season length, however, multidecadal variations in snow season length persist for the most of the record. Preliminary results indicate a shift in the snow season since the late 20th century that has a distinct spatial pattern. Season end occurs earlier in the season while the beginning of the snow season is occurring later. This has an overall effect of significantly shortening the total snow season length over the past few decades. Comparison between teleconnection patterns and the characteristics of the snow season using a PCA approach is used to elucidate the spatial patterns and identify important modulators. It is probable that both multidecadal oscillations related to teleconnection patterns and seasonal temperature shifts are responsible for altering snow patterns.

Keywords: snow, daily data, Midwest, PCA

Karen J Bakker, Associate Professor, University of British Columbia. Email: bakker@geog.ubc.ca; *The 'Commons' versus the 'Commodity': 'Alter'-globalization, privatization, and the struggle for the human right to water*

The struggle for the human right to water has emerged in recent years as a focal point of anti-privatization and 'alter'-globalization movements in many countries. Calls for a human right to water are frequently rooted in the assertion that water is a 'commons', positioned as a rejection of the commodification of water enacted through processes of 'green neoliberalism'. Some of these interventions offer deliberately non-dualistic, non-deterministic visions of the co-production of sociocultures, conjoined with unusually broad political alliances between organized labour, environmental groups, women's groups, indigenous groups, and anti-globalization activists, to name just a few. This paper will explore the conceptual possibilities opened up and foreclosed by this debate. I will document the production and mobilization of discourses of a 'human right to water' by both pro- and anti-privatization camps (private sector companies, NGOs, multilaterals, the United Nations, unions, environmental groups), linked to an excavation of the differing conceptualizations of water — commons or commodity — which underpin these competing discourses. The paper will explore the conceptual and political limitations of 'rights talk', and argue that these different visions of water rest on distinct (and at times incommensurable) understandings of water's biophysical characteristics, economic role, and social identity, which are in turn shaping important elements of the political struggle over control for water in many places. These insights will be brought to bear on recent debates in geography on the 'neoliberalization of nature', in an attempt to contribute to ongoing conceptual debates on the production/construction of 'sociocultures.'

Keywords: water, human rights, property rights, neoliberalization, social movements, socioculture

Faiza Shaheen Baksh, University of Manchester. Email: faizabaksh@yahoo.co.uk; *Understanding Neighbourhood Decline: Measuring Deprivation in England, 1971-2001*

To date area decline has been depicted in models of change developed on the basis of observations of urban areas, such as the invasion-succession model (Parks, 1952; Duncan & Duncan, 1957; Taeuber & Taeuber, 1965), life-cycle theory (Hoover, 1959), and the lettings-spiral social housing theory in the UK (Power, 1997). Despite the development of these theories there exists a gap in knowledge of where and why area decline has taken place at the national level. This paper uses a longitudinal Townsend deprivation dataset derived from the 1971, 1981, 1991 and 2001 censuses with GIS mapping tools to explore the geography of deprivation change. Regression analyses, as well as the Office of National Statistics area 'type' classification (e.g. inner-city metropolitan), are used to investigate the area characteristics associated with decline. The analysis results in a telling picture of economic and demographic features providing fertile ground for area decline. The paper concludes that there are three key factors associated with sharp decline including growth in unemployment (dictated largely by national labour market shifts), social housing builds and an influx of immigration. Furthermore there have been specific types of area that have been more vulnerable to decline, such as transitional economic and multi-cultural areas. Findings confirm the significance of population succession and the role of the housing market, but also demonstrate that neighbourhood change cannot be looked at in isolation from national economic and labour market shifts.

Keywords: Deprivation, area decline, models, England

Parthasarathy Balaji, ICICI Assistant Professor, International Institute of Information Technology, Bangalore, India. Email: pbalaji@iiitb.ac.in; Regional development and import substitution industrialization: The telecommunications equipment manufacturing industry in Bangalore, India

This paper explains why, even as the software industry in Bangalore, India, became globally competitive in the 1990s, ITI (formerly Indian Telephone Industries), the region's older telecommunications equipment manufacturer, struggled. This struggle was significant for two reasons. First, ITI's main product was electronic switching systems, whose costs and functions are largely determined by software. Second, in independent India's public sector-led import substitution strategy (ISI), ITI was the first public sector enterprise, with a monopoly over domestic switching equipment production until 1991. The contrasting fortunes of the software industry and ITI raises the following empirical question: why did a nearly half century old monopoly producer of switches have to struggle despite its critical input, software, becoming a source of prosperity in the same region for an independent industry which barely existed before 1985? Since the growth of the software industry coincided with India's move away from an autarkic ISI-led economic model to one emphasizing greater ties to the global economy, the empirical question also raises a theoretical question. Why is there differential performance in economic sectors when regions shift from ISI to a more liberal economic model? As many regions navigate this transition with varying degrees of success, the significance of the question extends beyond Bangalore. By examining how the policies shaping telecommunications equipment production affected ITI's relationship to the state, this paper will contribute to our understanding of the process of regional economic change in newly industrializing countries.

Keywords: Import-substitution industrialization, Telecommunications equipment, India

John Baldridge, University of Arizona. Email: wrkrcoop@email.arizona.edu; Producing Sin Patrón: Emerging Cooperative Institutions and Socio-spatial Transformation in Argentina's Recovered Businesses

Since Argentina's economic crisis of December 2001, nearly 200 formerly bankrupted businesses have been "recovered" by their workers, and now operate as democratic worker-owned cooperatives. In this presentation, I examine the collective action strategies these recovered businesses use to ensure survival and growth, and consequent transformations of work, the workplace, and the workers themselves.

Andrew Baldwin, Queen's University. Email: baldwina@post.queensu.ca; Carbon-nation: the relational ontology of carbon scarcity in Canada's boreal forest

In Canada, the climate change debate is neatly divided along ideological lines. Conceptualizing the climate change debate in such stark terms, however, obscures much of what is at stake in the climate change furor. Building on insights from postcolonial geography, this paper argues that geographies of race, nature and national identity are central to discourses of forest carbon management as they pertain to climate change mitigation and adaptation strategies in Canada. It is argued that as the boreal forest of northern Canada is fetishized as a carbon reservoir and materialized through a narrative of carbon scarcity, such a discourse effects a resettlement of numerous identifications. This paper focuses on the relational ontology of Canadian national identity and one of its included exclusions, a flattened, homogeneous aboriginal subjectivity performed through the carbon scarcity narrative.

Keywords: boreal forest, climate change, relational ontology, national identity

Jeff Baldwin, Ph.D., Willamette University. Email: jbbaldwin@willamette.edu; Towards a Biospheric Political Economy

The human-nature dichotomies native to modern/liberalist ideologies have constructed non-human beings as objects without agency. As a result, non-human beings are excluded from social science generally and from political economic analysis specifically. The science of ecology has allowed politics among non-human beings but only through the Darwinian imposition of a competitive and atomistic analog to liberalist epistemes. This paper aims to reformulate political economy so as to include non-human beings. In his critique of political economy, Marx observed that there are two forms of social power: a competitive and coercive power-over others, and a cooperative mutually beneficial power-with others. Marx, though, argued that non-human beings were not historically affective because they were not purposeful. Until very recently, even post-constructionalists such as similarly excluded non-humans from politics. The

paper refers to work by environmental ethicists to argue that non-human beings are intentful and so are also historically effective. "Nature" then has always been part of political economies. Drawing upon coastal ecology the paper observes that on co-evolutionary time scales, biospheric politics are not well characterized by coercive power regimes, but tend towards mutualism which enhances use value objectified in environments. The paper observes that socio-ecologies which seek to build power-over biospheric others decreases use values invested in environments and require imports of value from and exports of waste to some dismissed there and then. The paper concludes that human histories illustrate the value of building power with biospheric others, a strategy which moves socio-ecologies towards increased coherence and reliability.

Keywords: Environmetnal ethics, Marxist ecology, human-environment relations, political economy

Heidi L. Ballard, Ph.D., University of California, Davis. Email: hballard@ucdavis.edu; A Nexus for Integrating Knowledge and Improving Forest Stewardship: Non-timber Forest Products Harvesters and Community-Based Forestry in the United States

While the majority of people in the United States who gather non-timber forest products (NTFPs) do so for personal use, commercial NTFP harvesters can play an important role in forest management and rural community development. Commercial harvesters of products such as floral greenery, edible mushrooms and medicinals possesses extensive local ecological knowledge of the species and ecosystems in which they work. They also have the incentive to manage and continue to learn about the resources on which their livelihood depends. This untapped resource for improved forest stewardship has recently become connected to the community-based forestry movement in the United States. NTFP harvesters are emerging as a nexus for learning about forests and forest management that involves local community groups, public and private forest managers and scientists. This paper examines the efforts of community-based forestry and harvester organizations to integrate multiple knowledge sources in order to improve understanding and management of forests and equitable access to NTFPs. The three components — community-based organizations, NTFP harvesters and conventional scientists — constitute learning networks in which knowledge is exchanged and applied through activities such as inventory and monitoring. Harvesters learn formal scientific data collection techniques while managers and scientists learn from the experiential and livelihood knowledge of the harvesters to better inform management and understanding of ecosystems. These learning networks have the potential to institutionalize the best aspects of civil science, whereby marginalized communities work in collaborative partnership with university and agency scientists to co-produce knowledge in an authentic and equitable way.

Richard Ballard, School of Development Studies, University of KwaZulu-Natal. Email: Ballardr@ukzn.ac.za; Gareth Jones, London School of Economics. Email: G.A.Jones@lse.ac.uk; From 'Brittany' to 'Champagne' in Five Minutes: Producing and Consuming Gated Communities in Durban, South Africa

Gated communities have become a prominent feature on the edge of cities in South Africa. Each has a bill board conveying a marketing niche: 'Natal Colonial', 'Tuscan', 'Tudor', 'Cotswold', 'country' 'eco estate', 'equestrian estate', 'golf estate' and 'game estate'. There is no doubt that there is an element of geographical escapism playing out. Yet interviews with residents suggested the architectural and other symbolism which makes up the menu of choices often takes on an ultimately arbitrary character. Residents are frequently indifferent to the architectural style of their community. The majority of residents do not play golf on golf estates or ride horses on equestrian estates. And while most cite security as a major motivation for moving there, only a minority have ever experienced crime. Some residents even express surprise that they ended up living in a gated community at all. The success of this sector depends on a confluence of factors. Developers have capitalized on a particular juncture where surplus investment money exists to bankroll developments, there is a high demand for home purchasing, and changes in South African cities have resulted in a certain appeal for privatized associational living of this kind. This paper attempts to explore the symbolic and political economies of gated communities. It argues that the relationship between the production and consumption of these spaces is not linear.

Keywords: Gated communities, identity, South Africa, segregation

Clint Ballinger, . Email: cjb89@cam.ac.uk; Economics' "Primacy of Institutions or Geography in Development" Debate: A Fatal Flaw in Acemoglu, Johnson, and Robinson's (2002) "Reversal of Fortune" Argument

The "reversal of fortune" argument (Acemoglu, Johnson, and Robinson 2002) has been highly influential among political economists and economic historians in the debate on the causal relations between institutions and geographic factors in long-term development (this argument is in part responsible for Acemoglu winning the prestigious John Bates Clark Medal in economics). The reversal of fortune argument ingeniously attempts to use the abrupt changes in institutions due to colonization as a natural experiment to understand the complex relation of geographic factors and institutional development in long-term economic development. We show that, unfortunately for their highly creative attempt to gain analytical leverage from a natural experiment, the reversal of fortune argument is undermined by what historian Alfred Crosby has termed the "Columbian Exchange." Methodologically, the presentation illustrates how the creative use of descriptive statistics (following recent suggestions by the comparative political economist Michael Shalev) can partially overcome inherent problems of spatial autocorrelation in comparative and econometric political economy.

Myra Bambacus, NASA Geosciences Interoperability Office. Email: cyang3@gmu.edu; Interoperability and Spatial Web Portal

This presentation introduces an interoperable architecture supporting the sharing of geospatial data and information for different decision support tools. First, standards and specifications, defined by ISO, FGDC, and OGC, are introduced in an interoperable architecture to support geospatial portals. Second, the NASA Earth Science Gateway (ESG) is introduced as a geospatial portal prototype leveraging the interoperable architecture for the discovery, integration, sharing, and reuse of legacy and future components of NASA earth observations and earth system modeling simulations. Finally, an example of applying the interoperable architecture and ESG is introduced in connecting NASA DAACs' data holdings, services, to NASA partner agencies' decision support tools, such as Air Quality forecasting hosted by EPA and NOAA.

Matthew Bampton, University Of Southern Maine. Email: bampton@usm.maine.edu; Cathleen McAnneny, University of Maine, Farmington. Email: McAnneny@maine.edu; Measuring Conceptual Understanding in Undergraduate GIS Education: Developing an Instrument and Creating a Baseline

The Maine Geospatial Curriculum Project (MGCP6), comprised of 6 University of Maine System Campuses has successfully developed a statewide outcomes based multidisciplinary GIS curriculum. After five years of implementation it has become apparent that we must develop a core-concept based assessment tool to measure student learning. Using techniques developed by education researchers in other fields, most notably physics, chemistry, geology, and biology we are now developing a web-based measurement tool. The central underpinning of our project is the notion of misconceptions: the idea that in many areas of STEM education there are fundamental barriers to learning, derived from student's faulty "common sense" understandings of the world. Identifying these misconceptions is an essential prelude to developing interventions that will overturn them. Using a Latent Semantic Analysis (LSA) we will test a sample of GIS and non-GIS students to build a geospatial concept inventory, and a concept map. This concept map will form the foundation on which a prototype two-dimensional assessment instrument will be built. In the second stage the assessment instrument will be used to pre- and post-test student conceptions and misconceptions in undergraduate GIS courses on all MGCP6 campuses over three semesters. Periodic interviews with a sample of students will be conducted to validate the instrument. Test results will be subjected to statistical analysis to measure for variations in score against three control groups, and for variations by campus and demographic variables.

Hyowon Ban, Ohio State University. Email: ban.11@osu.edu; Visualizing Difference and Similarity between Definitions of Exurban Areas

Recently, exurban areas have received attention because of fast growth. There are a number of suggested terms of exurbanization, however most of them are separate. These existing definitions of exurban areas lack of consensus so the exurban boundaries are uncertain. In this work, the ontological comparison of existing definitions of exurban areas are made spatially explicit. Difference and similarity between these definitions are visualized and compared with graded fuzzy membership functions instead of traditional crisp memberships. Therefore the heterogeneity of being exurban in each location of traditional exurban areas is revealed. With an empirical experiment using GIS data and 3D geovisualization

techniques, the utility of visualizing the uncertainty of exurban areas is demonstrated. The 3D geovisualization clearly presents the similarity and difference between the two definitions. This suggests new possibilities to explore the semantic relationships between different concepts about the same theme. This work can be extended with a weighted fuzzy membership function to help decision making for land-use and a 3D animated map to visualize time-dependent change of exurban boundaries.

Email: liangg@infra.kth.se; Jiesheng Wang, Professor, Remote Sensing Satellite Ground Station, Chinese Academy of Sciences. Email: ; Zhijun Chen, Ph.D., Remote Sensing Satellite Ground Station, Chinese Academy of Sciences. Email: ; Satellite Monitoring of Urbanization in China

The unprecedented combination of economic and population growth since the early 1980s has led to dramatic changes in China's landscape. China is in transition from a largely rural society to a predominantly urban one. Two decades ago, fewer than 20% of China's people lived in urban areas; today it is 40% including in 46 megacities of 10 million or more; and by 2020 it is expected to be 60% (i.e., another 300 million people will move to urban areas in the next 20 years). Therefore, monitoring and analysis the spatial-temporal patterns of urbanization are of critical importance for urban planning & sustainable development in China. The objective of this research is to monitor and analyze spatial-temporal patterns of urbanization in China using satellite images acquired in mid-80s, mid-90s and present. Remote sensing provides a systematic, synoptic view necessary to map urban forms and their changes over time at regular intervals, thus provide excellent opportunity for monitoring the pace of urbanization. Three study areas that experienced rapid urbanizations are selected for the research, one in Jing-Jin-Ji (Beijing, Tianjin and Hebei) in Northern China, one in Yangtze River Delta (Shanghai-Nanjing) in Eastern China, and one in Pearl River Delta in Southern China. Two areas that experienced slower-pace urbanization in western china are also selected as comparisons. The spatial-temporal patterns of urbanization during mid-1980s to mid-1990s are being analyzed and compared with those of mid-1990s to present. The urbanizations in coastal areas are being compared with urbanizations in the interior China.

Keywords: Satellite, Monitoring, Urbanization, China

Shawn M. Banasick, Kent State University. Email: sbanasic@kent.edu; Dugong v. Donald Rumsfeld: Cultural Properties, Legal Spaces and the Conflict over US Military Bases in Okinawa, Japan.

US military forces stationed in Japan are a major component of the US strategy to promote regional stability in East Asia. However, approximately half of the US military personnel are based in Okinawa prefecture. The extreme concentration of US Forces Japan in Okinawa has had a strong impact on Okinawan development, and a variety of anti-base protest movements have emerged since the end of the Second World War. In this paper I adopt a legal geography perspective to examine the struggle to stop the construction of a new US military base in the northern area of the main Okinawan island. The anti-base protest centered on the possible impact of the base on the Dugong, a sea mammal similar to a manatee. The Dugong has been of significant cultural value to indigenous Okinawans, and the proposed base might result in significant damage to its main breeding grounds. Much of the legal struggle was focused on assessing the cultural significance not only of the Dugong themselves, but also of the Dugong's habitat. The legal decision hinges on whether US participation in the World Heritage Convention means that the Japanese government's protection of the Dugong requires an equivalent US government protection of Dugong habitat in accordance with the US National Register of Historic Places. The Dugong case suggests that the struggle to incorporate Okinawan perspectives into the dominant legal discourses could significantly affect the US military presence in the region.

Keywords: indigenous, legal geography, Okinawa, Japan.

Tawan Banchuen, Student. Email: txb213@psu.edu; The Geographical Analog Engine: Weighted Euclidean and Semantic Similarity Measures for US Cities

In today's information age, geographers are overwhelmed with data to analyze. This paper presents a semi-automatic tool that helps geographers weed out irrelevant information and navigate the information space when locating similar places, arguably one of our longstanding main tasks. The tool measures similarity of places based on numerical as well as textual descriptions. It employs Euclidean distance to measure numerical similarity and various semantic measures for textual descriptions. The latter measures include taxonomy-based measure,

set-based measure, corpus-based measure, and expert judgment. As a test case, the paper uses statistical data from the County and City Databook, which contains, for example, population, household income, labor, crime, manufacturing, trade, government finances, and climate data. For textual descriptions, information is gathered from various Web sources, including Wikipedia, City-Data.com, and usmayors.org. To aid data exploration, the tool displays raw data and analysis results in forms of maps, parallel coordinate plots, table views, concept graphs, and annotated text.

Keywords: analog, semantic, similarity, semi-automated method, data mining, visualization

Sutapa Bandyopadhyay, graduate student, University of Denver. Email: sbandyop@du.edu; Connecting India: Spatial Inequality in the distribution of Cellular Phone Network in India

Cellular phones have been enormously popular in India, and have set the market on fire since the beginning of the 21st century. The reduction in overall price of the handsets and increase in number of service providers are some of the reasons behind the massive expansion of the industry. The expansion has however not taken place in a uniform manner. The more urbanized, industrialized and more affluent states have put up a far better performance in comparison to the backward states. While the largest number of subscribers is concentrated in Maharashtra, Gujarat, Andhra Pradesh and Punjab, the smallest number of them is in North-East, Assam and Jammu & Kashmir. The large metropolitan areas are the main pockets of concentration by virtue of their tertiary and quaternary sectors. Very few subscribers are found in the rural areas. The infrastructures available in the cities help in the establishment of the cellular phone network and hence lead to the concentration of users. However, now BSNL is trying to spread the network to rural India as well. But still the major portion of Indian population living in rural areas is outside the purview of cellular networks. The cellular phone industry is increasing by leaps and bounds and is expected to serve the entire country very soon adding a new dimension to the changing world of communication.

Keywords: distribution, cellular phone network

Abhijit Banerjee, University of Delaware. Email: abanerje@udel.edu; An Evaluation of the Potential and Limitations of Ecotourism as a Vehicle for Conservation and Sustainable Development in India

Although ecotourism has been conceived as a responsible form of travel that benefits both conservation and local communities, in practice it has often been abused. This paper offers a critical evaluation of ecotourism in protected areas (PAs) in India, using a representative sample for analysis. Data was collected on their tourism trends, impacts and management which was then evaluated against the four established principles of ecotourism: environmental impact, benefits to local communities, contribution to conservation, and visitor education. The study revealed certain trends: other than restricting certain areas and activities there was little concern about ecological design or pollution with increasing tourism taking a heavy toll on the environment; local people got only menial jobs while tour operators made significant profits; meager amounts were generated for conservation compared to visitor numbers; and visitor education efforts were negligible with most tourists solely interested in "wildlife sighting". This study concludes that ecotourism in sensitive areas cannot be conducted as a purely business venture and offers the following policy recommendations: PA managers should partner with local communities and NGOs to integrate ecotourism with sustainable livelihoods; experts should be consulted on the design of low-impact infrastructure and undesirable amenities and activities should be avoided; costs should be modest to balance conservation and community development against access to ordinary citizens; and visitor education should be an integral component to improve visitor experience as well as to reduce undesirable behavior.

Keywords: ecotourism, India, protected areas, conservation

Aniruddha Banerjee, PhD, Prevention Research Center, Berkeley. Email: aniruddha.banerjee@gmail.com; Modifiable Areal Unit Not A Problem (MAUNAP): Effects of Scale and the COSP in Autoregressive Models

Autoregressive models that manifest as space and time series have become increasingly popular. Ever since Box and Jenkins showed autoregressive models (time series) are better at prediction (than ordinary structural econometric models), it has become one of the cornerstones of modern economic theory. The statistical relationship between variables at a given scale, frequently used to measure relationships, is dependent on the choice of size and shape of the geographic units. This is due to a change of support that occurs when individual level data is grouped. The effects of change of support are known as the change of support problem (or COSP) and defines the family of associated problems like the modifiable areal unit problem (or MAUP) and ecological fallacy. This paper identifies the links between COSP and autoregressive theories. Examples of conflicting theories arise when multiple correlation peaks (or cycles) occur and

are indicative of some serious problems in the conceptualization of these sorts of models. Hence, it is difficult to develop universal space-time models. However, to reach the goal, the need is to evaluate the mathematical primitives of space-time models that are often used without careful interpretation. I formulate a theory based on the concept of 'length scales', 'mixing measures', 'mixing under multiple processes', markov random fields, manifolds and the Hammersley-Clifford theorem to re-evaluate the mathematical primitives that trigger COSP. Such a re-evaluation suggests that interpretation is invalid without a theory and that theories can be developed when concepts like 'length scales' and 'mixing' are thoroughly understood.

Keywords: COSP, MAUP, length scales, mixing measures, mixing under multiple processes, markov random fields, manifolds and the Hammersley-Clifford theorem

Jeff Banister, University of Arizona. Email: banister@email.arizona.edu; The Cultural Politics of Water and State-Formation on Mexico's Mayo and Yaqui Rivers, 1926-1992

Contemporary Mexican water politics evinces a critical tension between the long history of State centralization around hydraulic resources, and recent federal policies that would altogether devolve irrigation management to water-users. Analysts studying the effects of these reforms remain constricted by a dearth of historical research on State-led irrigation development, particularly since the implementation of the 1926 Federal Law of National Waters, which marked the beginning of the heaviest government involvement in the country's hydrology. This paper examines the changing roles of the Mexican State as it constructed a bureaucratic, scientific knowledge-base from which to develop and manage agricultural water resources in Sonora's Mayo and Yaqui Valley Irrigation Districts, from 1926 to 1992. This was a period during which the federal government amassed then lost unprecedented political and economic power around the control of northwest Mexico's hydrology. The State's political authority, built on an edifice of hydro-power, could rarely if ever function as a top-down imposition, but instead accrued through the manifold interlinked projects?cultural, economic, political, spatial?that radically reshaped the northwest's landscapes. The paper concludes by making a case for re-conceptualizing political power in post-revolutionary Mexico, calling for a more robust theoretical and methodological approach the State than scholars have thus far employed.

Shuming Bao, University of Michigan. Email: sbao@umich.edu; Daniel Brown, University of Michigan. Email: danbrown@umich.edu; An Integrated Analysis of Flooding, Landscape Changes, Migration, and Regional Development in the Poyang Lake Region

Many environmental and economic problems require an understanding of the interactions of coupled natural and human systems, including: human communities, land use/cover patterns, hydrogeology, and floral and faunal communities. Environmental changes in any given region are driven by processes internal to that region (such as planning, local economics, migration, and spatial distribution of resources), as well as external processes (such as climate change, regional and global economy). In this presentation, we'll give an introduction to our research work on the region around Poyang Lake, Jiangxi Province, China, which combines the considerable wealth of data, models and analytical tools to assess its current status and future changes. We present an approach aimed at understanding the interrelationships between flooding, land-cover and land-use change (LCLUC), human welfare, migration, and regional development. We are developing a system of coupled models, including models of the natural and social systems at multiple scales, that will be used to perform environmental assessment and to improve our understanding of the human and ecological consequences of hydrological variability. This presentation will describe the models and how the coupled models may be used by a variety of agencies and stakeholders as a decision tool to explore the various management options and to understand the trends and dynamics occurring across the region.

Jayson Barangan, BA - Environmental Studies, University of Nevada, Las Vegas. Email: jaysonbarangan@yahoo.com; Green Cancer: A Synopsis of Miconia's Invasion and Mitigation Efforts in Maui County, Hawaii

Non-indigenous species are an urgent dilemma in the Pacific Islands because of their ability to disrupt ecosystem functions. Introduced through the import of goods, the nursery and pet trades, and the effortlessness of which persons can travel between countries, the dissemination of these species is a detrimental global phenomenon. This unremitting assault has had an overwhelming impact on myriad ecosystems and continues to jeopardize the few pristine natural areas left in the Pacific. As such, invasive species are a pervasive ecological threat. Owing to its geographic isolation, the Hawaiian archipelago has been particularly

susceptible to the invasion of non-indigenous plants and animals. Endemic flora and fauna that have evolved in Hawaii are directly impacted via competition for resources and reduced habitat quality. Amid hordes of non-indigenous species that currently occur in Hawaii, the highly invasive plant *Miconia* (*Miconia calvescens*) is the most ecologically harmful and a priority for control, largely due to the absence of natural enemies and its prolific reproductive cycle. With its displacement of native vegetation and wildlife, *Miconia* has decimated nearly 70% of Tahiti's rainforests. On the basis of parallels in habitat structure in Hawaii, alarm is clearly warranted. Precious biological resources are at stake, so containment of this species is paramount. Maui is the island in Hawaii where efforts for controlling *Miconia* were first mobilized. This poster provides a synopsis of *Miconia*'s phenology and impacts, also illustrating how increased public awareness and the use of Geographic Information Systems (GIS) have been instrumental in this ongoing battle.

Keywords: *Miconia*, Non-indigenous species, Control efforts, GIS

Jarrett J Barber, University of Wyoming. Email: jbarber8@uwyo.edu; Statistical Modeling for Map Positional Error

Map positional error has typically received attention from within the field of Geographic Information Science (GIS) while largely being ignored by the statistical community. This presentation gives the views of a spatial statistician toward the map positional error problem and the use of statistical models for characterizing map positional error for the purpose of producing improved predictions of true locations along with measures of uncertainty. A simple statistical model of positional error that incorporates information on the linearity of features is presented and illustrated using a small residential road network. The resulting predictions of true location are of a form that facilitates the characterization of uncertainty of practically any functions of position, hence facilitating the study of error propagation.

Keywords: Bayesian statistical modeling, linear map features

Hunter Barcello, University of Idaho. Email: hbarcello@gmail.com; Eric Delmelle, University of Idaho. Email: delmelle@uidaho.edu; Migration Patterns in Idaho from 1995 to 2005: Spatiotemporal Analysis

Idaho has been experiencing a significant population increase within the last fifteen years; growing at roughly twice the rate of the United States as a whole. This increase is the most pronounced in fast growing urban areas (such as Boise and Coeur d'Alene). What are the major driving forces behind this period of extended growth? Do migrants from outside Idaho have different destination preferences than intra-state migrants? In the paper, we present a spatial predictive model of migration from 1995 to 2005. The model is original as it uses IRS statistics of income data at the county level, along with various socio-economic data sets such as median house sale value and unemployment rate as well as data on natural amenities (such as National Forests and ski areas).

Keywords: Spatial Migration, Temporal Variation, Multiple Regression, Spatial Regression, Causal Attracting and Departing Factors., Amenities and Migration

Holly R Barcus, Macalester College. Email: barcus@macalester.edu; Migration Decision-Making, Culture, and Trans-National Identities: A Case Study of the Mongolian Kazakh Diaspora

In the early 1990s almost 60,000 Mongolian-Kazakhs migrated from Mongolia to Kazakhstan. The opening of borders and relocation programs to attract the diasporic Kazakh community back to Kazakhstan seemed viable reasons for this migration. However, nearly one-third of the migrants returned to Mongolia within five years despite the depressed economic conditions and isolated location of this region. This paper 1) explores the motivations and consequences of international migration for Mongolian-Kazakhs, focusing specifically on the decision to migrate and the importance of cultural and social factors in this decision; 2) examines the use and importance of social networks in facilitating the initial migration event and in its success or failure. Data was collected via semi-structured interviews with return and non-migrants in Hovd and Bayan-Ulgii aimags in Mongolia during the summer of 2006. Preliminary findings suggest the emergence of several migration strategies and a distinctive mover-stayer profile.

Keywords: Kazakh, Mongolia, Migration

Christopher S Barkan, M.A. student, University of Illinois at Chicago. Email: cbarka2@uic.edu; Foucault, Agamben and Violence

Neither Foucault nor Agamben place violence explicitly at the center of their paradigms of thought. To be sure, what we commonly think of as violence is featured so prominently in Foucault's *Discipline and Punish* and Agamben's *Homo Sacer* that one might be incredulous at this claim. But, as it will be shown, these texts, along with *The History of Sexuality*, in which "biopolitics" first appears and through which these two influential theorists are directly linked, actually do not successfully articulate a definition of violence and may not,

devoid of such a definition, situate it in the right relationship with or sufficiently close to the inaugural tropes? power for Foucault and sovereignty for Agamben? that most powerfully motivate and guide their thought. Hence we can surmise at this point that it is unlikely that the problem of violence? violence qua violence? could ever be brought to light, adjudicated and "solved" within the framework and, therefore, the lexicon of their systems of thought, unless, by chance, violence qua violence actually turns out to be synonymous with the terms of their discourses.

Keywords: Michel Foucault, Giorgio Agamben, biopolitics, camp, prison, violence

David Barker. Email: david.barker@uwimona.edu.jm; Clinton Beckford, Faculty of Education, University of Windsor, Canada. Email: clinton@uwindsor.ca; Agricultural Intensification in Jamaican small-scale farming systems: vulnerability, sustainability and global change.

The paper contrasts two regions of intensive small-scale farming in Jamaica, a fruit and vegetable area in southern St Elizabeth and a yam growing region in southern Trelawny. The former is the island's principal domestic food supply area while the latter is Jamaica's main yam export region. Yet, the relative success of these regions may have come at the price of increased vulnerability in the face of global change. The regions are located in different topographical and environmental settings and both farming systems represent successful adaptations by small farmers to local conditions. In one case, Guinea Grass mulch is used to compensate for low rainfall while, in the other case, sticks from local woodlands and forests are used to stake yam hills. The intensification and commercialization of production over the last 30 years has created local scarcities of farm inputs (mulch and yam sticks) which has led to higher production costs. The paper explores the dimensions of sustainability and vulnerability in these locally important food producing regions, in the context of local natural resources, the effects of trade liberalization and food imports, and the recent hurricane and drought impacts in Jamaica.

Keywords: Small farming, vulnerability, agricultural intensification, Jamaica

Jeffrey Barnes, MA Geography Student, Carleton University. Email: jbarnes3@connect.carleton.ca; Functional in situ conservation of cacao

There has been a renewed focus on the in situ conservation of agricultural systems and specific crops in agro-biodiversity research and its applications. This paper illuminates some fundamental barriers to in situ crop conservation among indigenous groups through a discussion of the difficulties encountered by the Kuna, a Central American indigenous community, in their attempts to revitalize production of *Theobroma cacao*. Regional variations in the success of cacao cultivation have led to concerns about the loss of related ethnobotanical knowledge among Kuna elders and civil society in San Blas, Panama. My research took place in 2005 as part of a larger project aimed at revitalizing the local production of cacao in light of decreasing cacao yields. The revitalization project overemphasized technical knowledge at the expense of ethnobotanical knowledge, causing cacao cultivators to become disinterested in the project. Although, cultivators gained an intimate technical knowledge of how to successfully grow cacao, they had little understanding of why one would continue its cultivation. Based on participant observation and in-depth interviews with shamans and elders, I found that this plant plays a significant role in cultural reproduction among the Kuna. When ethnobotanical research was shared with local cultivators, they expressed a sense of regret at not having consulted with local traditional authorities in concert with international technical expertise. In situ agrobiodiversity conservation projects tend to focus on technical methods of maintaining diversity, and could improve by paying more attention to cultural resources already present within communities, which have shaped current agrobiodiversity since time-immemorial.

Jessica R Barnes, Undergraduate, University of Wisconsin-Platteville. Email: barnesj@uwplatt.edu; Constraints on Mobility: Gendered Perceptions of Fear and in Oz Park, Chicago

Understanding people's perceptions of fear in public spaces is an important consideration for the creation and maintenance of public spaces that offer equal access and mobility for all. Examining how people move through these spaces can expose the societal cues that differentially impact people. This research project examines spatial perceptions of fear in urban public spaces for different genders. Specifically, are women's patterns of travel after dark effected by a perceived threat of violent crime and what about a place makes it threatening? To address these problems, I conducted research and analysis on people's perceptions of the threat to their safety in urban streets and park spaces during the day and at night, and how people traverse those spaces. One hundred ninety surveys were completed by daytime users of Oz Park in Chicago, obtaining

information on demographics, travel patterns, and perceptions of threat. Simple descriptive statistics were used to examine responses and reveal general behavior patterns. Women perceive a higher level of threat that is more spatially generalized and men perceive a lower level of threat that is more locationally specific. In addition, the respondents gave suggestions for improving the safety of public spaces. These suggestions may be used to facilitate greater equality in mobility through both the design of public spaces and by providing information for people to make informed critiques of their safety in the public spaces.

Keywords: mobility, gender, public space, safety, fear, women, feminist geography

Trevor J. Barnes, University Of British Columbia. Email: tbarnes@geog.ubc.ca; *The discipline that came in from the cold: how the US military-industrial complex changed geography*

WWII marked an epochal change in the relation of geographers to war and the military. The military had long utilised the skills of geographers, but from WWII the relation changed at least in the United States, and the military began less drawing upon existing geographical knowledge then directing a new kind that was increasingly formal, instrumental, team-based, and model driven. This trend continued even more strongly through the Cold War period, and further propelled by the interests of a new, collective assemblage, the military-industrial complex. The purposes of the paper are to examine the process by which geography within the United States became enfolded within this cyborg entity, and the character of the disciplinary knowledge regime that eventuated. The argument is pursued by following three individuals key to the new disciplinary regime through their travels within the military industrial complex: Waldo Tobler a pioneer of GIS whose first job is at RAND working on SAGE, the project to develop an early warning system for nuclear attack; Edward Ullman who is recruited into military intelligence during the Second World War, and maintains contacts afterwards first as a professor of geography at Harvard and later at the University of Washington; and Arthur Strahler, a geologist at Columbia University, who through his links to the US Office of Naval Research, funds and directs a set of students who later enter physical geography utterly transforming it to meet the dictates of the new regime.

Keywords: US military-industrial complex, geography

Ashley J. Barnett, University of Nebraska-Lincoln. Email: ashleybarnett@juno.com; *Nationalism and Archaeology in Israel*

The archaeological community now widely acknowledges that archaeology has been used in many ways and by many states and political organizations to influence public opinion. Since the formation of the State of Israel in 1948, Israel has had to continually reinforce its right to exist. This paper explores the manners in which the State of Israel has employed archaeology to support the state's *raison d'être* by investigating the designation of archaeological sites as Jewish. The paper analyzes and explores the artifacts, iconography, and other sources which are considered evidence of past Jewish populations; it also introduces various alternative interpretations of these artifacts. The author offers a statistical analysis of sites considered to have had Jewish populations, as well as a statistical comparison of sites in the Occupied Territories and the State of Israel proper. The results suggest there may be reason to debate the authenticity number of Israeli archaeological sites regarded as 'Jewish.'

Keywords: archaeology, Israel, Jewish, nationalism, Zionism

Elizabeth Barnett, PhD, MSPH, University of South Florida. Email: ebarnett@health.usf.edu; *Economic exclusion, uneven development, and disability among African Americans*

This study is grounded in theories of uneven development (from the critical geography literature), social environmental impacts on health (from the social epidemiology literature), and economic exclusion (from the sociology and political economy literature). The marriage of disparate disciplinary perspectives creates the possibility of a new paradigm to understand the pervasive health disadvantages experienced by blacks in the United States. This new paradigm views poverty, low educational attainment, and residential segregation as derivative - i.e. as consequences, not causes ? of more fundamental economic forces. The main hypothesis of this study was that health outcomes among African Americans would be more adverse in geographic areas characterized by economic underdevelopment and the exclusion of blacks from occupational opportunities. Using detailed race-specific socioeconomic, family, and housing data from the Public Use Microdata Sample of the Census of Population and Housing, I examined prevalence of disability among African Americans as a consequence of economic exclusion (measured by black male unemployment and occupational segregation between blacks and whites), and uneven economic development (measured by manufacturing employment; finance, insurance, and real estate employment; new housing units; and black in-migration). Results showed a strong association of disability prevalence with all measures of

economic exclusion and uneven development. Mainstream explanations of African American health experiences often invoke "poverty" and "low socioeconomic status" as causes. The results of this study contribute to a provocative re-framing of health policy debates about the causes and potential remedies of persistent racial health disparities in the United States.

Keywords: African Americans, health, disability, unemployment, uneven development, segregation

Keith D Barney, Ph.D. Candidate, York University. Email: kbarney@yorku.ca; *Laos and the Making of a Resource Frontier*

With the greatest extent of intact forest cover in mainland Southeast Asia, post-socialist Laos is a last 'resource frontier' in Asia. Laos is a frontier of tropical timber harvesting, of sustainable village forestry co-management, of 'unused degraded forest-land' for tree plantations, and a frontier for forest conservation, eco-tourism and endangered species preservation. While realising that nature and people in upland Laos have long been integrated into global commodity relations, this paper will develop the usefulness of considering certain upland spaces of Laos through the metaphor of the resource frontier. Recent extensions of international resource capital and donor/state led territorializing processes in contemporary Laos are producing a complex and overlapping spatial patchwork: closely mapped spaces of co-managed protected areas and certified-sustainable village forestry are situated next to zones of rapacious state-sanctioned, over-quota logging. These places in turn are not far removed from surveyed land reform zones, creating 'degraded forest' which is cleared for industrial plantations of eucalyptus, rubber and oil palm. It will be argued in this paper that the complexity of social-natural landscapes emerging in contemporary Laos should be considered less as functionally distinct issues, places, socio-natures and events, but rather as contradictory expressions of a networked, resource frontier, which is producing a range of new global commodities. The creation of a resource frontier in spaces in Laos reflects regional forces of uneven development, and is constitutive of a partial, tenuous neo-liberalism in Southeast Asia.

Keywords: frontier, resources, territory, Laos, neoliberalism

Shaunna Barnhart, The Pennsylvania State University. Email: slb442@psu.edu; *"We're the crap capital of the country": A political ecology of biosolids fertilizer in Franklin County, Pennsylvania*

Sewage sludge is the solid waste produced from the treatment of commercial, industrial, and municipal wastewater; when applied to land for beneficial purposes, it is often called biosolids. The land application of this substance is an intensely debated issue with supporters arguing that applying biosolids to land is a sound recycling practice with environmental and financial benefits, while opponents argue that it is detrimental to both human and environmental health. This research explores the contentious nature surrounding the use of sewage sludge fertilizer in Franklin County, Pennsylvania. It traces how corporate controlled sewage sludge land application has become an issue for local control and democratic expression. Specifically, this research seeks to answer how local citizens and local government at the township level respond to and attempt to shape local and state level policy regarding sewage sludge (biosolids) application as a farmland fertilizer. A political ecology approach is used as its emphasis on the role of knowledge, discourse, and politics of scale provides a rich research perspective in understanding the contentious use of biosolids fertilizer. Interviews, primary documents, meeting records, newspaper articles, and secondary studies are employed in exploring the politics and discourses surrounding biosolids fertilizers.

Keywords: political ecology, biosolids, sewage sludge, Pennsylvania

Robert Barr, The University of Manchester. Email: robert.barr@manchester.ac.uk; *Seeing nothing from nowhere - Google Earth and the illusion of information*

Google Earth has transformed the lay person's view of geographic information by providing high resolution (or, more accurately, variable resolution imagery) of the entire earth's surface. It also offers the facility to overlay points, lines and areas as well as simple, or rendered, three dimensional objects on the surface of the image. However, apart from some street mapping, points of interest (often linked to Google advertising) and some boundaries and infrastructure, the image remains just that, an image. This view of the Earth, as a picture on which other primitive spatial objects can be superimposed harks back to the age of conventional cartography and the period when the store of geographic information contained in published maps was being digitised. Yet the world is moving on from this cartocentric view. The Alexandria project to create a spatially referenced digital library introduced the concept of the geographic information bearing object (GIBO), a spatial object characterised not only by its geometric form, but also by its place in an ontology which in turn determines the attributes that that type of object may have. This paper will explore the inherent

conflict between a cartographic and an information object based view of the world.

Keywords: geographic information, cartography, Google

Linda R. Barrett, University of Akron. Email: barrett@uakron.edu; *Tracing Spatial Patterns of Forest Cover in Northeastern Ohio Across Two Centuries, 1800 - 2000*

In broad outline, the history of forest cover in the state of Ohio is well known. What was essentially unbroken forest cover when first encountered by Euro-American settlers in the early 1800s soon became cleared farm fields, with a peak in cleared land within a century of the first settlers' arrival. Through the twentieth century, forest cover in some parts of the state has steadily rebounded. Previous studies have suggested that by 1850, the earliest date for which county-level summary statistics were published, Summit County in northeastern Ohio was among the most heavily deforested counties in the state, with less than 20% of the county remaining forested at the time. The objective of this study was to trace the detailed spatial patterns of the change from forest to farm field and beyond in two townships of Summit County. Nineteenth century records, including plat maps, tax records, and the manuscript censuses of population and of agriculture, as well as twentieth century forest survey maps and historical aerial photographs, were used to reconstruct the spatial patterns of deforestation and reforestation with as much spatial detail as possible. The results are helpful in interpreting the county-level summary statistics on which much of our previous information about the historical spatial patterns of forest cover in the state have been based.

Keywords: Ohio-northeastern, historical ecology, deforestation

Kenneth A. Barrick, Associate Professor, University of Alaska Fairbanks. Email: ffkab@uaf.edu; *Resurrecting New Zealand's Extinct Geysers: Environmental Management and the Use of Historic Photographs*

Geysers are exceptionally rare natural phenomena that represent increasingly important amenity, recreation, scientific, and economic assets. Geyser basins harbor many interesting hydrothermal features, including hot springs, mud pots and fumaroles. The sustainability of all geyser basins depends on a rather delicate balance of geologic conditions, which are easily impacted by development activities. The irreversible decline and extinction of about 100 geysers on the North Island of New Zealand from various forms of energy development offers important lessons for the environmental management of the world's remaining geyser basins. The continued viability of the world's remaining geysers requires proactive preservation regulations that prevent consumption of geothermal water or heat within the area supplying the geyser basin. Effective new regulations are dependent upon wide public support. The communication of historic photographs of New Zealand's long extinct geysers provides a potentially important mechanism to educate the public about what was lost when geysers were extinguished due to past development activities. The purpose of this paper is to summarize ongoing efforts to raise scientific and public awareness of the potential for environmental impacts in geyser basins using an internet based site, including case studies and historic photographs.

Keywords: environmental management, geyser, geothermal energy

Almar Barry, Dr., University College Dublin. Email: almar.barry@ucd.ie; *Drama And Geography: An Active Learning Approach In Small And Large Group Teaching*

Active learning encourages students to become independent, critical and autonomous thinkers which is necessary for an effective labour force in the modern knowledge economy. However, despite its perceived benefits, active learning remains an elusive notion in higher education. To date, there has been no empirical research completed assessing how active learning using Drama in Education enhances the learning experience for students. Furthermore, there is a perceived myth in universities that active learning using Drama in Education is difficult to achieve in a large group teaching context. The purpose of this paper is to analyse the reactions of students to active learning using Drama in Education in the teaching of economic geography in a large group teaching context. The analysis is based on results from questionnaires and interviews with 150 Third Year Geography students in UCD (2005-2006) and focuses, in particular, on their perceptions of active learning using a Drama in Education approach before and after it has been implemented in class. The intention of this research was to mine these students' perspectives on active learning as a method of teaching and learning using a Drama in Education approach. In doing so, this paper provides lecturers with a practical guide on how to effectively implement active learning in a large group teaching context using DIE. While the focus of this research was on teaching methodology in geography specifically, the findings reported also have wider application for teaching and learning in other disciplines across the university sector.

Keywords: Geography and education, active learning, Drama in Education, Large Group Teaching

James A. Barsimantov, University of California, Santa Cruz. Email: barjs@gmail.com; *Who Governs Mexico's Pine-Oak Forests? Nested Institutions and Forest Cover Change in Common Property Forestry*

Forest loss and rural poverty remain persistent in developing countries. Community forestry offers the potential for creating socioeconomic benefits while maintaining ecosystem services. Mexico has extensive experience with communal landholdings and community forestry, offering a unique opportunity to analyze the importance of nested institutions in creating effective forestry programs. I focus on the interaction between three levels of influence: community governance, external government and non-governmental actors, and markets for crops that compete with natural forest cover. I compared 12 communities with varying strengths of internal governance in the states of Oaxaca and Michoacan. In these states (a) effects of the changes in Article 27 of the Mexican Constitution on forests and land tenure have been dramatically different, (b) increased avocado production following changes in international trade agreements has caused widespread land use change in Michoacan but not in Oaxaca, and (c) internationally certified forestry programs in Oaxaca contrast sharply with a corrupt forestry establishment and widespread illegal logging in Michoacan. In each community, I conducted a land use change analysis, surveys in a 25% random sample of households, and interviews with community members and external actors. Results show that strong community governance does reduce land use change in regions where pressure to convert to avocado production exists. In weaker communities, reforms that opened the Mexican economy in the early 1990's resulted in a chain reaction of fractured ejido governance structures, illegal logging, land sales, and eventual land use change. The importance of government support of common property tenure is highlighted.

Keywords: community forestry, common property, mexico, land use change

Patrick J. Bartlein, University of Oregon. Email: bartlein@uoregon.edu; *Detection and attribution of cycles in paleoclimatic time series*

Many paleoclimatic time series exhibit variations that appear at first glance to be cyclic, quasi-periodic, or oscillatory in nature. For example, in Holocene records, a 1500-year "Bond cycle" has often been detected, and has been used to explain a number of things, including why, despite all evidence to the contrary, 20th century warming is not anthropogenic in origin. Once detected, cycles in time series naturally point toward explanations that could produce such variations, for example, via the propagation through the climate system of fundamental cycles in an external control of the climate system, usually the sun. However, identification of cycles in a paleoclimatic time series, followed by their attribution to some kind of external mechanism, in effect makes it unnecessary to further consider the large class of alternative explanations for quasi-periodic variations in climate (or in the environmental systems that produce paleoclimatic records) that arise from the nature of the system itself. In essence, once cycles are detected, thinking stops. Because cyclic-appearing or quasi-periodic behavior in time series can arise from sources that are not intrinsically cyclic (such as steps in data analytical procedures, or from processes that exhibit short- or long-term memory), and because it is natural to seek order when viewing highly variable time series, very stringent criteria for declaring the presence of cycles in paleoclimatic time series should be applied.

Catherine E Bartoli, Information Technology and Society Research Group. Email: cbartoli@temple.edu; *Neighborhood Food Systems: Urban Issues and Implications*

Food security is defined as "access by all people at all times to enough food for an active, healthy life". This includes the ability to attain "nutritionally adequate, safe and acceptable foods in socially acceptable ways". This paper explores the significance of food access and security for Philadelphia families. It focuses on neighborhood food systems and looks deeper into community knowledge and potential barriers to obtaining healthy, quality foods. Philadelphia, reporting the second lowest number of grocery stores per capita of any U.S. city, must continue to seek alternative solutions to this issue. This paper looks at multiple facets of the current system and sheds light on possibilities for filling access gaps. Individuals tend to have ready access to unhealthy, unsustainable food options as opposed to high quality alternatives. Barriers to healthy food access are better understood through survey implementation among families throughout Philadelphia.

Keywords: Food Security, Food Systems, Access

James H Barton, Professor, Thiel College. Email: jbarton@thiel.edu; *Measuring the Impact of Small Businesses on Employment Structure Using Locally Produced Business and Industrial Directories: The Case of Mercer County, Pennsylvania*

Since the dramatic decline of large industrial employers in Western Pennsylvania in the 1980s, local economic development professionals have been

particularly interested in the contribution of small firms to the economy of the region. Though publicly accessible data is available through governmental sources, its suitability for analyzing the growth of small firms and particularly the emergence of new firms is limited. However, locally produced industrial directories, generally updated on an annual or semiannual basis, have proved to be a valuable adjunct to government publications in identifying the emergence, size changes, and geographic location of specific firms and groups of firms over time. This presentation illustrates the use of local industrial directory data in Mercer County, Pennsylvania, as a means of tracking and analyzing the contribution of small firms to the changing economic geography of the area over a period of two decades.

Thomas Barton, Royal Holloway, University of London. Email: t.barton@rhul.ac.uk; *Music, memory, place and the reproduction of the nation - a discussion of John Adams' On the Transmigration of Souls*

In this paper, I consider the role of music and its relationship to a place of memory in the reproduction of the nation. I build upon the debates within geography in which the reproduction of the nation is explored and explained through a nation's relationship to the past - through the creation of a 'national memory' - and how such a relationship is articulated and contested in and through place. I argue that as part of this historically-oriented enquiry into the process of place-making and national identity formation music needs to be considered. First, due to its distinctive ability to critically and affectively represent the places and events of a nation's past, I suggest that music can significantly reinterpret the understanding of a designated place of national memory, and thus intervene in the reproduction of the nation. Second, it is often through its performance that music is able to reach a national audience, and I explore the impact of such a performance on a (place of) national memory. The paper centres on one particular place of national memory? Ground Zero in New York? to consider the role that one particular piece of music? John Adams' *On the Transmigration of Souls*? and its first performance plays in the wider creation of a national memory of the events of September 11th 2001, and how such a memory is implicated in the reproduction the nation.

Keywords: music, memory, place, the nation

Ann E. Bartos, University of Washington. Email: abartos@u.washington.edu; *"Future generations" and place-based environmental education*

Despite the fact that young people are a "future generation," few studies are conducted with young people to understand the tensions between the futures adults strive to promote and protect and the futures children envision and create. One way to understand these tensions is through ethnographic research of place-based environmental education programs. As field sites, these programs provide perspective into some of the structural influences shaping children's environmental concerns. Ethnographic research will help explore how children use and adapt the experiences and knowledges gained through environmental education programs into their everyday engagements with their peers, community and broader environment. These structural influences and children's everyday engagements contribute to how children imagine a future for themselves. Longitudinal ethnographic techniques will help unpack how these visions change over time and the implications these visions have for the development of environmentally driven political subjectivities. In this paper, I review the literature on place-based environmental education programs and propose a methodology to unpack the tensions between young people's and their educators' visions of the future. Researching with young people engaged in these programs contributes to understanding how young people come to know, relate to, and (re)present their current landscapes. By examining the ways younger generations interpret, contest, and rework visions of the future taught in their environmental education programs we will better understand the role today's imaginaries of the future play in creating the landscapes of tomorrow.

Japji Anna Bas, MA, York University. Email: japji@yorku.ca; *Participatory Food Costing as a Redesign strategy*

Despite both sufficient foodstuffs to feed the planets existing population and commitments from 187 UN member nations to reduce hunger, hunger remains a growing problem. In fact, as a result of the erosion of the social welfare state, hunger is a growing problem in affluent nations like Canada and the U.S. To date, survival strategies like food banks and community kitchens have dominated efforts at increasing food security. While these approaches do provide essential services, they fail to address the structural causes of food insecurity. By contrast, redesign strategies seek to address underlying issues of inequality. An example of such a strategy is found in the Nova Scotia Food Security Projects' (NSFSP) Participatory Food Costing (PFC) initiative begun in 2000. In this initiative,

participants who experience food insecurity engaged in an empowering food costing project, the results of which have already led to an increase in the food allowance for recipients of social assistance in Nova Scotia. The NSFSP is currently working towards other policy changes, such as an increase in Nova Scotia's minimum wage. The NSFSP demonstrates that grassroots initiatives can engender policy changes which positively impact food security on a structural level.

Begum Basdas, University of California, Los Angeles UCLA. Email: bbasdas@ucla.edu; *Participatory research methods and dilemmas in writing up activism*

My paper has two voices that emphasize the negotiations about being both a committed happy queer activist in Istanbul and a graduate student who wants to graduate in LA. I did an ethnographic research in Istanbul for my dissertation with women from different activist groups such as Amargi grassroots feminist organization, Istanbul Women's Platform, and LambdaIstanbul LGBTTT solidarity association - where I still continue to volunteer. My research included methods such as participant observation, interviews, and focus groups with participatory and action-oriented techniques however; my main access to field information was my active participation in these organizations as a queer woman activist. Majority of the work I do in LambdaIstanbul has no relevance to my dissertation research. Thus, the arguments and problems that are to be discussed in my dissertation have become a collaborative project between the issues I am particularly curious about and the experiences of women that have shared their everyday activism and urban life with me since 2004. This paper will then discuss my empirical work on the different processes of my participatory research and examine the dilemmas I confront when I decide to go back to LA and write up different chapters of my dissertation away from both the field and the experiences of the women I worked with.

Keywords: Activism, sexuality, queer, women, Istanbul, Turkey, qualitative methods

Fozia Bashir, California State University Northridge. Email: foziabashir2002@yahoo.com; *Forecasting Impacts of Urban Development on Natural Habitats of Merced County*

Urbanization is one of the largest-scale, most pervasive, and inevitable ecological processes on Earth. As a result of Urbanization almost all major cities are increasingly plagued by environmental problems. Habitat loss and subsequent fragmentation due to urban development are part of larger suite of anthropogenic impacts on biodiversity, but they now rank among the principal causes of species endangerment in the United States. The steady advance of ecological theory and increased interest in environmental conservation coupled with the advent of GIS and the increasing availability of data has promoted the development of many models which characterize the form and quality of ecological resources. This project will utilize the UPLAN (Urban Planning) model with a series of GIS data layers to explore the likely impacts of different land development scenarios on the natural lands of the Merced County in the future. Each developmental model incorporated different constraints on development and the extent to which the natural habitat was affected. Out of the three scenarios two offered a varying degree of protection to the environmentally sensitive land. While one scenario allowed no constraints on development. The three resulting UPLAN development maps generated as a result of three different scenarios were intersected with the habitat layer from Gap data. The areas of overlap were quantified to compare the affect of each scenario on various habitats. Under the three different policy scenarios the most extreme example of development will be observed if all the land is open for residential and commercial development.

Keywords: UPLAN, Projected Urban Development, Geographic Information System, Habitat loss.

Robert Baskin, U.S. Geological Survey / University of Utah. Email: rbaskin@usgs.gov; *Mapping benthic substrates using single beam and side-scan sonar in Great Salt Lake, Utah*

The U.S. Geological Survey, in cooperation with the State of Utah, collected bathymetric data for Great Salt Lake during 2002-06 using a high-definition fathometer and real-time differential global positioning system. About 12.8 million depth measurements were collected along more than 2,728 kilometers of transects. Byproducts of the bathymetric investigations include detailed analog and digital acoustic records of the benthic zone through most of Great Salt Lake. These data show a wide variation in the acoustic characteristics of the bottom materials and are inferred to indicate varying benthic substrates throughout the lake. Direct observation of benthic substrates and environments throughout the lake show the existence of microbial mats, fine muds, oolitic sands, tufas, cemented "hard grounds," and domal/columnal stromatolitic forms. Successful use of a 1,200 kHz high-frequency side-scan sonar in Great Salt Lake demonstrates that the use of side-scan sonar in defining the surficial characteristics of

benthic environments is possible even in highly variable hypersaline waters. The use of side-scan or multi-beam technologies in waters of varying salinity, such as the waters of Great Salt Lake, must include corrections for ranging errors due to variations in acoustic velocities. By combining data available from the bathymetric surveys, correcting for variations in sound velocities, and using side-scan sonar images of the benthic zone of the lake as ground-truth, accurate benthic substrate maps can be constructed. These maps could provide a quantitative benchmark for tracking future changes due to either natural or human disturbances and can provide accurate substrate maps for use in other investigations.

Keywords: Great Salt Lake, Bathymetry, sonar, mapping

William M. Bass, Houston-Galveston Area Council. Email: william.bass@h-gac.com; *Using GIS to Integrate Environmental Analysis into Regional Transportation and Land Use Planning*

Protection and enhancement of the environment is a major provision of the 2005 federal transportation legislation known as SAFETEA-LU (Safe, Accountable, Flexible, and Efficient Transportation Equity Act: A Legacy for Users). Furthermore, the need for environmentally responsible growth and development was affirmed by the people of the eight-county Houston metro region during the 2005 Envision Houston workshops, where citizens developed a collective vision of the region's future. The 2035 Regional Transportation Plan, developed by the Houston-Galveston Area Council (Houston's MPO), includes for the first time an analysis of environmental resources facing the greatest risk from both natural hazards and development. The project utilized a charrette (Delphi) approach in conjunction with land use data to identifying ecological systems most at risk from development, species habitat degradation, and fragmentation. The result of the analysis was an "Areas of Concern" layer which includes area most valuable from an ecological perspective. This layer was then augmented with the environmental resources information to produce an Undeveloped Environmental Resources geographic information system, which can be used to examine alternative planning scenarios, policy initiatives, and transportation investments. This information system is intended to facilitate detailed analysis of environmental aspects of long-range planning in the Houston metro region.

Thomas J. Bassett, University of Illinois, Urbana-Champaign. Email: bassett@uiuc.edu; *Locating Hunger: The Hunger Vulnerability Index*

The first goal of the United Nations' Millennium Development Goals is to cut hunger in half by 2015. Yet our knowledge of where the hungry are located is inadequate. Conventional indicators such as national food supply or underweight children underestimate the incidence of hunger and are subject to measurement errors. This paper presents an alternative indicator of hunger that combines food availability, household access, and nutritional outcomes. This composite index provides a summary measure of hunger vulnerability while diminishing the effect of measurement errors in each element of the index. The appeal of using this indicator is that it can provide a summary impression of the hunger situation, which is not always reflected in the individual measures. This composite index is also useful for identifying a problem. Understanding the problem can begin with examination of the components of the index, but must also include consideration of the many causal factors generating hunger. In contrast to the FAO measure of undernourishment, this index does not purport to measure the number of hungry people. It can, however, indicate how the hunger problem differs across countries and how it is changing over time.

Ludger Basten, Ruhr-University Bochum, Department of Geography. Email: ludger.basten@rub.de; *Between Time and Place: Ups and Downs in Potsdam*

While academic and political debates and theories of urban development have long held an inherent bias towards perspectives of growth rather than decline, in particular in North America, Germany has recently experienced a rather dramatic change in societal, political and academic discourse on urban development. Journalists and politicians alike have painted horror scenarios of urban decline in vivid colours, referring to a growing literature of empirical research by academics and planners for whom "shrinking cities" have become the latest topical theme. The speed and intensity with which the topic has taken centre stage is astounding, but while empirical research on the processes and management of decline continues, reflections of the theoretical bases for and implications of empirical research remain somewhat scarce. Thus, this paper first sets out some theoretical reflections before turning to empirical analyses of developments in the formerly East German city of Potsdam. On the theoretical level, the interconnectedness of discourse and "realities" is being discussed, showing the need for a more systematic conceptualization of the temporal and spatial scales of empirical inquiry. This is illustrated by focussing on the fate of

Potsdam's large-scale housing projects since unification, drawing on municipal documents, statistical and interview data. A spatially and temporally differentiated pattern of ups and downs emerges, which is interconnected with perceptions and discourses at other spatial and temporal scales. This reveals how complex and selective processes of growth and decline are, not least requiring highly varied policy approaches.

Pratyusha Basu, University of South Florida, Tampa. Email: pbasu@cas.usf.edu; *Information Technologies and Agricultural Livelihoods: The Role of Cybercenters in Rural India*

While new information and communication technologies (ICTs) are increasingly being promoted in the rural Third World as crucial to better governance and more timely market information, the role of rural participants in shaping the initial entry and subsequent presence of these new technologies has yet to be considered. This paper focuses on two internationally celebrated ICT programs in central India: 'Gyandoot,' initiated by a local government agency, and 'E-choupal,' established by the agricultural trading division of a prominent private sector company. Both programs work through the setting up of village cybercenters operated by individual entrepreneurs. The aim of this paper is to compare cybercenters established by these two programs in order to situate individual experiences of the work of cybercenters within wider neo-liberal policies which are currently transforming agricultural livelihoods in India. In the process, the paper will examine questions related to the policies of the two programs and the nature of their reception in rural contexts. Thus, it will consider whether ICT initiatives adopt similar strategies in their promotion of cybercenters, and whether the persuasiveness of these strategies are evaluated by rural cybercenter owners on the basis of the institutional framework from which they emanate. More broadly, it will reflect on the extent to which cybercenters provide a way for small-scale farmers to remain competitive in the global economy, or serve instead to more efficiently direct rural resources towards multinational agricultural interests.

Ranu Basu, York University. Email: ranubasu@yorku.ca; *Phronesis through GIS: Exploring Political Spaces of Education*

Distilling the different ways that neoliberal regimes have impacted the governance of public policy and planning is as much a political maneuvering exercise as it is a scholarly endeavour. The process of empirical research that attempts to uncover such impacts is from the very beginning fraught with numerous problems - sifting through rhetorical ambiguities, dealing with agenda-makers and data gate-keepers, and navigating through complex bureaucratic layers of regulations - all in a concerted effort to maintain and protect the interests of the rational state model. This frustration, though not uncommon in increasingly controlling and risk-adverse regimes, further necessitates that researchers draw upon an alternative repertoire of skills and understandings. Flyvbjerg's argument towards critical social science advocating a phronetic approach? an Aristotelian value laden concept highlighting the importance of 'practical wisdom, practical judgement, common sense and prudence'; balanced by Foucault's power-knowledge relations? provides a useful framework in navigating through these procedural hurdles. Reflecting on the process of research exploring various impacts of the neoliberalization of education in Ontario, this paper argues that using a hybrid form of phronesis - engaged in reflexive practices, hidden knowledge and unorthodox sources - combined with the contextual dimensionality of GIS, is useful to better understand the structural barriers in place and to develop a sensitivity to the political and ethical implications involved in exploring the conflicting spaces of education.

Simon P J Batterbury, Dr, University of Melbourne. Email: simonpjb@unimelb.edu.au; The strange process of scholarly practice: towards engagement in political ecology

The paper forms part of a project with Leah Horowitz and several others (including Piers Blaikie, who is not attending) to understand how the divide between the production of "research, theory and explanations", the task of most academic geographers, and "advocacy, policymaking, and direct interventions" - generally the task of those working for organizations elsewhere than in universities - has arisen, and how it may be overcome. I argue, following several scholars with varied political views, that relevance and engagement matter hugely for scholars, and specifically for 'critical political ecology' of human-environment relationships. The frequent claim that teaching and research must form the bulk of a scholar's life, says little about direct relevance. Nor does it illuminate how so many scholars, many presenting in our sessions, come to have 'actually existing' relevant contributions to environmental work or policy. At a time when the world is hugely concerned about the environmental and social impacts of local and planetary change, critical and radical analyses of the links between economies, politics and environments work best when coupled to outreach and media work, policy, solution-building, and the presentation of alternatives. To do this does not imply technocratic managerialism, but rather, it follows through on the sentiments of political ecologists and radical scholars. I illustrate these points with my own and other's work from West Africa, the UK, and Asia-Pacific.

Carl J Bauer, U. of Arizona. Email: cjbauer@email.arizona.edu; Rivers and Power in Chilean Patagonia

Large-scale hydroelectric power development is looming over Chilean Patagonia, the rainy, rugged, and remote land at the southern end of the Americas. Government and corporate plans for new dams have been driven by demands for energy. Other water uses and other values in water management, including environmental flows, have been secondary and advocates for them have been on the defensive. In this research I look at the relationship between Chilean electricity law and water law in governing hydropower, focusing on the different property rights to water that the two laws recognize. In Chile the laws and policies governing the electricity and water sectors share general free-market principles, but their specific structure and content are quite different, especially as they apply to water as a physical substance. The two sectors use water for different purposes and define property rights and duties in different and sometimes contradictory ways. Water's unique physical properties have always made it a slippery resource to control in legal, political, and economic terms. Electricity is a physical substance that is arguably even more peculiar than water. Hydropower, as the physical nexus between water and energy, presents thorny problems for water governance and sustainability.

John T. Bauer, University of Nebraska at Kearney. Email: bauerjt@unk.edu; Stability and Change in United States Religious Regions, 1952 - 2000

Religious affiliation in the United States exhibits strong regional character, forming patterns that identify and characterize the societal context in which individual religious communities function. Building upon work of other geographers, this paper presents three religious regionalizations of the American population, one each for 1980, 1990, and 2000. It then compares them to the religious regions delineated by earlier geographers who used different methods and

criteria. The results show that religious adherents in the United States still exhibit the same basic regional patterns that they did in the 1950s. Individual regions, however, vary in their stability. Some, such as those of evangelical Protestants, have spatially stable borders that do not expand or contract. Contrary to popular media perceptions, evangelical Protestants are not "taking over" the country. Most of their growth has been internal within the region. In contrast, the Roman Catholic region has dynamic borders that are quickly expanding into new areas. This growth was most dramatic in the American West, mirroring similar growth among the Hispanic population. The 1980, 1990, and 2000 Religious Congregations and Membership Surveys compiled by the Glenmary Research Center provide my basic data. I improved on their inclusiveness by interpolating missing adherents including secular citizens, and thereby created the most complete religious adherence dataset yet assembled. A combination of hierarchical and k-means clustering was used to aggregate this dataset into regions.

Keywords: geography of religions; regions; United States

Whitney A Bauman, PhD Candidate, Graduate Theological Union. Email: whitneyabauman@mac.com; The Death of God and the Death of Nature: Religious Grounds for Earth-healing in an Era of Climate Change

Contemporary environmentalists and post-Nietzschean theologians have something in common: both have lost the foundational justification for their epistemological claims. Theologians since Nietzsche's famous declaration of "The Death of God" have been struggling to understand what the symbol "God" means in a world where a personal, transcendent omni-God no longer makes sense. These theologians who seriously engage the "Death of God" have become more serious about constructing theologies of earth-healing, rather than theologies that support human exceptionalism. They have earned the name "eco-theologians." I contend that environmentalists have a lot to learn from these theologians in an era where we can pronounce the "Death of Nature." Though environmental thinkers such as Bill McKibben and Carolyn Merchant have suggested that "nature" as "pure", "pristine", "wilderness" no longer (if it ever did) exists, the reality that the climate is changing makes their work prophetic and their arguments key to contemporary environmental discourse. "Nature" for many environmental activists and ethicists serves the same function as "God" for theologians prior to the "Death of God" theologies of the 19th and 20th centuries. What will it mean to work toward "saving nature" when nature is inevitably going to change? There are some post-foundational environmental ethicists and philosophers who are beginning to think in this direction such as Donna Haraway and Bruno Latour. In this brief presentation, I will bring them into dialogue with eco-theologians to address how popular environmental discourse might move beyond foundational claims of what is "natural."

Keywords: Religion and Ecology; Postfoundationalism; Environmental Ethics

Rupert Bäumler, Institute of Geography, University of Erlangen. Email: baeumler@geographie.uni-erlangen.de; Andic properties in non-volcanic materials - an accidental variety of soil formation?

An increasing number of soils are described having andic and spodic properties that have developed in non-volcanic materials, and lacking typical Spodosol eluvial and illuvial horizons. They cover different parent materials under different climatic regimes. They have been regarded as restricted to small areas and therefore as non-significant. They were assigned to Andisols/Andosols, Spodosols/Podzols, or andic Inceptisols in Soil Taxonomy and WRB. Soil research in Nepal and Bhutan showed that these soils are widespread at the southern slopes of the Himalayas between 2200-3500 m across different bioclimatic zones. Two sites were analysed in detail by pedogeochemical and mineralogical methods to give an overview about properties and processes of soil formation to enhance the discussion about their position in the world of soils. The results indicate advanced soil development, extremely low bulk densities, P retention >85%, and the dominance of Al-hydroxo-interlayered clay minerals. Column experiments indicate podzolisation by mobilisation of DOC, Fe and Al. Radiocarbon ages of 16 ka BP and NMR spectroscopy indicate re-stabilisation of translocated organic compounds throughout the solum. Sand fractions consist of microaggregates highly resistant to dispersion. EDX element mapping of microaggregates gave high contents of evenly distributed Fe. It indicates a stronger influence of Fe compounds as previously thought, pointing at "ferro-andic" properties. With respect to their worldwide occurrence and their physicochemical properties, it is suggested a re-definition or simplification of existing classification schemes. The apparently distinctive processes need to be further investigated probably indicating that these are different from Andisolisation and Podzolisation sensu stricto.

Keywords: Non-volcanic Andisols, Soil Geography, The Himalayas

Sybille Bauriedl, University of Hamburg. Email: bauriedl@geowiss.uni-hamburg.de; *Transformed Visions of the Waterfront: Rivers as Resource of Urban Management Strategies*

The waterfront has been identified by urban managers as important location factor for the new urbanites of the service society. The revitalization of de-industrialized cities goes along with a strategic re-production of the waterfront. My argument is, that especially huge rivers of metropolitan areas became an important resource of urban imagination and waterfronts became the most contested terrains of urban development. I will give several examples from Hamburg, Barcelona and London to discuss the discursive construction of waterfronts as historical scenery, as maritime scenery, as location of tradition and creativity and as location of permanent vitality. For this practice spatial metaphors of harbor narratives were used and materialized by a symbolic transformation of waterfront wharfs, docks, cranes, sailing ships etc. The recent shape, the functional meanings and the symbolic meanings of urban rivers and waterfronts are a result of the dominant growth discourse in Western metropolis. As an effect of this discourse we can recognize a process of an homogenization of the urban waterfront. And we can identify civil disorder against redevelopment of the urban waterfront, too. I will discuss these aspects with references to the recent debate on urban political ecology.

Lucas Mitchell Baker Baze, University of Oklahoma. Email: Lucas.M.Baze-1@ou.edu; *The Little Ice Age and the Spiro Mound Culture of Eastern Oklahoma*

In the early 1400's in the central plains there were many cultural changes and migrations for which we have no explanation. It is my hope to prove within this paper to what extent environmental causes were the driving forces for this upheaval. This change just before contact changed the cultural landscape of the plains until contact. The data consists of linguistic, archaeological, and paleoecology data used to determine to what extent the environment changed from the late 1300's to the early 1400's. This time period from the middle 1300's to the middle 1800's in Europe is called the medieval warm period and the little ice age, a time of climactic shifts that had lasting effects on cultures around the world. Though the effects are not constant across the whole planet, or the same, all regions of the planet were affected by this climactic shift. Little research however has been done however on this phenomenon's effects on the peoples of North and South America. There is some debate on whether or not this actually happened and to what extent this climate shift changed the environment. The effects of the little ice age were felt in North America and this can be shown by analysis of the archaeological and paleoenvironmental data.

Karen Beardsley, University of California, Davis. Email: kbeardsley@ucdavis.edu; Nathaniel E. Roth, University of California, Davis. Email: neroth@ucdavis.edu; James H. Thorne, Ph. D., University of California, Davis. Email: jhthorne@ucdavis.edu; Patrick R. Huber, University of California, Davis. Email: prhuber@ucdavis.edu; Michael C. McCoy, University of California, Davis. Email: mcmccoy@ucdavis.edu; *Environmental Impacts of Urban Growth in California's San Joaquin Valley*

In the next 40 years, the eight counties of the San Joaquin Valley are projected to more than double in population from 3.3 million to over 7 million residents. This projected growth creates a need for planners in the region to identify how to preserve its diminishing natural resources. In June 2005, California's Governor formed the California Partnership for the San Joaquin Valley with a goal of improving the economic well-being of the Valley and the quality of life of its residents. In October 2006, this Partnership released the San Joaquin Valley Strategic Action Proposal that provides recommendations for improving the economic conditions of the Valley. Unfortunately the recommendations fail to address population growth impacts on the region's biological resources. To assess the impacts of this projected growth, the Information Center for the Environment worked with the Partnership to develop seven potential build-out scenarios using UPlan, a GIS urban growth model. These scenarios include: 1. Status Quo (current growth patterns continue) 2. East/West Infrastructure Improvement (attract growth along East/West roads) 3. Compact Growth (within current spheres of influence) 4. Farmland Protection (no growth on prime farmlands) 5. I-5 to Highway99 Exclusion (no growth between these highways) 6. New Cities (create four new cities) 7. Great Cities (existing big cities grow larger). We used the output maps to assess impacts on natural resources by overlaying 20 biological data layers with the predicted growth footprints. Scenario 3 has the least impact on these resources, and Scenario 6 has the second smallest impact.

Susan W. Beatty, University of Colorado. Email: susan.beatty@colorado.edu; *The Role of Fine-scale Heterogeneity in Maintaining Species Richness*

North-eastern deciduous forest communities are characterized by the occurrence of treefall gap disturbances. Treefalls disturb the soil, leaving persistent mound-pit microtopography for hundreds of years after the treefall event. Landuse management that obliterates this microtopography, such as clearing and plowing, provides a less heterogeneous soil surface for recolonization during forest regeneration. Comparisons were made between similar aged forests, but with different landuse histories and different degrees of fine-scale soil heterogeneity. In addition, forested sites with microtopography were monitored for species composition in microsites (mounds and pits) for 25 years. Forested sites without microtopography had a lower species richness and greater degree of dominance by a few species. Sites with a very high degree of microtopographic variation also had a lower species richness, than did sites with an intermediate degree of spatial heterogeneity. Sites that had been previously plowed, with a very homogeneous soil surface relief, had a similar species richness to intermediate heterogeneity sites, but with a higher number and degree of dominance of exotic species. In the non-plowed forested sites with microtopography present, the native species were much more likely to be found only in one microsite (a mound or a pit), whereas 60% of the exotic species occurred on both mounds and pits. The presence of microtopography appears to be important for maintenance of native species with higher equitability, but is not an impediment to colonization by exotics.

R Matthew Beatty, PhD, CSIRO Sustainable Ecosystems. Email: Matt.Beatty@csiro.au; Amy L Griffin, PhD, University of New South Wales. Email: a.griffin@adfa.edu.au; Guy Barnett, BSci (hons), CSIRO Sustainable Ecosystems. Email: ; *The landscape pathology of human health: the urban environment and human physical activity in Sydney, Australia*

The urban environment has a significant influence on human health, and with rapid urbanisation occurring globally, urban health issues will figure prominently in urban planning, health care, and policy debates. In recent years there has been a renewed interest in the role of the physical environment in influencing health outcomes, and understanding the ways that the urban environment interacts with social factors is a key step in developing a new

understanding of human health in coupled social-ecological systems. In this study, we combine a detailed analysis of the urban environment with a survey that measures adult human physical activity, a correlate of important health outcomes including obesity, cardio-vascular disease, and type-2 diabetes. In this study, we focused on the Sydney, Australia metropolitan region. The urban environment was classified using a combination of high-resolution satellite imagery, population census data, and urban infrastructure data. Urban patches were identified based on the amount of urban greenspace, neighbourhood form (i.e., road networks and housing density), and socio-economic variables (e.g., income, education, ethnicity). Patterns of human physical activity were assessed using a modified version of the International Physical Activity Questionnaire (IPAQ) distributed across the range of identified urban patch types. There are strong environmental and socio-economic gradients in Sydney and patterns of physical activity were variable as well. Results from the study will be presented as well as a discussion of problems encountered with the linking urban physical and social environment for health outcomes research.

Justin Beaumont, Dr., University of Groningen. Email: j.r.beaumont@rug.nl; Bas Spierings, Dr., Utrecht University. Email: b.spierings@geo.uu.nl; Sjoerd Zeelenberg, drs., University of Groningen. Email: s.zeelenberg@rug.nl; Beyond Anglo-Saxon hegemony? analyzing urban governance in The Netherlands

We critically analyze an Anglo-Saxon hegemonic tendency over theorizations of urban governance within human geography. In the context of this tendency, we aim at a new theoretical framework for the analysis of urban governance practices in The Netherlands. Studies of urban governance typically fall into familiar categories: changing modes of governance; urban entrepreneurialism; coalitions and regimes; regulation theories; actor and policy networks; and citizenship and social justice. Distilling a number of complex and interrelated debates, we take our cue from what we characterize as a bipolar but not mutually exclusive distinction between neostructuralist (or neostructural) approaches (Brenner and Theodore 2002; Brenner et al 2003; Brenner 2004) and neoinstitutionalist thought (Harding 1996; Le Galès 2002; Kazepov 2005). Drawing selectively from both we offer an integrated framework based on still developing investigations into multi-level, multi-institutional and context-sensitive governance practices in European cities (see Giersig and Beaumont 2006; Beaumont and Giersig 2006). Relating our ideas to the current urban policy regime in The Netherlands, the Big Cities Policy, we argue that: (1) there are important ways to go beyond an Anglo-Saxon theoretical hegemony in the analysis of urban governance; (2) there are possibilities for analyzing European urban governance by integrating theoretical issues with hitherto greater currency in the US and the UK; (3) there is much to learn from the application of these ideas to the analysis of urban governance practices in The Netherlands. The paper discussed implications for urban governance and outlines an internationally comparative research agenda for the years to come.

Email: a.hewitson@lboro.ac.uk; The internationalization of executive search: constructing markets through knowledge, rhetoric and discourse

Understanding the internationalization of professional service firms (PSFs) continues to attract considerable attention from economic geographers. However, despite rich empirical studies of PSFs, the theoretical framework used to explore the strategic internationalization processes and modes of entry into foreign markets has changed relatively little in recent times beyond established international business resource-based theories of the firm. Meanwhile, elsewhere the analyses of both globalization and transnational corporations have become increasingly intricate as commentators focus on explaining how firms are restructuring their international operations and form to compete in the knowledge economy. In this paper, therefore, we revisit internationalization theory relating specifically to PSFs through a case study of Europe's headhunting industry. Drawing on this comparatively neglected PSF, we provide refinements that reflect the ever growing and maturing body of knowledge that can be used to conceptualise transnational PSFs in contemporary globalization. In particular, we draw on recent insights into the contemporary role of intermediaries and 'soft capitalisms' in the global economy, as well as understandings of the various forms of 'spatial economy' that firms produce through a range of forms of internationalization - wholly own subsidiaries, networks and strategic alliances- to explain the internationalization of executive search firms and the way such firms have used forms of knowledge, rhetoric and discourse to construct new markets for

their services overseas.

Kim Beazley, University of Cambridge. Email: krb28@cam.ac.uk; Rights, Risks and Relocation: Evolving Impacts and Discourses at Tadoba-Andhari Tiger Reserve, Maharashtra, India

Since the early 1970s, over 100 villages and more than 3000 families across India have experienced relocation in the supposed interests of wildlife. This policy of "conservation-related relocation" continues today. The dominant belief within the Indian forest department and among some influential conservationists remains that "fortressed" protected areas, erased of anthropogenic presence, are essential for successful wildlife conservation. However, empirical studies systematically exploring conservation-related relocation policy, the relocation process itself, its long and short-term social and ecological consequences, and the multiple discourses that surround it are thus far lacking, particularly in the Indian context. In addition, the limited conservation-related relocation research that does exist has largely failed to build on, or draw sufficiently from, relevant empirical and model building work in the more established field of development-induced relocation learning. This paper discusses preliminary findings of an ongoing doctoral study that is aiming to reduce these limits to conservation-related relocation knowledge. Primarily qualitative research (participant observation, semi-structured interviews, discussion groups) is being undertaken in several villages within and around Tadoba-Andhari Tiger Reserve, an Indian protected area that has been the subject of intermittent village relocation strategies for over 30 years. This empirical research at Tadoba-Andhari will then be used to establish a model of conservation-related relocation that also draws upon the wider relocation literature, particularly the more extensive scholarship that focuses on relocations induced by development activities. A tentative version of this model is outlined and some of the themes beginning to emerge from the empirical research at Tadoba-Andhari are examined.

Evi Becerra-Acosta, student, University of Montreal. Email: e.becerra.acosta@umontreal.ca; Medium-term evolution of the urban heat island for the City of Montreal

The island of Montreal is a densely urbanized city. It is limited to the north by another island (Laval) and surrounded by areas with a substantial amount of forest areas. These conditions are ideal to sustain a heat island of at least the size of the island itself and of smaller scale heat islands within Montreal. For the last 20 years the urban and industrial areas within Montreal have been steadily replacing green areas and fowl land as well. These changes can be detected in the trends of time series of temperatures differences between Montreal and its surroundings. The objective of this study is to gain insight into the physical mechanisms responsible for the observed heat island effects in the city of Montreal for the last 20 years. To this end, the MM5 regional atmospheric model coupled to the Noah surface model has been used to model these medium-term trends. The atmospheric model was run with a 2km spatial resolution forced at its lateral boundaries with NCEP reanalysis for specific days chosen according to significant island heat events for the month of August from 1986 to 2006. The albedo and roughness length in the Noah model has been modified to account for the presence of urbanized areas as a first step to approach the problem. Preliminary results from experiments with different urban growth and distributions suggest that the observed heat island trends can be accounted for, to the extent that this low spatial resolution and the 2 physical constraints (albedo and roughness) permit.

Laurence C. Becker, Oregon State University. Email: beckerla@science.oregonstate.edu; Agro-Biodiversity and Cultural Diversity Face Globalization: Why Grow African Rice?

The recent successful inter-specific cross of Asian rice (*Oryza sativa*) and African rice (*Oryza glaberrima*) created new crop varieties (called Nericas) with potential for high yields. Together with renewed donor interest in supporting a Green Revolution in Africa, this technical achievement raises questions for agro-biodiversity conservation and the rights of peoples who depend on local crop diversity. Will West African farmers who currently grow *O. glaberrima* adopt the Nericas, leading to greater pressure on the reservoir of African rice biodiversity? Beyond the general regional distribution of African rice, little is known of the current roles played by genetically distinct varieties of *O. glaberrima* in local cultures and economies. Why have some farmers maintained *O. glaberrima* cultivation even under the pressure of national and international development programs and extension efforts that promote new, higher yielding varieties of *O. sativa*? Here we propose that a loss of local crop varieties managed by farmers in complex ecological habitats threatens the livelihoods of peasants least engaged in national and international trade. Agricultural practices sustaining African rice

biodiversity occur in environmental frontiers for modern variety development. In addition, they are carried out by farmers on the fringe of global development efforts. Cultivation of local crop varieties may be an expression of resistance to globalization.

David Beckingham, University of Cambridge. Email: djb79@cam.ac.uk; *Policing Irish drunkenness in nineteenth-century Liverpool*

In this paper I analyse the issue of Irish presence in nineteenth century Liverpool by looking at contemporary constructions of drunkenness in the city, and how the Irish, as the 'other' within the city, were rendered visible to the rest of the population though racialised numerical understandings of the city. It explores the spaces between the purported epistemological 'fact' of drunkenness and the observed reality of drinking to excess in Liverpool. The context, or knowledge, behind these epistemological 'truths' clashes head on with the realities of the failure of contemporary theory (e.g. sanitary theory, racial theory) to explain and account for drunkenness. There is a marked disjuncture between the contemporary anxiety and reality of drunkenness as exposed in official statistics and temperance society accounts. That disjuncture is explored through the problem of squaring governmentality theory with the contemporary disciplinary reality. What emerges is a projected interstitial space between the state and the social where the problematisation of drunkenness can be viewed within a framework of social control albeit one with a very uneven application. The empirical operation of racialisation is seen through the linking of working-class 'fallenness' (in relation to drink) to their class, race, ethnicity and geography.

Eric Redfield Beckley, Central Washington University. Email: beckleypyr@yahoo.com; *When Mining Ends: A Comparative Case Study of the General Mining Law of 1872 and the Surface Mining and Control Reclamation Act of 1977*

Numerous environmental problems surround the 1872 General Mining Law, which governs hard rock mining on public land in the United States. In contrast, the Surface Mining and Control Reclamation Act of 1977 (SMCRA) contains environmental protections for the mining of coal. Through a case study of the Zortman/Landusky gold mines and the Big Sky coal mine, this paper describes what water problems remain when a mine enters its final stages of reclamation and how these problems were allowed to occur. Tracing each problem from its inception in law or policy, looking at court decisions that set the tone and precedents for these laws, examining Federal and state implementation guidelines, and evaluating how the implementation processes are actually carried out exposes the source of these problems. This paper will offer a detailed understanding of how two laws and their implementing policies deal with the issue of water quality in mining and may provide policymakers with already existing options to solve these water issues. The expansion of the SMCRA or similar legislation to hard rock mining could provide an efficient and effective tool for the regulation of hard rock mining.

Email: irazabal@usc.edu; Macarena Gomez-Barris, PhD, University of Southern California. Email: gomezbar@email.usc.edu; *Does Culture Fade in Immigrants' Travel Behavior?*

This research aims to investigate, quantitatively, the nature of cultural preferences versus economic constraints within Latino communities in Southern California?also known as Latino New Urbanism. Through a review of existing literature on quantitative methods of defining compact lifestyles and economic indicators, a set of criteria were established in an attempt to separate economics (such as household income) from residence and transportation preferences (such as compact commuting patterns). After a set of general criteria were defined using the 1990 Census, year 2000 Census data at the city or PUMA level were used to supplement existing notions of assimilation into American culture, as specifically exemplified by commuting patterns. Determination of compact commuting as an outcome of choice or economic constraint is in this way investigated, offering greater insight into the motives behind Latino assimilation into American culture within twenty years of arrival. Then, a more detailed analysis using additional accessibility data offers yet another facet of the analysis. In this way our presentation proceeds with emerging questions of Latino culture and how it may differ from traditional Anglo-based lifestyles and includes a proposition of new research questions about indicators and methods to discern new immigrant behavior, assimilated immigrant behavior, and non-immigrant behavior. We then extend this to possible lessons learned for policy and planning.

Esther S. Beckmann, Bowling Green State University. Email: esbphd@buckeye-express.com; Jeffrey Gordon, Bowling Green State University. Email: ; *The Geographical Technique of Positive Place Association: Application for Stress Reduction in Middle School Students*

Anna Freud declared adolescence as a unique period of childhood characterized by normative upheaval and turmoil. Early adolescence, typified by middle school students in grades six through eight, is an emotionally stressful period even for well-adjusted children. Biological changes might provoke anxiety, a search for independence may tend to idealize peers, and efforts to challenge and assert self may result in feelings of vulnerability and inadequacy. Potentially intensifying this often overwhelming stage, is the present-day middle school atmosphere with metal detectors, patrolling security, and demands associated with proficiency testing. In light of continued physical and emotional changes and compounding stressors in middle and late adolescence, the use and efficacy of positive place association (PPA) was examined. PPA can be used as an intervention technique identifying individuals' most positive place experiences in order to help reduce their stress levels. This geographical and behavioral concept, used as an applied stress-reduction technique, was hypothesized to be viewed as having merit for this population. A preliminary study surveyed middle school teachers by briefing them about PPA and then examining their perceptions as to its potential utility in the classroom. All subjects indicated a willingness to learn PPA. Suggested uses, however, varied. The majority stated their desire to use PPA prior to testing, especially relating to proficiency testing. A number shared specific vignettes of student test anxiety. As hypothesized, after learning PPA, most subjects agreed that it should prove a useful classroom intervention and stated that they were eager to implement this technique.

Dan Bedford, Weber State University. Email: dbedford@weber.edu; Andrea Douglass, Weber State University and Ogden City GIS. Email: AndreaDouglass@ci.ogden.ut.us; *Changing Properties of Northern Utah Snowpack from a 20+ Year SNOTEL Record*

Mountain snowpack in northern Utah, like most of the rest of the western U.S., is exceptionally important, both as a water resource (sustaining the ecologically significant Great Salt Lake as a refuge for migratory birds, and enabling urban growth), and in its own right as a tourist and amenity migrant attraction through the ski industry. Also in common with many other parts of the western U.S., northern Utah is experiencing rapid population growth. These considerations make an understanding of the dynamics of mountain snowpack in this region very important. Concerns over future changes in snowpack dynamics in response to global and/or regional climate warming make the development of such an understanding all the more urgent. Of the two main forms of snowpack monitoring used in the U.S., manual snow courses and automated snowpack telemetry (SNOTEL) stations, manually-measured snow courses are often perceived to be more reliable. However, snow course measurements are typically only made twice a month, and records can be interrupted by events such as high risk of avalanche. SNOTEL records, by contrast, provide daily measurements of basic snowpack properties such as snow water equivalence. It is therefore possible to track snowpack evolution with quite high temporal resolution, if a little simple quality control of the data is first undertaken. This paper examines records from SNOTEL stations in the drainage basin of the Great Salt Lake for evidence of the major climatic influences on northern Utah snowpack, including several possible signals of climate warming.

Advancing Geospatial Skills in Science and Social Sciences (AGSSS), an NSF GK-12 program, emphasizes the development of spatial thinking skills in middle school science and high school social science courses. During the 2005-2006 academic year 4 graduate and 2 undergraduate Fellows participated in the program. This academic year, the 5 graduate-student co-authors of this abstract serve as Fellows. These graduate students work with educators to develop and modify curriculum material that purposefully engages the students in developing and refining their spatial thinking skills. Fellows assist teachers and students during lesson implementation by providing support for geospatial technology and by introducing the perspective of research scientists into the classroom. The

program also requires fellows to refine their own abilities to communicate complex ideas as they observe and assist students grappling with spatial-thinking concepts in the classroom. As part of a self-assessment initiative, Fellows keep weekly journals in which they record general classroom observations, challenges in helping students think spatially, and opportunities to introduce additional spatial-thinking into the classroom. The Fellows organize weekly meetings to facilitate coordination and cooperation for upcoming activities and to determine how best to assist teachers with their action research projects. Bi-weekly seminars, led by the faculty principle investigators, offer opportunities to discuss relevant research literature and to reflect on recent activities. These, and other, project activities ensure that Fellows will develop improved teaching skills and confidence as scientists.

Sarah Witham Bednarz, Texas A&M University. Email: s-bednarz@tamu.edu; Robert S Bednarz, Texas A&M University. Email: r-bednarz@tamu.edu; *Developing Spatial Thinking With, About, and Through Geospatial Technologies*

Spatial thinking comprises the knowledge, skills, and habits of mind to use concepts of space, tools of representation, and reasoning processes to structure, solve, and to express solutions to problems. Spatial thinking underlies a significant amount of geographic learning such as the use of maps, graphs, images, diagrams, models, and visualizations. In addition, it supports the description, explanation, and discussion of the functions, structures, relationships, and operations of various phenomena. Thus, spatial thinking is a foundation for using and understanding geospatial technologies. Despite its importance, spatial thinking is not an explicit part of science or social science curricula in K-12 US classrooms. Most students are not competent spatial thinkers. Students find that spatial thinking is the most challenging component of GIS use; although they can produce maps, they frequently cannot interpret them. Few K-12 science and social science educators are prepared, through pre-service education, professional development, or supporting materials, to teach students the cognitive strategies associated with spatial thinking. This paper presents research on spatial thinking from an ongoing NSF-funded program, Advancing Geospatial Skills in Science and Social Studies. It explores ways geospatial technologies may or may not support spatial thinking. A model to implement spatial thinking and geospatial technologies in K-12 classrooms based on the work of Shulman and Mishra and Koehler is presented. Special attention is focused on observed relationships between teachers' understanding and use of specific strategies to enhance students' spatial thinking abilities and the use of geospatial technologies, particularly GIS, IGIS, and remote sensing.

Drew Bednasek, Queen's University. Email: drewbednasek@gmail.com; *The Colonial and the Postcolonial Landscape of the File Hills First Nations Reserve*

Within the politics of commemoration it is important to remember that what is not commemorated may be just as significant in forming cultural landscapes as what is commemorated. On the Peepeekisis Reserve in south eastern Saskatchewan, Canada, the non-commemoration of the File Hills First Nations farm colony symbolises an end to one of the most oppressive colonial landscapes in North America. For much of the first half of the twentieth century, Indian Commissioner William Graham, the founder and director of the colony, hand-selected "superior" graduates from surrounding residential schools and located them onto individual farming plots on the Peepeekisis Reserve. Former students, often pushed into arranged marriages by Graham, were supposed to live "civilised" agrarian lifestyles using Euro-American ideals, such as discipline, morals, time/place regimentation, gender norms and non-native language, acquired during their time in residential schools. Today, the First Nation of Peepeekisis does not, for apparent reasons, commemorate its colonial past with monuments or museums. All of the material features of the farm colony's colonial landscape are fortunately gone, replaced by a people working to exercise their rights on their own land as it was negotiated by Treaty 4, the Indian Act and the Canadian government's fiduciary responsibilities. In this paper, I demonstrate how the Peepeekisis First Nation's non-commemoration of the farm colony symbolises not only a rejection of the brutal assimilation practices of the colonial government, but it represents the construction of a cultural landscape free from colonial intervention in livelihood, land use and education.

Melanie Bedore, Ph.D. student, Queen's University. Email: bedorem@hotmail.com; *Youth drop-in programs: A community-based initiative to generate social capital, engagement and empowerment among Canadian youth*

Background: Childhood and adolescence are critical periods of intellectual and social development, yet for some they are fraught with excessive risk behaviour that can impair their growth into healthy, engaged and productive adults. Issues like drug and alcohol abuse, physical inactivity, youth crime, unprotected sex, violence, and apathy can continue into adulthood and impair an individual's development into a productive member of society. Project focus: This research project looks to recreational drop-in programs as an intervention to empower youth in their community and reduce risk behaviour. I hypothesized that these programs would produce three positive outcomes in youth people involved: increased physical activity, reduced youth crime and improved community attachment and civic engagement through volunteerism and leadership. Methodology: I conducted open-ended qualitative interviews with fifteen administrators of drop-in programs in South-Eastern Ontario. The programs ranged in location (urban/rural), size, funding base and complexity of operations. Open-ended questioning allowed leaders to tell their stories and share triumphs and frustrations. Results: There is great geographic and programming diversity among these programs, yet central themes arise: leaders reported positive outcomes in youth involved, including greater physical activity, positive peer pressure and group dynamics, leadership opportunities and improvements in trust and self-esteem in the youth. Recommendations: Youth drop-in programs should be supported by communities and appropriate levels of government, but allowed maximum freedom to adapt programming to suit the needs of the youth population. They may present an opportunity to reduce risk behaviour and improve youth social capital through engagement and empowerment.

Laura Been, Antelope Valley College. Email: lbeen@avc.edu; *Landscaping for a Southern California Lifestyle*

Despite persistent water shortages American homeowners have developed an obsession with having lush, green, perfectly manicured, grass yards; even when the climate where they live doesn't lend itself to having such a yard. While efforts are made to curtail this wasteful use of water, it is the purpose of this research to offer a new approach toward conservation and prove that when given the chance, people will make the most sustainable choice. Beginning with an introduction of the Lifestyle Landscape Project, this thesis shows that alternative landscapings have a place in today's new housing developments and that this project should be used as a guide for future housing developments. The Lifestyle Landscaping Project was a joint undertaking by the local water district and housing project developer uniquely offering buyers yard landscaping options. In addition to offering traditional home upgrades new residents chose between landscapings, each using different amounts of water, and having a different cost. While the water conservation upgrades cost more the project was still a success for a number of reasons. Chief among the reasons were environmental concerns, specifically water use, and on-going maintenance. Learning from the results of this project allows it to be applied to future home developments. The data shows that environmental selling points are successful, yet the question becomes promoting the benefits of alternative (desert) landscaping. If developers will invest in offering and marketing water conserving landscapes home buyers will chose those alternatives.

Jason D Beery, Pennsylvania State University. Email: jdb425@psu.edu; *The New Space Tourism: The Privatization of Space Travel*

Technological innovation within the last few years is allowing for the creation of a new space tourism sector. As opposed to existing forms of space tourism, in which tourists pay approximately \$20 million to fly aboard Russian space vehicles to the International Space Station for 10-14 days, the new space tourism consists entirely of private companies offering two to three hour trips (aboard reusable private spacecraft) that travel beyond 100 km above Earth, the experience weightlessness and views of Earth against a black horizon, for \$100,000 - \$200,000. Here, I examine this rapidly developing empirical phenomenon, particularly how different actors are influencing the creation of a profitable space tourism sector and the implications of such a sector on broader themes of human activity in space. I empirically analyze the economic supply-side of space tourism through the (re)production of the place of space, economic and industrial geography, and political economy in the role of the government as a regulator and economic developer. In the longer-term, the success of this private space travel sector may lead to increased private participation in the public space travel and exploration.

As computer attacks are becoming more and more difficult to identify the need for better and more efficient intrusion detection systems increases. The main problem with current intrusion detection systems is their high rate of "false alarms". In this paper we discuss our experience in analyzing potential benefits of distributed multi sensor systems for intrusion detection. The goal of this project is to examine how to integrate multiple intrusion detection sensors in order to minimize the number of incorrect-alarms. The purpose of this paper is to discuss implementation of prototype multi sensor based intrusion detection system. We are especially interested in analyzing a traffic that has an abnormal or malicious character. A specific feature of the model is that the systems use honeynets and multiple sensors. A honeypot is a system whose value lies in bringing more attacks on the system. Frequently not only web servers but also Honeynets are objects of malicious attacks. An Intrusion detection monitoring multiple systems and networks requires the existence of multiple intrusion detection systems and a subsystem to fuse information from several sensors. In many cases, intrusion detection systems produce false alarms called "false positive." The typical response to this by the administrator is to reconfigure the intrusion detection system to not identify that particular event as an intrusion attempt. Our implemented model is in fact just a prototype and needs to evolve into more mature and efficient model. Future work will emphasize a revisit of database design

Denise Behrens, California State University, Long Beach. Email: dbehrens26@yahoo.com; *A Comparative Geographic Analysis of European Union and United States Governmental Foreign Aid*

In many respects, official foreign aid granted by the European Union exhibits important contrasts from that of the United States, most notably in terms of recipient nations, the forms and amounts of aid given, and stated objectives and strategies. Many of these transatlantic differences appear to have their origins in varying foreign policies, geopolitical interests, and historical linkages, among other factors, and can furthermore have a significant impact on the affected nations. Therefore, this paper will conduct a comprehensive examination of foreign aid granted by the United States and the European Union (primarily at the supranational level) from a geographic perspective. After ascertaining and analyzing the specific similarities and differences between European and American aid, some possible reasons for the spatial patterns revealed will be discussed. Finally, it will briefly speculate on the future of foreign aid from the European Union and the United States, as well as some of the potential repercussions of both current actions and planned initiatives.

This article presents a conceptual model of social-ecological dynamics that addresses the feedbacks of anthropogenic disturbance on the flow of ecological goods and services from ecosystems to society. We applied this model in developing an analytical GIS framework to identify areas of emergent vulnerability at a landscape scale. Because the nexus of human use, disturbance, and productivity can indicate more intense couplings between human and ecological systems, we suggest that spatial identification of where these features coincide may also be areas where unintended or unforeseen consequences of human

activity are more likely. Since social-ecological processes are different in every region, our approach emphasizes the use of place-based and locally relevant indicators of these factors. In the coastal rainforests of southeastern Alaska, there is concern about the legacy of commercial logging on fish and wildlife species of local subsistence and commercial importance. Some of these impacts have been observed in the short-term while many of the ecological feedbacks involve slower variables related to forest regeneration. Our approach spatially couples social and ecological variables to determine where high ecological provision, high human use and high human disturbance coincide on the SE Alaska landscape. We describe some of the systems dynamics linking these three factors and provide examples of how time lags and feedbacks among them heighten the possibility of sub-optimal decision-making. We argue that these areas represent loci of vulnerability in the social-ecological system, given the dependence of local residents on fish and wildlife resources for subsistence and commercial uses.

Meredith Beilfuss, Indiana State University. Email: mbeilfuss@isugw.indstate.edu; James H. Speer, Indiana State University. Email: gespeer@isugw.indstate.edu; *Undergraduate Students Perceptions of Fieldwork Preparedness*

The disciplines of geology and geography have a long tradition of gathering data in the field, outside the classroom. The 'field' becomes the laboratory where undergraduate students can learn and practice the skills of science. Prior to conducting fieldwork, experienced instructors need to prepare students for learning and working in the field by practicing the tools and techniques of gathering data and working as a team. In an effort to determine students' perceptions of fieldwork preparedness, student interviews and survey data were collected before and after an experiential learning opportunity. Students' perceptions of preparedness ranged from very well prepared to completely not prepared on issues such as the use of equipment, working together in teams, and making geologic maps in the field. Students discussed both self-reliance and reliance on the group to help complete fieldwork assignments. This pilot study will inform other instructors on possible strategies to use when preparing students for learning in the field.

The widespread thaw of discontinuous permafrost across the boreal plains of North America, including disappearance at its southernmost fringe, has resulted in changes to peatland vegetation and carbon cycling. The accepted regional model of peatland permafrost dynamics ascribes widespread formation to late Holocene cooling, and particularly to the onset and termination of 'Little Ice Age' cooling (LIA). However, detailed paleoenvironmental data in support of permafrost history and sensitivity have been lacking. Here we present a 9000 year high-resolution multi-proxy record of peatland history from a treeless thaw site at the southern limit of permafrost in Saskatchewan, Canada, using 11 AMS radiocarbon dates, plant macrofossils, carbon and nitrogen assays, and decomposition proxies. Minerotrophic conditions, first characterized by sedges and then by brown mosses, persisted until about 2500 years ago. Multi-proxy evidence suggests that permafrost developed before 700 years ago, associated with a sharp decrease in carbon accumulation. The age of a spruce needle layer at the transition between forest and post-thaw Sphagnum peat indicates that permafrost degraded between 300 and 500 years ago, followed by increase in carbon sequestration. These permafrost dynamics, which predate the LIA, are consistent with 1500-yr climate cycles evident in other Holocene records. The effect on modern vegetation of permafrost thaw at this site has persisted for hundreds of years.

Frederick L. Bein, Dr., Indiana University Purdue University at Indianapolis. Email: rbein@iupui.edu; Christopher J. Hill, . Email: baobab_lodge@yahoo.co.uk; *Multi Story Agriculture in Inhambane, Moçambique*

Multi-story agriculture in Inhambane Province of Mozambique occurs where approximately 30 useful plants are grown together in forest gardens that have evolved over the last 1000 years and have survived colonization, slavery, wars, droughts, pestilences, floods and cyclones. Only cowpeas, sorghum and wild fruit trees originate in Africa while introductions from Asia and America dominate the crop mix. The diversity of crops provides a basic diet and periodic income while maintaining a strategy of subsistence. Crops growing in symbiosis survive in the nutrient starved soil while coconuts and fruit trees reduce evaporation and constant ground cover provides erosion control. The high biodiversity helps to reduce pest and disease problems as do the short fallow periods at the lower levels

which effectively provide space for a few livestock to graze. Modernization is drawing farmers away from this life style and the multifaceted self sufficient farming traditions maybe forgotten.

Keywords: crop diversity, subsistence agriculture, agroforestry

Barry J. Beitzel, Trinity Evangelical Divinity School. Email: bbeitzel@trin.edu; Joint Nautical Ventures on the Mediterranean Sea by Tyrian Phoenicians and Early Israelites

Historical notices in the Hebrew Bible speak of a maritime partnership between Phoenicia and early Israel, according to which Hiram [I] and Solomon had one merchant fleet on the Red Sea which sailed to Ophir, and another fleet on the Mediterranean Sea, which sailed to Tarshish. Many scholars regard Hiram's partnership with Solomon on the Red Sea as a reliable tradition, but these authorities view any such nautical enterprise on the Mediterranean with great skepticism. This paper aims at presenting a range of evidence that points unmistakably to a Phoenician presence in the western Mediterranean by the 10th century BCE, thereby offering a level of plausibility to the biblical narratives in this regard. The evidence includes (1) numerous artifactual pieces — some inscribed in Phoenician and many exhibiting various forms of fine craftsmanship commonly ascribed to advanced Phoenician technology — found in secure archaeological settings in Spain; (2) evidence of 3 early texts which reference "Tarshish" as an early place-name in the Mediterranean; (3) evidence of actual Phoenician settlements located along the southern coast of Spain; (4) Phoenician materials found amidst early shipwreck sites in the Mediterranean; and (5) evidence of lead isotope analysis of copper oxide ingots found across the Mediterranean. In the process, the paper will seek to address such geographical questions as the location of Tarshish, currents and shipping lanes across the ancient Mediterranean, extent of land visibility from the surface of the water, and the location and nature of Phoenician ports.

A proper appraisal of the convergence between economic and spatial interdependency is essential in industrial cluster studies, for formal and informal collaborative relations are expected to develop between economically linked industries that are located in close geographic proximity. This paper presents a method for identifying industries that share both economic and spatial interdependency. The proposed framework integrates input-output and spatial autocorrelation based multivariate techniques to provide an objective mechanism for detecting spatially and economically clustered industries. The approach lays a basis to explore whether economically linked industries could tap advantages of co-location to lower costs, share information, and improve economic efficiency and innovativeness.

Matthew F. Bekker, Ph. D., Brigham Young University. Email: matthew_bekker@byu.edu; Daniel B Fagre, Ph. D., USGS-NRMS. Email: dan_fagre@usgs.gov; Ribbon Forest Dynamics in Glacier National Park, Montana

Linear patterns of subalpine forests termed ribbon forest have been described in several locations in the Rocky Mountains. The origin and maintenance of these patterns have been attributed to wind-snowdrift interactions and underlying lithological structure, but the dynamics of ribbon forests have not been well studied and are poorly understood. We examined the structure and dynamics of ribbons dominated by subalpine fir (*Abies lasiocarpa*), Engelmann spruce (*Picea engelmannii*), and whitebark pine (*Pinus albicaulis*) in Preston Park, a glacial valley located in central Glacier National Park, Montana. We used dendrochronology and field measurements of snow depth and solar radiation to explain the timing and magnitude of advancement of ribbon forests into wet meadows. The species, diameter, and height of all trees, and seedlings >30 cm in height were measured in seven 2-m wide transects spanning six meadows, and 60% (n=330) of these were cored or sectioned to determine tree ages. Seedling establishment was dense, but almost exclusively limited to the east and north sides of meadows. Although forest-meadow edge patterns seemed to suggest continuous and recent invasion, tree ages indicated episodic establishment, with very few seedlings younger than 40 yr. Tree invasion is controlled by snow depth patterns, which are influenced by endogenous feedback between ribbons and snow deposition on west and south sides of meadows, enhanced snowmelt due to increased solar radiation on north and east sides of meadows, and

microtopographic variability.

Michael Beland, California State University, Northridge. Email: mcb65370@csun.edu; Shawna Dark, Dr, California State University, Northridge. Email: shawna.dark@csun.edu; Using GIS to analyze historical conditions on the San Gabriel River

In recent years, a variety of public and private organizations in California have devoted resources to the restoration of wetland systems. As a result, government agencies and non-governmental organizations have expressed the need for development of reference conditions of wetland systems. Appropriate reference conditions, intended to distinguish natural processes from anthropologic effects on systems, can be established by compiling and analyzing available historical information. For my historical ecology study on the San Gabriel River, I use geographic information system software to integrate, analyze and create a visual representation of historical data. My synthesis of a wide variety of historical maps and textual source material results in the production of a map database of historical reference wetland systems thereby improving our understanding of the past landscape of the San Gabriel River watershed. This in turn provides a historical framework for organizations evaluating wetland restoration plans and management alternatives.

Oliver Christian Belcher, Graduate Student, University of Kentucky. Email: oliver@uky.edu; Between Law and Necessity: Mutable Sovereignty, Executive Power, and the Fabrication of the "Enemy Combatant"

In the aftermath of the construction of the Guantanamo prison complex and the Abu-Ghraib torture 'scandal,' a numerous amount of theoretical analyses emerged in geography and other disciplines around Giorgio Agamben's concepts of the 'exception,' homo sacer, the sociology of 'the camp,' etc. Most of these analyses focused on the possibilities of the spatialization of the 'exception,' and its consequences for conceptualizing power topologically within geography. This paper instead attempts an 'archaeology of the exception' by analyzing the legal penumbra of the 'enemy combatant,' and the geographical imaginaries involved in the production of such a legal object. While not taking for granted the transhistorical disposition of sovereignty as outlined by both Giorgio Agamben and Carl Schmitt ("The Sovereign is he who decides on the exception"), this analysis assumes that any theorization of (US) sovereignty and the exception has to be understood within the field of (US) governmentality. Therefore, the argument presented here considers the practices within the legal apparatus that produce the exceptional 'enemy combatant.' By underscoring both the mutability of sovereignty and the governmental practices involved in producing 'the exception,' the paper asks whether it is too hasty to conclude, as Agamben has, that 'the ban' is the original political relation.

Email: ; Geomorphological Mapping of the Shigar and Braldu Valleys, Central Karakoram, Pakistan, Using GIS and Remote Sensing Techniques.

The high Karakoram Himalayas is a region of immense topographic relief whose origin is currently not well understood. K2 is uplifting at 2-6mm a-1, however recent denudation is thought to be due mainly to surface processes, not tectonic unloading. Geomorphological mapping assists in evaluating the polygenetic role of glaciation, mass movement denudation, and fluvial erosion in landscape development and uplift. A series of twelve geomorphological maps 1:100,000 covering the Shigar and Braldu valleys up to K2 were produced using field mapping and photography, GPS measurements, and a digital elevation model generated from ASTER imagery. Landscape and morphometric analysis were performed using GIS software. The landforms are described in relation to geology, geomorphological processes, and altitudinal zones. Case studies of special locations include, for instance, flash flood deposits, active landslide areas, a sackung, and rock avalanches. Quantifying of landform types helps to understand the dominance of single geomorphological processes. Three distinct altitudinal zones could be identified, and each has a dominate erosion/deposition process and moisture pattern. These zones are: (1) the upper zone, above 6000 m is the zone of perennial glacier accumulation and avalanching; (2) the middle zone from 3000-6000 m where active and former glacial processes, freeze-thaw cycles, and fluvial erosion dominate; (3) the lower zone below 3000 m with sub-montane and

semi-arid conditions where alluvial fans, landslides, and breakout flood deposits dominate the landscape. This is the first complete geomorphological map series of the area which provides important insight into the nature of topographic evolution.

David John Bell, PhD, School of Geography, University of Leeds. Email: d.j.bell@leeds.ac.uk; Sexualizing Surveillance: Technologies and/of Exhibitionism

This paper explores the appropriation of new media technologies - camera phones, web cams, CCTV cameras - through practices that Hille Koskela labels 'empowering exhibitionism'. As a way to arguably transgress the dominating effects of 'surveillance society', these practices create a space for rethinking the role of surveillance technologies in the constitution of sexualized subjects. 'Caught in the Act' compilations of CCTV footage show 'found' images of public sex acts, while websites capturing and circulating images of public nakedness and public sex, such as dogging or 'eco-porn' websites, connect implicitly or explicitly to the history of political and countercultural staging of nakedness, framed in the context of new media 'prosumption'. The production, circulation and consumption of both 'found' and 'staged' images of public nakedness across a range of media provides a provocative opportunity, therefore, to rethink the forms and uses of 'spaces of exhibitionism' and the practices of exhibitionism as a particular articulation of the politics of nakedness.

Heather Bell, University of South Florida. Email: heatherbell6@hotmail.com; Describing the Hundred Year Flood: Patterns of Perception in Broome County, NY

Many have questioned the usefulness of 100 year flood terminology in communicating flood risk. New terms have been introduced, but are they better at conveying uncertainty and concern? This study compared three methods used to describe policy's benchmark flood: a 100 year flood; a flood with a 1 percent chance of occurring in any year; and a flood with a 26 percent chance of occurring in 30 years. Face to face questionnaires were conducted with residents living in the 100 and 500 year floodplains of Vestal and Union, two flood prone communities in Broome County, New York. Both towns had major flooding in June of 2006. Respondents were asked to rate the flood descriptions in terms of perceived likelihood, size, and level of associated concern.

Juli Bell, Department of Earth and Atmospheric Sciences, Purdue University. Email: jhbell@purdue.edu; Brenda Beittler Bowen, PhD, Department of Earth and Atmospheric Sciences, Purdue University. Email: bbowen@purdue.edu; Spectral Reflectance Characteristics of an Ancient Mars Analog Environment

Hyperspectral remote sensing is a passive, non-destructive technology used to collect spectral signatures of materials, including minerals, over a broader spatial scale than data gathered with handheld instruments. The Grand Staircase-Escalante National Monument in southern Utah contains an area of Navajo Sandstone mineralogy not explained by current models of fluid-rock interaction. Some of these minerals are also found on Mars and at naturally-formed acid saline lakes in Western Australia. These minerals include jarosite, hematite, alunite, and gypsum, which form in extreme conditions of acid saline fluids. The Utah site provides important information on the history of the fluid-rock interactions forming the minerals, and can be used to understand the development of the ancient Mars sedimentary environment and the modern acid saline lake environment in Western Australia. This study uses hyperspectral image spectroscopy to map the mineral distribution and analyze the site morphology to better understand the geologic history of the Utah site. Future work will include identification of spectral reflectance data that will be compared to Mars and the Western Australian acid saline martian analog in order to improve knowledge of their sedimentary evolution.

Martha Bell, University of Wisconsin - Madison. Email: martha.bell@gmail.com; How Can You Earn a Living From Clay Pots?: Rural Exchange Networks and Diversified Livelihood Strategies in the Peruvian Andes.

Rural exchange networks play a significant role in the livelihood strategies of Andean farmers, herders and artisans. Trade in these systems generally takes the form of barter of agricultural products for handicrafts and/or pastoral products. These exchange networks link the diverse ecological zones of the Andean region, providing access to a variety of agro-pastoral products. At the same time, they serve as an important component of livelihood strategies in cash

scarce, uncertain, Andean economies. This paper looks at one specific type of exchange practice - the trade of handicrafts (earthenware cooking pots) for agricultural products (mainly grains) in the context of the Northern Peruvian Andes. Through analysis of extensive interview data, this paper demonstrates how artisans can use craft production to provide food for their households without either initial capital investment or exchange of money. This paper also demonstrates that craft production and trade is only one component of diversified household economies in this region, and thus seeks to explain how craft production is a useful strategy and why it is used. Moreover, the spatiality of these exchange networks proves to be a key to understanding how they function and why they are effective. This spatial organization reveals interesting links between environment and local economies, allowing for alternative interpretations of the concept of "local food system."

Michael M. Bell, University of Wisconsin - Madison. Email: michaelbell@wisc.edu; William L. Bland, University of Wisconsin-Madison. Email: wlbland@wisc.edu; Ecological Power: Holons...and Agency, Intentionality, Narrative, Context, Change, and...

In this talk, we take the holon approach to ecology and environment we have been working on and extend it into a discussion of ecological power. In our use of a holon approach, we seek to take account of the reality of intentionality, human and otherwise, in ecology. Fundamental to this approach is a recognition that parts and wholes never absolutely exist, and yet as well a recognition that intentionalities seek to construct boundaries in an ever-changing, unfinalizable, and incommensurate ecology of contexts. Ecological power is the ability of a holon to sustain its intentionality from and among the many agencies of its ecology of contexts?which, perhaps paradoxically, requires near-constant change. As we will describe, ecological power is centrally dependent upon the successful construction of a holonic narrative, from and among the ecology of contexts. We will also describe how holonic narratives vary in degree to which they are inclusionary and exclusionary, and the degree to which they are dialogic and monologic. Which all sounds pretty dull and theoretical, but we will endeavor to show otherwise.

Scott Bell, Brown University. Email: scott_bell@brown.edu; Rachel Morello-Frosch, Brown University. Email: rmf@brown.edu; Post-Hurricane Katrina Health Outcomes

Hurricane Katrina affected New Orleans and the Gulf Coast in many ways. While new reports during and immediately following the disaster indicated the substantial human suffering there has been less focus on long-term health impacts and outcomes. This paper will explore some of the health outcomes that have emerged in the wake of the hurricane and examine several of the complex analytical issues associated with studying health and population dynamics following the immense disruption of Katrina. Environmental, health, census, and other data will be used to clarify how New Orleans and the surrounding area have responded to the devastation visited by the hurricane. We expect to focus on public health and population variability as key components in this study. Establishing a baseline from which to make pre- and post-Katrina comparisons will also be explored. Spatial patterns associated with the extent and type of damage as well as evacuation and return patterns will also be incorporated to establish whether post-Katrina health or illness can be predicated by any of these broad variables.

Keywords: Public Health, GIS, Spatial Analysis

Stephen Bell, Queen's University Belfast. Email: sbell15@qub.ac.uk; Analysing local migration patterns across space and time: A raster-based study

The first of Ravenstein's laws of migration, proposed in the 1880s, stated that the majority of migrations are of a short distance. It is therefore necessary to study local migration patterns in order to understand the true nature of internal migration. Many previous studies of migration have used aggregated data making it impossible to look at the local-scale, e.g. using data from censuses; or the spatial and temporal extents have not been broad enough to study large-scale spatio-temporal change. Working with migration data that highlights the movement of individuals, rather than using aggregated data, I have developed a methodology that will allow me to analyse changes of local migration across both space and time. Converting the data from a vector format into yearly raster surfaces that represent the variation of migration intensity, using spatio-temporal interpolation, I have begun to look at the spatio-temporal variation of in, out, and gross-migration at the local scale. In this paper I present some initial insights into the spatio-temporal nature of local British migration. By comparing separate regions of the country I intend to show how patterns of migration activity can be identified, the importance of looking at short-scale moves, and how temporal patterns vary with space and spatial patterns vary with time.

Daniela Belloli, University of Miami. Email: dbelloi@gmail.com; Jan Nijman, Ph.D., University of Miami. Email: nijman@miami.edu; *Paradise Lost? Deconstructing Miami's Affordable Housing Crisis*

Research on affordable housing (policy) in North American cities is complicated by the intra-metropolitan spatial variation in affordability and by questions of scale. The question of "affordable housing for whom" is inevitably a political question but it is inevitably geographical as well. In this paper, we investigate the affordable housing crisis that emerged in recent years in metropolitan Miami. This is an interesting case as it has for many years been one of the most polarized urban areas in the United States with a relatively large poor population, a small middle class, and high levels of residential segregation. In addition, in promotional narratives dating back to the early 20th century, having a home in Miami has often been described as owning a piece of "paradise." We examine the unfolding of the affordable housing crisis over time and across the metropolitan area. We combine quantitative and textual analysis and we ask two specific questions. First, how have trends in the cost of housing affected different income classes across the metro area? Second, what does a discursive analysis of recent debates and proposed policies suggest about the politico-geographical nature of the housing crisis?

Puckett, Syracuse University. Email: jgpuckett@maxwell.syr.edu; *Relative Prominence of Successional Theorists in Fifty Years of Journal Citations*

Questions about vegetation change following disturbance are prominent in the theoretical debates within biogeography and plant ecology. Disturbance has been viewed variously as an aberration triggering predictable succession back to the initial conditions; as a normal periodic event triggering cyclical but predictable change; or as a normal event triggering unpredictable change that may lead to an endpoint different from the pre-disturbance vegetation. While many authors have weighed in on these ideas, they are most often associated with, respectively, the scholars F.E. Clements, A.S. Watt, and F.E. Egler. To track the changing relative prominence of these theories, we used the Science Citation Index to examine the citation patterns of key papers by the three authors named above in journal articles over a 50-year period (1956-2005). This method does not allow measurement of the "popularity" of competing theories - citation does not imply agreement - but it does provide an indication of the role of each in setting the terms of debate. More than two thousand articles cited the key papers, with the overall number increasing steadily since the late 1970s. While citations of Clements increased steadily over the past 30 years, citations of Watt increased more slowly, and citations of Egler leveled off after peaking in the late 1980s. Examined by journal discipline, citations in Biology and Ecology journals parallel the pattern described above, whereas Clements was cited more frequently in Geography journals, and less frequently in Forestry journals.

Karina Benessaiah, McGill University. Email: karinaben@gmail.com; *Mangroves, Shrimp Farming and Coastal Livelihoods: Land Cover and Use change in the Gulf of Fonseca, Nicaragua*

Shrimp aquaculture since the 1980s has dramatically altered the landscape of the Gulf of Fonseca, Central America. While it provided employment and investments to one of the poorest regions of Central America, it also constituted a main threat to mangrove ecosystems and dependent livelihoods. Aquaculture was presented as conflicting with local livelihoods, shadowing the active role played by local people. Indeed there is a diversity of existing aquaculture activities, which influence local household economics. It is therefore important to identify the role that shrimp aquaculture has played in local household livelihoods and determine how these households have influenced coastal land use change. A stratified random survey was performed in Puerto Morazán, Nicaragua in 2006. Coastal land cover/use change was assessed using satellite imagery from 1976 to 2006. It was discovered that involvement in aquaculture lead to overall higher incomes, providing capital necessary for investments in fishing; key for subsistence. The long-term sustainability of shrimp aquaculture, however, is

undermined by high levels of indebtedness, limited access to credit and environmental degradation. This pattern was expressed spatially by initial conversions of natural areas to ponds, followed by a replacement of many small and medium-sized shrimp farms by larger enterprises. Lagoons, previously communally owned, were found to be the main areas of conflict between aquaculture and fishing. These findings are important in order to understand spatial patterns of coastal land cover/use change and how they relate to household dynamics, and subsequently provide a basis for sound integrated coastal management and poverty alleviation strategies.

Aïcha Benimmas, Université de Moncton. Email: benimma@umoncton.ca; *Maps in New Brunswick French-speaking Elementary Schools Social Studies Classes*

The map is the necessary tool that allows children construct geographic knowledge by the analysis of land issues (Maier, 1999). Its power lies in its ability to make abstract and difficult to represent land realities observable. It allows for the asking of territorial problems, to visualize them, to confront them with explanatory factors and consequently look to resolve them. Maps structure the thoughts of their readers (Chevalier, 1995), fashion their mental maps and can even manipulate their opinions (Monmonnier, 1993). Despite this cognitive contribution and maps' popularity, the map remains an undervalued tool in terms of pedagogical uses in schools (Mosenthal and Kirsh, 1990; Wiegand, 2006). However, geographic education has been characterized for at least a decade by the consideration of the specificity of the discipline, the problematical nature of its contents and the interest given to geographic reasoning (Gregg and Leinhardt, 1994; Young, 1994), to which maps must play a crucial role. This study has three objectives: 1) to discover elementary school social studies teachers' map representations, 2) to determine how elementary social studies teachers' representations influence their maps teaching strategies and 3) to assess the students' cartographic skills at the end of elementary school. The data collection method is both qualitative (semi-structured interviews) and quantitative (questionnaire). Also, the analysis method of the data is using content analysis and statistical analysis. Since the research is currently in process, the results will be discussed at the time of presentation.

Solomon Joshua Benjamin, Asst. Prof. Dept. of Political Science, University of Toronto. Email: sollybenj@yahoo.co.in, solomon.benjamin@utoronto.ca; *Conflictual Geographies of New Capitalism in Metro India*

I look at conflictual geographies in metro India where massive IT Corridors, expressways and International Airports contest 'slum lands'. The latter, constituting the bulk of employment and economic value addition, is pitched against the Supreme Court, urban elites, and national level policy makers with violent consequences: 300,000 people evicted in Bombay, 150,000 in Delhi, and 77,000 in Calcutta under its Marxist government. A renewed violence recently rocked Delhi when its administration forced by the Supreme Court attempted to seal 45,000 small shops, building on an earlier closure sought of 95,000 manufacturers. An aggressive urban elite, influential in policy via 'civil society' promotes 'electoral reforms and participatory planning'. This is to control chaos and reduce corruption to facilitate global aspirations. Such conflicts question earlier formulations around 'power and resistance' and social movements. The surprise turns out to be the centrality of the municipal arena. Interestingly, scholars from either ideological position see this to be a world of 'nervous greed, local thugs, corrupt local bureaucrats, ward level politicians, and small time peddlers of influence'. A much closer look shows how in deeply material ways, the politics of Space and Place is rooted in complex contemporary contests: New institutional re-alignments around Parastatal agencies and 'Civil Society' confront highly

politicized lower level bureaucracies; Globally connected financial architecture attracted to the most rapidly growing real estate markets in Asia confront small firm networks that already tap such surpluses; Finally, new laws for mega land acquisition stonewalled in local government administrative and legal loopholes.

Farmer-herder conflicts in Africa are often presented as typical examples of resource conflicts that illustrate the main message in the influential 'Environmental security' literature. However, political ecologists argue that these conflicts are more than just resource conflicts and that they should be studied within a broader historical and policy context. In this paper, we propose a detailed case study of a local conflict at village level between farmers and pastoralists in the Kilosa District in central Tanzania. This conflict led to the killing of 38 villagers in December 2000 and has been highly publicised and much discussed in Tanzania. It is frequently interpreted as a clear-cut resource conflict about access to water and grazing for the pastoralists in the dry season. However, the paper will demonstrate that to understand the conflict, it is also necessary to study the history of land use in the district, which involves the rise and fall of the sisal estates and state ranches as well as the history of villagisation, land tenure policy and pastoral policy in Tanzania. In conclusion, we argue that the root cause of the conflict is policy-makers' and other officials' lack of appreciation and understanding of principles of pastoral production leading to attempts to confine pastoralists in 'pastoral villages', which lack basic services and do not contain enough grazing land.

Keywords: political ecology; pastoralists; land use conflicts; pastoral policies, Tanzania

Chris Benner, Pennsylvania State University. Email: cbenner@psu.edu; *Industrial Agglomeration, Regional Labor Markets, and Call Center Jobs: the Case of Cape Town and Johannesburg*

Most studies of the relocation of call centers focus on national factors shaping location, including wage rates, tax and regulatory structure, unionization levels and the like. At the same time, local labor markets conditions and industrial structures within destination countries also play a critical role in shaping call center employment patterns. Call centers are complex, networked organizations and are typically supported by a web of institutions and firms that are frequently rooted in particular locations. Understanding the relationship between these local dynamics and national processes is essential for gaining a full understanding of growth and dynamics in call center jobs. Based on a detailed survey of 63 South African call centers, along with more than 50 in-depth interviews with call centre managers and 4 detailed case studies, this paper examines patterns of call center employment in Cape Town and Johannesburg, the two largest sites of call centers in South Africa. It explores how particular characteristics of the local labor force affect patterns of call center employment, and how local institutional practices, business networks, and labor market dynamics influence the types of call centers located in each area.

Drew E. Bennett, University of Texas-Austin. Email: dbennett@mail.utexas.edu; Rodrigo Sierra, University of Texas-Austin. Email: ; *From Cattle to Cacao: Changes in Indigenous Land-use in the Ecuadorian Amazon*

Landscapes in the Ecuadorian Amazon experienced dramatic changes during the last forty years as various development and colonization schemes expanded road networks and brought colonists into the region. The indigenous inhabitants of the Amazon were especially impacted as they confronted new political and socio-economic forces. This paper investigates the changes in land-use and livelihoods of one indigenous Kichwa group located in the Sumaco Biosphere Reserve of the Upper Napo region of the Ecuadorian Amazon. Particularly, through the use of land-use mapping and household questionnaires, it investigates the current use of natural resources in the construction of livelihoods. These results are then compared to historical accounts from an adjacent community to reveal that land-use and livelihoods changed dramatically over the past 40 years but that these changes are not unidirectional and that certain traditional land-uses remain important for household food security. In addition, a "mixed-use" cash-cropping strategy that increasingly incorporates shade grown cacao has largely replaced cattle ranching that came to dominate the area in the 1980s. Several groups promoting sustainable development in the newly created Sumaco Biosphere Reserve have played a major role in the adoption of these new

strategies.

John S. Benson, Minnesota State University Moorhead. Email: bensonj@mnstate.edu; *From Pagans to Partners: An American Church Explains Its Mission to Its Members (1922-2002)*

In most evangelical missions, individual missionaries send prayers letters back to the home country to explain their work and to ask for donations. In mainline churches, missionaries were usually salaried and the church updated members in the home country about the missions overseas. This paper analyses the changing message that the Augustana Lutheran Church (1862-1962), and its succeeding churches, The Lutheran Church in America (LCA) (1963-1987) and the Evangelical Lutheran Church in America (ELCA) (1988 to present) about their work overseas, concentrating specifically on the work in Tanzania. I have used four official church journals (The Lutheran Companion?Augustana; The Lutheran and World Encounter?LCA; and The Lutheran?ELCA) to look at the interest in missions by that church, who wrote the articles about the work, how they discussed their work, and how they viewed their companion Lutheran church in another country. The first articles were usually written by the missionaries themselves and concentrated on the mission stations and the ethnic groups with which they worked and the lives of the missionaries. In subsequent years, church writers from the US told the stories and often concentrated on the work of the partner churches, foreign policy issues, and less on the personal side of missionary life. I will use documents from various mission directors to analyze their sense of mission goals. In these articles, one sees a move away from a concentration on the individual American missionary to an understanding of the broader issues affecting other Lutheran churches around the globe.

Lisa M. Benton-Short, The George Washington University. Email: lbenton@gwu.edu; *21st Century Immigrant Gateway Cities*

The processes of globalization, urbanization and migration have increased the number and diversity of urban immigrant destinations. In order to understand the impact of immigrants on urban space, it is important to examine both the form and function of 21st century gateway cities throughout the world. This paper provides an introduction and overview of the common themes that unite the papers in these sessions. These themes include: the rise of hyper-diverse immigrant gateways, the cyclical nature of gateways, the impact of state policies on immigration, the expansion of categories of entry, how cities have become defacto immigration policy makers, identity issues, the creation of new labor markets and economic spaces, the spatial segregation or assimilation of immigrants, and the emergence of the city as the site for immigrant celebration or contestation.

This paper describes the development of an undergraduate program in sustainable community planning and emergency management initially created with existing faculty and classroom resources, and then expanded with substantive state funding. Such a program, necessarily, must fit with departmental and collegiate strategic plans and mission statements. The ultimate goal of many of the major programs at Huxley is to create scholarship on and service-learning opportunities in disaster-resilient, sustainable communities. The demand for such interdisciplinary programs in sustainable development with a multidisciplinary foundation is great. Certainly, the combination of emergency management and planning creates a unique niche that is much needed in both career fields. The program was established with the understanding that planning and emergency management are a good fit, especially given the long-standing tradition of research in hazard studies in geography and disaster studies in sociology, and that the same critical thinking, decision making, and robust communication skills developed in all major programs at Huxley College, Western Washington University, enhances emergency management education. The program described here, created in 2006, builds on a long-standing certificate program in emergency management, established at the university pre 9/11. This paper addresses questions of how to utilize existing courses in the creation of such a program based in interdisciplinary education and commitment to informed practice.

Academic Entrepreneurs and Local External Inventors

Invention, despite the romantic image of lone genius, is generally recognized to be a team sport involving multiple individuals, often with diverse backgrounds. Frequently the discourse about economic development assumes that local inventors will collaborate more frequently and with greater impact with academics from local universities. This paper uses detailed data on the composition and history of over 2000 invention teams from two prominent universities for fiscal years 1988 to 1999 (July 1, 1988 to June 30, 1999) to test the collaborative patterns of academic entrepreneurs with external inventors. Every invention disclosure represents the formal acknowledgement of the discovery of scientific results that may have commercial application. The invention disclosure is the first step towards patenting and subsequently licensing the technology that is disclosed. The disclosure lists the names of the inventors in the order that would be used on a patent application. The paper examines the location of external inventors to assess the degree of collaboration with individuals in the local environment and to discern if spatial proximity matters in the quality of the disclosure generated.

Lawrence.berg@ubc.ca; *Practicing Whiteness: Nature, Race and Geographies of Exclusion in Vernon, Canada, 1890-1925*

This paper examines historical geographies of practice as they enacted whiteness in the small municipality of Vernon, BC, Canada, circa 1890-1925. Racial discourses underpinned much of contemporary thinking at the time, and unlike present-day whiteness that tends to be more hidden the enactment of whiteness was also relatively 'visible' during this period. This paper focuses on two aspects of the geographies of whiteness. First, I discuss the way that whiteness was enacted through embodied practices. Second, I examine practices that enacted whiteness in ways that drew upon very specific constructions of the differences between a racialized human and non-human nature.

One of the most difficult tasks in landscape archaeology and the study of past cultural landscapes is the synthesis and integration of information from disparate sources. However, the widespread availability of computers has spurred the development of digital landscape reconstructions and recreations as tools in the synthesis of information about the physical features of historical landscapes. This paper discusses the use of Historical GIS, geospatial technologies, and advanced computer graphics to provide a spatial framework and digital context for generating a virtual representation of a past urban landscape. Through the use of virtual reality and immersive visualization, this project displays the recreated landscape of a small regional city in West Virginia that underwent an industrial boom in the late 1800s. In recent years, however, many of the city's structures have been lost or changed as it has undergone redevelopment or gentrification, and a comprehensive interpretation of the city's historical urban geography is now possible through the use of geovisualization. The project draws heavily on the highly accurate historic Sanborn fire insurance maps, as well as historical photographs and texts. These sources were utilized to generate over 300 custom 3D models of the known structures within the town center. The completed models were imported into the GIS, along with other GIS layers including ground surface, streets, trees, and street furniture to populate the virtual landscape. The completed 'scene' offers a visual representation of Morgantown's nineteenth century landscape and allows users to explore the recreated physical and cultural elements of the town.

Keywords: GIS, geovisualization, virtual reality, historical landscape

Cory W Berish, Ph.D., US EPA. Email: berish.cory@epa.gov; *Enterprise Architecture: Solutions For Our Future*

In 2004, R4 EPA partnered with the Office of Environmental Information to implement the Agency's Enterprise Architecture (EA) Program at the Regional level. R4 EPA established a Regional EA Team to focus on six priority areas for improving the management of program data, systems utilization, and to support multi-media collaboration within EPA and our State partners. Using an EA model and tools, the team is supporting human capital planning efforts in the area of succession planning. They developed a retirement eligibility matrix for

each organization. The data depict retirement eligibilities by critical job element. The EA team completed Phase I of the Region's effort to consolidate base cartographic and programmatic vector data and to provide users with a single point of access. Estimated annual return on investment was estimated at \$128,000 for labor, operations and maintenance. The EA Team also developed an approach for Region 4 to ensure our ability to provide analytical support in the event of future major hurricanes.

Lindsay Berk, University of North Carolina - Chapel Hill. Email:
berk@email.unc.edu; *The Effects of Prescribed Fire on Bird Communities in the Ponderosa Pine Forests of the Southwestern US*

Many bird populations have declined due to changes in fire regime and the resulting alteration of habitat. Some studies show that birds exhibit higher diversity in fire-maintained landscapes versus unmanaged landscapes, however, the impacts of prescribed fire on bird communities and the mechanisms behind these responses are unclear. Additionally, few studies have addressed the effects of prescribed fire on bird communities of the Southwest, especially in reference to the impacts of these fire treatments on foraging behavior. Here I illustrate a study that evaluated prescribed fire as a restoration tool for bird communities in the Southwest, addressing the following questions: 1) how does forest structure impact birds following a prescribed fire; 2) does foraging behavior impact avian responses to fire treatments at multiple spatial scales; and 3) how do birds alter their guild structure and foraging behaviors in response to these treatments? We collected data at study sites situated in the ponderosa pine forests in Arizona and New Mexico, using an experimental sampling design to measure response variables pre- and post-treatment. We implemented a prescribed fire treatment at each study site and sampled vegetation structure, bird species composition and abundance, and foraging behavior at all sites. With these data, we can examine how birds respond to fire treatments through their differing densities, foraging behaviors, and through scaling effects of these responses. These results will offer insight into the responses of birds to prescribed burning practices and will provide land managers with the necessary information to continue efficient forest management practices.

Thomas Berkhout, BA, MES, PhD Student, University of British Columbia. Email: tom_berkhout@yahoo.ca; *The Emergence of Sustainability Centred Organizational Fields*

Almost two decades after the release of the Brundtland Report by the United Nations, sustainability is still a widely contested concept. One explanation for this ongoing contention is that it is an idea that has the potential to create far reaching changes to a number of society's dominant institutions (e.g., capital markets, bureaucratic states, science, religion, and democracy). In this light, it can be argued that a sustainable future will require either the integration of sustainability-based principles into the existing dominant societal-level institutions or the emergence of sustainability as an independent institution. In the United States and Canada, a review of significant sustainability based policies and actions reveals that there has been a broader adoption of sustainability-based principles at the local scale and state scale than there has been at the national scale. This paper uses institutional theory to argue why the adoption of a shared concept of sustainability is more tenable at the regional scale in these two countries than it is at the national scale. A critical element is the increased opportunity for collaboration among the different organizations (e.g., government, private sector, NGOs, and civil society) that interact on a regular basis around sustainability related issues. Over time, the successive interactions between these recurring groups of organizations lead to the development of regional sustainability-based organizational fields. Operating at the level between individual organizations and society, these organically emergent fields play a critical role in the development, dissemination and reproduction of socially constructed expectations and practices concerning sustainability.

Daniel S. Berkowitz, NEXRAD Software Developer, National Weather Service. Email: daniel.s.Berkowitz@noaa.gov; Ronald G. Guenther, Software Engineer, RS Information Systems, Inc.. Email: Ronald.G.Guenther@noaa.gov; *Radar Coverage: A GIS Application*

Weather radars are used for many applications including providing estimates of precipitation accumulation amounts. These radar estimates are just one source of precipitation accumulation data meteorologists and hydrologists use for real-time forecast and warning operations and climatological applications. GIS data along with newly acquired Shuttle terrain data (1 arc-second) and radar locations updated based on GPS-data have been combined to provide improved maps of radar coverage for each scanning angle used by weather radars. These maps assist hydrologists in better specifying areas where non-radar precipitation accumulation estimates (e.g., rain gages, satellite data) can best be used to supplement the

radar-estimated precipitation amounts, especially in complex terrain and at long ranges from the radars. This poster will provide details on how the GIS database/application has been combined with the Shuttle terrain data and more accurate radar locations to create these new radar coverage maps for rainfall estimation and other applications.

Adam Berland, University of Minnesota. Email: berl0038@umn.edu; Modeling vegetation change in the Big Woods of Minnesota

Anthropogenic climate change is expected to elicit significant vegetation responses at the regional scale. Knowledge of past climate-driven vegetation dynamics will enhance predictions of future conditions. Specifically, it is important to understand how disturbance processes, such as fire, and ecological processes, such as succession and seed dispersal, have interacted to produce regional vegetation patterns in response to changing climate. The Big Woods of Minnesota is a dense hardwood forest located at the boundary between forest and prairie ecosystems. The area has seen marked changes in community composition and disturbance over the last several thousand years. While empirical paleoecological data have been able to describe past vegetation patterns in the Big Woods, computer modeling permits illumination of the processes behind these patterns. This work used the forest model LANDIS to simulate vegetation dynamics in the region. Sensitivity analyses illustrated how ecological assumptions in the model are evidenced on the simulated landscape. This research supports the hypothesis that topography and water bodies acted as firebreaks, and were therefore important in determining the location of the prairie/forest border.

Matthew M. Bernau, South Dakota State University Graduate Student. Email: mattbernau@hotmail.com; A Fencerow Prairie? Barbed Wire Fences as the Prairie's Last Stand in Southeast South Dakota

North American prairies have undergone a massive land use and land cover change since European settlement. It is estimated that ninety nine percent of the native tall grass prairies have been converted to agriculture or settlement. This study explores the possibility that some prairie species have been protected by barbed wire fences that serve as field boundaries in the agricultural landscape. Barbed wire fences were put in place to separate and confine livestock, and many still exist even though they are no longer needed, because they are expensive to remove. Clay, Union, and Lincoln counties in southeast South Dakota have been selected as the study area. Vegetation maps have shown that these counties are representative of the agricultural landscape that has been carved from native tall grass prairie. Vegetative sampling using the quadrat and census method will determine the species composition of plants that have been protected from cultivation by barbed wire fences in the study area. The outcome of this study may be important to plant geographers, geneticists, conservationists, and ecologists because fencerows are a potential source for native prairie species.

Christian Berndt, Universitaet Frankfurt. Email: c.berndt@em.uni-frankfurt.de; Migrant labor and territorial capitalism

In today's global age where the conditions allowing the production of quasi-national economies and societies have ceased to exist, various forms of mobile labor establish trans-territorial life-worlds which do not chime well with the institutions of national economic models. Applying a perspective which privileges mobility over stability, I analyze the dilemmas confronting the contemporary German political economy from the perspective of mobile labor. I argue that the much-cited "German Model" was founded on a particular geographical compromise: Resting mainly on the mobility of goods, the country's economic success crucially depended on an elaborate regime of limited cross-border mobility of production factors (labor, capital). Only this allowed the maintenance of the sedentary life-styles and high living standards of a core of the workforce. In addition to the global stretching of production systems and the tremendous pressure on unionized labor in the wake of it, it is the mobility of "low skilled" labor which appears to contribute to the erosion of the stable post-war territorial compromise. Using evidence from selected urban labor markets, I critically analyze the ambivalent responses to low wage migrant labor and identify the dilemmas resulting from these measures. Criticizing the "methodological nationalism" of predominantly defensive measures which have little to do with the social realities in cities such as Frankfurt or Berlin, I argue that decision-makers in Germany have not yet come to terms with the requirements of an increasingly connected world. Trapped territorially they instead unintentionally create new dilemmas for every problem they seek to solve.

Lea Berrang Ford, PhD, Public Health Agency of Canada. Email: leaberrang@hotmail.com; Sleeping sickness in Uganda: a spatio-temporal analysis of environmental change, social conflict, and disease re-emergence, 1970-2003

Sleeping sickness is a re-emergent, infectious disease affecting large regions of sub-Saharan Africa, resulting in significant public health and economic burden. South-eastern Uganda experienced an outbreak of sleeping sickness in 1976, and cases continue to be recorded in new regions of the country. This paper presents the results of spatio-temporal analyses of sleeping sickness in south-eastern Uganda for 1970-2003. Land use change variables are assessed as predictors of spatial variation in the disease using satellite proxy data and zero-inflated regression modelling. The role of civil conflict as a temporal trigger of sleeping sickness outbreaks is discussed. The results suggest that sleeping sickness is expected to continue to spread into currently unaffected regions, particularly given the presence of unstable political and social conditions in vulnerable north-central districts.

Kate A Berry, University of Nevada. Email: kberry@unr.nevada.edu; Jen Huntley Smith, Ph.D., University of Nevada, Reno. Email: jen@unr.nevada.edu; H. Peter King, University of Nevada, Reno. Email: howatt@unr.edu; Contested Waters: Water Politics, Law and Technology in Late 19th Century O'ahu, Hawai'i

This paper considers how Hawaiian water conflicts and their resolution reflected political/social/cultural tensions between traditional/indigenous and western EuroAmerican approaches as well as the changes they wrought to Hawaiian waterscapes, as ditches and infrastructure were used, discarded or adapted to new ends. Using late 19th century administrative and case law in the Kingdom of Hawai'i, we examine Hawaiian water decisions and law during a period of intense transformation, analyzing the ways that legal and political systems simultaneously reflect and shape the society within which they operate. The Commissions of Private Ways and Water Rights, established by the Hawaiian monarchy, invoked traditional Hawaiian as well as Western EuroAmerican assumptions and technological practices in adjudicating water conflicts. Some of the Commission decisions were appealed to the Hawaiian Supreme Court, leaving further records of water conflict resolution. Analyzing these decisions provides insights into the complex dynamics which arose as indigenous societies responded to, adapted and challenged western colonizing efforts. We examine the decisions of the Commissions and Courts that shaped the nature of water practices and technologies on O'ahu, by evaluating legal processes, analyzing individual agency, tracking alternate uses of water infrastructure and interpreting institutional frameworks.

Susan M. Berta, Ph.D., Indiana State University. Email: sberta@indstate.edu; Habitat Mapping for Indiana in 2000

There have been many changes in the habitats, the vegetation and the animals of Indiana between 1800 and 2000. The human population of Indiana increased from about 22,500 (20,000 Native Americans and 2500 settlers) in 1800 to 2.5 million in 1900 to 5.9 million in 2000. This rapid increase in human population brought great changes to the Indiana landscape changing our state from woods, prairie and wetland, into an agricultural state with many urban communities. The total land in agriculture went from less than 100,000 acres in 1800 to 16.7 million acres in 1900 to 15.1 million acres in 2000. The U.S. Fish and Wildlife Service / Fish and Wildlife Department engaged Indiana State University in project to examine the habitat and biodiversity of Indiana for the year 2000 and review the changes over the past 200 years. The result, in part, is a manuscript describing the Habitat of Indiana in 2000. Highlights of the habitat changes are presented for discussion.

Kathryn J. Besio, University of Hawaii-Hilo. Email: besio@hawaii.edu; *Being Haole: "race," education and US empire in Hawai'i*

Hawai'i is often characterized as an exemplar of the US melting pot because of its multicultural and multiethnic make-up. Yet racial identities, particularly bicultural racializations based on "whiteness" and its apparent opposite "Indigenous" complicate the state's/nation's multicultural identity. In the transcultural educational spaces of Hawai'i, one of the ways this is apparent is in the make-up of the student and staff populations in which "white" bodies make up a significant percentage of those who teach, and non-"white" bodies - a wide range of Pacific, east Asian, "Local" and Hawaiian bodies — comprise those who learn. In this paper, I look more closely at how being Haole — an indigenous construction of "whiteness" — calls forth for university educators the legacies American imperialism in Hawai'i, highlighting the day to day practices of race and US imperialism in myriad, taken-for-granted ways. For educators who may self-identify and are identified by their students as Haole, this identity construction may create opportunities for critical pedagogy, although simultaneously it also produces a kind of pedagogical paralysis. Drawing upon focus group interviews with "white" university educators in Hilo, Hawai'i, I look more closely at how our negotiations with this particular construction of whiteness in Hawai'i's colonial present, deploys, disregards and often embraces being Haole and all the complications it entails.

William B. Beyers, University Of Washington. Email: beyers@u.washington.edu; *State Trends in High Technology Industry in the United States: The Shift from Manufacturing to Services*

High-technology industry has been the darling of economic development organizations in the United States for the last half century. This sector has been defined in different ways over the years, but today the prevalent definition is based on the occupational structure of industries. Industries with relatively high levels of employment in scientific, engineering, and computer occupations have been regarded as high-tech in recent years, but there have not been assessments of regional trends in employment in these industries for some time. This paper uses national industry-x-occupation data to define high-tech industries, and reports on regional trends over the last decade. Traditional measures such as coefficients of regional specialization and coefficients of industrial concentration are presented, as well as shift-share measures. A key point of this paper is to emphasize the emergence of service industries as the leading elements in the high-tech sector in the U.S., replacing the historic focus on certain categories of manufacturing.

Geospatial information has been recognized as the common element in preparedness, response, and recovery activities as it enhances situational awareness and analysis leading to improved information communication, sharing, and time critical decision making. This paper will describe ongoing development of a computationally intensive and efficient, scenario driven geospatial modeling analysis, and visualization framework that allows near real time processing and integration of remotely sensed data, derivation of more intelligent data derivatives, and faster than real time modeling and simulations using capability computing. We will illustrate this concept through the current functions of the Visualization and Modeling Working Group of the Department of Energy, to which Oak Ridge National Laboratory provides the critical capabilities for geospatial modeling and visualization of population dynamics, transportation infrastructures, and commodity movements aimed to enhance the nation's ability to prepare and respond to natural disasters and other emergencies and developing novel solutions for emerging issues. In addition, we will discuss development and integration of transportation, physical and behavioral science computational algorithms; the integration of these models that address different spatial and temporal scales; and the development of dynamic optimization routines to take advantage of real-time data from sensor networks. Drawing from our experience in supporting national and international consequence management efforts for recent natural disasters including Hurricanes Katrina and Rita, and historic Tsunami of 2004, we will highlight the practical limitations of traditional disaster decision support structure and criticality of geospatial science and technology in advancing current modeling and analysis approaches.

Lisa Bhungalia, Syracuse University. Email: lbhungal@maxwell.syr.edu; *Urbicide in the West Bank: The Politics of Development and Demolition (1967-Present)*

Urbanism is at the core of the Israeli-Palestinian conflict. Since occupying the West Bank in 1967, the Israeli state has systematically produced and destroyed urban spaces?Jewish and Palestinian respectively?throughout the territory as a means of securing geo-political dominance in the region. While Israel has dismantled settlements in strategic zones of the Occupied Territories, such as the Gaza strip, it has erected a vast matrix of Jewish-only towns and infrastructure around Palestinian cities and refugee camps throughout the West Bank. The resulting matrix has successfully expanded Israel's de facto national borders into contested territory, while facilitating the economic, social, and physical deterioration of Palestinian urban centers. The process of urban destruction, or urbicide, has been accelerated through the demolition of Palestinian city-spaces within the context of Israel's contemporary "War on Terror." This paper investigates the relationship between Israeli colonialism and space?specifically, the ways in which Israel's expansionist ideology manifests itself across the West Bank landscape via a two-pronged process of urban development and demolition. Through the use of primary and secondary literature, this paper examines the concept of urbicide as it was written into Israel's national settlement plans during the early stages of state formation, and traces its evolution through Israeli settlement and counter-terrorism efforts from

1967 to the present.

Walters, Ph.D., Virginia Tech, Department of Biological Sciences. Email: jrwalt@vt.edu; Potential for using dendrochronology to reconstruct historical cavity excavation and maintenance of longleaf pine by red-cockaded woodpeckers

The red-cockaded woodpecker (RCW) is an endangered species endemic to the longleaf pine ecosystem in the southeastern United States (US). This non-migratory, cavity-nesting woodpecker specifically excavates cavities for nesting and roosting in living pine trees, preferably longleaf pine. The decline of the RCW and its endangered status are due to fire exclusion, human disturbance, and the decline of the longleaf pine ecosystem. The elimination of cavity trees and old growth pines from the RCW's historical range has resulted in small fragmented populations of RCWs located throughout the southeast. Based on one of these populations in Southern Pines, North Carolina, we are examining 175 longleaf pine cores that have undergone disturbance due to cavity excavation. Cavity excavation requires up to more than a decade, while cavity maintenance, another decade or two, keeps resin wells active causing considerable disturbance to the living pine tree. We have detailed records of the locations and RCW excavation histories of these trees and will use dendrochronology to investigate whether there is a disturbance signal in the annual ring-width growth of longleaf pine from the effects of cavity excavation and its active maintenance. Based on our findings, we hope to determine the potential for using this signal as a proxy for historical RCW cavity excavation and maintenance in old-growth and second growth longleaf pine forests, naval stores stumps, and salvaged and reclaimed longleaf pine from buildings. This technique could provide data on long-term spatial and temporal patterns of RCW activity in the southeastern US.

This project is intended to model the vulnerability of individuals in communities to communicable diseases. Communicable diseases transmit from individual to individual through a social network of human contact. The spatial and temporal heterogeneity in this process can significantly affect the outcome of population health. This project uses a network approach to modeling heterogeneous transmission patterns. Nodes and links in a network are used to represent individuals and individualized interactions. The characteristics of nodes and links and the topology of the network collectively characterize the exposure of individuals to diseases. A spatially explicit approach is incorporated to account for the spatial heterogeneity in contact patterns and changes in these patterns through location and time. The characteristics of the network are represented by a series of parameters according to the demographic and social structure of a community. The vulnerability of individuals to communicable diseases in communities is evaluated under difference scenarios.

Keywords: communicable diseases, network, spatial heterogeneity

Thomas Anthony Blanchette, Louisiana State University. Email: tbianc1@lsu.edu; Kam-biu Liu, Louisiana State University. Email: kliu1@lsu.edu; Environmental Impacts of Hurricane Ivan: Evidence From Remote Sensing and Lake-sediment Studies

Hurricane Ivan, a category 3 storm, directly hit Gulf Shores, Alabama, on September 16, 2004, with maximum sustained winds of approximately 130 miles per hour. The 16-foot storm surge inundated the coastal plains and caused massive tree mortality in the maritime forests around the Shelby Lakes in Gulf State Park. A remote sensing study was performed to analyze the vegetation damage by comparing Landsat-5 satellite imagery taken before the storm (July 20, 2004) and those after the storm (July 7, 2005). Vegetation indices, along with unsupervised/supervised classification schemes, were used to reveal land cover changes. Remote sensing results, supported by ground-truthing with GPS, show that approximately 47% of the forest was damaged or killed due to the storm. Fifty-two cores were collected from these lakes during three trips (August 2005, May 2006, June 2006) to study the sedimentary pattern resulting from the barrier-breaching and overwash processes. Some of these cores were compared with cores taken from nearby sites during the 1990s so that Ivan's sedimentary

signature can be identified. The lake-sediment study reveals a spatially uneven depositional pattern among Lake Shelby, Middle Lake, and Little Lake.

Dzamilia Bienkowska, Uppsala university / CIND. Email: dzamilia.bienkowska@kultgeog.uu.se; Local mobility of labor in two Swedish clusters

Clusters of similar and linked organizations located in particular places are increasingly perceived, by both industry actors and policy makers, as key to creating essential competitive edge in today's business climate. The concentration of skilled and specialized labor present in clusters implies an increased potential for local labor mobility. The mobility of workers is often portrayed as an advantage for clusters as it forms a channel for the dispersal of knowledge and enables individuals to expand their social networks as they encounter new co-workers. The concept of local labor mobility, its reasons and effects, is explored in two Swedish clusters of IT and telecom firms. The methods used in the study are interviews with representatives from cluster firms and analysis of register data. The findings suggest that mobility of workers on the local level can be described as an intricate interplay of the principal actors of mobility, that is individuals, firms and cluster organizations. These actors are all driven by their own motives, interests and agendas and influence the resulting level of mobility in many ways. The nature of this interplay implies that there is little room for simple policy measures geared towards realizing the full mobility potential of clusters. Furthermore, labor mobility involves several negative aspects, as it incurs costs and increases risks, can be damaging to business relations and can make a workplace unstable. Hence, increased labor mobility should not be perceived as an easy way to greater competitiveness in the case of the two clusters under study.

Keywords: Labor mobility, clusters, Sweden

Jess Bier, CUNY - Graduate Center. Email: faboohoo@aol.com; Deciphered Data: Mapping Palestinians in New York and New Jersey

A contribution to the emerging literature on Arab and Middle Easterners in the U.S., this paper analyzes a major discrepancy in the 2000 U.S. Census data: the merging of Palestinians and Israelis into a single category. While ancestry and language data include categories which differentiate among Palestinians and Israelis, the place-of-birth data do not. Therefore, the objective of this project was to overlay the ambiguous place-of-birth data for New York and New Jersey census tracts with hatched layers displaying ancestry and language data. The maps which have resulted provide for the visual exploration of the place-of-birth data in light of geographically separate Arab and Israeli communities. Such investigation allows researchers to visualize data error and estimate the number and location of Palestinians in the region, a partial correction for the drastic undercounting of Palestinians. This in turn will hopefully aid future research on both Palestinians and Israelis by encouraging awareness that the place-of-birth data for Israelis includes an un-recognized, and quite statistically significant, number of self-identified Palestinians. People of Arab and Middle Eastern descent are classified as "White" according to the U.S. Census, which means that the detailed SF-3 and PUMS data are the only data which include information on Arabs and Middle Easterners. Correcting misperceptions which arise from data ambiguity in the place-of-birth SF-3 tables is therefore a necessary part of future work in these communities, and it also has resulted in the creation of maps to better aid community advocates.

Sabin Bieri, University of Berne. Email: sabin.bieri@giub.unibe.ch; Playing Cat and Mouse. Violence, Urban Movement and the Role of the Police

Focusing on the role of the police towards 1980's urban movements in Switzerland, this paper considers struggles for "free spaces" by predominantly young people who politicised the public realm through transgressive acts. By ritualising violent confrontations with the police the movement shaped its self-understanding and public appearance. These encounters contained playful elements whilst, at the same time, the police was constructed as the enemy. Driven by their own vulnerability, increasing pressure and fear, both sides lost control in a territorial conflict for "the right to the city". I will argue that the role of the police forces was highly ambivalent in these confrontations and shaped by particular political agendas of their own. Based on official documents and in-depth interviews with former participants of the movement and authorities, this case study sheds a light on how political conflict was negotiated in a major Swiss city. Applying the Foucauldian concept of governmentality to the sources of the local police department, the proclaimed transition from a high intervention standard to one of low intervention initiated at the end of the 1960s was contested. I will argue by contrast that the disturbances rather

intensified by contradictory doctrines of police deployment, leading eventually to an upgrade of police forces. The paper refers to relational theorising of the state in recent cultural and political geography literature. Affect and emotion are considered as constitutive moments for the political and are adopted as crucial categories for the analysis of social transformation.

The white-throated sparrow (*Zonotrichia albicollis*), a socially monogamous songbird of the northeastern U.S., exhibits polymorphism in both sexes (white and tan morphs). Behavioral and genetic differences between morphs, combined with disassortive mating, lead to differential parenting and nest success between pair types. The white morph type is more aggressive and promiscuous; thus white-male/tan-female pairs are potentially less effective parents for a variety of reasons. Against the backdrop of regional climate, these parenting differences may be related to nest and reproductive success. Our objective is to relate the differential nest success of the *Z. albicollis* pair types to aspects of the regional climatic environment in the winter prior to nesting and during the nesting season itself. In this study, we investigate nest success (including number of eggs laid, number of chicks, proportion of male chicks, depredation) in the context of surface and upper level atmospheric variables for the Cranberry Lake Biological Station in the Adirondack Mountains. Monthly and seasonal temperature, precipitation, geopotential height and circulation data (standardized Pacific North American Index values) are used to characterize the winter and spring climate of the wintering and nesting grounds for the period 1988-2005. Correlation matrices and composites difference maps are used to examine the relationship between climatic variations and nest success, as well as differential success between pair types.

David Biggs, University of California, Riverside. Email: david.biggs@ucr.edu; *Insurgency and the Water Landscape in Vietnam*

Throughout the First and Second Indochina Wars, battle lines were commonly drawn between different environments—city and country, field and forest, above ground and below. Vietnam's networks of roads and airstrips facilitated the circulation of French, American and South Vietnamese government troops while remote mountain footpaths and sinuous delta creeks supported an alternate infrastructure that since 1930 became a basis for the Vietnamese Revolution. Since the first days of colonial conquest in 1858, many such struggles to 'pacify' or 'liberate' Vietnam were centered on water. Controlling traffic on waterways and clearing swamps were constant features of public works campaigns. During the Indochina Wars, such projects were often targeted for attacks, but in addition to such attacks, insurgent worked steadily from the 1940's to expand an alternative 'liberation' government from key bases on the creeks and inside the forests. Now working as leaders in post-war provincial and national governments, former insurgents have now focused many government-funded projects in these areas, producing an often-problematic mix of inherited, old government infrastructure with newer schemes often motivated less by sound environmental or economic planning and more by revolutionary loyalties to former base areas. This paper considers how the water landscape figured into the Indochina Wars and how the legacy of the insurgency played into post-war development of the hydraulic landscape in Vietnam.

Email: rajagopalan.balaji@colorado.edu; *Land use and basin-scale energy balance: Has irrigation countered regional warming in India?*

India is one of the regions on Earth that has areas showing decreasing surface temperatures over the past 50 years. Here we quantify the relative effects of aerosol forcing, greenhouse gas forcing, and land use on the energy flux in the Krishna Basin, southern India (259,000 km²) over 1952-1997. Irrigation has expanded to more than 40,000 km² in the basin, which resulted in near complete depletion of streamflow and significant aquifer over-abstraction. Simultaneously, annual evapotranspiration increased by ~36-55 km² and basin-average NDVI

increased. Surface air temperature decreased by up to 1 degree C over 1952-1997 in areas that experienced rapid irrigation development, but increased by 1 degree C or more in areas that are unirrigated, with either rainfed agriculture or non-agricultural land uses. Aerosols decreased incoming radiation by ~160 MJ/m² per year over 1952-2000, greenhouse gas forcing increased net radiation by 75 MJ/m² per year, while the ET increase from irrigation development reduced the sensible heat flux by 344 MJ/m² per year. Similar trends in temperature occurred in the Ganges basin, where temperatures increased 0.5 degrees C from 1885-1960, but then decreased ~0.3 degrees from 1960-2000, suggesting that irrigation development may have affected the energy balance and surface temperature of a significant fraction of the land surface of India.

Wendy Bigler, Southern Illinois University Carbondale. Email: wbigler@siu.edu; *Irrigation Agriculture and Desert River Interaction: Historical Akimel O'odham (Pima) and the Gila River*

Arid alluvial rivers can undergo considerable geomorphic change in response to flood events. This study suggests that historic Akimel O'odham (Pima) farmers' agricultural practices affected channel change in response to a large magnitude flood event in 1905. Using historical maps and General Land Office survey notes, I document channel change in the Gila River of central Arizona for two significant flood events in 1891 and 1905. While differences in land use along the channel did not appreciably impact channel change for the 1891 flood, these differences did affect channel change in the larger magnitude 1905 flood event. Following this flood, the channel widened much more in reaches bordering irrigation farm land than it did for reaches bordering forested land. This amplified widening was likely the result of farmers clearing land of soil-anchoring vegetation, as well as the constructing canals which would have transported floodwaters (and their ability to induce geomorphic change) to a broader area.

Denise Bijoux, University Of Auckland. Email: dbijoux@orcon.net.nz; Denise Bijoux, MA, University of Auckland. Email: dbijoux@orcon.net.nz; *Everyday Lives: Solicited Diary and Photo Methodologies in Research on Everyday Connections to Place*

This paper draws on preliminary results from Doctoral research that seeks to understand the importance of place of residence (house, neighbourhood, city) in personal processes of attachment, identity and social connection. Drawing on data gathered through interviews and solicited photo-diaries in 2006, the research explores women's experience of place and space as they go about their daily lives. The study is based around areas along a four kilometre stretch of road in Auckland, New Zealand that are identified as undergoing change on a number of levels and which represent a continuum of suburbs of socio-economic difference. Examples of movement within, between and beyond this area are explored in an attempt to discern how daily activities and movements might contribute to personal and collective senses of belonging and feelings of 'home'. Particular attention is paid to the methodologies employed and how, together, they offer a mode of capturing a nuanced, sensory and embodied experience of the environment that is deliberately subjective and selective and ultimately useful in understanding and representing the diversity of experiences and perspectives.

James J. Biles, Indiana University. Email: jbiles@indiana.edu; *Urban Economic Restructuring and Informal Employment: A Case Study of Mérida, Mexico*

The dual forces of neo-liberal reform and globalization have brought about profound changes in urban economies throughout Latin America, with concomitant implications for the livelihoods of those who live and work in cities. In theory, neo-liberal economic reform and globalization should reduce the role of the informal economy in meeting the needs of urban populations as both consumers and workers. Data from Latin America, however, suggest that the importance of the informal economy as a source of employment has not diminished in recent years. In fact, in the case of Mexico, the number of workers in the informal sector has increased by 25 percent during the past decade. This paper presents the preliminary results of research on informal employment in Mérida, Mexico. Based on a survey of nearly 600 households throughout the city, this case study employs an expanded typology of informal employment to assess the livelihoods of those who work informally. In addition, I make use of detailed work history data to identify patterns of mobility between and within formal and informal sectors of the urban economy.

Emily Billo, Syracuse University. Email: erbillo@maxwell.syr.edu; *The Hydrocarbon Industry: A Case for Corporate Governance in Ecuador's Amazon Region*

How has a multinational hydrocarbon industry restructured relationships between the state, society, and nature in Ecuador's Amazon region? What are the particular conditions, forces and relations of hydrocarbons production that have contributed to this restructuring? Specifically, this paper examines the question of whether the Ecuadorian hydrocarbons industry has been able to establish a "spatial" or "institutional fix" to overcome capitalism's inherent contradictions. This paper will begin to explore the ways in which the industry has also benefited from neoliberal restructuring of the state, and whether such restructuring has contributed to "corporate" governance within Ecuador, and perhaps most prominently, within the Amazon region. These theoretical questions are based on research conducted in three indigenous Kichwa communities along Ecuador's Rio Napo, in the north central Amazon region during July and August of 2005. At the time of this research, these communities are within or next to hydrocarbon "blocks" leased by different multinational companies, including: Occidental Petroleum and EnCana. This paper looks specifically at these companies' "corporate social responsibility" programs that have provided much of the community's infrastructure in recent years. This infrastructure has included school buildings, medical facilities and potable water systems. As a result, communities look to the companies for additional resources, rather than the state, suggesting that the companies "govern" the region. Yet, this research shows that company "responsibility" to communities is within carefully defined industry parameters, benefiting the companies, but at what cost to communities and the environment?

Tina Billups, University of North Dakota. Email: tina.billups@und.nodak.edu; *Staying Power: Aging-In-Place in Larimore, North Dakota*

The growing population of those aged 65 years and over is a phenomenon with significant social, economic, and political implications at the national and state level. Aging-in-place, or the residential stability of growing old in a familiar location, is one important attribute of this increasing elderly population. In the United States, many predominantly rural Great Plains communities are experiencing this phenomenon among their elderly populations. Larimore, North Dakota, with its substantial elderly cohort and rural environment, serves as a case study to determine why elderly age-in-place, what factors are involved, and what the implications are for rural communities. Data were collected by conducting surveys and interviews with members of the elderly population in the Larimore community, and conducting interviews with Larimore community leaders. The surveys and interviews were designed to determine the study group's socio-demographic characteristics, ascertain why the elderly residents choose to stay in Larimore, and identify what could be changed in the community to make their lives more satisfying and enjoyable. Results indicate that elders are choosing to remain in their location for a variety of reasons, which include attachment-to-place, close proximity to family members, and homeownership. Findings may be of interest to health care professionals, and those in planning positions for understanding this phenomenon in North Dakota's elderly population residing in rural communities.

Keywords: aging-in-place, North Dakota, population

Michelle Bilodeau, University of Washington. Email: micheb3@u.washington.edu; *Placed-based suicide: the 'scene' and unseen meanings of the San Francisco Golden Gate Bridge*

Suicide, according to the Center for Disease Control (2006), is ranked as the eleventh leading cause of death within the United States. While suicide may be recognized as an emerging public health epidemic, stigma of the act remains. Since the erection of the Golden Gate Bridge in 1937, over 1,200 people have committed suicide from this 'scene'. The Golden Gate Bridge is now the number one "suicide magnet" in the world. Yet, the four and half foot railings separating the bridge sidewalk from the water two hundred and fifty foot below remain unchanged from the original construction of the bridge. Opponents to a suicide barrier stress financial feasibility though there is an underlying concern that a barrier will destroy the architectural and iconic meaning of the bridge. I argue that the conflicting meanings of this 'scene' connect to how inadequately and ambivalently suicides, as well as mental health-related illnesses, are understood at larger social scales. In this paper, I examine the act of suicide from Golden Gate Bridge through the lens of governmentality and the body.

Keywords: health geography, cultural geography, governmentality, suicide, place, San Francisco

Email: llimachi@iiap.org.pe; *Vulnerability, Livelihoods and the Environment: Differences Across Urban and Rural Communities Around Iquitos, Peru*

Urban, peri-urban and rural populations in the Amazon rainforest may have different livelihood strategies, based on their location relative to roads, rivers and urban centers. This may lead to differences in living standards, including housing conditions, incomes, assets, and vulnerability. How do these populations relate to the rich natural environment in which they live, especially in terms of modes of livelihood? In times of crisis, do they increase their dependence on exploitation of natural resources? This paper will report on findings from a survey of 216 households in 15 communities in and around Iquitos, carried out by UNC and IIAP in 2005. The paper will also examine the dimensions of "vulnerability" and provide empirical evidence based on the survey

Keywords: poverty, vulnerability, livelihoods, urbanization, environment, Peru, Amazon

Nick Bingham, Dr, Open University. Email: n.bingham@open.ac.uk; *Biopolitics, Biosecurity and the modern way of death*

This paper seeks to work productively between two parts of the oeuvre of Giorgio Agamben hitherto little connected in the burgeoning critical literature on his work. This pairing comprises - on the one hand ? the superficially compelling but hugely generalised and anthropocentric theses on biopower for which he is perhaps best known on the one hand, and the tantalising because fragmentary and more than human centred speculations more recently collected in *The Open* on the other. Specifically, I suggest something interesting happens if we read the former in the light of the latter and its identification of human-animal relations (and not just the bios-zoë relation within the human) as a critical juncture for the working of the anthropological (and thus, I suggest, biopolitical) machine. Grounding this question in a consideration of the emerging regimes of biosecurity being mobilised against the perceived clear and present danger presented by avian influenza, I ask whether it is too easy ? and indeed inappropriate ? to make the connection between the states of emergency and exception currently being enacted across the world against poultry and the events to which Agamben has applied those terms in his earlier work or ? on the contrary ? too difficult because it forces us to confront the centrality of determining what, when, and where nonhumans are killable to protecting the logic of sovereignty and thus our collective ways of life.

Keywords: Biopolitics, biopower, biosecurity, Agamben, nonhuman

Amanda Bingley, Lancaster University. Email: a.bingley@lancaster.ac.uk; *Becoming unremarkable: can psychotherapeutic approaches become well-established research methods in geographic and other social science enquiry?*

Can social and cultural geographers draw psychotherapeutic methods into mainstream research design or will those of us actively using these approaches always stay at the fringes of the discipline, by default or choice? From Burgess et al.(1988) in their seminal work using psychoanalytic 'small groups' a limited number of empirical studies in the 1990s and 2000s have designed research with methods drawn from creative and integrative psychotherapeutics (Bingley, 2002; 2003). A theoretical debate has emerged that draws on psychotherapeutic experience as opposed to applied psychoanalytical theory (see Bondi, 2003). This small but persistent movement in social and cultural geography is seemingly unusual, remarkable, and innovative. In this paper I aim to further the debate around the use of psychotherapeutic methods and consider some of the challenges, benefits and disadvantages in making the shift from innovation to unremarkable. I explore whether it is either desirable or even possible for the methodology to become mainstream given that these methods require extra training which is not routinely part of postgraduate education; many experienced researchers may not be aware of the nature of therapeutic methods and the different perspectives they offer; some feel uncomfortable with the approach. I note there is a certain disconnection between the focus of those engaged in theoretical debates in psychoanalytic geographies and those who draw on the theory to design empirical research using psychotherapeutic methods. I conclude by highlighting one or two possible indicators of the level of integration and acceptance of this specialised methodology into the discipline.

Keywords: psychoanalytic geographies, methods

Jon R. Binnie, Manchester Metropolitan University. Email: j.binnie@mmu.ac.uk; *Queer imaginings of an enlarged Europe*

This paper discusses recent transformations in European Union sexual citizenship associated with the enlargement process. It is through debates on the enlargement process that questions of sexual dissidence have assumed a much higher profile than hitherto within the EU. In particular there has been increased visibility around the issue of the treatment of sexual minorities in a number of

central and eastern European countries both prior to and since accession. At the same time the particular crisis and opportunity for sexual citizenship associated with EU accession in some states associated with the emergence of sophisticated activist networks challenging homophobia within political discourse. In parallel we are witnessing the growth of critical attention to sexual politics in central and eastern Europe. Much of this attention is coming from emerging formations of queer studies that only partially owe their intellectual basis to the 1990s development and establishment of queer theory in the US and the UK. These intellectual developments have in turn led to calls for the more assertive articulation of distinctive central and eastern European trajectories of queer thinking different from those seen to be established in US and UK academia. The paper discusses multiple and competing imaginings of a queer Europe, and examines the tensions between elite and grassroots visions at different spatial scales.

Keywords: Sexuality, Europe

Aaron Binns, Florida State University. Email: awb04d@garnet.acns.fsu.edu; *Archaeological Site Detection and Prediction using GIS and Multispectral Satellite Imagery Integration*

Applications of GIS in archaeology are a growing, but still somewhat simplistic and under utilized field of study primarily restricted to basic mapping, visualization, and predictive modeling. Similarly, the primary source of remote sensing data used to locate and identify buried archaeological remains has been largely derived from vertical and oblique aerial photography. Rarer still is the archaeologist who will integrate this spatial and temporal data with today's geospatial technology to improve the results and integrity of archaeology's ultimate goal of accurate explanatory and correlative predictive modeling. As high resolution satellite imagery improves, and economies of scale expedite and expand its availability and cost effectiveness, its applications for archaeology must be investigated and fully exploited. The major drawbacks in GIS predictive modeling to date has been a general lack of geospatial familiarity within the archaeological field, and the subsequent use of speculative and/or unreliable data to create predictive models. The introduction of a new geospatial toolbox capable of merging and improving the existing archaeological record and all its relevant environmental and socio-economic variables is required. A toolbox that compliments the integration of high resolution satellite data and aerial photography, from many remote sensing systems, with GPS and the growing prowess of GIS to streamline and topologically examine the vast wealth of under utilized multi-disciplinary data to appreciably improve both the spatial and temporal capabilities of predictive modeling of prehistoric dynamics and development. Key Words: Predictive archaeological modeling, environmental and socio-economic variables, high resolution satellite imagery, Geographic Information System Integration.

Keywords: Predictive archaeological modeling, environmental and socio-economic variables, high resolution satellite imagery, Geographic Information System Integration.

Karl W Birkeland, Forest Service National Avalanche Center. Email: kbirkeland@fs.fed.us; Kalle Kronholm, Norwegian Geotechnical Institute. Email: kalle.kronholm@ngi.no; Katherine J. Hansen, Montana State University. Email: khansen@montana.edu; Eric Lutz, Montana State University. Email: elutz@montana.edu; *Temporal Changes in the Spatial Variability of Snow Stability: Implications for Predicting Snow Avalanches*

Snow avalanches are a significant hazard in alpine environments worldwide. In the United States snow avalanches kill more people on an average annual basis than earthquakes or landslides. This paper summarizes a two-year study of temporal changes in the spatial variation of snowpack properties at the scale of individual slopes. Knowledge of such variations in snow stability and snowpack properties, and how they change, is critical for understanding and predicting snow avalanches. We measured weak layer shear strength and micropenetrometer hardness in the field to quantify snowpack stability and snowpack structure. Our

results suggest that some measures of spatial variability increase through time, providing one possible mechanism for increasing slope stability. Due to the difficulty in quantifying the exact spatial structure (and how it changes) of slopes in the field using current technology, we also developed numerical techniques to quantify the potential error when measuring and describing spatial structure, and a cellular automata model to assess the effect of spatial structure on slope stability. These numerical approaches confirmed the difficulty in quantifying temporal changes in spatial structure, as well as providing evidence that small-scale (on the scale of 1 to 10 m) increases in spatial variability can have a very strong stabilizing effect on avalanche potential. Future work utilizing new non-destructive tools like radar may help to better quantify temporal changes in spatial variability. In the meantime, the spatially variable nature of the snowpack continues to be a primary source of uncertainty for professionals and recreationists assessing avalanche conditions.

Trevor L. Birkenholtz, Ohio State University. Email: birkenholtz.1@osu.edu; *The Capacity of Irrigation Technology in Socioecological Change: Irrigated Landscapes, Produced Scarcity, and Adaptive Social Institutions in Northern India*

Over the past thirty years, twenty million tubewells have proliferated across India during its Green Revolution. Nearly two million of these are in Rajasthan, India's most arid state and the site discussed in this paper. Today, the tubewell continues to flourish even as groundwater overdraft is accelerating throughout the region. The degree to which this rapid technological diffusion has transformed groundwater based socioecologies is not clear. What capacity does this technology have in motivating socioecological change and differentiation? Following Mitchell (2002), this paper attempts to examine the role of technology and non-human nature, such as groundwater and soil, in social and ecological change to render the issue of power and agency a question rather than an answer. The results of this analysis suggest, first, that there is differentiation in agricultural income and productivity among tubewell adopters that mostly follow traditional axes of difference. Second, findings show that this inequality is partly offset by the creation of new social institutions: tubewell partnerships. These tubewell partnerships, however, both enable and constrain the production of new socioecologies. So that, third, at different moments in the economic process, the tubewell has different capacities to effect its associations and bring about socioecological change, including the creation of new forms of social and individual institutions and land(water)scape change.

Philip D. Birnie, Ohio State University. Email: birnie.1@osu.edu; *Relocation and Co-Location of Small Businesses in the Context of Gentrification*

Over the past few decades, urban "redevelopment" projects have drastically altered countless business districts throughout U.S. cities. Through the execution of these projects, incoming establishments linked to corporations displace locally owned small businesses. Amid formidable challenges, some small business owners nonetheless, are able to relocate and remain in business. There exists a substantial literature discussing how small business owners utilize networks to address challenges despite limited resources and also a literature that recounts the ramifications of displacement due to gentrification. However, to date, a coupling of these literatures has not occurred. Specifically, I ask: how do small business owners utilize networks to overcome the challenges of displacement and remain in business? Drawing on the experiences of displaced small business owners from a redeveloped business district adjacent to the Ohio State University, I synthesize these two issues, analyze how small business owners' networks permit relocation, and sometimes encourage co-location in the context of gentrification.

Keywords: gentrification, small business, networks, displacement

Kristina Monroe Bishop, University of Arizona. Email: kmbishop@email.arizona.edu; *How the End of Apartheid Changed Medicine: The Media's Construction of Biomedical and Traditional Treatments for HIV/AIDS*

From 1990-1994, the apartheid system was dismantled in South Africa ushering in a new democratic government. Concurrently, HIV/AIDS reached epidemic proportions and currently at least one in five adults is HIV positive. The South African government's response to HIV/AIDS has been widely covered in the news media. Denial and stigma are rampant within the government and within the local communities. AIDS activists and foreign governments criticize the South African government's promotion of 'traditional medicine' over biomedical treatments. Even as biomedical treatments for HIV/AIDS become more widely available in South Africa, many with the disease use traditional medicine with the government's support. What materials constitute 'traditional medicine?' A scan of national and international media lists everything from herbs, to vitamins, to garlic, and various other "natural" products. Biomedicine, however, is constituted of western pharmaceuticals, often touted as 'toxic' by South African government officials. Using textual analysis of the media publications from 1990 to the present, I will examine how ideas of African traditional practices which use "natural" products are portrayed by the American, British and South Africa media. I will examine how biomedicine, as a scientifically proven form of treatment, is portrayed both by government officials and by AIDS activists. I will explore how the post-apartheid state has rendered legitimate particular types of traditional medicine in light of the rhetoric of the African Renaissance and explore the discussions that arise from this newfound legitimacy over what materials constitute medicine.

Alpine glaciers play a critical role in climate dynamics and landscape evolution. Although global observations indicate general glacier retreat, glacier sensitivity to climate forcing in the Karakoram is complicated due to complex topography, debris-cover variability, and climate feedback mechanisms. Consequently, we conducted a study on the Baltoro Glacier system and assess various glacier parameters related to glacier mass balance and erosion. Fieldwork was conducted in the summer of 2005. Multi-temporal satellite imagery, satellite-derived, and SRTM digital elevation models were used in modeling and change-detection studies to assess energy-balance parameters, ice-volume and debris-cover conditions. Our results indicate that ablation is highly variable as a function of topography and debris-cover characteristics. Field results indicate a downwasting rate of 6 cm day⁻¹ and ice depths of ~ 85-300m from the terminus to the base of K2. Variations in supraglacial lake impoundments and catastrophic flooding were observed. Geochronology results reveal young glacial stages which document rapid valley incision rates. Our results indicate dynamic surface conditions, production of significant amounts of meltwater, and highly variable glacier topography. We collectively discuss these results in the context of glacier sensitivity to climate forcing and glacier erosion and landscape evolution.

Michael C. A. Bitton, Louisiana State University. Email: mbitto1@lsu.edu; *Interpreting Geomorphic Change in Coastal Areas: Hurricane Katrina's Impact on Port Fourchon, Louisiana*

This paper examines changes to the Port Fourchon, Louisiana, area as identified through remotely sensed imagery. Pre- and post-Hurricane Katrina Landsat TM and Radarsat data were used to identify changes in the Fourchon area by means of comparing changes to the land-water interface. Results indicate that there has been a landward migration of Racoon Spit, and the total size of the island is decreasing, thus leaving the area west of Port Fourchon more vulnerable to wave-energy impacts. As well, sandy barriers across bays east of Fourchon were breached during Hurricane Katrina exposing more land area to potentially higher wave energy. However, these barrier forms were recovering soon after the storm. Although Port Fourchon suffered minimal damage, a direct blow from a severe hurricane could have dire consequences and potential damages could be amplified if the shoreline continues to migrate further landward, thus minimizing the protective capacity of the current coastal system.

Roger Bivand, Norges Handelshøyskole. Email: Roger.Bivand@nhh.no; *Spatial structure, autocovariance, and model mis-specification: eigensystem approaches*

The eigensystem approach to models of spatial data offers both opportunities and challenges in application. The most obvious is the choice of representation of spatial structure, which may be related to knowledge of micro-level factors driving interaction. When no micro-level hypotheses are present, the choices involved in selecting suitable spatial link matrices are non-trivial, and affect the outcomes of analyses. A further choice concerns the representation of the autocovariance in the model, placing it in the error of the full model (spatial error), or the null model with dependence only affecting the response variable (spatial lag). Finally, it is possible that the eigensystem approach, when applied to a mis-specified model, that is a model with other mis-specification problems than those addressed in the spatial link matrix, will lead to inappropriate inferences. The paper discusses these choices in relation to ongoing concerns in applied spatial statistics using a range of examples and implementations.

Keywords: Spatial statistics, Spatial autocorrelation, Spatial analysis

Mark D. Bjelland, Gustavus Adolphus College. Email: mbjelland@gustavus.edu; *Millennial Dreams: Greenwich Millennium Village and the Paradoxes of Creating Environmentally Sustainable, Socially Inclusive Communities*

In 1999, the U.K.'s urban task force headed by superstar architect Lord Richard Rogers issued a report entitled, *Towards an Urban Renaissance*. The report made a strong argument for the importance of new models of sustainable urban design in order to stem the destruction of the British countryside and reinvigorate urban cores that were falling victim to neglect and dereliction. One outcome was the Blair government's creation of a set of millennium communities that were to demonstrate the application of sustainability principles to British cities. The most prominent and most advanced of the seven millennium communities is Greenwich Millennium Village which opened just in time for the millennium celebration. This study draws upon the perceptions and experiences of a sample of residents of Greenwich Millennium Village to assess whether the social and environmental goals of the project are being met. The results suggest a number of paradoxes for large government-sponsored, urban sustainability demonstration projects.

Email: george.boehlert@oregonstate.edu; *Rockfish, tree rings, and climate: marine-terrestrial linkages in the Pacific Northwest, USA*

We apply dendrochronology techniques to otolith growth increments of long-lived splitnose rockfish (*Sebastes diploproa*) in the northeast Pacific to i) generate multidecadal growth chronologies, ii) relate growth to ocean variability, and iii) compare with tree ring chronologies throughout the US Pacific Northwest. Rockfish otolith growth increments were thin sectioned, measured, and crossdated verified using COFECHA. The chronology was related to upwelling, sea surface temperatures, ENSO, and the PDO, and significantly ($p < 0.01$) correlated with indicators of cool, productive ocean conditions, especially during the winter and spring months. February upwelling accounted for 50% of the variance in the splitnose chronology. The chronology also significantly ($p < 0.01$) and negatively correlated with high elevation tree ring chronologies located throughout the Pacific Northwest. Tree-ring chronologies that correlated with the splitnose rockfish chronology shared a sensitivity to winter and spring ocean variability, and allowed a reconstruction of splitnose rockfish growth to the year 1600 AD. This approach revealed significant climate-driven linkages between the growth of organisms at 300 m depth in the Pacific Ocean with those at 2,000 m in the Cascade and Sierra-Nevada Mountains. We also report on pilot projects involving yelloweye rockfish, geoduck clams, and freshwater mussels.

Keywords: dendrochronology, Pacific rockfish, climate

Jennifer L. Black, MS RD, New York University. Email: j.black@nyu.edu; James Macinko, PhD, New York University. Email: james.macinko@nyu.edu; *Neighborhoods and Obesity: The Roles of Area Socio-demographics, Food Availability and the Physical Environment*

Purpose: In addition to individual factors such as genetics, SES, and gender, evidence suggests that neighborhood socio-demographics, food availability and the physical environment are determinants of obesity. Findings from a systematic literature review on neighborhood determinants of obesity will be presented. Methods: PubMed and PsychInfo were systematically searched using the keywords: neighborhood, obesity, SES, income, racial composition, income inequality, multilevel, food, supermarket, grocery store, farmers market, price, fast food, built/physical environment, physical activity, crime, and transportation. Fifty-one studies were identified, coded and abstracted. Results: Decreased

neighborhood SES is consistently associated with obesity, but the roles of income inequality and racial composition remain equivocal. Neighborhood SES and race are associated with access to healthy food, supermarkets and exposure to fast food. Access to fitness facilities, green space, land use and walkability are associated with increased physical activity and reduced obesity, while graffiti, perceived crime and traffic may promote weight gain. A small number of studies have assessed the associations between single neighborhood variables and obesity, but to date, no single conceptual model or assessment tool comprehensively describes these factors and their relationships. Seldom have protective neighborhood variables been assessed in concert with obesogenic factors. Consequently, the overall neighborhood effect on obesity may have been over- or underestimated. Conclusion: We have proposed the Neighborhood Obesity Model (NOM) to illustrate the relationships between individual and neighborhood determinants of obesity and a Neighborhood Obesity Index (NOI) to quantify these effects. Next steps include testing the model and index using data from New York City.

Keywords: neighborhood, obesity, food, physical environment, socio-demographics

Jason Kenna Blackburn, PhD, Louisiana State University. Email: jblack6@lsu.edu; Kristina M McNyset, PhD, US EPA (ORD). Anthrax, caused by *Bacillus anthracis*, threatens public health as a zoonosis, and can lead to massive economic losses in livestock and wildlife. This was evident with two of the largest North American outbreaks in several years in the 2005/2006 summers. Despite this, our understanding of anthrax natural ecology is weak, yet necessary for cost effective control within its endemic range. While traditional control response of annual vaccination, outbreak site management and herd treatment is effective for livestock it needs to be made more efficient, and make better use of recent scientific advances. This approach is untenable in wildlife, therefore demanding a need for increased surveillance and improving our understanding of *B. anthracis* distribution. Ecological modeling and GIS-based analyses can provide methodologies for predicting the spatial distribution of anthrax, while at the same time GIS-based surveillance systems can be employed to track disease and response in real-time. Reliable spatial predictions of endemicity allow control programs to target and monitor specific animal populations, which pays off in greater efficiency and quicker recognition of unusual outbreaks. This paper will review current ecological modeling approaches used in anthrax prediction. Model predictions for the distribution of *B. anthracis* will be presented for the contiguous United States. These models provide insight into biogeographic affinities across landscapes and allow for an evaluation of the species' success within an evolutionary ecology framework. Integrating disease predictions and GIS-based tools also identify gaps in vaccination and control efforts and improve response time through democratization of data and farmer education programs.

Keywords: anthrax, ecological niche modeling, GIS-based surveillance, wildlife, livestock

Chris Blackden, MA, University of Kentucky. Email: rubinfarr@hotmail.com; Metasovereign: Modes of Power in the WTO

Theorizing the WTO in terms of sovereignty opens up a number of interesting questions. Does the concept of sovereignty have a useful theoretical role in a governmental framework where power is conceived of as dispersed and capillary? How do we link the seemingly remote and distant abstraction of the WTO with embodied actors on the ground? How do we treat a case where two sources of sovereignty operate in the same territory and over the same subjects? Where does violence fit in where a sovereign authority has no military apparatus? Drawing upon the work of Foucault, Mitchell, and Agamben, we can think of the WTO as a set of circulating references that create the effect of a central sovereign reference point. Such reference points of authority need not be territorially exclusive, as in the traditional nation state. With the rise of multistate organs like the WTO, such arrangements of overlapping sovereignty may be becoming the norm.

M. Jason Blackman, UBC School of Community and Regional Planning. Email: mjason.blackman@gmail.com; Broadening the Creative Paradigm in Vancouver

Vancouver has experienced twenty years of escalating real estate values. During this period, residential megaprojects located in the peninsula led to a revalorization of the downtown core by the new middle class. Subsequently, Vancouver has attracted much attention due to its high livability rankings. This

paper will argue that these successes often serve to eradicate spaces where vernacular activity is situated. Specifically, because land in Vancouver is so valuable, the activities and uses that occur on urban space are highly regulated. In addition, the insertion of predominantly residential land uses in close proximity to areas that traditionally served more diverse functions ranging from industrial production to night-time entertainment/performance spaces has led to conflict over the use of public space and externalities such as noise and traffic. The impacts of related government policies and programmes in Vancouver, particularly those at the municipal level, are outlined and assessed. Key challenges and barriers for the expression of vernacular creativity, in particular the visual arts and other spontaneous forms of creativity in the public realm are identified. This paper offers an analysis that exposes the limitations of the current conception of livability and makes recommendations for a broader of the definition of livability that includes provisions to ensure that spaces of vernacular creativity are nurtured and protected in the city of Vancouver.

Keywords: vernacular creativity, inner city, livability, public space

Eric M. Bladh, California State University, Los Angeles. Email: embladh@gmail.com; John Kirchner, PhD, California State University, Los Angeles. Email: jkirchn@earthlink.net; Transit Oriented Developments

Transit villages, or transit-oriented developments, have become increasingly popular in the urban world, but are sometimes caught up in controversy over justifying their existence. These types of developments need to validate their usefulness through careful scrutiny of their roles in meeting community needs, being sure that they combine the advantages of mass transit with careful community and land-use planning. This paper takes a look at the transit oriented development model (TOD) and discusses its pros and cons for new or redeveloped urban centers across the nation. It also reviews one proposed development in the Metropolitan Los Angeles area, considering its conceptual framework and possible weaknesses, and offers suggestions to help capture the highest possible use of transit for village residents. Such independent reviews can be used by both planners and developers for optimal planning and implementation of TOD's.

Keywords: tod, transit oriented development, transportation, urban planning

Jacob Blair, University of Oregon. Email: jblair@uoregon.edu; Map users & symbolization: Interactions between spatial ability and visual search.

I am investigating whether a subject's measured spatial ability has a relationship with measured times to completion (TTCs) in a map search task. In addition, I will also discuss the mitigating effects on TTCs that different visual variables have. Finally, basing my analysis on visual search theory, spatial ability theory and domain expertise theory, I will look into the interaction between the effectiveness of a map's design and the ability of the user of the map.

Virtual globe programs such as Google Earth can be used as an easily accessible platform to communicate relevant geospatial data to the public. This popular software program is an interactive map of the Earth that can display user-generated geospatial datasets stored in Keyhole Markup Language (KML) format. These KML files can be generated automatically or exported from popular geographic information system (GIS) programs such as ArcGIS. Currently, the U.S. Geological Survey (USGS) provides real-time, global earthquake epicenter locations, along with Shakemaps and "Did You Feel It?" maps in KML format to make the data more widely accessible. Methods are now being generated to convert geologic hazard maps in the San Francisco Bay Area into KML format to accompany the earthquake data. Although the USGS, California Geological Survey (CGS), and other groups have collected a wealth of geologic information in the Bay Area, little has been done to organize and provide this data in an accessible manner. By converting the geologic maps into KML format, they can be downloaded and viewed as overlays on the aerial imagery and 3D terrain provided in Google Earth. This project presents the methods used to convert important geologic information such as bedrock geology, liquefaction susceptibility, faults and fault zones, landslides, flood zones and various shaking scenarios in the Bay Area into KML. As a result, these methods can provide quick and accessible decision making support in the form of post-earthquake information to emergency response agencies, as well as public and scientific audiences.

Megan K Blake, University of Sheffield. Email: m.blake@sheffield.ac.uk; Lucy Crane, University of Sheffield. Email: L.Crane@sheffield.ac.uk; *Moulding food*

Research on food production has focused on the transitions foods make as they travel from farm to fork. Our paper aims to extend this research by moving beyond the economics of food with a focus on what happens to food once it enters the home and is taken up by household members. The temporality of food states brings to the front a complex myriad of connections, disconnections and reconnections between family members and food, invigorating institutions to moments of practice. Specifically, the moments between shopping and cooking and cleaning become defining moments where the questioning or blind acceptance of social norms occur, thereby exposing the structuring framework that is under the surface. By reflecting on and comparing the practices of several middle class families in the UK, the clash between food institutions and the practice of everyday life are highlighted, which in turn illuminates the ways that family members more broadly engage with and become members of particular social groups.

Keywords: Food, family, institutions, everyday life, practice

R. Denise Blanchard-Boehm, Texas State University. Email: RB06@txstate.edu; William A. Bass, M.S., Houston-Galveston Council of Governments. Email: William.Bass@h-gac.com; "Assessment of Risk Perception Based on Prior Flood Occurrences in South-Central Texas: The Influence of Cartographic Visualizations and Experience on Accurate Risk Perception"

Natural hazards are normally occurring events, and pose a range of risks for society. Risk perception research studies are especially useful for determining actions people may undertake, or may not undertake, due to a lack of understanding or incorrect perception of risk. The majority of risk communication and risk perception research conducted in the past twenty-five years have utilized traditional forms of cartographic products. This research focuses on participants experience with flood hazards, and how new techniques in Geographic Information Systems and Cartographic Visualization might influence one's perception of risk associated with historical precipitation events and their potential for flooding.

Benjamin L. Blandford, MA Student, University of Kentucky. Email: Benjamin.Blandford@uky.edu; *Structured Public Involvement in Land Use Planning*

Theory in urban planning has tended to be either process oriented, such as through community participation, or outcome oriented, such as through new urbanism. This paper describes a new tool for use in urban planning, one that acknowledges the principles of new urbanism and emphasizes the process of Structured Public Involvement. This process attempts to resolve the problems of procedural justice that have plagued urban planning. This paper also describes the implementation of this tool in Franklin - Simpson County, Kentucky. This small community in southern Kentucky has just begun to feel the pressures of development from the neighboring growing cities of Nashville, Tennessee and Bowling Green, Kentucky. Fearing the onslaught of suburban sprawl, concerned citizens united and invited a consortium from the University of Kentucky to help them identify and implement specific planning strategies aimed at managing growth. This paper demonstrates how, by using the process of Structured Public Involvement at several public meetings, the citizens were able to document their preferences for land development patterns that, unbeknownst to them, were also consistent with the principles of smart growth.

Keywords: Urban Planning, Public Involvement, Smart Growth

Paul W. Blank, Humboldt State University. Email: pwb1@humboldt.edu; *Shifting Orientations in Mediterranean History*

The Mediterranean Sea has witnessed shifting orientations in its long history. In the Ancient World, the most important divide in the sea was between east and west, whether civilized east, barbarian east, or, in later centuries, Greek east, Latin west. The east-west divide reappears periodically, as it did during the civil war in Bosnia in the 1990s. A north-south schism first appeared in the Mediterranean during the first millennium BCE. In this period, Greeks colonized the northern littoral and Phoenicians colonized the southern littoral. The pattern of Indo-European north and Semitic south reappeared dramatically with the Arab-Islamic invasions of the seventh and eighth centuries CE. This was a major reorientation, which spelled the end of the ancient world and the beginning of medieval times. In this context, the ideas of Henri Pirenne once again become germane. Despite a reprise of the east-west orientation during the Renaissance, the north-south divide came to dominate modern Mediterranean history. As Europe developed, the southern Mediterranean languished, until the entire southern littoral fell under European colonial control during the nineteenth and

twentieth centuries CE. Even after the retreat of formal colonialism, the north-south divide remains salient, with a prosperous, developed north dominating an impoverished and unstable south. As policymakers confront the dangers of this north-south schism, it is important to be aware of the deep historical roots of the Mediterranean's shifting orientations.

Keywords: Mediterranean, schisms, ancient history, Renaissance, Pirenne

Alison Blay-Palmer, Queen's University. Email: palmera@post.queensu.ca; *Sustainable food systems: A study in relativity and relationality*

Building links between eaters and growers is a challenging task. This paper follows the creation of an on-campus farmers' market at Queen's University (Kingston, Ontario) in the fall of 2007. The enthusiasm and voracious demand for local food by the students and from the university and food service institutions contrasts sharply with the actual supply capacity on the part of the growers. The (re)creation of direct farmer - eater ties clearly exemplifies the relational and contingent nature of local food systems. By rebuilding local ties and moving away from distanced and homogeneous connections typical of the industrial food system, one discovers the personal stories that are the essence of political, social, ecological and economic interaction. This paper makes the point that post-structural and political ecology interpretations are inevitable and essential to framing and understanding these complex, heterogeneous relationships. Only multifaceted and dynamic theoretical perspectives suffice as we unravel the nuanced and layered stories that are typical of sustainable local food systems.

Keywords: farmers' market, political ecology, post-structuralism, Ontario, sustainable food system

Jiri Blazek, Charles University. Email: blazek@natur.cuni.cz; *Regional development in the Czech Republic - from divergence to stabilization?*

The paper aims to challenge (on the example of the Czech Republic) the prevailing view about predominating divergent tendencies of regional development in Central East European post-communist countries. Paper starts with outline of convergence/divergence debate from both theoretical and methodological viewpoints. Secondly, empirical analysis of development of regional disparities during the post-communist period was performed on two hierarchical levels (14 regions and 70 districts) in order to test several research hypotheses. Moreover, the districts were arranged into two separate groups - metropolitan and non-metropolitan regions as development potential of these two groups of districts differs significantly. The main hypotheses are: 1) a partial shift of traditional socioeconomic axis from traditional North-West - South-East direction to new West - East direction as a result of changed geopolitical situation, 2) stabilization of scale of regional disparities since the turn of millennium, 3) shift of differentiation from regional to microregional level. On the basis of analysis of trends of development of regional disparities of selected key indicators it can be concluded that: 1) the partial shift of socioeconomic axis to West-East direction has been confirmed but only in case of some of analyzed indicators, 2) regional disparities generally stopped growing approx. since years 2000/2001, 3) but the disparities continue to grow within the group of metropolitan regions which indicates growing differentiation among regional centers.

Keywords: regional disparities, convergence/divergence, economic and social indicators

Jennifer Blecha, University of Minnesota. Email: blec0013@umn.edu; *'If You Get To Know Those Animals, You Really Love Them': 'Moral Proximity' And Urban Livestock Agriculture*

The past century has seen the rise of the industrial agri-food system, which for livestock animals has increasingly meant life and death in enclosed factory-like facilities that are kept at a physical and psychological distance from urban consumers. In stark contrast to this dominant system, the past decade has seen a growing number of urban Americans begin keeping small numbers of livestock animals close to home, for example raising backyard chickens or participating in a community agriculture project including dairy goats or beehives. This paper examines how dominant economic systems and political discourses have objectified animals as raw materials in the industrial production process, and how these relations are enacted spatially. I consider to what degree animal confinement facilities and slaughterhouses might be understood as Agambian 'spaces of exception' where beings have been reduced to such a status that anything can be done to them. This paper also draws on work in feminist political geography (particularly Hyndman 2007) to highlight embodied practices that produce situated knowledges with concrete political effects. Through qualitative research with small-scale urban animal-keepers, I explore how the interactions these individuals have with their animals affect their perception of animal subjectivities. These practices challenge and disrupt agri-industrial assumptions and power relations by bringing animals into physical and 'moral proximity' (Ó Tuathail 1996) with the people who benefit from their bodies and labors.

Keywords: animals, proximity, livestock, care, moral geographies, subjectivities, urban

David Bleeden, University of Illinois-Chicago. Email: dbleeden@att.net; *Conjoining Body and Population: Giorgio Agamben's Biopolitics*

Giorgio Agamben has argued that Michel Foucault's biopolitical thesis requires correction, but he leaves the details of the resultant biopolitical framework undelineated, despite it being the foundation upon which his Homo Sacer project rests. This paper endeavors a construction of Agamben's biopolitics. To accomplish this, it first offers a brief exposition of Agamben's project, with particular attention paid to the sovereign choice on exception, the state of exception this choice initiates and their role in the production of homo sacer, bare life. The paper argues that what Agamben calls "the biopolitical body of the West" be understood as the collection of all bare life?which is all human life given Agamben's argument that all life is in some degree bare—or what Foucault called "population." From this conceptualization, the paper explores how Foucault's distinction between discipline and regulation, and specifically the norms thereof, function foundationally in Agamben's project. Agamben contends that deciding on the exception, the sovereign decides upon the inclusion of life in law. That is, the state of exception normalizes human relations such that law can function as theorized in the Western tradition. Norms then generate the paper's argument and Agamben's biopolitical framework is thus developed upon the conceptualization that it is not a matter of the intersection of norms of regulation and discipline as Foucault described, but of their co-articulation. The state of exception is, from this perspective, further theorized as a zone of indistinction between discipline and regulation, body and population, sovereign power and biopower.

Keywords: Agamben, Biopolitics, Foucault, Post-Structuralism

Nat Bletter, City University of New York/New York Botanical Garden. Email: bletter@earthlink.net; *Distribution of Stimulant Plants in the New World and Implications for the Discovery of Chocolate*

Of all the types of psychoactive plants available to humans, the stimulant plants are perhaps the most often used and have quite a wide distribution. In the New World, yerba mate (*Ilex paraguariensis*), guayusa (*Ilex guayusa*), guaraná (*Paullinia* spp.), cacao (*Theobroma cacao*), yaupon (*Ilex vomitoria*), coca (*Erythroxylum* spp.), tobacco (*Nicotiana* spp.), sweet flag (*Acorus calamus*), and mormon tea (*Ephedra* spp.) are some of the more commonly known and used stimulants. Strangely, despite the fact that cacao had a native range extending to northern South America, the seeds of cacao were only discovered by the Mesoamericans to make an excellent stimulating beverage. Looking at a map of the distribution of all of these stimulant plants shows us that one hypothesis to explain chocolate's localized discovery is that the inhabitants of all other areas of cacao's range besides Mesoamerica had many other, more easily prepared stimulant plants at their disposal. Only the Mesoamericans had to resort to the complex process of fermenting, roasting, shelling, grinding, cooking, and frothing of the cacao seeds to make a stimulating beverage because they had no other stimulant plants growing nearby.

Desmond Blik, Concordia University. Email: desmond.blik@gmail.com; Pierre Gauthier, PhD (McGill), Concordia University. Email: pierreg@alcor.concordia.ca; *Neo-liberalism Mediated by Landscape: Morphological interpretations of post-industrial transformation in Montréal, Canada.*

Variability in the reconfiguration of urban residential environments has raised questions concerning the interaction of neo-liberalism with specific local and regional contexts. This paper presents the results of an ongoing case study that seeks to understand the particularity of contemporary residential reconfiguration in an industrial district in Montréal, Canada, by exploring the historical and spatial emergence of its built landscape as a structure influencing the outcomes of economic strategies and forces. By employing morphological analysis, we reveal how contemporary processes of residential redevelopment in the Lachine Canal industrial district can be viewed as an outcome of a dialectic between structural permanencies present in the built landscape and prevailing economic forces which privilege privately-funded, internationally-standardised development models. By unveiling the role of the built landscape as a structure mediating neo-liberal privatisation and privatisation, we suggest that the analysis of patterns in the urban structure can serve as a means for comprehending local and regional nuance in the enactment of neo-liberal transformation, especially in cases of the reconfiguration of residential environments.

Keywords: urban, neo-liberalism, privatisation, residential redevelopment, industrial restructuring, built form

Mikhail S Blinnikov, St. Cloud State University. Email: mblinnikov@stcloudstate.edu; Jason R. Lindsey, Political Science, St. Cloud State University. Email: jrlindsey@stcloudstate.edu; *Green Youth of Eurasia: Growing up in the Post-Soviet Space*

We address the fundamental question of spatiality of youth development from the perspective of theory and practice in natural education programs for high school and early college age in 3 post-Soviet republics: Russia, Ukraine and Kazakhstan. While it is undeniable that the three states have increasingly diverged with respect to their economic and political endeavors over the past 15 years, much remains the same in traditionally apolitical corners of the society with a high degree of social inertia, i.e., after-school nature education. We analyze existing types of programs and projects in 3 countries based on certain geographical parameters in a largely qualitative study that draws upon direct observations, participation, and limited questionnaire use. Specific regions of study include central Russia, South-Central Siberia (Novosibirsk Oblast and the Altai), Kyiv, Odessa, Almaty, and Oskemen regions. The role of geographic factors in shaping the similarities and differences in the naturalist programs of these areas is discussed, as well as their degree of change from the Soviet period.

Stefano E. Bloch, Ph.D Student, University of Minnesota, Twin Cities, Department of Geography. Email: bloch027@umn.edu; *The "prop" industry: locations and collections of a film industry service provider*

The break-up of the major motion picture studio system as a result of the 1948 U.S. v. Paramount anti-trust decision set the stage for an increase in the number of Hollywood's flexibly specialized production firms. This shift from a vertically integrated studio system to a vertically disintegrated production network generated a new population of independent studio services and adjunct service providers over the next several decades. In 1986 Storper and Christopherson predicated that small, newly independent service providers would continue to agglomerate around the existing Hollywood studios over the next several years, holding the film industrial complex together in Los Angeles. My research shows that in the twenty-years since Storper and Christopherson's publication of "The City as Studio; the World as Back Lot," the properties, or 'prop,' industry has been particularly illustrative of the rapid trend toward spatial agglomeration of adjunct studio services. The prop industry has actually experienced a boom in growth, arranging itself into three distinct clusters in Hollywood, the San Fernando Valley, and West Los Angeles. Aside from its proximity to existing sound stages, the formation of these clusters is also the result of personal relationships among prop-house owners, and the shopping patterns of set-dressers and prop-shoppers. The geography of the prop-house industry is illustrative of current industrial locations theory, but it is the interesting stock of futuristic furniture, vintage memorabilia, cast-off medical and military equipment, and fabricated hand-props that is the key to the difference in quality of this Hollywood studio service.

Keywords: Hollywood, film industry, economic clusters, props, properties supply, Los Angeles

Email: nbates@uic.edu; Judy Birgen, Chicago State University. Email: jbirgen@csu.edu; *Mapping Food Access as Patterns of Retail Investment: Examples from Chicago*

Studies of low food access or "food deserts" are being completed nationwide and have been very useful for community organizations. These studies usually focus on lack of access to chain supermarkets. The Northeastern Illinois Community Food Security Assessment is an in-depth study of food access in the Chicago area, utilizing GIS, door-to-door survey, market basket, and qualitative approaches. The GIS portion of the study utilizes a new approach to create distance rasters from residential addresses in the Chicago area to the nearest chain, independent, and discount supermarket, as well as food pantry and fast-food restaurant. Data on food-stamp purchasing and spending by ZIP Code is also examined. The other portions of the study enlighten this data to allow us to understand better the impacts of differences in food access on neighborhood residents. This deep analysis of food access, involving many types of stores, reveals possible reasons for the emotional impact of "food desert" studies. Differing levels of food access often act as a marker for residents of how well their neighborhood is served by the mainstream economy. Viewing food access in this way ties such studies to theories of urban change and community investment and under-investment. Measures of food access might be used as one measure of retail investment that particularly affects residents, emotionally, economically, and physically. This presentation will discuss the assessment as a whole, the GIS methodology and results, and tie these results to larger issues of retail investment that rise from the rest of the study.

Keywords: food deserts, retail geography, Chicago, supermarkets

Peter Blodgett, Huntington Library. Email: pblodgett@huntington.org; *Developing America's Playgrounds: National Parks and the Evolving Vision of Outdoor Recreation 1916-1939*

The 1920s and 1930s witnessed an enormous increase in the volume of American domestic tourist travel, powered by the expanding private ownership of personal automobiles and the widening availability of paid vacations. Even during the depths of the Great Depression, large numbers of Americans still possessed the resources to indulge their wanderlust. Among the most popular destinations for these new travelers were the scenic wonders of the fledgling national park system, organized in 1916. Many tourists, however, sought more active diversions than simply enjoying the contemplation of physical beauty. Their growing enthusiasm for many different kinds of outdoor activities imposed new and greater demands upon the nation's recreational resources, especially those managed by the federal government. To probe the relationship between national parks and the increasing American appetite for outdoor recreation, this paper will focus upon the struggle during the years between World War I and World War II to reconcile conflicting visions of how Americans might most effectively enjoy protected landscapes. In particular, the essay will investigate the frequent reliance by the federal government in this period upon private means to achieve public ends. This examination will include not only the intertwining of national park concessionaires with national park management but also the broader collaborations between private enterprises and public agencies to promote the use of such landscapes as documented by contemporary travel literature and advertising and the records of federal agencies such as the National Park Service and the National Conference on Outdoor Recreation.

Nicholas Blomley, Simon Fraser University. Email: blomley@sfu.ca; *Homelessness and freedom? Why Waldron was wrong*

In an influential paper in 1991, Jeremy Waldron laid out a powerful argument against laws regulating the homeless. Arguing from first principles, he notes that all human liberties must be exercised somewhere. Property rules, for Waldron, are a central device through which actions in space are regulated. The particular plight of the homeless person, however, is that 'there is no place governed by a private property rule where he is allowed to be' (299). This means, of course, that the homeless person is forced to live her life out in the only space not governed by such rules - the streets, parks and sidewalks of the city. Superficially egalitarian rules that govern behaviour in public (regulating sleeping or urinating in public, for example) are shown to be particularly punitive for the public place. Denied access to private property, the homeless are 'comprehensively unfree' (302) under such a regime. While helpful in making sense of the particular plight of the homeless in relation to dominant property relations, Waldron's treatment does not explain the ways in which homelessness itself may partly be produced, regulated and legitimized through property. Put more simply, the predicament of the homeless, for Waldron, is that they are outside property: I suggest below that their problem may be that they are utterly entangled within it. Waldron relies on a liberal geography of rights: I offer a more critical reading.

Keywords: homelessness, rights, property

Gina Bloodworth, Central Washington University. Email: bloodwog@cwu.edu; *"Innovation" And Confusion Concerning Water Rights In The Rapidly Developing West.*

In the fractious world of water politics, some new innovations in the re-allocation of water rights in the west are the proving ground for the next generation of water managers and water users. In a sharp contrast to the usual arrangement of players and alliances in the irrigation agricultural economy, some senior water rights holders in the Columbia River Basin in Washington State have recently embarked on a water rights swap like no other seen before. The logic underpinning this new arrangement is to reduce loss of surface water via transport, allow for increased in-stream flow, while making the current water users more efficient. A cartographic representation of senior water rights, irrigation canal and diversion networks, and groundwater availability provides a geographical tool for understanding both how the new water rights allocation might work, and what is still unclear about surface-groundwater interaction. It remains to be seen exactly what the larger implications of this redistribution of the surface water flow will mean to the hydrologic regime of Kittitas County, and the Yakima River sub-basin of the Columbia River system. Can water managers view this as solving one water problem by creating another, or as a template to be replicated in other areas of the arid mountain west?

Keywords: water resources, policy, Columbia River, Washington state

Shauna M Bloom, Phd Candidate, University of Guelph Department of Geography. Email: sergeippa@yahoo.com; *Exploring Local Food Systems in Rural Ontario*

This research will address a gap in the literature concerning rural food systems and the importance of non-farm intermediaries in linking farm and non-farm actors. It will further explore the discourse surrounding food quality in the local food system. The significance of food in the agro-food system has shifted research from a mutually exclusive dualistic approach, one where research on production was separated from the research on consumption, to a more integrative approach where linkages and networks along the entire agro-food system are explored. Non-traditional intermediaries, such as local health departments, are emerging as important players in connecting farm and non-farm actors. Many local food system initiatives are organized around three main themes (1) community food security and access to healthy food, (2) amenity and rural development, and (3) sustainable agriculture. These three themes can be found, in their various forms, in many initiatives around Ontario. From an initial informal survey of local food systems it is clear that many initiatives are focused on providing fresh food to consumers while providing alternative outlets for farm products. Indeed, much of the current literature on local food systems reflects this focus on fresh quality food. Huron County, Ontario is a rural agricultural county with no large urban center to send its agricultural products, yet local food initiatives are emerging. This research will explore one local food initiative in Huron County, the Field to Table Network. This research will document the challenges of developing and maintaining a local food system with multiple agendas.

Keywords: local food, food quality, agro-food networks

Virginia L. Blum, Professor, University of Kentucky. Email: vblum1@pop.uky.edu; Heidi J. Nast, DePaul University. Email: hnast@depaul.edu; *Getting the 'Drive' Right: Psychoanalytic Theory and Social Science Method*

This paper explores the utility of psychoanalytic insights and methods in social science work. We argue that psychoanalysis has always emphasized the social and material to the extent that it addresses the production of subjectivity through the organism's interaction with its environment. Psychoanalytic understandings of this interaction differ radically, however, between Freudian drive theory and later non-Kleinian theories of object relations. Whereas the latter tends to premise the vicissitudes of the subject upon idiosyncratic experiences at the hands of caregivers, the former insists on psychical forces that extend far beyond individuals and their narrow family circumstances. Accordingly, Freudian drive theory draws upon and documents arrangements of the social to create theoretical/interpretive frameworks that lie beyond the idiosyncratic utterances of the analysand. In this sense, Freudian psychoanalytic judgments depend upon, and are riveted to, the social, and arguably psychoanalytic 'cures' involve re-situating the individual in socio-linguistic space. We preface our argument by outlining two major developmental theories in psychoanalysis: Freudian drive theory and the deficit models of object relations theory. We suggest that some of the difficulties geographers face in assessing how to decipher the "unconscious" from sociospatial data might be resolved by differentiating between these two very different theories. We argue that Freudian drive theory is better equipped to handle the social in that it presumes non-idiosyncratic contexts. We end our paper by considering several examples to show how the unconscious might be accessed through analyzing a variety of material/social conduits through which it circulates.

Keywords: psychoanalysis, the unconscious, drive theory

Dan G. Blumberg, Ben-Gurion University of the Negev. Email: blumberg@mail.bgu.ac.il; *SAR and hyperspectral data; a New era in spaceborne remote sensing of the environment*

In the next couple of years at least two SAR high resolutions payloads will be launched, and during the next decade many more. These are complemented by hyperspectral missions with their advantages too. Optical remote sensing is being used routinely in environmental and agricultural management and studies. Radar data which is often used in geophysical studies is not utilized heavily in environmental and agriculture practice and specifically X-band data are not commonly used. In this presentation unique high resolution polarimetric X-band radar data from Elta Systems Inc test bed SAR flown onboard a Boeing 737 aircraft are shown alongside hyperion and other hyperspectral data that can be used. The results shown are for arid environments where the potential use of X-band SAR for agriculture and bio-geophysical studies alongside hyperion data will be demonstrated. Most importantly the detection of subpixel vegetation clusters and other issues that were difficult to assess in the arid areas will be shown.

Keywords: Remote-Sensing, SAR, Geomorphology, Vegetation

Kenneth Blumenfeld, University of Minnesota. Email: blume013@umn.edu; *Convective Variables as Predictors of Severe Thunderstorm Evolution Over a Major Urban Area*

This paper reports on an ongoing investigation of severe weather frequencies over the Twin Cities Metropolitan Area, Minnesota. Although the densely-populated center of the study area exhibits, on average, three times higher severe weather frequencies than suburban and rural portions of the area, these discrepancies clearly result from the well-documented clustering of severe weather spotters around major urban areas. The center of the area actually becomes a relative frequency minimum for "extreme" events, indicating that clustering of spotters has the effect of "catching" more marginally severe weather episodes. Analyses of radar and atmospheric sounding data indicate that extreme severe weather episodes within this dense urban center are associated with larger values of instability and wind shear than similar episodes in a nearby, non-urban control area. This combination of relatively low extreme event frequencies and higher convective parameter values raises the possibility that such high-end events have lower overall probabilities in major urban areas than neighboring non-urban areas.

Keywords: Severe weather, urban hazards, urban climatology, thunderstorms, extreme events

Mark Allan Blumler, SUNY-Binghamton. Email: mablum@binghamton.edu; *Fire, Grazing, and Environmentalism*

Both fire and grazing constitute "disturbances" in traditional as well as modern succession theory. American ecologists' beliefs re the role of fire in ecosystems have undergone radical reassessment, whereas thinking re grazing has remained more consistent. In contrast, in parts of Europe the trends have been almost reversed. Environmentalists' beliefs have had strong influences on ecological (scientific) thought. When and where fire was/is viewed negatively, the purported harmful effects are strikingly similar to those proposed to result from grazing. In the western US today, there exists the same certainty regarding the supposed harmful effects of livestock grazing that formerly prevailed concerning fire. As was the case for fire, it may be time to re-think the proper role of grazing in ecosystems.

Béatrice Bochet, University of Lausanne Switzerland. Email: beatrice.bochet@unil.ch; *Residential aspirations, back to the city and new urbanism: what is at stake in Swiss cities?*

As with most other European countries, the processes of urbanization have accelerated in Switzerland over the last few years. A new system of urbanization would seem to have imposed itself over the last three decades. It is characterized by the formation of urban spaces that have been increasingly diluted, heterogeneous and fragmented, not only by the greater intensity of flows and dependence on the car, but also by the ever greater ecological imprint of cities. These patterns of spatial development indisputably emerge at the heart of environmental issues. Our main objective being in fine to describe the process of urbanization in Swiss cities and show that the future of such sprawling territories is not fixed. Our research on the ground revealed an evolution in the modes of habitat related to ways of life, work organization and mobility that suggest the possibility of the return of a part of the population to the center of cities (end of the rule of the model of the individual home). The successful implementation of a global policy of control of urban sprawl's negative effects is highly influenced by the adaptation of property offer to the demand of new habitat models satisfying both the necessity of urbanization cost controls (economical, social, environmental) and people's emerging aspirations. These results allowed us to define a strategy to curtail urban sprawl and identify the applicability of principles of new urbanism on the territory of the lausanne agglomeration.

Keywords: urban sprawl, residential aspirations, new urbanism, quality of life

Judith K. Bock, Elmhurst College. Email: judyil@aol.com; *Haps And Mishaps - Experiences of Undergraduate Teaching*

Teaching geography at the undergraduate level has long been permeated by lectures. Undergraduates often take geography classes as part of a required sequence, view it as a requirement, and so are less likely to appreciate its importance to their lives. Utilizing a variety of teaching strategies provides unique ways in how the college student interacts with geography. Integrating geography topics with various disciplines, as well as current events, provides relevancy of geography to the student's life. Fieldwork, which is the essence of geography, engages students in meaningful geographic and educational experiences. Use of technology to enhance - not necessarily teach - geography also

broadens a student's understandings. Meaningful lab assignments, using the "tools of the trade," and discussions using the Socratic method provide extensions to the text. With updated teaching strategies, students begin to see the relevance of geography to their understanding of and interactions in the world.

Keywords: Geography Education

Annemarie Bodaar, University of Amsterdam. Email: A.Bodaar@uva.nl; *Delivering urban renaissance through the revitalization of ethnic neighborhoods as places of leisure and consumption*

In recent years, the commercialization of ethnic neighborhoods has become an important focus of local government agendas aimed at delivering and/or sustaining urban renaissance. Various inner city neighborhoods with high concentrations of immigrants are - despite the accumulation of social problems - revealing itself as breeding grounds for ethnic entrepreneurship or as attractive sites for leisure and consumption. Examples are Brick Lane (London), Kreuzberg (Berlin) or Belleville (Paris). More and more travelers, leisure seekers and others indulge in ethno-cultural events and festivals and gravitate to the centers of immigrant ethnic commerce. Hence, ethnic neighborhoods are playing an increasingly important role in urban revitalization. Under particular circumstances, the commodification of cultural features helps foster the inclusion of both highly skilled and unskilled immigrants in the emerging service economy, and, at the same time, allows them to boost the urban economy. Under which conditions do these ethnic neighborhoods evolve as tourist destinations, which factors contribute to its success and what are the intended and unintended consequences? What is the role of the state and other parties with an interest in these developments in steering this process? And what are the implications for the urban landscape? These questions will be addressed drawing on fieldwork collected in two ethnic neighborhoods in Amsterdam and The Hague in the Netherlands, which in recent years have made a transition from no-go area to areas for tourism and consumption.

Keywords: Immigration, ethnic neighborhoods, tourism, cities, ethnic entrepreneurship, cultural economy

David J Bodenhamer, The Polis Center at IUPUI. Email: intu100@iupui.edu; *Developing a Humanities GIS*

This presentation imagines a future for the use of GIS in the humanities arising from the cultivation of interfaces between the humanities and social sciences. Specifically, it calls for a re-envisioning of the humanities through exploration of theories and technologies of spatialization, that is, through critical consideration of the ways in which the "spatial turn" in the social sciences?and its nascent form in the humanities?can constitute a bridge between these two avenues of investigation into self, culture, community, and humanness. The result will be a fusion of disciplines and methods capable of taking advantage of a uniquely constructed Humanities GIS.

In the global economy, targeted or niche marketing is essential for higher cost producers in the United States. Competing in mass markets with undifferentiated products is difficult, as these markets are more price sensitive, and producers such as China can produce much more cheaply. While government policy cannot reverse global and technological forces, it can help the industry adapt to the challenges and opportunities. Knowledge of what Pennsylvania's markets are, how they are changing, and where the greatest competition lies is necessary to devise strategies to maintain the market or access new markets. The main goal of this project was to determine what markets Pennsylvania hardwood processors currently access, how these processors see their markets changing, and how they view their future. The research included analysis of secondary data and information from a mail survey of the hardwood processors themselves.

Keywords: hardwood processing, industry, markets

Paul Bodnar, Vector Research Group, LLC. Email: paulbodnar@vectorresearchgroup.com; *A Novel Approach to Geographic Profiling*

Current geographic profiling models utilize predefined equations or algorithms to predict the offender's home location. These models are limited because they do not effectively incorporate important environmental conditions into the prediction algorithm. The addition of environmental conditions to the geographic profiling model results in a more accurate analysis requiring less data than needed using other models. With this novel method, in some cases only two or three sites are needed to obtain an accurate geographic profile. This presentation covers the details of the new methodology, and specific case studies will be

presented.

Keywords: Geographic Profiling

Yosef Bodovski, The Pennsylvania State University. Email: yosefb@private.as; Chris Benner, The Pennsylvania State University. Email: cbenner@psu.edu; Racial Segregation in Urban-Rural Continuum: Do Patterns Vary by Geographical Region?

Most research comparing racial segregation across the country takes metro areas as the primary unit of analysis, neglecting the compare differences in segregation at smaller scales within metro areas. Research that does go deeper typically focused on differences between the central city versus the rest of the metro area. Yet classifications between city and suburb are becoming somewhat problematic. As inner ring suburbs have become older, denser and more racially diverse, Central City boundaries no longer reflect real division between what are typically considered urban and suburban areas. This project takes a different approach, using population density as a basic measure for urban-suburban continuum. I use Census 2000 and 1990 block data for White, Black, Hispanic and Asian race groups. Each metro area is divided into four sub areas based on block population density. The information theory index (H) is calculated for each of these sub areas. This index is probably the best measure of spatial segregation since it takes into account all major race groups. It is based on 'entropy' which is a measure of race diversity in particular area, and calculates weighted average deviation of each unit's entropy from the study area entropy. The comparison between four H measures inside particular metro area gives an idea how spatial segregation changes with the level of urbanicity. Comparing areas with the same level of population density in different metro areas one can make a conclusion how different is the race segregation in similar urban areas throughout the country.

Keywords: Race, Segregation, Metro Area

Darcy L. Boellstorff, Ph.D., Bridgewater State College. Email: dboellstorff@bridgew.edu; Soil Carbon and Agricultural Land Management in a Typical Semi-Arid Region of Central Spain

Soils in semi-arid agricultural lands are at high risk of desertification due to a combination of environmental factors that may be further compounded by social and political conditions. The same types of soil management practices that help reduce carbon losses have been shown to convert degrading soil regions into areas where soil organic matter is aggrading. This connection could stimulate the development of payments for farmers under national and regional policies aimed at reducing atmospheric CO₂, while having the added benefit of soil restoration and improved agricultural sustainability in semi-arid regions. However, there is a need for better understanding factors causing spatial variation of certain types of soil carbon to determine regional estimates and farmers potential for involvement semi-arid might have in emissions-trading policy. During June 2006, 42 soil samples under different long-term land management types and landscape positions were collected in the Torrijos region of Castilla-La Mancha, Spain. Preliminary results from lab analyses show significant variation in soil carbon related factors under the different soil management and landscape position types. These results are being used in a geographic information system (GIS) to estimate medium to long-term soil carbon storage for a typical catchment in this region under different long-term land management scenarios.

Jeff Boggs, Department of Geography, Brock University. Email: jeff.boggs@brocku.ca; Ivo Mossig, Institut fuer Geographie, Justus-Liebig Universitaet Giessen. Email: ivo.mossig@geogr.uni-giessen.de; Spatial Shifts of Employment in the German Publishing Industries 1993-2002

This paper examines the locational dynamics of employment change in the German publishing industries. The examination is conducted using Kreise-scale data from the years 1993 and 2002 in addition to other secondary and primary sources. This time and place is chosen for three reasons. Firstly, data at this geographic scale enable us to identify patterns of regional specialization that should arise if agglomeration economies exist at the scale of the city-region in this industry. Secondly, data at this temporal scale allow us to identify the medium-term effects of German reunification on this cultural industry. Thirdly, data at this geographical and temporal scale allow us to observe if patterns of employment change emerge that indicate that processes of circular and cumulative causation are at work in this cultural industry. The paper closes by discussing market size as the limiting factor on regional specialization, and if this explains the patterns we observe in these data.

Rian Bogle, United States Geological Survey. Email: rbogle@usgs.gov; Pat Chavez, US Geological Survey. Email: pchavez@usgs.gov; Miguel Velasco, US Geological Survey. Email: mvelasco@usgs.gov; Ground Based Remote Sensing Systems for Ecosystem Monitoring

Landscape and habitat monitoring at high temporal resolutions, via satellite or airborne imaging systems, is often technically difficult and prohibitively expensive, resulting in the frequent need for low-cost, high-availability field-based instrumentation and data collection systems. The USGS Southwest Geographic Science Team in Flagstaff, Arizona, has designed and developed several field-based systems to address this need. Utilizing low-cost embedded linux-based computers, off-the-shelf commercial data loggers, cellular modems, and radio frequency systems, these systems allow for the placement of networks of field-based digital cameras and environmental/weather monitoring stations in remote locations such as the Mojave Desert and Hawaiian Islands. These systems are being used in studies as diverse as dust-storm genesis and coral-reef health, and have potential across a wide range of landscape and climate change applications. With these systems we are not only able to update and maintain the stations remotely, reducing costs in physical maintenance and data collection, but also monitor landscapes in near real time, retrieving high-density data (such as images) on demand or on regular automated schedules in a secure manner.

Maria Boile, Rutgers, The State University of New Jersey. Email: boile@rci.rutgers.edu; Sotiris Theofanis, Rutgers, The State University of New Jersey. Email: stheofan@rci.rutgers.edu; Empty Marine Container Logistics

With the global container population approaching 23 million TEU (20-foot container equivalent units) and the annual production of new boxes exceeding 2.5 million TEUs, it is estimated that 2.0-3.0 million TEU of empty boxes are sitting in yards and depots around the world waiting for use, depending on the very dynamic nature of container transportation, container building and leasing industries. Stockpiling of containers at the port terminals or at nearby areas is often considered to be a potential environmental hazard and is said to consume valuable land for businesses. On the other hand, efficient container operations, influenced by international practices and governed by global trade patterns indicate that storage of empty containers near by a port is unavoidable. The presentation addresses the very dynamic and multidimensional problem of empty marine container management in a port megacity region, with special reference to the NY-NJ region. The two major aspects of empty container management, namely effective use of empty equipment with empty trip minimization, and empty container accumulation, will be discussed, with a focus on the later. Global experiences and trends and regional challenges for NY-NJ will be presented.

Keywords: maritime transportation, shipping, empty container

Luis A. A Bojórquez-Tapia, Insitute of Computational Earth System Science, UCSDB. Email: luis@icess.ucsb.edu; Sensitivity Analysis to Minimize Linguistic Uncertainty in Regional Integrated Assessments

Significant progress has been made in the integration of geographic information systems and multicriteria decision analysis (GIS-MCDA) to solve spatial decision problems involving participatory policymaking, conflicting goals, and incommensurate evaluation criteria. Yet, the multi-dimensional nature of policymaking poses some methodological challenges for sensitivity analyses aimed at reducing the inherent linguistic uncertainty that is typical of integrated environmental assessments. This uncertainty arises from imprecise categorizations of areas, such as "high impact" or "low impact," and its reduction is a key element in consensus building efforts. We present here a framework used for dealing with linguistic uncertainty in the cumulative impact assessment of two urban watersheds in Mexico. It combined the Analytical Network Process and a fuzzy-pattern recognition procedure to identify areas according to the cumulative impacts. The sensitivity of the category thresholds was handled through the application of psychophysics principles, which allowed us to identify those thresholds that conveyed the most meaningful information to stakeholders and policymakers, and enabled consensus concerning the cumulative impacts in the study region.

Peter K. Bol, Harvard Univeristy East Asian Languages and Civilization Department. Email: pkbol@fas.harvard.edu; Guoping Huang, Harvard Center for Geographic Analysis. Email: ghuang@cga.harvard.edu; Modelling Population Distribution in Chinese History: a case study of Zhejiang Province in twelfth century

Chinese population data go back 2000 years. The challenge is to distribute this population across the landscape in a manner most likely reflects patterns of settlement, rather than assuming that population density within an administrative unit is uniformly distributed. For this reason, an automated model is created

for combining political and physical geography. Using SRTM data this model generates slopes and stream flows which, when taken together with the locations of administrative seats from the China Historical GIS project and historical population data, provides a means of distributing population. Testing with far more detailed contemporary data has shown that the model can predict settlement patterns with very high degree of accuracy. Much in history is directly tied to the spatial distribution of population, the most important resource governments had available to them.

Alana Boland, University of Toronto. Email: boland@geog.utoronto.ca; *From factory to field: Managing urban water pollution in socialist China*

This paper explores the environmental underpinnings of China's socialist development through a study of water quality issues that emerged in the wake of rapid industrial and urban expansion in the 1950's. I examine the state's discursive and material responses to water pollutions problems - and the limits of these responses - in the urban centers of Jiangsu province. How did infrastructure investment priorities and urban development strategies change due to water pollution in and around cities? How was (political) sense made of water pollution during this period? What were the efforts taken to extract value from wastewater that was being produced at an unprecedented scale? And what in turn were the institutional and biophysical limits of a socialist industrial ecology strategy applied to water?

Keywords: Water management, China, urban political ecology

Barbara Boland, . Email: bboland@uark.edu; *Improved Blue Oak Mapping in the Central Coast Ranges*

California blue oak (*Quercus douglasii*, Hook. & Arn.) is emerging as an important species for research based upon the climatic sensitivity of its annual growth rings, for its old-growth status and its conservation needs. Dendrochronologists have found it to provide an excellent proxy for precipitation, streamflow, San Francisco Bay salinity, and Sacramento-San Joaquin delta null zone location. Though not widely acknowledged as ancient woodlands, blue oak may actually constitute the largest old growth hardwood forests in California. And, with very low regeneration rates across the last half century, it is alarming to consider that we may be looking at the final stands of this lovely and valuable endemic tree. A methodology for single species mapping employing Landsat 7 ETM+ imagery, mapped at a smaller minimum mapping unit than is currently available, is presented here. The problems posed by medium resolution data, the normally sparse canopy coverage of blue oak, and variable understory composition are addressed with a hybrid approach using several percentage canopy coverage classes with different understory types in the study area of the Interior Coast Ranges of San Benito County.

Email: Kate.Darby@asu.edu; *Pumping Groundwater, Draining Rivers: A Political Ecology of Water and Development in Rural Arizona*

This paper examines emerging environmental, political, and legal conflicts over the exploitation of groundwater resources in the central highlands of Arizona. Our focus is on the 14,247 sq km Verde River watershed in north central Arizona a region which contains the Prescott Active Management Area, one of five zones in the state in which groundwater is regulated by state law. While the study area hosts one of the few perennial streams in Arizona, residents in the watershed depend almost exclusively on groundwater, a resource now being mined at rates in excess of recharge. A host of environmental issues have catalyzed civil society groups across the region, each variously seeking to stop, control, or mitigate impacts of rapid development in the region. Based on in-depth interviews, public fora transcripts, government and civil society group documents, media accounts, and scientific reports, we examine the competing water resource discourses and scalar politics of key citizen groups, government and development interests in the region. The growing political and legal controversies over interbasin groundwater transfers into the PrAMA and claims of projected future impacts on Verde River flows in downstream areas are highlighted. We examine the uses of science and expert knowledge by contending groups as they construct scalar claims. We conclude by discussing the socioenvironmental implications of groundwater mining and growth on the vulnerability of people and places in the study area.

Keywords: water, political ecology, environmental conflicts

Gerald Edward Bolthouse, Graduate Student, Western Washington University. Email: jebbolt@hotmail.com; *Reconstructing Satoyama: Metaphor and the Production of Agricultural Landscapes in Japan*

Recently, the spatial and cognitive dimensions of the Japanese term satoyama have been greatly expanded. Originally, satoyama was used to indicate managed woodlands near villages; however, the term is now used to symbolize the rural agricultural landscape at large. The spatial expansion of satoyama has resulted in the internalization of the nostalgic traditional village and, in addition, modern ecological ideas of sustainability and symbiosis. As a result of this internalization, satoyama has become a potent metaphor. This research examines both how and why the satoyama metaphor has been constructed. What emerges is that satoyama has been articulated through scientific discourse and volunteer action as a response to socio-ecologic change. As a by-product of its construction, the satoyama metaphor is fostering positive change in local communities and adjacent landscapes. Therefore, I argue that satoyama offers an excellent example of the ways in which metaphor can: (1) facilitate communication between scientists and the public and (2) actively propel the reshaping of material landscapes.

Liz Bondi, The University of Edinburgh. Email: liz.bondi@ed.ac.uk; *Empathy, interpretation and reflexivity: applying psychoanalytic ideas to interviews*

The use of psychoanalytic ideas to make sense of other people's lives has the potential to deepen understanding but also raises concerns about the abuse of power and interpretive violence. This paper argues for the potential of modest and reflexive applications of psychoanalytic ideas in relation to research interviews, illustrated with respect to a single interview. Attending to what was said during the course of the interview, I illustrate convergence and overlap between empathic responsiveness and (partial) interpretation. Using my own affective response (counter-transference) I push interpretation beyond what was said and in so doing offer a psychoanalytic version of reflexivity.

Keywords: psychoanalysis, reflexivity, interviews

Anne Bonds, University of Washington. Email: abonds@u.washington.edu; *A rural-urban divide?: Mass incarceration and the interconnected geographies of crime control*

In the last two decades, the US prison population has exploded by 400 percent and now exceeds two million. Scholars argue that the mass incarceration trend is transforming geographies of both rural and urban spaces. Rural spaces are increasingly associated with rising prison development and the criminalization of rural communities of disadvantage. By contrast, the majority of individuals who populate these prisons are people of color, primarily drawn from urban spaces. Even further, constructions of crime in urban spaces are often linked to justifications for rural prison expansion. In this paper, we explore the interconnections between rural and urban geographies of incarceration and the ways in which these geographies are linked to material and discursive constructions of criminality. We argue that these constructions are produced and mobilized geographically to legitimate prison expansion, increasingly hyperpunitive social and criminal justice policies, and the retrenchment of racialized and classed inequality. Further, we argue that the spatiality of these constructions act to obscure the central dynamics that race/ethnicity and class play within the monumental expansion of criminal justice over the past thirty years.

Keywords: prisons, criminality, inequality

Dudley B. Bonsal, Department of Geography, The Ohio State University. Email: bonsal.1@osu.edu; *Urbanization Influences and Wildland Impacts of Land Transformation Along the Wildland-Urban Interface in Northeast Ohio*

Urbanization often results in fragmentation of wildlife habitat as forest and wetlands are transformed by the expansion of human activity, for reasons ranging from economic and population growth to a desire of individuals for improved quality of life and infrastructure. Because urban form is a consequence of such social and economic forces, patterns of fragmentation will therefore be associated with socioeconomic factors. Exploratory analyses of land cover data for the Cleveland-Akron-Elyria Combined Statistical Area will reveal whether urban configuration has changed over time, and whether such changes have a significant effect on the vitality of habitat along the urban-rural interface. Systematic land use changes in the region are calculated, and a regression analysis is performed in order to understand the relationship between socioeconomic factors associated with land use change and patterns of fragmentation. Socioeconomic factors of interest include educational attainment, per capita income, and age of the housing stock. The potential impact of land use change and fragmentation on wildlife habitat, through the utilization of landscape metrics such as perimeter-area ratio and contagion, is also examined.

Mark Bonta, Delta State University. Email: markabonta@yahoo.com; Covert Geographies?

While the “invisible world” of covert political activities has been amply and critically examined by academicians outside of geography, it has rarely been subjected to spatially-informed theoretical approaches within the discipline. The Cold War activities of the CIA, MI-6, NATO, Wall Street firms, and other organizations have been minutely analyzed through several excellent recent texts (e.g., D. Ganser, NATO’s Secret Armies: Operation GLADIO and Terrorism in Western Europe; A. McCoy, Politics of Heroin; F. Stonor Saunders, Who Paid the Piper? The CIA and Cultural Cold War; S. Dorril, MI6), and our knowledge of parapolitics is growing exponentially thanks in large part to the declassified documents available online at sites such as The Memory Hole and National Security Archives. The ramifications for geography and geographers of the multitudinous activities of so-called “invisible governments” or “secret states” are quite broad and often startling; this paper seeks to open a dialogue not only on the geographicality of the covert world, but also on its effects on our research practices.

Keywords: secret government, CIA, Cold War, Gladio, covert geographies, Honduras

Christopher G Boone, Arizona State University. Email: cgboone@gmail.com; Environmental equity, parks, and accessibility in Baltimore, MD

Rising obesity levels, and an associated rise in diabetes mellitus, in the western world have caused many to examine the role of built form in reducing opportunities or incentives for physical activity. A number of studies have shown that having access to parks and recreation areas increases physical activity. From a public health perspective alone, it is critical to ensure that individuals have access to safe, accessible places for recreation and exercise, and parks are one important component of that goal. As an environmental amenity, the distribution of parks in relation to where people live is also an environmental justice issue. This paper examines access to parks and open space in Metropolitan Baltimore using census data, PRIZM lifestyle clusters, and responses from the annual telephone survey of the Baltimore Ecosystem Study. Accessibility metrics are measured against a needs-based assessment for recreation. This paper is part of a larger study on the long term dynamics of environmental equity being conducted for the Baltimore Ecosystem Study, an Urban Long Term Ecological Research site.

Keywords: environmental justice, Baltimore, parks, GIS

Kevin Borden, University of South Carolina. Email: kevinborden@hotmail.com; Spatio-temporal Trends in Natural Hazard Mortality among U.S. Counties

Deaths caused by natural hazards represent a permanent effect hazard events have on populations. However, the lack of a comprehensive, reliable dataset has hindered research related to such deaths. Studying hazard-induced mortality over time and across space will lead to a greater understanding of its geography, and ultimately lead to identification of factors that contribute to hazard mortality’s spatial patterns. With this understanding of hazard-induced mortality, we can explore linkages between pre-event vulnerability, and hazard mortality as an indicator of a post-event outcome. The purpose of this research is to examine the human burden of hazard events by analyzing the spatial and temporal patterns of hazard-induced mortality in order to better understand the relationship between pre-event social vulnerability and post-event outcomes (hazard mortality). The research design will consist of 1) creating a county level geo-referenced database of hazard induced mortality for the United States; 2) using these data to reveal and analyze hazard induced mortality patterns among U.S. counties; and 3) analyzing the spatial relationship between pre-event vulnerability and post-event hazard mortality. The questions that guide this research include: What spatial and temporal patterns are evident in hazard-induced mortality? How does hazard induced mortality manifest itself with respect to seasonality, urban / rural nature of the county, and the extreme versus chronic nature of the event? Is there a spatial relationship between pre-event social vulnerability and hazard-induced mortality as an outcome?

Keywords: Hazards, Mortality, Vulnerability

Dale R. Borders, Ph.D., Grand Valley State University. Email: bordersd@gvsu.edu; The Effect of Kinship on the Settlement Patterns of the Southwest Michigan Frontier

The Effect of Kinship on the Settlement Patterns of the Southwest Michigan Frontier The role of kinship in the social organization and settlement evolution of an agricultural frontier in nineteenth century North America is examined using a case study of twenty townships from southwest Michigan. Low population density of frontier society required the rapid creation of a supportive social network to maintain settlement integrity and hence viability. Nuclear families supply that minimum demographic imperative. Kinship’s role as a

principal element of social organization on agricultural frontiers in southwest Michigan specifically, is examined. The nuclear family and larger kin-based organizations known as “kinship clusters” that evolved from nuclear families were a specific social adaptation for settlement of agricultural frontiers. Several researchers have referred to this as a “clustering phenomenon.” These “kinship clusters” could also provide a focal point that would attract other settlers to the area. The significance of kinship clusters as an adaptive strategy in agricultural frontier settlement and the resultant settlement pattern that developed was supported with statistical testing. Nearest neighbor analysis using census and other records and point data from Calhoun County maps from 1831 to 1840 demonstrated a trend in settlement patterning that showed initial clustering followed by random settlement. This analysis revealed that initial kinship clusters acted as a focal point for subsequent settlement on the frontier. This paper confirms the importance of kinship in the spatial structuring of initial settlement on the frontier primarily as a vehicle for establishment of spatially constrained cooperative and integrative social networks.

Email: ; Geographical Aspects of Interactions in Production Networks: Results from a Field Survey of Steel Making and Automobile Production in Argentina

The paper analyzes geographical aspects of the structure and contents of interactions in production networks of semi-industrialized countries. By comparing two networks with a different geography (automobile is more dispersed; steel is more concentrated) the paper looks at the effect of geography on interactions and on the creation of technical competencies within firms and production networks. A series of indicators were developed of both interactions (within firms and networks but also between them and institutions such as S&T units, universities, and firms’ associations) and competencies (by looking at work organization, quality systems, R&D efforts). We focus on the steel production network lead by the major Argentinean steel-maker, Techint? a multinational conglomerate with steel mills in several parts of the world and operations in other industries (oil, engineering, telecommunications). The sample of firms surveyed includes suppliers of a number of inputs and services (stratified in terms of their relevance for the nucleus of the network) and a variety of local clients. As for automobile production, the sample includes about one hundred makers of autoparts. The paper draws on a recent field survey of 200 firms located in and around Buenos Aires and Córdoba. This survey is part of a larger study of production networks in Argentina funded by the Argentinean Undersecretariat of S&T and coordinated by Univ. Nac. Gral. Sarmiento (it includes wine-making, fruit-processing, software for the agricultural sector, energy, and the suppliers’ network of INVAP? Argentina’s producer of satellites and nuclear reactors).

Keywords: production networks, interactions, competencies, steel making, car manufacturing

Michael Erec Borger, The University of Hawai’i at Manoa. Email: michaelborger@gmail.com; The Case of Jetty Construction at Oregon Inlet, North Carolina

In 1970, Congress authorized the Army Corps of Engineers to construct twin mile-long jetties on both sides of Oregon Inlet, NC in order to stabilize the inlet and prevent its natural southward migration. The jetties were proposed to make the inlet safer to navigate for commercial and recreational fishing boats, provide access to the ocean from Pamlico and Albemarle Sounds, to develop the regional fishing industry and to increase the lifespan of the Bonner Bridge. They were also pitched as a more economical way to stabilize the inlet than continued dredging of the channel. To build the jetties, the Corps needed permits from the Department of Interior which was unwilling to issue them due to potential harm to adjacent Federal lands. Along with the National Marine Fisheries Service, which is administered by NOAA and the Department of Commerce, other non-governmental environmental groups and recreational users, the jetties were contested on both environmental and economic grounds for their potential erosional effects on adjacent Federal lands, disruption of larval transport and lack of economic justification over dredging. As required by NEPA, Environmental Impact Statements were issued by the Corps and, in turn, contested by the jetty opposition, most effectively by the Inman Panel and NMFS. The case was presented to the White House Council on Environmental Quality in 2001. The CEQ, Corps and NOAA reached an agreement in 2003 not to proceed with the jetty construction and instead aim for deeper dredging and timelier, publicly available navigation information.

Daniel Borough, Ph.D., California State University, Los Angeles. Email: dborough@calstatela.edu; *Linking Home Values to Elderly Migration and Neighborhood Transition in Southern California*

Traditional theories related to neighborhood transition and the life course suggest that as newer, cheaper housing is created in more remote suburbs younger families leave their traditional White neighborhoods and thereby create housing opportunities for African Americans and other ethnic minorities. This typically results in older, Anglo residents temporarily co-residing with younger, ethnic minorities and the eventual transition of the neighborhood from White to non-white. The recent housing boom in the United States and especially Southern California may have changed this traditional pattern. Anecdotal evidence suggests that higher home values in urban areas may have resulted in increased mobility among the elderly. The purpose of this paper is to present the preliminary results of research into how home values influence elderly migration and, by extension, neighborhood transition and community structure in urban communities in Southern California. Using statistical and mapping methodologies, I investigate how home values relate to elderly mobility and how the resulting mobility influences neighborhood transition and community character. This study relies upon data from a variety of sources and looks at both historic and contemporary patterns. The results of this study could prove useful for researchers and policymakers in multiple ways including: improved understanding of elderly mobility, advancing understanding of the neighborhood transition process, and providing city planners and other agencies with a model to predict future population needs.

Email: jmalczew@uwo.ca; *GIS-based multicriteria evaluation: Implementing an AHP extension using Fuzzy Linguistic Ordered Weighted Averaging (FLOWA) operators in GIS for group decision analysis*

Spatial decision making problems typically have three major characteristics: multicriteria, multi-participants and fuzziness. This paper focuses on the integration of GIS and an extension of Analytical Hierarchy Process (AHP) using Fuzzy Linguistic Ordered Weighted Averaging (FLOWA) procedure for a group decision making setting. AHP-FLOWA is a multicriteria combination operator. The nature of the FLOWA depends on some parameters, which are expressed by means of fuzzy linguistic quantifiers. By changing the parameters, FLOWA can generate a wide range of decision strategies. We propose a GIS-multicriteria evaluation (MCE) system through implementation of AHP-FLOWA within ArcGIS, capable of aggregating linguistic labels and measuring consensus for a group spatial decision making. We suggest that the proposed GIS-MCE would simplify the definition of decision strategies and facilitate an exploratory analysis of multiple criteria with a group of decision makers.

Maria Borovnik, PhD, Massey University, New Zealand. Email: m.borovnik@massey.ac.nz; *The Shipping Industry as a Global Force on Seafarers' Labour: Global Pressure on Local Labour Unions*

This paper considers maritime space as dynamic and multiply inhabited, and seafarers as a transversally circulating group bound in a transnational framework in which the steady flow of remittances are a regular link to home families and communities. Added to the transnational dynamic in the seafarers' framework has to be the globalisation efforts of the shipping industry in attracting workers from countries, such as Kiribati (in the central Pacific), that are on the global periphery. Shipping agents argue that the benefits are two way. Shipping lines earn efficiency by employing foreign workers for low wages, but foreign workers simultaneously earn a job in a highly competitive environment. International labour unions, however, have faced some difficulties in having to negotiate wages between the industrialised "old" seafarers' work force and the new mass of workers from the developing world that are willing to be employed under difficult circumstances in order to provide for their families. Drawing on the example of Kiribati this paper will explore the issues that local labour unions have to face in being squeezed between employment agencies, international labour unions, and seafarers supporting their families.

Email: rick_mueller@nass.usda.gov; *A Link Between GIS and Remote Sensing: A Florida Citrus GIS and a Florida Cropland Remote Sensing Classification*

A Florida Citrus Geographic Information System (GIS) and a Florida (2004) Cropland Data Layer (CDL) remote sensing classification were produced by the

USDA's National Agricultural Statistics Service (NASS) and NASS' Florida Field Office (FFO). The Citrus GIS was created to modernize the methodology for maintaining and conducting the biennial census of Florida's commercial citrus trees. Trees in production, acres planted, variety, and planting dates were documented in the GIS. Citrus grove location information was stored, historically, by the FF0 using paper-based maps and known grove boundaries were drawn by hand. The repetitive redrawing of groves with each census was no longer needed with the development of the modernized Citrus GIS. Additionally, grove boundaries and attribute information were physically linked in the GIS. The Florida Cropland Data Layer Product (2004), a remote sensing land cover classification, was produced using the Citrus GIS and Farm Service Agency (FSA) Common Land Unit (CLU) data as sources of ground truth information for the classification. See5 Decision Tree software was used to perform the classification. The spatial distribution of agricultural crops across the state was captured in the Florida CDL. Agricultural crops classified in the Florida CDL include; corn, upland cotton, grass/pasture, peanuts, citrus, sugarcane, sorghum, soybeans, winter wheat, rye, oats, millet, watermelon, trees, and other fruit/vegetable. Non agricultural information was derived from the 2001 National Land Cover Database (NLCD) which was produced by the Multi-Resolution Land Characteristics Consortium (MRLC).

Keith Bosak, Georgia Southern University. Email: kbosak@georgiasouthern.com; *"Going Global: Ecotourism and globalization in the Niti Valley, Garhwal Himalaya, India"*

The local Bhotiya people of the Niti valley have experienced dramatic changes in their livelihood options over the last fifty years. Prior to 1962, the Bhotiya practiced transhumance and trade with Tibet. When the border with Tibet was closed in 1962, the Bhotiya continued to practice transhumance in a more limited geographic area. In 1974, Nanda Devi was opened to western mountaineers and the Bhotiya began earning money as porters and guides for expeditions. Unfortunately, the mountain was closed to all people in 1982 following serious concerns of environmental degradation from too many visitors. The Bhotiya had to return to farming and grazing animals. In 2001, after almost twenty years of economic and cultural decline, the Bhotiya began an ecotourism initiative with the goal of providing a livelihood option that would promote conservation and equity while providing an income for local people. This project explores the way in which the Bhotiya have operated within and across scale and constructed scale in order to adapt to the changes brought about by globalization.

Ron A Boschma, Utrecht University. Email: r.boschma@geo.uu.nl; Frank Neffke, Utrecht University. Email: f.neffke@geo.uu.nl; *Relatedness and Related Variety as Sources of Regional Growth*

Evolutionary Economic Geography is an emerging field of research that aims to bring together insights from evolutionary economics and economic geography. In our paper, we aim to apply EEG to the macro-level of the spatial economic system as a whole. The economic development of regions may be analysed as an aggregate of sectors in a region. This sectoral logic underlying the evolution of spatial systems is known as the process of structural change. Regions that are capable of generating new industries with greenfield technological opportunities giving rise to new product lifecycles and expanding demand will experience growth, while regions that are locked into earlier specialisations with mature lifecycles will experience decline. A major concern in this literature is whether specialized regions or diversified regions are more capable of developing new sectors and sustaining older sectors. So far, life cycles of individual industries have been analysed mostly in isolation. We intend to go a step further. Starting from a macro perspective, we suggest introducing a topology of technological relations that link industries together. In this paper, we use concepts like related variety and relatedness to explain how related industries may provide growth opportunities for regions. In addition, we intend to use these concepts in a dynamic way, as we hypothesize that related variety and relatedness (and thus the industrial topology of technology) change over time through branching processes. It is these shifts in relatedness that we expect to have major impacts on the long run opportunities for future development of industries in regions.

Ron Boschma, University of Utrecht. Email: r.boschma@geog.uu.nl; Bjorn T. Asheim, University of Lund, Sweden. Email: Bjorn.Asheim@keg.lu.se; phil cooke, cardiff university. Email: cookepn@Cardiff.ac.uk; *Constructing regional advantage: policy platforms based on related variety and differentiated knowledge bases*

The paper presents an alternative regional innovation policy model, based on the idea of constructing regional advantages. This policy model brings together concepts like related variety, knowledge bases and policy platforms.

Recent experiences have called into question though the way regionalization of innovation policy has been implemented. Technology and innovation policy has been, and still is primarily focused on enhancing R&D, particularly in Europe. Copying of best practices, as identified by benchmarking studies, is popular amongst policy makers but bound to fail, as illustrated by regional policies aimed at creating new growth sectors (like biotech) or simply imitating successful models like Silicon Valley from scratch. There is awareness that 'one-size-fits-all' regional policy models do not work in a highly fragmented, globalizing economy, if they ever did, because these policies are not embedded in their spatial settings. One reason for these policy failures is that there is little understanding of how regions move into new directions or start up new growth paths, and to what extent public policy may affect this renewal process, and how. This paper will present a policy framework that takes up this challenge, building on new theoretical concepts. The objective of the paper is to provide an alternative regional innovation policy model, based on the idea of constructing regional advantage. We bring together three key notions that have recently been introduced in the literature: related variety, differentiated knowledge bases, and policy platforms.

Keywords: related variety, innovation policy, regions

Eric Boschmann, Ohio State University. Email: boschmann.1@osu.edu; Mei-Po Kwan, Ohio State University. Email: kwan.8@osu.edu; Socially Sustainable Urban Transportation

Drawing upon relevant literature, this paper examines the concept of socially sustainable urban transport. The paper argues that sustainability, when more broadly conceptualized, necessarily incorporates the social, and subsequently considers how urban transport influences the achievement of social sustainability in urban regions. Socially sustainable urban transport is defined along parameters of social equity, social exclusion, and quality of life. While this research literature is in its infancy, several other well-established research areas provide potential theoretical, methodological, and applied insight into the development of future socially sustainable urban transport research agendas, including: urban form, location- and individual-based accessibility, and city/regional planning for sustainability. Finally, the implication of socially sustainable urban transport upon sustainable communities is explored.

Fernando J. Bosco, San Diego State University. Email: fbosco@mail.sdsu.edu; Stuart C. Aitken, San Diego State University. Email: saitken@mail.sdsu.edu; Tom Herman, San Diego State University. Email: ; "A Kid has a Right to Speak to Anybody They Want to in the World": Children as Institutional Brokers in a Border Community

This paper was inspired by a California State Assembly Bill to prohibit the use of immigrant children as translators and interpreters in public institutions or in any public or private agency, organization, or program that receives state funding. The study focuses on young people and their families in Chula Vista, a community of San Diego contiguous to the Mexican border. By analyzing how young people exert a continual and subtle influence on the knowledge and perspectives of immigrant adult family members, we suggest some of the ways immigrant families overcome barriers to assimilation and citizenship and become involved in their communities. We suggest that in this context, young people take on huge familial and community responsibilities and are powerful conduits and catalysts for cultural transformations. The efforts of children and young immigrant people, however, are being actively resisted and contested. Children's family responsibilities are being replaced by new marketized relationships that represent the commodification of family care. In the context of neo-liberal reform and diminished state support for immigrant families, it is the state itself, through legislative efforts, that is leading the efforts against immigrants' strategies for settlement and belonging. We critically link our findings to a broader discussion regarding immigrant experiences of citizenship and civic and community incorporation in the context of neoliberalism in the United States.

Keywords: immigration, children, citizenship, neoliberalism

Pablo S Bose, University of Vermont. Email: pbose@uvm.edu; Reclaiming World City Status: Transnational Subjects and the Transformation of Kolkata

Once a central node in the command and control functions of the British Empire and a world city in the age of colonialism, the Indian metropolis Kolkata has fallen increasingly into the periphery through the last century. More recently however, the trend towards decline has been arrested. The arrival of new service industries, redevelopment initiatives and especially the explosive growth of new housing construction are apparent heralds of renewal. Nowhere is this more apparent than on the eastern fringes of the city, bordering a large wetlands region home to a thriving informal economy. Luxury condominium complexes and their attendant facilities are being built in this area at a fast pace and on a grand scale. The political, economic and ecological implications of such developments are considerable, yet within the city the construction of these condominiums is

accepted by most. Moreover, a major market for these housing projects is wealthy overseas Indians; the complexes are accordingly built with assumed transnational aesthetics and sensibilities in mind for transnational Indians or those closer to home that wish to live like them. I argue in this paper that it is the idea of diasporic Indians and their transnational lifestyles that are important influences on local civic leaders, city planners, private capital, and social movements alike. The mythic power of the diaspora is in this sense a crucial catalyst for transforming both the political and physical landscape of the region and a central part of the strategy to help Kolkata regain its former global prominence.

Robert Bothmann, Minnesota State University, Mankato. Email: robert.bothmann@mnsu.edu; Mapping Graduate Research

Many graduate research projects have a geographic focus in which the research is conducted. Sometimes graduate students have ideas for research and find that such research was previously conducted or may want to review similar research topics. Catalog librarians create descriptive and analytic metadata that describe resources held by a library. The metadata contain geographic information in standardized language for topical and geographical terms, as well as coded geographic data. The catalog records for Minnesota State University, Mankato graduate students' theses and alternate plan papers dealing with topics in Minnesota were extracted and converted into a format usable in GIS, in which the subjects of the research were mapped. The data show the areal extent of past research by topic. The data are useful to graduate students and faculty to explore graduate research by geographic areas. Likewise, unmapped areas show where a research topic would be original. This application is also extensible to other types of library catalog metadata, such as cartographic resources or books.

Keywords: GIS, metadata, graduate research, library catalog

George F. Botjer, University of Tampa. Email: gbotjer@ut.edu; Marsh Drainage and the Third River Project in Iraq, 1991-2003

Saddam Hussein's drainage of the al-Hammar, Central and al-Huwaizah marshes, after the Gulf War, was widely condemned on humanitarian and political grounds. Viewed principally as economic warfare against the Shi'ites, the emptying of the marshes was presumed to have little or no constructive purpose. In fact, this massive water diversion had been anticipated since the days of King Faisal I, when it was called the Third River Project. Phase I of the 1991 hydrography plan involved draining about 80% of the vast marshland that lay close to the juncture of the Tigris and Euphrates rivers. That phase was completed just before the 2003 invasion. Phase II would have entailed the channelization of the Tigris-Euphrates overflow (the erstwhile marsh water) into a 120 mile- long waterway, emptying into the Persian Gulf about 40 miles west of the Shatt al-Arab. Phase III was a development program based on the new hydrography. Reclaimed land would make the country less dependent on food imports, and the oil which had been discovered beneath the marshes could be exploited more efficiently. Also, a new "gateway" city (a latter-day St. Petersburg?) would be dredged out of the coastal plain, on the banks of the "third river." The feasibility of resuming this project will be discussed.

In this paper we study a class of evolutionary models of industrial agglomeration with local positive feedbacks, which allow for a wide set of empirically-testable implications. Their roots rest in the Generalized Polya Urn framework. Here, however, we build on a birth-death process over a finite number of locations and a finite population of firms that, first, choose to locate their activities among existing production sites that are heterogeneous in their intrinsic attractiveness and, second, select where to settle under a regime of dynamic increasing returns depending on the number of firms already present in each location. We explicitly characterize the stationary distribution, i.e. the probability of finding a given number of firms in each location, and we study how the properties of the limit configuration depend on the interplay between the distribution of agglomeration economies and intrinsic attractiveness among locations. Then, we present two examples of small economies to illustrate the model and we analyse their asymptotic behaviors. Finally, we discuss a number of empirical applications of our theoretical framework. The basic model, once taken to the data, is able to empirically disentangle the relative strength of technologically-specific agglomeration drivers (affecting differently firms belonging to different industrial sectors in each location) from site-specific geographical forces (horizontally acting upon all sectors in each location).

Keywords: Industrial Location, Agglomeration, Dynamic Increasing Returns, Markov Chains, Polya Urns.

Hiba Bou Akar, Department of City and Regional Planning, UC Berkeley. Email: hiba@berkeley.edu; Reproduction of Spaces of Power: Hezbollah after the War

Is Hezbollah a terrorist organization, a non-governmental organization, a philanthropic institution, or a Lebanese political party? Such categories often get blurred between politics, militarization, service provision, all of which characterize Hezbollah as seen from different perspectives: what is a militia for the international community is a housing provider for the urban poor in the southern suburbs of Beirut. By intervening in the production of low-income housing for the civil war displaced Shiites, Hezbollah plays a primary role in reconfiguring post civil war Beirut's geographies of power and spaces of control. The party has been using market mechanisms (ex: information transmission and investment incentives), 'neoliberal tools', to channel supporters from their informal shelters to these housing projects, creating ethnic enclaves in contested sectarian terrains. My paper will focus on how such an organization plays a role in shaping post-conflict urban territories, and on how ideologies and mechanisms of control affect urban reconciliation in divided cities. The recent war in Lebanon cannot go unnoticed. Most Shiite neighborhoods in the southern suburbs of Beirut, mainly Hezbollah-affiliated enclaves, have been destroyed. The paper will argue that the damaged urban spaces will be an opportunity for the party to "re"-produce spaces of control and power, using not only religious ideology and state apparatuses but also the market itself. The new spaces of contestation will challenge the hegemony of the state and international community by creating a localized counter-hegemony using infrastructure provision, housing production, microcredit loans, education, as well as religious identity and ideology.

Keywords: Hezbollah, war, housing, market

Michelle A. Bouchard, South Dakota State University. Email: Michelle.Bouchard@sdstate.edu; Wetland loss in the Prairie Pothole Region of Eastern South Dakota

Since 1780, over 50% of wetlands in the United States have been drained. Many of the agricultural states have had much higher losses, with some states losing up to 90% of their wetlands. Although Eastern South Dakota's lands are heavily used for agriculture, only ~35% of wetlands have been drained. This presentation will look at how settlement patterns, transportation, environmental conditions, and regulations have affected wetlands in Eastern South Dakota and why wetland loss has not been as great as in other agricultural areas.

Julie-Anne Boudreau, University of Quebec. Email: julie-anne.boudreau@ucs.inrs.ca; Nathalie Boucher, University of Quebec. Email: nathalie.boucher@ucs.inrs.ca; Political subjectivities in spaces of circulation: Bus rides and domestic work in Los Angeles

Based on fieldwork in Los Angeles, this paper attempts to understand the degree to which political mobilization is grounded in everyday experience, specifically the experience of moving through the city. Domestic workers living in Eastside neighbourhoods, commuting daily to their work places in the mansions of the Westside (a one-way trip of a minimum of an hour), cross

contrasted spaces and interact with people they see daily in the space and time given by the bus ride. Systematic observation on busses and in-depth interviews have revealed interesting patterns in the formation of political subjectivities. What does it mean when people circulate? What type of political beings are domestic workers when on the busses and when they step out? How empowering or disempowering is it to move through space? How are those circulatory spaces politicized?

Keywords: mobilization, everyday life, bus

Larry S. Bourne, Professor, University of Toronto. Email: bourne@geog.utoronto.ca; Changing Dimensions of Income Inequalities in Canadian Cities

Contemporary processes of urban growth and change continue to produce new sources and geographies of social inequalities within cities. This paper outlines a continuing project on the changing determinants of inequalities in income and employment opportunities, and an investigation of the shifting spatial scales at which these inequalities are expressed. The analysis examines variations in household income among and within Canada's metropolitan areas over time and links these changes to shifts in local and regional economies, demographic change, and public policy. The results confirm the importance of embedding local changes within a framework of broader forces operating and the urban system and global scales.

Mark W. Bowen, University of Kansas. Email: mwbowen@ku.edu; Human Constructs, Channel Morphology, and the 100-Year to 500-Year Flood along the Colorado Front Range

High-magnitude floods, while rare, have potential to inflict catastrophic change; as more landscape becomes altered by humans this potential increases. Impacts of bridge construction on the natural environment were analyzed for one high-magnitude flood along two mountain streams in the southern Colorado Front Range. Penrose, CO received over six inches of rain in two hours, which, depending upon estimates, resulted in a 100-year to 500-year flood along 8-Mile and Brush Hollow Creeks. Bridges for U.S. Highway 50 constrict flow through lower reaches of both streams, which caused Highway 50 to flood. Also, high energy flow washed out several roads downstream. For both streams, cross-sectional surveys and Wolman pebble counts were conducted across the floodway, and longitudinal profiles were surveyed upstream and downstream of Highway 50. 8-Mile Creek displays a unique pattern in channel morphology upstream and downstream of the bridge due to the constriction of flow backing up water upstream and increasing erosion downstream. Flow was constricted to such a degree that Highway 50, situated 6 meters above the stream bed, was overtopped. Brush Hollow Creek channel morphology was not impacted by Highway 50 even though flow overtopped the bridge. A small check-dam installed approximately 2 km downstream of the bridge initially restricted flow but was subsequently breached, controlling upstream channel morphology. This dam, when breached, caused considerable, rapid downcutting as evidenced by several knick-points along the stream. Thus, human constructs in these watersheds have significantly altered natural channel response to high-magnitude, low-frequency flood events.

John T. Bowen, Jr., University of Wisconsin-Oshkosh. Email: bowenj@uwosh.edu; A People Set Apart: A Supply-Side Perspective on the Spatial Development of the Airline Business Class

Beginning in the 1980s in the transatlantic market, air carriers developed business class as a separate, highly lucrative product. Today, business class is a crucial source of profits for airlines across much of the world. In this paper, the spatial expansion of business class services and their contemporary spatial organization are analyzed. The latter analysis reveals that, among densely traveled routes, the share of business class seats is greatest on secondary intra-Europe routes but comparatively low on routes linking the dominant world cities. And yet the most recent chapter in this story has been the emergence of all-business-class carriers, including start-ups on the New York-London route. Earlier all-business-class ventures failed but the international liberalization of the airline industry and shifts in the air travel market have fostered a more favorable outlook for their success this time. Much as such airlines may represent the culmination of the decades-long development of business-class service in the air, new business traffic-oriented terminals and airports may be the culmination of a similar trend on the ground. The implications for the established full-service network carriers and for the airline industry more generally are examined. Although the recent proliferation of low-cost carriers has been hailed for its democratizing effect, the elaboration of business class services attests to the persistence of the airline industry's "caste system".

In this paper we consider the practical significance of informal care across the lifecourse. 'Care' is the product of feelings of anxiety and concern about others and informal care is the practical application of care in terms of unpaid work and activities that takes place in social settings, places and spaces. These caring feelings and activities reflect the experiences of people in families and relationships, employment, organisations and institutions, and are subject to a range of policies both directly and indirectly related to acts of care. We show that care can involve mutual dependence in all settings and all points of life for all members of the human race and so focus on interdependencies across the lifecourse, at different spatial scales, expressed through a variety of forms of communication and experiences. These include expressive embodiment, talk, text, email and institutional rules (for example, bullying and harassment). In exploring these ideas we draw on empirical research from two bodies of work: migrant care workers (drawing on empirical work on by McGregor (2006) and volunteering (drawing on a study of volunteering conducted by Bowlby and Lloyd Evans, 2006). Seeking to theorise the nature and form of interdependencies and care across the lifecourse, we have used theoretical and empirical work to develop a conceptual framework, namely caringscapes, (McKie et al 2002) through which these concepts and their ethical implications might be understood.

Keywords: Care, lifecourse, time, space

Erik Bowles, Kansas State University. Email: ehb7705@ksu.edu; *A New Heat Wave Classification Model*

Intensity and frequency of heat stress hazards have been increasing worldwide, and are expected to continue to increase over time. The nature of this hazard is difficult to universally define because of the variations in local climate norms and acclimatization by people over space. This study proposes a new heat wave classification model of events on a qualitative scale from 1 to 5 using heat index stress measures. The model is applied to several locations representing differing climatic regions in the United States. Hourly heat index values are calculated and analyzed to provide a daily categorization that identifies event intensity, duration, and frequency. Analysis is based on the twenty-year period from 1981-2000. Results provide a better appreciation for local exposure levels to annual heat hazards and their extremes.

Keywords: Heat waves, classification, climate extremes

Jerrod K Bowman, University of Alabama. Email: bowma012@bama.ua.edu; *Regional Commissions as Agents of Social Justice*

This paper examines the recent upsurge of regional commissions forming in the South, such as the federal Delta Regional Authority, Alabama's Black Belt Commission, the attempt to form a federal Southeastern Crescent Authority, and the attempt to form a Gulf Opportunity Zone in the wake of Hurricane Katrina. The paper considers whether regional commissions are capable agents of social change and social justice. The paper then utilizes traditional spatial segregation measures to quantitatively determine the Appalachian Regional Commission's success in reducing economic segregation in the area. These measures suggest that economic segregation in the region remained relatively constant during the study period, which in turn suggests that the Appalachian Regional Commission may not necessarily serve as an effective agent of social change and social justice.

Keywords: social justice, regional commissions, segregation measures

Caru Bowns, Ph.D., Pennsylvania State University Dept Landscape Architecture. Email: cub10@psu.edu; *Community Development in Brazil and the New Republic Initiatives for Social Reform*

Between the 1960s and 1990s Brazil experienced a series of major changes in population growth, industrial development and social structure that impacted the character of interior communities and urban settlements. Since military rule in the 1970s, the return to democratic government has been associated with the growth of civil society and a reformist agenda for the social sphere. The agenda has been hampered by the larger political context of (re)democratization, economic instabilities and institutional reform but has not prevented social reformists from introducing several significant changes to Brazil's social landscape: acknowledgement of social rights; universal access to social programs, and establishment of minimum benefits. These new trends in public and institutional processes in Brazil have been the subject of research by both political and social theorists. More difficult to assess is the "geography" of Brazil's civil society and the New Republic's policy impacts. Today Brazil is a predominantly urban nation having transitioned from 70 percent rural in 1940 to currently 80 percent urban. This paper addresses the question: "How has community development and the quality of life in Brazil's interior communities

and ex-urban settlements been effected by the new social policies?" Social science data, anthropological and settlement research inform a material manifestation of social reform in Brazil's settlement landscapes. According to Draibe 2002, areas of housing, basic sanitation and public transport are virtually excluded from the federal reform agenda. The research reveals that however oblique federal funding for community development efforts, patently modest achievements are taking root to stabilize many disturbed communities.

Ronald Boyce, Seattle Pacific University and Bakke Graduate University. Email: rboyce1045@aol.com; Ronald Boyce, Seattle Pacific University and Bakke Graduate University. Email: rboyce1045@aol.com; *Contrary Conclusions of City Origin: A Biblical Perspective*

Speculation about the origin of the city is varied and controversial. Some say the first city simply evolved with advancements in agriculture and metallurgy. Others have questioned this thesis and have suggested that the rise of the city preceded critical advancements in farming and metallurgy. The Bible suggests a hunter originator for the first city rather than a farmer, but careful study is required. In fact, either thesis of origin can be argued from a biblical perspective.

Emily Boyd, Dr, James Martin 21st Century School Fellow. Email: emily.boyd@ouce.ox.ac.uk; *Privatizing the commons: why carbon offsets are a cause for concern?*

This paper examines the concept of carbon governance, in particular focusing on the role and nature of property rights. Governance of public goods such as the Earth's atmosphere and tropical forests calls for multiple level interactions between institutions, yet these interactions have yet to be fully understood. A text book example is that of carbon offsets and land use change, which continues to be one of the most hotly debated contemporary international issues. In particular, much deliberation has taken place on the impacts of so-called carbon sinks projects on local livelihoods. Less attention however, has been paid to the underlying property rights and institutions that frame these offsets. Drawing on institutional theory from International Relations and Common Property Resources, the paper argues that the current carbon governance framework is driven by a property rights paradigm. This paradigm legitimises a hierarchy of values and supports exclusionary approaches, resulting in tensions with local efforts to protect the commons. It also remains unclear whether such a framework helps or hinders development and for whom?

Keywords: carbon offsets, property rights, development

Richard Boyden, National Archives & Records Administration. Email: richard.boyden@nara.gov; *National Archives Geospatial Data Preservation*

Preservation of geospatial electronic records is a challenge for data owners and data archivists. The National Archives is working on a number of approaches to this problem: in the short term, working with the Federal Geographic Data Committee to come up with workable data transfer standards and a GIS archival profile; in the long-term, developing new technology to manage persistent objects in an Electronic Records Archives.

John Boyer, Virginia Tech. Email: joboyer@vt.edu; *Losing Geography: Impacts of 'False' Terroir on the Virginia Wine Industry*

While currently topical, the concept known as terroir is not a new concept. Terroir refers to the natural and cultural features of a geographically delineated body of land which interact to create a unique set of conditions that in turn confer specific characteristics on the wines produced there. Key factors include climate, topography, geology, soils, varietal selection and wine-making practices. In many countries, the identification of viticultural terroir is undergoing serious study, due in part to an increasing demand by consumers for knowledge and understanding of the origin of each wine produced. However, in many newer viticultural production areas in the New World, terroir areas default to, and are defined by, political borders as opposed to any real homogeneous natural or cultural features. This practice is becoming increasingly problematic for wine producing areas having to compete in an ever-increasing globalized market. The marketability of over-generalized products is decreasing rapidly in an industry where specific wine description for specific regions and specific vintages has become the norm. The Virginia wine industry faces just such challenges in its modern history. Having grown successfully and rapidly for three decades, it likely will begin to stagnate soon due to increased competition and 'false' terroir labeling, leading to consumer confusion about what it means to be a 'Virginia wine.' This paper provides an analysis of geographic delineation of the wine regions in Virginia; their past, present and future potential; and how the industry may already be irreparably damaged by losing its geography.

Keywords: Terroir, viticulture, wine, grape, Virginia

Kate Boyer, Rensselaer Polytechnic Institute. Email: boyerl@rpi.edu; *breast pumps, live/work balance and new geographies of care*

This paper ties together efforts in cultural geography to re-conceptualize agency in a more-than-human world and destabilize nature/culture dichotomies; as well as interest in space as it's experienced through emotion and the body, as signaled in some strands of non (or, more-than) representational theory. Building on the work of Philo, Conradson and others, I'm interested in the role of objects in human activity as a way to shift concerns of non-representational theory away from elite kinds of performances (like dance and theatre) and toward the 'amazing yet ordinary' performances of everyday spatial practice. I suggest that THIS amazing yet ordinary activity challenges commonplace understandings not only of the workplace, but of nature and technology as well; destabilizing the coherence of body-boundary and the 'naturalness' of nursing, and opening the possibility new ways of folding carework into the wage workplace.

Keywords: live/work balance, carework, technology

Max Boykoff, James Martin Research Fellow, Oxford University Centre for the Environment. Email: maxwell.boykoff@eci.ox.ac.uk; Michael K Goodman, King's College London. Email: michael.k.goodman@kcl.ac.uk; *An Inconvenient Celebrity? Promises and Pitfalls of Celebrity Involvement in Climate Change Science, Policy and the Public*

What is the relationship between public celebrity involvement in climate change and greater discursive traction on this issue in science, policy, and the public? From musical groups promoting 'carbon neutral' tours, to actors and former politicians starring in big screen global warming feature films, high-profile personalities have appeared to amplify concerns about human contributions to climate change. Many feel that prominent figures substantially contribute to greater public understanding of climate change science, as well as catalyze climate policy cooperation. However, critics posit that increased involvement from the entertainment industry has not served to influence substantive long-term advancements in these arenas; rather, it has instead reduced the politics of climate change to the domain of fashion and fad devoid of political and public saliency. Widening our purview to examine the role of climate change-related celebrity activities at the interface of climate science, policy and the public, this paper examines how the (de)legitimation of celebrity politicians and politicised celebrities influences unfolding discourse on climate change. Moreover - situated in contemporary (consumer- and spectacle-driven) carbon-based society? we interrogate various effects that this particular set of personalities has on debates over climate change causes, consequences and action. In theorising on/within the carbon economy, this paper seeks to tease apart some of the promises, pitfalls and contradictions of this increasingly entrenched set of non-state actors we deem 'an inconvenient celebrity'. Thus, ultimately? as a form of climate change action? we ask, is it more effective to 'plant' celebrities instead of trees?

Keywords: celebrity, climate, media, science-policy, public, discourse

Paul Boyle, University Of St Andrews. Email: p.boyle@st-andrews.ac.uk; Daniel Exeter, University of Auckland. Email: d.exeter@auckland.ac.nz; Zhiqiang Feng, University of St Andrews. Email: zf2@st-andrews.ac.uk; *The Influence of the Modifiable Areal Unit Problem on Spatial Clusters of Suicide in Scotland*

Suicide rates among young adults (15-44 years) in Scotland increased dramatically between 1980 and 2000 and there is growing political and academic concern about the possible causes. We explore whether suicide clusters geographically and, hence, whether there is any evidence that suicide behaviour may be 'contagious'. In Scotland, there is anecdotal evidence suggesting that suicide clusters may exist but no study has explored this statistically. Using suicides distributed across 10,058 specially constructed small zones which are 'consistent areas through time' (CATTs), and controlling for age and sex, we find a large, significant and surprisingly persistent spatial cluster of suicide in East Glasgow in 1980-2, 1990-2 and 1999-2001. However, it is possible that the scale and arrangement of the CATTs may have influenced the results -the 'Modifiable Areal Unit Problem' (MAUP). We therefore repeated our analyses for different configurations of the CATTs. We show that the East Glasgow cluster was statistically significant in every configuration, confirming that this suicide cluster is not an artefact of the zone geography. This raises the question of whether contagious processes influenced this cluster. We therefore extended our analysis to control for socio-economic deprivation and show that the cluster becomes insignificant in every spatial configuration. Rather than relating to contagious processes, the cluster reflects an area of severe deprivation which is strongly related to suicide behaviour in Scotland among young adults. The significant policy implications of these results are discussed.

Keywords: Suicide, clusters, Scotland, MAUP

Alexandra Bozheva, Ryerson University. Email: bozheva@yandex.ru; *The New Wave of Immigration from Russia to the USA: New Faces and New Places*

Collapse of the Soviet Union and instability in economic and social conditions caused the increase in the migration from FSU abroad. International emigration from Russia was directed mostly toward three countries: Germany, Israel and the USA. This study is focused on pull factors related to attractive sites in the USA. In the recent decade, immigration from Russia to the USA underwent significant changes. The structure of permanent and temporary migration flows evolved from the prevalence of refugees toward the intellectualization of immigration. The spatial pattern of immigration had changed toward extending of settlement geography and its increasing variety, first of all, due to less concentration around New York area. The similar trend was true for temporary immigration, as the number of Russian arriving through New York port decreased. The combination of pull factors that determines the distribution of Russian immigration through out the USA, has also drastically changed. At the beginning of the new wave, the existing distribution of Russian foreign-born population served as the only decisive factor. At the modern stage, the destination choice of immigrants from Russia is also influenced by employment opportunities created by in research and development sector. However, the presence of the Russian foreign-born population will continue to be the major factor. Regarding temporary immigration from Russia, the combination of pull factors is more complicated. Along with distribution of Russian foreign-born population and funds for R&D, the percentage of population employed in 'professional specialty' occupational group is another factor that plays no less important role.

Kathleen E. Braden, Ph.D. Geography, Seattle Pacific University. Email: kbraden@spu.edu; *The Impact of Nature Tourism on Biodiversity Change in the Russian Federation*

With more than twelve percent of the earth's land area, the Russian Federation's situation for species conservation will inevitably impact the biodiversity of the planet. Since the devolution of the Soviet state, biodiversity has been poorly maintained in Russia, with an increasing number of species under threat of extinction. The Russian Ministry of Natural Resources, international environmental NGOs, the United Nations Development Programme, and the World Bank Global Environmental Facility have all earmarked the tourism sector to provide alternative incomes and alleviate some of the stress on biological resources. These plans are examined, particularly related to nature tourism, the Russian system of zapovedniki (reserves), the ability of the Russian state to attract foreign tourists, and the role of the wealthy tourist class emerging within the Russian elite.

Keywords: tourism, Russia, biodiversity, nature reserve

Danielle Bram, CSU Northridge. Email: starturtle_75@hotmail.com; *A Spatial Analysis of Fennel (Foeniculum vulgare) in the Santa Monica Mountains*

Invasive plant species are a tremendous concern for land managers, as the detrimental effects of these noxious invaders have a huge impact on the surrounding environment in multiple ways. Alien plant invasions can reduce native species richness, change the local fire regime, alter hydrological patterns and compromise water quality. Fennel (*Foeniculum vulgare*) is an extremely aggressive invasive plant species spreading rapidly in the native sage-scrub community in the Santa Monica Mountains of Southern California. I used a combination of logistic regression analysis and Geographic Information System (GIS) tools to create a habitat suitability model which predicts the potential spatial distribution of fennel. Presence/absence data for fennel was obtained from a vegetation mapping project performed by the National Park Service and USGS. The environmental variables analyzed were elevation, slope, aspect, road and trail proximity, hydrologic networks, distance to development, and fire frequency. Elevation, road, trail and stream proximity, and fire frequency were found to be strongly correlated with the presence of fennel. When validated using additional field data, the final predictive raster maps proved to be a reliable indication of the potential distribution of fennel. The results of the study could provide land managers with a more targeted approach in their quest to control and/or eradicate fennel in a proactive and efficient manner.

Keywords: gis, predictive model, invasive species, Santa Monica Mountains

Allison Bramwell, PhD Candidate, University of Toronto. Email: abramwell@lincsat.com; *Under the radar: local workforce development networks and economic development in Hamilton and Ottawa, Canada*

This paper examines the impact of political conflict and consensus among local civic associations, educational institutions, and municipal governments on new economy growth and workforce development initiatives in Hamilton and Ottawa, Ontario, Canada. Like many other industrial city-regions facing the challenge of economic restructuring, Hamilton seeks to diversify its economy to counteract the erosion of its traditional manufacturing base. In contrast, Ottawa

has a strong high tech sector. In both cases, knowledge-intensive industries such as advanced manufacturing and biotechnology in Hamilton, and ICT in Ottawa require a high level of skills in the local labour market. While Ottawa has a critical mass of highly educated knowledge workers, Hamilton struggles to create, attract and retain highly skilled workers, coupled with a higher than average population of people requiring social assistance. Consensus exists among local actors around the importance of workforce development initiatives to support knowledge-intensive economic activities, but policy ambiguity rooted in federal/provincial jurisdictional conflicts has resulted in serious gaps and overlaps in worker training and education in Ontario. Recent research in Hamilton and Ottawa suggests that a variety of actors are successfully involved in the design and delivery of regionally sensitive and socially inclusive education and training to adult workers at the local level in spite of larger institutional barriers. There are links between economic development and workforce development in both cities, but of particular significance is the existence of a robust local network between civic associations, educational institutions, and the municipal government in Hamilton.

Keywords: workforce development, networks, local economic development

Daniela Brandt, University of Berne. Email: brandt@giub.unibe.ch; From Geography to Strategy: Internationalisation of wireless services in Switzerland - An Evolutionary Economic Approach

When it comes to explaining internationalization strategies of mobile communication incumbents the existing literature is largely derived from business and management studies. In management studies internationalisation strategies are explained by rational, static norm strategies, which tend to proclaim a global marketplace with more or less footloose companies. A few remarks on company internal factors and home, as well as host markets aside, general dynamic aspects and a wider contextuality are still neglected in much of this literature. However, recent work in evolutionary economics and economic geography has shown that contextuality provides a valuable framework for the analysis of the development and change of strategic routines. Especially telecommunication incumbents are still influenced by national institutions. Additionally, as national institutions are the outcome of power-relationships with important actors within the national industrial complex, the framework for strategic developments not only has to be context-sensitive, but dynamic too. Empirical work on the former Swiss monopoly player 'Swisscom Mobile' shows that while international industry trends undoubtedly play an important role in shaping internationalization strategies the national path and place dependent elements have to be added to the model in order to reach an overall satisfactory explanatory framework.

Keywords: Internationalisation Strategies; Evolutionary Economics; Institutionalism; National Network Embeddedness; Mobile Telecommunications Industry; Incumbents

Christian Brannstrom, Texas A&M University. Email: cbrannst@geog.tamu.edu; State and Private Environmental Policymaking on a Neoliberal Agricultural Frontier

South America's "neoliberal frontier" (Hecht 2005) is defined a region of relatively recent (post-1980) export-oriented mechanized farming resulting in high rates of clearing, mainly of tropical dry forests and savannas, that have failed to attract conservation policies. This paper evaluates Hecht's "neoliberal frontier" in the context of export-oriented mechanized farming of the savanna ecoregion in northeastern Brazil. Land-use and land-cover changes are analyzed for ~12,000 km² study region in northeastern Brazil's soy-cotton belt (1979-1986-2000-2005). The results indicate that savanna covers ~50% of the study region and continues to occupy relatively large fragments amid farms often exceeding 5,000 ha. Underlying drivers of land-cover change include soybean markets and subsidies, agronomic technology, and permanent migration of southern Brazilian farmers to the region; significant obstacles to production, in the form of land-tenure insecurity, poor transport, and infertile soils, remain. Since 1990, a private farmers' organization has developed environmental policies that often outpace state agencies, which lack resources and personnel. Various aspects of private and state policies are summarized in the context of land-change maps, and categorized in terms of activity, information, agenda-setting, and discourse. The study area differs from Hecht's "neoliberal frontier" of northeastern Brazil notion in three main ways: (1) the development of an endogenous environmental debate; (2) the leadership role, in practice and discourse, of a private farmers' organization; and (3) the striking pattern of land-use and land-cover outcomes.

Keywords: Brazil; savanna; agriculture; neoliberal; environment; policy

Boris Braun, University of Bamberg. Email: boris.braun@ggeo.uni-bamberg.de; Alexander Bloechl, University of Bamberg. Email: alexander.bloechl@ggeo.uni-bamberg.de; Land-use, natural hazards and economic loss: lessons from a landslide-prone area in Southern Germany

Urban sprawl has become a typical and increasingly important consumption pattern in many Western countries. Inadequate land usage and rocketing property prices have led to a severe scarcity of space in many agglomerations pushing urban development in areas that are not particularly suitable for building. Moreover, in many mountainous areas attractive hillside locations are in high demand leading to building activities on steep slopes that are prone to landslides. Housing developments in high-risk areas result in an over-consumption of natural resources and in an increasing risk of economic losses due to landslides and other natural hazards. An important aim of modern hazard research is to assess and to reduce economic losses caused by extreme natural events. This paper will present results of an integrated study of landslide risks for settlements and infrastructure on the Swabian Alb in Southern Germany. New methods to estimate the potential damage and economic losses have been developed within this project. GIS-based techniques for mapping landslide hazards allow the development of detailed landslide risk maps that can be used on both the regional and the local level. By using this detailed information planning institutions are able to refine and to adopt future strategies for more sustainable urban land-use planning. Environmental economic geography, in collaboration with physical geography and other geosciences, can be an important contributor to these efforts.

Keywords: economic geography, natural hazards, landslides, Germany

Jeff Bray, Florida State University. Email: jbray@mailers.fsu.edu; Gay-Straight Alliances: The Politics of Constructing Space and Identity in Public Secondary Institutions

Public schools are saturated with socio-spatial competition and dissension. Institutions of public secondary education are collectively engulfed in an ongoing power struggle to define the experience of educational space. Opposing conceptions of social justice and traditional values, as well as the resulting power struggles which work to deny or institutionalize them within the educational space, are clearly present within the current debates concerning Gay-Straight Alliances in American public high schools. Gay-Straight Alliances are student led and organized extra-curricular groups designed both for gay and straight students as a means for communication, friendship, and support. These groups have sprouted throughout the United States, and have garnered intense opposition from social conservatives. The struggle for and against Gay-Straight Alliances is one fought at many scales and by numerous actors within the fabric of American society, turning high schools across the country into battlegrounds within a much broader culture war. This presentation serves as an interconnected series of case-studies and critiques concerning the geographical dynamics of education, policy, public space, and cultural-politics with respect to Gay-Straight Alliances in American public high schools.

Anthony J. Brazel, Arizona State University. Email: abrazel@asu.edu; Donna Hartz, graduate student, Arizona State University. Email: hartzda@yahoo.com; Shaping of an Arid City's Microclimates, Phoenix, Arizona, USA

It is well-known that microclimates on the earth's surface vary as a function of local scale factors such as terrain, surface land cover, moisture, wind systems, and in urban environments through processes related to anthropogenic activity and morphology and composition of the built environment. The "shaping" of microclimates in human-dominated systems, in addition to site and situational aspects of these environments, comes about by legacy effects evident in the landscape, inadvertent development consequences, and outright attempts at mitigating unwanted parts of the microclimate variance from place to place. In arid environments, often climate conditions are near upper thresholds important to maintaining sustainable features of the urban environment without considerable strain on resources to ameliorate vulnerable components of the urban ecosystem. Health, comfort, energy costs, water stress and drought are all elements that are related to past and present "shaping" of urban environmental microclimates, in addition to the general climatic setting and background global/regional changes that take place. Several ongoing projects in Phoenix, AZ demonstrate the shaping of past and present microclimates, the relevance of understanding this shaping, and the specter of future changes for this arid environment. As mentioned by several researchers of arid environments, lessons can be learned from legacies and past successes in arid environmental settlements and the role of careful design of urban areas for the future.

Christopher Brehme, University at Buffalo. Email: cbrehme@buffalo.edu; *Identifying factors that contribute to spatial decision-making strategies among lobster fishers*

This research elicits and examines the mental models used by different lobster fishers to establish and refine their trap placement strategies and compares these models to current scientific theories and spatial databases of fishing patterns. The research is based on field work in Maine and Western Australia, which share a reputation for effective management and a high level of fisher-scientist cooperation. Trap placement strategies are expected to vary based on a number of factors: fishing experience, use of geospatial technologies, level of engagement in current scientific research, and social networks. The research involves a mixed methods approach that includes spatial analysis in GIS, ethnography, participant observation, and historical research. Sources include spatial data from government logbook programs, historic records of individual fishermen, reports, oral histories, and interviews with fishers and scientists in Maine and Western Australia.

Keywords: fishing, GIS, Maine, Western Australia

Jason Bremner, Carolina Population Center. Email: jbremner@email.unc.edu; *Livelihood Diversification among Indigenous Peoples of the Ecuadorian Amazon*

Throughout the Amazon, new roads, infrastructure, oil pipelines, colonist settlements, and mechanized agriculture suggest an uncertain future for indigenous peoples. Case studies reveal that indigenous people of the Amazon are facing intense socio-economic, demographic, and cultural changes. This research proposes an examination of the determinants of a very important aspect of change reported to be occurring among indigenous populations: the adoption of non-farm employment, which is often referred to as livelihood diversification. Livelihood diversification may have unforeseen impacts, both positive and negative, on families, communities, and resource management institutions, and thus the future of indigenous lands and peoples. I therefore, seek a deeper understanding of the factors that contribute to these livelihood decisions. Specifically this research addresses the question, "What are the individual, household, and contextual factors that lead indigenous households to decide to diversify livelihoods and participate in non-farm employment?" I answer this research question using survey data collected from 500 households of five different ethnic groups and model both the decision to participate in non-farm employment and the level of participation using a Heckman's selection model. I suspect that indigenous households respond to changes in different ways related to their assets, capabilities, and available opportunities, and that these responses are mediated by social institutions and local context. Consequently, I expect that different ethnic groups will show different levels of participation in non-farm employment even when controlling for household and community level determinants. As such this study will highlight the importance of cross-cultural analysis when studying livelihoods.

Keywords: Indigenous, Livelihoods, Amazon

Chris Brennan-Horley, University of Wollongong. Email: chrisbh@uow.edu.au; Chris Gibson, University of Wollongong. Email: ; Andrew Gorman-Murray, University of Wollongong. Email: ; Gordon Waitt, University of Wollongong. Email: ; *Exploring the qualitative economy of a rural festival: beyond quantitative impact evaluations*

Conventional stories about the economic dimensions of festivals are expressed in terms of commercial impact, and quantified using specific methodologies. Researchers in tourism and event management have employed multiplier analysis, visitor survey and business impact methods to model direct and indirect economic contributions of festivals. In this paper we seek to broaden discussions of the economic dimensions of festivals. We explore results from field work conducted at ChillOut, Australia's largest Gay and Lesbian festival held outside a major capital city. Our approach revolves around understanding qualitative economic dimensions of festivals and special events, paying particular attention to both to meanings and identities created by festivals, and the context in which they take place. We analyse the economic dimensions of the ChillOut festival in

terms of direct commercial impact, and contrast this with other qualitative themes: place identities, belonging and acceptance, heteronormativity and 'the pink dollar', and situated knowledges of festival economies. We present the qualitative economy as a concept that provides a contextualised interpretation of economic dimensions of festivals, beyond numerical estimations.

Keywords: Heteronormativity, festivals, qualitative economy, economic geography

Ludger Brenner, El Colegio de Michoacan, A.C.. Email: brenner@colmich.edu.mx; *Management of Protected Areas in Mexico*

The poster presentation shows the problems that larger Latin American countries confront in the area of managing Protected Areas. In the case of two Mexican Biosphere Reserves, the interests, strategies and specific actions of a variety of actors involved in Protected Area management are identified. Special emphasis is placed on the spatial level(s) on which their actions take place and conflicts among different stakeholders. The study revealed that the existence of a large number of actors with conflicting interests and opposing strategies was not just an obstacle to a more integrated and participative form of Protected Area management, but also to sustainable tourist development. It was further noted that organizations -both governmental and non-governmental- are often inadequately conceived and poorly-coordinated. Thus, despite large amounts of investment, it has not yet been possible to enhance regional development or local participation. In order to resolve these complex problems, it is suggested that a formally constituted Round-Table with crucial decision-making power be installed, in which legitimate representatives from all stakeholder groups involved and concerned could express and negotiate their interests.

Keywords: Protected Areas, Management, Tourism, Mexico

Neil Brenner, New York University. Email: Neil.Brenner@nyu.edu; *Rescaling processes and the urban question: reflections on the geographies of 'urban' change under globalizing capitalism*

Since the early 1990s, questions about the scalar constitution of contemporary political-economic processes have attracted intense interest among social scientists. Interdisciplinary debates on the global/local interplay, the "glocalization" of capital accumulation, the rescaling of statehood and the politics of scale have resonated broadly and deeply throughout the social sciences. This presentation evaluates and sharpens certain key elements of this "new political economy of scale" in order to investigate the changing character of the urban question under contemporary "globalizing" capitalism. I argue that contemporary scalar transformations necessitate a fundamental rethinking of the urban. This proposition is developed, in a first step, through a critical evaluation of the apparent "scalar turn" within the contemporary social sciences. Second, and on this basis, I consider several realms of sociospatial restructuring in post-1980s capitalism that have profoundly transformed the scalar configuration of urban processes. While I insist that the contemporary urban question cannot be grasped entirely with reference to scalar transformations, I suggest that such transformations have fundamentally altered the geographical and institutional terrain within and through which the process of urban development unfolds. Therefore, the urban question and the scale question are today intertwined in ways that require sustained theoretical, methodological and empirical scrutiny. A brief conclusion underscores some of the basic limits to a scalar perspective on the urban question: the geographies of urbanity are polymorphic, and cannot be reduced to any one dimension.

Keywords: Scale, rescaling, urban question, sociospatial theory, globalization, neoliberalism, Europe.

Thomas Brenner, Max Planck Institute. Email: brenner@econ.mpg.de; *Determinants of the Spatial Distribution of Industries - Theory and Empirical Evidence for Germany*

The aim of this paper is to understand the factors that determine the location of firm sites. To this end, a model is developed that predicts the probability of a location in a specific region dependent on local externalities and the co-location of industries. The model is then fitted to the empirical data for each 2-digit industry separately. A number of other factors, such as university education, public research, population density, and the industry specialisation of the region are included in the analysis. The study allows to examine to what extent the location of an industry is determined by the interaction within the industry.

Keywords: Local externalities, spatial distribution, local resources

donald.friend@mnsu.edu; *Quantifying the Significance and Modeling the Distribution of Rock Glaciers in the San Juan Mountains, Colorado, USA*

The quantitative significance of rock glaciers is assessed and their spatial distribution patterns are analyzed in the San Juan Mountains, Colorado/USA (2874 km² above 3400 m a.s.l.). Statistical estimation techniques and generalized additive models are used to efficiently evaluate a set of 2933 surface points obtained by random sampling and air photo interpretation. Results show that active and inactive rock glaciers in the study area occupy an estimated area of 70 km², which corresponds to a water equivalent of 0.50-0.76 km³, and estimated rock glacier debris volumes imply postglacial denudation rates (vertical lowering rates) of 0.5-1.1 mm per year within the talus sheds of rock glaciers. The generalized additive model, which is able to represent both linear and nonlinear effects, is based on topographic attributes derived from digital elevation models of the Shuttle Radar Topography Mission (SRTM). The model structure indicates that the covariables of local slope, slope of the contributing area, local curvature and size of the contributing area are among the main factors controlling rock glacier distribution. The predictive capabilities of the models for mapping rock glaciers regionally are further improved by combining terrain attributes and Landsat Enhanced Thematic Mapper (ETM) remote sensing data.

Keywords: generalized additive modeling; rock glacier; terrain analysis

Stefano Breschi, CESPRI-Università Bocconi. Email: stefano.breschi@unibocconi.it; Francesco Lissoni, CESPRI-Università Bocconi and Università di Brescia. Email: francesco.lissoni@unibocconi.it; *Mobility of inventors and the geography of knowledge spillovers. New evidence on US data*

In the past 20 years, research on the geography of innovation has revolved largely around the concept of "localized knowledge spillovers" (hereafter LKSs). For long supported only by circumstantial evidence, the LKS hypotheses was first tested by Jaffe, Trajtenberg and Henderson (1993; hereafter JTH). The three authors argued that knowledge spill-overs may be measured by the "citations to prior art" contained in most patent documents, and produced a statistical experiment showing that such citations come disproportionately from the same geographical area of the cited patents. The JTH experiment relies on the assumption that technological knowledge is largely tacit, so that face-to-face contacts are the necessary vehicle for its diffusion; in turn, geographical proximity is a necessary condition for those contacts to take place. In this paper we exploit new data on US inventors in Chemistry, Pharmaceuticals, and Biotechnology from EP_CESPRI database, and show that the key variable affecting knowledge diffusion is the social distance between patent inventors, which results from inventors moving across firms and/or marketing their research services. These ties are key vehicles for knowledge; to the extent that they are localized, knowledge flows are localized too. We also show that social distance explains the results obtained, by Thompson and Fox-Kean (2005), who have recently questioned the validity of the JTH experiment, on the basis of what they regard as a technical detail; namely, that the technological classification chosen by JTH to produce the control patent sample is so loose that their experimental evidence should be discarded as spurious.

Caroline Bressey, Dr, UCL. Email: c.bressey@ucl.ac.uk; *Geographies of work, race and anti-racism in England and Wales 1890 - 1945*

The idea of a nation opposed to racism is entrenched in the ideals of the British imagination, especially as a part of memories of the Second World War. Paradoxically this is coupled with a whitening of British history, including a lack of recognition of Black people's contribution to the Home Front. Also highlighted by conflicts during both World Wars, areas of work were often sites of struggle and provide moments of insight into British attitudes to race. When Black seamen in Cardiff went on strike in response to changes in employment structures in 1911 they were supported by the majority of their peers. By the time the League of Coloured Peoples investigated the experience of seamen in the city in the 1930s, racial prejudice had become embedded within union ideology and institutionalised by the British government. Yet critiques of racial prejudice had begun as early as the 1890s when the anti-racist movement in Britain was evolving as a political and social movement. The geographies of British anti-racism need to be placed in this broad historical context. This paper seeks to place the experiences of the Black community at the centre of a consideration of the early anti-racist community in England and Wales, and its focus on the exploitation of labour, 'at home' and in the empire, as a site of resistance.

The development of software tools that focus on emergency response scenarios is a recent research focus in geovisual analytics. What makes this research challenging is the multidimensional, multiscale, multisource nature of the geospatial, temporal, and abstract information components that characterise such scenarios. The goal is to enable exploration and analysis of this information in a flexible, integrated, interactive environment that requires minimal training. In the Improvise visualization environment, users build and browse multiple coordinated information displays. Improvise is unique in its allowances for precise control over how interaction affects data appearance in and between multiple maps, scatter plots, tables, and other views. Building and browsing activities are integrated in a live user interface that supports incremental design. Users rapidly modify and extend their visualizations to develop hypotheses and exploit discoveries during ongoing exploration and analysis. Improvise is open source Java software freely available on the web; its visualizations are saved as regular XML documents in a self-contained, platform-independent format for easy sharing and dissemination of results. This paper describes how we are using Improvise to build tools for exploring and analyzing how campus critical infrastructure impacts stadium evacuation scenarios. The spacetime display and querying capabilities of Improvise allow us to combine information sources that describe campus infrastructure in ways that support interactive experimentation on the effects of stadium layout, seating variations, blocked exits, traffic and parking patterns, and other scenario variables on the ability of campus planners and emergency personnel to respond to disruptions by identifying and exploiting available resources.

Shiri M. Breznitz, University of Cambridge. Email: sb443@cam.ac.uk; *How do power struggles impact the technology transfer ability of universities? Reflections from Cambridge, UK.*

The University of Cambridge, UK is known for its academic research and its contribution to local economic growth. However, this contribution was not the result of an official university policy, but based on social networks of individual entrepreneurs from the university and industry. Examining the changes in the university technology transfer policy and organization, which were implemented in the late 1990s, explains how political conflicts impacted the Cambridge biotechnology cluster. Power struggles between the UK government and the University of Cambridge, as well as conflicts inside the university, had a negative impact on the university's technology transfer ability. This impact is measured through the university's contribution to the local biotechnology industry.

Scott A Bridwell, University of Utah. Email: scott.bridwell@geog.utah.edu; Harvey J Miller, University of Utah. Email: harvey.miller@geog.utah.edu; *Disclosure limitation methods for activity-travel data*

Recent innovations in positioning technologies, such as GPS and location-aware mobile telephones, are greatly increasing our ability to track the locations visited by individuals at detailed spatial and temporal resolutions. The data derived from these tracking technologies offer tremendous potential for studying

activity-travel behavior, but also present significant privacy concerns. In this paper we present methods for developing privacy safeguards for densely-tracked objects within activity-travel data. Our methods focus on limiting disclosure threats while maintaining the usability of released datasets. Disclosure occurs when unintended information—usually of an identifying or sensitive nature—can be attributed to the individuals within a released dataset. Our disclosure limitation methods adapt geographic masking techniques for time geographic representations. Geographic masks limit disclosure threats by applying data transformations to sensitive spatial data but are limited to a static perspective in which people are represented as static points; this is insufficient for limiting disclosure when capturing dynamic sequences of interdependent stationary and moving behaviors as is the case for most activity-travel data. Our methods conceptualize people as space-time paths. We demonstrate methods for constructing and masking space-time paths from a GPS activity-travel dataset. We explore the degree to which the masks limit disclosure possibilities and also assess the sensitivity of analytic results in response to different mask implementations. The results indicate that our masking methods are useful for data management entities considering the implications of releasing detailed activity-travel data, as well as analysts considering the potential biases present within the data.

John Briggs, University of Glasgow. Email: john.briggs@ges.gla.ac.uk; Indigenous knowledges and development: experiences from Bedouin communities in southern Egypt

Indigenous (or local) knowledge has been seen to offer an alternative means of reducing rural poverty in many parts of the Global South. Its use and deployment in development, however, can be problematic. Drawing on evidence from Bedouin communities in southern Egypt, this paper explores some of these difficulties.

Keywords: indigenous knowledge, development, Egypt

Eddie Bright, Oak Ridge National Laboratory. Email: brightea@ornl.gov; Phil Coleman, Oak Ridge National Laboratory. Email: colemanpr@ornl.gov; Budhendra Bhaduri, Oak Ridge National Laboratory. Email: bhadurib@ornl.gov; LandScan: Status and Direction

Accurate representations of population distribution are critical for a wide variety of research needs including resource management, policy analysis, risk analysis, and emergency preparedness. Multi-variable, dasymetric population distribution models developed at Oak Ridge National Laboratory (ORNL) apply GIS and Remote Sensing data and technologies to spatially and temporally disaggregate census counts producing a non-uniform distribution of the population. LandScan, a global high resolution (~1km) population distribution data set, is improved annually reflecting new census counts, spatial data, and imagery modifications to the distribution models. Research areas include automated urban land cover mapping utilizing ORNL's high performance computing capabilities. LandScan USA is a very high-resolution (~90-meter cell) population distribution project depicting nighttime (residential) population as well as daytime population distributions throughout the U.S. The integration of demographic and transportation models with LandScan USA allow the unique capability of estimating time-variant population dynamics which can greatly enhance the analytical capability for numerous applications. Future development will include seasonal and event-driven population distributions and demographic characterizations.

Christy Briles, University of Oregon. Email: cbriles@uoregon.edu; Cathy Whitlock, Montana State University. Email: whitlock@montana.edu; Patrick Bartlein, University of Oregon. Email: bartlein@uoregon.edu; Postglacial vegetation and fire dynamics on different substrates in the Klamath Mountains, NW California

The role of climate in maintaining the biological diversity of the Klamath Mountains of northwestern California since the last ice age (~15,000 cal yr BP) is not well understood. Vegetation records from the region either show little or a lot of vegetation change since the last ice age, and at many sites the sedimentation rates are too slow to capture individual fires. Therefore, a network of vegetation and fire histories, using pollen and macroscopic charcoal preserved in lake sediments, was developed to compare with the preexisting records to help clarify the vegetation and fire history of the region. The differences are likely the result of different geologies of the sites. Campbell lake is underlain by mudstones and metavolcanics, Taylor Lake by granodiorite and Bluff and Cedar lakes (Mohr et al., 2000; West, 1989) by ultramafics which pose severe nutrient limitations to plants. The vegetation records on non-ultramafics have very similar vegetation records dominated by haploxylon Pinus, Abies and Tsuga mertensiana during the late-glacial period, haploxylon Pinus, Cupressaceae, Quercus vaccinifolia and Roseaceae during the early Holocene, and haploxylon Pinus, Abies and Pseudotsuga during the late Holocene. Sites on ultramafics are

dominated by diploxylon Pinus, Artemisia and Poaceae in the late-glacial period and diploxylon Pinus, Cupressaceae and Quercus vaccinifolia in the early and late Holocene. On millennial time scales, fire histories are very similar at all sites, however on shorter time scales, they show different patterns.

Robert Brinkmann, Ph.D., University of South Florida. Email: rbrinkmn@cas.usf.edu; Philip Reeder, Ph.D., University of South Florida. Email: preeder@cas.usf.edu; Philip van Beynen, Ph.D., University of South Florida. Email: vanbeyne@cas.usf.edu; Characteristics of the Western Edge of the Brooksville Ridge, Florida

The Brooksville Ridge is part of a north-south parallel ridge system in peninsular Florida. The ridges are small, karst-modified cuestas that erode on the edges during high sea level stands. The surfaces of the ridges have been exposed longer than any other areas in the peninsula due to their relative height and thus exhibit some of the most advanced karst features in the region. This area of the peninsula has extensive caves, the greatest local relief due to sinkhole formation on the ridges, and the greatest density of springs. Ridges also contain complex uvalas, solution valleys, and disappearing streams. During high sea level stands, the ridges were islands in late Cenozoic seas. In this setting, the ridges can be thought of as similar to current karstic islands in shallow marine environments, such as the Bahamas Islands. This poster explores the western edge of the Brooksville Ridge to evaluate the presence or absence of coastal features one would expect to find on the shores of karstic islands. To accomplish this task, a digital terrain model of the western edge of the ridge was created and paleoshoreline features were identified. The results indicate that the paleoshoreline can be classified into features such as bays, beaches, and dune fields. However, it is noteworthy that the edge was irregular compared with the edges of modern karstic islands like the Bahamas. This is largely because the edge of the Brooksville Ridge contains many paleoembayments that are part of karstic solution valleys or ancient spring runs.

Timothy J. Brock, UGA Marine Extension Service. Email: tbrock@uga.edu; Balancing Economic Development and Environmental Quality: A Case Study of the Georgia Coastal Green Subdivision Program

Coastal Georgia is one of the fastest growing regions in the United States. The population growth and increased development in this region has had many negative impacts on the environmental quality of the coast, most specifically water quality. The once forested coastal watersheds are being depleted by a surge of residential development, which impairs the fragile estuarine ecosystem. These estuaries, which are highly productive habitats, are now at risk. To lessen this environmental impact, Georgia has implemented a program to promote green development in the region. The Georgia Coastal Green Subdivision Program consists of an outreach program to encourage local developers to implement aspects of green development and better site design principles into their plans; and a certification program that recognizes green subdivisions in the area. The program seeks to educate local developers on the economic and environmental benefits of green development and will also develop more immediate and tangible incentives from municipal and county officials. This paper examines the social, economic and environmental issues being addressed by the Georgia Coastal Green Subdivision Program, as well as, the current progress and future plans of the program.

Email: ; *Furthering University/Community Partnerships for Environmental Justice: Children's Health and Safety in Low-income Neighborhoods in East Austin, Texas*

The urban environment has long been an arena of contestation and the focus of activist demands: for fairer distribution of environmental services, for removal of polluting industries, for rezoning of industrial areas. Such demands for greater "environmental justice" increasingly influence planning and policy-making and have become the focus of a growing body of academic and policy-oriented research. Environmental justice research is often community-driven and participatory in nature, involving qualitative methods such as interviewing, participant observation, mental mapping, and participatory GIS. By incorporating formal, scientific knowledge with local perspectives on urban space, environmental justice has become a powerful approach to understanding and negotiating the sometimes conflicting interests of activist groups, neighborhood organizations, policy makers and corporate interests. This service learning course, offered by the program in Community and Regional Planning in the School of Architecture, introduced students to the origins, theories, and methods of environmental justice, focusing in particular on environmental issues in marginalized, low-income and ethnic neighborhoods in the United States and in Latin America. For our final class project, we collaborated with neighborhood organizations, the activist environmental justice group PODER, and city planners to investigate environmental justice concerns in East Austin, specifically health and safety concerns associated with industrial sites. We jointly developed a research methodology, conducted field research and gathered data, and produced a GIS, a DVD, a report, and posters to assist different actors engaged with environmental policy-making in East Austin.

Email: drobins@rci.rutgers.edu; *Regional trend analysis of satellite-derived snow extent and global temperature anomalies*

The extent and variability of seasonal snow cover are important parameters in climate and hydrologic systems due to effects on energy and moisture budgets. Northern Hemisphere snow cover extent, comprising about 98 percent of global seasonal snow cover, is the largest single spatial component of the cryosphere, with a mean maximum extent of 47 million square kilometers (nearly 50 percent of the land surface area). During the past four decades, much important information on Northern Hemisphere snow extent has been provided by the NOAA weekly snow extent charts, derived from visible-band polar orbiting and geo-stationary satellite imagery. Since 1978, satellite passive microwave sensors have provided an independent source for snow monitoring, with the ability to penetrate clouds, provide data during darkness, and the potential to provide an index of snow water equivalent. We see both positive and negative trends in snow cover derived from these data sets, depending on region and time of year. We continue to search for attribution of these trends. We present regional trend analysis of both snow cover data sets, and comparisons with gridded temperature anomalies from the NASA GISS Surface Temperature Analysis data.

Keywords: snow extent, global temperatures, trend analysis

Loona Brogan, MS student, Environmental Thought and Culture, University of Vermont Rubenstein School of Environment and Natural Resources. Email: she.loves.trees@gmail.com; "Talking Trees:" historic photographs + oral histories = tree-centered sense of place

"Talking Trees" is an oral history and image gathering project designed to utilize and supplement an existing on-line historic photo archive with complementary 'now' images and oral history recordings focused on the life stories of four individual trees and three publicly-held treescapes in Montpelier, Vermont. How have they endured or changed over time, both physically and in our cultural perceptions of them? Do certain trees' life stories and treescape histories give depth to the history of Montpelier, and can the internet provide an effective means of eliciting and conveying such? I consider trees individual living beings,

and treescapes communities of individual trees. In this digital era of increased human alienation to the rest of the living world, I aim to use the internet as an archival research tool to 'meet' and 'get to know' a few trees and treescapes personally. I will then use the same tool—the world wide web—to introduce them (and my experiment) to others. My goal is to provide a pilot interdisciplinary methodology by which fellow tree enthusiasts and place-based educators can discover and articulate the stories of their communities' great trees and treescapes. So many of us want to feel more connected with the places we inhabit and the communities of other beings we live here with; it is my hope that this interdisciplinary research method, dendrography (which draws on dendrology, oral history and archival document and imagery analysis), will facilitate deeper relationships between people, trees, and our evolving history together through time.

Keywords: environmental history, dendrography, trees, oral history, historic photos, local history, digital archives

Justin Michael Brolley, Florida State University. Email: jbrolley@coaps.fsu.edu; James J. O'Brien, Florida State University. Email: jim.obrien@coaps.fsu.edu; *The Effects of ENSO, NAO, and PDO on Monthly Extreme Temperature and Precipitation in North America*

The El Nino-Southern Oscillation (ENSO), the North Atlantic Oscillation (NAO), and the Pacific Decadal Oscillation (PDO) produce conditions favorable for monthly extreme temperatures and precipitation. These climate modes produce upper level teleconnection patterns that favor regional droughts, floods, heat waves, and cold spells, and these extremes impact agriculture, energy, forestry, and transportation. The above sectors prefer the knowledge of the worst (and sometimes the best) case scenarios. This study examines the worst and best case scenarios for each phase and the combination of phases that produce the greatest monthly extremes. This study examines extreme monthly temperature and precipitation for each combination of the phases of the three climate modes. Data from nearly 740 stations in Canada, Mexico, and the United States are gathered from the Global Historical Climatology Network (GHCN) and the United States Historical Climatology Network (USHCN), and 55 years from these stations bootstrapped to produce larger time series. The bootstrapped data are sorted, and the tenth and ninetieth percentiles are analyzed. It has been found that the magnitudes of temperature and precipitation anomalies are greatest in western Canada and the southeastern United States during winter. Summertime temperature anomalies are weak, but precipitation anomalies are strong in the eastern United States. The magnitudes of the anomalies and the corresponding phase combinations vary regionally and seasonally.

Keywords: climate, extremes, ENSO, NAO, PDO, North America, short-term climate variability

Ava Bromberg, M.A. Urban Planning 2007, UCLA Department of Urban Planning. Email: avab@ucla.edu; *What Could Require More Creativity: The Role of Neighborhood Spaces in the Development of Noncapitalist Social Relations.*

My paper examines the creativity of neighborhood spaces that advance social forms and economies outside the current regime of capitalist accumulation. I will introduce Mess Hall, a locally invested, globally networked neighborhood cultural space in Chicago that operates on an economy of generosity to host exhibitions, skill-sharing, lectures, meals, and more. I present Mess Hall as part of a continuum of contemporary spaces such as the Garment Worker's Center in Los Angeles and Mother's Centers International, and historically Jane Addams's Hull House and Margaret Kohn's Radical Spaces. These spaces - in choosing to operate outside the dominant social, economic, and political framework but with a critical awareness of what is lacking from inherited political, social, and economic structures of their time - present a radical synthesis. In so doing, they advance a kind of creativity not captured by most the Creative Economies and Cultural Industries literature (Florida 2002, Scott 2001, Pratt 1997) because their value cannot be comfortably reduced to economically quantifiable impacts within the capitalist framework. Yet, I will argue, these spaces have crucial social and democratic functions that raise fundamental questions about where and how we gain access to the kinds of knowledge and fun that can be synthesized into new meaningful (and transformative) social, political, and economic forms. These spaces face formidable challenges to maintain their critical and creative function over time in the face of institutionalization. They raise interesting questions about how policies might ensure access to creativity in this expanded sense.

Keywords: creativity, neighborhood spaces, spatial theory, democracy, public space, culture, cultural policy

Lars Bromley, American Association for the Advancement of Science. Email: lbromley@aaas.org; *Geospatial Intelligence Networks for Human Rights Organizations*

Since early 2006 the American Association for the Advancement of Science (AAAS) has been documenting and developing applications of geospatial technologies to human rights work. With funding from the MacArthur Foundation and in collaboration with non-governmental organizations, AAAS has created customized information products on human rights violations in Darfur, Zimbabwe, Colombia, Burma, Lebanon, Israel, and elsewhere. AAAS is also documenting potential applications and methods on a project website to create the basis for training materials. Applications thus far largely exploit high-resolution imaging satellites and publicly available data sources to provide inputs into advocacy and legal campaigns. Longer-term goals seek to develop geospatial intelligence networks and early warning systems to assist non-governmental organizations in preventing and responding to human rights violations. This session will provide a brief survey of AAAS activities to date and collect information from audience members on other relevant efforts and applications.

Keywords: gis, high-resolution remote sensing, data integration

David M. Brommer, The University of Alabama. Email: dmbrommer@bama.ua.edu; *An Analysis of Seasonal Precipitation Duration Throughout the Conterminous United States*

The changing character of precipitation has been the focus of numerous climate change studies. Variations in the intensity, amount, timing, and frequency of precipitation, whether frozen or liquid, have important implications on the physical, chemical, and biological processes on Earth. While intensity, frequency, and the amounts of precipitation throughout the United States have been thoroughly analyzed, the variation in precipitation duration has not. This research focused on precipitation duration for the conterminous United States, characterizing the spatial and temporal variations in precipitation duration and evaluating duration's relationship to changes in surface temperature anomalies. Data were collected from 87 first-order National Weather Service weather stations throughout the conterminous United States for the period from 1949 through 2004. Through a series of statistical tests, it was noted that precipitation occurrences during the cold season and in the annual average decreased in length throughout the period of record in response to warmer atmospheric temperatures. The spatial and temporal variation in precipitation duration in relation to surface temperature anomalies reveal the intricate relationships between the processes for precipitation development on local, regional, and continental scales and identifies precipitation duration as an important variable in the study of climate change.

David H. Bromwich, Professor, Ohio State University. Email: bromwich.1@osu.edu; Andrew J Monaghan, Dr, Byrd Polar Research Center. Email: monaghan.11@osu.edu; *Recent changes in snowfall and near-surface temperature over Antarctica*

There are only a handful of continuous snowfall and temperature records spanning more than a decade in Antarctica, a continent that is 1-1/2 times the size of the United States. Considering that climate is known to fluctuate on timescales longer than a decade, it is critical to reconstruct these records for an extended period over the entire continent in order to put Antarctic climate variability in the context of the longer-term changes observed across the globe. Here, we exploit the spatial and temporal continuity of simulated snowfall and temperature fields from an atmospheric model to 'fill in the gaps' in the sparse observational records of these variables. The result is a ~50 year reconstruction of spatially-resolved snowfall and temperature fields over Antarctica. We examine the relationship between temperature and snowfall, the impact of Antarctic snowfall on sea level, and implications for future climate scenarios.

Keywords: snowfall, temperature, Antarctica, global sea level

George A. Brook, University Of Georgia. Email: gabrook@uga.edu; *Stalagmite Evidence of Droughts in Belize at the Time of the Classic Maya Collapse*

The Maya civilization peaked in population density and socioeconomic complexity during a Classic Period extending from A.D. 25 to 900, but declined abruptly over the years from A.D. 750 and 900. Reliably-dated reflectance, luminescence and stable isotope data from a stalagmite from western Belize provide a 3300-year record of climate change encompassing the Maya Preclassic, Classic, and Postclassic periods. The stalagmite record indicates that a series of droughts, forming the most prolonged dry interval in the 3300-year record, lasted from A.D. 700 to 1135 and thus coincided with the collapse of the Maya civilization. In addition, two earlier droughts coincided with Preclassic Abandonment and the Maya Hiatus, also periods of decline in the Maya civilization. Comparison of the stalagmite record with distant records shows broader-scale climatic teleconnections with Central and South America, and two major

segments of the record coincide with the Medieval Warm Period and Little Ice Age. Correlation of the stalagmite record with variation in solar irradiance, as well as with distant paleoclimate records, suggests that the droughts inducing both the temporary declines and the final collapse of Maya civilization were driven by large-scale changes in ocean-atmosphere conditions across the North Atlantic and the Bermuda Rise.

Sheere K Brooks, London School of Economics & Political Science (LSE). Email: S.Brooks@lse.ac.uk; *Do we really need more tourism in Jamaica? Exploring the highs and lows of merging tourism with agriculture in the bid to create alternative livelihoods*

Background to the paper: In recent years, the tourism industry in Jamaica is a key sector for economic growth for the island in recent years. Infrastructure development across the island, such as the North-coast Highway, should create easier linkages between tourist towns while broadening the holiday experience of tourists to the island. Hence, the opportunity for widening and introducing other typologies in the tourism product, away from the traditional package of sun, sea and sand is now favourably pursued. Policy objectives in the Master Plan for Sustainable Tourism Development (2001), indicates will result in a more inclusive tourism sector by engaging more local participation in tourism, while creating opportunities for alternative livelihoods. Issues: The implications of these proposals brings into focus the willingness on the part of young people to adopt agriculture as alternative livelihoods in view of the mainstream tourism industry's perceived image of glamour and ease of informally making a living. This raises several questions; can these plans be construed as necessarily positive for communities located in the tourism passage; should the tourism agenda be used to engender the creation of alternative livelihoods in agriculture? Aim of the Presentation: This paper will discuss the potential of new developments outside the traditional nexus of agriculture and trade, by considering new opportunities for forging partnerships between the tourism and agriculture sectors. The paper aims to take the debate surrounding 'linkages and leakages' between tourism industry and other sectors in the economy to another level in light of global economic changes.

Email: pedlowma@uenf.br; *Globalization, Deforestation, and the Expansion of the Cattle Industry Into the Brazilian Amazon: A Research Strategy*

Deforestation in the Brazilian Amazon represents a real threat to global environmental security principally through impacts on the global carbon cycle and loss of biological diversity. Satellite image analysis indicates that 12-15% of the region's natural forest has been converted. Cattle ranching in Amazônia has been the subject of a substantial amount of econometric and ethnographic research, in large part because of its prominent role in tropical forest conversion. Recently, Brazil's cattle industry has expanded at nearly exponential rates becoming one of the world's largest suppliers of various animal products. Most of this growth is attributed to beef product exports, surging from \$234 million in 1990 to \$1.3 billion in 2003. This paper presents a research strategy to systematically examine the functional linkages between Brazil's increasingly globalized cattle industry and the Amazon's booming livestock sector.

Keywords: deforestation, cattle sector, Brazilian Amazon, globalization

Barbara Brower, Portland State University. Email: browerb@pdx.edu; *"A Region Should Play the Hand that Nature Dealt It": Rethinking the arguments for restoring Glen Canyon*

There seems to be a recurring story that captures the division within American environmentalism: a story about big dams on wild rivers. Glen Canyon Dam, one controversial component of the Colorado River Storage Project, replaced an extraordinary stretch of wild river known to a passionate few with a power plant and flat-water reservoir beloved by millions. The inundation of Glen Canyon, "place no one knew," represented a tragic loss for some environmentalists of the late 20th century akin to the damming of Hetch Hetchy reservoir for John Muir and his Sierra Club friends a generation earlier. But as it was with Hetch Hetchy, the Sierra Club has been divided over what to do about Glen Canyon Dam. A resolution passed by the national SC board in 1996, calling for dam removal, infuriated local SC chapters working on other issues in the desert Southwest. They saw their work undermined by a policy considered abhorrent—even whacko—within the region. But prolonged drought has dropped the level and diminished the usefulness of Lake Powell, while resurrecting Glen Canyon. Projections of global warming suggest a new, water-scarce reality for the booming states of the Colorado basin, and provide a new suite of arguments, untainted by the offending "drain-it!" rhetoric, to deploy in the restoration of a

living Glen Canyon.

Allison Brown, Department of Plant and Soil Sciences, University of Massachusetts, Amherst. Email: broccoli1313@yahoo.com; Michael Montesano, PhD, The National University of Singapore. Email: ; *Small Volume Agriculture Auctions Play a New Role in Rural Development*

In much of the agriculture marketing world, the small-volume produce auction has been supplanted by other selling mechanisms deemed to be more efficient. However, in some places, in particular Pennsylvania, small-volume produce auctions have persisted over time. Like farmer-to-consumer farmers markets, auctions are proving their continued usefulness in the agriculture marketing system of developed market economies. Other contexts have newly witnessed the introduction of low-volume wholesale auctions as means of marketing and of price determination. Among these contexts is the rubber sector of southern Thailand, historically dominated by a small number of large corporate concerns and affiliate marketing networks. State efforts to foster rubber auctions in the Thai South appear to have challenged these networks and thus brought benefit both to smallholders and to the region's rubber sector. Their putative success raises important questions relating both to the efficiency of low-volume wholesale produce auctions in competitive sectors and to the possibility of fostering such auctions for the benefit of producers. This paper presents Pennsylvania wholesale vegetable auctions and Thai low-volume rubber auctions as case studies and proposes a theoretical construct explaining the possible mechanism by which this "inefficient" market mechanism remains useful in a competitive modern market. It suggests a series of research activities to evaluate the auction mechanism and to assign it a place in the marketing system in developed and less-developed market economies. Finally, it considers approaches to fostering the development of low-volume wholesale auctions in contexts to which they remain alien or unknown.

Amie Brown, King's College, London. Email: amie.brown@kcl.ac.uk; *Policing, Citizenship and the New Public Management: The Neighbourhood Policing Agenda in the UK*

Since the turn of the century, the UK police service has undergone significant reforms which have altered the governance of policing. Reforms have increasingly revolved around the 'citizen focused' agenda of Neighbourhood Policing which seek to involve local communities and individuals as active citizens in reducing crime and anti-social behaviour. At the same time the police are being subject to a wider public sector reforms from the government which are having significant impacts upon policing, particularly at the local level. This paper examines the shift towards the principles of this New Public Management and the implications it has had on how the police manage, implement and deliver police reform. It argues that the police are being simultaneously pushed to drive for the efficient and effective use of their resources, whilst also being expected to engage with an ever increasing and wider range of 'communities' in the governance of policing. I will draw upon empirical research from two case studies in the Thames Valley to explore how the police are reacting to, translating and implementing various reforms. I conclude by examining what the changing nature of the police service can tell us about the current management of the public sector, concepts and practices of policing, and geographies of governance.

Christopher Brown, New Mexico State University. Email: brownchr@nmsu.edu; Quita Ortiz, NMSU Department of Geography. Email: marqorti@wrri.nmsu.edu; *The Impacts of Land Use Change on Water Resources and Traditional Acequia Culture in North Central New Mexico*

Rural areas throughout the western United States are undergoing rapid and far-reaching land use changes that impact water management, riparian ecosystems, and traditional cultures. Impacts to water resource use and management include: potential risks of groundwater contamination due to increased numbers of single household septic systems, potential overdraft of groundwater resources, surface water quality impacts, and changes in the distribution of water supplies from agricultural to municipal/industrial uses. In northern New Mexico, the acequia water use regime and attendant acequia-related cultural values are at particular risk due to increasing urbanization pressures and the potential impacts on actual water use, water quality, and riparian vegetation along irrigation ditches and streams. GIS, remote sensing, and aerial photography interpretation techniques are used to create a series of land use change maps to assess the impacts of critical water resources and local communities along the Black Mesa Reach of the Upper Rio Grande Basin. Land use maps we generate depict changes in water resource use and management, risks to groundwater, changes in acequia

management and water use, and riparian ecosystem impacts. This project provides insight to local and state planning programs with constructive methods for further research, and is also applicable to other western states with similar challenges.

Keywords: Water resources, Acequias, land Use Change

Rural areas rich in natural amenities have undergone a recreation-related boom in recent years. Much of this growth has been fueled by demographic trends, as aging baby-boomers have approached retirement age, fueling a rise in ownership of vacation properties in communities located near forests, lakes, oceans, mountains, and deserts. Population growth has been dramatic in recreation counties, with these areas collectively growing nearly three times as fast as other nonmetro counties during the 1990's. While such growth has been previously investigated, less is known about how places that border recreation areas have been affected by recreation-led development. To what degree does recreation-driven growth affect these "border counties" in economic terms? Are employment and income levels affected? Are rents being driven up in these communities, as individuals are forced to seek lower-priced housing in more distant locations? And what are the social impacts? Does recreation affect commuting patterns, poverty rates, or education levels? To what extent are health care and crime rates in these areas affected by recreation? The purpose of this paper is to investigate how border counties are affected by recreation-led development. Initially, the issue of rural recreation is described in the context of the existing literature base. Next, we discuss recent changes in key socioeconomic variables in border counties. Regression analysis is then used to identify direct and indirect socioeconomic effects in border counties arising from recreation-related development. We conclude with a discussion of the policy relevant nature of recreation for rural development.

Keywords: recreation, rural America, tourism, nonmetro

Elizabeth A. Brown, . Email: eabrown@sfsu.edu; *'You can judge a civilization by the treatment of its children': State power, benevolence and the changing geographies of childhood?*

Given recent attention to neoliberal state policies, many have remarked about the changing nature of childhood and the decline of the childhood ideal. Nowhere is this seen more clearly than in the U.S. juvenile justice system. Rational actor punishment policies, transfers to adult court, and the decline of rehabilitative services in juvenile institutions are all examples of how neoliberal rationalities infuse juvenile justice policies. Under these regimes, children are regarded as responsabilized subjects, able to clearly distinguish between the allowable deviances of childhood and adult behavior. In this talk, I place this contemporary history within a larger history of children's deviance. Between 1905 and 1930, the Seattle juvenile court actively promoted this ideal through its dispositions, dependent in part on the geography of the city. Without an appropriate domestic milieu, children were not identified as such by the court. Children from urban centers and those without the luxuries of a middle-class, single-family home were excluded from the court's benevolence. At the turn of the twentieth century, court authorities actively promoted the childhood ideal in order to secure certain norms of responsibility in the parent-child relationship. Today, these norms are largely taken for granted. I argue that the turn towards the rational actor model of criminality (or what might be referred to as neoliberal crime control) in actuality reflects the entrenchment of the childhood ideal rather than its disappearance.

Gavin Brown, King's College London. Email: gavin.p.brown@kcl.ac.uk; *Thinking beyond homonormativity: explorations of a diverse gay economy*

There is a danger that, as geographers engage with the concept of homonormativity, we apply it uncritically and uniformly to all mainstream expressions of lesbian and gay culture, finding everywhere the taint of neo-liberal political imperatives. In this process, we run the risk of losing any sense of geographic specificity. This paper does not reject the concept of homonormativity out of hand, and accepts that the political and economic policies associated with neo-liberalism shape many aspects of contemporary lesbian and gay politics, the commercial gay scene and the everyday lives of lesbian and gay people. However, it recognises that these processes are experienced unevenly and in very different ways depending on the geographic context. This paper will critically review recent writing on homonormativity and then, drawing on the recent work of Gibson-Graham (2006) consider the prospects for a 'weak theory' outlining the diversity of lesbian, gay and queer economic practices. To this end, the paper will examine a number of gay and queer spaces to consider the different forms of enterprise, transactions, and labour that take

place within them. On this basis, the paper will suggest that there are many forms of social and economic practices that persist within gay and queer spaces that offer alternatives to the homonormative practices of neo-liberalism.

J. Christopher Brown, Ph.D., University of Kansas. Email: jcbrown2@ku.edu; *The Moral Geography of Development in the Amazon*

Current debates in Amazonian environment and development studies pit the directives of the “Washington consensus” (top-down development) against strategies of local resistance that empower traditional livelihood and cultural practices that are “in tune” with their environments. The debates do not lead to any resolution, but rather lead to relativistic or absolutist positions that cannot be reconciled with one another in practice. This paper employs a critical realist, moral geographic perspective akin to Robert Sack’s “Geographical guide to the real and the good” to examine the current controversy about the expansion of mechanized soybean cultivation in the Amazon. Sack’s framework is applied in an attempt to envision a process, discussion, and place-making policies that would be based on intrinsic geographic judgments. The conclusion points out how such criteria could be applied in other human/environmental conflicts around the world.

Keywords: Amazon, Brazil, development, moral geography

Lawrence A. Brown, Ohio State University. Email: brown.8@osu.edu; Madhuri Sharma, Ohio State University. Email: sharma.113@osu.edu; *Racial/Ethnic Mixing Among US Metropolitan Areas*

This paper examines US MSAs with populations greater than 1 million, encompassing thereby both the very largest and mid-sized metropolitan areas, 49 in all. We address racial/ethnic diversity across the MSAs as a group and individually. Diversity is in terms of the major census categories of African American, American Indian, Asian, Caucasian, Hispanic, and Other. The research is motivated by knowing that US cities are becoming more diverse overall, but that this intermixing at the neighborhood-level lags behind. This separation is addressed by using Theil’s Entropy (H) index, which allows us to treat the six groups simultaneously. These are examined through cartographic analysis and also serve as a dependent variable to better understand why some MSAs are more multi-racial/ethnic in their neighborhood structure than are others. Independent variables for this exercise include MSA size and diversity score; proportion of the population who are foreign-born, below poverty level, lived elsewhere in 1995, in managerial or professional occupations, and who have achieved various education levels; median year built for houses, housing value, and household income; and a new-housing-construction index. This will enable us to distinguish variables in terms of the extent to which they explain racial/ethnic mixing at the neighborhood level and how it varies across space. Data is from the 2000 Census of Population, for each MSA and its census tracts.

Mark Brown, Statistics Canada. Email: mark.brown@statcan.ca; Desmond Beckstead, Statistics Canada. Email: des.beckstead@statcan.ca; *Comparing Science and Engineering Employment in Canadian and U.S. Cities*

In recent years, cities have become increasingly interested in their ability to generate, attract and retain human capital. One measure of human capital is employment in science and engineering-based occupations. This paper provides a comparison of the employment shares of these specialized occupations across Canadian and U.S. cities by using data from the Canadian and the U.S. censuses from 1980-1981 and 2000-2001. The paper, therefore, provides a perspective on how Canadian cities performed relative to their U.S. counterparts over a 20-year period. It also seeks to evaluate how cities of different sizes have performed, because large cities may be advantaged over smaller cities in terms of factors influencing both the demand for, and supply of, scientists and engineers.

Michael Brown, University of Washington. Email: michaelb@u.washington.edu; *Animal Husbandry: Bestiality and the Making of the Human Animal*

This paper takes geographies of sexualities in a new direction, one with links to nature-society and political theory. When a man in Washington State died while engaging in bestiality, the state legislature faced a strange sex panic, immediately passing legislation to punish those engaging in sexual acts with animals. In this paper we use political theory to trace out the implicit contradictions amid the rationalizations behind the legislation about sexuality and nature. In spite of the regular trespass onto animals’ bodies that take place in the name of agriculture, domestication, and entertainment, legally prohibiting sex with an animal seemed to require several different justifications, none of which were unpacked. We do so here. This paper examines the ways that the taboo of

bestiality constructs paradoxical boundaries between human and non-human animals. The projection of human fantasy and anxiety onto the bodies of animals reflects a desire to construct humans as reasonable, civilized creatures capable of consent. The crossing of the boundary between human and animal is used symbolically as a dehumanizing act for the human and a victimizing act for the animal in ways that reflect very human anxieties about the intersections of sexuality, race, class, and place. We challenge the dominant construction of bestiality as helpful to neither man nor beast.

Molly E. Brown, PhD, Science Systems and Applications. Email: molly.brown@gsfc.nasa.gov; Richard Choularton, MA, Chemonics International/FEWS NET. Email: rchoularton@few.net; Christopher C. Funk, PhD, University of California Santa Barbara. Email: funk.cc@gmail.com; *Vegetation Remote Sensing Imagery and Rainfall Data in the Contingency Planning Process triggered by Early Warning of Food Emergencies*

This talk will explore how scenarios are used in the context of contingency planning and food security early warning in Africa as governments respond to the consequences of droughts and floods. Biophysical remote sensing of vegetation, rainfall and floods combined with high accuracy digital GIS products have increased the effectiveness and accuracy of these products for day to day monitoring. Early warning of an incipient agricultural drought derived from monitoring triggers the contingency planning process at the national governmental level, supported by international organizations such as USAID’s Famine Early Warning Network or FEWS NET. Contingency planning focuses on updating relevant national contingency plans, using scenarios for drought impact on food security. These scenarios usually are described as ‘Worst Case’, ‘Mid-Case’, and ‘Best Case’, and are focused on providing guidance for humanitarian organizations’ assistance and enabling the government to launch the assistance planning process. The same information bases are used to develop scenarios as to do early warning. Early warning can trigger contingency planning, and contingency planning can help focus early warning efforts. In this context, remote sensing can help to trigger earlier contingency planning. Historical remote sensing data can also be used to model droughts or floods in a scenario building effort, although such efforts are often beyond the technical ability of local planners.

Nancy A Brown, . Email: nab212@psu.edu; *The Impact of Prescribed Fire on Biodiversity of Understory Forbs in an Old-Growth Pine Ecosystem in the upper Midwest.*

The pine ecosystems of northern Minnesota, USA developed with and were maintained by disturbance, primarily fire. Approximately 150 years ago the newly arriving European settlers began active suppression of all wildfires. The absence of fire contributed to both a significant shift in dominant tree species from pine to hardwoods, and to a lack of pine regeneration. Itasca State Park is a 12,950ha *Pinus resinosa* (red pine) - *P. strobus* (white pine) old-growth forest in northern Minnesota. Park personnel began experimentally restoring fire to the pine forest in 1997 using prescribed burns with unit size ranging from 400 to 1400ha. Yearly monitoring of ecosystem response is conducted through data collection from permanent plots. The focus is on measuring changes in conifer

and hardwood density and biomass, as well as changes in species richness, particularly of the herbaceous understory. These measurements are used to evaluate whether fire is changing the succession trajectory in the pine ecosystem. This research is investigating whether a shift in dominance of specific herbaceous understory species is occurring as a result of prescribed burning. Initial analysis of plot data indicates that fire restoration has produced an increase in species richness in the herbaceous understory, although a shift in species dominance is not as clear cut.

Robert N. Brown, Ph.D., Appalachian State University. Email: brownrn@appstate.edu; *Cross Road Blues: Geographical Mythology and the Life of Robert Johnson*

Mississippi Delta blues musician Robert Johnson died in relative obscurity in August of 1938. Following the 1991 release of Robert Johnson: The Complete Recordings by Columbia Records, his estate has generated millions of dollars, and as Patricia Schroeder has noted, he has reached iconic status in American popular culture. Music critics consistently praise his artistic accomplishments, yet it is the mythology surrounding his life and death that has captured the collective imagination of people throughout the world. This paper explores the geographical mythology of this story. One of the central themes of this mythology is that Johnson entered into a Faustian bargain with "the Devil" to gain his superb musical abilities. The myth states that, at midnight, Johnson met a demonic figure at a lonely Mississippi Delta crossroads and entered into an eternal pact that afforded him uncommon musical abilities. Some argue that this myth bears a striking similarity to West African religious traditions. In the paper, I analyze the nature and meaning of the idealized landscapes in the myth. In addition, I explore the importance that actual Delta landscapes hold for the thousands of blues pilgrims who flock to the Delta to search out places associated with the myth of this most mysterious of bluesmen.

Ryan Luther Brown, University of North Alabama. Email: rlbrown@una.edu; *Spatial Distribution of Small Town Decay in Rural Alabama*

This study investigates underdevelopment in rural Alabama. Recent literature has identified indicators of small town decline across America. In rural Alabama, most notable ones include: closure of manufacturing plants; relocation of retail and wholesale businesses; deteriorating housing and healthcare; population losses and poor physical and social infrastructure among other things. This undergraduate research project seeks to answer the following research questions. Are factors for and indicators of small town decay in rural Alabama uniform across the State? What are the spatial patterns of small town decay in rural Alabama and how can they be represented within a GIS? To answer these questions, a comprehensive literature review is conducted. Also, an Alabama small town GIS database is built within ArcGIS environment. The data layers include census data, land use and land cover information, topographic data, and hydrographic layer. From these datasets, an Alabama base map is built. Preliminary results from this work reveal that the factors for small town decline in rural Alabama are not uniform across the State. The south central part of the State appears to exhibit more characteristics of decay than other parts of the State. Similarly, the GIS analysis reveals a link between small town decay in rural Alabama and ethnic concentrations. As the study concludes, the causes of small town decay in rural Alabama are both internal and external in nature.

Kath Browne, University of Brighton. Email: k.a.browne@brighton.ac.uk; **Andrew Church, University of Brighton.** Email: ; *Count Me In Too: Examining The Margins Of The 'Gay City'*

Lesbian, gay, bisexual and trans (LGBT) individuals and communities have long been regarded as 'sexual dissidents', resulting in their marginalisation and exclusion. Recently, however, LGBT landscapes in contemporary British cities are becoming more culturally accepted and gay villages are often seen as central to the cosmopolitanism of cities. Nevertheless, as lesbians and gay men become more accepted and acceptable in terms of legislation and funding, there is a need to explore who sits on the margins of the 'acceptable gay' including but not limited to socio-economic othering. How these margins are established, identified and lived is not uniform. Using Brighton and Hove as a case study this paper will use the results of a large scale questionnaire and focus groups to explore the possibilities as well as the 'problems' of the margins. It will examine how multiple marginalisations can be subsumed within the 'acceptable gay' identity and strategies employed to avoid the negativity and stigmatisation of otherness. The paper will also consider those who cannot pass as the 'acceptable gay' and consequently suffer intersecting forms of discrimination. In this way, the uniformness of homonormativity will be questioned alongside exploring the power relations that constitute not just the 'gay scene' but Brighton and Hove as a 'gay city' and its margins.

Sue Brownill, Dr, Oxford Brookes University. Email: sbrownill@brookes.ac.uk; **Juliet Carpenter, Dr, Oxford Brookes University.** Email: jcarpenter@brookes.ac.uk; *Fit for purpose? Governance and sustainable communities in the Thames Gateway*

There is increasing debate about the role of governance within polycentric city-regions. This dovetails with debates around governance for sustainable communities. Policy and academic literature present a number of different narratives around whether networked governance is 'fit for purpose' in their realisation. Drawing on a review of governance in the Thames Gateway to the east of London, which arguably applies the model of a polycentric city-region, this article reveals the gap that exists between this policy rhetoric and the reality on the ground. The analysis points to the tensions and contradictions in facilitating sustainable communities including those between the conflicting goals of economic competitiveness and social and environmental sustainability which lay behind the sustainable communities agenda; between overall strategies and local conditions; and those that arise in attempts to 'join-up' agencies and strategies. We conclude that these tensions and contradictions and the resulting hybridity and complexity in governance forms and processes that result need to be the focus of inquiry as opposed to simple contrasts between networks and top-down governance.

Lusiana Browning, University of Delaware. Email: browning@udel.edu; **Lusiana Browning, University of Delaware.** Email: browning@udel.edu; *Self-Help Housing: The Geographic Impact of Habitat for Humanity Projects in Wilmington, Delaware*

Providing quality affordable housing for the urban poor has been an on-going concern for many countries. Since the Industrial Revolution, urbanization fueled by both natural increase and rural-to-urban migration has become an inevitable process for almost all societies. This influx of people into urban centers produces a high demand for affordable housing that the housing market is rarely able to provide. Governments are often equally unable to close the gap in demand for inexpensive housing. The result is often overcrowding and the profusion of squatter settlements. In response, the idea of "self-help" housing has been suggested as a feasible solution to housing needs. In developing countries, this approach refers to practice where low-income groups build their own dwellings through collective efforts. In the United States, the adoption of such an approach has been slower, but recently self-help housing has been considered a viable sustainable alternative to government housing assistance programs. Using case studies, the experiences of self-help housing program homeowners in two Habitat for Humanity neighborhoods in Wilmington, Delaware are examined.

Alec Brownlow, DePaul University. Email: cbrownlo@depaul.edu; *Devolution, Voluntarism, and the Construction of Entrepreneurial Ecologies in Philadelphia*

In the U.S., the resurgence of urban environments in public consciousness and political discourse has largely become manifest through the practice and discourse of Restoration Ecology. From Atlanta to San Francisco to Minneapolis and Milwaukee, narratives and histories of environmental decay have been accompanied by increasingly normative calls for restoration - of waterfronts, urban parks, greenways, etc. Insofar as restoration and the creation of attractive greenspace corresponds with efforts to facilitate or increase processes of accumulation and urban competitiveness, these 'entrepreneurial ecologies' - along with the practice of restoration - are increasingly embraced by urban boosters as legitimate quality of life indicators. The growing role of the voluntary sector in producing these ecologies, however, is fundamental to the success or failure of these restored areas. In short, voluntarism maintains the capacity to either accommodate or undermine any normative meaning and significance given to the restoration process by an urban entrepreneurial agenda. This paper explores this phenomenon in Philadelphia, where ecological restoration in two urban forests has acquired political significance among local volunteers attempting to apply their own, often resistant, meaning to their restoration practices and to the landscapes being restored.

Andrea Brunelle, Ph.D., University Of Utah. Email: andrea.brunelle@geog.utah.edu; *Sedimentological indicators of beetle infestation and climate from the U.S. Northern Rocky Mountains*

Paleoecological reconstructions from two lakes in the U.S. Northern Rocky Mountain region of Idaho and Montana revealed the presence of bark beetle elytra and head capsules (cf. *Dendroctonus* spp, most likely *D. ponderosae*, mountain pine beetle). Occurrence of these macrofossils during the period of time associated with the 1920/1930 A.D. mountain pine beetle outbreak at Baker Lake, Montana suggest that when beetle populations reach epidemic levels, beetle parts will be found in the lake sediments. In addition to the beetle remains found at Baker Lake, ca. 85 cal yr BP (1920-1930s outbreak), remains were also identified from ca. 8331, 8410, and 8529 cal yr BP. At Hoodoo Lake, Idaho remains were found at ca. 7954 and 8163 cal yr BP. These Holocene records suggest the infestations occurred during periods that were cooler and effectively wetter than present and are associated with the 8200 year climate event. In addition, the early Holocene infestations occurred in forests dominated by whitebark pine. These two lake records provide the first preliminary data set for understanding the long-term history of climate controls on *Dendroctonus* bark beetle activity, which may be useful for managing current and future outbreaks.

Canada and the United States share a tradition of day-to-day co-operation and have developed an "intimate" knowledge of each other that is apparent in the current tradition of quiet diplomacy and low-level functional solutions in a few key policy arenas (free trade, labor, and environmental standards). For Canadians, co-operation with the U.S. always involves considerations of identity and sovereignty. Generally, Canadian officials resolve this issue by maintaining

low-key functional and effective relations with their American counterparts, which inherently limits any expansion of the supranational role of the North American Free Trade Agreement (NAFTA), but concurrently enhances other multilateral relations among Canadian and American public and private organizations. This paper draws on findings from research on the Canadian-American border led by the Policy Research Initiative (PRI) since 2004 and on the recent PRI survey of Canadian-American leaders, as well as on the author's fieldwork on multilevel governance issues arising from the emerging cross-border regions in Europe and North America. Relying on four analytical lenses?the economy, local and central politics and policies, and local cultures?this paper examines how emerging cross-border regions are changing Canadian-American relations. Specific attention is given to the varied forms of co-operation across policy fields in order to detail (1) the general and specialized and (2) the formal and informal relations and (3) the emerging border regions. The overall argument is that the appearance of cross-border regions indicates a progressive emergence of policy parallelism in a multitude of policy arenas, particularly, a specifically North American form of integration.

Stanley D. Brunn, Professor, University of Kentucky. Email: brunn@uky.edu; *Old State/New State Identities: Images on the Last Soviet and First Russian Stamps*

Postage stamps, as products of the state, represent useful measures of state definition and identity. And states that have experienced major internal changes in governance, legitimacy, political and economic alignment can be expected to see those shifts evident in visual representations. I examine the major themes that appeared on the stamps of the last years of the USSR and the first of an independent Russia. From 1989-91 the USSR issued 332 stamps and from 1992-94 there were 160 issued by Russia. The first issues portrayed themes about Lenin, the end of WW II, and Communist Party leaders. The first issues of Russia included religious themes, the city of Moscow; there were no overt military images, nor were there stamps showing Russian territory, the flag, or political leaders. Several themes were represented before and after 1991, including space achievements, Olympics, major artists, and memorials.

Jeff C Brunskill, Bloomsburg University of Pennsylvania. Email: jbrunski@bloomu.edu; *Incorporating Weather Observation Equipment into Introductory Geography Coursework*

In recent years a number of schools have made investments in weather observation equipment, particularly web-based cameras and digital observation stations. One of the primary objectives of these efforts is to bring real-time, localized, weather observations into the classroom. In this regard, many schools use the technology to post real-time webcam imagery online and collect packets of observational weather data for detailed analysis in the classroom. The focus of the current project is to develop a platform whereby schools can make more effective in-class use of the weather information they collect. One aspect of the project is to develop a database driven system that more readily integrates the imagery and data from webcams and observation stations with online sources of weather information, such as radar and satellite imagery produced by the National Weather Service. The goal is to make it easier for students and faculty to investigate past weather events by developing a system that continually collects and archives these sources of information thereby allowing users to post-process data and identify local events of relevance to classroom discussions. Ultimately the system will allow users to recall past events and easily develop summaries that include time-lapse videos, graphs of meteorological variables, and web-based imagery. A second, broader, goal of this project is to investigate how the technological approach can be incorporated into the classroom to more effectively bridge the gap between a student's everyday observations of the weather and the concepts presented in an introductory meteorology or physical geography course.

Joseph H. Bryan, UC Berkeley. Email: jbryan@berkeley.edu; *Jim Crow at the edge of Empire; a genealogy of multiculturalism on the Atlantic Coast of Nicaragua*

This paper takes up the spatialization of race and the racialization of space at the intersection of vernacular and cosmopolitan multiculturalisms in the Caribbean town of Puerto Cabezas. Tracing its rise from an outpost of North American banana and logging empires based in the Jim Crow South to the capital of a multiethnic autonomous region, I develop a genealogy of race in terms of its role in orchestrating different projects of rule. Rather than treating space as field onto which racial identities are projected, I demonstrate how contemporary understandings of space are relationally linked to struggles over identity and place. This approach affords a critical perspective on current iterations of neoliberal multiculturalism in Central America, attending to the ways in which

identity and place are remapped in terms political economy and race. In the conclusion I revisit current debates over the relationship between activist research and cultural critique, identifying possibilities for a postcolonial geography.

Michelle J Brym, The University of Tennessee. Email: mbrym@utk.edu; Challenges to the Creation of a Transnational European Space along the Polish/German Border

The term "the re/bordering of Europe" has been used by scholars to describe the opening of the newest interior borders of the European Union to the movement of people and goods, while simultaneously reducing the flow across the eastern exterior borders of the EU. For Poland, a new member country of the European Union, re/bordering means tightening its eastern borders with Kaliningrad, Belarus and Ukraine, while its western border with Germany slowly dissolves. To encourage integration the Polish/German border was zoned into four Euro-Regions to facilitate cross-border economic cooperation and joint work on environmental issues. The EU discourse refers to these places as transnational European space that supports the development of a shared European identity based on cross-cultural understanding. So what does being a European citizen mean for people living in the Polish western borderland? Border scholars argue that sometimes as the physical border between the two countries dissolves the cultural border is strengthened, reinforcing, in this case, boundaries between Polish and German citizens. Drawing on my own preliminary research in the Polish border province of Lubuskie and the literature on the integration of the Polish/German border, I will develop several hypotheses on how cultural boundaries are being reproduced or dismantled by Polish residents and how these processes influence Polish expressions of national identity.

John Bryson, University of Birmingham. Email: j.r.bryson@bham.ac.uk; Industrial Design and Competitiveness in an Increasingly Global World

Industrial design is a service function that is fundamental to the production system of advanced capitalism; when industrial design is done effectively it can reduce costs by increasing the overall efficiency of the production process and convert a functional object into an object of consumer desire. Industrial design is one way in which manufacturing related added value can still remain grounded within the economies of the member states of the European Union - it can be a key source of competitive advantage and a source of added value. This paper explores the relationship between design and national competitiveness in two related ways. First, by developing and exploring a series of statistical indicators derived from the Global Competitiveness Report. These indicators are used to identify a ranking of national economies that have created and maintained design-based national competitiveness. Second, by exploring and evaluating national strategies intended to increase and enhance the contribution design makes to national economies. In this analysis the growth and development of design-centred regional and national policies are explored in relation to the economies of Europe as well as the Asia-Pacific. The paper highlights the current design-based competitiveness possessed by some developed market economies. It also reveals the threat that Europe is increasingly going to face from Asia-Pacific. Currently, some Asia-Pacific countries are developing national and regional policies that are intended to enhance the design-intensity of their low-cost manufacturing production systems.

Susan Buckingham, Brunel University. Email: Susan.Buckingham@brunel.ac.uk; Gendered Geographies of Environmental Injustice: bodies, households, campaigns and cabinets

To date, the focus of environmental justice research has significantly been on the variables of class, race and income (unmediated by gender) and how these intersect with environmental decision making; gender has largely been conspicuous by its absence in environmental justice discussions. One of the reasons for this, the paper argues, is that geographies of gender are still not well understood by those working in environmental professions, policy making arenas and campaigns, themselves clearly demarcated along gender lines. In particular, those groups which might be expected to draw policy makers' attention to gender inequalities with regard to the environment also appear to lack a clear understanding of, or at least focus on, these geographies. Feminist research has drawn attention to the more local scales of women's activity, where they become more visible including the household and the community. Meanwhile, it is often at the most intensely small scale that environmental gender injustice is manifested: the body, the family and the household. Drawing on feminist research as well as environmental justice literature, and informed by research in Europe, the paper will argue the importance of taking into account the small scale in environmental gender injustice and its place in both environmental justice policy making and campaigning which is increasingly informing the environmental agenda. The

relationship between the neglect of this scale, and the gendering of decision making and campaigning at the national scale will also be explored.

Geoffrey L. Buckley, Ohio University. Email: buckleyg@ohio.edu; Improvement and Protection Associations in Baltimore, Maryland, 1900 - 1933

Neighborhood improvement and protection associations in Baltimore, Maryland occupied a prominent position in the decision-making hierarchy prior to passage and enforcement of strict zoning laws. They were especially influential when it came to attracting amenities such as parks and street trees and discouraging or eliminating disamenities such as unwanted land uses. These associations - of which there were approximately 70 scattered across the city in 1910 ? were also known for their covenants and exclusionary housing practices. One particularly rich resource that casts light on the activities of these groups is the Peabody Heights Improvement Association file. This paper focuses on the key issues that resonated with members of the Peabody Heights Association during a period of intense settlement and development pressure as revealed in two volumes of meeting minutes preserved in special collections at the Maryland Historical Society. In addition to discouraging African-American in-migration and opposing "undesirable" development, the Peabody Heights Association supported a variety of local and city-wide initiatives, including street-tree planting and maintenance, park and playground expansion and enhancement, and strict air pollution control and monitoring. To achieve its goals, the group worked closely with other neighborhood associations and civic groups, revealing a pattern and scale of activity that heretofore has received scant attention. The records of the City Board of Park Commissioners, the city forester's office, and other improvement associations offer additional insights into neighborhood practices, priorities, and politics.

Patrick H. Buckley, Assoc. Prof., Western Washington University. Email: patrick@cc.wvu.edu; John Belec, University College of the Fraser Valley, BC, Canada. Email: John.Belec@ucfv.ca; A Delphi Analysis of Cross Border Environmental Issues in the Fraser Borderland

The Fraser Borderland is a unified bio-physical region that straddles the international border in north western Washington State/south western British Columbia. A recent, protracted public protest, largely Canadian based, over a proposed gas-fired power plant, south of the border, highlighted the absence of governing mechanisms to address regional cross-border issues. This was exacerbated by the confusion and multiplicity of scales that the issue invoked. Federal, State, Provincial, Regional and Local officials all claimed partial jurisdiction. With the immediate issue of the power plant now apparently resolved, questions are raised about the future of governance in the Fraser Borderland. For example, what does this issue, and its resolution, reveal about a refiguring of the hierarchy of scale levels, or deterritorialization in the Fraser Borderland? [Jessop, 2002]. To what extent is this associated with a shift from topocratic to adhocratic governance modes [Leresche and Saez, 2002]? How has it affected the development of a cross-border regional consciousness? This paper will present the results of a crossborder resource management Delphi study analysis, that was carried out in 2006. A group of key local actors, from both sides of the border, were invited to participate in the multi-round Delphi study. Analysis will focus both on a critique of the Delphi technique in such contexts, as well as on the opinion provided.

Jessica Budds, Open University. Email: jessica.budds@manchester.ac.uk; *Overground, underground: the social construction of surface water and groundwater and its implications for changing waterscapes in Chile and Peru*

Water resources management responds to a perceived need to manage water more effectively and more holistically. To achieve this, water is sub-categorized into two key resources: surface water (rivers, lakes) and groundwater (aquifers, springs). While on the one hand, the two 'waters' assume different biophysical properties, on the other, they are always inherently interconnected to varying degrees within the drainage basin. This paper seeks to reflect on the socio-scientific construction of water into surface water and groundwater and subsequently consider its practical implications. In particular, the paper analyses how surface and groundwater differentially configure control over, access to and use of water, and the implications of this for social organization around water, discourses over water management, understandings of the hydrological cycle and material changes within waterscapes. These questions are explored through empirical examples from Chile and Peru. Particularly in arid areas, groundwater extraction has recently increased significantly for economic uses, especially agriculture and mining, which has produced important social and material changes within waterscapes. This scenario raises a number of challenges for groundwater management. Important issues explored here include scientific uncertainty regarding aquifer capacity and dynamics, problems of defining groundwater rights and uneven access to these rights, challenges of monitoring groundwater levels and regulating flows extracted from private wells, lay perceptions of water quality and understandings of aquifer depletion, inequalities in access to technology for groundwater control (exploitation or preservation), and difficulties of fostering communal groundwater management.

Email: g.mekala@pgrad.unimelb.edu.au; *Spatial and Gender Dynamics of the Effects of Growing Urban Areas on Irrigated Agriculture in Central Mexico and South India*

This paper addresses the spatial and gender dynamics of the effects of urban centers on urban, peri-urban and rural irrigated agriculture in Mexico and India. The research for this paper was conducted in and around Irapuato city in central Mexico by Buechler from 1998-2004 and in and around Hyderabad, in southern India by Buechler and Devi from 2001-2006. After 2007, over 50% of the world's population will live in developing country cities. Ever greater volumes of water will be used to supply residential, commercial and industrial demand which will affect the quality and quantity of water available for agricultural use. The dynamics in Irapuato and Hyderabad are part of a wider pattern of urbanization and water management. The urban footprint of these two cities was found to extend beyond the urban area to the peri-urban and rural areas, and to other areas within and outside of the national borders. They exerted a strong influence on water availability, accessibility and quality for agricultural activities. The interplay between urban location on the one hand and water availability and quality on the other had a profoundly gendered effect on livelihood options. Distance from the city was an important factor in determining which crops were grown in each location. Crop preference was also gendered and women and girls played an increasingly prominent role in water management for agriculture. The gendered movement of labor across regions and across national boundaries was also integrally connected to the effect of these urban areas on water and agriculture.

Michaela Buenemann, James Madison University. Email: buenemmx@jmu.edu; *Vulnerability of Drylands to Creeping Environmental Phenomena: An Assessment Using Three Spatial Models*

Creeping environmental phenomena (CEP) such as desertification and woody plant encroachment are posing significant challenges to the sustainable management of drylands around the world for two major reasons. First, it is tricky to disentangle the complex spatio-temporal web of human-environment interactions involved in CEPs. Second, it is difficult to predict a landscape's relative vulnerability to CEPs because they are complex and happen almost imperceptibly over long periods of time, across extensive and frequently remote areas, and within a given land cover category. This study aimed at tackling these two issues using woody plant encroachment (WPE) as a case CEP. To do so, three spatial models, each integrating both GIS and remote sensing data, were developed, evaluated, and compared: Geographically Weighted Regression (GWR), Weights of Evidence (WoE), and Weighted Logistic Regression (WLR). Results of this study show that all models could produce reasonably accurate WPE

vulnerability surfaces, with highest accuracies in the most and least vulnerable parts of the landscape. Especially when used in conjunction, these models may therefore facilitate the identification of areas for conservation, restoration, or other purposes. However, only the distinct, unique, and complementary information provided by the GWR and WoE models was useful for assessing the relative importance of factors influencing WPE. When used jointly, these two models may thus well be suitable for the generation and testing of existing and new hypotheses about the process. Overall, this study suggests that integrative GIS, remote sensing, and spatial modeling approaches have enormous potential for CEP assessments in drylands.

Milan Bufon, University of Primorska. Email: milan.bufon@upr.si; *Multicultural Regions And Contact Areas In The Context Of European Integration*

The European continent, the motherland of nationalism, and the part of the world where political borders and different territorial and cultural identities are mostly interrelated, is now facing new challenges regarding how best to represent its numerous interests within one system. With the increase of international integration European countries began to devote greater attention to the development problems of their multicultural regions and border areas that had to be helped to undertake certain functions in the international integration process. The fostering of a more balanced regional development also resulted in a strengthening of regional characteristics, which the new model could no longer ignore. Regional characteristics in turn have always been preserved in Europe by persistent historical and cultural elements of ethnic and linguistic variety. Therefore it is not surprising that the process of European integration based on the new regional development model was accompanied by a parallel process of ethnic or regional awakening of minorities and other local communities. The key question for contemporary Europe (though of course this is not limited to Europe) political geography is, then, how the process summarised under the twin labels of social convergence and deterritorialization will effect the persistent maintenance of regional identities and the corresponding divergence of regional spaces. Or, in other words: is the 'unity in diversity' European programme ever practicable and exportable on a world-wide scale or are we to be absorbed by a new global 'melting pot'?

Joni Bugden-Storie, Ph.D., Western Carolina University. Email: jbugden@email.wcu.edu; *Polarimetric SAR Feature Extraction for Agricultural Land-Cover Mapping in Latin America: Developing Spatial Products for Environmental Decision Systems*

The results of this project will contribute to the development and demonstration of a system for the detection of significant changes in natural, agricultural and urban ecosystems within a semi-arid region of Argentina. This system for monitoring land-cover change will be implemented into decision-making to work toward sustainable development. The goal of this project is to generate land-cover maps in order to show diverse agriculture (e.g., vines and olives in Argentina), natural areas, and urban areas in semi-arid regions. Using quad-polarimetric SAR data, the authors hope to extract not only diverse land-cover but also biophysical characteristics (crop height, soil electrical conductivity, water content) that will indicate agriculture sustainability and point to those areas most at risk of salination. Ten quad-polarimetric images will be acquired based on funding from the Canadian Space Agency - SOAR Program. The RADARSAT-2 satellite will be launched in March 2007 and acquisition of images will begin in August 2007. Activities to be completed over the next year for this project include (a) polarimetric radar workshop in Buenos Aires, Argentina; (b) field data collection; and (c) organizational meeting in San Juan, Argentina to discuss methodology, tasks and responsibilities.

Keywords: Biophysical, Remote Sensing, Polarimetric Radar, Argentina, Semi-Arid

The creative class thesis proposed by Florida (2002) is much debated. An

important argument of the thesis is the significance attached to people climate; specific qualities of place that attract and retain creative persons in particular cities, which in turn attract firms in need of creative employees. The importance of people climate may be a particular feature of the US society with over 50 cities of more than one million inhabitants, and, thus, the fact that members of the creative class here have got many similar cities to choose from as places to live and work in. This paper analyses the importance of people climate for recruiting creative class members in societies with a quite different city structure than the US, that is countries dominated by one large city. The four Nordic countries of Denmark, Finland, Norway and Sweden all have a dominating capital region, and demonstrate quite different results as regards the importance of people and business climate from those reported by Florida. Preliminary results indicate that as creative class members in the Nordic countries cannot freely choose between several more or less 'equal' cities as regards the possibilities of urban lifestyles and job opportunities, the people climate tends to be of secondary importance. The analyses indicate that creative class members often select their place of living on the basis of where they can find exciting jobs, communities of occupationally similar workers and with wider opportunities on the labour market.

Keywords: economic geography, creative class, city structure, quality of place, people climate

Ron N Buliung, Assistant Professor, Department of Geography, University of Toronto at Mississauga. Email: ron.buliung@utoronto.ca; Joshua Mitchell, Graduate Student, MSA Program, Ryerson University. Email: ; Tony Hernandez, Director, Centre for the Study of Commercial Activity, Ryerson University. Email: thernand@research.ryerson.ca; Retail Morphology and Consumer Travel Demand in the Greater Toronto Area

The Greater Toronto Area (GTA), Canada's largest metropolitan region, has experienced extensive retail structural change since the mid-1990s. The vast majority of new retail development within the GTA market has been in the form of large format (often termed 'big-box') retailers. These big-box retailers (e.g., Home Depot, Wal-Mart, Best Buy) have clustered together in suburban locations throughout the GTA, forming a range of unenclosed power centre developments. Typically centred on a shared parking pad, power retailing has served the functional demands of suburban shoppers, with developments over the last fifteen years having transformed the retail landscape. While the growth of this retail format has been well documented, the travel impacts associated with power retailing have not been quantified and compared against traditional enclosed shopping centres. Using shopping travel observations taken from the Transportation Tomorrow Survey in conjunction with retail structure data from the Centre for the Study of Commercial Activity, several measures of consumer travel behaviour have been estimated for power centres and shopping centres in the GTA between 1996 and 2001. Results indicate that despite the rapid growth of power centres, shopping centres remain the most significant element of retail structure. Auto-use for shopping travel dominates trips to both retail formats, while transit plays a limited role in shopping travel to shopping centres, and is almost non-existent for travel to power centres. The paper concludes by discussing the regional policy context of the findings and identifies a number of areas for further research.

Jacob Bull, University of Exeter, Cornwall Campus. Email: Jacob.A.Bull@ex.ac.uk; Watery masculinities: Fly-fishing and the angling male

Angling in the UK is dominated by white males, with women holding only 5% of rod licences in England and Wales. Consequentially, angling offers an important insight into how masculinity is (re)defined. With the location of angling often constructed as remote, 'rural', and often 'wild', the non-human experienced through angling could easily be considered as a site for the masculine domination of nature - the angler duels with nature and exhumes his (sic) prize from the unknowable watery place. As such the angling nature can be understood as a mechanism for the (re)defining of the anglers machismo; that by becoming hunter the savage masculinity of a pre-modern age is revisited. However, the masculinities played out through angling are more complex than previous studies have suggested. While undoubtedly, aspects of domination, mastery and competition are evident, the regulation and technology involved require the angler to engage with nature not in a heroic or brutish savage manner but through the delicate presentation of a fly; to cast with finesse; to imitate nature in a quiet, contemplative 'civilised' manner; to become a medley of encounters with the rural, forming multiple alternative masculine subject positions. As a consequence of this, coupled with the agency granted to the fish, the 'duel' may become more of a 'pas-de-deux'. Therefore, based on research conducted on the lived experience of anglers in the Southwest of England, I offer a more nuanced account of alternative and multiple masculine subject positions emergent in

encounters with fish, 'nature' and the 'rural'.

Keywords: Masculinities, Non-human

Henry Buller, University of Exeter, UK. Email: H.Buller@exeter.ac.uk; Eating Biodiversity

Drawing upon recent writings on the commodification of nature and the revival of 'nature' as a component of additional product value within the food chain, this paper presents findings from a current research project examining the way in which grassland biodiversity is integrated as an input into certain 'quality' meat and dairy product chains in Britain and France. What cows eat, and the 'natural value' of that feed is translated through the food chain into various reconstructed notions of quality, reflected not only in different dimensions of the final product but also in the nature of the production, manufacturing and retailing process and experience. Hence combinations of non-human (grass species, insect species, cow breeds and individuals) and human (stockpersons, farmers, conservationists, manufacturers, retailers and consumers) combine in the assemblage of notions of quality and in the negotiation of its 'value'.

Keywords: Nature, Biodiversity, Commercialisation

Rebecca A Buller, University of Nebraska- Lincoln. Email: rbuller1@bigred.unl.edu; The Millinery, the Manse, and Memories: The Historical, Cultural, and Contemporary Landscapes of Post Office Communities

Along the riparian woodlands and on the Sandhills' prairies of Holt County, Nebraska, nodes of settlement once dotted the maps. With the beginning of pronounced European American immigration into the area in the late 1870s and early 1880s came the need for postal services. From 1875 to 1912, seventy-seven such post offices had been established. Around some of these post offices, small unplatted communities grew. An exploration of the literal and figurative landscapes of the post office communities serves as a small window into the ways of life during the booming, yet brief, period of resettlement of the Northern Great Plains. A combination of plat maps, newspaper articles, post office records, census documents, and other historical society archives as well as mailed surveys and personal interviews aided in the reconstruction of the settlements. The historical, cultural, and contemporary landscapes reveal, years after the discontinuation of post offices, how and why some communities' landscapes endure.

Keywords: landscapes, post office communities, Nebraska- Holt County

Mike Bulthuis, University of Ottawa. Email: mikebulthuis@rogers.com; Disruptions on the urban landscape? Or young people's geographies of home in the urban environment

Youth hanging out in public spaces are sometimes regarded as a disruption to the ideal, liveable and safe urban landscape, with adult responses framed by perceptions of deviance or feelings of vulnerability. In such instances, youth are positioned as outside of the paradigmatic ideal citizen (working, stable and independently able to engage in public and private). This paper theoretically interrogates whether and how one might interpret the presence of youth in public space differently and seeks to shift an orientation from adult attitudes and values to those directed and centred by youth. How might youth use public space during the process of transitioning from parental or guardian-controlled childhood domestic environments to adult independence and private households? Might youth's intentions in public space be understood as "acts of residence" (Hartig and Lawrence 2003) within the city? varied actions contributing to "home" beyond the physical boundaries of housing? In particular, might this use of space be understood as an opportunity, even for housed youth, to experience "private" moments? a sense of home? away from the watchful eye of parents or guardians, and protected by a more anonymous public gaze? Recognizing the weak ability of many youth to independently attain the necessary resources to ensure refuge and restoration within the private, physical spaces of housing, this paper seeks to articulate a theoretical framework for empirical research to be conducted with local youth, investigating the everyday environments in which youth imagine, contest, enact and embody "home."

Keywords: youth geographies; meaning of home; public and private space

Adam G Bumpus, University of Oxford. Email: adam.bumpus@ouce.ox.ac.uk; The Governance of Carbon Offsets: Nature, Neoliberalism and New Actors

This paper provides a critical analysis of the current governance structures that are exhibited in international carbon offsets. Addressing both the clean development mechanism (CDM) and voluntary carbon offsets (VCOs) this paper highlights some of the critical geographical issues that have heretofore been omitted from the largely technical debate on offsets. I show how carbon offsets represent capital accumulation strategies through the devolution of governance over the atmosphere to the market and the use of global space for capital accumulation. Shifting governance of the atmosphere to the market also brings

with it questions of legitimacy and actor accountability in providing social and environmental protections. Despite both mechanisms being premised on the commodification of carbon, they exhibit very different governance structures. The CDM illustrates how states, influential intergovernmental organisations like the World Bank, and the private sector construct flows of capital across bureaucratic and spatial scales to help facilitate the expansion of carbon capital. VCOs on the other hand exhibit more horizontal governance structures across space that more resemble heterarchy between carbon reducers and consumers. Drawing on the literature surrounding offsets and two empirical examples from Honduras, the implications for these differences in governance are discussed in light of the rationale(s) for carbon offsets. In addition to pointing to avenues of future critical research on the issue, this paper also shows that there may be progressive possibilities that certain offset mechanisms can provide for understanding carbon reductions for development.

Kjersten Bunker Whittington, Stanford University. Email: bunker@stanford.edu; Walter W. Powell, Stanford University. Email: bunker@stanford.edu; *Networks, Proximity and Innovation in Technological Communities*

Industrial districts or regional clusters depend heavily on the networks that arise from reciprocal linkages among co-located organizations, while the physical proximity of the partners to a relationship can alter the nature of information and resource flows through networks. We consider the joint effects of geographic proximity and network position on organizational innovation using negative binomial count models of patenting activity for a sample of life science firms across a 12 year time period (1988-1999). We find evidence that regional agglomeration and network centrality exert complementary, but contingent, influences on organizational innovation. We conclude that network effects persist both independently and inter-dependently with geographic variables, and regional characteristics influence the degree to which centrality enhances innovation. One implication of our results is the degree to which the geographic features of networks may represent distinct avenues of influence. We suggest that the types of ties that companies forge locally may be those most apt to signal membership and engagement with a regional community, rather than those that most effectively direct flows of information and resources using legal mechanisms that emphasize exclusivity or secrecy. Thus, regional ties may be more porous than the more distant, arms-length ties that characterize non-regional connections. The differences in types of ties suggest how regional politics, culture, and organization alter the way that networks direct information and resource flows. We discuss how regional clusters of activity uniquely contribute to technological innovation in knowledge intensive industries.

Keywords: regional agglomeration, inter-organizational networks, innovation, biotechnology,

Frank S Buonaiuto, PhD, Hunter College. Email: fsbuonaiuto@optonline.net; *Rip Current Hazards In New York*

Rip currents are complex phenomena that pose significant danger to beachgoers worldwide. These narrow (typically on the order of 10 - 20 m) currents flow seaward from the surf zone attaining velocities greater than 1-2 m/s, and comprise part of the normal wave-driven circulation patterns derived from alongshore variations in wave height. The formation, magnitude, spacing, persistence and evolution of rip currents depend upon incident wave field properties, wind speed and direction, astronomical tides, and near shore morphology. In addition rip currents can exhibit long period oscillation or pulsing associated with surf beat and infragravity wave motion. According to the United States Lifesaving Association rip currents accounted for almost 23,000 of 71,000 lifeguard rescues in 2000, and are the third largest weather related killer behind hurricanes and tornadoes. Along the south shore of Long Island, NY there have been 41 rip current related deaths within the past decade. Although there are numerous factors that influence rip current dynamics, empirical models have been used to provide reasonable estimates of rip current intensity related to hydrodynamic, atmospheric and morphologic properties. One such model developed to forecast rip currents warnings for the southeast Florida coast has been applied to the NY metropolitan region to hindcast rip current activity from 1991 through 2005. Preliminary results from the empirical model suggest spatial variations in rip current intensity arise mainly from incident wave angle, shoreline geometry, variations in tidal range, and the presence of engineering structures.

Tom Burditt, University of the West of England, Bristol. Email: Tom.Burditt@uwe.ac.uk; *Of wildlife, warden and wiggly ditches: the construction of grassroots knowledge at two nature reserves in South-west England*

This paper uses a mixture of ethnographic and autoethnographic methods to explore the 'knowledge networks' at two nature reserves near Bristol in South-west England: one owned by the Gloucestershire Wildlife Trust (a local, professional conservation charity affiliated to the national Wildlife Trusts federation) at which I am the site manager, the other owned and managed by a village-based community group. I combine theoretical insights from the science studies and new social movements literatures to show how the managers of these reserves were able to construct credible knowledge about their land that aided its management and helped them to cope with uncertainties. Significantly, both groups of managers have been able to formulate problems and perform solutions that were different to those advocated by the state nature conservation agency (and their powerful science-policy-legal networks). The paper looks at how the managers were able to establish such control - by establishing credibility and trust amongst, and by exchanging knowledge with, a wide network of enrolled allies: local residents, amateur naturalists, national experts, local conservation organisations and even staff from the state conservation agency. The resulting knowledge gained (and used) by the managers is essentially 'hybrid', built up from imported (scientific) advice, site-based observation, experimentation and research, anecdotes, intuitions and chance encounters. I conclude that imported scientific research is only one strand in 'real world' decision-making; it can provide useful insights to groups of people working in local contexts; it can also be resisted or adapted.

Lacy Jo Jo Burgess, PhD student, . Email: dolphinlove@ou.edu; Dr. Bruce Hoagland, PhD, . Email: bhoagland@ou.edu; *Analysis of Invasive Species Dynamics on a Stretch of the Canadian River, Cleveland County, Norman Oklahoma*

The goals of this study were to quantify the occurrence of exotic and invasive species on a stretch of the Canadian River south of the University of Oklahoma, in Cleveland County, Oklahoma. *Saccharum ravennae*, *Tamarix chinensis*, and *Phragmites australis* were of particular interest due to the dynamics in the concentrations of these species that was found during the course of the aerial photography analysis. Historic vegetation cover was established and analyzed through a series of five aerial photographs covering the time period 1966-2001. A unique classification consisting of 11 categories was developed and used to identify specific species of interest, as well as the most dynamic landcover categories. The species composition and densities were identified through a two part floristic survey of the sight; a walking survey and a plot survey which was established along transects near the river. The walking survey was conducted biweekly throughout the field season, April-October 2005; the plots were surveyed four times throughout the season. One hundred sixty-five species were encountered through both surveys. River dynamics appeared to have the greatest impact on the invasive species.

Keywords: invasive species, biogeography, landcover classification

Melissa Burgess, Australian National University. Email: melissa.burgess@anu.edu.au; *The Geography of Fear of Crime: A Spatio-Temporal Investigation*

Regardless of whether crime is present, people avoid areas where they feel afraid of becoming a victim of crime. With the widespread adoption of this behavioural response, fear of crime has emerged as a distinct phenomenon that causes numerous problems for the individual and the community. This presentation communicates the results from a simple, yet powerful, fear mapping technique trialled in Sydney, Australia. Using a Geographic Information System, a three-dimensional visual-diagnostic technique for mapping areas people avoid because they are afraid of being robbed, beaten or attacked was applied. The fear maps revealed distinct patterns of avoidance, showing obvious fear hotspots and streets perceived as safe thoroughfares through those fear hotspots. These fear hotspots reflected areas of crime and alerted the police to unrecorded criminal activity. The mapping technique also allowed the spatial exploration of fear and avoidance triggered by different environmental cues. A number of social and physical environmental cues were mapped including the presence of drug-users and sex-workers, which are presented. The patterns of avoidance adopted by different socio-demographic groups in response to these environmental cues, for example by gender and residential status, is also discussed. The results provide new spatially sensitive insights that can be applied in practice, for example encouraging the targeting of police and government resources to critical fear hotspots and to those environmental cues that trigger people to feel afraid. This study aims to build upon the ties between geography and criminology.

Kelly Burkle, University of Nevada, Reno. Email: burklek@unr.nevada.edu; *A High Resolution Reexamination of a portion of the Mission Cross Bog, Nevada record from 4,000-2,000 years ago*

The goal of this study is to reconstruct both regional and local paleoclimate within a region bordering the vegetative and hydrologic Great Basin using pollen and packrat midden analyses taken from the Jarbidge Mountains in Northeastern Nevada. The pollen record gives a regional perspective on vegetation and climate change in the area while the packrat middens provide evidence for which species were present as climate changes. The results of these proxy records will then be compared to previous research within the northern and central Great Basin to determine the local or regional scale of climate change. An 18 meter sediment core was recovered from Mission Cross Bog in July of 2005. Mission Cross Bog was previously examined at a coarse resolution by Bob Thompson and at a higher resolution for the last 2000 years by Marie Allan. Samples will be taken at consecutively higher resolutions (i.e. from every 250, 125, 60, 30 year intervals), and compared, to determine if there is a limit to high resolution sampling for pollen analysis. A high resolution record from 4,000 to 2000 years ago will identify critical climatic changes of the shorter duration wet and dry phases characterizing the Late Holocene.

Keywords: pollen, Great Basin, high resolution, paleoclimate

Adam W. Burnett, Colgate University. Email: aburnett@mail.colgate.edu; *Great Lake-effect snowfall variability and its relationship with lake and air temperature, ice cover, and regional-scale circulation*

Recently observed increases in snowfall over many sites that receive Great Lake-effect snow raise several questions. Assuming that such increases are not simply the result of data artifacts related to the way in which snowfall is measured, possible physical causes include changes in regional-scale circulation, air temperature, water temperature, ice cover, or some combination. Few studies have considered the combined relationship among these factors and lake snow. Lake-effect snowfall plays a significant role in both the environmental and socio-economic settings of the Great Lakes region. From a climate change perspective, changes in lake-effect snow may represent regional-scale manifestation of global warming. This study uses a variety of data, including: (1) 285 monthly snowfall records for the 1951-2004 period throughout the Great Lakes region; (2) associated air temperatures; (3) lake ice cover data from NOAA; (4) lake temperature information derived from near shore water intakes, buoy sites, and satellite-derived data; and (5) regional-scale circulation derived from surface observations and NCEP/NCAR reanalysis data. Single variant relationships between snowfall and these factors fail to reveal any significant relationships that are unique to lake-effect settings. However, the underlying spatial structure of snowfall variability throughout the region does reveal a lake-effect structure with coherent patterns of increasing snowfall in some, but not all, lake-effect locations. These variations appear to be circulation driven. This paper will attempt to control for the influence of circulation variability in an attempt to determine the degree to which other lake-effect controls are driving increased lake snow.

Apart from 2001, the Czech Republic has witnessed a positive net migration rate since 1971. This positive rate has shown dramatic increase since the Czech Republic became an independent country upon the dissolution of Czechoslovakia in 1993. In recent years the Chinese have represented a relatively sizeable immigrant group arriving in the Czech Republic. A majority of the newly arriving Chinese immigrants settle in the capital city of Prague. The Chinese, whose

numbers in the Czech Republic have been steadily increasing, are uncharacteristic of the typical Czech immigrant (Slovakian, Ukrainian) in their major modes of employment, such as restaurant ownership and import, distribution, and retail ventures, and techniques (or lack thereof) in assimilating and integrating with Prague's native population. This paper will give a summary of the economic and social situation of Chinese immigrants in Prague as well as their situation in various Western European cities in order to compare their experiences. The objective of this paper is to present a literature review and to construct a research agenda to be implemented later this year in Prague. The intention of this research is: (1) to investigate the increasing Chinese immigration to Prague; (2) to determine if there is a migratory pattern between Prague and specific origins in China; (3) to examine the motive behind their differences from Eastern European immigrants in employment practices; and (4) to explore various migration theories in explaining the processes of assimilation and integration and the settlement dimensions of these immigrants in Prague.

Keywords: Migration, Chinese immigrants, Czech Republic

Mark Troy Burnett, Ph.D., UCLA. Email: ; *Architecture, Monumentality, and National Identity: Contesting Memory in a Post Socialist Capital*

National identities are based in part on identification with particular places understood and contextualized in particular ways. From this assertion, this paper explores the development and changing role of Slovak national identity since independence in 1993, placed in the context of the capital city?Bratislava?and efforts to invest the urban landscape and urban milieu with a post-Czechoslovak/Communist narrative of nationhood and national identity as highlighted in contestations over architecture, monument, and urban design. Emerging from this analysis are two fundamental issues: 1) How does a "nation" that has recently acquired a "state" go about transforming a city, which has had little relevance to their national identity in the past, into "their" capital, "their" seat of government as well as a reflection and symbol of "their" higher ideals and national pride; 2) Conversely, how does Bratislava, and the imaginings of it as a capital and post-socialist city, located on the western margins of the political territory and overtly leaning toward the "West", condition Slovak national identity. Capital cities are an easily defined but poorly understood class of cities. Often marginalized in research as mere administrative centers, I argue that capitals are also symbolic theaters for national ideology, a reflection of the larger national stance towards urbanism and modernity, a catalyst of national economic development, and a bridge between local culture and the imagined community of the nation-state. Further, capital cities are highly politicized places that simultaneously structure and condition national identity and are structured by nationalist prax

Dorian J. Burnette, University of Arkansas - Fayetteville. Email: djburne@uark.edu; *A New Daily Temperature Record for Kansas, July 1828 to August 2006*

A 179-year record of daily mean temperature in Kansas has been developed from historical and modern instrumental data, extending from July 1828 to August 2006. Nineteenth century temperature data were obtained from original manuscripts of the U.S. Army Surgeon General, the Smithsonian Institution, and the Signal Service, and were carefully screened and corrected. Modern hourly temperature data were utilized to correct the historical temperature data for changes in observation time routines. Overlapping daily mean temperatures from sites with the best thermometer exposures were then attached to the modern record using regression methods. The resulting reference time series reflects coherent signals from the surrounding stations, assuring homogeneity. This new dataset is rich in temperature variability at all timescales, including positive and statistically significant trends in seasonal and annual temperature since 1828. The winter warming trend in Kansas has been almost double the summer warming. This record of daily temperature from Kansas is the only record to date that has been corrected at the daily timescale, and provides the longest and most detailed record of instrumental temperature in the continental interior of North America.

Amy C Burnicki, University of Wisconsin-Madison. Email: burnicki@wisc.edu; *Quantifying & Mapping Uncertainty in a Post-Classification Change-Detection*

The uncertainties associated with land-cover change products limit our ability to make accurate statements about the rates and spatial patterns of land-cover change. This has resulted in increased motivation within the land-use/cover change community to better understand errors associated with maps of land-cover change. This work addresses this challenge by building the quantitative methodology needed to describe both the temporal and spatial patterns of error associated with a land-cover change map produced through post-classification

change-detection. A post-classification change-analysis was conducted on Pittsfield Township, located in southeastern Michigan, using Landsat TM imagery acquired from 1991 and 1999. Measures, such as temporal correlation, cross-K statistic, and bivariate spatial autocorrelation statistics, are considered in quantifying the temporal interaction between classification errors. Additional measures were applied to quantify the spatial patterns of error for each classified map and the resulting map of change, and to identify secondary variables that exhibited significant correlations to error occurrences in the map of change. Finally, a regression model was developed to produce an associated error surface for the resulting post-classification change map indicating the probability of making a land-cover-change classification error. This map was compared to the results of a geostatistical analysis to demonstrate the utility of incorporating both error information from the individual classified maps and secondary variables when creating a map of change-classification error. The results of this study provide new insights into the quantitative, spatial, and temporal patterns of error in remote sensing based change analyses.

Email: josep.roca@upc.edu; *The interaction value applied to air passenger flows between European cities: A new European spatial configuration*

The traditional spatial configuration of the European geography was based upon the core-periphery model. The elaboration and publication in 1999 of the European Spatial Development Perspective (ESDP) challenged this core - periphery model. European spatial planning policies, aimed at encouraging social and economic, and with ever increasing importance, territorial cohesion, seek amongst other aspects, to encourage the development of a balanced and polycentric urban system. Furthermore recent studies carried out within the context of the European Spatial Planning Observation Network (ESPON) have proposed the notion of Metropolitan Urban Growth Areas, as Functional Urban Areas capable of acting as counterweights to the Pentagon. Taking into consideration the widely cited usefulness of airline data for assessing the World (and European) City Network (Smith and Timberlake, 2001 and 2002; and Keeling, 1995, in Derudder and Witlox, 2005) the research referred to in this paper draws upon 2004 EUROSTAT compiled air passenger flows between some 28 cities within the functional European space. Rather than seeking to replicate urban hierarchies, the research proposes a gravity model application in order to examine the mutual interaction between these cities. The results indicate the strongest interaction to exist between Barcelona and Madrid, what Hall (2005) terms Spain's two "political" and "commercial" capitals. The interaction values for these cities are then combined with geographical coordinates, in order to proportion a novel spatial configuration of the European spatial territory, with London at the centre, contrasting with the traditional visual geographical form expressed through more conventional mapping.

Scott F. Burns, Professor, Portland State University. Email: burnss@pdx.edu; *Terroir of Wines in Switzerland*

Terroir of the Wines of Switzerland Scott F. Burns, Dept. of Geology, P.O. Box 751, Portland State University, Portland, Oregon 97207 Switzerland today has 15,000 hectares in vineyards. In 1877 there were 33,000 hectares in production, but advent of pests, diseases, urbanization and the lower prices of foreign wines has reduced the hectares. Over 35 varieties are grown, but six varieties make up 95% of the vines planted in Switzerland: Chasselas, Sylvaner, Riesling/Sylvaner, Pinot Noir, Gamay, and Merlot. Chasselas makes up 45% of the planted area and 60% of the production, and this white wine is almost unique to Switzerland. It is greatly influenced by the soil and is marketed by the Swiss Romande regions of growth (Geneva, Dezaley, and Fendant). Sylvaner (6% of area) is the second leading white wine and has more body, bouquet and acidity than the Chasselas. It is grown mainly in the Canton Valais and is marketed under the label of Johannisberg. Riesling is grown mainly in the slaty soils of the region near Sion. Riesling/Sylvaner (Muller-Thurgau) (5% of area) is cultivated in the German speaking regions of Canton Valais (cooler climate in the upper valley). Pinot Noir (27% of area) is the main red variety grown in the German speaking parts of the country. Gamay (14% of area) is the second most productive and is grown near the Lake Geneva region and the Canton of Valais. In the warmer regions of the Ticino and the Graubunden one finds Merlot (6% of area) as the main grape.

James E. Burt, University of Wisconsin - Madison. Email: jeburt@wisc.edu; A-Xing Zhu, Ph.D., University of Wisconsin-Madison. Email: azhu@wisc.edu; Rongxun Wang, University of Wisconsin-Madison. Email: rongxunwang@wisc.edu; *Visual Spatial Data Mining Tools For Extracting Expert Knowledge from Soil Surveys*

For the most part soil mapping activities in the U.S. are directed at updating existing surveys prepared decades ago. Such surveys can be regarded as the spatial expression of a surveyor's mental model of soil-landscape relations. Although the scientist's model is seldom explicitly documented, it resides implicitly in the published map products. Recovery of the model has the potential to greatly accelerate the revision process by exposing soil-landscape concepts deployed in the original survey. To that end we have developed visual tools that extract knowledge in the form of frequency distributions of pixels within soil polygons. The distribution for a polygon indicates the range of environmental conditions over which that polygon has been mapped, and as such is similar to mental constructs often employed by surveyors. The software provides various displays and metrics for comparing distributions of one soil with another, which allows a new surveyor to identify similarities and differences in the environments occupied by those soils. In addition, frequency distributions for multiple polygons of the same soil can be compared. This provides information about the consistency of mapping, and is useful in identifying polygons that occupy anomalous environmental settings and therefore deserve special attention in the update. Editing features built into the software allow modification and formatting of the extracted knowledge for use in predictive expert systems such as SoLIM. This paper describes the new tools and their use in an ongoing update project in southwestern Wisconsin.

Elizabeth Burton, Dr, Oxford Brookes University. Email: ejburton@brookes.ac.uk; Lynne Mitchell, Oxford Brookes University. Email: lmitche1@brookes.ac.uk; *Inclusive Design for Getting Outdoors*

This paper presents findings from I'DGO (Inclusive Design for Getting Outdoors), a three-year research project funded by the UK Engineering and Physical Sciences Research Council under their EQUAL (Extending QUALity Life) Programme. Conducted by a Consortium of researchers from Oxford Brookes University, University of Salford and Edinburgh College of Art, the research aims to identify ways in which the outdoor environment could be designed to improve older people's quality of life. The paper will focus on the findings from interviews with 200 older people and from the measurement of the design characteristics of participants' local neighbourhoods. Participants were recruited from cities, large and small towns and villages in Oxfordshire, Gloucestershire and the Greater Manchester area and from a variety of location types including city/town centre, urban district, suburban/edge and rural. The research found that it is very important for the majority of participants (89.5%) to get outdoors, particularly for social contact, stimulation, fresh air and exercise. However, physical ailments, frailty or a perceived lack of safety are just a few of many stated reasons why they do not use their local neighbourhoods as frequently as they would like. Yet such restrictions are often caused or at least exacerbated by aspects of design from urban form to paving materials. Our aim, therefore, is to identify design features that help and hinder older people and to provide design guidance that will improve the ability of older people to use and enjoy the outdoor environment without compromising the needs of other users.

Bryan R. Bushley, East-West Center / University of Hawai'i. Email: bushley@hawaii.edu; *Assessing the Sustainability of Community Based Natural Resource Management Systems*

During the past few decades, the world has witnessed a trend towards increased decentralization and local control over the management of natural resources. This trend has been embraced by local and indigenous communities, as an affirmation of their traditions and rights; and also supported by both national governments and international donor organizations. The broad appeal of community based natural resource management (CBNRM) initiatives lies in their promise of enhancing community livelihoods while promoting the protection and sustainable management of valuable natural resources and threatened ecosystems. Despite abundant evidence of successful CBNRM initiatives, there have also been some failures, and significant challenges remain to their long-term viability. These challenges stem from internal discord within communities, the absence of proper incentives, pressure from external forces and actors, related power imbalances, and lack of a common vision. This paper introduces the STEEPLE Framework - a conceptual planning tool for evaluating the socio-cultural, technical, economic, ecological, political, legal and ethical dimensions of sustainability in diverse public policy dilemmas ? and illustrates its use in the evaluation of CBNRM programs and initiatives.

Kristina Bushnell, BA, University of Hawaii, Department of Geography. Email: kwbushne@hawaii.edu; Kristina W Bushnell, BA, University of Hawaii, Department of Geography. Email: kwbushne@hawaii.edu; *The Many Fires of Maha'ulepu*

This presentation follows a place-based struggle in Hawaii spanning over 125 years. Focusing on ideas set forth by philosopher Edward Casey, particularly his views on how place constitutes personal identity, or "the geographic self", this paper explores the coalescence of the ways indigenous peoples of Hawai'i carry place in themselves and the political struggle for place. At the advent of large-scale sugar cultivation on the south shore of Kaua'i in the latter half of the nineteenth century, a group of indigenous Hawaiians, Kanaka Maoli, formed a land company in Maha'ulepu to maintain lands in Hawaiian hands. Almost a century later, two more grassroots coalitions were created in efforts to preserve the contested lands of Maha'ulepu. Today, Kanaka Maoli, despite their reticence to join more formal political activity, continue to greatly influence the creation of place through their performance of place at Mahaulepu. Performance is not meant as a display for an audience, but rather as an expressive reflection of place, a way of being in place and doing place. In this way, Kanaka Maoli have played a major role in the ways subsequent settler groups have come to relate to place as well as the significance of preserving places. The roles of the body, spirit, story, sustenance and genealogy as well as pertinent political aspects such as access to place, or lack thereof are significant in approaching place-making in Hawai'i.

Keywords: indigenous peoples, place-making, performing place

Michelle Bussemey, Texas State University-San Marcos. Email: miischist@gmail.com; David R. Butler, Texas State University-San Marcos. Email: db25@txstate.edu; *Analysis of Land-use Change Illustrated through Repeat Photography of the Rio Vista Dam in San Marcos, Texas*

The use of repeat photography as a field method is a practical and simple interpretive tool to show changes in the physical landscape. The purpose of this paper shows the significance of comparing photographs as vital to understanding the temporal change of not only the physical landscape, but also change in the cultural landscape and human impact on a place. The relevancy of repeat photography as a technique in field research is addressed by the growing concerns of urban land-use, changes in the global climate, and the effects of man-made structures on geomorphic and fluvial systems. The employment of this method was used in analyzing the impact of the changes and structural improvements made to the Rio Vista Dam in San Marcos, Texas during the spring of 2006. The severe changes in the surrounding landscape and fluvial processes of the San Marcos River are examined by comparing nine sets of photographs. The results illustrate the drastic change in the riparian landscape, river channel, and public use. The enormous rise in the amount of users to the area is causing congestion in the river, muddiness of the waters, and trash to accumulate in the river and on the shore. The effects the newly constructed dam will have on the endangered gambusia and Texas wild rice could be catastrophic if the amount of users to the area continues to increase. Without proper supervision and restraints, the delicate San Marcos River system will reflect the impact of overuse and overcrowding.

Steve Randal Butcher, Kent State University. Email: sbutcher@kent.edu; *Interpreting the Epistemological Stance of the United Nations Regarding Genocide: Nations, Races, Religions, Ethnicities, and the 'Tribe'*

This paper addresses genocide vis-à-vis the process of international discourse. The United Nations has defined genocide as the intent to destroy in whole or in part a national, racial, religious, or ethnic group. Definitions for the four victim group categories and the idea of intent to destroy are purposefully ambiguous. While this ambiguity provides leeway for assessors in the determination of various events as genocidal, which calls for international intervention, it also allows for political maneuvering in the assessment process which delays, and in the case of Darfur, Sudan avoids completely, criminal inquiry and humanitarian intervention. My project investigates the UN's assessment process via the concepts used to define genocide. In particular I review the use of the term 'tribe' introduced in the International Criminal Tribunal of Rwanda. My contention is that the general epistemological stance of the UN adopts an orientalist and primordialist approach to defining African group identity formation, as in the cases of Rwanda and Darfur. Moreover, I forward Doreen Massey's understanding of space as social relations and Kevin Cox's notion of the politics of dependency as an alternative to the UN's apparent theoretical position. My assertion is that geographic thought can shed light on the epistemological and ideological underpinnings of the UN's international politics vis-à-vis its discursive practices regarding criminal tribunals and humanitarian intervention.

David R. Butler, Texas State University - San Marcos. Email: db25@txstate.edu; George P. Malanson, University of Iowa. Email: george-malanson@uiowa.edu; Stephen J. Walsh, University of North Carolina-Chapel Hill. Email: swalsh@email.unc.edu; Daniel B. Fagre, U.S. Geological Survey Glacier Field Station. Email: daniel_fagre@usgs.gov; *Influences of Geomorphology and Geology on Alpine Treeline - More Important Than Climatic Influences?*

The Western Mountain Initiative seeks to identify the key variables controlling treeline at keystone national parks of the west, represented by the primary sites of Glacier National Park on the northeast, Rocky Mountain National Park on the southeast, Sequoia/Kings Canyon National Parks on the southwest, and Olympic and North Cascades National Parks on the northwest. Field examination of treeline at primary sites, as well as at numerous secondary sites (including Mt. Hood, OR; Medicine Bow Range, WY; Niwot Ridge, CO; ranges in southern CO; southern Nevada; and the White Mountains, CA), suggests that climatic influences may in fact be less significant than geomorphic and geologic influences in determining the location and shape of alpine treeline. The hypothetical role of geomorphology and geology in controlling treeline is examined through the presentation of conceptual diagrams based on field observations. The variables of geomorphology (both landforms and processes, recent past and present) and geology (including lithology, structure, and tectonic setting) exert profound influence on the distribution, shape, and elevation of alpine treeline in the American West.

David J. Butler, University College Cork (UCC), Ireland. Email: d.butler@ucc.ie; *Southern Protestants Sidelined?: Perceptions and Experiences in Ireland since 1920*

Irish Protestants played a key initial role in the construction of Irish nationalism; later the logic of empire and communal conflict took precedence and Éire - Ireland was founded by a nationalist movement that was overwhelmingly Roman Catholic. For much of its history, the constitution and public culture of the south heavily reflected RC values, and the Protestants struggled to reconcile their communal narrative with that of the state. However, the dramatic economic and social changes that have taken place in Ireland in the recent period have opened possibilities for the building of new relationships. The empirical focus of this paper centres on two areas of the island of Ireland: West Cork, on the historical frontier of the Munster Protestant community - and North Monaghan ? forming part of the southern frontier of the Ulster Protestant community ? drawing on selected extracts from some 150 interviews gathered as part of a Higher Education Authority (HEA)-funded research project. West Cork and Monaghan saw some of the most serious attacks on Southern Irish Protestants during the War of Independence (1919-21) and Civil War (1922-23). Though many left, a significant community remains in both areas, predominantly though not exclusively on the land. This paper looks at the Protestant community in both areas today, the manner of their integration into the state and nation, and their struggle to reconcile their community narrative with the national narrative of the state and of the majority community.

isotope data: the Augrabies Falls system of the Orange River, South Africa

Quantifying rates of bedrock channel incision is fundamental to understanding rates and modes of long-term landscape development, yet the acquisition of such data has been problematic given the episodic nature of the high magnitude flood events that are likely to be responsible for most bedrock channel erosion. The development of cosmogenic isotope analysis now provides a means of quantifying rates of bedrock channel incision over time scales that are sufficiently long to integrate the effects of high magnitude - low frequency flood events. This approach has been applied to the Augrabies Falls system, the major knickpoint of the Orange River that forms the regional base level for the upper ~650 000 km² of the Orange Basin. As a result of very low base flows (100 m³ s⁻¹ or less, compared with flood peaks of 10,000 m³ s⁻¹ or more) a range of components of the complex landscape of the Augrabies Falls system are accessible for sampling, including the beds of anabranches above the main falls, the rock surfaces of subsidiary falls, interfluvies between channels, exposed rock bars in the middle of the main channel and tributary channels below the main falls. Concentrations of in-situ produced cosmogenic ¹⁰Be and ²⁶Al in quartz from the granite-gneiss bedrock give rates of incision of ~60 mm ka⁻¹ in channels above the main falls, while the channel in the gorge below the falls is downcutting at a rate of ~6 mm ka⁻¹. Interfluvial denudation rates are ~5 mm ka⁻¹.

Keywords: Geomorphology, cosmogenic isotopes, South Africa

Ruth Butler, PhD, Univesity of Hull, UK. Email: r.e.butler@hull.ac.uk; Buses, Bodies and Bureaucracy: reconsidering accessible public transport

Inaccessible transport has been identified as contributing significantly to the barriers which confront disabled people in mainstream education, employment, and social and leisure activities. Despite this, research into accessible transport has been limited in volume and scope. Much has concentrated on the physical infrastructure of transport networks. Often taking a medical model and/or technological determinist approach it has sought solutions to individual's impairments. It has also focused primarily on people with mobility impairments, failing to acknowledge the full range of people's needs. This paper reassesses the issue of accessible public transport in a more holistic manner. Considering recent debates about the nature of the 'social model' of disability, it looks at the impact of different impairments, the social discourses with which individuals must interact and the power of large scale institutions and economic structures on disabled people's experiences of public transport. Drawing on empirical data from the UK, the paper points to how social, economic and political factors impact upon physical design, customer care, transport policy and service providers' practices. It concludes that there need to be sustained cultural and attitudinal, as well as physical changes to transport services, at both a local and national level, if they are ever to be truly accessible.

Tim Butler, King's College, London. Email: tim.butler@kcl.ac.uk; Chris Hamnett, King's College London. Email: chris.hamnett@kcl.ac.uk; Education, Aspiration and Gentrification - a variable geometry?

There is now a widespread literature, in the sociology of education, on parental strategies in which it is generally assumed that gentrifiers are active and successful choosers of the best education available in their respective urban markets. In this paper I question the strength of this claim. Drawing on recent research being conducted in East London amongst gentrifiers from a range of social, economic and ethnic backgrounds, I argue that different groups often pursue very different education strategies. The most affluent, living in elegant housing convenient to where they work but in areas with poor educational provision, simply do not see state provision as providing for their needs. On the other hand, middle class households in lower level, usually state, professional employment often accommodate both to their children's desire to go to a 'local school' - although both children and parents will avoid what they see as the 'rubbish schools'. This *laissez faire* approach however contrasts strongly with that adopted by many respondents from a minority ethnic background whose aspirations for their children are aggressively oriented towards upward social mobility. For this group, the prime requirements are not only schools with a good attainment record but ones in which the peer group will not act as a drag on their children. This is often articulated in ethnic terms. These variations imply that there is no simple elision in London between gentrification and the generation of public policy at least in reference to education policy.

Keywords: Education Public_Policy Gentrification London

Anya Butt, Central College. Email: anya.butt@central.edu; Where have all the geography courses gone? An analysis of programs at Iowa universities and colleges

There are approximately 40 private colleges, 20 community colleges and 3 public universities in Iowa. For a state with a population of approximately three million people, around 13% of whom are between the ages of 15 and 25, this

represents a relative high level of access to higher education. Counterbalancing this opportunity is the reality that many of these are specialized colleges (theological seminaries or focused on professional programs). While some institutions may have offered geography majors in the past, the heyday of geography as a discipline in Iowa seems to have passed. At present it is only possible to major in geography at two public universities and one community college, with the opportunity for a minor in geography at one private college. Many institutions do offer a number of geoscience related or cultural geography related courses, either through environmental science majors or, less frequently, global studies programs. While higher education institutions do not offer specific programs in geography, the education programs at the same time require a number of geography courses for the middle school endorsement, which presents a conundrum regarding the importance of geography in our educational systems. This presentation examines what, among this multitude of educational institutions the status of geographic education in the state of Iowa at the college level is, by looking at course offerings in geography, environmental science and requirements within the education major for a geography/social science teaching endorsement, as well as address the impact of GIS on curriculum development in these areas.

Keywords: higher education, college curriculum, environmental science, GIS, education endorsement

Bilal Butt, Michigan State University. Email: bilal@msu.edu; Grazing on the Edge: Pastoral Livestock Movements and the Etiology of Grazing Conflicts Around Protected Areas in Southern Kenya

Pastoralism is often described as one of the most efficient land use strategies in rangeland environments. Over the last half-century, pastoralists in East Africa have faced a series of land reductions, which have altered patterns of mobility and increased vulnerability to environmental change. One of the unanswered questions in these human-environment interactions is: What role do protected areas play in influencing the livelihood strategies of pastoralists who live along the borders of protected areas? The purpose of my dissertation research was therefore, to understand the livestock herding strategies of pastoralists who reside at the periphery of protected areas. Two research objectives were addressed to achieve this purpose. First, I sought to determine the patterns and driving processes of livestock mobility within and around protected areas. Second, I attempted to understand and contextualize the conditions under which conflicts between pastoralists and protected area managers take place. This research integrated theoretically plural perspectives on the cultural, economic, political and socio-environmental processes of resource access and control by pastoralists. These theories, combined with multi-method fieldwork (geospatial techniques, key informant interviews, oral histories, herd follows and household surveys) provided empirical evidence about the contemporary herding strategies of Maasai pastoralists around the Maasai Mara National Reserve (MMNR) in southern Kenya. This paper will illustrate the spatial and temporal dimensions of livestock grazing around a protected area and explicitly assess and contextualize the patterns and processes of livestock mobility to the outcomes of violent conflict between herders and protected area managers.

Charles E. Button, Ph.D., Central Connecticut State University. Email: buttonche@ccsu.edu; Scales of Soil Lead Contamination, Class and Race

Although the negative health effects of lead ingestion by children under the age of six has been well established, it is still an ongoing problem in the United States. In 2001 the Centers for Disease Control indicated that nearly one million children living in the United States have lead levels in their blood that are high enough to cause irreversible damage to their health (CDC 2001). This research expounds on previous research that was conducted at child day care centers in the greater Cincinnati area and discusses associations between soil lead contamination, race and class at micro- and macro-scales.

Keywords: class, contamination, lead, race, soil

Kenneth J Button, George Mason University. Email: kbutton@gmu.edu; Henry Vega, George Mason University. Email: Hvega@gmu.edu; The Effects of Air Transportation on the Movement of Labor

The effects of the deregulation of airlines markets and the new technologies that have been introduced into air transportation have been heavily studied. Much of this analysis has been on the impacts on the industry and the immediate welfare implications for passengers and, to a lesser extent, cargo consignors. This study looks at the longer-term effects of the modern air transportation system on labor markets and labor migration. The growth of the service sector, the emergence of more flexible manufacturing techniques, the reduction in trade-barriers, and the creation of more sophisticated financial markets has led to greater mobility in production and in capital movement. This has been explored to some extent. Labor is, however, also more mobile - for example since the

admission of Poland to the European Union some 465,000 of its worker have joined the UK labor market. Air transportation facilitates easier migration, makes it possible for short-term migration, and allows migrants to maintain contact with their home country. Within larger countries, such as the US, there has also been a growth in long distance "week-day" migration as spouses work in different parts of the country to be reunited at weekends. The empirical analysis makes use of aggregate data to look at trends in international labor movements and provides case study-based analysis on the impact of air transportation within the US.

Keywords: Air Transport, Labor Migration

Kent Hughes Butts, Ph.D, Army War College. Email: kentbutts@yahoo.com; *Energy and Geopolitics: the Case of China's Minerals Quest*

This paper focuses on the rise of the Chinese economy and its growing requirements for energy and strategic mineral resources, examines the inter-agency strategy that China applies to obtain its mineral imports and explores the significant geopolitical implications of this strategy. The Chinese economy grew by 10.9% in the first half of 2006; China's energy demand rises approximately one percent less than economic growth. China's steel consumption rose 35% compared to a year ago and its rising mineral demand has driven up the price of copper by 37% and oil by 33%. Moreover, China's mineral policy stresses owning the resource not buying it for the highest price on the world market, as does the United States. As a result China has bought mineral concessions in many areas of strategic importance to the United States; this practice gives China leverage over the behavior of the resource owning states and a stake in their security interests. For example, China has invested 100B in the Iranian sector and already gets 11% of its oil from Iran, it is highly unlikely that China would support meaningful National Security Council sanctions against Iran, and refused to support similar sanctions against the Sudan, from which it obtains 5% of its oil. Future tensions between the US and China over its minerals acquisition policy are possible.

David Butz, Brock University. Email: dbmarley@brocku.ca; *Tourism and Porterage Labour in Shimshal, Northern Areas, Pakistan*

This presentation provides an overview of how trekking porters in the village of Shimshal, Northern Areas, Pakistan understand the challenges of working as labourers in a transcultural tourism economy, and situates their understandings in the context of contemporary tourism in Shimshal. A typology of ten important 'dimensions of concern' is presented. The presentation concludes by outlining the efforts of the Shimshal Nature Trust (SNT) to manage tourism in the community in ways that deal with the issues about which porters are most concerned.

Keywords: tourism, mountain communities, labour

Stephanie A Buway, University of Oklahoma. Email: sbuway@gmail.com; *Renewable Energy Education and Awareness in Oklahoma*

Creating an energy independent nation by using our own domestic energy sources is a main goal in the United States today. From adding ethanol to gasoline to reduce our oil imports to installing solar panels on our rooftops, the quest for energy independence is gaining momentum. Where do the children of our future fit into this revolution? They will be the ones who vote on future environmental legislation and control the way the country uses its energy resources. Educating our children while they are still young will allow them to grow up with the proper environmental knowledge necessary to lead the country responsibly. As such, there is a strong push in schools today for better energy related curriculum. Therefore, I intend to determine the level of renewable energy education and awareness in the state of Oklahoma. I will have distributed a survey to high school teachers and students across the state of Oklahoma. The surveys will contain questions such as: What do you already teach/know relating to renewable energy? What would you like to see taught in the classroom regarding renewable energy? Are the students aware of the changes they can make in their own lives to conserve energy? After analyzing the surveys, I would like to make the Oklahoma school system aware of the pressing issues related to renewable energy in the state by providing suggestions for curriculum improvement as well as to make students aware of their energy future.

Stefan Buzar, Dr, University of Oxford. Email: stefan.buzar@chch.ox.ac.uk; Anett Steinfuehrer, Dr, Centre for Environmental Research Leipzig-Halle. Email: ; Annegret Haase, Dr, Centre for Environmental Research Leipzig-Halle. Email: ; *Significant invisibles: flat sharers as drivers of inner-city transformation in Europe*

Flat sharers have emerged as one of the most distinct representatives of

'new' household types in developed world cities. But despite their widespread existence for some decades now, they have been marginalised both in official statistics and in housing studies. In this paper, we shed some light on flat sharing households within European inner-city areas. We discuss their entrance into the 'mainstream' of contemporary urban lifestyles. Flat sharing today is a form of collective housing of at least two childless, usually younger persons in a similar position in the life cycle. Sharing the flat and the housing costs is the basis of their relationship, but living together is a further motivation. By using survey data from recent on-site research across Europe, we discuss the spread, actors and subjective meaning of flat sharing, as well as its role in inner-city reurbanisation processes. The reviewed evidence indicates that flat sharers - though to a varying degree in different locales - visibly transform the demographic and social landscapes of European inner cities.

Keywords: flat-sharing, households, lifestyles, population geography, Europe

Michael Buzzelli, Queen's University. Email: m.buzzelli@queensu.ca; *Vulnerability and environmental justice: A spatial analysis of ambient air pollution*

This paper is concerned with developing and refining the science of environmental health hazard exposure analysis and providing new substantive insights into the micro-geographies of risk inequities. Land use regression (LUR) is used to assign annual average exposures of criterion pollutants (NO₂, NO, NO_x) to neighbourhoods in Toronto and Vancouver, Canada, and explore associations with sociodemographic characteristics. Based on comprehensive sampling campaigns (2003), validated high resolution spatial analysis shows that regulatory ambient monitoring can significantly under-represent air pollution exposures. The micro-geographies of exposure in this study also point to nuanced, and sometimes unexpected, relationships between neighbourhood socioeconomic status and chronic air pollution exposure. Accordingly, this paper joins a growing environmental justice literature outside the US that points to a range of relationships between environmental health hazards and socioeconomic markers beyond the traditional focus on race and low income communities.

Keywords: air pollution, land use regression, Toronto, Vancouver

Andrew Byerley, Department of Human Geography, Stockholm University. Email: andrew.byerley@humangeo.su.se; *The Colonial African Housing Estate: Strong Points in the Post-WWII Colonial Diagram of Power.*

Before WWII there was no planned 'African' urban housing and few industrial jobs in Jinja, Uganda. By the mid-1950s a large 'industrial complex' had been assembled comprising a dam, industrial work places, housing estates, and associated physical and social infrastructure/institutions. This transpired in a town and in a territory that, in the estimation of the creators of this 'model-modern' project, was deemed unsuitable for manufacturing industry. What ideas was this project produced from and in relation to? How and why were populations to be 'de-tribalized', socio-spatially canalized, and their relations re-coded? Jinja Town is analysed in terms of having constituted a strong point with shifting functions in a series of contested diagrams of power. Certain spatial enclosures and agents are examined in terms of having risen/fallen in terms of their deemed efficiency in actualising specific lines and modalities of power; the "African" housing estate, the "Asian" and the "Chief" being important among these. Drawing from the theoretical work of Foucault and Deleuze/Guattari, and based on lengthy ethnographic fieldwork, I analyse the colonial production of space and the making and becoming of place. This is channelled through a historical and spatial analysis of the Walukuba 'African' Housing Estate, built between 1949 and the mid-1950s. I examine this estate as having been a key disciplinary space in the transition from the pre-W.W.II sovereign diagram of power to a more disciplinary and subsequently bio-political diagram in the post W.W.II era. The paper further seeks to problemize the endeavour of 'doing Foucault in Africa'.

Keywords: Space, place, diagrams of power, colonial planning, de-tribalisation, bio-politics, Jinja, Uganda

Robyn Byers, Towson University. Email: robyn.byers@gmail.com; *Evaluating Chesapeake Bay Policy Implementation in Accomack County, Virginia*

Accomack County, Virginia, is a rural, but rapidly developing county on the Delmarva Peninsula between the Atlantic Ocean and Chesapeake Bay. In 1989, the Chesapeake Bay Preservation Area Ordinance was adopted in Accomack County, detailing steps for development within the Chesapeake Bay Preservation Area, roughly half the county. Implementation of this ordinance is a combination of permitting and site visitation. This paper evaluates the implementation of this ordinance using the number of site visits conducted over a six-month period in relation to the development permits that were approved. Databases from the county detail the permit information and the site visit information. Less than 30% of the permitted sites were visited during the three development phases: pre-development, development, and post-development. The sites visited were largely sites that received complaint calls by the public. Accomack County's

lack of support for additional staff notably impacted the implementation of this ordinance; only one staff member was responsible for all of the permitting and field visitations for this ordinance. The large number of sites not visited during construction will likely lead to the inefficient use of Erosion and Sediment Control measures and other Best Management Practices throughout the Chesapeake Bay Preservation Area.

Keywords: Chesapeake Bay; Erosion; Sedimentation; Water Quality

Karl John Byrand, University of Wisconsin-Sheboygan. Email: karl.byrand@uwec.edu; Promoting Visitor Experiences at Yellowstone's Upper Geyser Basin, 1872-1990

Cultural landscapes within national parks are not islands immune to change. They are dynamic in the sense that their cultural features have evolved to reflect transformations of external influences. Rather than being isolated, they have been molded by American culture, the national park idea, and even marketing ploys. The cultural landscape of Yellowstone's Upper Geyser Basin, the area encompassing Old Faithful Geyser, is no exception. It too has been shaped by the larger regional and cultural milieu, which in turn has generated changes in the visitor experience. Since the park's inception, the Upper Geyser Basin's landscape has been promoted widely to visitors by park overseers and concessionaires. Through time, different elements of this national park landscape were promoted not only because of the changing wants and needs of those who would visit, but also because of park administrators' changing ideas of the national park experience. As such, different "selling points" were emphasized during different stages of park development. The result of this was the creation of a cumulative, yet changing visitor experience. Travel brochures and guidebooks promoting the Upper Geyser Basin and diaries of those who have visited serve as indicators of the landscape that was sold to the visitor compared to the landscape actually experienced. These sources have revealed four distinct periods of landscape promotion of the Upper Geyser Basin between 1872 and 1990, which will be discussed in this paper.

Keywords: Historical Geography, cultural landscape, national parks

Kristin B. Byrd, University of California, Berkeley. Email: kbyrd@nature.berkeley.edu; Adena Rissman, University of California, Berkeley. Email: arissman@nature.berkeley.edu; Adina M. Merenlender, University of California, Berkeley. Email: adina@nature.berkeley.edu; The Effectiveness of Conservation Easements: Assessing Development Threats in the Lassen Foothills, California, with Uplan, a GIS-based Urban Growth Model

Land trusts have been acquiring conservation easements in greater numbers across the country in order to meet their conservation missions. However few studies have addressed the ecological and social outcomes of conservation easements. Our study addresses the question: To what extent are conservation easements effective in reducing existing threats to biodiversity, specifically from development? The Lassen Foothills region in Northern California served as a case study, as it contains endemic oak woodlands subject to subdivision, and The Nature Conservancy holds a cluster of conservation easements there. Our approach was to determine what future development might occur in the region if present-day conservation easements were non-existent. Since the study area is primarily located in Tehama County, we developed a scenario of future development in the county using the application Uplan, a GIS-based urban growth model developed at the University of California, Davis. We chose Uplan because it can project low-density rural residential growth, the development type most likely to affect the Lassen Foothills region. Consequently our results focus on projections for this land use category. Based on population predictions and present-day population distributions, by 2050 the demand for new low-density rural homes is about 560 lots over 90,000 acres (assuming a minimum lot size of 160 acres). This low demand can be met by land available for development, even with easements present. Based on the model, easements do not reduce development threats in this case, but they serve to push development away from the foothills and closer to the Central Valley.

Keywords: conservation easement, urban growth model, rural residential

Néstor D. Cabral Antúnez, Universidad Nacional De Asunción. Email: caan_9495@yahoo.com; Mapa Base Del Proyecto Uso Sostenible Del Sistema Acuífero Guaraní en Paraguay - SAG-PY

En el presente documento se exhiben los trabajos cartográficos realizados en el marco del Proyecto llevado a cabo entre la Secretaría del Ambiente (SEAM) del Paraguay y el Instituto Federal de Geociencias y Recursos Naturales (BGR) de Alemania. Este proyecto, denominado SAG-PY, contribuye como piloto al proyecto "Protección Ambiental y Desarrollo sostenible del Sistema Acuífero Guaraní" financiado por el GEF, a través de la OEA. El Proyecto SAG-PY está actualmente en fase de ejecución y requirió de la elaboración de un mapa base del área de estudio para facilitar el manejo y la normalización de los datos cartográficos georreferenciados y de un mapa Hidrogeológico del área de estudio

actualizado para el conocimiento actual de la hidrogeología a nivel regional. Estos mapas serán utilizados como input en la elaboración de un modelo numérico de la zona de estudio, por otro lado, el proyecto GEF también requirió de un mapa base del Sistema Acuífero Guaraní (SAG) a fin de satisfacer las necesidades del Sistema de Información del Sistema Acuífero Guaraní (SISAG), actualmente en fase de elaboración, quien proveerá la base técnica para la toma de decisiones con relación al acuífero, aportando el conocimiento básico para resolver problemas actuales y emergentes. Por ello el Paraguay utilizó el mapa base ejecutado dentro del proyecto SAG-PY como producto de contrapartida nacional. La base cartográfica, será volcada en la formulación de un modelo matemático de la zona de estudio, que constituirá una herramienta base para la gestión integrada del acuífero.

Keywords: Acuífero Guaraní; SAG; SAG-PY.

Kirsten Valentine Cadieux, Yale University. Email: kvcad@yahoo.com; Fertile Resistance, Using Normative Garden Spaces to Incubate Critical Urbanism

Remnants of nineteenth century garden city ideology regularly spill into current discussions of urban planning: the idea of the garden as a regulator of urban behavior is evident in calls for the preservation of open space and greenspace in and around cities. This presentation reports on ethnographic work on garden land use in the city and region of Christchurch and Canterbury, Aotearoa New Zealand, where garden suburb planning traditions inform the practices and narratives for shaping urban space. Demonstrating that the impulses to engage in interactions with the natural and cultivated environment often transcend urban boundaries, this work on urban and peri-urban gardens points to processes of exurbanization and examines the interaction of exurban aspirations and contemporary land use management strategies for containing urban sprawl and mediating land use conflicts and competitions in the urban-rural fringe.

Keywords: landscape, urban planning, New Zealand, governmentality, garden

Louisa Jane Cadman, Sheffield Hallam University. Email: Louisacadman@hotmail.com; The topology of the biopolitical decision: the politics of human rights and mental health

In recent years the work of Giorgio Agamben has proved apposite for geographers interested in paradoxical spaces of abandonment and exception complicit with liberal-democracies in the West. This paper focuses on one such paradox: the expanse, yet concomitant failing, of human rights claims in contemporary biopolitical contestations. Complicit with the formation of nation-states Agamben (2000), following Arendt (1973), argues that the so-called sacred and inalienable 'rights of man' are revealed to be without any protection once it is no longer possible to conceive of them as rights of the citizens of a state. This manifests through an inherent failure to protect those who are stripped of everything except that they are human (or bare life) - exemplified by limit figures such as the refugee and, in my focus here, those deemed of unsound mind. Analysed from a Foucauldian perspective however, Agamben's project is unable to grasp the methodological and historical importance of strategic power relations and Foucault's parallel claim that when politics becomes biopolitics (the politics of life), life itself resists? a resistance manifest here through the rise of psychiatric survivors. After outlining this theoretically contestable terrain the empirical part of this paper focuses on those seeking recourse to the Human Rights Act 1998 to contest proposals to reform of the Mental Health Act 1983 in England and Wales. Here I utilise Foucauldian understandings of political agonism to focus more substantively on political decisions over human rights violations contained in the proposals.

Keywords: Agamben, Arendt, Foucault, biopolitics, sovereignty

Caitlin Cahill, University of Utah. Email: caitcahill@gmail.com; Reframing risk: Gentrification, discourse and public policy

This paper considers the relevance of neoliberal discourse and representational practices for public policy and public understanding of gentrification. While there is a well-developed body of scholarship in the field of community participation and development that is pertinent to the grassroots project of challenging gentrification, not enough attention has been given to the role of material social practices of identification, agency, and cultural representations (Wilson & Grammenos 2005; Wilson et al. 2004; Rinaldo 2002). Wilson and Grammenos suggest that a successful anti-gentrification platform must challenge "the assault of real-estate capital on youth bodies head-on and effectively confront virulent constructions of identity and neighborhood" (2005, 309). Racial representations such as "teen moms" or "Lazy and on welfare" function as part of an "at risk" discourse by which young working class women of color are managed and produced?politically, culturally, ideologically, economically, and geographically— in the neoliberal context of the gentrifying/still disinvested Lower East Side neighborhood of New York City. In this paper I report upon the participatory action research project "Makes Me Mad! Stereotypes of young

urban women of color,” in which a research team of young women engage in the “culture wars,” developing an interpretative framework for affirming the right to self-represent (the right to their bodies, identities, and subjectivities) and their right to the city as mutually constitutive. My discussion will consider the policy implications of reframing revanchist racialized discourses and contesting the inevitability of global urban restructuring at the urban scale.

Keywords: gentrification, neoliberal discourse, young women, representations, policy

Qiang Cai, University of Iowa. Email: qiang-cai@uiowa.edu; *Controlling the Spatial Support in Disease Mapping - A Point-Based Approach*

Disease mapping is an important tool in controlling and preventing disease and understanding why some areas suffer greater disease burdens than others. Currently dominant area-based disease mapping approaches are known to suffer three problems: the small number problem, the modifiable areal unit problem (MAUP), and the problem of failing to capture small-scale spatial variation within the mapping areas. These problems arise because of the lack of control of the spatial support of the disease burden measures. This paper proposes a point-based disease mapping method that allows flexible control of the support of these measures. The method is a spatial filter-based method using geocoded disease cases and high-resolution population data. The main advantages of this method are clear rules for selecting spatial support, more reliable disease burden estimates and improved hypothesis testing capability. The method is applied on simulated disease data based on hypothetical spatial distributions of disease risk and high-resolution population data. Results support the stated benefits.

Keywords: disease mapping, spatial support, spatial filter, disease cluster detection

Yongming Cai, Clark University. Email: yocai@clarku.edu; Eugenio J. Marciano, Mount Holyoke College. Email: emarciano@mtholyoke.edu; *Simulation of Dam Break Scenario Using GIS Technique and Hydrodynamic Modeling*

Dam break causes losses of human lives, damages to the infrastructure, and interruption of economic activities. Coes Reservoir, located in North-west of Worcester, Massachusetts, was built in 1885. The design and construction of Coes Dam do not meet today's standards. Simulation of Coes dam break therefore is important to communities downstream for emergency preparedness. The research integrates geographic information systems (GIS) and hydrodynamic modeling to predict possible dam break scenario. The digital elevation model (DEM) and river geometry features, such as stream centerline, cross sections, bank lines, and flow path, were created in GIS environment. The data were used to prepare inputs into HEC RAS. In HEC RAS, unsteady state model was employed for hydraulic calculation. The floodplain boundary, inundation depths, and other outputs were transferred back to GIS for visualization and post-analysis. Federal Emergency Management Agency (FEMA) Q3 flood data were used to verify and assess the results. The results show that the ground topography and the channel shape of the river network significantly impact the spatial pattern of flooding caused by dam break. The integration of GIS and hydrodynamic modeling provides a time efficient way and greatly enhances the capacity in simulating dam break scenario. The study lends its methodology to facilitating emergency response and planning.

Email: clafon@geog.tamu.edu; Jon Moen, Umeå University. Email: jon.moen@emg.umu.se; *Climate and Reindeer at the Mountain Birch Treeline*

Forest tundra boundaries occur world wide in both Arctic and alpine locations and many have been shown to respond to changes in climate over both short and long time spans. The treeline environments of Fennoscandia are particularly sensitive indicators of climate change. They are of special interest because they occur at the intersection between both Arctic and alpine conditions, and the species that forms the treeline (mountain birch: *Betula pubescens* ssp. *czerepanovii*) is deciduous. Most northern hemisphere treelines are characterized by coniferous trees. Another interesting characteristic of these treelines is that they are impacted by reindeer herbivory. Reindeer herding is an important part of the culture of the local indigenous people (Sami) and consequently the interaction between reindeer and the treeline environment is of interest both scientifically and practically. In this study, we examine the interaction of establishment and growth with climate and herbivore populations at alpine treeline locations in Sweden. We use dendrochronological methods to determine the periods of above average establishment within the supra-treeline zone and investigate growth trends in the supra-treeline birch trees for evidence of the impacts of herbivory

from both reindeer and the autumnal moth. We hypothesize that establishment and growth are negatively affected by the presence of large herbivore populations. Here we present data illustrating the differential responses of treeline birch populations to climate under varying levels of reindeer activity.

Marcellus Caldas, Michigan State University. Email: caldasma@msu.edu; Cynthia Simmons, Dr., Michigan State University. Email: simmo108@msu.edu; Robert Walker, Professor, Michigan State University. Email: rwalker@msu.edu; Stephen Aldrich, Mr., Michigan State University. Email: aldrich30@msu.edu; *Land Reform and Spontaneous Settlement Formation in the Brazilian Amazon*

Research addressing the causes of forest loss in the Brazilian Amazon has implicated many factors, ranging from the role of markets in the south of Brazil to the size of individual farming households. Much remains to be learned, however, about the social and institutional conditions underlying this massive process of environmental degradation in the Amazon basin. Specifically, poor farmers, who have grown disillusioned with the Brazilian government's promise of land redistribution, have taken it upon themselves to form settlements, or assentamentos. The paper addresses a particular type of assentamento presently affecting the most vulnerable parts of the Amazon forest, which is found on terra devoluta. The goal of the paper is to comprehend the social processes leading to such spontaneously-formed assentamentos through the application of a Logit model. It is hypothesized that spontaneous settlements are a consequence of early land reform policies that created Projetos Integrados de Colonização (Colonization Integrate Program) and stimulated in-migration to the region. Consequently, early migrants have created a second generation of settlers that now seeks its own land.

Historic remotely sensed imagery has the capability of offering the academic and research communities a vast amount of information that would otherwise be unobtainable. However, film based collections of imagery are mostly not processed digitally or cataloged and thus are not available to researchers. This project has been designed to investigate methods of cataloging and scanning film based remotely sensed imagery and to create a searchable spatial database to make this imagery available to the scientific community. The imagery processed in this project is from the following platforms: Seasat, aircraft radar, Skylab 2, 3, and 4, aerial photography, and Shuttle Imaging Radar-A. A catalog system was developed to store and categorize the canisters of film. Unique identification codes were used to distinguish the data contained on each roll of film. Scientific methods of scanning were investigated to determine the appropriate settings for scanning the transparency film. Scanning paper ground path maps of the locations of the flights is necessary to georeference the maps to the geographic coordinate system and then digitize the ground paths. Construction of a spatial database was undertaken to preserve the relationship between the film based rolls of imagery and digitized flight paths. The anticipated result of this project will be to permit researchers to select a geographic area, see what type of historic imagery is available for that area, and then download the imagery of their choice.

Keywords: remote sensing - historic, radar, gis, scanning - scientific

David A Call, Syracuse University. Email: red10dc@yahoo.com; *Impacts Associated with Ice Storms: The Shocking Truth*

Ice storms caused more than \$16 billion in insured losses from 1949 through 2000, and this arguably represents less than 20% of the total cost to the United States. However, the impact assessment for ice storms is incomplete. Researchers tend to focus on an analysis of particular sectors (e.g., insurance, forestry) and miss the larger picture. What are the primary impacts of ice storms? How have they changed through time? Are there differences between regions of the U.S.? Based on a study of major storms occurring from 1886 to 2006, I argue that the loss of electrical power, along with its associated indirect impacts, is far and away the most disruptive and longest lasting impact of an ice storm. While the inter-regional differences in impacts are small, I claim that rural areas are more likely to suffer longer power outages and transportation disruptions. Finally, I will conclude with a discussion of ways to reduce the impacts of ice storms.

Eduardo Camacho-Hübner, GIS Research Laboratory - Ecole Polytechnique Federale de Lausanne - Switzerland. Email: eduardo.camacho-huebner@epfl.ch; *Understanding the Territory as a Semantic Tool for Analysing Historical Processes*

In this paper, we deal with an original methodology developed in order to analyse urban morphological processes. This analysis is chiefly based on the construction of digital ontologies to formalize the concept of morphological process. We discuss three different issues linked to this formalization. First, we examine the interpretive approach, which is in the straight line of historiography. The historical paradigm leading to this approach is used to build a GIS-based tool for exploring urban morphological processes from archival and historical cartographic data instead of producing new data from predictive formulae. Second, we investigate the links between descriptive and explanatory concepts found in the morphological literature by extracting geographical knowledge from archival sources. These networks are called digital ontologies and are built using the archival information of the city of Geneva (Switzerland). Third, we show how the analysis of the resulting semantic networks helps us unveil transformation processes based either on the evolution of data or the evolution of concepts. The former are called instantiation processes and deal with transformations observed directly from data changes. The latter are called meta-processes and represent the evolution of the perception of the city through History. Finally, the generalization of this methodology is discussed in order to explore other fields in which geographical knowledge can be interpreted as the relationship between data and concepts in a given context as, for example, political science and economics.

Keywords: Digital Ontologies, Process, History, Geneva-Switzerland

Emilie S Cameron, Queen's University. Email: 4esc@qmlink.queensu.ca; *'Hidden Place': Race, Nature, and the Politics of Spectrality*

This paper will critically examine the proliferation of haunting metaphors in the humanities and social sciences over the past decade or so, and particularly their mobilization within explicitly post- and anti-colonial contexts. Increasingly, scholars are conceiving of indigeneity in spectral terms, often as a way of conceptualizing indigenous presence in places that non-indigenous peoples had previously constructed as empty or in which indigeneity had been imagined to be expelled, lost, or forgotten. Inspired in part by Derrida's notion of 'hauntologies', some scholars pursuing the spectral are interested in calling attention to that which 'haunts' dominant ontologies and, to that extent, the recovery of indigenous 'ghosts' can be understood as a politically progressive effort to identify the ongoing and constitutive presence of indigenous peoples in settler colonies. And yet there are risks involved in conceptualizing indigenous peoples in ghostly terms, and this paper will elucidate some of those risks through consideration of the ghost stories animating a wilderness park in southwestern British Columbia.

Keywords: haunting, postcolonialism, indigeneity

Laura J. Cameron, Dr., Queens University. Email: cameron@post.queensu.ca; *Freud in the Field: Some Early Twentieth Century Encounters in Participant Observation*

Participant observation currently is understood as a key method in the human geographer's tool kit, yet little geographical attention has been directed to its history. Anthropologist Bronislaw Malinowski often is credited with creating the revolutionary immersive approach to culture (which later became known as participant observation) when he lived with Trobriand Islanders during the period of the First World War. In this paper, the emergence of participant observation is situated in what Buzard terms the "turn-of-the-century maelstrom" of self-conscious imperialism and the "deliberate blurring of boundaries between investigator and object" in a wide range of discourses including Freud's recognition of "transference" situations. Malinowski's famous encounter with psychoanalysis is explored in relation to his fieldwork approach, but also in terms of his interactions with British publishers and the distinctive way in which Freudianism was received in Britain. The paper concludes by outlining how the repudiation of Freud would become key to anthropology's boundary-work and begins to reflect on potential geographical connections and consequences.

Email: carl.amrhein@ualberta.ca; Vladimir Yassenovskiy, University of Alberta. Email: vsi@ualberta.ca; *Oil-for-Food: Energy, Equity, and Evolution of Urban Supermarket Locations*

An era of cheap oil in the last half of the Twentieth Century has influenced the urban form and infrastructure placement in many North American cities, including de-population of inner city areas and suburbanization of populations. This paper examines grocery retailing locations as an indicator of changes in

urban form and function coinciding with the mass use of oil energy. A case study of Edmonton (Alberta, Canada) analyzes supermarket chain locations 1970-2001 in relation to changes in socio-economic characteristics of city census tracts. In Edmonton, supermarkets have expanded to the suburbs at the same time as some supermarkets in mature areas of the city have closed. Supermarkets are now beyond a walking distance of much of the population, leaving the urban retail food distribution system heavily dependent on external energy sources. Given that food is a basic need that must be consistently satisfied, what are the health, social, and environmental implications of the current configuration of urban supermarkets?

Keywords: food retail, sustainability, equity, energy, supermarkets, health, urban, Canada

Michael Camille, University of Louisiana at Monroe. Email: camille@ulm.edu; Patty Watts, University of Louisiana at Monroe. Email: watts@ulm.edu; *DAMSALS2 ITEST Project- Year Two Results*

The Mississippi Delta has the highest poverty rates and greatest degree of illiteracy in the U.S. While current information indicates that nationally the digital divide is narrowing, lagging far behind other groups are African-Americans, rural residents, persons of low socioeconomic status, and single parent families? a perfect description of the demographics of the Delta. The DAMSALS2 NSF ITEST project at the University of Louisiana at Monroe, is helping teachers, many of whom lack even the most rudimentary technology skills, begin to provide students with skills needed to prepare them for technology intensive careers?including those in agriculture. The professional development model used by the DAMSALS2 project consists of an intensive three-week institute for teachers followed by weeklong science/technology camps for students. These camps allow teachers to practice new skills in a non-threatening atmosphere with the support of their peers and project staff. During the academic year, participants are supported in the implementation process by classroom visits from project staff, on-line Blackboard interactions, and face-to-face meetings. The purpose of this presentation is to measure the project's impact on the participating teachers as well as their students. The evaluation plan designed for the project measures content knowledge, technology skills, and attitude changes of participants and their students, as well as classroom behaviors of teachers. There is credible evidence that the DAMSALS2 project is positively impacting both teachers and students. Increases in teacher technology skills and content knowledge appear to have been transferred to the classroom to result in increased student achievement.

Richard Campanella, Tulane University. Email: rcampane@tulane.edu; *Post-Katrina: Observations of a New Orleans Geographer*

Many geographers nationwide weighed in on the analysis of Hurricane Katrina and its aftermath in the season following the August 2005 catastrophe. Fewer have followed the slow and nuanced recovery process since the incident faded from national headlines, and even fewer geographers have participated in it, far outnumbered by urban planners and architects. This paper offers some observations of a New Orleans-based geographer and long-time city researcher who has been heavily involved in post-catastrophe recovery efforts. Topics will include: ? how Katrina's floods reintroduced New Orleanians to their own historical geography; ? how philosophies regarding science, engineering, culture, and humanism contest proposed locations of the "build/no-build line;" ? how and why Katrina's floods affected locally born citizens differently from transplants, and what this might mean for the future of "local culture;" ? how numerical data are used to substantiate preconceived relationships between the geographies of environmental risk and race/class; ? how one poorly made GIS map initiated one of the largest grassroots neighborhood-planning efforts in recent memory; ? how "green space" became a verb?and a dirty word; ? how narratives of cultural exceptionalism versus national assimilation, though incompatible, are nevertheless tapped simultaneously to justify and carry out rebuilding; ? how Katrina may affect popular perceptions about New Orleans' exceptionality.

Keywords: Katrina, New Orleans, Louisiana, hurricanes, disaster recovery, planning

David Campbell, Durham University. Email: david.campbell@durham.ac.uk; Marcus Power, Durham University. Email: marcus.power@durham.ac.uk; *The Scopic Regime of 'Africa'*

Visual performances are central to the construction of 'Africa' in the European imagination. Established over time, these performances reduce the plurality and hybridity of a place comprising nearly 900 million people, 57 countries and numerous cultures to a single entity marked by an iconography of despair, disaster and disease. This enactment of 'Africa' renders it, in particular places and at particular times, as an object of colonialism, imperialism, military intervention and humanitarianism. This paper will examine the historical production of 'Africa' through the varied technologies of vision (colonial

exhibitions, historical photography and contemporary photojournalism, cinema and virtual reality games) that comprise a 'scopic regime' which enacts the object it claims to describe.

Hugh Campbell, CSAFE- University of Otago. Email: hugh.campbell@otago.ac.nz; Julia Hobson Haggerty, PhD, CSAFE - University of Otago. Email: julia.haggerty@stonebow.otago.ac.nz; *Reconsidering "Grass-Fed": The exposure(s) of pastoral agriculture in New Zealand and the resilience of farmers, pastures and animals*

This paper considers the environmental history of pastoral production in New Zealand with regards to the linkages between neoliberalism and intensification, two critical forces shaping the global pastoral landscape in the latter part of the twentieth century. While neoliberalism has been linked with the intensification of pastoral production in parts of the global South, in New Zealand, the influence of neoliberal economic strategies on the socio-ecological dimensions of farming converged with a long-standing history of intensification of pastoral farming systems. Intensification has been such a successful response to agricultural deregulation in New Zealand that along with commodities, the country's farming systems themselves are now being imported to places with more extensive production systems. Through a regional case study of the Southland province informed by farm-level oral histories and agricultural census data, this paper considers the socio-ecological dimensions of two critical transformations in pastoral farming in the years since World War II: the first marked by state intervention, the latter by state abdication. We describe transformations in pastoral farming with an emphasis on the ways in which elements in the regional farm landscape accommodated and/or resisted the trend toward intensification of pastoral production. Our linkage to a broader discussion of "what's new about neoliberalism?" is achieved through our consideration of the differences in agro-ecological resilience in two radically different governance contexts affecting intensification of the pastoral landscape.

Lisa M. Campbell, Duke University. Email: lcampbe@duke.edu; *Bottoming Out on Baselines: Scientific Uncertainty, Authority, and Morality in Ocean Policy and Management*

In 1995, fisheries scientist Daniel Pauly coined the term 'shifting baselines syndrome' (SBS), referring to the tendency of fisheries scientists to envision stocks as 'recovered' when they reach levels scientists recall from earlier in their own lifetimes. As a result, Pauly argued that scientists mismanage stocks because they tolerate gradual and incremental elimination of species, set inappropriate recovery goals, and use the wrong reference points when calculating costs of economic losses due to overfishing. The concept of shifting baselines is simple and its logic is compelling, and this helps to explain its widespread popularity in fisheries and other ocean sciences, in both the academy and among policy makers. This paper draws on social studies of science and political ecology to examine the conceptual and operational implications of SBS for ocean policy, and the less obvious but perhaps more important prescriptive and normative implications and assumptions. Using a case study fishery in the Caribbean, the paper considers how the 'science' of SBS can mask the policy preferences of the scientists and managers interested in identifying the 'real' or 'natural' baseline. Overall, the paper argues that the normative and prescriptive assumptions underlying SBS currently limit the contribution it will make to improving ocean management.

Stephanie A. Campbell, Simon Fraser University. Email: sac1@sfu.ca; *Living the livable city*

Livability, as a politically powerful concept, is increasingly invoked in contemporary urban planning. Inherently geographical, livability discourse is often deployed in support of mixed-use neighborhood development projects within larger, city-region plans of constructing the livable city. However, a shallow conceptualization remains of the social, economic and political implications of the conceptual and practical linkages between 'livability' and 'neighborhood' that are made in contemporary urban policy. In this paper, I consider how livability discourse is mediated between the social and physical production of contemporary urban neighborhoods through one neighborhood in Vancouver, British Columbia. Often referred to as The Drive, this neighborhood has been identified by city planners, its residents, and other Vancouverites as an example of the livable neighborhood through its various characteristics, including the central location within the city-region, a mixture of commercial and residential uses, green spaces, walkability, and connections to multiple modes of transportation. These physical characteristics are argued to foster a vital characteristic of the livable neighborhood, a sense of community. This notion of the livable neighborhood informs three interrelated processes: (1) the production

of the neighborhood built environments, (2) the consumption of the neighborhood, and (3) neighborhood-oriented strategic activism. I argue that, through these processes, the shaping of socio-spatial inequality ranging from the scale of the neighborhood to the city-region can be explored, and the role of the neighborhood as the building block of the livable city can be critically evaluated.

Keywords: livability, neighborhood

Jessica Campos, The University of Arizona. Email: jrcampos@arizona.edu; *Practicing Borderless/Transnational Solidarities Through US-Mexico Grassroots Resistance Networks*

How are collective transnational coalitions and solidarity actions formed and practiced? Doing participatory action research, I worked with a local (Tucson, Arizona), collectively organized group that is engaged in the movement to resist the negative economic, social, and environmental pressures of the globalized economy. This US-Mexico coalition spans from Southeastern Mexico to Minnesota moving through the already existing networks of indigenous resistance circles. One project that is moving through these circles is a 'Coffee Project' (Café Para la Vida Digna/ Coffee for a Dignified Life) that worked its way from an 'Autonomous Zapatista Municipality in Rebellion' in Chiapas, Mexico to the United States. The coffee cooperative established the autonomous economy in order to create a self-sustaining income to fund education centers and health clinics. While the physical details as to how the coffee has moved through the network must remain clandestine, I explore the social/collective organizing that has begun to take shape in Tucson, Arizona. The main objective of the group is to stand in transnational solidarity with the group in Chiapas as they work together to find ways to create social change. The group believes that social change not only starts on an individual level, but also within social relations. As such, the network practices an organization that is collective. Tracking the collective organizing of the group has revealed much in the way of 'how work gets done' in an environment where all parties involved have a voice.

Sarah G Cant, University of Plymouth. Email: sarah.cant@plymouth.ac.uk; *Creative togetherness: passions and spaces in improvisation*

Improvisation 'is a way of working spontaneously in response to whatever is happening? essentially the end point is unknown until it arrives' (Tufnell and Crickmay, 2004:289). This paper draws together creative cultural geographies, geographical knowledges of practice and performance, and participation in dance and experimental theatre to examine improvisation as a specific mode of creative practice. 'Working with attention to the moment by moment emergence of what is coming to form' (ibid.), improvisation draws attention to the multiple possibilities for action, space and response, from which many alternative choices may be made or intuitions revealed, instead of fixing upon a preconceived outcome. Improvisation permits the unexpected, playfulness and passions, revealing wider social and spatial impacts for improvisation as a creative practice. This paper explores the potential for improvisation as a creative geography. Specifically, the paper pays attention to the heightened senses and spaces of attachment and creativity that emerge when two people work together closely within the context of improvised performance; working relationships may be caught finely within differentiated intensities and subjectivities, affecting balances of power between individuals, and subsequently the feel of the work, the creative process, performance and relationships between selves and spaces. Roles of leading, following and co-incidence are examined, addressing moments of otherness, strangeness and a politics of difference occurring/emerging between two people. Attention to gendered subjectivities and balances of power, present through unspoken dialogues, suggest an ethics of the passions may be present within improvised creative practices.

Since the North American Free-Trade Agreement (NAFTA) in 1994, it has been clear that NAFTA has had profound effect on US economies as well as US-Mexican environment. South Texas, due to its geographic characteristics sharing the border between US and Mexico, is one of the most highly impacted areas. This study investigates the land use/land cover changes of Weslaco, TX from 1996 to 2004 as a preliminary study. Weslaco, TX is a small border city with population of 26,935 in 2000 located at 15 miles Southeast of McAllen. Digital Ortho Quarter Quads (DOQQ) images are utilized for Land-use/Land-cover

classification. This study identifies the details of land-use/land-cover change on Commercial/industrial, water body, residential, agriculture and vegetation for 8 years during post-NAFTA period. The result indicates fast urbanization in the city and the vicinity showing around 25~30 % of land use increase in commercial and residential, and mainly the agricultural field is decreased due to urbanization showing around 40 % of decrease.

Lina Cao, University of Utah. Email: lina.cao@geog.utah.edu; Tom Cova, University of Utah. Email: cova@geog.utah.edu; *Hantavirus Dynamics in Deer Mice Population Using a Spatially-explicit Agent-based Model*

Hantavirus pulmonary syndrome (HPS) is characterized by acute respiratory distress with a high mortality rate (>50%). HPS was traced to the infection with Sin Nombre Virus (SNV), a strain of hantavirus of which deer mice are the primary reservoir. So far there is no vaccine or effective drug to prevent or treat the HPS. Therefore, there is a need to understand the nature of the virus host, its temporal and spatial dynamics, and its relation to the human population in order to predict the risk of the disease and design effective prevention policies. In recent years, agent-based modeling (ABM) has emerged as a very promising bottom-up modeling approach to simulate individual behaviors and their interactions at a micro-level which results in emergent phenomena at a macro-level. It provides virtual laboratories to test various hypotheses as well as to experiment with a range of 'what-if?' scenarios. A spatially explicit ABM was developed to simulate deer mice movement, their interactions and diseases transmission in habitats with various levels of disturbance. This research helps us understand the important ecological parameters of hantavirus infections in deer mouse population, and expand our understanding of the risk factors of developing HPS in humans as a consequence of SNV infection.

Katherine F Card, School of Geography and Earth Sciences, McMaster University. Email: cardkf@mcmaster.ca; Susan Vajoczki, School of Geography and Earth Sciences, McMaster University. Email: vajoczki@mcmaster.ca; *A Comparison of Marine Turtle Conservation: Caribbean and Pacific Coasts, Costa Rica*

The aim of this research was to compare marine turtle conservation methods on the Caribbean and Pacific coasts of Costa Rica at three sites: the Caribbean Conservation Corporation site at Tortuguero and the Canadian Organization for Tropical Education and Rainforest Conservation site at Cano Palmo, and the Ostional Wildlife Refuge. These sites were selected to represent diverse approaches in the conservation movement within Costa Rica, including American, Canadian and Costa Rican. During the early 1900s many marine turtle populations around the world were near extinction due to hunting. Recently factors including nesting beach destruction due to anthropogenic use, incidental capture in fisheries, fishing practices degrading turtle feeding grounds, as well as pollution, have all been linked to declines in marine turtle populations. Marine turtles fill unique ecological roles in the ecosystems of both sea grass and coral reefs. Their absence from these ecosystems destabilizes the food web and has negative effects. Currently, all species of marine turtle are endangered, and three are considered critically endangered. Data from expert and stakeholder interviews conducted during November 2006 - January 2007 are used to compare conservation strategies employed at the three turtle nesting sites. This research enhances current understanding about marine turtle conservation methods. It describes the Costa Rican situation but has wider applicability.

Keywords: marine turtles, conservation, Costa Rica, endangered species

Scott A. Carlin, C.W. Post Campus, Long Island University. Email: scott.carlin@liu.edu; *Global Climate Change: Anthropocentric Crisis, Biocentric Solutions*

Cap and trade systems to reduce greenhouse gas emissions are a defining feature of the Kyoto Protocol and likely to be a centerpiece of upcoming U.S. legislation. Measures of global carbon dioxide in the atmosphere have risen from pre-industrial levels of 280 ppm to over 380 ppm today. If global cap and trade systems are implemented aggressively those rates will still rise to 450 ppm by 2100 using optimistic assumptions, which will significantly alter global climate systems. Other IPCC scenarios call for carbon dioxide levels of 700 or even 900 ppm. Various social movements argue against these IPCC formulations. They don't dispute the science but its cultural context. Rather than trying to sustain a global culture premised on consuming the earth's resources, biocentrists argue that we need to reorient our lives toward minimizing resource consumption and

promoting ecological sustainability. This paper will analyze the resurgence of biocentrism in recent years, examine its relevance to global warming debates, and address the question: can biocentrism offer a meaningful path forward?

Keywords: climate change, biocentrism, political geography

Jean Connolly Carmalt, University of Washington. Email: jcarmalt@u.washington.edu; *Ethics before profit: Using geography and human rights to promote social justice*

Unlike other areas of law, human rights law is fundamentally dynamic and open to input from a large variety of actors, including scholars. As such, it offers a powerful framework within which to advance a geographically informed alternative to neoliberal policies. Human rights push the boundaries of neoliberalism by legally requiring ethical considerations - such as having enough food to eat, adequate shelter, and affordable health services ? to trump any "right" to private property or profit. Particularly in the area of economic and social rights, geographic insights are invaluable. By approaching rights like food, health, housing, and work through a systemic, historically informed analysis that focuses on spatial relationships, geographers offer an effective way to translate universal norms into locally relevant standards.

Keywords: human rights, social justice, ethics

Eleanor J Carn, Royal Holloway & Bedford New. Email: e.carn@rhul.ac.uk; *The Creative Passion of the DJ*

The purpose of this paper is to explore and argue the ways in which 'DJing' is both creative and passionate. For this research 'DJ' is the term used to define those whose role it is to play, mix and manipulate pre-recorded musical tracks to constitute the soundscapes of the night-time cultural economy. Combining pre-recorded tracks and live elements to create a soundtrack to a night, building the music up and taking it down to entertain and shape the experience of those on the dance floor, is an art form. Moreover, not only is DJ-ing centrally involved in the production of the nightclub as a space for people to engage passionately with music, it also exemplifies what Amin and Thrift (2004) term a wider cultural economy of passions. Whilst structured through the markets of the night-time economy, DJ's livelihoods and labour processes are fundamentally passionate affairs. This paper aims to contribute to the teasing out of these relations between labour and love, product and passion, commodification and creativity, ambition and affect. Empirically, the paper will draw on my on-going doctoral research on the livelihoods, practices, socialities and biographies of DJs in the local 'scene' of a town in the South East of England.

Guigar Caroline, Temple University. Email: makati@temple.edu; *Finding Time: How Women Integrate Health ICTs into Their Daily Routines*

Abstract: It is widely regarded that women use computer technology less than their male counterparts. Yet little is known about how economically disadvantaged, minority women and mothers use information and communication technologies (ICTs) on a daily basis. The assumption that women are less interested in technology can have severe repercussions in how telemedicine systems targeted to women are designed and implemented. This paper examines how 32 women in metro Philadelphia used an Internet-based telemedicine system to manage their Gestational Diabetes from home during their pregnancies. Most of the women complied with the use of the system by sending their health data despite enormous challenges in their daily lives ? including poverty, significant health problems, full-time employment and the daily demands of raising additional children. The African-American women in the study were more likely to be high and medium compliers. Additionally women with little-or-no income found ways to comply ? and were often high compliers in the study. Finally, women with multiple children at home were more likely to be high compliers compared to women who had no children at home. The result of this study offers a radically different picture of technology compliance among women. It demands that we redefine compliance among poor women. Ultimately, women do comply but their rate of compliance looks different due to their circumstances. This

study also raises questions around the implications for vulnerable populations who access and use ICTs in connection with their daily health care.

Richard Carp, 90029940, Appalachian State University. Email: carprm@appstate.edu; *Spatial Cosmologies Embedded in Scientific Language: Ecology vs. Environment*

The metaphors and images we use to imagine the world carry meaning far beyond their specific arena of application. For example, "ecology" and "environment" embody divergent and incompatible spatialities that correspond to equally divergent and incompatible cosmologies, each with a distinct anthropology (understanding of the human). "Environment" is structured by the dynamic of center and periphery: something (the center) is surrounded by "its" environment. "Ecology" is structured by the dynamic of processual relationality: elements participate in one another and none is central. The anthropology of environment is humanistic: the human is at the center. The anthropology of ecology is participatory: the human is one element in a dynamic pattern of relationship. Thus environment and ecology participate in incompatible cosmologies, with incompatible spatialities. "Environment," considered in its full symbolic dimensions, is inimical to "ecology," similarly considered. Because of their cosmological import, both environment and ecology must be understood as religious metaphors, carrying fundamental messages about ontology and anthropology. The struggle between these two cosmologies is of some importance today. Not only ecological sciences, but also new models from physics, suggest that the relational spatiality of the ecology cosmology is more nearly accurate, while discourses in and about sustainability suggest that ecological degradation cannot be reversed or even halted without decentering the human in relation to the rest of the community of beings.

John Carr, J.D., Ph.C., University of Washington. Email: carrj@u.washington.edu; *"Skateopia Now!" or Exclusion from the City?: Discipline and domestication in Seattle's skateparks*

In U.S. cities, young people have encountered a variety of exclusionary and disciplinary responses to their use of public space. This paper discusses the costs that have accompanied political efforts to claim a place in the city for a particularly problematic group - namely urban skateboarders ? in Seattle, Washington. While public groups of young people have long been associated with disorder, the mobility and visibility of urban skateboarders marks them as a particularly disruptive population. Seattle is currently attempting to address the challenge posed by urban skateboarders through the relatively novel strategy of creating public skateparks. In so doing, however, the City has effectively opened a much broader debate about Seattle's young people and public spaces. On one hand, by creating skate parks, the state seeks to effectively contain, discipline, and ultimately domesticate skateboarders. At the same time these aims have been complicated by the efforts of agents to mobilize (or oppose) the effort to build skateparks as a means of furthering their own vision of who should be included and excluded from the city's public spaces, and under what terms. These competing visions have transformed relatively banal issues of skatepark construction into powerfully contentious occasions to revisit longstanding political struggles over the racial, economic, cultural, and demographic complexion of Seattle's neighborhoods. Accordingly, this paper seeks to interrogate the extent to which skateboarders' efforts to claim a space in the city come at the cost of increasing surveillance and discipline.

Gian-Carlo Carra, University of Calgary. Email: sixtynewcrew@shaw.ca; *The Affordable Housing - Affordable Living Gap: Historic, Current, and Proposed Interventions along Calgary's East Corridor*

The success of affordable housing is either dependent on or augmented by its transit-supported, pedestrian accessibility to jobs and essential services. Urban spatial forms that are oriented towards walkability, are situated along extensive public transit systems, and offer a mix of land-uses (urban environments), provide an affordable living arrangement ideal for the location of affordable housing. Such environments, however, represent a small portion of the land inventory and market in North American cities. Most cities today are characterized by expansive, private, and low-density automobile-dependent postwar urban spatial forms (suburban or sprawl environments). Moreover, the affordability of urban environments that are transit-oriented and accessible is increasingly challenged by gentrification processes that raise land values, impact the arrangement and types of social services, and can exclude populations that most need access to public space and public transit. This process is creating a gap between affordable housing and affordable living. As a boom city struggling to address disconnects between sustainable development policy objectives and path-dependent practice, Calgary's socio-economically, ethnically, and spatially diverse East Corridor illustrates the affordable housing - affordable living gap. The East Corridor, historically devalued by public housing projects, is now poised to experience gentrification. The City of Calgary, unsupported by higher levels of government, is currently working with NGOs to 'solve' the affordable housing crisis while the private sector is pursuing its own interventions. Meanwhile, urban social movements, supported by local academics, are pursuing alternative approaches focused on affordable living as opposed to the traditionally narrow focus on affordable housing.

Keywords: affordable housing, affordable living, urban spatial form, gentrification

Margaret Carrel, University of North Carolina - Chapel Hill. Email: mcarrel@email.unc.edu; *Flood control as a risk factor for cholera in Matlab, Bangladesh*

Does flood protection actually increase risk of cholera in Bangladesh? This question is relevant in the context of ongoing embankment construction by the government of Bangladesh, but is one that has not been examined in-depth until this point. Using a twenty-year dataset collected from 142 villages in Matlab, Bangladesh, a case-control study was implemented to examine whether spatial patterns of cholera incidence had shifted since flood control was introduced to half of the study area. Demographic and health information for cases and controls were analyzed using geographically weighted regression and GIS. Initial findings suggest that residing in a flood protected area is a risk factor for cholera infection.

James G Carrier, PhD, Oxford Brookes University. Email: ; Andrew Garner, PhD, Oxford Brookes University and DSTL. Email: agarner@bulldoghome.com; *Neoliberal nature conservation: rules of engagement and environmental protection in Jamaica*

Attempts to create greater justice in environmental conservation often call for the engaging of local populations of resource users in the planning and operation of management systems. While such calls are laudable, identifying and engaging with these populations can be difficult in ways that are not always apparent to planners and management bodies, and can end up working to the disadvantage of those populations. This paper describes these difficulties in terms of the coastal waters in Jamaica, and especially Negril, the site of a national park. Here efforts have been made to engage local fishers in environmental protection but with mixed success. Cast as key stakeholders and recipients of development on the one hand and amoral destroyers of the environment on the other, fishers react by alternately playing the game or using non-compliance to protest against attempts to limit their activities. The chapter uses the construction of local stakeholders and unintended effects of attempts to generate good governance to uncover factors that shape local populations in relation to conservation efforts. In the environmental and development landscape of Negril, fishers appear as a group for whom advocacy is required, but advocacy itself carries with it assumptions about both the kind of group they are and the problems they face. The result is a construction of local fishers that works to the advantage of local elites and to the disadvantage of the people who historically have used the coastal waters.

Keywords: Jamaica, fishers, conservation, governance, politics

John C. Carroll, California State University - Fullerton. Email: jcarroll@fullerton.edu; *Filling in the Bubble: Infill Housing in Orange County, California*

The high cost of housing in Orange County, California has been an intractable problem for the past quarter century. The unprecedented increase in rental rates and home prices over the past decade reveal the persistence of the housing cost challenges. Despite leveling off, the median home price in Orange County is near \$700,000. Concurrently, the median rent asked for an apartment unit now nears \$1,200. Such market conditions impact quality of life by pushing housing demand to adjacent areas of the Inland Empire, further exacerbating traffic woes, hindering the ability of major employers in workforce recruitment, and limiting the region's competitiveness with other urban centers. The phenomenon of infill housing has received considerable attention as a possible remedy to escalating home prices. Recent demographic and land use changes have generated an increase in infill housing projects in northern Orange County. There are signs that some of this activity may contribute to the affordable housing crisis rather than ease the strain. This study analyzes a comprehensive inventory of infill housing projects in the north Orange County communities of La Habra, Brea, Fullerton, Placentia, and western Yorba Linda to evaluate the scope of infill housing in the region.

Ashley Carse, University of North Carolina, Chapel Hill. Email: acarase@email.unc.edu; Flora Lu, Ph.D., University of North Carolina, Chapel Hill. Email: flora@email.unc.edu; *The Impacts of Petroleum Development on Food Sharing and Sociality among Amerindians in the Ecuadorian Amazon*

This paper discusses how petroleum extraction affects community dynamics, specifically the inter-household exchange of food among indigenous peoples of the Ecuadorian Amazon. Because of the importance of food exchange to the physical and social lives of Native Amazonians, we focus on the impact of petroleum exploration and exploitation on these patterns. Food sharing both allows groups to mitigate subsistence risk and plays an important role in expressions of sociality. We use longitudinal data collected among the Huaorani of the Shripuno River to explore how households adapt to changes incurred through interaction with oil companies. Using ethnographic observations, interviews, and quantitative household economic diaries, we provide a much-needed look of how this pervasive form of large-scale resource extraction in the Amazon affects people's daily lives and relationships. When seismic exploration was occurring in 1997, significant changes in dietary intake and inter-household resource transfers occurred, with a shift away from food from the forest and rivers and the oil company usurping the food provisioning roles of families and neighbors. However, a return visit in 2001 found the absence of oil activity around the villages, and a return to subsistence activities and sharing. These findings illustrate the resilience of indigenous communities who possess an intact resource base which enables them to remain self-sufficient, but also the potential disruptiveness of petroleum extraction. Our data show that sharing between Huaorani households is tied to subsistence risk mitigation, and thus oil company policies can undermine normal productive activities and also affect sociality.

Audra J Carson, Undergraduate, South Dakota State University. Email: ajoelle4@hotmail.com; *Transforming the Corn Belt: A Marshall County, South Dakota Case Study*

The U.S. may need an additional five million acres of corn for ethanol, livestock feed, and human consumption by 2010. Farmers in Marshall County, South Dakota historically grew small grains, but since 1984 they have shifted to corn and soybeans, and the county is now part of the Corn Belt. While the number of acres planted to wheat declined from 108,000 acres to 21,000 acres, corn acreage doubled from 48,000 to 92,000 acres, and soybeans increased from 1,700 acres to 99,000 acres to become the most important crop in the county. This research shows the impact of increased corn and soybean production at multiple scales from the individual farm, to Marshall County, and the wider Northern Glaciated Plains Ecoregion of South Dakota. The transformation has been driven by high soybean prices, corn subsidies, genetically modified crops, and new varieties of corn that are productive in cool climates. Recently, high-energy prices have stimulated new demands for corn-based ethanol and biodiesel from soybeans. Results include fewer acres devoted to small grains, increased use of no-till farming techniques, and the conversion of natural grasslands and pastures to cropland.

Keywords: land change, Corn Belt, soybeans, biofuel, genetically modified crops

Barb'ra-Anne Carter, University of Oklahoma. Email: akaauntiebop@yahoo.com; *Romancing Cannibalism: An examination of anthropophagi in the geographic imagination.*

Early travelers, explorers, and missionaries have often shaped the role of the Other into cannibals. Cannibalism is not only used to describe man-eaters but as a function of otherness. They have often been portrayed as a behavioral modification incentive for children through nursery rhymes and folktales. Religious zealots also utilized the ideal of cannibalism in attempts to convert The Other to Christianity. Their tales of other cultures from abroad spurred social groups into funding programs to send missionaries into the deep equatorial jungles in search of "cannibals" and "savages." This paper will explore the role of humans as products and producers in literature. What man-eating societies are products of the imagination and which were real. What societies throughout history have participated in cannibalism and why. It will also examine the uses of anthropophagi as it was employed throughout history for medicinal purposes. Will the medical techniques humans engage in at the dawn of the twenty-first century, such as organ harvesting and stem cell research be dismissed as crude and sophomoric in the twenty-fifth? This paper will also address the consumption of humans in ritual, real and imagined

Keywords: cannibalism, medical geography

Catherine Carter, University of Maryland. Email: cclearter@umd.edu; Martha Geores, University of Maryland. Email: mgeores@geog.umd.edu; *Heaven on Earth: The Shakers and their Maps*

A map is more than a locational reference for a place or space. It also represents the social and cultural aspects of a place or space and/or the attitude of the cartographer toward the particular place, its inhabitants, and its social/cultural situation. Users view maps through ideological filters so that the space seen on the map is interpreted instead of being literally comprehended. The result of the combination of abstraction and interpretation is conceived space as Henri Lefebvre defined it. Conceived space is clearly evident in the maps drawn by the 19th century religious sect known as the Shakers. As the Shakers shared their maps among the various Shaker villages a community was established that extended beyond the borders of the individual villages. This research examines the Shaker maps from both theological and cartographical points of view, considers the nature of the space produced by the maps, and shows that the resulting space is theological space.

Keywords: religion, historical, cartography

Eric D Carter, Millersville University of Pennsylvania. Email: Eric.Carter@Millersville.edu; *Bridges are the new dams: Privatizing infrastructure development, integrating regional economies*

Under the neoliberal free market paradigm, remote and underdeveloped areas continue to be integrated into the global economy. Newer approaches to infrastructure development de-emphasize the direct role of states in investment and planning, and in conjunction with this trend, create new scales of development. This paper reviews worldwide trends in a reorientation of "big" development, including: the increasing role of private-public partnerships and direct investments of foreign capital (for example, in the construction of major bridges and toll highways); the growing importance of trans-national, regional transportation corridors; the "outward" orientation of development, wherein states focus on creating linkages to global markets for existing products/sectors, rather than subsidizing the development of non-competitive industries or regions; the emergence of new development schemes within the "sustainable development" paradigm, which requires states, banks, investors, and entrepreneurs to consider environmental impacts of new development (even as integration of remote regions inevitably creates conditions for economic exploitation of natural resources). To illustrate these trends, the paper will develop two case studies: first, a critical examination of the Inter-American Development Bank's Regional Infrastructure in South America Initiative; and second, a related discussion of a recent wave of planned or completed highway bridges (in Argentina, Sweden-Denmark, Italy, and China), intended to serve multiple purposes: as physical linkages between long-separated regions; as key segments of international transportation corridors; as circuits of commerce; as absorbers of excess capacity in the global construction and engineering industry; and as potent symbols of the assumed fluidity and interconnectedness of the globalized economy.

Keywords: development, globalization, neoliberalism, transportation

Gregory A. Carter, Ph.D., The University of Southern Mississippi. Email: greg.carter@usm.edu; Kelly L. Lucas, The University of Southern Mississippi. Email: alan.criss@usm.edu; *Impact of Hurricane Katrina on Vegetation of the Mississippi Sound Barrier Islands*

The Mississippi Sound barrier islands, which from west-to-east include Cat,

West Ship, East Ship, Horn, Petit Bois and Dauphin, insulate the mainland coast, 13-20 km to the north, from the higher wave energies of the open Gulf of Mexico. As Hurricane Katrina passed due west of the islands along its northerly path (lat. 30.2 deg. N., long. 89.6 deg. W.), minimum distance from the eye of the storm to island center ranged from 48 km (Cat) to 133 km (Dauphin). Consequently, the westernmost islands were subjected to greater wind speed, storm tide depth and wave energy. Approximate ranges in maximum sustained wind speed and tide depth were 200 to 140 km/h and 7 to 2 m for Cat and Dauphin, respectively. Satellite image data acquired for each island before and one week after Katrina were compared to determine immediate storm impact on total vegetative cover. Analyses based on the normalized difference vegetation index (NDVI) indicated losses in vegetative cover of 0, 6, 2, 114, 46 and 39 ha (0, 8, 17, 16, 27 and 51 percent of pre-storm cover) on Cat, West Ship, East Ship, Horn, Petit Bois and West Dauphin, respectively. Thus, percentage loss in vegetative cover increased with distance from storm center, contrary to expected results. This was likely a consequence of the greater tidal depths and thus more extensive island submersion nearer the storm center which apparently reduced the scouring of vegetation by waves and currents during the period of maximum storm energy.

Norman Carter, San Diego State University. Email: ncarter@mail.sdsu.edu; *Lofts vs. tents: the contested residential space of downtown Los Angeles.*

This study examines contested residential space in downtown Los Angeles. The renovation and conversion of dysfunctional older office buildings into residential lofts, apartments and condominiums in the core area of the central city has attracted thousands of new residents in recent years. New units under construction and in the planning and permitting stages indicate that the residential population will surge in the next few years. These new tenants are competing for space long occupied by the homeless population of Skid Row. The abundance of social service agencies in the vicinity supporting the indigents makes their presence more durable and sustainable for the foreseeable future. The current situation is an uneasy stasis with each group employing powerful advocates to defend their rights and access to public space. Preliminary analysis of this conflict reveals that neither the loft dwellers nor the tent campers have a decisive advantage over the other leaving a continuing struggle for the available space in the downtown area.

Keywords: Los Angeles, homeless, lofts, Skid Row

Perry L. Carter, Texas Tech University. Email: perry.carter@ttu.edu; *Variable Fetishes: Race and Explanation in Scientific Geography*

The term scientific racism is usually associated in the popular imagination with craniometry and eugenics and less so, if at all, with linear models and spatial analytical techniques. Yet, until recently, the unreflexive application of quantitative methods has been the primary means through which race in the United States has been examined. More perniciously, race has been used as an explanatory variable in quantitative models to explain crime, drug use, delinquency, urban blight, low test scores, and a variety of other deviant behaviors and social ills. Racial explanatory variable - binary variables (e.g. 1=White, 0=Black) and areal composition variables (e.g. percentage of Mexican-Americans residing in a census tract) - use in many quantitative studies amounts to little more than the academic equivalent of racial profiling. These studies assume that race is an essential quality that individuals possess. This paper reviews scientific geography's use of racial variables. It takes previous works in this field as cases and uses them as tools of instruction and construction in the building of a critical scientific geography.

Keywords: quantitative geography, critical geography, race

Sean Carter, University of Exeter. Email: s.carter@exeter.ac.uk; *Diasporic Reproduction of the Nation*

This paper seeks to explore a range of ways in which 'the nation' comes to be reproduced and re-articulated within diasporic communities. In particular it traces a range of practices undertaken by those within the Croatian diaspora in the United States that reproduce a sense of the nation of Croatia as a network, capable of operating within, through and beyond state borders. Amongst a range of issues, this paper is particularly concerned with theoretical issues relating to diaspora and nation, including: the role of elites within diaspora communities; the relationship between the homeland state and the diaspora community; cultural forms of national reproduction in the diaspora; and the rise of forms of national reproduction that cannot be tied down either within the diaspora, or the homeland (particularly through digital forms of community).

Keywords: Diaspora, Nationalism, Croatia

Thomas Sydney Carter, PhD, University of Winnipeg. Email: t.carter@uwinnipeg.ca; *Economic Restructuring in Winnipeg: Attracting Creative Workers and Capturing Investment in New Growth Sectors*

According to Richard Florida one of the keys to economic growth in cities is the ability to attract creative workers and to translate this into creative economic outcomes in the form of new investment and development ideas, new high tech businesses and regional growth. An analysis of selected indicators suggests Winnipeg, a mid-sized Canadian city, located in a largely agricultural area has struggled to capture investment in the new growth sectors and attract a "creative class." Further analysis examines the outcomes of these trends: the effects on the socio-economic characteristics of the population; the structure of the labour force; effects on urban development, central business district and inner city decline and revitalization; and, Winnipeg's comparative position in Canada's urban system in general. The analysis suggests that failure to capitalize on new growth sectors during economic re-structuring can have both positive and negative outcomes for mid sized cities and their populations.

Keywords: economic restructuring, new economy, creative class, mid sized cities

Richard Carter-White, . Email: rec205@exeter.ac.uk; *Writing the unrepresentable with the non-representing: Auschwitz and photography*

According to Maurice Blanchot, the true writing of the disaster would be one which erases itself, which indicates an excess beyond the realm of communication and meaning: 'the disaster de-scribes' (1995). This assertion chimes with the testimony of survivors such as Primo Levi and Elie Wiesel, and the analysis of Saul Friedlander, who claim that attempts to render Auschwitz as known and meaningful through writing which aims to identify with the event risks its normalisation and potential forgetting. For Robert Eaglestone (2004), an ethical form of writing on the Holocaust would be one that establishes a barrier against understanding and meaning: such a form makes the event present, and yet delineates an absence, in meaning and representation, that defers identification and closure on the part of the audience. This paper discusses photography as constituting a form of Blanchot's disastrous writing. As Janina Struk (2004) has documented, photography has dominated global perceptions of the Holocaust, from its use as wartime propaganda through to its shaping of and deployment within discourses, museums and tours today. While such individual photographs, and their translation into subsequent discourses and practices, present the Holocaust for interpretation and understanding, the paper argues that the medium of photography simultaneously undermines and contradicts any such movement towards identification and meaning. Photography is presented as a medium of irreducible difference and otherness, the evidential capacities of which are located less in its tendency towards mimetic representation and meaning-making than in the rupture in representation that Auschwitz created, and photography enacts.

Keywords: Auschwitz, photography, writing, representation, difference

Carolyn L. Cartier, University of Southern California. Email: cartier@usc.edu; *Regimes of Production/Consumption in Urban China: Diamonds and Disneyland*

The 'Consumer Revolution' in China entered the current stage of conspicuous consumption after 1992, when the state deepened growth-oriented reform and its dependence on service sector expansion. In the process, individual consumption became justified as a pillar of domestic economic development. This examination of consumption in urban China focuses on contemporary leisure luxury consumption and follows three lines of inquiry. First, it makes an argument for conceptualizing consumption in relation to production and locates a regional regime in formation between PRC coastal cities and Hong Kong, the latter as China's main center of "learn to/from" production/consumption, and as leading place of internationalized citizen-consumer subject formation with Chinese characteristics. Next, the paper examines the cultural economy of consumption through elements of Chinese feminist theory to explain contrasts between 1980s PRC state ideology that reinscribed women's roles within the household and contemporary alternatives in other sites including the elite professional marketplace. Then the paper examines leading objects of urban consumer desire, their sites of production/consumption and their gendered characteristics through the highly popularized market for diamonds, its disassociation from heteronormative gift-giving and its association with leisure sites, including Disneyland.

Keywords: Economic Consumption Urban China

Jenny Carton, University of Sheffield. Email: J.Carton@sheffield.ac.uk; *Writing the self after non-representational theory*

This paper seeks to contribute to 'cultural geographies of the self', exploring the place of writing in theoretical, literary and corporeal registers. It seeks to reconceive of a writing self that doesn't privilege the subject as an a priori precursor for expression, but rather as that which emerges from and with the act of writing itself. Following the insights of Maurice Blanchot and

Emmanuel Levinas, I argue that the act of literary writing performs a profound moment of (both spatial and temporal) separation, which approaches the philosophical conception of an original and unknowable 'other'. Accordingly, the writing subject can now be thought of as responsive rather than simply reactive; as relational and contingent rather than autonomous or creative. Indeed, the paper argues that by recognising the writing self in this way we can finally overcome those normative claims to introspection and self-expression, and show the writing-self is performatively ethical in its orientation towards the 'other'.

Keywords: writing, subjectivity, practice

William Cartwright, PhD, EdD, RMIT University. Email: william.cartwright@rmit.edu.au; *Atlas2point0: Constructing an Atlas Using Social Software*

Atlas2point0 is the name given to a project that is exploring the potential of using social software to provide the means whereby users construct their own atlas. The potential offered by Web 2.0 for collaboration between users and cartographers to compose atlases provided the initiative for this project. It was conducted by a research and development consortium that included cartographers and communication scientists. Whilst the results reported in the paper are preliminary and not tested, the authors believe that it is important to bring their initial findings to fora for discussion, dissection and debate. This paper provides a background to the development of Atlas2point0 and the thinking behind how it might 'work'. It then provides information about the theoretical development of the concept. Then it illustrates how the prototype was developed. Finally it poses questions that the research team believes need to be addressed in the quest to elicit input from colleagues at the meeting.

Keywords: Cartography, Atlas, Web 2.0

Caverlee Cary, GIS Center, University of California, Berkeley. Email: ccary@berkeley.edu; *Visualizing the Buddhist Realm*

The sacred geographies of Buddhism have come down to us in various ways. There are maps that make visible the cosmos and the complexities of its resident deities. There are maps that guide the travels of pilgrims through geographic features marked by the divine. And as texts trace legitimizing lineages of people, places, and Buddhist images, so too maps embed landscapes with meaning through space and time, making manifest the past in the present. "The Map and the World: Visions of the Buddhist Universe" is an international collaborative project bringing together scholars from a range of countries around the theme of Buddhist visualizations of space. This presentation presents the work of the University of California, Berkeley Geographic Information Science Center in support of the project, and presents examples of maps expressive of the Buddhist tradition.

Keywords: historic maps

Irene Casas, SUNY at Buffalo. Email: icasas@buffalo.edu; *Information and Communication Technologies Use in Route Planning in Local Unfamiliar Environments*

Information and communication technologies (ICT), in particular navigation aid devices such as the Internet, in-vehicle navigation systems, cell phones, On-Star, and Global Positioning Systems (GPS), have changed the way people go about planning their routes when making a trip to unfamiliar locations. Behavioral changes introduced by the use of these technologies need to be explored since they not only affect the individuals' particular travel plans but also have implications in their spatial learning, map usage, and increase in familiarity abilities, and their inclination to be more daring in unfamiliar environments. For individuals who before the technology depended on others for navigational purposes, had no skills in map reading, or were afraid to get lost in unknown places, the use of the technology and what it can do for them introduces new challenges and opportunities. This research examines the use of the aforementioned technologies in route planning in local unfamiliar environments by means of a survey. Local is defined as the place where an individual makes his/her home. The main objective is to test the following hypotheses. People who use navigation aid devices are: (1) less afraid to venture themselves in unfamiliar locations, (2) have developed a stronger ability to read maps, and (3) get lost less frequently. Based on the results, potential policy implications are discussed and recommendations are made into what are the technologies preferred so that they can be exploited by policy makers with the purpose of bettering the operation of the transport system.

Keywords: ICT, route planning, local environments

Mark E Casey, Newcastle University. Email: M.E.Casey@ncl.ac.uk; *Tourist Gay(ze) or Transnational Sex: Australian Gay Men's Holiday Desires*

Travel is theorised as an increasingly important facet for contemporary gay male identity development, echoing earlier claims that identities have become 'more tightly drawn to particular lifestyles'. For Cox, (2002:152) travel should be viewed as a serious business that may challenge and change identities and

sexual cultures at home. Rather than the voyeurism associated with gazing at an otherness as positioned by John Urry, (2002), the gay male traveller is likely to search out key gay sites, to be presented with an image of oneself, or a self one wishes to become. Through drawing on findings from the ESRC funded research project: Tourist Gay(ze) or Transnational Sex: Australian Gay Men's Holiday Desires, undertaken in Spring 2005 with gay men living within the Australian cities of Melbourne and Sydney, the paper will ask can we now move beyond understanding tourist sites and spaces as hetero and/or homo in their appeal and in turn move beyond a hetero/homo tourist binary? Or are gay tourists likely to be searching for a shared culture, identity and pleasures that are used to build up an image of a world not defined through heteronormative imperatives? Is it then possible to theorise and address (sexual) identities and sexual practices through their transnationality and if so how does this challenge the (hetero)normalizing of 'other' sexualities within Australia?

Keywords: Travel, gay males, Australia, sex, sexual identities

Jennifer R. Cash, Ph.D. (Anthropology), University of Pittsburgh. Email: jrcash@pitt.edu; *The Communists Cannot Take Us to Europe: Negotiating Moldova's Place in the Post-Socialist World*

This paper examines the idea of "Europe" as it used in political and social debates in the Republic of Moldova. In 2005, Moldova's communist-led government announced the intention to join the European Union, reversing the position officially held since 2001, which oriented the country toward Russia. As evident in the title quote - "the Communists cannot take us to Europe" ? many individuals now find themselves in the strange position of being ideologically anti-Communist and pro-European, at a moment when Communists themselves have become pro-European. In other words, Moldova's internal social and political geography is shifting in response to the increased proximity and power of the European Union. Far from being a new phenomenon, however, my research with intellectuals in Moldova reveals that their relationship with "Europe" has been long-standing, undergoing several shifts in the past century, as the "European" affinity for various ideologies (specifically nationalism, socialism, and communism) has been alternately recognized and disavowed. This paper therefore explores these shifts and asks about the temporal, rather than spatial, dimensions of European identity in Eastern Europe. By interrogating local memories, legacies, and nostalgia, it becomes clear that in the "East" it is important to ask not only "where is Europe," but also "when is Europe"?

Keywords: Europe, Moldova, imagined geographies, political identity

Lin Cassidy, University Of Florida. Email: cassidy@ufl.edu; *Patterns and Processes of LULC Diversity in Sisaket, Thailand, and Ordor Mean Chey, Cambodia*

Land-use Land-cover (LULC) diversity reflects the dynamic complexity of the human-dominated landscape. This research tests whether the concept of LULC diversity has the potential to allow researchers to find commonalities across a range of different social-ecological systems. We direct known drivers of LULC change to the consideration of change in LULC diversity instead of in actual LULC types and compare the same processes on the adjacent, but different landscapes of Sisaket province, Thailand, and Ordor Mean Chey province, Cambodia. We assess whether there are general trends in the response patterns of LULC diversity, and hypothesize that intermediate levels of LULC diversity are more likely to persist over time, and that changes in LULC diversity represent a change in the resilience of the social-ecological system.

Keywords: Land-use Land-cover, Theory, Complex Adaptive Systems, Diversity, Socio-ecological Systems, Thailand, Cambodia

Chris N. Castagna, University of Hawaii at Manoa. Email: castagna@hawaii.edu; *Maori Places and the Changing Forests*

In response to shortages of native timber by the beginning of the twentieth century the New Zealand government began to develop vast planted monoculture forests of exotic conifers. The new forestry, based on principles of scientific management, also incorporated European forms of understanding and using space, and was designed to efficiently produce usable timber products. Much of the land that has been planted in exotic trees belongs to Maori and Maori constitute many of the people involved in the new forestry. Maori have long maintained a deep and meaningful connection with the native forests of Aotearoa, exercised as part of their kaitiakitanga (guardianship). Most forestry histories focus on anthropocentric uses of forests rather than situating forests within ecological relations and fail to question social constructions of nature. This paper contends that Indigenous peoples, such as Maori, actively shape their worlds in connection with larger global processes, and that it is too simplistic to assume that colonialism, as well as globalization, are simply the extension of Western capitalism at the expense of local economies and knowledge systems. With the recognition that 'culture' is not monolithic this paper draw attention to the some of the diversity of relationships that Maori experience with their lands and forests and will seek to address the following questions: How have the logic of

scientific forestry and the physical introduction of exotic timber species into Aotearoa/New Zealand been negotiated by Maori? How has this contributed to a changing sense of place for Maori?

Keywords: indigenous, place, New Zealand

Rose Tina Catania, Dartmouth College. Email: catania@dartmouth.edu; When "Becoming White" means performing "Indianness": re-forming racial identities on the Mexico-United States border

This ethnography explores racial performance in Laredo Texas. I specifically delve into the ways individuals enact and perform race in the context of an annual cultural event, Washington's Birthday Celebration (WBC). The celebration's major events — pageants featuring embodiments of Pocahontas, Native Americans, and Martha and George Washington— intermix with stereotypical symbols of Latino-ness through other displays and parades. These events serve to reinscribe borders between class, race, gender, and nation on the location of the body. I become particularly interested in the process by which these racial discourses shape and re-imagine whiteness in a Latino context, specifically through historical re-enactments and the appropriation and othering of a Native American identity. While wealthy whites and Latinas reinscribe their whiteness by personifying Martha Washington and colonial ideals in one pageant, a parallel event features another group of Latinas who aspire toward whiteness through theatrical representations of "Indianness." The myriad cultural performances that comprise the WBC create competing conceptions of Latino/a and "Indian" racialization, with the goal of claiming a valued white identity.

John Paul Cervas Catungal, BA Hons, MA (Candidate), University of Toronto. Email: catungalj@geog.utoronto.ca; The Rebirth of Privilege? Creative City Discourse, the Dangers of Renaissance Language and the Right to the City

Why is the language of "renaissance" used in much creativity-led urban regeneration? I ask this in the context of the recent adoption of Richard Florida's "creative city" discourse by the City of Toronto and a local non-retail business improvement area (BIA). I examine two documents (Toronto's Culture Plan for the Creative City and the Liberty Village BIA's Strategic Plan) and how they are implemented in order to unearth how the language of renaissance is embedded in creative city discourses and what its impacts are on urban governance and the built environment. I argue that though these approaches differ because they stem from different sectors - one public, the other private? they are nonetheless intimately linked by a commitment to a neoliberal urbanism that places focus on arts, culture and creative enterprise as the most important tools for an urban renaissance. The use of renaissance in creative city policy dangerously creates privileged geographies: cultural corridors and creative hubs turn into privatized centres of commerce; the priority shifts from accessibility to security and branding; and the displacement of vernacular spaces of creativity is framed as collateral damage. In creative city renaissance strategies, histories of struggle and the architectural façade become sanitized, romanticized and commodified as the stories of grandiose landscapes are continually rehearsed through constant renovation and marketing. I caution against the privileged spaces created by creativity-based strategies by invoking Henri Lefebvre's call for "the right to the city", which imagines a renaissance based not on neoliberal urbanism, but on social justice.

Keywords: creative class, culture-led regeneration, urban renaissance, business improvement, urban governance

Brian Ceh, Ph.D. Assoc. Professor, Indiana State University. Email: sceh@indstate.edu; Joseph Koroma, Indiana State University. Email: joekoroma@hotmail.com; Regional Impact of Social and Cultural Acumen on Economic Development in the US

To what extent a region's social acumen or cultural mindset affects its economic well-being is difficult to quantify. This paper investigates any such association for the US by state. Using socio-economic and technology data, it is found that social conservative states are not equally vibrant in technology production compared to socially progressive states. This is peculiar since many social conservative states are growing among the fastest in population. It is argued here that a region's cultural mindset does play some kind of role in determining its economic development. This mindset can be quantified to some extent by variables measuring human or social capital, such as investment in education, arts, public transportation, technology, or education attainment. When these variables are analyzed, sharp geographical patterns emerge that coincide with regional patterns of technology production and creativity. Socially progressive states are found to have higher levels of technology, creativity, and human or social capital. In spite of this, notable population growth in many socially conservative states is being helped by the sunbelt phenomena and the footloose nature of the new economy. Their economic and population growth

has less to do with their social acumen and more with factors beyond their control. In other words, if New York, Chicago or Boston were located in the south, Atlanta, Charlotte, Houston, Dallas, and Phoenix, to name a few, might not be as large as they are today.

Sofia Cele, Department of Human Geography. Email: sofia.cele@humangeo.su.se; In Streets, Yards and Secret Corners. Place-Interactive Methods as Means of Communicating with Children

Research that involves children and their relationships with different aspects of place bring methodological as well as theoretical difficulties. These challenges mainly refer to the complexity of experience and power relations between children and adults. The focus in this paper is an exploration of how place-interactive methods such as walks and photography provide abilities to meet these challenges. Drawing on a research project that focus on how children in Sweden and England communicate their experience of place, it is shown that when place is allowed to be an active part in the research process many difficulties can be overcome. The performative aspects of the methods make the body and its sensuous experiences a central part of the research. The active participation and involvement of children as well as the researcher make it possible to create situated knowledge that are not alienated from lived experience due to power relations and the limits of the spoken word. This has an impact on consultation practice as well as the theorising of children's geographies.

Ryan Centner, University of California, Berkeley. Email: rcentner@berkeley.edu; Redevelopmental territoriality in "post-neoliberal" Buenos Aires: Mapping the microcitizenships of megaprojects

This paper addresses the micro-political repercussions of new landscapes in a city emblematic of Latin American economic shifts during recent decades. Across social divides in Buenos Aires, I examine the complexly circumscribed forms of territorial political membership that a wide variety of local actors has co-produced in the Argentine transition from neoliberal prototype to an ostensibly "post-neoliberal" posterchild. I call these forms of belonging "microcitizenships," which have a sharply geographic dimension. Drawing on nearly two years of ethnographic fieldwork and extensive strategic interviewing with a range of stakeholders, this paper compares how unequal urban citizenship unfolds in practice - through both conflict and collusion - in three neighborhoods (Puerto Madero, La Boca, and Abasto) that have all been the site of transformative megaprojects since the early 1990s, but differ from each other in the overall economic class of their residents. I show the distinct manners in which the local state, developer interests, disparate groups of residents, and everyday users jointly accede to spatiotemporally intricate maps of legitimate belonging in these sites that were once heralded as beacons of neoliberal change but are now the focus of efforts to overcome the infamous Argentina crisis of 2001-2002. All mainstream commentary points to a spectacular recovery for the South American powerhouse, but scrutiny of these three sites shows how the territorialized remedies to neoliberalism, and particularly the strategies of the so-called "new Latin American left," can have perversely exclusionary outcomes despite their vigorously nationalist discourses of inclusion.

Keywords: citizenship, urban redevelopment, Argentina, political geography, neoliberalism, Latin American Left

Muharem Cerabregu, Univ of Prishtina. Email: zinniakelly@earthlink.net; Geographical Name Creativity Of Hawaii: An Example That Illustrates The Global Character Of Geographical Generic

Naming geographical features of Mid Pacific islands of Hawaii, represents an interesting phenomenon that shows having essential and universal importance. Considering its geographical position and notion, we get an impression that we are dealing with a very far and isolated part of the world that allures by its nature and culture. But, geographical name study of these island discover their common root and unity with global cultural heritage. However, the geographical name system of Hawaii is consistent and retains a clarity of representing geographical phenomena. Analyzing geographical names and obtained results show a striking similarity of local geographical generics with those of continental parts surrounding Pacific. A difference in use of geographical generics exists only in prevalent forms. In fact, the geographical name composition is related to a predominance of some geographical generic forms that reflects a limited flexibility of geographical generics and of geographical affix. The specifics of geographical names of Hawaii is a consequence of local volcanic landscape of islands. An observation and investigation of these features and their relation with local geographical expression that distinguish Hawaiian geographical name system that may be used as an scholarly example. Hawaiian geographical name creativity represent a cultivation throughout the centuries. the fruitfulness of this geographical name study answers some fundamental questions related to this

cultural heritage. in fact, as in the case of Hawaii , also as in the other parts of the world, the Illyrian System of Geographical name is fully applicable.

Dawna L. Cerney, PhD, Youngstown State University. Email: dlcerney@ysu.edu; David R Butler, PhD, Texas State University. Email: DB25@txstate.edu; *Illustrating Landscape Change in the Geography Classroom with Digitally Enhanced Images*

Landscape photographs are often used as a central teaching tool to illustrate geomorphic, geologic and biogeographical features to university geography students. Some features are difficult for the inexperienced student eye to recognize. This paper demonstrates how landscape features, patterns, subsequent environmental change within photographs can be extracted and enhanced using level slicing, and image registration based on spectral reflectance, for classroom instruction. These techniques are illustrated using photographs the Waterton-Glacier International Peace Park taken between 1914 and 2005. Subtle changes in canopy age structures, riverbed channel changes and past landscape disturbances and restoration become apparent with these techniques, offering application to a variety of courses.

Astrid Cerny, University of Washington. Email: acerny@u.washington.edu; *The myth of greener pastures: Kazak pastoralists in a modernizing Chinese state*

Nomadic Kazaks have herded livestock for centuries in the northern mountainous regions of Xinjiang in far western China. Increasingly, the constraints outnumber the opportunities for sustainable management of their most important resources. In addition to economic constraints such as deleterious profit/cost ratios, and social imbalances such as insufficient education, nomadic Kazaks are subject to forces beyond their immediate control. Subtle climate change is both qualitatively and quantitatively documented, while governmental efforts to stabilize grassland ecologies and develop the region contribute additional pressures. This paper evaluates the viability of nomadism in northern Xinjiang within the recent context of specific measures undertaken as part of China's "Develop the West" plan. Fencing of grasslands and settlement of nomads are promoted by current state agendas, both of which have foreseeable long-term impacts for property rights, while heralding the loss of traditional spatial patterns and foreshadowing unsustainable development.

Keywords: Xinjiang, sustainable development, ecology

This paper explores how cruise ship tourism as an increasingly integrated global industry has the potential to alter landscapes and livelihoods in coastal communities. Tourism has been promoted as a strategy for regional development in southeast Alaska, offering some relief from employment declines in the timber industry and commercial fishing. Tourism also has been endorsed at the community level by some civic leaders and pro-business proponents. In this paper we rely on ethnographic data from two study communities in coastal Alaska to discuss the costs and benefits of tourism for various stakeholders. We use a political ecology framework to show how the tourism industry generated income and employment for some resident groups, but threatened access to resources for stakeholders seeking to maintain a viable livelihood or rural lifestyle. Global cruise lines eager to meet customer demand pressured local partners to increase tour volume and diversify activities, which brought even more visitors into the wild. Conflicts intensified as tour providers expanded further into the backcountry, impacting commercial fishing, subsistence, and local recreation. These cases demonstrate how local actors sought to negotiate with regional and global institutions to regain access to resources and locally-defined spaces. We also show how local and regional development initiatives in one industry can negatively impact another industry, particularly when both depend on finite natural resources. The changes wrought by tourism have implications for resource-based livelihoods and also suggest challenges to constructions of a rural Alaska identity.

Keywords: coastal and marine tourism, community development, Alaska

Niccole Villa Cerveney, Ph.D., Mesa Community College. Email: ncerveney@mail.mc.mariacopa.edu; Ronald I. Dorn, Ph.D., Arizona State University. Email: ; Steven J. Gordon, Ph.D., United States Air Force Academy. Email: ; David S. Whitley, Ph.D., W&S Consulting. Email: ; *A new geographic triage method used to identify endangered rock art sites*

In order to identify those petroglyph and pictograph panels most susceptible to erosion, we propose a field-friendly index including various elements of

existing strategies. This Rock Art Stability Index (RASI) has five categories: "Setting the Stage"; "Preparing for Future Detachment"; "Loss of Stone Incrementally"; "Loss of Stone in Chunks"; and "Rock Coatings and Deposits". Initial testing reveals that training of individuals with no prior background in weathering can be conducted within a two-day period and yield reasonable results. RASI's use as a tool of cultural resource sustainability includes the use of a Geographic Information System to store, display and analyze rock art. After presentation of the basic RASI, those in attendance will conduct a virtual analysis of the weathering of a rock art panel.

Randall S. Cerveney, Arizona State University. Email: cerveny@asu.edu; *World Weather Extremes*

Fundamentally, while there is general agreement that a weather extremes record database (e.g., world's hottest temperature, etc.) is needed, questions remain - particularly at the global scale? as to how extensive of an extremes record database should be established, how such a database can be maintained, and, importantly, what procedures, agency and personnel can be used to adjudicate claims. The development of a climate/weather extremes archive might be best handled by one of the existing WMO's Commission for Climatology (CCI) Open Programme Area Groups (OPAGs), such as Group II (Monitoring and Analysis of Climate Variability and Change). Within OPAG II, a working structure for global monitoring activities and a working relationship with other countries involved in climate monitoring already exists, so a climate extremes focus is a natural extension of activities already underway within the WMO.

Keywords: Weather Records Extreme

Ho-Seop Cha, Department of Geography, The Ohio State University. Email: cha.25@osu.edu; *Enhancing Public Transit Service Equity in Hilliard, Ohio using multi-optimization methods*

Public transportation is not providing adequate service to those in transport-disadvantaged areas. Since public transportation receives funding from federal, state and local sources, it must strive to be equitable. To assist public transportation agencies in providing more equitable service, this research has focused on the development and application of optimization methods to provide equitable service. Previous research in Hilliard, OH identified the appropriate number and location of public transportation service stops using the location set covering problem (LSCP) and geographic information systems (GIS) approaches. To enhance the level of equity in public transit, configuration of the service stop should reflect the need for equity. This requires that the number and location of service stops are equity-oriented. The optimal selection of the number and the location of service stops in the previous research consists of two separate sets based on origin-based and destination-based approaches. However, they should be incorporated into one set to provide a practical service system to satisfy both origin- and destination-based service stops. This motivated the previous research to develop further with multi-objective optimization methods. Therefore, a particular focus in the paper is on the incorporation of two different sets of optimal solutions of transit service stops into one using multi-objective optimization methods. The ability to identify the appropriate allocation of service stops to maximize the level of equity will help local transit agencies to better prioritize and plan future services subject to greater public expectations of performance.

Keywords: equity, transport-disadvantaged, GIS, location set covering problem, multi-objective optimization

Elizabeth Chacko, The George Washington University. Email: echacko@gwu.edu; *Étrangers: Immigrants in cosmopolitan Zurich and Geneva, Switzerland*

In this paper, I examine immigration trends in Switzerland, focusing on the nature of immigration to its two major cities, Zurich and Geneva, in the light of the economic and political factors in the sending and host countries as well as Switzerland's immigration and naturalization policies. Foreigners make up about a fifth of Switzerland's population and nearly a quarter of its workforce. Foreign workers have been recruited since the late 1880s to meet the country's special or changing labor requirements. More recently, labor migrants have been joined by refugees, asylum seekers and persons who are part of family reunification flows. Through an examination of data at country, canton and city levels, I analyze the spatial concentrations and educational, age and occupational profiles of key immigrant groups in Switzerland and their impacts on the socio-cultural and political structure of the country and the cities of Zurich and Geneva.

Keywords: Zurich, Geneva, Switzerland, immigration

Jennifer Chadwick-Moore, Graduate Student, Department of Geography and Environmental Planning, Towson University. Email: jchadw1@towson.edu; Kang Shou Lu, Ph.D., Assistant Professor, Department of Geography and Environmental Planning, Towson University. Email: kshoulu@towson.edu; Predicting Archaeological Settlement Patterns Using A Neural Network Model

Predictive modeling of archaeological settlement patterns has been utilized in the United States since the late 1970s and early 1980s. As Geographic Information Systems (GIS) developed, it provided a quicker and easier method for this type of spatial analysis. The contemporary GIS has evolved into a tool commonly used among archaeologists for analysis and management purposes. The rationale and methods for predictive modeling have been debated in the archaeological community since the formation of the practice, but now there is even more dispute with the everyday use of GIS. There is disagreement in the approach (inductive versus deductive), site and survey (no site) data, and types of variables used. This project will test widely used variables for analysis and evaluate their effectiveness for predicting historic and prehistoric sites in Maryland. Predictive models will be developed based on two frameworks: logistic regression and backpropagation neural network. The dependent variables representing archaeological sites are binary with only yes and no values. The predictors include environmental and cultural variables. All models will be calibrated or trained using a set of survey data for the archaeological sites extracted from surveyed areas based on a random block-based sampling method. Data for other sites will be used for model testing and validation. Semivariogram and principle component analysis will be performed to examine if there is spatial autocorrelation and multicollinearity problems respectively. It is expected that this study will help identify effective spatial models, significant predictor variables, and appropriate sampling methods for archaeological modeling and site protection.

Keywords: GIS, predictive modeling, neural network

Robert G. Chamberlain, Jet Propulsion Laboratory. Email: rgc@jpl.nasa.gov; William H. Duquette, Jet Propulsion Laboratory. Email: William.H.Duquette@jpl.nasa.gov; Some Algorithms for Polygons on a Sphere

A limited search for polygon algorithms for use in a new military training simulation that interfaces with several others produced only planar algorithms. To avoid having to implement several different sophisticated map projections to guarantee compatibility with all the other simulations, we opted to develop algorithms that work directly on a sphere. The first is an algorithm to compute the area of a polygon whose edges are segments of great circles. Since our models represent the locations of some things as being located at mathematical points, the second topic is whether a specified point is inside a specified polygon. Possibly pathological cases are identified and eliminated. When we realized that most political boundaries are actually rhumb lines, we looked at the relationship between the maximum distance between rhumb lines, great circle segments, and the line segments that connect points on a plot of latitude vs longitude as a function of length, azimuth, and latitude. We found the maximum polygon edge length consistent with the real-world size of our practical resolution. One way to define a large number of polygons is to draw big ones, then smaller ones on top of them. Thus, it would be useful to know the area overlapped by both polygons. Again, potentially pathological cases are identified and eliminated.

Keywords: polygons, algorithms, spherical geometry, rhumb lines, areas, polygon-on-polygon, point-in-polygon

Charlotte N. L. Chambers, University of Edinburgh. Email: c.n.l.chambers@sms.ed.ac.uk; Bounding the Lagoon: The Case of the Pasua Rahui, Tongareva, Cook Islands

This paper presents an exploratory study into the significance of boundaries and conceptualisations of spatiality in the context of declining numbers of an important food species, pasua (giant clam *Tridacna maxima*) in the island community of Tongareva. Tongareva, or Penrhyn as it is also referred, is the northern-most island in the Cook Islands group in the Eastern South Pacific. Tongareva represents an interesting case study in so far as it is simultaneously a 'remote' place and one firmly embedded in trans-national networks of communication, travel and exchange that link both the human and non-human in Tongareva to other parts of the Cook Islands and more widely. This paper specifically focuses on historical and contemporary understandings of physical and conceptual boundaries on Tongareva in terms of how such boundaries are invoked, accepted and contested, negotiated and maintained. The use of rahui, a Cook Islands Maori work which describes placing harvest restrictions on either a particular area of lagoon or on a particular species for a set period of time, is a very particular invocation of a boundary. I use empirical material obtained during fieldwork on Tongareva in March-July 2006 detailing discussions over the use of rahui to manage declining numbers of pasua, to illustrate how current understandings of spatiality on Tongareva, shape social and ecological outcomes with

specific consequences.

The Atkinson site, located in the Lauder Sand Hills, glacial Lake Hind Basin, SW Manitoba is an important multi-component archaeological site. Previous geoarchaeological research along the 850 m-long cutbank exposure of the Souris River adjacent to the site, ongoing since 2002, has revealed an eolian and fluvial post-glacial stratigraphic sequence (geomorphic units A-E). Recent flooding followed by low water levels in the Souris River revealed fresh exposures. This made it possible to address remaining questions about the contacts between units, the number of dune depositional episodes, and dune migration directions. Thirty-one stratigraphic profiles were described and added to the data base. Geomorphic units were traced across the exposure and mapped using a total station, correlated with profiles described in previous years, and the existing topographic site map was expanded by ~ 15,000 m² using a total station. Additional sand samples of eolian units (B-E) were collected and analyzed for particle-size distribution (sonic sifter, half-phi interval) and 37 new cross-strata measurements from unit B were added to the data base. Our results confirm: mid-Holocene dune unit B conformably overlies unit A2 but welds with unit C, and both units C and B pinch out downstream near the archaeological excavation block; units D, E, and A2 extend across the entire exposure, units D and E represents four distinct episodes of late Holocene dune activity (dune migration from the northwest), the mid-Holocene unit B dune migrated from the west, and grain populations from eolian units (B, C, D and E) are distinguishable statistically.

Kam Wing Chan, University of Washington. Email: kwchan@u.washington.edu; Major Issues in China's Urbanization and Policy

This paper is a synthesis and discussion of several major issues in China's urbanization in the last two decades. The paper first analyses two fundamental features of the Chinese spatial system: the administrative hierarchy and the restriction of population mobility. This is followed by an empirical study of recent national urbanization trends and the patterns of population growth of individual cities based on the 1990 and 2000 Census data. The paper goes on to examine the politics and economics underlying urban growth and the configuration of the urban system. The final section explores the policy implications, and future urbanization and migration policies and national development strategy.

Keywords: China, urban, urbanization

Kam Wing Chan, University of Washington. Email: kwchan@u.washington.edu; Man Wang, University of Washington. Email: mwang87@u.washington.edu; The Social Geography of Wuhan - Mobility and Processes

Based on the long-form data of Census 2000 and fieldwork, this paper examines the social spatial patterns of Wuhan, China, focusing on the intra-urban mobility, rural-urban mobility and their interaction in the second half of the 1990s. The major stream of intra-city mobility was relocation due to housing reconstruction and demolition, which involves the movement of people from the urban city center to new residential areas in the outer fringe of the urban areas. This emergent suburbanization process also generated a large number of people in the category of "person-hukou separation," a special phenomenon in many Chinese cities, as well issues of aging and unemployment in the city center. On the other hand, many outside migrants, most of whom were from the rural areas in search of better jobs, came to settle in the city center and offset the population loss, creating a new urban social geography. Wuhan's story shows a "succession" "invasion" process, which is an inverse to the Western immigration pattern. Even though most outside migrants are concentrated in the city center and at the urban fringe, Wuhan's social geography shows some special features quite different from other major cities in China owing to a possibly different

process. The Wuhan case is studied in the context of China's rapid urbanization and its social, economic and political processes in the transition era.

Roger C.K. Chan, The University Of Hong Kong. Email: hrxcucc@hku.hk; Urban Agglomerations in China

In the 21st century, the impacts of globalization, such as the shift in economic production, forced economic restructurings, are greatly affecting and stimulating the growth of China's and other countries' economic developments. The construction of new cities stems from the need to accommodate a population size of 6 billion in China. The growth of cities in China uses the gather and disperses of resources urban agglomeration formula together with the considerations of each city's individual economic situation, natural resources, and the development pace as its guiding principle to increase the functionalities of cities, establishing stronger organic metropolises. In order to ensure a more balanced and sustainable socio-economic development between all metropolises and smaller districts, three strategic approaches are identified and discussed in this paper.

Keywords: urban agglomeration, urbanization, China

Philip L. Chaney, Auburn University. Email: chanep1@auburn.edu; Hurricane Katrina Damage and Recovery Issues at Dauphin Island, AL

Hurricane Katrina produced a storm tide of approximately 6.6 ft above mean sea-level at Dauphin Island, Alabama, which damaged or destroyed one-third of the approximately 1500 homes on the island. The recovery process has included several landuse planning and development activities that appear questionable. The west end of the island, where 190 homes were completely destroyed, is being re-developed even though this area has a history of severe hurricane damage. National Flood Insurance Program regulations, which guarantee coverage to a homeowner even if the home has previously been destroyed by flood, appear to play a critical role in this process. Furthermore, the FEMA buyout program for flood-prone homes is voluntary, not mandatory, so it appears that the only means for preventing further hurricane damage at this site is total erosion of the island. Interestingly, lots along the west end beach that are currently under water are being purchased by potential new homeowners. Although these lots are currently unusable, they may be re-developed in the near future because of a plan to rebuild the beach with funding provided by FEMA, which is being justified as protection for infrastructure. Additional development on the island in the form of several new condominium units will increase tourist activity and lead to an expansion of service-related business facilities on the island. Therefore, the recovery process at Dauphin Island appears to be driven by decisions that will increase, rather than decrease, the community's exposure to hurricane damage in the future.

Chang-Yi David Chang, National Taiwan University. Email: changyi@ntu.edu.tw; Jack F. Williams, Michigan State University. Email: jfw@msu.edu; Environmental Impact and Risk Management of Mountain Highway Construction in Taiwan

Land is precious in Taiwan. Thus, competition for use of land can be intense and lead to serious environmental problems. Intensive land development in mountainous slopelands that accounts for three fourths of Taiwan can derive more severe disasters, especially after the construction a new highway. This speech is an attempt to depict a detailed examination of the first Cross- Island Highway finished in 1960 and its impact based in part upon original field work conducted from 1970s to recent years. Some 50 years after the construction of the highway, there now is widespread agreement in Taiwan that the highway construction is a prime example of unwise use of mountainous regions and its consequences. Taiwan Government approved a National Land Recovery Act on January 20, 2005. All new highway construction, new agricultural and other developments at the elevation of 500 meters above sea level would be banned.

Chung Chang, Environmental Psychology Program, City University of New York. Email: cchang@gc.cuny.edu; How could GIS contribute to the geographical imagination of gentrification? A case study of New York City, 1990-present

Geographers have used techniques such as statistics, policy analysis and Geographic Information Systems (GIS) to study gentrification. GIS is mostly utilized to map the location of gentrifying neighborhoods. Environmental psychologists, in addition, have employed qualitative research methods like participatory observation and in-depth interview to investigate the impact of gentrification on daily life. In my opinion, the full potential of GIS to analyze and visualize gentrification has yet to be realized. This project will apply GIS

methodologies to study spatial patterns and relations of gentrification in New York City. Variables from the U. S. Census will be mapped to reveal the extent of demographic and socio-economic changes. The Real Property Assessment Database (RPAD) of New York City's Department of Finance that records zoning, land use, etc. of each tax lot will be plotted to illustrate the conditions of the physical environment. The case study will adopt the third wave gentrification theory by Hackworth and Smith (2001) that argues post-1990 gentrification is led by corporate-government partnership. Such collaboration facilitates non-local actors with global-level influence and capital to lead gentrification into previously ungentrifiable areas. The discussion will focus on how GIS, in producing such explicit social and physical condition atlas, could be a powerful new tool for the study of gentrification and to facilitate residents' visualizing their geographical imagination for the existing state and future scenarios of their communities.

Keywords: geographical imagination, GIS, gentrification, New York City

Kuo-Chen Chang, National Taiwan Normal University. Email: kcchang@ntnu.edu.tw; Bio-Hotspot Monitoring in Taiwan by Integrating Multi-platforms and Multi-resolutions Remote Sensing Imageries

In the past 3 decades, people in Taiwan have relied heavily on silicon for our development. People have witnessed the increase of GNP and degrading of the environment quality. A healthy environment is the basis for a healthy economy. Without that, we would not be able to survive, let alone sustainable development. Since the turn of the century, people began to realize that we do need to do something to achieve our goal of sustainable development. Our first task is to identify the areas that are in critical situation and must be taken care of immediately. In this research, we will explore the potential of integrating multi-platforms and multi-resolutions remote sensing Imageries to monitor biodiversity hotspots in Taiwan.

Keywords: Bio-Hotspot, FORMOSAT-2, Remote Sensing, Image Processing, GIS

T. C. Chang, National University of Singapore. Email: geotc@nus.edu.sg; Peggy Teo, National University of Singapore. Email: geoteop@nus.edu.sg; The Shophouse Hotel: Vernacular Heritage in Creative Singapore

The geographic literature on urban creative economies has focused largely on the creative class(es) that cities attract and the urban creative zones that have developed viz. gentrified neighborhoods. As a "global city for the arts", Singapore's creative economy is evident in a number of ways not too different from other world cities, and yet distinct in other forms. One dimension which has not received much attention, for example, is the emergence of "boutique hotels" since the mid-1990s. The shophouse (literally a building with a shop on the ground floor, and residences on upper levels) was the vernacular architectural style of the working class in colonial Singapore and Malaysia. This paper critiques the creative uses of the shophouse vernacular and highlights the contestations surrounding the emergence of hotel landscapes. Contestations include conflicts between hoteliers and urban planners on permissible land uses, the loss of former tenants from the shophouses, and the creation of new place images not always in keeping with local histories and geographies. Our paper suggests that the boutique hotel phenomenon in Singapore goes beyond a straightforward process of nouveau riche gentrification. Beyond the fetishization of the shophouse, counter evidences revealing the emergence of new modes of creative governance and a re-embrace of the downtown by Singaporeans underline an evolving perspective of the creative city.

Keywords: hotel, tourism, vernacular, heritage, creativity, Singapore

Maggie Chapman, University of Edinburgh. Email: maggie.chapman@ed.ac.uk; Walking through fences: environmental (mis)management by goats and humans

Environmental management (and conservation) in the UK is driven largely by non-governmental organisations that privilege institutionalised and technocratic knowledges such as performance indicators and targets, in an attempt to make 'nature' conform to pre-determined notions of ecology and ethology. However, in many management projects there is little understanding of or engagement with the assumptions and consequences of such approaches. In this paper I highlight some of the limitations of such managerial strategies and identify some of the contributions that environmental management could make towards a more coherent and sustainable environmental ethic(s). I use the case study of feral goats in Scotland to illustrate how professional conservation judgements failed to acknowledge the importance of local (non-professional) wisdom about goat behaviour and grassland ecology. Goats were to be used as management tools in Kintyre, Scotland, to control grassland vegetation for the benefit of the threatened Yellow Milk-vetch plant. This rested on the ability to control goat behaviour; elaborate plans were devised to restrict and manipulate goat foraging, with the assumption that the goats in question would/could not

resist such regulation. I show how the patriarchal knowledge system of environmental science not only relies too heavily on institutionalised and professionalised fixes, but also fails to acknowledge agency in non-humans. I argue that environmental management could make radical contributions to a forward-looking nature conservation and environmental ethic(s) by challenging the social centralisation and organisational hierarchies within environmentalism, and refusing to assume that existing structures are necessarily the most appropriate means of tackling environmental dilemmas.

Keywords: animal geography, environmental management, feral goats, conservation, professionalisation of knowledge, environmental ethics, agency

Thomas Chapman, Florida State University. Email: tec03c@garnet.acns.fsu.edu; Electoral Geographies of State Same-Sex Marriage Referenda

The intense debate in the United States over same sex marriage is replete with competing views of the 'moral' and cultural landscape, for which definitive patterns have emerged that are associated with various socio-economic characteristics of the voting public. I examine this issue in an electoral context as it played out in several states during the 2004 general election. In analyzing the socio-spatial constructions both within and between states, I direct attention to issues such as race, class, age, and level of education, and their impact on the voting outcomes of state-wide marriage referenda. In particular, African American discourse in supporting or opposing these amendments presents a paradox, in terms of same sex marriage as a civil rights issue or as a conservative religious 'moral' issue. Intersections of the political-economy and notions of "local culture" have also influenced the spatial outcome of the vote. These constructions are linked with the so-called 'culture wars' raging across American society as a whole, and they help illustrate some unique geographies that play out within local and regional contexts.

Keywords: gay rights, marriage, culture wars

Heather Chappells, Lancaster University. Email: h.chappells@lancaster.ac.uk; Will Medd, Lancaster University. Email: w.medd@lancaster.ac.uk; Fluid resilience: the 2006 drought in the south east of England

The concept of resilience has gained increased currency in academic and policy worlds in recent years, and yet analysis tends to have been dominated by assumptions that resilience is to be found in holistic integration and systemic adaptation enabled by processes such as social learning and adaptive management. Situating water within an urban political ecology perspective, and drawing upon science and technology studies, we propose a more fluid concept of resilience, one in which resilience takes different forms across different places, scales and socio-technical contexts. More specifically we explore what experiences of the 2006 drought reveal about the 'resilience' of UK water systems, through co-dependent levels of provision and consumption. The 2006 drought in the SE of England has revealed synergies and tensions in modes of water regulation, provision and practice and the continued contradictions of 'market environmentalism' in the UK water sector. In our analysis we explore these socio-ecological contradictions as they are played out in the relationships between everyday domestic practices, the spatially differentiated challenges of local water resource management and national strategies of regulating for drought. In examining how UK water regulators, managers and households defined scarcity, renegotiated socio-technical dependencies, and formulated 'appropriate' responses during this summer's drought, we show how 'fluid resilience' is played out at multiple interconnected levels. Focusing on the interplay between different emergent manifestations of resilience, we show how these are caught in the tensions of market environmentalism that mediate the relations between the everyday practices of consumers, water resource management and regulation.

Keywords: resilience, drought, water systems, consumption, provision

Sharad Chari, LSE & UKZN. Email: s.chari@lse.ac.uk; Remnants of Apartheid: Antipodean Critique and the Compromises of Radicalism

Reminiscing after apartheid about two histories of race and space in 'Indian' and 'coloured' communities next to oil refineries in Durban, South Africa, what is striking are the many ways in which popular consciousness reflects the remains of racial capitalism, and political struggle. Keeping in mind that analytical categories like race, labour and nation are made and maintained by histories of rebellion and compromise, this paper asks how neighbours of oil refineries remember racialised histories of labour and livelihood, while re-engaging racism and anti-racism after white supremacy. What is clear is that although these plebeian voices do not speak the languages of the orthodox Left, this should not be cause for alarm. This paper argues that rather than settling for theoretical resolution in plebeian critique, an antipodean perspective might collect, sort, sift, and live with the materiality of evidence, to bring to view the connective tissue that holds together human-environment collectivities, however fragmented or contradictory, and even in neighbourhoods surrounded by oil refineries. Rather

than await the right ideology to articulate the structured devastations of the present, in other words, the seeds of 'radicalism' may be in the everyday practices, compromises and solidarities through which human-environments persist.

Keywords: Radicalism, Apartheid, Antipodean

Philippe Charland, Université du Québec à Montréal (Dept. of History). Email: charland.philippe@courrier.uqam.ca; *Aln8baŋwi kdakina - Our World in the Abenaki Way : Abenaki Place Names in Québec*

This paper relates to the reconstitution and the definition of the Northeast of America's territorial space. The main objective is the reconstruction of the Abenaki's territorial map, one of the aboriginal nations who live in this region, as a part of my Ph.D. thesis. Supported by the essence of identity expressed through the original Abenaki toponymy within le "territoire québécois", it was possible to trace their historical territory, the W8banaki. By examining systematically the historical, cartographical and geographical sources available, it was possible to collect more than 1000 toponyms of Abenaki origin; they referring to more than 800 geographical entities. Based on this gazetteer the toponymic classification was carried based on the toponyms' character; the toponyms were then placed on maps. Related to the presence of Abenaki in various sources, the complementarity of the data established the effective presence of the Abenaki within a definite territory in Québec according to the historical sources that the European colonists preserved.

Igal Charney, . Email: charney@geo.haifa.ac.il; Igal Charney, University of Haifa. Email: charney@geo.haifa.ac.il; *A matter of framing: architecture, tall buildings, and the skyline of central London*

Since 2000 a handful of very tall buildings were approved in central London, a fact that challenged well established planning practices in that part of London. Their promotion by the mayor but opposition to them by conservation groups meant an intense campaign ahead; nonetheless, it ended in a flash. This article examines how this debate was framed to relegate arguments and concerns of those who oppose tall buildings. To make tall buildings acceptable, London's mayor drew on the merits associated with iconic architecture and high-profile architects. Under Ken Livingstone's incumbency, tall buildings were supported by the expertise and clout of global architects who provided legitimacy to mayoral ambitions to reach for the sky. Stressing the meaning of high-quality design and iconic architecture helped to play down deep-rooted antagonism and to channel the debate to improving the aesthetic qualities of London, a goal that enjoys wide consensus.

Keywords: London, skyline, urban design, tall buildings, global architects, iconic architecture

Susan Charnley, USDA Forest Service, Pacific Northwest Research Station. Email: scharnley@fs.fed.us; *Community Forestry in Practice: Where Are We Now?*

The destruction of tropical and temperate forest ecosystems has been a major concern among people working in the field of environmental conservation over the last few decades. The demise of forest ecosystems also threatens members of forest communities, who have social, economic, and cultural ties to nearby forests. There are a growing number of examples of "community forestry" initiatives in which forest communities have gained authority over forest management and use, under the assumption that the devolution of power to communities will lead to improved outcomes in terms of both forest and community health. This paper reviews and characterizes different approaches to community forestry that have been implemented in different parts of the world over the past two decades, with a focus on how effective they have been at providing social, economic, and ecological benefits. It also examines the reasons behind the successes and failures of these approaches at sustaining forest ecosystems and forest communities, and identifies what can be learned by comparing and contrasting different models of community forestry from different parts of the world.

Keywords: community forestry, world

Jacquelyn R. Chase, Associate Professor, Cal State University, Chico. Email: jchase@csuchico.edu; *Their Space: Gardeners as Environmental Agents in a Brazilian Gated Community*

Gated communities continue to multiply on the fringe of every major city in Brazil. In the region to the south of Belo Horizonte known as the Eixo Sul, there are over thirty gated communities. Most scholars see these communities as enclaves of the rich, enabled by security technologies, walls and distance to live free from fear. But to see gated communities as enclaves obscures the ways that they are dependent on the people of surrounding areas for their own viability. During the week when they are in the city, homeowners entrust their properties

to gardeners, domestic servants and caretakers. This study extends the scholarship on gated communities by exploring the use of space by gardeners as they move between these places of privilege and their homes beyond the gates. The intensely personal relationship between gardeners and homeowners leaves traces of mutuality and power on the landscape, especially in the gardens. Gardeners often teach their employers about plant care, and bring them cuttings, seeds and fruit from their own gardens. However, homeowners are pressing in the other direction by subscribing to the modernization of gardening which they see as the domain of a new caste of professional landscapers and ecologists. The study is based on in-depth interviews with gardeners and homeowners, literature on gated subdivisions, and employment data collected by the homeowners' association of one gated community near Belo Horizonte.

Keywords: Brazil, landscape, gated communities

Caitlin L. Chason, San Diego State University, San Diego, CA, Department of Geography. Email: chason@rohan.sdsu.edu; Short Interval Fire Occurrence and Post-Fire Recovery Patterns in Chaparral Vegetation

Recent growth and development in San Diego County into areas with shrubland vegetation cover has contributed to an increase in fire occurrence and a decrease in fire rotation intervals. High fire frequency may have detrimental impacts on shrub species that require a specific period of recovery before further disturbance by fire (Zedler, Gautier, & McMaster 1983). Wildfire recurrence intervals of five to ten years can result in type conversion of chaparral to coastal sage scrub, and even shorter intervals can result in the replacement of chaparral with herbaceous vegetation dominated by exotic and invasive grasses and forbs (Wells 1962; Zedler, Gautier, & McMaster 1983; Haidinger and Keeley 1993). Stands of chamise chaparral burned two or more times in time intervals of 10 years or less from 1970 to 2003 in San Diego County, California were examined to determine if short fire rotation intervals between fires has contributed to the type conversion of chaparral to coastal sage scrub or grassland vegetation types. Geographic information science (GIS), field observation, and image interpretation methods were used to identify and select individual stands of chamise chaparral. An evaluation of vegetation community change was conducted using traditional field mapping techniques. The objectives of this study were to map and analyze the spatial distribution of chamise chaparral stands that have experienced short interval fires and investigate the topographic and fire history characteristics that may be associated with type converted stands.

Keywords: type conversion, chamise chaparral, field mapping, fire history, GIS

James F Chastain, MA, United States Military Academy. Email: james.chastain@usma.edu; Where Did They Vote For Le Pen?

The 2002 French Presidential election manifested a re-emergence of extreme right-wing ideology as a potential socio-economic-political ideal within an advanced market democracy coping with the pressures of globalization and concomitant geopolitical and geo-economic transitions. The purpose of this research is to test the hypothesis that socio-economic correlates of globalization influenced the 2002 French presidential election. Specifically, that the right-wing political party, the National Front, gained support from voters reacting to a constructed context of globalization. This study models that support for Jean Marie Le Pen is a function of the relative presence of four socio-economic factors at the departmental level: the number of immigrants, the rate of unemployment, education levels, and age.

Keywords: Jean Marie Le Pen, 2002 French Presidential Election, National Front

Robert A Chastain Jr, Oak Ridge Institute for Science and Education. Email: robert.chastain2@us.army.mil; Mapping Vegetation Communities Using an Integrated Approach

A vegetation map is being produced for the U.S. Army's Fort Lewis Military Installation in western Washington, using a combination of remote sensing and spatial analytic methods. The mapping area has been stratified into separate cover types (upland forest, woodland/savanna, prairie, riparian forest) based on biophysical characteristics, and the effectiveness of different mapping approaches (maximum likelihood and decision tree statistical classification, object-oriented feature extraction) is being assessed within each region. Inputs to the analysis include passive and active remote sensing data obtained at multiple resolutions. High resolution multispectral QuickBird images were acquired for leaf-off (winter) and leaf-on (growing season) conditions, permitting object-oriented feature extraction using the structure and reflectance of individual tree crowns. Moderate resolution Landsat TM image data were also acquired (leaf-off and leaf-on), facilitating differentiation of forest vegetation types from information contained in the middle infrared bands. High density Lidar data (leaf-off and leaf-on) were also procured, enabling identification of individual tree crowns, accurate estimation of tree canopy cover, and development of geospatial representations of vegetation structure (e.g., tree height and forest structural

complexity). Analyses of classification accuracy will determine which mapping approaches are most effective within the different vegetation types, and thus will be integrated into the final vegetation map. Initial results indicate that object-oriented feature extraction using high resolution QuickBird and Lidar data outperforms pixel-based statistical classifiers in open savanna and woodland communities, whereas moderate resolution Landsat image data is successful at discerning forest vegetation types.

Keywords: vegetation mapping, remote sensing, feature extraction, classification, lidar

Ipsita Chatterjee, Clark University. Email: ichatterjee@clarku.edu; Title: Social Injustice and the Fascist City

Space, left to itself is inert and Euclidean, it is only in the geographies of justice and distribution that space acquires its progressive or regressive character. Globalization and intense movement of capital, ideas, information play a dual role in these geographies. It alters the personality of cities, economies and nations and it simultaneously alters the mix of values which constitutes these local spaces. Contrary to popular belief, a resurgence of local conflict in a globalizing world cannot be simply explained as the 'nostalgic local' resisting the secularizing forces of the global in its desire to preserve its parochial identity. Global and local can no longer be understood as ontologically given, confrontational scales; but rather viewed as constitutive of each other. Conflicts at local scales are not discrete local events - a nostalgic 'outside' to the global - but are complexly connected to processes of globalization. The above claim is examined through a case study of Hindu-Muslim conflict in Ahmedabad city, India. There, a Hindu-Muslim riot broke out in 2002. The Hindu community attacked its Muslim neighbors, killing and raping indiscriminately, usurping property, and annihilating the 'other' through state sponsored genocide. With the help of data collected through field work, I argue that it is no longer enough that literature in geography simply talk about exclusion and marginalization in global cities as if they were in situ local characteristics but make the conceptual leap to indicate how Neoliberal urbanization can be fascistic in dividing the urban poor in ethno-religious lines.

Keywords: Neoliberal globalization, urban renewal, global-local symbiosis.

Sudip Chatterjee, Student. Email: schattrj@memphis.edu; Multilevel Modeling of Infant Mortality in Shelby County Tennessee: A HLM-GIS Approach

This research study investigates infant mortality in Shelby County, Tennessee from 1999-2003. The average infant mortality rate of Shelby County in these 5 years is 12.7 deaths per 1000 births with the highest in 2003(14.9) and the lowest in 1999(11.7). Rates were considerably higher for African American (17.37), Chinese (17.24) than whites (6.24). The infant mortality rate for all races combined was 13.95 for male infants, 11% higher than rate of 11.51 for females. 77% of infant deaths attribute to low birth weight. Unmarried mother infant mortality rate (16.83) is twice as married mother infant mortality rate (8.21). The purpose of this research is threefold: (1) to provide a detailed rationale for using multi-level statistical modeling in investigating infant mortality; (2) to demonstrate how Hierarchical Linear Modeling (HLM) can be used to analyze the relationships between community level environmental data, individual risk factors, and birth outcomes. (3) to demonstrate an integration of spatial and non-spatial analytical methods in birth outcome studies. Geographical Information System (GIS) were applied to extract multi-level variables level-1/ individual level and level-2(a larger group or community containing level-1) associated or responsible for infant deaths to set up a HLM. Within the HLM, each of the levels in the data structure is formally represented by its own sub-model. HLM could explain infant mortality variance much more than other regression techniques. Moreover, HLM could provide a way to examine how the characteristics of Shelby County moderate the effects of the individual-level or level-2 variables on infant mortality.

Keywords: Hierarchical Linear Modeling, Spatial Clustering.

Paul Chatterton, Leeds University Uk. Email: p.chatterton@leeds.ac.uk; Challenging enclosure. Lessons in autonomy and self management.

This paper is about enclosure - the struggle against it and the struggle for the commons. Since the dawn of capitalist society and the beginning of land enclosures in the UK, the (re)claiming of space from private ownership by popular movements to re-collectivise their lives and fight the commodification of land, labour and life has had a long and rich history (see Coates, 2000; Ward, 2002; Diggers and Dreamers, 2005, Thompson, 1980; Harvey 2005). It continues today through well known popular struggles such as the Zapatistas of Mexico, the Landless Peasants Movement of Brazil, and those fighting the enclosure of natural resources. The focus of this paper stems from a current 2 year research project funded by the Economic and Social Research Council (ESCR) in the UK which explores the possibilities of developing self-managed spaces of struggle and possibility against enclosure ? what we call 'autonomous

geographies' (see www.autonomousgeographies.org). The paper relates detailed stories from two of our case studies where we have engaged with groups as action researchers: first, radical urban social centres which have emerged over the last half decade to promote self-managed politics, challenge gentrification and create common bases for social movements. Second, anti-gentrification networks which are attempting to expose, challenge and reverse enclosure through the privatisation of housing in the UK. Through these case studies, the paper develops theoretical arguments around the concepts of autonomy and self management, and explores the extent to which new forms of democracy and citizenship can be developed around them. See: www.savelittlelondon.org.uk www.whorunsleeds.org.uk www.autonomousgeographies.org

Sutapa Chattopadhyay, University of Minnesota, Duluth. Email: schattop@d.umn.edu; *The SSP, Myself and the Tribals*

I relied on feminist-informed qualitative methods to understand the mechanisms of involuntary migration and rehabilitation, of the displaced people, due the construction of a multipurpose river valley project in the Narmada Valley. Feminist scholars, in particular, have raised questions and concerns on the ethical dimensions of conducting qualitative field surveys. I employed a combination of methodologies including collection of archival materials, household surveys and narratives from tribal villagers in four rehabilitated villages of Gujarat. The analysis of the narratives and discourses helped me to understand space, gender and discourse. In addition, feminist-informed qualitative methods helped me in making explicit connections between myself and the Adivasi respondents, identifying women's personal experiences, gendered roles and activities and everyday challenges of the migrants. This research suggests the need to apply different feminist methodologies to aid in understanding the displaced's day-to-day challenges and promote more studies of this genre in the feminist and population geographies.

Keywords: Feminist-informed qualitative methods, population geographies, development projects, tribals, India

Lisa Shanti Chaudhari, Doctoral student, University of Georgia-Department of Anthropology. Email: shanti@uga.edu; *Health knowledge and behavior in urban Trinidad and Tobago*

Historical migrations, contemporary global exchanges and cultural expressions have created a unique setting when looking at the range and variation in patterns of health care knowledge and behavior in multiethnic Trinidad and Tobago. This paper focuses on results from exploratory research in urban Trinidad and Tobago during the summer of 2006. My objectives were to assess the inequalities in access to health care knowledge and resources. I looked at the range and variations in patterns of health care knowledge and behavior in five urban communities. I addressed questions of health choices and preference incorporating background information such as migration histories, education level and environment growing up. The methods included surveys, focus groups and semi-structured interviews. The data were qualitatively and quantitatively analyzed emphasizing the importance of understanding local changing perspectives in health knowledge and subsequent behaviors, especially in communities and countries with dynamic migration patterns. The results indicate that health preferences listed do not match up with actual health choices when seeking treatment for recent illnesses. The actual individual health care networks show the diversity and emphasis on health care choices that are close to home and continued use of local ethnomedical choices despite living an urban setting. This research enhances our understanding and valuing of diversity in alternative health care models, indicative of how different communities participate in determining levels of medical pluralism within an urban health setting.

Email: rbogle@usgs.gov; *Use of remote sensing to detect and map temporal and spatial vegetation dynamics to help map landscape erosion vulnerability: Mojave Desert and Moloka'i, Hawai'i*

Vegetation sheltering of the soils is a critical parameter that influences the level of vulnerability to erosion. In the Southwestern United States, wind erosion and dust emission are concerns with respect to soil loss and its effects on air quality, as well as on human health and safety. In Hawai'i, water erosion and sediment runoff onto coral reefs are major concerns. Methods to detect, map, and monitor temporal and spatial vegetation dynamics within a landscape are critical for mapping and monitoring the degree of vulnerability to erosion. Changes that occur from season to season in annual vegetation and perennial grasses because of differences in climate/rainfall conditions and the spatial

distribution of perennial nongrass vegetation are critical parameters that influence potential erosion of landscapes. Change-detection algorithms and procedures were developed to detect and map differences between wet and dry conditions by identifying areas of annuals and perennial grasses. Algorithms and procedures for spatial variability analyses were used to detect and map differences in the spatial coverage and distribution of nongrass perennial vegetation in the Mojave Desert and the island of Moloka'i, for studies of wind erosion and water erosion, respectively. Results showed that (1) dust emission in the Mojave Desert is greatly enhanced following drought and almost completely shut down after only a few months of heavy winter rainfall and (2) the highest amount of vegetation dynamics in Moloka'i occurred on the lower half of the watersheds, with these areas perhaps being the most promising sites to consider for management efforts.

Keywords: remote sensing, vegetation dynamics, change detection, spatial variability, wind erosion, water erosion, vulnerability, Mojave Desert, Moloka'i

May Chazan, Doctoral candidate, Carleton University. Email: mchazan@connect.carleton.ca; *Theorizing Activism: Reflections on Engaged Research Practice*

Why, among even many critical scholars, is there a continued hesitancy toward stepping outside certain pre-prescribed 'researcher' roles to become 'advocates' or 'activists'? It is my contention that the current trepidation toward activist research is rooted in simplistic notions of activism and embodied in artificial boundaries constructed between theory and practice, and between the academe and 'the field'. In this paper, I seek to challenge these theory-practice and field-academy dualisms through a reflexive examination of my two-year research process with street traders in Durban, South Africa. I specifically consider four interrelated factors influencing academic uneasiness with engaged scholarship: (1) the view that activism is atheoretical; (2) the tendency to frame activism as overt, physical and dramatic events; (3) the prevailing belief that engagement can hinder critical analysis; and (4) the dominant scholarly perspective that activism should remain located outside the academy. Through this, I offer a more nuanced theorization of scholarly activism - as a theoretically-engaged, critical and reflexive commitment to working for social justice beyond the walls of the university.

Keywords: Engaged scholarship, critical methodologies, activism

Deborah L. Che, Kansas State University. Email: dche@k-state.edu; *Envisioning Detroit Chinatown*

Chinatowns can be found in cities around the world. These residential and occupational enclaves which have been produced by Chinese migration also represent exotic visual and culinary destinations for residents from other parts of their metropolitan areas as well as for tourists. This historical paper examines the evolving envisioning of Detroit Chinatown. Drawing from documentary/archival materials (i.e., newspaper articles, photographs, reports), oral histories, interviews, and U.S. Census data, this paper illustrates how Detroit Chinatown has been viewed by the wider (Euro-) American society as an exotic, foreign Chinese colony in the heart of an industrial Midwestern city; as a neighborhood whose anti-Communist, model minority, locally apolitical population was positively contrasted with those of other minorities during post-World War II Detroit's dramatic economic and political transition; and as a slum 'needing' to be demolished as part of an early 1960s urban renewal and freeway development project, which given resulting suburbanization ultimately affected the viability of the relocated Chinatown and downtown Detroit. Alternately Chinatown has been envisioned by the Detroit Chinese as the heart of the community to more recently as a site recognizing the earlier neighborhood demolition, the violent death of Vincent Chin at the hands of two auto workers in 1982, and the subsequent, domestically-oriented political activism of Chinese-Americans. Even with the development of a new suburban Chinatown, Detroit Chinatown also has been envisioned as playing a key role in revitalizing the Cass Corridor and providing a future attraction near the city's downtown and Cultural District.

Keywords: Chinatown, Detroit, Asian migration, urban renewal

Clara Cheeves, University of Washington. Email: clarac@u.washington.edu; *Urban Agriculture and the Common Good: Embodying revolutionary ideals and sustainability in Cuba*

This poster illustrates that the growth of urban agriculture in Cuba is a direct result of Revolutionary government support and is now a major contributor in providing food security and a more sustainable country. The development of urban agriculture arose in a period of economic hardship in the early 1990s known as the "Special Period." After the collapse in 1989 of Cuba's major trade partner, the Soviet Union, and the tightening of the embargo by the United States against Cuba, the Cuban government found itself unable to provide food for the population. The people are the base of the revolution, and their welfare is the first priority of the revolutionary government. Through the passage of laws and the provision of land to the people for cultivation, the government

demonstrated its commitment to the success of urban agriculture. This success has placed Cuba in the forefront of development practices leading toward a more sustainable future. Urban agriculture provides economic growth, food production with a reduced environmental impact, and equality in the form of increased nutrition.

Keywords: Cuba, sustainability, urban agriculture

DongMei Chen, Queen's University. Email: chendm@post.queensu.ca; *The effect of spatial autocorrelation and class proportion on the sampling design for thematic map accuracy assessment*

Four thematic maps with combinations of two spatial autocorrelation levels and four different class proportions were simulated to study the effect of spatial autocorrelation and class proportion on precision of accuracy measurements from different sampling designs. A series of eleven sample sizes were simulated using three popular sampling designs, including simple random sampling (RS), systematic sampling (SS), and stratified random sampling (StrRS) on the four simulated maps. The conventional error matrix and related measures were calculated for each simulation, and precision of estimating different measures was compared among three sampling designs. Recommendation for use of a particular sampling designs and sample size depends on the spatial autocorrelation level, class proportion difference, and the accuracy indices that a given application requires. In general, the class proportion difference had more impact on the performance of different sampling methods than the spatial autocorrelation on a map. For estimating the accuracy of individual classes, stratified sampling achieved better precision than RS and SS with much small sample sizes, especially for estimating the small class. For estimating the overall accuracy, different sampling designs achieved very similar precision with fewer sample sizes. To achieve a better estimate of kappa coefficient, stratified random sampling is recommended on maps with high class proportion difference while random sampling is preferred for maps with low spatial autocorrelation and low class proportion difference.

Keywords: Accuracy assessment, spatial autocorrelation, sampling design, remote sensing

Guo Chen, Pennsylvania State University. Email: guc110@psu.edu; *A Dream beyond Reach? Homeownership for Low-income Groups in Urban China*

China's homeownership-oriented housing reform has improved the living condition of the majority in urban China; yet it also has raised the cost of accessing quality housing for some. For low-income groups, housing is an important asset to cushion them against persistent poverty. While recent studies examined bifurcated issues such as migrant housing disadvantages and determinants of housing tenure choice in China, few have offered an integrated approach to the understanding of the housing condition of and prospects for the urban poor that are constituted by socially, economically and institutionally divided groups of individuals and families including migrants and natives. In this paper, a two-level analysis of a housing survey data is conducted to support the argument that both the socioeconomic and institutional characteristics of individuals and families and the availability of low-cost housing in communities are playing critical roles in shaping the tenure decision of low-income groups in China. In order to access better, more secure housing, most face a dilemma between pooling family fund at the risk of financial insecurity and counting on underdeveloped housing welfare programs. Those with few family financial resources and broken connections with both work units and local communities are left in the "nowhere place" of abject housing poverty. The empirical finding further suggests that urban poverty in China is not simply the consequence of individual incapacity in the face of marketization or due to the existence of biased policies towards rural migrants, but instead a reaction to the emergence of transforming institutions.

Keywords: Poverty, Housing, China

Hao Chen, Clark University. Email: hchen@clarku.edu; *Which Gradients Are Associated With Successes And Failures Of Land Change Predictions*

This paper proposes a method to quantify the goodness-of-fit of a land change prediction along a gradient of an independent variable. The assessment budgets prediction errors and successes along the axis of a gradient of an independent variable, and identifies which locations along the gradient are associated with those errors and successes. The paper develops a variety of goodness-of-fit measurements, with the purpose to examine the independent variable in a composite way. They are designed to help understand 1) how the gradient along an explanatory variable performs differently in its calibration and validation stages; 2) how the error and success distributions are sensitive to the change of the variable's gradient scales; and 3) how the error-success pattern evolves along the change of unit-of-analysis scales of the variable in the context of a multi-resolution change space. The paper applies the proposed approach to Massachusetts, and demonstrates that it can reveal which independent variables

are associated with predictive accuracy and error.

Keywords: Land Change Modeling, Factor Goodness-of-fit Assessment, Central Massachusetts

Hong Chen, University of Washington. Email: hongchen@u.washington.edu; *China's Changing Urban Politics and the Impacts on Chinese Cities*

With the radical effects of economic, cultural, and political globalization, local governments have changed their focus from market regulator to market facilitator. By cooperating with the private sector, local government has sought to maintain economic growth in a climate of increased political economic instability and inter-locality competition. Combined with economic reforms, China's transition from a centrally-planned system to a market-oriented economy is transforming the fundamental nature and structure of its cities in post-Mao era. Though China's changing urban governance differs from Advanced Capitalist States, its impacts on Chinese cities are unclear. Based on the literature of Western urban politic theories, this research focuses on defining China's urban politics and evaluating different actors' roles in Chinese cities. In order to identify the role of local government, the research also conducts a case study of Guangzhou which reveals that Chinese governments have used the host of sporting mega-events to stimulate urban development.

Jian Chen, University of Memphis. Email: chenjianecnu@gmail.com; *GIS-Based Urban Flash Flood Modeling in Memphis, TN*

More and more storm-derived urban flash flooding takes place unexpectedly, this increases damage and direct & indirect economic losses. Modeling the complexities of flash flood hazard in the urban settings where flood consequences are great have recently received increased attention and motivates this research. Specifically the following research questions support the development and implementation of flood modeling in the study area: What flooding characteristics (spatial extent and inundation depth) can be expected when specific storm takes place? This research represents a case study analysis of an urban location on the campus of the University of Memphis in Memphis, TN. The study area is isolated from riverine flood influence with a history of flood disruption and losses. A GIS-based flood model is applied to assess the flooding characteristics for any specific level (intensity and duration) of storm event. This model adapts the Green-Ampt model to estimate cumulative infiltration during the storm event. A GIS-based flat-water model is then applied to assess the spatial extent and inundation depth of the ponding storm water (conveyance capacity of sewer system is considered) using high resolution topographic data. The Alternating Block Method is used to generate the model input, the design storm hydrograph of any specific level of storm in the study area based on historic observation data. Uncertainty of the model is addressed by sensitivity analysis of initial differences in soil moisture conditions, occupied levels of sewer system, and different resolution DEMs inputs. Matrices of modeling results according to different inputs are compared.

Ke Chen, East Tennessee State University. Email: mail2kechen@yahoo.com; *A Spatial Perspective on the Venture Capital Investment in the U.S Biotechnology Industry*

This paper investigates the geography of venture capital investment in biotechnology industry. The study first examines the geographic location of biotechnology firms that received venture capital investments and the spatial distribution of investment in dollar value, with recognition of investment stage, product type, and neighborhood effect. The study continues to explore the spatial distribution of agencies that provide venture capital. These agencies include venture capital firms, large biotechnology / pharmaceutical firms, and government economic development programs. Lastly, the spatial flow of biotechnology venture capital investment is studied at both individual firm level and aggregated metropolitan and regional level. The results of this study help to understand the importance of geographic location in venture capital investment.

Understanding the relationship between landscape pattern and ecological processes has been a central yet challenging research theme in landscape ecology. Over the past decades, many landscape metrics have been proposed but few

directly incorporate ecological processes. In this paper, we propose a landscape index, namely, location-weighted landscape contrast index (LWLCI) in view of the role of landscape type in ecological processes, such as soil erosion and nutrient loss. Within the framework of the Lorenz Curve theory, we develop this index by integrating landscape pattern and point-based measurements at the watershed scale. The index can be used to characterize the relative contribution of landscape pattern with regard to a specific monitoring point at a watershed. Through a case study on nutrient loss in the northeastern China, we find that nutrient loss tends to be higher for a watershed with a higher LWLCI value, and vice versa. LWLCI can be used to evaluate the relative potential risk of soil loss or nutrient loss by comparing their values across watersheds. We also discuss several areas where attentions should be paid when applying this index to a heterogeneous landscape site.

Qi Chen, University of California, Berkeley. Email: qch@nature.berkeley.edu; Michael Lefsky, Colorado State University. Email: lefsky@cnr.colostate.edu; Peng Gong, University of California, Berkeley. Email: gong@nature.berkeley.edu; Dennis Baldocchi, University of California, Berkeley. Email: baldocchi@nature.berkeley.edu; Validation of Canopy Height Estimation Derived from ICESat GLAS Data with Discrete-return Airborne LIDAR Data

Canopy height is a crucial parameter for forestry inventory, carbon cycle modeling, and climatology modeling. The Geoscience Laser Altimeter System (GLAS) carried on the Ice, Cloud and land Elevation Satellite (ICESat) provides the unprecedented ability of measuring the global-scale canopy vertical structure information, based on which canopy height can be potentially derived. However, the evaluation of methods for estimating global canopy height calls for very accurate measurements of canopy height across different species, terrains, and regions. To obtain and/or access the canopy height information in the field across the global is very difficult and subject to the errors from inconsistent field measurement methods. Fortunately, an increasing amount of airborne discrete-return lidar data are acquired through companies, universities, and government agencies, which serve as an ideal source for accurate canopy height estimation and validation purpose. This study is to present a consistent method of estimating canopy height from discrete-return lidar data for different forest types and terrain characteristics. The discrete-return lidar data can also produce detailed and accurate digital elevation models and canopy surface models within the footprint of GLAS waveforms. These detailed terrain and canopy surface elevation information will be used to explore the errors of canopy height estimation from the GLAS waveforms.

Keywords: Lidar, GLAS, discrete-return, validation

Email: rpullen@ciesin.columbia.edu; Greg Yetman, CIESIN, Columbia University. Email: gyetman@ciesin.columbia.edu; Can Interdisciplinary Research Improve Natural Hazard Risk Management? The Case of the Global Natural Disaster Risk Hotspots Study

The diversity of natural hazards, each with their own set of physical characteristics and patterns of exposure and vulnerability and each with their own research communities and stakeholders, presents a difficult problem for disaster managers and other decision and policy makers. Which hazards pose significant risks for different sectors, regions, or constituents? What interactions between hazards are important? How do the overall risks of natural hazards compare with other risks and issues? What solutions address multiple risks? Unfortunately, because of the diverse scientific disciplines involved including the natural and social sciences, engineering fields, and medical and public health professions, the research community has not yet learned how to translate its research results consistently into usable and understandable forms for applied users. At the 2004 AAG, we reported on preliminary results from an international study of "global natural disaster risk hotspots," aimed at identifying areas at high risk from one or more natural hazards using a comparable framework. Since then, the hotspots study has received wide attention. It received a "Good Practice" award from the Independent Evaluation Group of the World Bank in 2006 as an "initiative with demonstrated impact/results." A private company asked us to adapt the results for use in supply-chain risk management. Lessons learned from these experiences include the tradeoffs between "state-of-the-art" in disciplinary vs. interdisciplinary research, the relative utility of mapping vs. ranking, the importance of assessing aggregate economic risks, and the need for historical data to provide context for understanding present and future hazards and risks.

Keywords: natural hazards, risk, disaster management, policy, interdisciplinary research

Shuang Chen, Nanjing Institute of Geography and Limnology. Email: schens@niglas.ac.cn; Environmental challenges of urban growth: The case of Suzhou, China

Since the late of 1990s cities in the east coastal developed area in China have expanded fast with a low development density like the cities did in Europe and North America. Great population and industries migrated from the central urban area to suburban area. Especially for big cities in the Changjiang River Delta area which holds a high level of urbanization, decentralization of population and industries have been strengthened by governmental behaviors including adjustment of administrative regime, establishment of new urban master plan and issuance of optimum policies in recent years. The resulting urban sprawl led to loss of arable land, decrease of green space and degradation of environment in the city's periphery. In the Changjiang River Delta Suzhou City experienced rapid expansion, both in its economy and in its area. In this paper, the author will offer an analysis of the environmental costs of urban growth for Suzhou City — an analysis that incorporates some of the direct and indirect costs associated with development on the urban fringe, and explore relationships of environmental costs with the expansion model of land use, size and etc.. The paper will also provide an analysis of the current policy framework guiding and responding to urbanization induced changes in the local environment.

Keywords: urban growth, environment, cost, land use

Wei-Ming CHEN, . Email: kattyouth@gmail.com; The Reaction of Taiwan's Government When Facing the Environmental Negotiation in WTO

Economic development and environmental protection are two major goals that the government wants to pursue nowadays. Therefore, the World Trade Organization (WTO) stated the objectives of sustainable development and environmental protection in the preamble to the agreement established by the WTO. As a member of WTO, Taiwan advocates sustainable development too. Because there is limited natural resource and dependence on international trade, it would be a chance to keep the balance between environmental protection and economic development. Taiwan has been a member of WTO since 2002 and the government has paid much attention on the trade and environment negotiations. The attitude of government will not only influence the negotiation results, but the development of environmental industry in Taiwan. Hence, realizing how the government draws up the negotiation position will be an interesting and meaningful research topic. Through analyzing Taiwan's WTO official documents and interviewing the officials and delegates of trade and environment negotiation, we found that they didn't have full pictures of the environmental industries in Taiwan. They don't know what kind of environmental industries in Taiwan have the economical growth potential when facing world trade liberalization. As a result, Taiwan's negotiation position became conservative and moderate. Since Taiwan's delegates often lack adequate background data, they cannot make an immediate and correct judgment during the negotiation process. One of the most crucial works we need to do is create an environmental industry database. Moreover, training delegates who have both the environment and economic background as another step would be needed.

Email: ; Lin Li, Indiana-Purdue University. Email: ; Topographic analysis of temporal and spatial pattern of vegetation indices derived from AVIRIS data in Santa Monica Mountain, CA

A variety of vegetation indices derived from remotely sensed data have been widely used to estimate the chlorophyll content, the leaf area index, and the vegetation water content, the important vegetation biophysical parameters. Vegetation spectral indices are determined by several combined factors such as vegetation types, topography, climate, and soil moisture condition. The role of topographic factor is significant, particular in mountain areas. It is necessary to investigate in more detail the importance of topographic factor influencing variation in vegetation indices. This study explored the relationship between vegetation spectral indices and topographic attributes derived from the Airborne Visible/Infrared Imaging Spectrometer (AVIRIS) data and Digital Elevation Model (DEM) data, respectively. AVIRIS offers an opportunity to calculate all vegetation indices in optical spectrum (400 - 2500 nm) while a number of topographic attributes, elevation, slope, and aspect, are computed from DEM data. Two statistic analyses were carried out in the study. First, a simple correlation analysis was applied to all vegetation indices and topographic attributes, computing Pearson r correlation coefficients. The scale effects and temporal variation of vegetation indices were also considered in the correlation analyses. Second, a stepwise regression analysis was employed in this study,

considering vegetation indices as the dependent variable and topographic attributes and vegetation types as independent variables. The information about vegetation types was extracted from the AVIRIS data. Understanding spatial and temporal pattern of vegetation indices is helpful for wildfire risk assessment in study area.

Keywords: AVIRIS, DEM, vegetation index, topographic attributes

Xiannian Chen, West Virginia University. Email: xchen4@mix.wvu.edu; Security Issues of Internet GIS

Combining with advanced computer technologies, information technologies, and the other emerging new technologies, Internet GIS becomes a highly distributed system. Internet GIS is a mobile, powerful, and flexible system. It provides a new perspective for people to share geography, and other related information. People can browse the information easily with the Internet browsers such as Internet Explorer, Mozilla FireFox, Netscape, or other related tools such as ESRI ArcGIS client. But the security issues of Internet GIS rise up at the same time. Many aspects of Internet GIS have more or fewer issues about security. In this research, we will study the security issues from three aspects. First, we study the security issue of GIS data, which are used for Internet GIS purpose. Secondly, we study the security issues of Internet GIS map services, which are used to serve GIS data over Network. Thirdly, we study the security issues of the data transaction.

Xiaodong Chen, Michigan State University. Email: chenxia2@msu.edu; Guangming He, Michigan State University. Email: heguangm@msu.edu; Jianguo Liu, Michigan State University. Email: jliu@panda.msu.edu; Integrating Complex Interactions in A Coupled Human-nature System: An Agent-based Modeling Approach

Complex interactions among people, natural resources and policies have been recognized as important issues in environmental management. Due to the complexities, multi-disciplinary and cross-scale characteristics of data and methods, traditional approaches usually fail to explore the interactions in coupled human-nature systems. This presentation reports an agent-based spatial model that addresses the interactions among rural population, conservation policies and giant panda habitat in Wolong Nature Reserve of China. Local residents in Wolong collect fuelwood in the panda habitat as one of the most important energy sources, hence leading to panda habitat degradation. To protect panda habitat from further degradation, several conservation policies have been implemented in Wolong. However, these policies are short term with uncertainties of being extended or revised. Using a set of artificial-intelligence rules, household agents make decisions about their socio-economic activities under different combinations of policies or policy scenarios. By simulating the life history of individual persons, households, and dynamic interactions among people, policies and panda habitat, the roles of socio-economic, demographic and policy factors in panda habitat conservation can be better understood. Moreover, the general framework and approach of this study can be applicable in other coupled human-nature systems.

Keywords: agent-based modeling, multidisciplinary, systems integration, giant panda habitat

Xuexia Chen, Science Applications International Corporation, contractor to U.S. Geological Survey (USGS), Center for Earth Resources Observation and Science, Sioux Falls, SD.. Email: zhu@usgs.gov; A relative radiometric correction method to improve landscape monitoring using mosaicked multi-temporal imagery

Satellite data have been widely used to detect landscape features and mosaics of images collected on different dates are often used to monitor large areas. Adjacent scenes may have seam lines due to radiometric variation caused by atmospheric or other effects. Our study developed a relative radiometric correction method for mosaicked images. In this study, 11 Landsat TM and ETM+ images acquired in the summers of 1999 and 2000 were mosaicked to assess vegetation cover in the high plateau area of Utah. Four scenes collected on June 6, 2000, were identified as "base images" and the other seven were "target images". About one thousand pixels were selected along each boundary of adjacent base and target images. Of these pixels, each base image pixel was associated with a target pixel based on their similar surface cover and therefore their surface reflectance should be nearly identical. These associated pixels of target and base images were highly correlated in each band, with r-squared values that ranged from 0.66 to 0.97. Linear regression functions were generated for each band and pixel values of the target images were recalculated. After this relative radiometric correction, the scene lines that had been visible between individual adjacent scenes of the mosaicked images were no longer noticeable. The accuracy of a three-class (tree, shrub, and herbaceous) classifier was

improved from 76.5% to 78.1%, for radiometrically corrected versus non-corrected images, respectively. These results demonstrate that the radiometric correction improved land cover classification using mosaicked multi-temporal satellite data.

Keywords: relative radiometric correction, mosaic, satellite imagery

Xuwei Chen, Texas State University - San Marcos. Email: xc1001@txstate.edu; Microsimulation of Hurricane Evacuation Strategies of Galveston Island

This article investigates the effectiveness of simultaneous and staged evacuation strategies for hurricane evacuations of Galveston Island using agent-based microsimulation techniques. In the simultaneous strategy the entire population of the affected area is informed to evacuate simultaneously, whereas in a staged evacuation strategy, the affected area is divided into different zones, people in different zones are informed to evacuate in a sequence. The simulation results suggest that the most efficient staged evacuation strategy can help reduce the evacuation time for Galveston Island by approximately one hour. This strategy helps relieve traffic pressure on the IH-45 bridge and mitigate traffic conflict between adjacent zones, therefore leads to a reduction in total evacuation time. The simulation results also indicate that previous studies might have underestimated the evacuation time of Galveston. We also found that an evacuation under the rapid response assumption does not necessarily lead to an effective evacuation as a result of severe traffic congestion. This study fills a void in the literature about the performance of simultaneous and staged evacuation strategies applied to large geographic areas. In addition, this study demonstrates that a microsimulation approach has the capability to capture some of the characteristics of traffic congestion resulting from interactions among individual drivers which could have otherwise been missed by a macro simulation approach. Microsimulation is indeed a very useful modeling tool for evaluating different evacuation strategies and options. It can be used to assist emergency managers and planners to determine effectiveness evacuation procedures for a given area.

Yi-Chia Chen, Louisiana State University. Email: f370718@ms16.hinet.net; Identity Shift in a Post-Military Society: A Case Study of Quemoy

The purpose of this study is to reveal the ongoing identity construction in a post-military society under the interaction with demilitarization, cultural tourism and border-crossing. In pursuing the reconciliation with China, demilitarization emancipates the locals in Quemoy from the state narrative during the military rule, and empowers them in home construction and border-crossing. However, the dismissal of the identity as a military outpost simultaneously calls for an inquiry to reposition the social self in the changing context. As landscapes often seen as human inscriptions whose meanings can emerge through a reading of them in the syntax, this study by investigating the changes of the landscapes unfolds the proclamation made by the locals on who we are and what is it that we are jointly up to. The underlying discourses of landscape changes influence the identity construction in distinctive ways: 1) The development of heritage tourism, while incites restoration of the historic landscapes, sacralizes these places as the representative image of home; 2) Through the interpersonal interactions, the border-crossing makes realize the difference of the everyday cultural practices, which results in the complicated checkpoints and the strict Customs regulations; 3) Demilitarization, though deprives of the essential functionality of the military structures as war apparatus, sequentially monumentalizes significant ones playing out to be the mnemonic carriers of the immediate past. The identity contest among the military outpost, the tourist island and the gateway city articulates the inhabitants' quest for the economic development and their pursuit of the image of home.

Keywords: identity construction, demilitarization, cultural tourism, border-crossing

Yi-Fong Chen, National Dong-Hwa University. Email: hwafong@yahoo.com; Are We "Natural" Enough? The Ecological Tourism and Social Development in Taroko National Park Area and San-Chan Tribe, Taiwan

This paper aims at exploring the socio-cultural influence of the newly established ecotourism, which integrates cultural revitalization, ecological conservation and social development, in both Taroko National Park area and San-Chan aboriginal community. Many cases in different parts of the world indicate that the indigenous peoples have developed patterns of resource use and management that reflect detailed knowledge of local geography and ecosystem, and contribute to the natural conservation through their living practices. The development of ecotourism is expected to follow the guideline of both respecting indigenous culture and conducting sustainable development. The aborigines in

Taroko region are one of the earliest indigenous tribes to come into contact with tourists from outside, as the result of the world-renown Taroko Gorges drawing tourists from all over the world. Under the influence of the “community comprehensive construction project”, the ecotourism performing in greater Taroko region establishes the criteria to evaluate the “new partnership relations” between the state and the indigenous peoples. While in San-Chan community, due to the environmental risks produced by the stone-mining company and the negative impacts generated by the unregulated mass tourism expansion, the local indigenous people decide to close the public access to the attractive tourism spot for its fragile ecosystem for three years, while at the same time establish a community development association to promote ecotourism, to diminish the negative tourism impacts and to create job opportunity for poverty alleviation. These two cases embrace the ‘nature’ as an important element in their construction of new place identity.

Email: ycchen@ust.hk; *Wal-Martization in Southern China*

This paper analyzes the impact of Wal-Martization on the supplier networks and the labor condition in southern China. Wal-Martization refers to a new form of low-cost production practice that led by Wal-Mart and its imitators. Many local and international retailers are now demanding their suppliers to meet the “Wal-Mart price” as a new standard in their purchasing practices in southern China. This article suggests that a new retailer-driven commodity chain - led by Wal-Mart - began to strongly influence the purchasing price of consumer goods produced by the suppliers that compete fiercely for Wal-Mart’s order. The “high-volume” purchasing power of Wal-Mart allows it to pass the cost of price war in the retail sector - “Everyday Low Prices” - to its supplier networks. The unbearable risks of fulfilling the stringent Wal-Mart’s order requirements ? such as short deliver time and uncompromised quality ? have triggered down the commodity chain with the lower tier suppliers bearing the highest risk. The consequence of this downward squeeze has direct negative consequences on Chinese workers. Workers in Wal-Mart supplier factories see their salaries declining, benefits disappearing, unpaid overtime increasing, and health and safety conditions deteriorating. Moreover, these impacts have spread beyond the Wal-Mart supplier networks to almost all consumer goods industries in China due to the price competition set-off by Wal-Mart. In short, Wal-Martization has intensified the ‘race-to-the bottom’ competition among retailers and suppliers while increase the labor exploitation in the supplier factories in southern China.

cafes123@163.com; *Using Dynamic Recurrent Neural Networks For Integrated Spatio-Temporal Forecasting*

Spatio-temporal forecasting has been developed from individual spatial or temporal forecasting and gained heavy attention for its promising performance in handling complex data in which not only spatial but also temporal characteristics must be taken into account. Among other methods, static feedforward neural networks are employed to discover the hidden and deeply entangled spatial relationships. However, such approach is insufficient in forecasting dynamic processes developing over space (such as forest fire and air temperature), which usually change nonlinearly. Dynamic recurrent neural networks can consider both the parametric and structural learning due to the feedback mechanism in the neuron nodes. Therefore, we used a dynamic recurrent neural network for integrated spatial-temporal forecasting. It is illustrated by a real case study of annual temperature prediction of meteorological stations in China. Such an integrated spatio-temporal forecasting achieved better forecasting accuracy than those obtained by conventional time series analysis and spatial forecasting using a static feedforward neural network. It reveals that dynamic recurrent neural networks can be used as a general tool of spatio-temporal data prediction for complex data with temporal and spatial attributes.

Email: liu@geog.tamu.edu; *An Agent based Cellular Automata Model for Urban Simulation of Houston Metropolitan Area*

This paper examines the urban land use changes in the Houston Metropolitan Area. Houston is currently the only major city in the US without a zoning ordinance, and market forces are the major forces to drive commercial location decisions. Therefore, if we could incorporate the individual behavior of each agent influence on triggering the land use change, more precise predictions of urban dynamic change could be generated. UrbanSim is an agent based CA model

to interpret how a metropolitan region is growing and how various combinations of land use and transportation policies and investments are likely to direct these trends. First, causal factors for urban land use changes are discussed. Then, several factor layers are chosen as the basic driving forces for the urban expansion, e.g. population, employment, transportation, land use plan, and land policies, etc. Third, modification and tuning of the model parameters are implemented. Finally, the complex influence of the non-zoning urban development and the policy implications are described.

So-Min Cheong, Dr., University of Kansas. Email: somin@ku.edu; Craig ZumBrunnen, University Of Washington. Email:
craigzb@u.washington.edu; *Working in Interdisciplinary Contexts*

Is not geography already the most interdisciplinary of disciplines? Why do we need any special consideration of interdisciplinary education and research training? On the one hand, the all too common tensions we all hear or know about between physical and human geographers within many of our own academic departments and institutions should itself disclose this need. On the other hand, increasingly geographic problems from the local to the global involve highly interrelated and complex humanistic, social and natural science issues and much more! Unmet real societal needs and practical financial concerns of researchers about declining governmental support for graduate education and research funding by governments, especially for state-funded research universities, are rapidly coming into an alignment that favors interdisciplinary education, training and research efforts. In this short paper we focus on changing paradigms of interdisciplinarity, interdisciplinary praxis, and suggestions of ways to enhance skills for research, education, communication, and management while working in interdisciplinary contexts. We highlight unmet and under-met training needs and experiential ways of improving them. We call attention to some of the institutional impediments to interdisciplinary work. We draw heavily on our personal experience in our suggestions of how to enhance skills sets for successful interdisciplinary and “transdisciplinary” work. In a nutshell, we see attention to language, personal work styles, experiential-problem-based learning, team-work, and formal group-process training exercises as crucial ways for improving the skill sets needed for intellectually stimulating, rewarding and successful interdisciplinary work. Time allowing we will demonstrate one of our group processes.

Email: jwelch@wcupa.edu; *Foreign Aid in Sub-Saharan Africa: Failure to Alleviate Poverty*

It is a common perception among academic researchers and aid practitioners alike that the presence of Western foreign assistance policies in Sub-Saharan Africa is largely responsible for the region’s somewhat slow but steady economic growth in recent years. Others have attributed this recovery to better aid practice, strong poverty-focused donor programs and generous foreign assistance to Africa. Foreign assistance is expended on grounds that resource inflows are used to improve and enhance the life of the people entrapped in the vicious cycle of poverty. This paper uses aid flow data published by the World Bank in a cross-country panel regression to estimate its impact and correlation with the overall economic growth captured by the gross domestic product (GDP) for a universe of 48 Sub-Saharan Africa countries between the years 1970-2004. The paper notes three worrying observations: (i) the relationship between foreign aid and growth is non-existent; (ii) the highly selective aid practice means millions of poor people in this region are neglected, and; (iii) aid-effectiveness in Africa is inhibited by negative donor practices.

Spatial data has become one of the standard input requirements for environmental modeling. A comprehensive understanding of uncertainty embedded in spatial data and the propagation of spatial uncertainty in modeling results is critical to deciphering model behavior and making informed decisions. Particularly in urban atmospheric dispersion modeling, results of simulations can vary significantly according to different atmospheric and geographic conditions. This paper examines spatial uncertainty and uncertainty propagation in urban atmospheric dispersion modeling, using the QUIC dispersion model as an example. We term the two main sources of uncertainty as spatial data uncertainty and model parameterization uncertainty. Spatial data uncertainty mainly

arises from measurement and transformation uncertainties in building data. Model parameter uncertainty attributes to parameters used in computational model which may not accurately represent real world scenarios. We employ the Monte-Carlo method to examine both spatial data and model parameter uncertainties. In order to assure statistical validity on uncertainty assessments, we generated 30 randomly perturbed sets of input building data and model parameters. With the perturbed data sets, two groups of model results are simulated by the QUIC dispersion model. The first group of model results is based only on building data uncertainty with default model parameters, whereas the second group of model results is based on model parameters uncertainty with default input building data. Two groups of model results are then compared with results from field experiments. Results of the study contribute to the understanding of spatial data and model parameter uncertainties in urban atmospheric dispersion modeling.

Keywords: Spatial uncertainty, model parameter uncertainty, urban atmospheric dispersion model, Monte-Carlo, uncertainty analysis, QUIC dispersion model, GIS

Ivan Cheung, Association of American Geographers. Email: icheung@aag.org; GIS Education and the Emerging GIS&T Community in the U.S.

The long-term sustainable growth of the U.S. GIS&T community (or the geospatial industry) relies upon the development of a diverse, multi-faceted GIS educational system. In the U.S., there are over 450 academic programs offering GIS education and training. These programs offer stand-alone GIS courses, undergraduate and graduate degrees, as well as professional certificates. Some are offered through traditional methods while others are delivered through distance learning programs. This paper attempts to provide a comprehensive look at how these programs vary across the U.S. For examples, how accessible are these educational and training programs to urban versus rural population? Is there a spatial "mis-match" between the supply of GIS education and demand of GIS-training workforces in the U.S.? How are different academic disciplines, such as Geography, approach the tremendous needs to deliver quality GIS education? The main objective is to provide a base-line understanding of the state of the U.S. GIS education.

Anil K. Chhangani, JNV University. Email: chhanganiak@yahoo.com; Paul F Robbins, Ph.D., University of Arizona. Email: robbins@email.arizona.edu; S.M. Mohnot, Ph.D., School of Desert Sciences, Jodhpur, India. Email: ; Wildlife Conservation and Adaptation in the Indian Aravalli: Panthers, Hanuman Langurs, and People

Conservation mandates in the Aravalli hills of India have sought in recent decades to protect top predators, especially panther (*Panthera pardus*). The research described here examines the relationship between wildlife species within the Kumbhalgarh Wildlife Sanctuary (KWS), specifically examining predator and prey relations. The analysis of scat collected from KWS reveals that the panther is the main predator in the Aravalli ecosystem and that the strongest prey-predator relationship in the area is that between panthers and Hanuman langurs (*Semnopithecus entellus*), which are essential to predator survival. In the 50 scat samples collected from within the sanctuary, Hanuman langurs hairs predominated. The order of presence of hairs is: langur (29%), goat (17%), wild boar (15%), sheep (13%), cow (13%) and others (13%) (blue bull, peacock, dog, camel, etc.). This analysis and our visual observations suggest that Hanuman langur tops the list of most valuable prey of panthers in KWS and survival of panthers is therefore depends on availability of langurs. Since langurs, in turn, are highly adapted to human presence and depend heavily on crop raiding for subsistence, the indirect importance of human cultivation on the sanctuary edge for meeting conservation goals can be inferred.

Ashwini Chhatre, Harvard University. Email: ashwini_chhatre@ksg.harvard.edu; Illegible lands, unruly people, and technologies of government: Environmental decentralization in historical perspective

Even as environment became the focal point for action in the late twentieth century, the idea of community emerged as a strong alternative to state agencies in addressing environmental problems. This trend is foremost in policies aimed at countering the threat of global deforestation, with scores of countries formulating policies to devolve management authority to village communities. Decentralization is being hailed not only as a remedy for protecting the environment; it is also celebrated for its democratic potential. However, behind the grand narrative of decentralization and celebration of civil society might lay more prosaic reasons of state. Changes in political economy, and its relationship to the exercise of state power and the legitimacy of coercion, might be one of them. The analysis of the politics of decentralization needs to be located in the

history of state formation and the concomitant political economy of the environment, with special attention to the material interests of various actors, including the state and its fragments. This article traces the emergence of one case of decentralization in Colonial India.

Netra B Chhetri, Arizona State University. Email: Netra.Chhetri@asu.edu; Decision Making Under Uncertainty: Ranking of Multiple Stressors on Central Arizona Water Resources

This paper explores the value of multiple stressor analysis as a support for decision making under uncertainty associated with water management policy in the Central Arizona region of the southwestern United States. More specifically, we assess the significance of each stressor in its relation with the vulnerability of water supply systems and generate a ranking of the stressors through a weight-of-evidence approach. Based on the causal links between stressors and their effects on water resources, the multiple stressors of Phoenix AMA are broadly placed in three categories: municipal, agricultural, and biophysical. Our analysis shows that outdoor irrigation uses within the municipal category is the largest stressor on water resources. Ranked second is the loss of water due to rise in temperature and simultaneous reduction in precipitation due to global warming in the Colorado and Salt/Verde River basin, the largest supplier of surface water to the Phoenix AMA. This is followed by the stress on water resources resulting from inefficient agricultural practices. Indoor water use is ranked fourth among the stressors. The relatively low ranking of indoor water use is not surprising given the implementation of efficiency standards and innovation of technologies in plumbing fixtures. Higher residential water demand due to increased night time temperature in the urban area is a distant fifth. Analysis and ranking of multiple stressors in the water resources of Phoenix AMA reveals that outdoor water use and agriculture practices are comparably fertile targets for efficiency gains from technical and management perspectives.

Guangqing Chi, Mississippi State University. Email: gchi@ssrc.msstate.edu; Stephen J Ventura, University of Wisconsin-Madison. Email: sventura@wisc.edu; A Spatio-temporal Examination of Population Change: Demographics, Accessibility, Developability, Desirability, and Livability

Population growth (or decline) has been studied in several fields including demography, human ecology, population geography, environmental sociology, transportation planning, and regional economics. However, little systematic work has been undertaken to synthesize their different approaches to and views on population change. In this study, we examine population change holistically in an attempt to shed light on the mechanism of population change. We first systematize population change's driving forces and spatial and temporal dimensions from an interdisciplinary perspective. The driving forces are organized and developed into five indices - demographics, accessibility, developability, desirability, and livability. We then test our approach by examining population change from 1970-2000 in Wisconsin at the municipal level. The findings suggest that such an approach helps systematically understand driving factors' effects on population change, capture their spatial autocorrelation, minimize the multicollinearity, reduce heteroskedasticity, eliminate spatial error and lag dependence, and integrate the two seemingly unmixable approaches of environmental modeling and demographic modeling together.

Keywords: population change, spatio-temporal model

Lan-Hung Nora Chiang, none, National Taiwan Univ. Email: nora@ntu.edu.tw; *Transnational Lives of Taiwanese Immigrant Women in Canada: An Appraisal*

Despite increasing interest in the study of Taiwanese immigrants, the underlying concept and methodology remain gender-blinded. The major questions raised for this research is how female immigrants cope with ensuing difficulties in the new environment; and how their civic participation affect their lives. Around fifty women were interviewed in Toronto and Vancouver, in 2005~2006, using a semi-structured questionnaire, ethnographic interviews, and participant observation methods. Most of the middle-class women being studied in this research had careers in Taiwan prior to immigration, but have become full-time home-makers and study mothers. Most of them belong to "astronaut families" where the husbands have returned to Taiwan to make a living. Being not in the labour force, they spent their time on their kin in Canada and Taiwan, and engage in volunteering work in the host country. Despite their years of immigration to Canada, their civic participation are characterized by social embeddedness at this stage.

Lifang Chiang, University of California at Berkeley. Email: lifang@berkeley.edu; *Bay Area Machine Shops: A Regional Geography of Skilled Manufacturing*

This paper will explore the role of skilled manufacturing in an advanced regional economy by presenting the case of the precision machining sector in the San Francisco metropolitan area. I begin by inverting the often-heard question, "why and where has manufacturing gone?" By instead posing a nearly opposite but more specific question, "why are machine shops and machinists still here?" I hope to offer insight into the survival and future prospects for the region's machine shop sector and its overall skilled manufacturing base. What explains the continued existence of over 700 machine shops in what is popularly thought of as a "knowledge economy" or "high technology" region? Viewed through the lens of sociologist Marc Granovetter's "social embeddedness" framework, spatial, technological and cost factors come into play, but arise out of social relations and organizational practices. The latter include the evolution of a complex and increasingly fragmented network of supplier-customer relationships; collaborative arrangements between shops; and the strategic use of a skilled and adaptable workforce. My session talk and accompanying paper will 1) document the historical trajectory of this long-standing sector, 2) inquire as to the current state of business, employment and training in the sector, and 3) postulate future directions for firm and worker opportunities in the regional machine shop sector.

Shih-Shen Chien, NUS. Email: crison@gmail.com; Litao Zhao, . Email: ; *Why Send non-local Cadres to Local Offices?*

Unlike many countries with political decentralization/devolution that local leaders are democratically elected, China practices a relatively unique political system that local leaders are assigned by upper-level governments. In this paper, we particularly focus on a type of local leaders promoted not from the 'native-ness' but from the non-local cadres. The existing researches identify three different but interrelated political reasons why non-local leaders are promoted: first, the effort of the centre against localism; second, a training package offering local management experiences to potential 'rising stars'; and third faction politics in Beijing by sending their protégé to 'occupy' different localities. What has not yet well documented is an economic reason with a geographic perspective: non-local leaders who are promoting from advanced places to underdeveloped places for the reason that experiences and tacit knowledge of development attached to those cadres are able to be diffused from to economically developed areas to laggard regions. The authors further empirically test the argument by a case of local economic development in eight county-level regions in underdeveloped mid and north Jiangsu (at least in contrast to developed and globalized south Jiangsu) in related to career paths of their leaders from 1996 to 2004. In terms of career path, there are two groups: the mid/north 'nativeness' vis-à-vis the southern non-local. The regression test shows positively that those who were non local (naming, from south Jiangsu) did generate more FDI, GDP, and fiscal revenue, particularly as compared to their counterparts who were nativeness in mid and north Jiangsu.

Brian Child, University of Florida, IUCN Southern African Sustainable Use Specialist Group. Email: BChild@africa.ufl.edu; Brian Jones, Private Consultant. Email: bjones@mweb.com.na; *Principles, Performance and Challenges of CBNRM in Southern Africa: 20 Years of Experience*

This paper outlines the history of CBNRM in southern Africa. It explains how networking across the region and across disciplines led to a common set of inter-disciplinary principles that guided implementation and the emergence of a new conservation paradigm. It then briefly presents a set of CBNRM performance metrics, describing the progress made by these programmes in southern Africa since the late 1980s. When applied properly, this data suggests that devolution consistently contributes to conservation and poverty alleviation and empowerment. This contrasts to some extent with peer-reviewed literature that is starting to portray CBNRM as a failure. We address this dichotomy by establishing a clearer institutional and operational definition of CBNRM. Finally, we turn to governance, which is an emerging but still weakly defined narrative in development writing and practice. CBNRM is entering its second decade of implementation, and we observe that (as NGOs and donor funding are phased out) it is facing three challenges: that of sustaining technical capacity beyond the project cycle; a suggested increase in internal conflict associated with devolved rights (cf Fabricius et al, 2004); and governance, with aborted devolution, corruption and elite capture being particular threats. We use our practical experience with CBNRM in southern Africa to define and discuss key governance issues at several scales, and to relate these to the sustainability and resilience of CBNRM.

Anne Chin, Texas A&M University and National Science Foundation. Email: chin@tamu.edu; Peng Gao, Syracuse University. Email: pegao@maxwell.syr.edu; *Modeling step-pool sequences in mountain watersheds*

Mountain watersheds are increasingly under pressure from human land uses that include logging, mining, grazing, and urban development. Mountain channels are characterized by a preponderance of steps and pools, producing a striking, repetitive staircase-like longitudinal profile. Although the rhythmic character of the step-pool streambed has long attracted the attention of scientists, few studies have successfully quantified the nature and significance of this spatial rhythmicity. This paper develops a quantitative model to describe and predict the rhythmic step-pool morphology in a range of environments. Time-series analytic techniques are applied to a large database of step-pool streams to test the hypothesis that predictable, periodic step-pool streambeds develop in diverse environmental settings, and that a general model is capable of describing their characteristics. The model reveals the extent to which step-pools are expressions of meandering in the vertical dimension, similar to pools and riffles in downstream channels, and suggesting a fundamental adjustment to maintaining equilibrium channel geometries under high energy conditions. Such a model is potentially useful in the design, management, and restoration of steep channels. Because mountain streams are important habitats for many sensitive aquatic species, results of this study can also have implications for the ecological management of impacted mountain watersheds.

Miriam Chion, Clark University. Email: MChion@clarku.edu; *Streets of Color in San Francisco*

During the last decade, San Francisco has been shifting from a diversified place of production to a homogeneous and upscale place of consumption. This shift reflects broad national trends in which professionals and wealthy suburbanites are moving into the city attracted by the trendy industrial character, Latin music, or streets' festivals. (Johns 2004, Zukin 1995, Sandercock 2003) Between 1995 and 2005, major investments in San Francisco shifted towards upscale housing and entertainment facilities in the inner city neighborhoods, where marginal immigrant populations, small businesses, and artists had created an intense street life. In this development process, the new residents and government policies were undermining the production of that street life by displacing its producers. While the global economic restructuring, gentrification, and creative class approaches have highlighted particular dimensions of this development process, they only provide a partial understanding. I argue that this development should be explained by the tensions between the production and consumption of San Francisco's spatial capital, a concept I proposed drawing from Massey's (2005), Castells' (1997), and Lefebvre's (1991) work. I particularly focus on how dance troupes, ranging from folk to avant-garde ensembles, engage in the production of spatial capital by converging in San Francisco to dance and bring together disperse local and international communities. Behind the colorful performances they deliver at the carnival or local theaters, I explore the challenges they face to find rehearsal studios, housing, and gathering places in San

Francisco, as they encounter upscale development and city policies and regulations.

Peter George Chirico, United States Geological Survey. Email: pchirico@usgs.gov; *Digital terrain modeling of the projected water level increase at the Kajakai Reservoir, Afghanistan*

The assessment of Afghanistan's natural resources is a major component of the long term recovery and reconstruction activities currently being conducted by foreign donor agencies. Natural resource assessments include scientific investigations to map energy, mineral, and hydrologic resources, as well as natural hazards. Authorities are planning to install new spillway gates at the Kajakai Dam and Reservoir, located on the Helmand River in the south-western Afghan provinces of Helmand and Uruzgan. The new spillway gates will increase the water level and allow for greater hydro-electric power generation and increased water for irrigated agriculture. To investigate the effects of the increased water level, 2.5m resolution panchromatic SPOT-5 stereo imagery was acquired to develop a high resolution digital elevation model (DEM). The resultant DEM has a horizontal resolution of 5m and a vertical accuracy of $\pm 10.03\text{m}$ and was developed using stereo-autocorrelation techniques and ground control point (GCP) measurements. Integrating the DEM with pan-sharpened Quickbird imagery enabled the delineation of reservoir elevation levels, individual households, and critical land-use/land-cover data which were provided to government officials and agencies assisting with reconstruction planning. Officials used this information to perform a cost benefit analysis of the Kajakai Reservoir capacity increase that balances concern for flood control and households which will need to be relocated with the water demands of irrigation, power production and the need for drinking water.

Brett R. Chloupek, Oklahoma State University. Email: brett.chloupek@okstate.edu; *Young Czechs' Perceptions of the Velvet Revolution, Velvet Divorce, and the Modern Czech Identity*

Young college-aged Czech students find themselves coming of age during a period of momentous change within their country. These students are caught between two unique generations of Czechs. The earlier generation grew up in Czechoslovakia, a country dominated by the post-World War II communist regime. It was this generation which was active in the dissident movements and student protests that brought an end to the communist control of Czechoslovakia in 1989. The later generation is the first in over 50 years not to know communism. Members of this generation however, know Czechoslovakia only as a part of their history and are growing up in an emerging capitalist society. The focus of this paper is on the intermediate generation of students who experienced both the reemergence of Czechoslovakia from years of communism as well as its subsequent breakup. These students were too young to have participated in both the Velvet Revolution and Velvet Divorce, yet still old enough to remember them. They represent valuable, albeit largely untapped sources of information and offer useful insights into the effects these monumental transitions had on their country and its culture, as well as its national identity and relationship with Slovakia. The purpose of this paper is to articulate young Czechs' perceptions on how the Velvet Revolution and Divorce have affected the modern Czech national identity.

Fletcher P Chmara-Huff, MA, Ohio State University. Email: fletcherp@gmail.com; *Making Room for the Indigenous in Western Space*

Methodologically, indigenous space is difficult to contain in western spatial paradigms. This is due to the 2 dimensional representations of space that are emblematic of the geographic profession, namely maps, rather than multidimensional lived spaces. This paper explores a brief history of representation of indigenous spaces through a case study in the Great Basin and explores methodological frameworks that are used by indigenous and non-western peoples to try to come to terms with indigenous space. In addition, new directions for potential research will be explored.

Email: arc@mar.dfo-mpo.gc.ca; *Greenhouse Warming and Changes in Biogeographic Ranges of Marine Species on the NW Atlantic*

We report the potential for shifts in range of marine species as sea surface temperatures (SSTs) change with greenhouse warming. Our study focused on 30 species harvested in US and Canadian waters of the NW Atlantic and included shellfish, finfish, and seaweeds, as well as introduced and invasive species and an important copepod prey. We used a bioclimate envelope approach, determining

each species' "thermal habitat" from its geographical distribution (water depths and range in latitude) with respect to satellite-derived data on sea surface temperatures. We then applied projected SSTs to predict changes in range. Projected temperatures were derived from four Atmosphere-Ocean General Circulation Models for the period when average global air temperatures are expected to increase by 4°C , ~2090. Differences in the magnitude of SST changes between the two climate warming scenarios we used were less than differences among models. Our analyses show that all species will experience some distributional change and many species which have their southernmost extent near Cape Hatteras are likely to experience retraction of range there. For some species a retracted distribution is expected within Canadian waters. Species with greatest change in range include a seaweed, serrated wrack, capelin and Atlantic salmon, a species already listed as endangered. Canadian fisheries could benefit from the northward expansion of range of the blue crab and common periwinkle. However, range expansion of two invasives, the Japanese shore crab and green crab also is predicted where these species are presently limited by winter ocean temperatures of the Canadian Atlantic.

Eunyoung Christina Choi, Syracuse University. Email: euchoi@syr.edu; *Everyday life of Undocumented North Korean migrants in Changing Geopolitics of Northeast Asia*

Northeast Asia is in transition from its Cold War stage and adapting to market driven neo-liberal imperatives. In this transformation, the number of North Korean migrants who flee to China and then on to safe third countries has dramatically increased since the 1990s in response to life threatening food shortages in North Korea. Most of the detected undocumented North Korean migrants in China have been forcefully deported to their country according to the Chinese-North Korean treaty and received harsh punishment as "betrayals of the state" in their home country. The current outward migration from North Korea is also significant because of its gender composition. More than 70 per cent of these North Korean migrants are women, many of whom are migrating to China in the form of human trafficking. Given that, I seek to understand the changing geopolitics of Northeast Asia through the lens of marginalized North Koreans' "embodied stories of migration" (Hyndman). Specifically, I will focus on the migrant bodies who cross the North Korean-Chinese border and, in so doing, move from a closed socialist system of a totalitarian regime into a capitalist economy and thereby become subject to the influence of international politics including UN policies and states' powers of North Korea, China, South Korea, and the U.S. Rather than seeing North Korea and international politics from the above and outside, I intend to explore how North Koreans themselves have experienced the changing geopolitics in their everyday lives and in relation to their gender and class identities.

Gwangyong Choi, Rutgers University. Email: tribute@hanmail.net; David A. Robinson, Rutgers University. Email: drobins@rci.rutgers.edu; *Climatology and Variability of Northern Hemispheric Seasonal Onsets and Durations*

To date, climatologists have mostly used a three-month fixed season concept to examine long-term fluctuations of seasonal climate (e.g. summer is defined as June 1 to August 31) This fixed seasonal definition facilitates the mathematical calculation of seasonal averages, but is clearly flawed, as seasons vary according to geographical locations and years (e.g. the timing of summer is quite different in Hawaii and Alaska). We derive the spatially and temporally-floating seasonal onset dates across the Northern Hemisphere using surface air temperature, vegetation, and snow cover data sets, in what may be the first effort employing this approach. Furthermore, we assess the interannual variability of seasonal onset, including changes associated with the warming of the past several decades. Maps of seasonal climate cycles demonstrate that seasonal onsets and durations across the Northern Hemisphere are affected by various climate factors, such as latitude, altitude, continentality, and shadow effects of topography. We also find that compared to 1979-1987, the length of summer (summer onset to fall onset) has increased by 5-25days in the post 1987 period in Europe, Mongolia, and the southwestern US, as well as over oceans near 30°N . In contrast, winter is abbreviated by 5-30days in the post-1987 period in the Rockies, western Europe, the western Former Soviet Union, and northeast Asia, as well as near the Arctic circle. More detailed results, such as degrees of spatial and temporal variability in the climatology and trends of seasonal cycles, and its potential linkages with the Northern Hemisphere atmospheric circulation, will be discussed.

Keywords: seasonal onset, seasonal duration, seasonality variability, Northern Hemisphere

Mississippi State University. Email: ; *Multitemporal Water Budget Database*
for National Fire Risk Assessment

Landscape moisture is recognized as an important component for modeling fire risk. The cumulative interplay of precipitation and evapotranspiration help characterize landscape moisture. This study designed a spatiotemporal database to derive and manage water budget estimates using daily assessments of precipitation and evaporation (P-E). Precipitation estimates are compiled using Digital Precipitation Array products that are Doppler radar-based estimates of hourly rainfall accumulation. Evaporation estimates are calculated from the weather station measurements such as wind speed, solar radiation, minimum relative humidity, and maximum temperature observations. In addition, database building process is automated including coordinate transformation, creating new feature classes in the database, and P-E calculation and mapping. This study shows the process of designing and building a geodatabase to manage multitemporal climatic data that can be used for fire risk assessment.

Gaffen and Ross's "Climatology and trends in U.S. surface humidity and temperature" Revisited - 10 years after.

Spatial patterns and temporal changes of apparent temperature were examined by hourly heat index values over the contiguous United States during a 45-year period (1961-2005). At lower threshold values for heat index, the normal daily frequency of maximum heat index shows no surprising spatial patterns. At higher threshold values of heat index, a distinct southwestern desert and south central Gulf coast pattern emerges for the normal daily frequency of heat index. Extreme heat index events in the southwest are driven by high surface temperature, while extreme heat index events in the south-central are driven by thermal and moisture advection from the Gulf of Mexico. Significant increasing trends were found at each threshold over most of the contiguous U.S. However, a decreasing trend is also found in the Pacific West Coast, the Intermontane West, and along the U.S./Canadian Border. This research also shows future trends in extreme heat index associated with increases in humidity and temperature in the lower troposphere.

The role of American missionary in the formation of public-private spatial division

This paper seeks to explore the unknown genealogy of public and private spatial divisions established by American missionaries in the early twentieth-century in Korea and cast light upon the complicated ways in which the consideration of gender, civilization and religious practices played a significant impact upon inscribing the public-domestic sphere. For Americans, one of the most glaring manifestations of the backwardness of the Korean people was characterized by the total 'lack' of the distinction between what Americans saw as private-domestic and civic-public. Coupled with the 'unhygienic, primitive and miserable living condition' typified of the Korean peasants, the overall spatial arrangement was interpreted as the sure sign of a civilization in decline, which only the promotion of Victorian domesticity was able to remedy and rectify. Given the limited resource and political and monetary influence at their disposal, the privileged means with which to pursue this goal was through the domestication of the Victorian ideal within the spaces of home and church: the material improvement of home was likened to spiritual growth while the proper cultivation of domesticity and femininity equated to progress in civilization. But this was far from being a case of simple superimposition of Western spatial divisions. The ongoing debate amongst American missionaries concerning domestic spatial arrangements exposed a contradiction at the heart of Western modernity in Korea, one that was played out at the level of private, domestic space, rather than of public, institutional space for which American missionaries were most known.

Hydrological Impacts of Climatic and Land Use Changes in a Meso-scale Basin in the Midwestern U.S.

The purpose of this study is to model the impacts of the potential changes in both climate and land use on the streamflow of the Kishwaukee River Basin (KRB, size 3258km²) in the Midwestern United States under various climate-land use combined scenarios. The Hydrological Simulation Program - Fortran (HSPF) was calibrated for different locations in the KRB and was repeatedly run with eight climate/land use combined scenarios generated by combining two climate

scenarios and four land use scenarios. The two climate scenarios are from the HadCM3 climate model simulations under A2 and B2 greenhouse gas emission scenarios, and the four land use scenarios representing different degrees of urban growth are from the Land use Evolution and impact Assessment Model (LEAM). The results of the study can be summarized as follows: (1) Annual runoff is predicted to decrease by the 2040s under both A2 and B2 emission scenarios, but urban growth will have some effect of diminishing the decrease. (2) The summer (June, July and August) and low-flow season (August, September and October) runoff is predicted to substantially decrease by the 2040s under both climate scenarios, which leads to soil moisture decrease over autumn and winter. (3) The effect of combining climate and land use scenarios has not been confirmed under the present approach, which suggests the need for incorporating the feedback between climate, land use, and hydrological models.

Negotiating Marginality in the Workplace and Local State: Disabled Women's Experiences of Employment and Employment Assistance in Canada

This paper reports on the results of a cross-Canada survey on disabled women's experiences of employment and government employment assistance. Findings indicate that many disabled women continue to struggle to maintain marginal and often tenuous relationships to places of paid work. They also indicate that government efforts to assist disabled women in finding and keeping a job often make little difference in disabled women's lives. Much more can and must be done in order to ensure that disabled women have access to jobs that pay a living wage and provide accommodation of their needs, and have the kinds of employment assistance that can make real differences in their places in the working world.

Maps API for Internet GIS Applications

Since the launching of Maps Application Programming Interface (API) in 2005, many web developers, including both geographers and non-geographers, applauded the freely adaptable tools and spawned a lot of Internet applications. Many well-known customized "map hacks" geocoded point locations of feature (e.g. Chicago crime data, photo sharing) by using the Map API provided by Google or Yahoo. The success of the Maps API largely attributed to its availability of global data coverage, dynamic navigation, query capability, and ease of implementation. Despite of its versatility in dynamic exploration of geographic data online, the Maps API lacks the GIS functionalities (for example, spatial join) compared to standalone GIS software or other established Internet Mapping Services. The goal of this research was to examine the potential of the Maps API for Internet GIS applications. This research employed the Google Maps API and developed a web prototype that disseminates the spatial information of urban sprawl in Mundy Township, Michigan. The web prototype explored and extended the existing functionalities in displaying and processing both raster and vector data. The results revealed that the spatial and attribute information of a GIS database can be effectively represented in the Google Maps API by using Geographic Markup Language (GML). The GML approach shows that Maps API has great potential for building more complex GIS functionalities that standalone GIS software possesses. This work provided useful insights in the future development of Maps API for Internet GIS applications.

A Review of Tropical and Subtropical Canopy-Level Urban Heat Island Studies

Observations of canopy-level Urban Heat Island (UHI) phenomena in several tropical and subtropical cities are presented and reviewed. Comparisons with temperate city UHI studies will be done in two ways. Firstly, maximum UHI intensities recorded in "ideal" conditions of clear and calm weather are related to population size of selected (sub) tropical cities and compared with existing temperate city data. Secondly, temporal dynamics of (sub) tropical UHI are examined and also contrasted with temperate city UHI observations. These results are related to several factors, such as (i) the impact of different urban morphologies of temperate and tropical cities on the UHI, (ii) to the expansion of UHI form with city growth, and (iii) to the variability of the "rural" background of the tropical UHI. Lastly, relationships between moisture (i.e. soil moisture and humidity) with UHI intensities, as well as topographic and coastal influences on UHI form and intensity are noted and discussed.

Nicholas R. Chrisman, Université Laval, Réseau GEOIDE Network. Email: nicholas.chrisman@geoide.ulaval.ca; *Research networks in GIS: Towards a geography of research funding*

Yes, GIS research has expanded, everyone knows. But there is a geography of research funding that has led to different results in different places. This presentation will start with the funding mechanisms available in the earliest period of GIS development. I will start with Professor Horwood at University of Washington, Howard Fisher at Harvard, and Roger Tomlinson. I will then move to the 1988 competition that led to NCGIA in USA. Other countries took somewhat different paths, dependent on the institutional structure of science and academic life. This presentation will concentrate on Canada and the Networks of Centres of Excellence. One of the NCE networks, GEOIDE, is in its ninth year. It has had a larger budget than NCGIA, so it is a time to ask if these funds were well spent. As Scientific Director of GEOIDE, it is my job (and pleasure) to demonstrate how Canada has invested its research funds to obtain measurable results. This example can contribute to a geography of research funding for other portions of the discipline.

Jon Christensen, Stanford University History Department. Email: jonchristensen@stanford.edu; *How the West Was Shaped*

Spatial analysis can provide powerful tools for historians to illustrate how space has been constructed and changed in complicated ways over time. In most cases, spatial analysis tools are used to analyze spatial relationships in order to represent them more accurately and objectively. In this paper, I discuss a project using GIS, other spatial analysis tools, and computer graphics programs to represent the subjective construction and experience of space on railroad lines in 19th century America. Instead of rectifying older more subjective cartographic representations to modern standards, this project uses the same tools to distort accurate modern maps of railroad lines to understand how subjective space was constructed differently in different places over time by changing railroad freight rates. Some places were brought closer together; others were moved farther apart. This project involves developing a computer model to create dynamic visual cartograms that change shape as data on real freight rates derived from historical archives change over time. This model is being constructed to bring changes in space into history in a salient fashion for research and teaching. This will be a proof of concept of a tool that could be used more widely in representing and teaching spatial concepts in history and for further research into the ways in which time, cost and other variables change space in other periods and areas of the world.

Shannon M Christie, PhD Candidate, University of Saskatchewan. Email: shannon.christie@usask.ca; *Methodologies of Political Ecology in the American West: Are they Coherent and Complete?*

Recent work on political ecology of the American West documents how influxes of exurban in-migrants seeking amenity values and 'pristine' nature have brought worldviews and land uses into conflict with those held by 'local' residents who chiefly rely on land for resource extraction. These studies illustrate the need for researchers to understand both historical and contemporary land and resource use conflicts. It is frequently lamented that the field of political ecology does not have a coherent theoretical basis or methodological approach. We explore this complaint by undertaking a survey of methods used in applied political ecologies of the American West. Our review reveals that case study methodologies and techniques are almost universally employed. Methods include participant observation, attendance at public meetings, and interviews with community stakeholders, public agency officials, representatives of nongovernmental organizations and regional or local industries, and Aboriginal peoples. Several studies supplement interview data by conducting content analysis of public documents and records; while some further supplement findings with mail-out (quantitative) surveys of local households. While the dominance of these methods provides suggests a unified methodological approach for political ecology research in the American West, we present a couple of cautions. First,

the time period over which studies are conducted is uneven and second, documentation of ecological change is limited. These findings raise questions about the extent to which changing ecologies are understood and integrated into longitudinal political stories rather than used as a backdrop to dynamic politics currently being played out in the region.

Classifications of remotely sensed data have widespread usage for land-change studies, but with medium- and coarse-resolution data (1km and higher), problems with "mixed pixels" obfuscate detailed multitemporal change detection. Previous studies of change detection been facilitated by the use of Landsat-like imagery, with 15-30 meter spatial resolution, which provide a convenient analogue to anthropogenic and natural features in the physical landscape. Coarser resolution multispectral imagery offer many advantages over finer-resolution imagery for studies of large regions, including an increased frequency of acquisition and broader swath per scene, enabling inquiries of the interannual and interseasonal trends associated with land cover transitions. Additionally, per-pixel uncertainty information assigned to these discrete classifications offers the associated confidence in the chosen class, informing the appropriate use of these data. Through the analysis and comparison of spectral and temporal signatures of MODIS 1km multispectral and classified imagery with finer Landsat imagery and aerial photographs, this study seeks to understand the class confusion that can hamper regional change detection, using examples from the United States (Northern California; Massachusetts) and Mexico (Michoacán; estado de México). Results of this research will recommend improved methods of calibration and validation, aiding regional inquiries of land use and land cover change worldwide.

Keywords: land-cover change, remote sensing, MODIS, uncertainty, anthropogenic change, phenological variation, multitemporal analysis

Bitter Christopher, University of Arizona. Email: cbitter@email.arizona.edu; **David A. Plane, University of Arizona.** Email: plane@email.arizona.edu; *Climate Regions and Migration Patterns by Stage of Life Course*

The objective of this paper is to examine the relationship between climate and population distribution within the United States. Prior research has found climate to be an important determinant of both quality of life and migration. However, studies of this nature typically represent climate as a set of distinct variables, which may not accurately reflect the influence that climate has on human welfare and quality of life. We feel that it may be more appropriate to express climate in a holistic manner, hence, this paper focuses on the relationship between population distribution and climatic "regions". The empirical analysis begins by examining changes in the distribution of population among climate regions from 1920 to 2000. Recent migration trends, disaggregated by age category, are then analyzed in order to gain a better understanding of which climate types are most attractive and how this relationship varies with an individual's stage in the life course.

Keywords: climate, migration, population, quality of life

Susan Christopherson, Cornell University. Email: smc23@cornell.edu; **Jennifer Clark, Georgia Institute of Technology.** Email: jennifer.clark@gatech.edu; *Power In Firm Networks: What It Means For Dynamic Regional Innovation Systems*

The role of power within regional firm networks is noted in empirical studies but insufficiently theorized. In this paper we take a "contrarian" position, questioning whether the model of network trust and cooperation reflects reality in regional innovation systems. We use a case study to illuminate power relations in firm networks and original research on innovative small firms in the "photonics" industry in New York State. Our findings indicate that transnational firm control over resources critical to innovation, including skilled labor, negatively affects the potential for innovation by small and medium-size firms. There are differences in the extent to which firms are capable of shaping extra-regional networks and thus, in their "strategic space". Transnational firms, in particular, are able to influence market governance rules at different scales, and use the state apparatus to meet their goals - to reduce risk or increase control over new intellectual property, for example. In this context, small innovative firms and large transnational firms do not share the same interests. Indeed, the capacity of small innovative firms in a region may be impeded by ability of large

transnational firms to shape conditions, such as regional labor markets, to meet their needs at the expense of the smaller innovative firms. Evidence for them the photonics case study demonstrates how instead of cooperation and enhanced opportunities for innovation, small firms experience competition for resources.

Keywords: Regional innovation systems, photonics industry, firm networks, economic development

Chi-Jung Chu, London School of Economics. Email: c.chu@lse.ac.uk; Re-examining museums and globalization

The last decade of the twentieth century saw the golden period of globalization in the museum world. Into the new millennium, museums have shaped a new urban landscape under the instruments of the state. Guggenheim Bilbao's experience has drawn a world-wide attention. Building grand museums becomes one of the state's urban regeneration projects and is seen as a major cultural program for the state. However, globalization in the museum field brought strong scepticism. Some fear that museums are in danger of "Disneyization", and it further erodes the local cultural identity and the state's sovereignty. The research investigates how states and museums of the peripheral positions in the world network responded to the globalization trend. The research adapts Wallerstein's world system theory as the backbone in investigating the global museum trend. Appadurai's proposal on the changing frameworks in the global cultural flow further explains the global museum branch building frenzy. The research uses two high-profile, state-lead museum projects as case studies: the Guggenheim's Taichung branch project and the National Palace Museum's branch project. The research argues that, on the macro-level, the relation between museums and globalization is contingent on the power play among states. It is not only cultural but economic, political resources that are at stake. On the micro-level, the research contends that the local context is critical in any global-scale museum project and that the state's role is essential in the orchestration.

Keywords: globalization, development, museums, state, cultural policy, Guggenheim, National Palace Museum, Taiwan

Yongwan Chun, The Ohio State University. Email: chun.49@osu.edu; Modeling Network Autocorrelation among Migration Flows by Spatial Filtering

Spatial migration models usually start from the premise that a migration flow among an origin and a destination is independent of flows among other origin and destination combinations. This assumption, however, is usually invalid in the empirical analysis of migration systems. Behavioral arguments can be made that make a subset of flows stochastically dependent on each other. For instance, the set of outflows from a particular origin may be correlated among each other. Competing behavioral assumptions lead to different specification of the underlying network autocorrelation structure. While a migration matrix is of dimensional order n by n , the resulting network autocorrelation structure will be of dimensional order n^2 by n^2 . Consequently, with increasing n a network autocorrelation structure will rapidly become computationally infeasible but still can be handled for migration flows among the 49 conterminous U.S. states (including D.C.), which are used here to exemplify the proposed methodology. It is common practice to model migration flows within a Poisson regression framework. This framework, however, needs to be extended to accommodate network autocorrelation. Spatial filtering using eigenvectors from the network autocorrelation structure as spatial proxies is proposed in this paper. Spatial filtering algorithms identify a subset of eigenvectors which augment the Poisson regression model and thus force network autocorrelation in the flow residuals of the augmented model to vanish.

Keywords: network autocorrelation, migration, spatial filtering, Poisson regression

Su-Yeul Chung, Western Illinois University. Email: S-Chung2@wiu.edu; 'Guided' Re-clustering of Racial/Ethnic Minorities in Suburbs: A Case Study of Korean Immigrants in Chicago IL PMSA

Moderate decline in racial/ethnic residential segregation during the last two decades in U.S. cities has called our attention to minorities' re-clustering even after moving to suburbs. However, many scholarly researches develop at the basis of the four major racial/ethnic categories - White, Black, Asian, and Hispanic -, lacking investigation of potential variance within each categorical group and, more importantly, processes of their re-clustering in suburbs. In response, the research attempts to understand variance in clustering/segregation across nationality groups by comparing residential patterns of the four major Asian nationality groups in Chicago IL PMSA, 1990 and 2000. Concerning the processes of minorities' re-clustering in suburbs, at least three factors have been pointed out: 'segmented path of assimilation', 'racial/ethnic preference in residential choice', and 'discriminatory practices in housing market'. The research also attempts to estimate relative roles of each factor through investigating Korean homebuyers and co-ethnic home sales agents in the study area. This research is expected to unveil underpinning processes of decentralized clustering of minorities by highlighting the roles of co-ethnic home sale agents in

geography of race/ethnicity in U.S. cities.

Keywords: segregation, race/ethnicity, Korean immigrant, segmented path of assimilation, racial/ethnic preference in residential choice, discriminatory practices in housing market

Andrew Church, University of Brighton. Email: a.church@bton.ac.uk; Tourism, power, culture and the creative industries in the core's periphery

The south east of England is often represented as a dynamic core growth region with the global city of London at its heart. Certain tourism resorts in the south east of England, with relatively high levels of deprivation, are portrayed as peripheral locations in this core region. This paper uses a case study of the resort of Hastings to explore how narratives of peripherality and creativity have featured in local urban regeneration and tourism revitalization policies. During the 1990s regeneration policy was dominated by strategies based on infrastructure for reducing peripherality and improving accessibility to an area of the south east relatively poorly served by road and rail transport. The decision of a planning enquiry to reject new road proposals in the area on environmental grounds led to a rapid reformulation of policy agendas to emphasize skills, education and the creative industries as a key source tourism revitalization and urban regeneration. The paper will use primary data from interviews with key policy actors and cultural industry workers to illustrate how problematic discourses based on the importance of a 'creative class' have served to dominate local regeneration agendas with significant consequences for the local tourism industry. The power resources of the key regional and sub-regional organizations are considered to indicate how the policy emphasis on creativity and culture developed. Conclusions will consider the problematic issues arising when 'core' region discourses of the 'creative class' are mobilized in peripheral locations.

Rebecca Ciccone, University of Nevada, Reno. Email: desertbecca@yahoo.com; Round Them Up And Drive Them In: Land Use Changes from Cattle Ranches to Subdivisions in the Truckee Meadows, Reno, Nevada.

Four eras (1935, 1975, 1995, 2005) of development, real estate growth, and landscape conversion from rural-agricultural-pastoral properties to subdivisions in the Truckee Meadows is tracked using GIS, aerial photographs, and county statistics. The interesting detail is just how the historic past of the Truckee Meadows is being used to entice newcomers to settle and buy up these former agricultural and pastoral lands. A variety of statutory and policy decisions at the city and county levels have made this possible. The irony of this is the fact that most of the subdivisions bear, as advertising promotions, the name of ranches on which they are built.

Caroline Cicero, MPL, MSW, Doctoral Student, University of Southern California, Leonard Davis School of Gerontology. Email: cicero@usc.edu; Outbound Seniors Community Fall Prevention Program: A New Paradigm for a Neglected Public Health Problem

This session introduces a community-based fall prevention program, the Outbound Seniors Model (OSM). OSM addresses the neglected public health problem of outdoor falls. This archetype finds its theoretical roots in Environmental Gerontology. Unlike other fall prevention programs, which concentrate on interior home modifications, behavioral change, and medical interventions for "at risk" older adults, OSM focuses on the environment a community dwelling elder encounters when he/she steps out the door. Original qualitative research, including interviews with public officials and focus groups with older adults who have fallen in their communities, helped translate the idea into an applicable model. OSM employs the geological metaphor of the earth's layers to illustrate varying levels of environmental modifications for reducing outdoor falls. Any municipality concerned about creating a safe and elder-friendly community can implement OSM.

Keywords: Outbound Seniors, fall prevention, environmental Gerontology, spatial aging, public health

Marie Cieri, The Ohio State University. Email: cieri.1@osu.edu; Creating Visions of "Pay Dirt": A Geo-Artistic-Activist Response to Post-Katrina Realities

I am involved in a project in New Orleans that I believe offers insights into ways geographers might play a part in envisioning and potentially precipitating alternative futures on a local, national and/or global scale. Since May 2006, I have been collaborating with artist Mel Chin and a team of local activists, scientists and educators to formulate an issue-based cultural response to economic, social and environmental conditions that certainly existed before Hurricane Katrina but were made undeniably manifest to the nation and the world in its wake. The two interlocking issues on which our team is focusing are, on the one hand, displacement of hundreds of thousands of people from their homes and, on the other, the grave level of soil contamination that greets those who

have returned or are contemplating return to the city. In my role as “consulting geographer,” I am researching the parameters of this far-flung and constantly changing diaspora as well as collecting scientific data about contaminated soils in order to develop a series of maps and other visualizations that convey the enormity and urgency of the situation. These graphic representations are being used to supplement Chin’s efforts to mobilize New Orleans citizens wherever they are living, activists and other supporters of social change to join in “Pay Dirt,” a nationwide action that will highlight the need for soil remediation by tapping into the unique power of the arts (in this case, in league with geography) to envision and communicate alternative futures within the public sphere.

Anna M Cieslik, graduate student, Clark University. Email: acieslik@clarku.edu; *Those Who Stayed Behind. The Effect of Recent Polish Emigration on Cities and People*

The aim of this paper is to investigate how municipal policies can influence flows of skilled labor. Particularly, it illuminates how the socio-economic environment of a city in Poland prevents/encourages emigration of young professionals. I also consider the effect of skilled emigration on urban labor markets and evaluate the potential consequences of return migration. Currently, about 700 000 people have left Eastern Europe to look for jobs in the United Kingdom. Similar number can be estimated to have left for other EU countries (in particular Ireland, Germany, France, Holland, Sweden and Norway). The British Accession Monitoring Report states that 34% of the migrants arriving from new member states were employed in administration, business and management. On the one hand, the massive migration of skilled labor is expected to have a lasting negative effect on post-socialist economies. On the other hand, return migration might contribute to the transfer of new skills from Western to Eastern Europe. In this study I estimate the potential effects of return/non-return of skilled Polish migrants on the labor market and analyze how cities can regulate the migration outcomes. The main questions that this research addresses are: 1. What is the role of municipal policies and urban socio-economic environments in regulating the circulation of skilled migrants? 2. Does the transnational transfer of knowledge occur? Do the returning migrants bring in new, internationally learnt skills and technologies that foster local economic development?

Keywords: migrant professionals, transnational transfer of skills, EU accession, Poland, Cities

Claudio Cioffi-Revilla, US Department of State and George Mason University. Email: ccioffi@gmu.edu; *Polichart Analysis: A Computational Cartographic Approach for Visualization of Human and Social Dynamics*

Conventional cartography for visualizing historical and geographically distributed information (e.g., thematic maps or historical atlases of, say, poverty, conflict, economic development, or other social data of historical interest) is limited by several longstanding problems, including arbitrary projections, information cluttering, territorial distortions, and other issues. Misconceptions and inferential errors can also result from these problems. Polichart visualization—a new computational methodology inspired by social cartography and computational tools—solves some of these problems by improving the topology of the base grid onto which historical data are plotted, and by adopting a set of simple albeit graphically efficient conventions. The resulting visualizations maintain several critical features (N-S-E-W orientation, territorial contiguities, and others), while eliminating some of the worse problems with conventional thematic maps of historical processes. This paper describes this new approach in support of computational analysis human and social dynamics and provides some examples with specific policharts applied to historical patterns of conflict and peace. Examples include the historical evolution of nuclear proliferation potentials in various world regions, state failure potentials that may provide historical insights, and other macro-historical processes. Extensions to smaller geographic units (e.g., county or provincial data) and risk analysis (e.g., visualization of hazard rates in event history analysis) are also discussed.

Keywords: cartography, map, global issues, world

Luc Claessens, University of Connecticut. Email: luc.claessens@uconn.edu; Christina Tague, University of California Santa Barbara. Email: ctague@bren.ucsb.edu; *Hydro-Ecological Linkages in Nitrogen Export from Urbanizing Watersheds*

We investigate the role of small streams in controlling nitrogen export from an urbanizing watershed, Baisman Run, located within the Baltimore LTER program. From extensive field experiments and hydro-ecological modeling, we demonstrate that small streams play an important but complex role in controlling nitrogen export from this urbanizing watershed. In-stream nitrogen processing is strongly controlled by both stream size and stream flow conditions. In addition, spatial and temporal variability in nitrogen concentrations throughout the stream network complicates the interpretation of experimentally derived

uptakes. We will present a variety of results from nutrient addition experiments, synoptic sampling, long-term nutrient budgets, and stable isotopic sampling. In addition we will present results from hydro-ecological modeling investigations, including the development of a simple geomorphic-based model of nitrate loss, and its application using Lidar-derived stream characteristics.

Keywords: hydrology, ecology, urbanization, watershed, nitrogen

Email: jtilley@usgs.gov; Leslie Milheim, U.S. Geological Survey. Email: lmilheim@usgs.gov; *Mapping Riparian Forest Buffer Restoration Opportunities*

Riparian forest buffers provide multiple environmental benefits including nutrient uptake, bank stabilization, stream shading, sediment trapping, aquatic and terrestrial habitat, and stream organic matter. Buffer restoration is one of the most popular and cost effective watershed restoration techniques. The Chesapeake Bay Program Partners have committed to restoring 10,000 miles of riparian forest buffers by 2010 as part of an overall effort to restore the health of the Chesapeake Bay. Gaps in riparian forest buffers and very narrow buffers represent restoration opportunities. Gaps can be identified using remotely-sensed imagery; however, imagery characteristics influence the dimensions and types of gaps that can be detected. Gap dimensions and proximate land characteristics are important factors influencing the restoration value for any particular gap. This project compares the utility of moderate-resolution, Landsat-derived land cover products with high-resolution land cover products derived from IKONOS and/or digital aerial photography for mapping a range of forest riparian gap sizes in a variety of landscape settings. Geographic Information Systems and image classification software are used to evaluate the relative utility of moderate vs. high resolution land cover products for identifying gaps in riparian forest buffers and for identifying any improvements to nitrogen and sediment loading models that may result from the use of higher resolution data. Factors considered in the analysis include high-resolution imagery characteristics (e.g., spatial resolution and spectral band composition) and moderate-resolution landscape factors (i.e., riparian vegetation class, surrounding land cover, soil type, surficial geology, topography, class heterogeneity, average patch size, and number of patches).

This paper explores the feasibility of a hypothetical hydrogen rental-car business based at the Orlando (FL) International Airport. We examine barriers to using hydrogen as a fuel source for the rental car market and propose some possible solutions. We draw on three primary lines of research. First, to understand the consumer point of view we conducted a personal intercept survey of 435 rental customers at the Orlando Airport. We asked questions about socio-demographic characteristics, awareness and knowledge of hydrogen, reasons for and against renting a hydrogen car, willingness to pay more, destinations in and around Orlando, and willingness to drive out of their way to refuel. Second, to study the corporate point of view we interviewed managers of rental car companies; particularly a company that currently rents hybrid vehicles and previously rented electric and CNG vehicles. Important issues for a successful business model included: a steady revenue stream via rental of conventional vehicles; a means of identifying customers willing to upgrade to alt-fuel; parking and HOV benefits for alt-fuel cars; adequate range and refueling locations; breakdown concerns; the status value of alt-fuel cars; the availability of such cars elsewhere; and the all-important resale market for used vehicles. Third, we studied the barriers to the hydrogen economy in general and applied the hydrogen-specific lessons to the rental car business. Based on these three dimensions, we assess the feasibility of a hydrogen rental car business in Orlando.

Roger Alex Clapp, Simon Fraser University. Email: aclapp@sfu.ca; *Forest politics, plantations, and the hardwood chip trade in Australia, Chile and South Africa*

This paper delineates three phases in the interaction between global commodity trade and environmental mobilization. Case studies of Australia, Chile and South Africa, combined with time series analysis of trade statistics, show that the Japanese paper industry has played a significant role in the development of

environmental movements in its trading partners. Japanese demand for hardwood chips has created successive regional booms in old-growth clearance, plantation establishment, and environmental opposition. Each phase contains the seeds of its own destruction. The maturation of eucalyptus plantations is closing the window of opportunity for turning old-growth forests into wood chips. The superior pulping qualities and rapidly increasing supply of plantation-grown eucalyptus have given the Japanese industry alternatives to pulping old-growth trees. Market campaigns directed at global consumers have accelerated that transition. In response to those campaigns, chip exporters have sought government subsidies and launched strategic lawsuits against environmental campaigners. The paper concludes that technological transitions in the paper and plantation sectors have placed many old-growth forests beyond the economic margin. The preservation of those forests, however, requires political actions to prevent government subsidies from propping up a destructive industry.

Cool, Creative and Complex: Exploring social networks and gender in project-based creative industries (advertising) in London

The recent literature on the organisation of firms has highlighted the importance of project-based firms. The significance of project-based modes of organizing in new industries has been seen by some as heralding the development of a new 'logic of organizing' in market economies, particularly in the creative industries. However, much of this literature follows a macro-level perspective. In doing so, scholars ignore workers in these industries who are said to be at the forefront of the 'new economy'. Alongside this literature, scholars have highlighted the importance of social networks for ones reputation and career progression. Although, there has been some evidence suggesting that women and minorities have less access to network connections and are often less able to utilise the connections they have, this type of analysis has been absent from the literature on social networks within economic geography. In light of this, I use a micro-level (interview-based) approach to explore working practices in the new economy, particularly in project-based creative industries, where social networks are important and gender differentiations are present. I explore these themes through a case study of the advertisement industry in London in order to show the extent to which men and women's networks differ. Hence, this paper aims to contribute to our understanding of the gendered experiences of men and women working in the new economy particularly highlighting project-based industries. Second, it will also address an area of neglect in economic geography concerning gender and social networks and network rewards for men and women.

Dennis Kubly, Bureau of Reclamation. Email: DKUBLY@uc.usbr.gov;
Amy Cutler, Bureau of Reclamation. Email: ACUTLER@uc.usbr.gov; *The Western Water Institutional Solutions and WWIN GIS Collaboration: Findings of Focus Group Discussions with Reclamation Area Offices on Water Conflict and Cooperation*

In September of 2006, focus groups were held in the Grand Junction, Albuquerque, and Provo U.S. Bureau of Reclamation Upper Colorado Area Offices to determine how water conflict is currently managed and how it could be better managed. In each office from 10 to 20 participants shared their experiences. Managing water conflict figured prominently in the daily activities of virtually every participant, but played a bigger part among more senior managers. Several common themes emerged. One was that conflict often occurs during periods of profound change. Recent changes in Western water resource management include the emergence of new constituencies such as endangered species, Native Americans, second homes, or recreational users. Traditional users such as irrigators have often fought these changes and demanded compensation for water they judged to properly belong to them. Compensating those who felt they had lost legitimate rights was deemed critical to the avoidance of conflict. Water negotiations often take place over many years, but play an important role in reaching collaboration. Collaboration often occurs when users begin to recognize the legitimate needs of other constituencies and also see that, in the absence of a negotiated settlement, a court will impose a solution. Building relationships among diverse constituencies is also key to collaboration, as are joint fact-finding efforts. Dueling scientists must be asked to collaborate intensively. Finally, it is deemed critical that every constituency have a place at the negotiating table and a voice. Negotiations often fail when critical stakeholders are not a part of the collaboration process.

This paper will discuss the findings of a study investigating parental influences on childhood obesity. Our aim is to identify whether local child-feeding behaviour patterns might be a contributory factor. Previous research has indicated that certain child-feeding behaviours - restriction in particular - may contribute to childhood overweight and obesity. Most research into child-feeding behaviours (in the context of child weight) has been undertaken in the United States, with very little complementary research in United Kingdom populations. We are conducting a survey to investigate self-reported child-feeding behaviours of parents of primary school children (age range 4 to 11 years) in Sheffield, United Kingdom. As far as we are aware, this is the first study to collect data on child-feeding behaviours from parents of school-age children in the United Kingdom. We are using the Parental Feeding Style Questionnaire, developed by Wardle et al. (2002) and validated in the United Kingdom using a sample of parents (n=214) of younger children (age range 3.8 to 5.3 years). We will present the results of our survey and comment on possible implications for childhood obesity policy. Child-feeding behaviours are currently neglected by policy-makers, but may be an important aspect to address if we find that parents do report using inappropriate or 'risky' child-feeding behaviours. Our research group forms the Public Health strand within an interdisciplinary research programme called 'Changing Families, Changing Food', funded by the Leverhulme Trust.

Dean H K Fairbanks, California State University Chico. Email: dhfairbanks@csuchico.edu; *An Investigation of the Spatial and Temporal Patterns of*

It is important to understand the abiotic and biotic features that limit the distribution and abundance of a species, especially, for species and habitats that have a special conservation status, such as *Orcuttia tenuis* and vernal pools. This study investigated the possible spatial and temporal factors that may determine the distribution of *Eleocharis macrostachya* and *Orcuttia tenuis* within two vernal pools located in Tehama County. The abiotic data (rock cover, soil depth to hardpan, and basin elevation) were compared with *E. macrostachya*, and *O. tenuis* cover to investigate spatial patterns for these plant species. Annual *E. macrostachya* and *O. tenuis* cover were compared with annual precipitation and air temperature to find temporal patterns for these plant species. The spatial results found that depth of soil to hardpan determines *E. macrostachya* distribution, and *E. macrostachya* cover shapes *O. tenuis* distribution. Basin elevation appeared to have little effect on either *E. macrostachya* or *O. tenuis* distribution. The temporal results indicate that *E. macrostachya* and *O. tenuis* abundance is relative stable at a 1.0 m² scale but *O. tenuis* varies at a 0.25 m² scale. The inconsistency of *O. tenuis* abundance at a micro scale could be due its preference for warmer air temperatures causing a possible "shifting mosaic steady state." Even though abundance is relatively stable for *O. tenuis* and *E. macrostachya* in both pools, there is negative spatial relationship between them indicating possible competition. *Eleocharis macrostachya* may not hinder *O. tenuis* abundance but may dictate its distribution within a pool.

David B. Clarke, Professor of Human Geography, Swansea University. Email: d.b.clarke@swan.ac.uk; *The ruins of the future*

What was once designed to withstand the test of time - the production process generating by-products which, serving no useful purpose, were classed as waste and condemned to instant disposal ? is, in a society of consumers, destined for an ephemeral existence. "Now, it is the turn of the useful part to be short lived, volatile and ephemeral, to clear the stage for the next generation of useful products. Only the waste tends to be (alas) solid and durable" (Bauman). This paper explores urban transience and durability in the light of this reversal, taking its cue from Baudrillard's statement that "One can imagine entire cities put together not from the waste of what has already served a purpose and therefore retained some trace of its previous usage, but of things that were waste 'from the outset' ? assured of never growing old or being revived in any memory."

Keywords: transience, durability, instant, cities

Martin Clarke, University of Leeds. Email: martin.c.clarke@btinternet.com; *Exploring the geospatial impacts of demographic change on personal income and the financial services markets in the UK using MOSES*

As is well documented the demographic structure of the UK and many other European countries will experience significant change over the next 20 years. With an ageing population composed of more single person households it is projected there will be a 20% growth in the number of UK households by 2021. This will put increasing pressure on an already overheated housing market. At the same time, due to the fall in equity markets in the early 2000s there is predicted to be a substantial deficit in pension payments to those retiring over the next decade. It is likely that this will lead to households looking to release the equity they have accumulated in their properties to make good the shortfall in their pension expectations. In this paper we shall describe how we are attempting to model some of these processes using MOSES - a dynamic microsimulation model of the UK population of individuals and households being developed at the University of Leeds. In particular, given there are major differentials in population change, income and house prices between and within regions of the UK, we are interested in modelling how the impacts of these changes pan out at the local level, the implications for local housing markets and in the wider context, for the financial services industry.

Keywords: microsimulation, demographic change, housing market

Casey Cleve, UC Berkeley. Email: cleve@sfsu.edu; **Maggi Kelly, PhD, UC Berkeley. Email:** mkelly@nature.berkeley.edu; **Faith Kearns, PhD, UC Berkeley. Email:** mmoritz@nature.berkeley.edu; *A Comparison of Pixel-based and Object-oriented Classification Approaches for Mapping Wildland Urban Interface (WUI) Areas using High Spatial Resolution Aerial Photography*

People are moving into the wildland-urban interface (WUI) — where urban and wildland areas intermix — at increasing rates worldwide. Living in the WUI places property and lives at risk from wildfire. Accurately mapping WUI areas can provide decision-makers with the information needed to help mitigate these risks. Freely available, high spatial resolution aerial photographs are increasing available to local agencies tasked with wildfire mitigation in the WUI. However, traditional photointerpretation methods can be labor intensive and expensive. Therefore, exploring image processing techniques that can partially automate this map classification process is useful. We compared the accuracy of pixel-based and object-oriented classification methods to differentiate between three urban land-use/land-cover categories that are particularly important for wildfire mitigation — built areas (structures and transportation), surface vegetation/bare areas, trees/shrubs, as well as shadows. The object-oriented classification approach consisted of a combination of fuzzy membership and nearest neighbor supervised classification, while the pixel-based approach consisted of unsupervised classification methods. Results indicate that the object-oriented approach yielded a 17.97% higher overall accuracy than the pixel-based classification approach. These results show that using an object-oriented classification approach for identifying fire hazards in the WUI is a promising technique that may help decision-makers to mitigate wildfire risks.

Keywords: object-oriented classification, wildland-urban interface

David A Cleveland, University of California - Santa Barbara. Email: cleveland@es.ucsb.edu; **Daniela Soleri, University of California - Santa Barbara. Email:** soleri@es.ucsb.edu; *Towards sustainable, local food systems: Agriculture and urbanization in the Goleta Valley, California*

As food production and distribution systems become increasingly globalized and centralized, consumer interest in negative environmental and social impacts of these systems has also increased. Use of urban and periurban land for food production and marketing provides an alternative, and is central in efforts to increase food system sustainability by increasing the local aesthetic, nutritional, educational, economic and environmental benefits of agriculture. Yet at the same time, pressures for non-agricultural development of growing populations and their demands for housing and urban infrastructure, and for preserving outlying natural areas by urban infill, challenge the possibility for this alternative. We examine the struggle of the City of Goleta, California, and the adjacent unincorporated Goleta Valley, to find a balance between protecting its dwindling agricultural land and farmers, and responding to demands for conflicting development. Data are from interviews with local interest groups, government bodies, key individuals, and a survey of farmers and food consumers. We analyze the environmental, economic, and social assumptions different viewpoints are based on, and the implications of these assumptions at the state, national and global scales, and over the long term. The goal is to facilitate discussion and consensus building by helping to make assumptions and their implications across scales more transparent.

Benjamin Peter Clifford, King's College London. Email: benjamin.clifford@kcl.ac.uk; *The Planner's Tale: The sharp end of delivering a British urban renaissance*

In 2001, a UK government green paper on 'Delivering an Urban Renaissance' was published, picking up a number of recommendations made by noted architect Lord Rogers. In the same year, another green paper was also published which called for fundamental change in the planning system, including the stated objectives of making planning both more efficient and more community focused. Both reports were conspicuous by their lack of engagement with the realities of urban planning on the ground. In this presentation, I draw on empirical material from my research with the British planning profession to argue that it is fundamentally important to consider their perspective and role in delivering an urban renaissance at what we might-term the 'street-level' (Lipsky, 1980). I explore how planners, as both built environment professionals and local government employees, find themselves on the sharp end of top-down programmes of planning reform as well as changing local governance and wider change in the public sector, particularly that associated with the so-called 'New Public Management' and the rise of an 'Audit Society' (Power, 2002). I try to draw connections between these various reforms through consideration of their impacts on the planners themselves and by giving voice to the planning profession through interview and questionnaire results. I conclude by suggesting that despite it being a relic of post-war Modernism frequently at odds with more entrepreneurial models of local governance, the planning profession is central to the actual delivery of an urban renaissance in Britain.

Nick Clifton, Dr, Cardiff University. Email: cliftonn1@cardiff.ac.uk; **Phil Cooke, Prof, Cardiff University. Email:** CookePN@Cardiff.ac.uk; *The Creative Class: is there evidence for a 'Capital City effect'?*

In this paper we begin to explore how city role and status may impact upon the creative class. The context for this is the UK, with data (both qualitative and quantitative) presented on London (England), Cardiff (Wales) and Edinburgh (Scotland). Previous work in this area has led us ask questions about these and other 'national & regional capitals' in a setting of quite distinctive regional (devolved) economic governance set-ups. Particularly, asymmetric devolution in the UK means capitals play potentially different (but simultaneous) roles both within their devolved territories and the wider UK context. As such, any creative class impacts may not be uniform. Moreover, how (devolved) national and (capital) city-region 'quality of place' policy interacts (and conflicts) may be observed; is this potential interaction of policy an issue for capitals in a way in which it is not for other 'provincial' cities? Also, it is likely that capital city effects will be both a) direct / tangible - for example higher levels of employment in areas such as public administration and perhaps related activities such as PR, journalism, consultancy and so on, and also b) less tangible in nature - e.g. reputation or 'halo' effects, self-confidence and the like. These are among the issues investigated. More generally, if there are capital effects- how important are these relative to the other factors hypothesised to impact upon the distribution of the creative class? - does the relative strength of the effect itself vary according to the nature of the capital under consideration?

Keywords: Creative Class, Cities, Governance, Policy

Michael Logan Cline, M.A., University of Arizona, Department of Geography. Email: mcline@email.arizona.edu; **Jon Pelletier, Ph.D., University of Arizona, Geosciences Department. Email:** ; *Cinder cone hillslope modeling at the San Francisco volcanic field, AZ*

Cinder cones in the southwestern U.S. are unique landforms because both the age and initial morphology can be well constrained and the parent material is homogenous. As such, cinder cones of a variety of ages provide an ideal natural laboratory, analogous to pluvial scarps, for investigating the controls of hillslope processes. Past work using the diffusion equation to model the cone shape has had relative success because it provides a good approximation of morphology change on large spatial scales. We tested a radially-symmetric diffusion equation to model cinder cone evolution. First, we developed an analytical solution to cone evolution based on a Bessel series expansion. We systematically surveyed multiple cinder cones of known ages in the San Francisco volcanic field near Flagstaff, AZ for comparison to the model. Each cinder cone was surveyed in multiple directions to investigate slope-aspect control. We compared the radially-symmetric diffusion equation's analytic solutions with the observed crater-rim morphologies to evaluate the accuracy of the model and to determine the effective diffusivity over the age of the cone. The crater rim is generally devoid of channels so it provides a good location for constraining hillslope diffusion and rates of cone evolution. In addition, we propose a conceptual model of cinder cone degradation. Preliminary findings show that eolian influx changes the texture of the cone itself, increasing the relative rate of cone evolution through time by forcing non-diffusive hillslope processes within the large-scale

diffusive morphology of the cone.

Norman W. Clippinger, Research Associate, University of Colorado, Boulder. Email: clipping@colorado.edu; *Influence of fine-scale land use on the presence of meadow jumping mice (*Zapus hudsonius preblei*)*.

Human land use may have a major influence on the presence or absence of various species of wildlife. Residential development, excessive grazing or agriculture in grasslands, gravel mining, and industrial activity may have a detrimental effect on riparian habitat in the Colorado piedmont. Riparian habitat is essential for populations of Preble's meadow jumping mouse (PMJM; *Zapus hudsonius preblei*), a subspecies listed as threatened by the U.S. Fish and Wildlife Service. In this study, I employed a land cover dataset in a GIS to model any possible differences in land use between PMJM capture sites and non-capture sites in riparian habitats of Colorado. I used ArcView to identify the land use classifications (using the NLCD database) of surface water, low-intensity residential development, grasslands, and forest- or shrub-lands at 960 PMJM trapping sites. In addition, a series of new land use category grids (at the same 30 m resolution as the original grid) were created by calculating the land use of the majority of cells within a radius at varying distances from capture sites: 60 m, 90 m, 120 m, 150 m, 180 m, and 210 m. Logistic regression was used to analyze the resulting dataset. There was a significant negative effect of low-intensity residential development on the presence of jumping mice, and significant positive relationship between shrub-land and presence of jumping mice. This pattern was repeated at all radial distances from capture sites, indicating that land use at varying scales surrounding these sites had similar effects on jumping mouse populations.

John Cloud, NOAA Central Library. Email: john.cloud@noaa.gov; *Google Earth through a Keyhole*

At the heart of Google Earth is Google's purchase, in 2004, of Keyhole Corporation, a digital mapping company founded in 2001. Google's press release said: "Keyhole customfounded in 2001 in Mountain View, California. ers include consumers, large and small businesses and public agencies", without further specification. The major "public agencies" using Keyhole products were and are members of the US Intelligence Community. "Keyhole" itself is a play on words. When the modern American security protocols on "overhead intelligence" were created in the Cold War, TALENT was created to control aerially acquired imagery and data, and then KEYHOLE was created to control satellite-derived materials. The "Keyhole" is also a metaphor for the holes between classified and unclassified realms in American reconnaissance science and technology. American reconnaissance capabilities were so productive, yet so secret, that methods were devised to share sensors and data with "nominally" civilian agencies, which acquired their own TOP SECRET labs. These are coordinated at the highest federal level by the Civil Applications Committee (CAC), the interagency broker between the classified and unclassified realms, which by tradition is headed by a suitably high official of the US Geological Survey in the Department of the Interior. This is the direct legacy of USGS's uses of CORONA reconnaissance satellite imagery (1960-72). Google Earth is yet another descendant of this process; these are glimpses through a keyhole, and also evidences of the major engine of the Military -Industrial- Academic Complex that has structured American geography for over half a century.

Nathan Lee Clough, Ph.D. student, University of Minnesota. Email: clou0062@umn.edu; *BIDs and the urban public sphere: discourse, speech, and control in new public spaces*

Social scientists from Amin et al. (2000) to Zukin (1996) have stressed the important role that urban public space plays in creating healthy, livable, and democratic cities by providing space for sociability, solidarity, and political action. Yet the increasing privatization of urban space and governance mechanisms, which is exemplified in the pervasive phenomenon of Business Improvement Districts (BIDs), has led some to posit the 'end of public space'. Through an analysis of BID planning documents and 'best practice' guidelines in the US and UK, in conjunction with ethnographic research on political activism in an American BID, I interrogate the discursive and material orientation of BIDs towards democratic expression in the prominent urban public spaces these organizations now control. The lack of a discursive space for a public sphere in BID documents, alongside the documented marginalization of non-consumer practices in BID spaces, suggests that these organizations pose distinct challenges for those who would use the city as a public forum, a site for democratic debate, and as a place for political action.

Keywords: Business improvement districts, public space, democracy

Marie-Soleil Cloutier, University of Montreal, Canada. Email: ms.cloutier@umontreal.ca; Philippe Apparicio, INRS-UCS, University of Quebec. Email: philippe_apparicio@ucs.inrs.ca; *When proximity matters: a spatial analysis of child pedestrian accidents in urban school context*

Child pedestrians move within complex spaces and many factors influence whether or not they will be involved in a collision. In Montréal, Canada, accidents affecting child pedestrians (5 to 14 years old) remained almost constant from 1994 to 1999. However, the fact that children attend school during weekdays is barely taken into account in researches studying the link between risk factors, exposure to these various factors and frequency of accidents. The objective of this paper is to integrate the elementary public school environment in the spatial analysis of accidents. This means that the study period is limited to the different school calendars and that the proximity between accidents and schools is considered through the construction of "proximity zones". The proposed methodology integrates several spatial databases into GIS to calculate number of accidents per zone (dependent variable) and seven predictors of child pedestrian accidents: 1) school language; 2) school enrolment; 3) percentage of 5-14 years-old children; 4) social deprivation index; 5) road network density; 6) main road density; 7) land-use entropy index. Then, these variables are used to perform a global regression model and geographically weighted regression (GWR) model. The global model shows that social deprivation, school language and main road density are the most important predictors to explain child pedestrian accidents. However, the GWR results demonstrate that all predictors vary significantly in space. Finally, they suggest that prevention initiatives should take into account the social and physical particularities of each neighbourhood to target relevant risk factors locally.

Keywords: Child pedestrian accidents, spatial analysis, geographically weighted regression, risk factors, geographic information system

Michael Coan, Science Applications International Corporation. Email: coan@usgs.gov; Joyce A. Fry, Science Applications International Corporation. Email: jfry@usgs.gov; Collin Homer, U. S. Geological Survey. Email: homer@usgs.gov; Charles Larson, Science Applications International Corporation. Email: larson@usgs.gov; *Development of a Land Cover Change Product from Two Generations of the National Land Cover Database (1992 and 2001)*

The Multi-Resolution Land Characteristics Consortium has supported the development of two national land cover products: National Land Cover Database (NLCD) 1992 and NLCD 2001. These two data sets provide the user community with unique tools to evaluate land cover change. Research shows that direct comparison of these two land cover products, which were created using different modeling methods, is problematic. The NLCD Change Product was developed to offer a more accurate and useful guide to change analysis than can be provided by direct comparison of NLCD 1992 and NLCD 2001. A multi-stage processing method utilizes both NLCD products in procedures that include reclassifying both eras of land cover using a decision tree classifier at Anderson Level I, filtering intermediate results with confidence parameters, determining changed versus non-changed pixels, and labeling the final change product using a "from-to" change classification code. A comparison of the prototype NLCD Change Product with a skilled manual interpretation indicates approximately 85 percent agreement in the type and spatial distribution of change. This overview of the methods, procedures, and models involved in creating the NLCD Change Product allows users to understand the strengths, weaknesses, and appropriate use of the product.

David M. Cochran, Ph.D., University of Southern Mississippi. Email: David.Cochran@usm.edu; Carl A. Reese, Ph.D., University of Southern Mississippi. Email: Carl.Reese@usm.edu; *Local Knowledge of Historic Hurricanes among Coastal Miskito and Garifuna Communities of the Honduran Mosquitia*

Central America is vulnerable to hurricanes, but most of its nations are ill-equipped to mitigate their impacts. Furthermore, little scientific knowledge exists about the effects of historic storms in the isthmus. These challenges are most acute in isolated regions like the Mosquitia of eastern Honduras and Nicaragua. In this paper, we report the results of a 2006 participatory research mapping project in the Honduran Mosquitia where we worked with indigenous Miskito and Afro-Caribbean Garifuna communities to construct local histories of recent hurricanes. We collected information on hurricane tracks, storm surge, and storm duration, as well as the local impacts of Fifi (1974), Mitch (1998), and other historic hurricanes that have struck the region. We then compared our research results with existing scientific information on these historic hurricanes. Our findings demonstrate that coastal indigenous peoples have an important contribution to make in hurricane research in isolated areas of the developing world.

Allan Cochrane, Open University. Email: a.d.cochrane@open.ac.uk; Trying to define urban policy: exploring the meaning of a 'chaotic conception'

In one sense 'we all know' what urban policy is. It's what we say it is at any particular time - the latest cluster of initiatives intended to have some sort of impact on the lives of urban residents. But ultimately, of course, this is a profoundly unsatisfactory definition, which makes it impossible to assess the impact of urban policy over time, because the targets and nature of the initiatives keep changing, without it ever quite being made explicit and without 'lessons' being learned. Numerous attempts have been made to define the area more precisely, but none has been able to capture its complexity or adequately to explore its significance. The field is dominated by an apparently endless series of (sometimes very interesting) case studies from which it is difficult to draw any overarching conclusions. It has, therefore, been argued that urban policy is simply a 'chaotic conception' and that seeking to define it in any 'scientific' way is unlikely to be a very productive task. But that does not mean that there are no insights to be drawn from the study of urban policy. Here two things will be argued: first, that it is possible to identify a series of strands or themes that run through the experience of urban policy in practice; and second that exploring the ways in which they overlap and interweave at different times and in different places offer a very powerful route into understanding the changing shapes of welfare and post-welfare states (neo-liberalising and beyond).

Keywords: urban policy, welfare, post-welfare

Michelle Cochrane, MPH, Ph.D., University Of California - Berkeley (at PRC). Email: micochrane@earthlink.net; The social determinants of disease in the 'The Russia.'

This paper discusses the demographic crisis in the Russian Federation since the dissolution of the former U.S.S.R. in 1991, and the social determinants of disease in the 'New Russia'. In 2005, Nicholas Eberhardt concluded that "Russia is now at the brink of a steep population decline? a peacetime hemorrhage framed by a collapse of the birth rate and a catastrophic surge in the death rate?" arguing that the country's demographic losses represent the "greatest premature loss of life during 'peacetime' in modern history" (Eberhardt, 2005: 1-2). Over the long-term, Life Expectancy (LE) has fallen or stabilized at low levels in the former U.S.S.R. between 1965 and the present; however, LE estimates have fluctuated sharply in the past two decades, and can obscure important sexual and geographical differentials in mortality. For medical geographers and demographers, the most compelling research issue has been to explain declining LE, and increasing mortality rates, especially among men of working ages (Shkolnikov et al., 2004: 68). This paper reviews the evidence for the hypothesis (Bobak and Marmot, 1999; Plavinski et al., 2003) that cardiovascular disease and stress associated with 'transition' to a market economy (exacerbated by high rates of alcohol consumption), are the major social determinants of disease in the 'New Russia'. Moreover, Plavinski et al., (2003), Wilkinson (2006) and others have argued that the over-whelming majority of excess male mortality in Russia in the 1990s has been concentrated among lower social classes with limited education? those who have suffered the most from economic shock therapy.

The promotion of university-industry research-based partnerships and the stimulation of knowledge-intensive entrepreneurship have become core elements of regional development policy. In practice, however, increased university involvement in regional innovation systems has not been a policy panacea, and early optimism and euphoria has given way to considerable scepticism and frustration. We argue that part of this ambivalence can be traced back to considerable confusion concerning the mechanisms that underpin the translational effort to convert university-based knowledge into knowledge that is applicable in the commercial domain. In this paper we seek to analyze the variety of ways by which one particular local university has contributed to strengthening its regional innovation system and the factors that have shaped these translational mechanisms. Empirically, this paper provides a case analysis of the role and involvement of Lund University in the regional innovation system of the South Swedish region Scania. To do so, it focuses specifically at the three major areas of business engagement, i.e. (1) the creation of Ideon as well as research-based entrepreneurship at Lund University, (2) support for the life-

science cluster Medicon Valley and, (3) support for the food industry through 'Food Innovation at Interfaces'. The analysis looks particularly at the co-evolution of different organizations and institutions over time. In this analysis it draws on a regional innovation system framework to explore how particular institutional networks evolve, reshaping the functionality and capacity of the innovation system in which they are embedded.

Darryl T. Cohen, U.S. Census Bureau. Email: darryl.t.cohen@census.gov; Measuring Sprawl: A Comparative Analysis Using Demographic Data From the Decennial Census

Urban sprawl, or the proliferation of lower density urban settlement, has been a popular research topic among geographers in recent years. While the body of work on sprawl continues to grow, a precise, quantifiable, and widely accepted definition of what constitutes sprawl remains elusive. This is due partly to the lack of a consensus on just what constitutes sprawl from a conceptual standpoint, as well as the limited availability of comprehensive and detailed data of the nature required to discern between sprawl and non-sprawl areas. While freely distributed national data sets detailing the physical characteristics of urban areas (e.g., road networks, building footprints, etc., which are easily obtainable for some cities and not others) are scarce, the demographic data provided by the decennial census remain a viable resource in quantifying the nature of cities and their suburbs on a national scale. This paper will explore data from the most recent decennial census and examine how demographic variables may be used to identify and measure the level of sprawl in selected urban areas in the United States.

Nir Cohen, University of Arizona. Email: ncohen@email.arizona.edu; For the kids' sake: state and (trans)-national identity formation among second-generation Israeli migrants in the US

The paper focuses on Israel's relationship with second generation migrants in the United States. In particular, it examines the role played by the state-sponsored Scouts Movement (Tenuat HaTzofim) in North America in shaping youth migrants' (trans)-national identities. It argues that the movement and its activities are socio-cultural spaces created by the Israeli state in order to reach out to youth migrants and re-assert their national identity. By re-inserting itself into the lives of children migrants, I argue, the state expropriates effective responsibility from their parents and subjects them to a wide range of hegemonic practices aimed at bolstering their loose national identity. It further expands their geographical imagination of Israel as a complex socio-political environment to which they could more easily relate to. These and other state-sponsored practices aimed at young migrants are contingent, I argue, upon processes of state power re-structuring and re-territorialization which allow the state to transcend its boundaries at will and target specific de-territorialized subjects

Keywords: Identity formation, second generation, migrants, Israel, state-diaspora relations

Roseann Cohen, University of California, Santa Cruz. Email: rcohen@ucsc.edu; Cartographies of a shifting landscape: Displaced farmers and the politics of resource control in the city of Cartagena, Colombia

In illegal spaces bordering Cartagena's growing shantytowns and industrial sector, dispossessed farmers plant yuca, ñame, corn, papaya, plantains and sesame among other crops. These farmers have produced an agrarian landscape at the city's edge after fleeing violence in Colombia's countryside. My paper presents a cultural biography of this landscape. I produce an ethnographic

account of the way plants, seeds, and soils are endowed with power and meaning as violent conflict over natural resources reappears in urban contexts, collides with rural environmental imaginaries, and is marked by the complex histories and geographies of forced migration.

Keywords: forced displacement, dispossession, cultural biography of the landscape, urban political ecology

Shaul Cohen, University of Oregon. Email: scohen@uoregon.edu; *The Northern Irish Pivot: Parading From Contention to Peace?*

As Northern Ireland moves on through an international peace process, events on the ground are continuing to unfold. The contentious parading tradition displays elements of both opportunity and obstacle in relation to the broad set of challenges that accompany the negotiations and community relations that are elements of the political process. This paper draws upon interviews with parade organizers, official and unofficial negotiators, and the general public in Derry/Londonderry to study the relationship between micro-level acts of resistance and the fortunes of the macro-level negotiations. Parades in this city are the largest in Northern Ireland, and create some of its most contentious spaces, albeit for a limited period of time. Though negotiations have led to a diminution in associated violence for a number of years, progress in peace talks raises the stakes of these parades, making them a potential target for radicals on both sides of the dispute. At the same time, continuing success in relation to the parades provides momentum for territorial sharing arrangements that could be beneficial elsewhere in Northern Ireland, and beyond. Data from field work from 2003 through December 2006 will be presented, and recent developments in the peace process discussed.

Keywords: Territoriality, Identity, Northern Ireland, Political Space

Spencer Cohen, University of Washington. Email: zhuge99@u.washington.edu; J.W. Harrington, Professor, University of Washington. Email: jwh@u.washington.edu; *Chinese Municipal Policies in Support of Innovation: An Institutional Analysis*

This paper assesses the effectiveness of municipal level institutions and relevant economic development entities in the People's Republic of China and makes some initial appraisals of the responsiveness of these institutions and organizations to - and effectiveness in carrying out - national policies on development. This paper begins with a theoretical discussion of institutional analysis, including the varying incentive, or disincentive, laden structures that exist within the PRC system at the municipal level and a theoretical framework for innovation. Next, we consider two Northeastern cities in Liaoning province, Dalian and Shenyang, and discuss areas of difference in technology innovation-directed development policies and evaluate the effectiveness of these policies.

Keywords: China, political economy, institutional analysis

Patrick S. Cohendet, Professor of international business, HEC Montreal - BETA Strasbourg. Email: patrick.cohendet@hec.ca; Laurent O. Simon, Associate Professor of Management, HEC Montreal. Email: laurent.simon@hec.ca; *Knowledge intensive firms, communities and creative cities*

In this paper, using Montreal (PQ - Canada) as an example, we argue that "creative cities" tends to favour a specific "ecology of knowledge" where some major Knowledge Intensive firms tend to emerge and grow through a specific form of co-evolution: the city nurtures the KI firm with flows of specialised knowledge and creativity, and in turn the main KI firms nourish the creative soil of the city through an anchor role. More precisely, we suggest that this co-evolution is mediated by different types of "knowing communities". We argue that creative cities offer the conditions for the development of absorptive capabilities captured by the knowing communities, as if KI firms had "delegated" the building of these capabilities to the city. In turn, KI firms use the competences of communities through repeated projects that generate creative slacks for further expansion of creativity that drive the growth of the firm but contribute also to nurture the development of knowing communities and their active interplay in the creative city. The KI firm in a creative city is thus viewed as an innovative system that on the one side manages and exploits internally the creative slack that results from its multiple projects and on the other side places its indirect absorptive capabilities in terms in its local external immediate environment: the fertile soil of creative city. (Paper based on empirical material from KI firms in the fields of video-game making, advertising and communication, and the performing arts / entertainment business).

Keywords: situated creativity, knowing communities, creative city

Avery S. Cohn, M.E.Sc., University of California, Santa Cruz. Email: avery.cohn@gmail.com; *Cleantech Venture Capital at the Energy Crossroads*

Alternative energy has been proposed as a means to improve energy security, create jobs, mitigate climate change, and improve environmental quality. Yet investments in research and development (R&D) for alternative energy are dwindling, with the exception of investments made by the so-called "cleantech" venture capitalists. Understanding R&D trends is critical because investments at the energy crossroads will likely have profound environmental, economic and geopolitical implications for years to come. While a number of studies have examined why industry and government R&D spending has decreased, none has explained the growing "cleantech" phenomenon. My research describes and quantifies venture capitalist investment in alternatives energies and explains the social, political and economic contexts that drive these investment choices. For detail I focus on the case of Silicon Valley clean-tech investors and their investments in the world's largest alternative energy sector?The Brazilian ethanol industry.

Keywords: cleantech, venture capital, Brazil, environment, alternative energy, biofuels

Jeffrey D. Colby, Appalachian State University. Email: colbyj@appstate.edu; James G. Dobson, National Environmental Modeling and Analysis Center. Email: gdobson@unca.edu; *Flood Modeling in the Coastal Plains and Mountains: An Analysis of Terrain Resolution*

The number of flood disasters has increased worldwide in recent decades, however, few studies have attempted to compare flood modeling efforts in divergent environments. In addition, identifying the optimal resolution at which to represent digital terrain models (DTM) for modeling floods is critical. In this research flooding of the Tar River in the coastal plains and the Watauga River in the mountains of North Carolina were modeled using hydrologic information obtained following Hurricanes Floyd and Ivan, respectively. The effectiveness of DTMs derived from LIDAR and USGS elevation data represented at a series of resolutions were assessed. A new quantitative method was introduced for evaluating the horizontal extent and internal pattern of flooding. The extent and internal pattern of flooding in the coastal plains was found to be especially sensitive to the representation of terrain, and in the mountains 30m data regardless of source were found to be dramatically unsuitable for representing topography. The use of a variety of diagnostic metrics significantly enhanced the evaluation of flood modeling results.

Alexander Cole, Copenhagen Business School. Email: sc.ivs@cbs.dk; *Spillovers or buffers? The importance of firm-specific competences in the animation sector and what it means for location-specific pecuniary and non-pecuniary externalities in cultural industries*

Recent analyses of creative industries have often referenced the importance of knowledge spillovers and 'industry buzz' as locational factors driving agglomeration. A geographic and social milieu rich in relational and hence learning possibilities is seen as a natural counterpart to the so-called "Hollywood Model" of organization, in which firms are little more than temporary legal-shells, bringing together specialized labor for the duration of a given project. However, the issue of how firm-specific competences are built, and the role of the geographic milieu in the development of these competences is rarely addressed within this model. Drawing on empirical evidence from animation studios in both Europe and the United States this paper investigates how location affects the competence accumulation process in firms. The importance of different locational factors?labor markets, suppliers, distributors, and milieu—are investigated, and the relative importance of internal and external mechanisms of competence accumulation are assessed.

Keywords: cultural industries, agglomeration

Roy Cole, Grand Valley State University. Email: coler@gvsu.edu; *Change in primary agricultural production and processing in West Africa: governance, international competition, comparative advantage, and value-added, 1960 to 2004.*

Historically, many African countries have possessed a comparative advantage on the world market in certain local crops. The unprocessed export of some of these crops (palm oil, for example) led the way in the development of the "legitimate" trade after the slave trade was outlawed in the 19th century. This study focuses on several West African crops that have been historically important as primary product exports and for which particular West African countries held a comparative advantage at independence. The investigation is focused on the shift from primary to processed agricultural product production and export in West Africa since the 1960s and the internal and external variables that account for such change. Results indicate that as a consequence of institu-

tional turmoil, economic instability, and international competition many West African countries have lost the comparative advantage that they once enjoyed to other developing countries but that local processing has been increasing.

Keywords: West Africa, agriculture, exports.

Amanda Coleman, University of Oregon. Email: acolema1@uoregon.edu; *Bridging the Region-Nation Divide: Citizenship as Panacea in the U.S. South*

Recent geographical scholarship has reconceptualized traditional narratives of the U.S. South, rejecting the notion of a passively constructed region by illustrating the ways in which popular culture acted to define 'the South' during the post-bellum period (Winders, 2003). Geographers have also reconceptualized traditional accounts of the South-nation relationship, elucidating how the post-Civil War South was actively constructed as the antithesis of 'American' values (Jansson, 2003). My work is influenced by and contributes to this reconceptualization, focusing on the 1930s, a period in which tensions over perceived differences between 'southern' and 'American' values were at their highest point since the Civil War. My research details the narratives of difference that surrounded the 1930s South and demonstrates how citizenship became a prominent theme in South-nation relations during that time. Employing a regional labor organization and a federal farm relief agency as case studies, I illustrate how the concept of citizenship was deployed as an apparent bridge across the South-nation divide. I argue, however, that regional and federal reformers' interpretations of 'citizenship' were strongly guided by differing perceptions of 'the South' and the South-nation relationship. I also argue that these contrasting perceptions hindered the application of citizenship as an integrating force in region-nation relations. I thus examine how actively constructed narratives of a differential South influenced the deployment of national narratives of citizenship within the region. Through an examination of this topic, I seek to contribute to fuller understanding of the influence of regional narratives on region-nation relations.

Keywords: political geography, citizenship, US South

Jill S. M. Coleman, Ball State University. Email: jscoleman@bsu.edu; *The human mortality response to atmospheric circulation changes during the transitional seasons*

A synoptic type classification scheme has been developed for the central United States based on automated principal component analysis/cluster analysis (PCA-CA) methodologies. It employs daily NCEP/NCAR reanalysis data over all seasons of fifty-seven years (1948-2004) in creating synoptic types from surface and upper air (925, 850, 700 and 500 hPa) temperature and humidity data as well as sea level pressure and geopotential heights and winds aloft. The PCA-CA procedure creates ten central U.S. synoptic types exhibiting distinct seasonal preferences, but with all ten types possible during the transitional seasons. These patterns are then used to investigate the holistic impact of weather on daily cause-specific human mortality rates during spring and autumn from 1978-1998 for four U.S. Metropolitan Statistical Areas (MSAs). Distinctive increases (or decreases) in mortality rates are associated with one or two synoptic types, displaying notable spatial and temporal variability.

Keywords: bioclimatology, human mortality, synoptic classification, central United States

Mathew Coleman, Department of Geography, Ohio State University. Email: coleman.373@osu.edu; *Deserting Sovereignty, Sovereignty's Deserts*

Hardt and Negri write in *Multitude* that sovereign power is a not an autonomous force exercised over subjects. Rather, sovereignty is a "dual system of power" which requires the constitutive participation of the ruled. This "two-sided" formulation allows for a possible revolutionary politics of exodus from sovereignty: a key weapon of the ruled, given the dependence of sovereign power on its creative energies, is the prospect of withdrawal or desertion. For Hardt and Negri, undocumented migration is about exactly this strategy. The "odyssey of migration" creates hybrid and miscegenated lines of flight which refuse sovereign cartographies as well as the global hierarchies on which capitalism feeds. Hardt and Negri's treatise stands the concept of biopower on its head to speak of the ways in which sovereign power is parasitical on its subjects, and in turn how subjects might forsake this relationship. However, it also glosses over the ways in which the sovereign responds to such acts of refusal. Focusing specifically on US geopolitics in the Mexico-US border region, I argue that if deserting sovereignty, undocumented migrants are at once violently abandoned by the sovereign in the deserts. At the same time, this does not mean that we can speak of US statecraft in the region as a coherent or cohesive entity. Rather, US immigration-related statecraft is both non-subjective and overdetermined - a mess of projects which for all purposes is a centerless and disoriented apparatus of power, albeit with a patterned outcome in terms of migrant deaths in the border region.

Keywords: US statecraft, undocumented migration, Mexico-US border

Ashley Coles, University of Arizona. Email: ashley.coles@gmail.com; *Cultural Psychology and Hazards Research: An Integrated Model for Risk Perception and Warning Response Behavior*

Risk perception research has proven useful in natural hazards mitigation by providing agencies or officials responsible for the dissemination of warnings with an idea of how people might respond, and how altering these warnings or dissemination methods might stimulate a wider practice of what they consider the "appropriate" response. Many of these studies fail to investigate how cultural context and social interactions affect risk perception and response to hazards. To further the practical application of cultural theory to hazard warnings and mitigation, this paper will identify the key cultural and social factors that appear to have the most influence on human risk perception and behavior throughout hazards research, as represented by a sample of case studies. These factors will then be applied to an integrated conceptual model of culture developed from the ideas of M. Douglas (1992) combined with existing models in cultural psychology. The factors which are integrated in this model include (a) trust in the hazard science as well as the government; (b) social incorporation; (c) self- and community-efficacy; (d) social autonomy, and (e) time orientation. It is hypothesized that understanding where communities' values stand with regard to these factors will improve the ability of emergency managers and warning officials to prepare and mobilize the public in the event of a natural hazard. The integrated model presented here illustrates how a synthesis of the Douglas model with cultural psychology models provides a more comprehensive and practical understanding of the mechanisms that affect people's risk perception and hazard response.

Keywords: culture, risk, hazards

Benjamin Coles, Royal Holloway University of London. Email: b.coles@rhul.ac.uk; *Placing Alternative-foods, Their Markets, Their Networks, Their Geographies*

Responding to what has been called 'a place-less food-scape' where modern food provision occurs largely in ambiguous and disparate locales, alternative food initiatives have appeared seeking to reconnect producers and consumers. These networks themselves depend on 'alternative' places, commodities and consumption mutually constituted through dialectical arrangements of place and commodities themselves through discourses of geographic imaginations and imaginative geographies. Beyond notions of the (simple) commodity fetish, alternative' commodities emphasize some factors of production while simultaneously obscuring others?akin to the double commodity fetish, but with a slightly different twist. Borough Market, located under railway viaducts near London Bridge is one such place of 'alternative' commodities. Here consumers can meet producers (or their agents) and engage in a kind exchange where commodities and knowledges about them are produced and consumed through an air of geographic specificity all in a decidedly different type of shopping space. At Borough, some objects for sale are explicitly 'placed,' identified as from somewhere along their commodity chains by virtue of their labeling, while others remain origin-less, suggesting that geographic pedigree is extendable by proxy through specialized places of consumption. Borough Market, as an entrance into alternative food networks and as an assemblage of geographic knowledges, is a survey of how different geographies are mobilized through and by 'alternative' commodities. Considering their literal and figurative pathways into the market itself questions how place and ideas about place assemble to enact geographic lore about alternative commodities as produced through conjoined yet distanced commodity spaces.

Keywords: alternative-foods, commodities, place, geographic-imaginings, consumption, mobility

Tim Coles, University of Exeter. Email: t.e.coles@ex.ac.uk; *Evaluating tourism geographies in the United Kingdom: will moving the goal posts make any difference?*

Regimes of governance in higher education in the United Kingdom are changing. Reports of the demise of the Research Assessment Exercise (RAE) in Spring 2006 now appear premature. Nevertheless, the likelihood of significant change in the competitive environment remains high in the near future. As a subject, tourism is undoubtedly a central component in our understanding of the operation of contemporary global society. This is evidenced in the wide range of disciplinary locations in which tourism scholars are active. Under previous evaluation schemes, studies of tourism were driven underground in the prevailing climate of 'game playing' and 'creative submissions'. The new landscape of regulation is taking shape although the position of the social sciences has been problematic. This paper considers some of the prospects for the production of new knowledges of the spatialities of tourism. In a system that would appear to offer some signs of encouragement, dangers may lie ahead in terms of the types and mechanisms of knowledge production.

Keywords: tourism, higher education, governance, knowledge production, United Kingdom

Stephen Collier, The New School. Email: CollierS@newschool.edu; *Neoliberal Reform and the Problem of Public Value*

This paper examines how neoliberal theorists, and neoliberal reforms, deal with “public sector” value. The first half of the paper scrutinizes how neoliberalism approaches public value as a specific object of reflection and rationalization by examining the neoliberal theory of public finance. It argues that the major figures in shaping this theory held a complex view of public value, one oriented both by formal principles (such as efficiency, economy, and liberal views of democratic government) and by a substantive ethical concern with the ends of governing. The second half of the paper examines one of the key technical mechanisms through which neoliberalism has integrated public values into budgetary mechanisms: redistribution formulae. In particular, it examines how redistribution formulae function in neoliberal budgetary mechanisms in post-socialist countries. It argues that the technical architecture of the reforms themselves is such that positive understandings of public value can be incorporated into them. This process does not contradict the intentions of technocrats applying neoliberal reform formulae in new contexts. Quite the contrary: The incorporation of public values - whether defined bureaucratically or by various expression of public preference ? is an intended design feature of neoliberal reform.

Keywords: neoliberalism, public value

Chris Collinge, Non-Member. Email: c.j.collinge@bham.ac.uk; *Complexity and Dialectics: deconstructing society and space*

Dialectics and deconstruction share a common root in the problematic of dualism, a problematic that in its modern form stretches back through Derrida and Marx to the philosophies of Hegel and Kant. In their different ways both dialectics and deconstruction address the aporias that are entailed in dualistic thinking - on the one hand by assimilating contradictory terms through an all consuming exercise in sublation, on the other hand by highlighting the process of différance and gesturing mutely through this towards an absolute Other that lies beyond assimilation. Following Nancy Jay’s influential feminist analysis of gender and dichotomy, and following comments by Derrida himself, it has been argued by some poststructuralists that it is only dichotomous dualisms that permit or require deconstruction (Jay, 1981; Massey 1992). But the evidence suggests on the contrary ? and in accordance with the spirit of Derrida’s oeuvre ? that deconstruction also functions across the dialectic, and indeed that it destabilises dialectical thinking to the point where this reveals its duplicity and incoherence. Dualisms are by no means homogeneous in form, however, and far from working alone they generally operate through a series of linked oppositions that produce a textual weave of great complexity. In this paper I examine some of the complexities of dualistic thinking within dialectical materialism and ? by developing a deconstructive reading of Marxist theories of society and space ? suggest that we must address this complexity if we are to elucidate the deconstructive ‘system’ through which space is being written.

Keywords: deconstruction, dialectics, complexity, dualism, graphematics

Francis Leo Collins, University of Auckland. Email: f.collins@auckland.ac.nz; *Bridges to Learning: the economic and social networks of international education in Auckland, New Zealand*

International education is a fundamentally transnational project. It relies on the movement of either individuals or knowledge across national borders, disturbs the centrality of the nation-state in the educational reproduction of its populace, and is facilitated by economic and social networks that act as bridges between countries of origin and education. In this paper I address this latter point through reference to research conducted with South Korean international students in Auckland, New Zealand. I discuss the emergence of transnational economies of export education between Auckland and South Korea that include businesses like education, travel and immigration agencies, educational institutes and homestay providers. Usually operated by Korean-New Zealanders, these immigrant businesses, alongside more traditional forms of immigrant entrepreneurialism, constitute part of the bridge that facilitates the movement of international students from South Korea to Auckland. The other related component of these ‘bridges to learning’ are the social networks that students rely on to make the decision about where to study and their eventual adaptation to life in the otherwise foreign urban landscape of cities like Auckland. What these economic and social networks suggest is that the practices of differently positioned transnational subjects - migrants, international students and tourists ? are inter-related and inter-dependent. Moreover, the movement between these different positions that is exemplified in the stories of some international students suggests that the educating state’s, and indeed many academics’, conceptualisations of such positions as distinct migratory categories is highly problematic.

Keywords: transnationalism, international education, New Zealand, South Korea

Matthew T Collins, University of Sheffield, UK. Email: m.t.collins@shef.ac.uk; *Everyday Walking in Cities: An Engagement with Affect and Silence*

This paper reflects on acts of ‘everyday’ walking in an urban context, and outlines a theorisation of everyday walking that draws on post-phenomenological and post-structuralist engagements with geography and the body. As such, it contains both a critique of capitalist social organisation and its delimitation of affective ‘flows’, and posits rather those ideas of Deleuze and Guattari which conceive of the affective realm as constantly tending towards exceeding these delimitations. The research uses these ideas to theorise everyday walking as a practice where subjectivity is formed and re-formed through bodily and psychic spatial engagements, and will argue that everyday walking offers certain potentials to subtly overflow and subvert the limits and structures placed on affective flows. In presenting this argument and placing it in context of the act of ‘everyday’ walking, this paper forwards an approach that can be called ‘schizoanalysis’. In this it clearly follows a Deleuzian critique of a classical psychoanalytic/Freudian model and develops a more subtle, dynamic understanding of bodily drive and affective desire. Finally, the paper draws on Deleuze’s arguments on repression and silence to argue that everyday walking can allow us to exist in silence away from the repressive forces that attempt to force us to speak or produce statements all of the time. Silence is thus recast as productive and not as lacking.

Keywords: cultural geography, walking, everyday, affect, Deleuze, silence

Rachel Colls, Durham University. Email: rachel.colls@durham.ac.uk; *Materialising Children’s Bodies: Body Mass Index (BMI) and the practices of measuring*

Within the context of public health policy in Britain, childhood ‘obesity’, as contextualised within a wider global ‘obesity epidemic’, has been highlighted as a key concern for contemporary and future populations. As a consequence the British government has committed to the Public Service Agreement (PSA) target to halt the ‘year on year rise in obesity amongst children in England aged under 11 by 2010’. This has involved collecting local level data through weighing and measuring all children in reception year and year 6. This paper critically interrogates these weighing practices by considering the mechanisms through which children’s bodies are materialised as ‘obese’ through the use of the Body Mass Index (BMI). This will be contextualised within work in feminist science studies work that highlights the practices through which scientific objectivity is produced and then become enrolled in the production of particular bodies. Drawing on empirical work that examines the weighing practices of one Primary Care Trust (PCT) in Britain, the paper will focus on the ways in which children’s obese bodies become problematically fixed as ‘fat’ through using BMI, the spatio-ethical consequences of measuring children’s bodies in schools, the role of other bodies in the diagnosis of ‘obesity’ and the emergence of a politics of refusal to take part in these practices by schools, parents and children. It is this refusal that introduces a materialisation of a child’s fat body that defies the enforced classification of obesity through the normative regimentation of medical and political apparatuses of surveillance.

Frances A. Colón, . Email: colonfa@state.gov; *My Community, Our Earth: Promoting Geography & GIS to support basic science and math education in the Muslim World*

My Community, Our Earth partners have launched a program to support basic math and science education in the Muslim World, with support from the US State Department. Through its innovative use of geographic education and technology combined with an inquiry-driven, hands-on pedagogy that involves youth with local projects, the program is developing and distributing core innovative educational resources in Arabic; designing and conducting a hands-on week-long workshop learning experience in Tunisia for 25 master teachers, competitively selected from across the North Africa region; and establishing and facilitating follow-on mentoring activities linking participating educators with geography and educational experts worldwide. Project objectives are aimed at improving general science education in the Muslim world: 1) to improve the quality of education in geography, science, technology, engineering, and mathematics related fields within primary, middle and secondary educational institutions in the region 2) to showcase the power of geographic tools and technologies for inquiry-driven, project based education within predominantly Muslim countries 3) to improve teacher training, curriculum content, and positive community involvement through resource sharing and networking 4) to engage and support children and youth, including girls and women, at various levels of K-12 education in high-quality and interactive learning experiences that build knowledge, skills, and a community ethic. In combination, the MyCOE pedagogic approach, the integrative perspective of geography as a discipline, and the power of geographic tools and technologies for learning basic math and science offers a unique opportunity for supporting education in the Muslim world

in a way that adheres to a broad vision for global understanding.

Keywords: Muslim World, education, GIS

Heather.Colson@asu.edu; *Hazardous Floods Across the United States and Regional Relationships with El Niño/Southern Oscillation*

Floods are one of the most common natural disasters as well as one of the most costly. The number of hazardous floods, or those associated with damages, deaths, or injuries, is on the rise in the United States. The change is potentially due to an increase in the intensity of precipitation events and almost certainly due to land use changes. While the land use contribution to the increase in hazardous flood events is important, there is also a need to understand the atmospheric characteristics associated with hazardous floods. This research project focuses specifically on hazardous flood events in the United States from 1960 to 2004 as documented in the Spatial Hazard Events and Losses Database (SHELDUS). Using impacts data to define flood occurrence represents an approach to a natural physical problem from a social perspective and yields patterns that are different when climatically defining floods in speaking more directly to stakeholders. Hazardous flood events are identified in the database by county, but here they are regionalized for further analysis with regard to phases of El Niño/Southern Oscillation (ENSO) and variability in the associated transport of atmospheric moisture and the resultant precipitation. Of particular interest is the regional relationship between precipitable water and precipitation and how the ratio of the two varies with flooding occurrence and ENSO phase. The characteristics of hazardous floods and the relationships among flooding, ENSO, precipitable water, and precipitation across the United States are presented by region.

Keywords: hazards, floods, El Niño/Southern Oscillation, United States

Craig Colten, Louisiana State University. Email: ccolten@lsu.edu; *The Primacy of Place in the Geographical Review*

In a world of "Red and Blue" states, a globalizing economy, and faith-based conflict, daily newspapers highlight geographic difference. For most of the past century, the Geographical Review has set itself apart from other academic geographical periodicals by continuing to showcase the primacy of place that accounts for the dynamism in our contemporary world. This paper will draw on sterling examples of geographical research that expose the particularities of one region that I am most familiar with, the American South. For decades, geographers have examined issues of race, human-environment interaction and public policy, rural-based economic activities, and sub-tropical resources and their management. Using many different methodologies and examining places through the lens of diverse theories, the common strength has come from authors who bring great expertise about the place that they write about. Reviews of articles about other parts of the world would yield comparable results. The insights gleaned from this review indicate the enduring value of place-based geographic inquiry and will provide direction for the future of the Geographical Review.

Keywords: place, South, Geographical Review

Joshua Comaroff, UCLA. Email: comaroff@onebox.com; *Islands of the sovereign fantastic: discontinuity and power in the national imaginary*

Island prisons are the quintessential arenas of power-in-action. Like other prisons, which have frequently been described as archipelagic, these particular islands are among the great crucibles of the socio-geographical imaginary. An agency is possible in these forgotten places, these "islands of history" (to borrow Marshall Sahlin's phrase), which would be simply unthinkable elsewhere. Islands drift out of national-territorial space, into the limen of the Westphalian order?becoming places where the absurd is powerfully emergent; where given structures are, in the manner of the carnival and The Tempest, overturned and righted. This paper explores the history of these islands of power, in two forms: the literary-fantastic (including the utopian) and the carceral. Examples include Devil's Island and Utopia, the Chateau d'If and the Garden of Eden, Verne's Mysterious Island, and the haunts of Doctor Moreau and Robinson Crusoe. Through these examples, certain spatio-political theories of social power and control, from Michael Mann to Jean Genet, will be interrogated. These will be used to triangulate a relationship between sovereignty, fantasy, and spatial disarticulation in the figure of the island?which, it will be argued, serves as "laboratory" of state disciplinary power itself.

Keywords: islands, prisons, carceral geographies

H. Jason Combs, Arkansas State University. Email: hcombs@astate.edu; *The South's Slave Culture Transplanted to the Western Frontier*

The Missouri Compromise of 1820 had a significant impact on northwest Missouri's settlement patterns. Missouri's slave state status attracted a higher number of southern pioneers than what would have normally been expected. These early settlers brought with them their entire cultural-economic system?the production of hemp and tobacco with slave labor. Within the Platte region, the

geographic distribution of these cultural variables is explained by pioneer origins. Those areas settled primarily by Upper Southerners possessed the greatest number of slaves and produced the most hemp and tobacco. The findings demonstrate that by 1850 the Upper South's southern slave culture had been transplanted to northwest Missouri's Platte region.

Jonathan C. Comer, Oklahoma State University. Email:

jon.comer@okstate.edu; *Influences on the Locations of Professional Sports Stadiums in North America*

A recent slowdown in the expansion of North America's top professional sports leagues (MLB, NBA, NFL, and NHL) does not seem to have had much influence on the pace of new facility construction. This stadium "arms race" escalates the competition between cities for teams, raises the stakes in the public versus private funding debate, and increases the demands on already scarce tax dollars. Given that the average cost of a new facility is nearing \$500 million, understanding the influences on how and where new stadiums get built can provide key insights for both legislators and taxpayers. Such insights can help legislators make important funding decisions and can help taxpayers decide whether or not to vote for such activities, providing the funding package is even put to a vote. Both geographic and socioeconomic variables are analyzed in an attempt to make sense of what appears to be a chaotic and even random process of funding and siting professional sports stadiums. Though the overall sports industry is modest in size and is on roughly the same economic scale as the envelope industry, the corporate welfare directed towards sports represents a huge drain on local and state government finances and a questionable investment of these funds.

Keywords: sports stadiums, location analysis, professional sports

Patrick J Comer, NatureServe. Email: pat_comer@natureserve.org; *Terrestrial Ecosystem Classification, Mapping, and Applications to Ecosystem Management*

Natural resource conservation assessments often lack comprehensive, consistent and detailed classification systems to guide mapping. Over the past decade NatureServe has collaborated with partners to classify and map terrestrial ecological systems and vegetation throughout the Americas. Here we discuss lessons learned pertaining to classification approaches, mapping methods, and application of these concepts to ecosystem management.

Keywords: ecosystem classification, ecosystem mapping, ecosystem assessment

ramonupr@yahoo.com; *Latino and Puerto Rican Migrants Characteristics in the Orlando Metropolitan Statistical Area*

This research will consist of explaining the migration, settlement, and assimilation patterns of Puerto Ricans and Latinos in the Orlando MSA. By using the Census 2000 Migration Data, this research will examine the Latino migrants' variables of household type, household income, nativity, education, and the age and sex of the total population that migrated from the different United States regions under study (Northeast, Midwest, South, and West) and settled in the Orlando area. By the use of the US Census Bureau, the research will also examine

the Puerto Rican migration flow to the Orlando MSA, their ethnic enclaves, and their characteristics of place of birth, household income, labor market outcomes, and educational attainment. The goal of this research will be to identify the differences and equalities among the Puerto Rican and Latino immigrants in the Metropolitan Statistical Area of Orlando. In this way, we will not only be able to identify their characteristics as immigrants, but also their assimilation levels to the American culture.

Keywords: migration, settlement and assimilation patterns, Orlando MSA

Alina Congreve, University College London. Email: alina@congreve.prestel.co.uk; *People, participation and planning: the continued significance of the Skeffington report.*

This paper explores the emergence of public involvement in planning. The experience of the US has been very influential in terms of shaping UK practice in public participation and common themes will be developed. Public involvement in planning first emerged in Britain in the 1960s. Realisation that the systems of regulation were failing developers and the public led to a number of government committees being established to address key issues, including the Skeffington report which was commissioned to examine the role of public participation. However, despite being almost universally quoted in research and policy documents, limited research has been carried out on the Skeffington report and its implications. Did the report lead to the development of more effective processes of public involvement in planning in the immediately period after publication? What is the longer term legacy of the Skeffington report? The issues that pre-occupied Skeffington still pre-occupy us today: that public involvement often comes too late after plans are made; that public involvement can slow down the process; that most members of the public have limited understanding of the planning system; and that it is easier to publicise activities than to create genuine public engagement. There is, a strong current of optimism that runs through the report that tries to overcome the difficulties. At the heart of the report is the aim that "People should be able to say what kind of community they want and how it should develop". This is something that still resonates with us today

Keywords: planning, participation, US/UK comparison

Heather K Conley, Ph.D., Illinois State University. Email: hkconley@ilstu.edu; *Did El Nino Cause the Emergence of Hantavirus Pulmonary Syndrome?*

The emergence of Hantavirus Pulmonary Syndrome (HPS) in the western United States highlighted the importance of environmental variability in the emergence of infectious diseases. This was the case in the 1993 Hantavirus Pulmonary Syndrome (HPS) outbreak, where El Nino-driven rains increased food resources, causing a rapid increase in the rodent population and spill-over into susceptible human populations. Several subsequent studies examined the role of interannual climate variability on HPS incidence. The goal of this presentation is to re-examine the role climate variability played in the emergence of HPS. Specifically, this research incorporates theories derived from population ecology and phenology to explain unstable rodent population dynamics in the area, and the implications on the prevalence of Sin Nombre Virus (SNV) within the rodent population. This study suggests that although El Nino may have created ideal conditions for an HPS outbreak in 1993, more subtle changes in the intensity and duration of wet- and dry-spells may have created ideal conditions for the outbreak to occur. This study offers insights into indirect climate impacts on human health, but it also demonstrates how gradual climate changes may increase vulnerability to infectious diseases when an extreme event occurs within the context of gradual environmental changes.

Keywords: Hantavirus Pulmonary Syndrome, disease ecology, rodent-borne disease, climatology

Jamison F. Conley, Pennsylvania State University. Email: jfc173@psu.edu; Mark Gahegan, Pennsylvania State University. Email: mng1@psu.edu; *Visual Analytics and Terrorist Surveillance: Safeguarding Privacy and Public Trust*

One of the prominent applications of visual analytics is detecting and tracking suspected terrorists. The Total Information Awareness (TIA) program was a federal government initiative to use data mining technologies for this purpose. However, the TIA was vigorously opposed on many grounds, with concerns about whether the government should have access to personal data about each US resident, concerns about privacy, and concerns about errors leading to wrongful accusations of innocent people. Because of these concerns, the TIA program was terminated after Congress halted its funding. Visual analytics for intelligence analysis requires "the ability to piece together information buried in disparate data?including immigration records; patterns of travel; telephone calls; and names, affiliations, and locations of suspected terrorists?to enable them to spot an emerging attack" (Thomas and Cook 2005, p. 2). The same primary issue facing the TIA also faces visual analytics: how to be responsible stewards and analysts of data to ensure that the government's use of visual analytics and

data mining retains the public trust. The research agenda for visual analytics, "Illuminating the Path" (Thomas and Cook 2005) addresses these concerns and lists several strategies for safeguarding privacy, including data minimization, data anonymization, feature perturbation, and Hippocratic databases. This talk examines the state of the art in these strategies and compares them to lessons learned from the TIA program's termination to inform research in ways to retain the public trust.

Deirdre Conlon, Graduate Center - CUNY. Email: dconlon@gc.cuny.edu; *Women's migration and the 'necessitarian logic' of the contemporary Irish nation-state*

Over the past two centuries Ireland's renown has been as an emigrant nation, but in the past decade, and associated with rapid economic growth and shifting state policies, Ireland has emerged as an immigrant-receiving nation. Therefore, throughout its history and in the present the Irish nation-state as well as questions of identity and belonging therein have been tied up with the issue of migration. Focusing on recent inward migration to Ireland and taking narrative accounts of everyday life by refugee and asylum seeker women as its specific locus, this paper explores some of the intersections between women's migration and the burgeoning of the neo-liberal Irish nation-state. This focus is combined with theoretical interest in Henri Lefebvre's oeuvre, specifically, the interconnected critiques of everyday life and of the state. This analysis draws on work by Neil Brenner and Stuart Elden that elucidates Lefebvre's critical examination of the 'necessitarian logic' of the neo-liberal state. The analysis also draws on Cindi Katz's discussion of countertopography as methodology and political project. By threading the representations and day-to-day experiences of migrant women through the social and spatial production of the Irish nation-state this paper aims to further an understanding of the relations between women's migration, nationhood, and the contemporary Irish nation-state.

Keywords: women's migration, neoliberal state, Henri Lefebvre

Steven Connett, University of Nevada, Reno. Email: SteveConnett@hughes.net; Steve Subith, University of Nevada, Reno. Email: subith@charter.net; Scott Mensing, University of Nevada, Reno. Email: smensing@unr.edu; *Vegetation and Climate Reconstruction Using Pollen Analysis From a Lake Within the Lake Tahoe Basin, Sierra Nevada Range, California.*

Evidence from sunken stumps in lakes and stream beds in the eastern Sierra Nevada suggests that there have been significant periods of drought. Trees 23 m tall that appear to be rooted in place have been found at a depth of 30 m in Fallen Leaf Lake, at the south end of Lake Tahoe, California. Limbs on these sunken trees have been cross dated with living juniper in the region and have an age of 1085 - 1153 A.D. Sunken stumps have also been found in Lake Tahoe, dating to between 5500 and 6200 cal yr BP. Those stumps are generally thought to represent lowered lake levels during the Middle Holocene. In this poster we present data from pollen analysis of a shallow lake within the Lake Tahoe Basin. We recovered a 540 cm sediment core from "Lily Lake," a site within 2 km of Lake Tahoe and 10 km of Fallen Leaf Lake. Radiocarbon dates on organic sediment confirmed that the core spanned the Holocene. We analyzed sediments at 1 to 10 cm increments in an attempt to obtain as high a resolution record as possible during periods previously identified as droughts. This enabled us to reconstruct an independent record of Holocene climate change within the Lake Tahoe Basin. These results provide a better understanding of the potential for significant droughts in the Sierra Nevada that could affect the water supply to Northern California and Nevada.

Keywords: Drought, stumps, pollen, Holocene, Lily Lake, and Fallen Leaf Lake.

James JT Connolly, Ph.D. Candidate, Columbia University. Email: jjc2119@columbia.edu; Elizabeth Currid, University of Southern California. Email: currid@usc.edu; *Agglomeration Effects: Art and Culture in the Advanced Service Economy*

The emphasis being placed by multiple fields on the importance of agglomeration economies as a fundamental element of the global production system has generated a great deal of research at both the macro and micro level. We argue in previous work that the qualitative evidence on industrial clustering developed by the micro level case study approach is evocative of broader macro patterns that are both similar and dissimilar across industries and geographies. We build on this to further highlight the need for meso level methodological approaches that bridge between the specifics of place found mostly within the economic geography literature and the abstraction of space that generally characterizes the geographical economics literature. In this paper, we further develop this argument by expanding upon a three-tiered spatial analysis methodology in order to examine the degree, type and location of clustering within metropolitan regions and draw conclusions informed by previous work on

advanced service industries. Specifically, we test the robustness of our initial findings which show that among advanced service sectors, art/culture and media are the most inclined to cluster and to possess the most uniquely urban, as opposed to regional, geographies of production. We expand our analysis to include all mid- and large-sized MSAs in the U.S. in an effort to confirm and refine our initial findings and further focus our conclusions on the social and political impacts of the spatial patterning and clustering tendencies that we observe within urban regions and within specific industries across regions.

Keywords: Art and Culture, Advanced Services, Agglomeration

John P Connors, Clark University. Email: jconnors@clarku.edu; Incorporating spatial dependence into land cover classification using texture analysis and object-based methods

One of the fundamental concepts of geography is spatial dependence. This concept is expressed in Tobler's first law of geography, which states that everything is related, but things that are closer are more related. Nonetheless, this concept is often overlooked when classifying remotely sensed data. This paper incorporates spatial dependence variables into the classification process and examines the impact of these variables on an object-based classifier and a pixel-based classifier. Furthermore, this paper compares the impacts of spatial dependence on data of different spatial resolutions (i.e. Ikonos and Landsat 7 ETM+) for a heterogeneous landscape. The methods presented in this paper seek to increase the accuracy of land cover classification for fine resolution data, so that it may be comparable to that of medium resolution data. Classification of fine resolution data is problematic because as spatial resolution decreases, within-class spectral variance increases, decreasing spectral separability. The approach of this paper differs from many common approaches to classification of remotely sensed data, which are often performed on a per-pixel basis and consider each pixel's spectral response independent of its neighbors. Thus, per-pixel classification undermines the potential usefulness of spatial relationships present in the data.

Keywords: spatial dependence, object-based classification, texture analysis

David Conradson, University of Southampton. Email: d.conradson@soton.ac.uk; Faith-based welfare and expressions of justice: organisational theologies and practices in New Zealand

Over the last decade, a number of church-based welfare agencies in New Zealand have begun to re-evaluate their service provision for marginalised citizens. One outcome has been a growing critique of traditional forms of charity, as expressed in the provision of emergency relief for instance, and a stronger engagement with the structures underlying social inequality. Drawing on research with four professionalised agencies in the city of Christchurch, the paper explores the external impetuses and dynamics surrounding this shift in focus from what some have described as "mercy" to "justice". Attention is given to the neoliberal social policy context within which this development has occurred, and to the theological and institutional resources that organisations have drawn upon in these new expressions of faith-based welfare. The study suggests that some Christian social service organisations in New Zealand have achieved a measure of independence from government, which in turn enables them to articulate a critique of contemporary social policy. Whether this amounts to a radical challenge of the status quo, however, is a matter for consideration.

Keywords: Faith-based welfare, social justice, neoliberalism, theology, New Zealand

Mary Conran, Student, University of Hawaii. Email: conran@hawaii.edu; Returning the Gaze: Exploring the Possibility for a Dialogical Tourism

Postmodern sensibilities that celebrate difference and locality have opened up new possibilities for tourism operators who have come to realize market potential for the commodification of local culture. Local governments and local peoples themselves have become savvy to opportunities to more fully participate in the global capitalist economy through tourism. Perceived isolation, and lack of economic and material development is often the main attraction in what can generally be called cultural tourism. This is not to say that tourists who participate in these forms of cultural commodification and consumption are unaware of their contradictory position as a consumer of what they may hope to be the essential non-commodified, unmediated experience. Rather, as it has been shown elsewhere, the postmodern, authenticity seeking tourist often hopes to overcome their own postcolonial positionality through dialogical interaction. For tourism planners, this phenomenon should not be overlooked, as there is an increasingly lucrative market for more dialogically organized touristic experiences. In what I call dialogical tourism, the quality and exceptionality of the touristic experience can be translated into increased profits for local communities. Of equal importance is the potential for the "mobilization of scale" where spaces of dialogue between local peoples and a global network of supporters may contribute to the realization of local objectives. As an attempt to contribute to

the realization of mutually beneficial tourism, this paper will offer a new direction for tourism planners in local communities, where rather than being unidirectional, the tourist gaze is returned.

Stavros T. Constantinou, Ohio State University. Email: constantinou.1@osu.edu; Dimensions of Contemporary Greek American Ethnic Identity: The View of Converts.

The purpose of this paper is to explore the persistence of key dimensions of Greek American ethnicity through the use of focus group analysis, with particular emphasis on the views of converts to Orthodoxy. This work follows on the survey findings of earlier studies in northeastern Ohio. The focus group consisted of members of the Annunciation Greek Orthodox Church in Akron, Ohio and was balanced by age, gender, generation, and parishioners who converted to Orthodoxy. Participants were asked to rank the top five attributes of Greek American ethnicity from a prepared list or they could create their own. After completing their selections, participants were asked to comment on their choices. The entire focus group session was taped and transcribed. The combined ranking produced the following attributes: attendance at the liturgy, emotional orientation toward Greece, knowledge of the Greek language, Greek cooking at home, holding office in Greek American organizations, including the church, and exchange of visits with Greek Americans. Although participants expressed a wide range of opinion, their comments underscored the importance of church, family, socialization, and place. One participant summarized the most important dimensions of Greek American identity in the following statement: "I was attracted to the family and the religion . . . it all comes back to the Church, the center point of keeping the Greek thing going." Another put it this way: I married a Greek and there was no question that I would become Greek Orthodox."

Keywords: Greek Americans, ethnic identity, church

Michael Contreras, The University of Akron. Email: muhalo@hotmail.com; Site Suitability for Locating Coffee Production Facilities in Puerto Rico

According to the US Department of Agriculture, Puerto Rico coffee production for the 2005-2006 crop year is forecasted to exceed 20 million pounds. Even with this level of production, Puerto Rico occasionally needs to import coffee from Costa Rica and the Dominican Republic in order to meet demand. There is a strong business justification for the expansion of coffee production on the island. This research will explore a site suitability model to determine the most environmentally suitable locations for expansion of existing plantations and location of new plantations. The business geography of coffee production on the island will be explored.

Keywords: coffee, Puerto Rico

Kristen Conway-Gomez, Ph.D., California State Polytechnic University, Pomona. Email: kconwaygomez@csupomona.edu; Cross Cultural Research: Implications for data collection

Humans in the Bolivian Amazon have utilized Podocnemis river turtles in their diets since at least the 16th century. Such consumption has led to species decline throughout their ranges. This study examined the potential effects of market and perception of wealth on the consumption patterns of Podocnemis unifilis and P. expansa. Findings suggest that proximity to market does not lead to greater turtle consumption and the relationship is negative with declining perception of wealth. Data collection was affected by my standing as an outsider. The implications of this reality are worthy of note as this may be an issue faced in cross-cultural studies, an essential geographic research theme. While the data analysis findings have potentially important conservation and management implications I explore here the implications for data collection in a cross-cultural research setting.

Keywords: human geography research, culture, Latin America, natural resources

Mindy M Conyers, Texas State University. Email: mindyconyers@hotmail.com; Flow Resistance Estimation in the Upper Animas River Watershed, Colorado, USA

Small mountain rivers often lack stream gauging networks making the collection of field data and estimation of certain channel characteristics extremely important. Accurate estimates of river velocity are of particular interest to those who study land use management, flood plain development, and channel change prediction. The Manning equation is one of the most common techniques used to estimate velocity, and it incorporates an empirical variable, n , which describes flow resistance. Previous research focused on the difficulties associated with using the estimation formulas and the high variations in resultant n values. Very little research has its focus on the geographic distributions of this flow resistance parameter. By combining data collected in the field with

estimations of certain channel characteristics, it is possible to examine these distributions in order to determine whether geographic patterns of flow resistance exist. This research will investigate the possibility of such patterns at the watershed scale following the computation of resistance coefficients described by the Manning, Jarrett, Chezy, and Darcy-Weisbach equations. The study area for this research is the Upper Animas River Watershed located in southwestern Colorado just above the city of Silverton. The impacts to the fluvial system caused by historic mining practices in this area are prevalent. Knowledge of the future dispersion of contaminated sediments from mining relies heavily on the ability of researchers to predict channel change, and this prediction relates directly to the channel's estimated resistance to flow.

Keywords: fluvial geomorphology, mountains, channel roughness

Brian William Konz, University of Massachusetts, Amherst. Email: bwkonz@hotmail.com; Los Altos de San Miguel: Forest Change, Protected Landscapes and Autonomy in Guatemala's K'ichean Altiplano

In the nine years since the creation of the regional municipal park Los Altos de San Miguel in the communal forests of Guatemala's K'iche' Maya department of Totonicapán a number of interesting changes have occurred. From the perspective of the park's creators, which included NGOs, government agencies, municipal politicians and various local leaders, the park's creation involved both the consent and participation of local people. From the perspective of critics however, the park was hastily declared and is part of a larger trend throughout the highlands whereby authority over communal forests is being concentrated in the hands of municipal authorities. On the basis of recent fieldwork, including in-depth interviews with samples of 20 households from each of two villages within the park's boundaries, interviews with leaders and public officials, I examine some of the park's effects and ongoing controversies. Specifically, I discuss three themes. First, I show that a constellation of factors has led to a degree of forest resurgence though this phenomenon is spatially uneven across the park. Second, I show how local perceptions of the protected area are instructive, not only of the failure of planners to inform residents of what the protected area would mean, but also of some of the more wide-ranging challenges facing the promotion of protected landscapes in indigenous people's homelands and in so-called developing regions. Finally, I explore some of the implications the park has had for Totonicapán's status as one of Guatemala's semi-autonomous regions and what it could mean in the future.

Michael P. Conzen, University of Chicago. Email: m-conzen@uchicago.edu; Americanizing Russia's Colonial Capital: Sitka, Alaska, from Prince Maksutov to the U.S. Townsite Survey

What the United States inherited in New Archangel (Sitka) with the purchase of Alaska in 1867 was a very small 62-year-old capital city of a vast colony ruinously exploited for its coastal fur-bearing wealth. Sitka was a company town built by the Russian-American Company holding a monopoly Russian colonial charter and garrisoned by the Czar's navy. As a nineteenth century trading enterprise, it was a strange mercantile city by American standards. After the takeover American authorities hardly knew what to do with it. Notwithstanding that the town was the capital of Alaska, they starved it of resources, and long delayed the creation of civil government. This paper traces the evolution of Sitka from a rotting, moss-covered, log company citadel and workshop community at the end of Russian ownership?without streets or plumbing?into an American maritime port with regional functions and more-or-less standard urban infrastructure and appearance. It examines the effects of waiting 57 years for American authorities to survey and retrofit a townsite plat (1923-4) and confirm title to most property. This inversion of the usual city-building sequence complicated Sitka's spatial development and, through its resulting irregularities, has lent it a certain undeniable modern-day charm. However, the price paid was decades of slow and chaotic economic growth, political neglect, and social privation. As an early American pseudo-colonial possession it stood in sharp contrast to most towns in the Far West. This historical geography needs proper interpretation by the Sitka National Historical Park interpretive program.

Andrew C G Cook, PhD Researcher, Queen Mary University of London. Email: a.c.g.cook@qmul.ac.uk; On Expatriates and Elitism: The production of everyday geographies and exclusions in post-socialist Prague.

Since the tumultuous events of 1989, Eastern Central Europe (ECE) has experienced a variety of social, economic, cultural and political transformations that have had spatial implications at a variety of scales. The significant political-economic transformations at the regional, national and local scales have invariably impacted upon the everyday lives and spatialities of many individuals

(Smith & Stenning, 2006; Stenning, 2004). Concomitant with the transformations to individual's everyday lives has been an increase in highly skilled 'West-East' transnational migration that is, I argue, a direct outcome of the structural political-economic (neo)liberalisation that has pervaded the region. Such transformational processes have led to the formation of significant 'communities' of expatriates within many of the EU accession countries, especially within the Czech Republic and Prague specifically. This paper then, serves to highlight how the everyday lives and geographies of transnational professionals construct narratives and spatialities of exclusion/inclusion. Drawing upon and rethinking the theoretical work of several spatial/political theorists, this paper aims to reconceptualise the micro-foundations of difference, alienation and Othering between foreign professionals and Czech professionals and residents. Such an approach serves to demonstrate how the struggle over various forms of capital in spaces of production and consumption can lead to a re-articulation of difference between these groups. Additionally, I argue, the temporal (and spatial) trajectories of such individuals are dependent upon the possession of these various forms of capital, particularly in breaking down perceived barriers and fostering a more inclusive set of social and economic relations.

Keywords: Transnational professionals, Eastern Central Europe, exclusion

Ian R Cook, University of Manchester. Email: ian.cook@postgrad.manchester.ac.uk; Business Improvement Districts, urban governance and the politics of creating safe, welcoming and profitable consumption spaces

Accompanying the remaking of English town and city centres into consumption-orientated, investment-friendly spaces has been a intensive securitisation and monitorisation of these spaces. In order to encourage increased investment and consumer spending it is widely believed that these spaces must be redesigned and promoted as safe, welcoming and profitable. A variety of overlapping and very-visible agents, technologies and policies of urban social control have been developed and called upon within these securitisation agendas. What is more, the governance, delivery and financing of these agendas have increasingly involved private sector agents, institutions and monies often in partnership with those of public sector. In light of these observations, this paper will explore the contemporary governance of town and city centres in England, their urban social control agendas, and the critical role and influence of the private sector and public-private partnerships within this. The recent introduction and increasing importance of privately-funded and privately-governed Business Improvement Districts (BIDs) will be focused on and their urban social control agendas, technologies and relations critically analysed. Within this, two aspects of the BIDs will be explored in detail: first, the roles, performances and rationales behind the frequently-used BID warden schemes and the increasing funding and governing of Police Community Support Officers (PCSOs) by BIDs; and second, the relations and joint-working between the BID social control agendas-including the wardens and PCSOs?and the other burgeoning public and private agents, institutions and technologies of urban social control.

Ian Cook, School of Geography, University of Birmingham. Email: i.j.cook@bham.ac.uk; Citizenship, kinship, thingship: hydrocortisone relatedness

Responding to recent critiques of 'defetishising' research arguing that this concentrates on a limited range of symbolic identity-affirming commodities, this paper reports on a 'follow the thing' auto-ethnography of hydrocortisone, a widely prescribed steroid which a) is necessary to the normal bodily functioning of people with a variety of medical conditions (e.g. asthma, eczema, sarcoidosis); b) enters the market via health care networks of research, manufacturing, diagnosis, monitoring and prescription; and c) whose fleshy connectivities draw together debates about 'relatedness' and 'thingship' to question and expand belonging with, and responsibilities for/to, others near and far.

Keywords: thingship, medicine, relatedness, autoethnography

Nancy E. Cook, Brock University. Email: ncook@brocku.ca; Gendered Globetrotting: Mapping Development Travels to Northern Pakistan

Scholars interested in processes of cultural globalization have increasingly focused on global flows of people to understand the impact these migrations have on power relations at both local and transnational scales. I contribute to this body of work by examining the relationship between gender and global mobility in the transnational context of international development. In particular, I draw on ethnographic fieldwork in Gilgit, northern Pakistan to investigate how Euro-American women use the global mobility enabled by overseas development work to negotiate constraining regimes of femininity at 'home,' enhancing their self-determination in the process. Historically, Euro-American women have had a marginal relationship to global mobility. The requirements of femininity involve sticking close to home, thus making travel a masculine activity. By choosing to

leave home, women development workers in Gilgit disrupt discourses of femininity related to travel, and thereby enhance their self-definition as independent and autonomous individuals. But as they read their own global mobility as a sign of Euro-American women's freedom and gendered empowerment on the global stage, they simultaneously draw on discourses of race, Orientalism and imperialism to construct Muslim Gilgiti women (the supposed 'recipients' of development) as immobile subjects rooted to the domestic sphere by the Islamic institutions of purdah and hijab. This binary construction of mobile Self/immobile Other enhances development workers' self-understandings as autonomous globetrotters, as it perpetuates both colonial-era discourses of oppressed, dependent Muslim women and imperial power relations at the local and transnational scale.

Keywords: gender, mobility, globalization, development, transcultural relations, Pakistan

Amy E. Cooke, University of North Carolina - Chapel Hill. Email: acooke@email.unc.edu; *The State of the Range: the influence of boundary creation on land-use and vegetation in northern Tanzania*

In this paper I use ethnographic and ecological data to examine how fragmentation of traditional rangelands has altered the grazing regime and resource base of the Tanzania Maasai. Historically, East African rangelands have been maintained through the complex interactions of rainfall, fire and grazing. Pastoralists have been an integral component of these interactions for hundreds of years, grazing cattle, sheep and goats and setting fires to improve forage quality. In 1971, Tarangire National Park was carved from the territory of the Kisongo Maasai, separating dry season grazing areas from the rich wet-season pastures of the Simanjoro Plains, one of the first among many new boundaries created during the 20th century. Removed from the park borders, the traditional Maasai grazing system was compressed into half its territory, while wildlife continued to move freely between wet and dry pastures. Simanjoro Maasai are currently undergoing intense political pressure as conservation interests and national policy makers debate the importance of the area for wildlife preservation and commercial agriculture. Plowing the plains reduces resource availability for migrating wildlife and pastoralism; alterations in land-use patterns may also subtly alter resource quality, which impacts the long term sustainability of these rangelands. By comparing historical resource use and vegetation composition to recent ethnographic and ecological data, this paper attempts to examine both the easily observable as well as these more subtle shifts in Simanjoro ecology. The results of this study have important implications for both traditional pastoral subsistence strategies and wildlife preservation on the African savanna.

Philip Cooke, Professor, Centre for Advanced Studies, cardiff University. Email: cookepn@cf.ac.uk; *Organics-Aesthetics: Authenticity as a Regional Development Instrument*

To the extent we can say that a 'knowledge economy' exists, all the relevant indicators show it is a highly urban, mainly metropolitan phenomenon. Once more, talent moves increasingly towards these spaces for employment. But there is a backlash to the associated agglomeration diseconomies that values the authentic over the generic, quality over quantity and rural over urban living and working. In this presentation an evolutionary economic geography model is derived for application in low knowledge economy but high authenticity settings. These are predominantly rural, score relatively poorly on measures of knowledge intensive manufacturing and services industries but can be classified as 'agro-touristic regions'. They include, for example, Galicia, La Rioja, Asturias, Valencia, Andalucia, Puglia, Umbria, Trentino-Alto Adige, Sardinia, Mecklenburg, Sicily and Tuscany. All these regions score between 60% and 80% of the EU average (100 - leader regions score up to 160%) on the knowledge economy index but many are highly accomplished 'creative regions' characterised by high quality cultural infrastructures, gastronomy, natural environments and associated agro-tourism. The research points to a positive future for regions of this kind, in which recognition of embryonic, system-like connectivity to institutions supporting sustainable continuation and growth gives them 'cumulative causation' rather than 'creative destruction' capabilities more commonly associated with metropolitan knowledge economies. Accordingly, they become, through the application of 'cultural knowledge,' magnets rather than resistors for demographic and economic growth.

Brad Coombes, University of Auckland. Email: b.coombes@auckland.ac.nz; *Challenging the Collaborative Ideal: Exploring the Dilemmas in Joint Research with Indigenous Claimants to New Zealand's Waitangi Tribunal*

Driven by 'benefit sharing' requirements and the institutionalisation of research ethics, collaborative inquiry has become orthodox in academic research with indigenous peoples. Yet, at the same time as this strategy has ascended to normative status, cultural geographers and indigenous academics have increasingly challenged both autochthony and the essentialisation of indigenous peoples as singular collectives, problematising the assumption that there is a research partner with whom to collaborate. Despite increasing recognition of indigenous plurality and its associated ethical dilemmas in, for example, land claims settlement, collaborative research is typically conducted with traditional leadership structures and may, therefore, accentuate rather than address the justice, representativeness and ethical consequences of academic research. The ethical dimensions of four of the author's research projects for Treaty of Waitangi settlements in Aotearoa/New Zealand illuminate the fallacies of the collaborative ideal. In each case, literal implementation of contractual requirements for collaboration would have disadvantaged particular tribal and sub-tribal groupings, perpetuating the cultural violence of colonial and pre-colonial power structures.

Adam Coomes, University of Louisville. Email: Adamjc22@yahoo.com; Alvin Rentsch, University of Louisville. Email: arrentsch@hotmail.com; *Unsupervised Classification of Iroquois Park in South Jefferson County, Kentucky*

This paper examines the effectiveness of an unsupervised classification of Iroquois Park in South Jefferson County Kentucky- an isolated knob with diverse land cover features. The unsupervised classification was used with ground truthing to categorize land cover from LANDSAT imagery of the area (2003; 30 x 30m color). The spectral bands that would be used to create the classifications and to determine the number of classification categories were chosen using ERDAS IMAGINE. Eight classifications were used in order to cover all the major features within the park. The approximate longitude and latitude of sixteen locations, including two sites for each class, were identified and a photographic recording of each site was made to aid in accurately classifying the areas. The unsupervised classification worked well for the area and thus this could be used to complete classification studies at additional sites in the area.

Email: arild.angelsen@umb.no; *Will Land Use Intensification Save the World's Critical Ecosystems?*

Scientists, policy makers and NGOs throughout the world are striving to find effective strategies to protect the critical ecosystems and habitats that sustain life on Earth while provisioning an increasing demand for food, fiber, and fuel from agriculture. Land use intensification (i.e., using land currently in use, more intensively) is promoted on the grounds that it spares more remote, fragile and often biological diverse areas. This policy is supported by the belief that the prime agricultural lands have long been cultivated and that future demands are most efficiently met by increasing production on those lands. The base assumption is that by promoting intensification everywhere, critical ecosystems will experience less pressure from extensification. Drawing on land use theory and empirical evidence in three environments of concern - tropical rain forests, savannas and drylands, and coastal mangrove swamps? we challenge this view, suggesting that effective protection can arise only through tailored intervention and an improved understanding of land use intensification and the land use

transition.

Meghan Cope, University of Vermont. Email: mcope@uvm.edu; *Child-Friendly Cities? Design and Policy Implications in the Context of US Cities' and Social/Spatial Injustice*

The concept of 'child-friendly cities' has achieved a fair amount of support in European nations, in part as a response to the UN's Convention on the Rights of the Child, resulting in hundreds of large and small examples of urban design and policy practices that welcome, accommodate, and focus on children and youth as valuable members of local communities. Ranging from 'home zones' and the Dutch woonerf (entire neighborhoods constructed around streets for play where cars are merely slow, occasional guests) to city charters that facilitate Youth Councils to represent young people's views and wishes, the notion of breaking down the barriers of childhood for urban residents has resonated in the realms of academia, policy, planning, and youth advocacy. Several Canadian cities have also implemented some of these strategies, but few US cities are aware of, much less embracing, child-friendly strategies. This paper critically reviews the concept of 'child-friendliness', which tends to be heavy on design and light on social change, and considers its potential adaptability and applicability in US cities, especially those plagued by high levels of racial and economic marginalization.

Keywords: child-friendly cities, social justice, children's geographies, urban geography

Catherine Corson, University of California, Berkeley. Email: ccorson@nature.berkeley.edu; *A Political Ecology Analysis of Madagascar's Biodiversity Conservation Agenda*

At the 5th World Parks Congress in September 2003, Madagascar's President announced his intention to triple protected areas in Madagascar. Drawing on analyses of project documents and ethnographic data collected in Madagascar and the United States, this paper investigates the production of the Madagascar biodiversity agenda across sites of policy-making that span local, national and international spheres. It examines how the interpretation and implementation of the effort to expand Madagascar's parks is being shaped through negotiations among the Malagasy State, multilateral and bilateral donors, international conservation organizations, and local authorities. It traces how these negotiations articulate both with the historical conflict between the Malagasy State and rural farmers over access to and control of Madagascar's forests and with the contemporary pressures imposed by a liberalizing economy. Finally, it shows how bureaucratic practices and power relations interact to restrict community participation in the initiative despite conservation narratives and associated programs advocating community forest management. Through these analyses, the research reveals the fractured and contested ongoing process of the territorialization of Madagascar's forests.

Keywords: political ecology, Madagascar, biodiversity, territorialization, development

Mark W. Corson, PhD, Northwest Missouri State University. Email: mcorson@nwmissouri.edu; *The Search for a Cost Effective Simulation Training Environment for Reserve Component Logistics Organizations*

US military logistics units are able to deploy world-wide and establish multi-functional logistics operations capable of fully sustaining large numbers of troops for long periods of time. Preparing for these complex operations poses many training challenges given that units are often geographically separated at their home stations, and seldom work together due to the high cost of field training exercises. Additionally, training exercises can never replicate the scale of effort required for a major operation. Reserve component logistics organizations provide a majority of US military logistics capability, yet suffer from a lack of training resources and opportunities even worse than that experienced by their active duty counterparts. Computer simulations utilizing virtual environments have great potential to facilitate the training of higher level logistics headquarters in logistics command and control functions. The ability to customize the virtual environment to represent potential operating areas using either maps or remotely sensed imagery may substantially improve the training experience. The ability to conduct training in a virtual environment via network or the internet could allow for geographically separated units to conduct multi-echelon training as often as needed using very few resources. This paper traces the research effort to find a cost effective, customizable, and simple to use simulation environment that will facilitate distributed, multi-echelon, and realistic multi-functional logistics command and control training primarily for reserve component units.

Dominic J Corva, Ph.C., University of Washington. Email: corvad@u.washington.edu; *Neoliberal imperialism and its Others in Latin America*

The concept of U.S.-enforced "regime change," as well as the practice of training and funding foreign police forces to pacify an insurgent population, is nothing new for Latin America. This paper traces the continuity of "neoliberal imperialism" in the region by examining the connections and differences among three key moments: the 9/11/1973 Pinochet coup, the 1989 invasion of Panama, and a recent press conference featuring Chilean president Michele Bachelet and Bolivian president Evo Morales. I argue while the Pinochet coup d'état represented the first moment of neoliberal imperialism in Latin America, the 1989 invasion of Panama should be considered a key "second moment" of neoliberal imperialism: regime change justified by geographical imaginations associated with security in a "borderless world." The third moment looks to the future of resistance to political and economic imperialism, by placing together two representatives of the "move to the left" in Latin America, both with close personal experiences of the first two articulations of neoliberalization and imperialism in Latin America.

Keywords: neoliberalism, imperialism, Latin America

Geraldo M. Costa, federal university of minas ge. Email: gemcosta.bhz@terra.com.br; Carlos Eduardo Flores, Federal University of Minas Gerais. Email: carloseduflores@terra.com.br; *Socio-spatial issues of urbanization in Brazil: the case of labor force commuting in the Metropolitan Region of Belo Horizonte (MRBH)*

Since the 1980s a process of moderate population growth has occurred in the major Brazilian metropolitan regions. This was a turning point after a long period of intense population growth that had peaked in the 1970s. Despite this slowing down, there is still significant population growth occurring in poor peripheral metropolitan areas. This growth shapes a socially segregated space in terms of social reproduction, and characterizing an asymmetry between the localization of jobs and the residence of workers. As a result there is an intense low-income labor force commuting process. This paper analyzes this process in the Metropolitan Region of Belo Horizonte, an urban agglomeration of about four million people located in the southeast, the most developed region of the country. First, the paper approaches the spatial formation of that urban region on the basis of the existing literature that considers the actions of the main social agents responsible for the metropolitan space production since the fifties. Secondly, the paper explores the empirical evidence from an origin-destination survey to analyze socio-spatial implications of commuting. Besides understanding the particularities of that urban region from the perspective of asymmetrical relation between residence of labor force and jobs location, the paper invites a dialogue between researchers dealing with similar issues in Brazil and Latin America more generally, and in other parts of the world.

Keywords: metropolitan region, labor force, commuting, Brazil

Heloisa S.M. Costa, Federal University Of Minas Gerais. Email: hsmcosta@terra.com.br; *Urban peripheries in Brazil: new challenges to multi scale policies and politics*

The articulation between urbanization, nature and social production of space are discussed in the context of recent metropolitan expansion in Brazil. The paper focuses on the ambiguous role of the social agents - state, organized society and capital ? in creating the conditions of production, while still neglecting social reproduction, housing included. These agents thus contribute to patterns of inequality in the production and appropriation of urban space ? from well provided developments, usually luxury gated communities, to the so-called peripheral popular settlements. The urban peripheries embody the complexity of contemporary urbanization, with important implications in terms of social demands and regulation. The paper explores urban and environmental policies to assess whether they lead to social justice or maintain inequalities. Recent urban legislation and politics reinforce local planning and participation within a context of multi-centered regional metropolitan expansion. At the same time new forms regional and metropolitan planning have to be reinvented after authoritarian metropolitan regulations were dismantled. Struggles around social demands sometimes coincide and other times clash with social and environmental values, depending on the public or private appropriation of gains associated with property. Evidence comes from research in the southern area of Belo Horizonte, the third largest Brazilian metropolitan region. There is an interesting convergence of urban and environmental policies in the area characterized by land use conflicts between the collective interests of environmental preservation, the private interests of iron ore mining, and those of property developers and upscale housing dwellers.

Pedro Costa, ISCTE. Email: pedro.costa@iscte.pt; *Agglomeration for creativity in cultural activities: What difference does it make?*

Recent interest on "creative cities" makes clear the relation between urban territory and creativity-led sustainable development dynamics. Numerous academic research and policy-making has been developed on this lately, linking those dynamics to the development of creative activities, creative classes or even creative institutional solutions. Being urban territories the natural center for creative dynamics, some spaces have been though particularly noticed, as they distinguish in offering specific conditions, in terms of dimension and agglomeration effects, which seem to be determinant to expand creative processes, particularly in the case of the production of cultural products, our particular research interest. In effect, creative process is clearly related to urban space, particularly to agglomeration effects, both by theoretical approaches in multiple fields (e.g. geography, sociology, economics, psychology,?) and by quite a few empirical studies. However, the complex roots of this relation are not totally understood and many of its determinant factors still remain quite unexplained. This paper aims to explore this relation between creativity and the agglomeration of cultural activities in specific parts of urban space, where creative mechanisms predominantly embed and develop. In the first part, a transdisciplinary conceptual framework to analyze the relation between creativity and agglomeration is developed, identifying the main motivations which explain the importance of urban agglomeration to creative processes in art and culture. In the second part, some empirical results of an on-going research are presented. Based on a survey to cultural agents in Lisbon, Portugal, a typology of motivations for explaining these creative roots is presented.

Kimberly Coulter, University of Wisconsin-Madison. Email: kcoulter@wisc.edu; *Territorial appeals: A discursive approach to nation narration. The case of German film*

Feature films are highly effective in producing and reproducing nations: their industries fuel territorial economies, while their images construct borders in the mind. Contemporary German national narratives that succeed commercially outside of their home markets, however, emerge as co-products of multiple regional, state, and supranational interests. As they cross more borders in their production and distribution, these bordering processes are becoming more interdependent and indirect. To understand the relational networks out of which cinematic national representations emerge, I propose an approach that focuses on the discursive, performative paths through which a film is funded, produced, marketed, and talked about. In these discourses, I pay critical attention to how territory is invoked to justify a project or win support for a position. These invocations, which I call territorial appeals, appear in a variety of forms but ultimately aim to shore up support for either a specific territory or even the legitimacy of territory itself. This approach demonstrates the power of territorial subjects in the continuous and contingent renegotiations of nation. Based on in-depth interviews with government and film industry stakeholders and analysis of supporting texts, I bring this approach to bear on the border-crossing production and distribution of contemporary German films about the national past.

Thayne A. Coulter, Bureau of Reclamation. Email: tcoulter@do.usbr.gov; John Wilkins-Wells, PhD., Colorado State University. Email: johnww@lamar.colostate.edu; *Local Water and Land Use Planning Interface Opportunities*

Traditional irrigation districts in the Western United States continue to be faced with major challenges associated with urbanization. This is often due to the fact that regional land and water use planning are not sufficiently coordinated in many localities. Irrigation districts as water suppliers are often required to make adjustments to changes in land use with minimal forecasting or planning tools, most of which are located in the hands of city and county planning offices. Because irrigation districts were not originally designed as land use planning entities, but rather as water purveyors, greater effort is needed to ensure that they are provided with such information. This paper explores ways in which improved coordination between land use planning agencies and traditional irrigation districts might be realized. Experience is drawn from a series of workshops and forums conducted on this issue in the West over the past several years, and funded through the Bureau of Reclamation's Science and Technology program. Innovative methodologies for data gathering, analysis and technology transfer are emphasized based on experience with multiple application examples.

Email: ; *Residents' perceptions of neighborhood and the implications for community change*

When presented with the task of drawing the boundaries of their neighborhood, how do people respond? Do people living in the same area, refer to it by the same name? Does one's view of neighborhood depend upon age, race, income, or family structure? This paper will explore these questions in greater detail for neighborhoods in ten U.S. cities - Denver, Des Moines, Hartford, Indianapolis, Louisville, Milwaukee, Oakland, Providence, San Antonio, and Seattle. Respondents in each neighborhood completed a survey and drew their neighborhood on a map. These respondent drawn maps were analyzed for consensus within a geographic information system. The maps from residents who shared the same neighborhood name were examined to determine the degree of consensus among them in terms of the areas included in their perceived neighborhood. Additionally, we identified neighborhoods about which there was consensus using nearest neighbor hierarchical clustering. Each consensus area was then explored along demographic, social, and economic dimensions. The neighborhoods examined in this paper are involved in the Annie E. Casey Foundation's Making Connections initiative, which works to improve conditions for families and children in isolated neighborhoods. How residents view their neighborhood has implications for community organizing and neighborhood change. The final component of this paper considers how the role of the neighborhood and how residents' neighborhood identity can influence community organizing efforts.

Keywords: mental maps, U.S. cities, defining neighborhoods, community change

Francois Courchesne, Professor, Université De Montréal. Email: francois.courchesne@umontreal.ca; *Root-induced acidification and trace metal speciation in the rhizosphere of forest soils*

Tree growth and atmospheric deposition represent two key sources of acidity to forest soils. We investigated the contribution of tree roots to acidification and to the speciation of metals in soils. To do so, bulk and rhizosphere soil materials were collected in a range of contaminated and pristine forested sites from southeastern Canada. Water-soluble organic C (WSOC), pH, and the concentrations of trace metals Cd, Cu, Ni, Pb and Zn were determined. At all sites, the rhizosphere was generally more acidic and its WSOC content was higher. The mineralogy, notably the abundance of amphiboles and plagioclases, significantly differed between the two components because of accelerated weathering in this corrosive microenvironment. The fraction of water-soluble Cu present as Cu²⁺ was higher in the bulk soil because of Cu complexation by organics in the rhizosphere. As a corollary, the activity of Cu²⁺ did not significantly vary with proximity to roots but Zn²⁺ increased in the rhizosphere. The total concentrations of most water-soluble and salt-extractable metals were however higher in the rhizosphere. Yet, the acid-extractable metals only marginally differ between the two components. These results were supported by speciation analyses conducted on the solid phase of soils. In brief, the processes acting in the rhizosphere strongly impact on the acid-base status of forest soils and, consequently, on the speciation of metals. Because of the key roles played by the rhizosphere, we submit that it should be considered when estimating bioavailability and the ecological risks associated to metals in soils.

Joshua J Coutts, U.S. Bureau Of the Census. Email: joshua.j.coutts@census.gov; *Re-Evaluation of Approaches to Delineating Statistical Geographic Areas*

The development of statistical geographic areas for use in tabulating and publishing demographic data traditionally has focused on the representation of geographic concepts, with demographic and statistical concerns in the background. Concerns about reliability and quality of data have prompted an increased focus on more rigorous approaches to defining statistical geographic areas. An argument is advanced advocating movement away from this traditional view of statistical geographies as passive containers of data. Consideration is given to development of statistical geographic concepts and criteria that both delimit area associated with a particular demographic group or geographic concept, and foster production and dissemination of reliable and meaningful data.

Keywords: population; statistical geography; data reliability

Tom Cova, University of Utah. Email: cova@geog.utah.edu; *An agent-based approach to modeling warning diffusion in emergencies*

A number of models exist for representing the process of people leaving an area in an emergency at macro, meso and micro scales. In almost all cases, however, the process of notification and warning diffusion is overlooked. Evacuation models begin with vehicles entering a network at varying rates without regard to the information gathering, dissemination and decision making processes that led to these trips. In short, a large body of behavioral research has not found its way into contemporary modeling efforts. For this reason, it is difficult for emergency managers to utilize the results of this research in practice. This paper proposes an agent-based approach for incorporating findings from the disaster behavioral literature into a model for better representing notification, warning diffusion and, ultimately, evacuee departure rates.

Steven Covington, The Aerospace Corporation. Email: steven.covington.1@gsfc.nasa.gov; Jeff Masek, NASA. Email: Jeffery.G.Masek@nasa.gov; *The NASA/USGS Mid-Decadal Global Land Survey*

The U.S. Geological Survey (USGS) and the U.S. National Aeronautics and Space Administration (NASA) are augmenting a series of decadal global land surveys with one based around the 2005-2006 epoch. The Mid-Decadal Global Land Survey (MDGLS) will build on previous datasets from the 1970's, 1990 and 2000, while increasing the total coverage and, for the first time, include Antarctica. The MDGLS project will utilize remote sensing data from the Landsat 5 and 7 satellites operated by the USGS. The activity has been organized into two phases with the USGS leading the first phase: Data Acquisition, and NASA leading Phase 2: Product Generation. In Phase 1, data acquisition is based on each scene's geographic location, climate and land cover seasonality. To mitigate the perennial risk of cloud contamination, the strategy is to maximize the collection from both the Landsat 7 ETM+ and the Landsat 5 TM instruments. Phase 2 of the MDGLS will concentrate on production of a set of images that best reflect the land cover/land use of the Earth while providing products with a temporal compatibility to previous surveys; facilitating land change analysis across the four survey epochs. Product specifications and distribution policies are being formulated in consultation with a Science Steering Committee, the NASA Land Cover/Land Use Change Science Team, and the USGS LDCM Science Team. This paper will provide a synopsis on the strategies taken for the implementation of both Phases 1 & 2 of the project and give an update on the progress of each.

David J. Cowen, University Of South Carolina. Email: cowend@sc.edu; *A National Vision for Land Parcel Databases in the United States*

Early in 2006 the National Research Council's Mapping Science Committee formed a committee to develop a National vision for Land Parcel Databases. Building from the NRC's 1980 report "Need for a Multipurpose Cadastre," this study is designed to highlight the status of land parcel databases in the United States, provide a vision for the future, and develop a strategy to complete this NSDI Framework data layer. Specifically, the committee was asked to (1) identify the benefits of parcel databases to all stakeholders (public and private); (2) describe the current status of parcel databases across the nation at all levels of government; (3) document what is possible using examples of successful systems; (4) provide a vision of what could be possible nationwide; and (5) identify a strategy to achieve the vision, including the role of the federal agencies, and accounting for challenges that must be overcome. The paper will report on the findings and recommendations from this study. It will highlight the analysis of more than 400 responses from a wide range of stakeholders and discuss the comments from Federal Agencies, The Private Sector, and Policy-Makers and National Associations who participated in the committee's land parcel summit. An important part of the committee's work focused on the current intergovernmental relationships that impact the sharing of parcel data. This relates directly to the role of land parcels as a National Spatial Data Infrastructure (NSDI) framework data layer and as part of the OMB Geospatial Line of Business.

Deborah Cowen, York University. Email: dcowen@yorku.ca; *Anti-Social Security?*

Crises of national security have historically been definitive periods for nation building and for the genesis of 'solidarity' and social security. Exceptional moments of crisis like war have allowed labouring citizens to make forceful political claims and institutionalize new forms of entitlement. The current moment is markedly different. Contemporary national security policy severely compromises labour rights and social forms of security. Ironically, national security projects also pose acute challenges for global trade by impeding the efficient movement of goods across borders, with transnational corporations like

Wal-Mart systematically undermining security initiatives. Port workers are at the epicenter of conflicts over 'economy' and 'security', and struggles over the changing meanings and relations between social and national security. They, at once, play a pivotal role in policing the territorial borders of the nation and are central to the global movement of goods. In both the US and Canada, security clearance programs administered through biometric identity cards are under development for workers in this sector. Proposed measures subject workers and their families to extensive screenings and threaten to institutionalize racial profiling, undermine job security and civil rights, and blur the boundaries between 'terror' and crime. In this paper I explore the restructuring of work and citizenship as a vital dimension of national security projects. I suggest that there is urgent political need and rich theoretical insight available from thinking through struggles over different forms and geographies of 'security'.

Helen M. Cox, Geography Department, California State University, Northridge. Email: helen.m.cox@csun.edu; Alan Yong, Geography and Geology Departments, California State University, Northridge. Email: yong@usgs.gov; *Geomorphological feature extraction using satellite imagery and contextual-based image analysis*

Remote sensing imagery from the ASTER (Advanced Spaceborne Thermal Emission and Reflection Radiometer) and Landsat 7 ETM+ satellites are commonly used for geologic mapping work, but not common in seismic studies (Yong et al, 2006). Local rock and soil conditions (geotechnical site conditions) are critical for determining the amount of shaking and damage that can be expected in an earthquake. Traditionally these have been determined from conventional geological maps, which have been drawn from seismic field experiments and from local sampling over many decades (Wills and Clahan, 2006). Data have been recorded by different geologists and a variety of means, which has led to inconsistencies. In addition, the spatial precision of the maps is poor in some areas, and in many regions of the world the required data simply do not exist. The use of remote sensing data allows for the possibility of global scale mapping of geotechnical site conditions at a high and consistent spatial resolution. Multi-wavelength spectral reflectance data from ASTER are available at a high spatial resolution and at enough channels to potentially allow for the classification of rock and mineral type from this imagery. In addition, software now exists for the extraction of features from digital data through the use of color, shape, size, and contextual information. An exploration of the results of using digital imagery in concert with context-based image analysis to distinguish geomorphological features will be presented. This work offers exciting potential for applications in other geographic fields such as vegetation and land-use mapping.

Email: plk3@columbia.edu; *FairWeather Factors: Social Vulnerability in the Northeast Megaregion*

Currently 49 million people reside within the neighborhoods of the Northeast megaregion; projections claim another 18 million will by 2050. Current population growth is complimented by extensive and intensive urban spatial development and corresponding increase in the number of weather related societal impacts. The objective of this paper was to use 2000 neighborhood level data to construct a comparative megaregion index of social vulnerability to climate change. The use of a factor analysis method simplified our final 27 variables into clusters of six analogous factors to explain 79 percentage of the variability of the original variables. The individual factor variances were used as a weighting schema for each factor before their incorporation into an additive model which generated the index of social vulnerability. Mapping the six factors and the index of social vulnerability to climate change provided a general foundation for analyzing megaregion vulnerability trends and hot-spots. Highlighting four major cities as case studies (Boston, Hartford, New York - New Jersey, and Philadelphia) provided an opportunity for closer review of the data and to demonstrate the presence of spatial heterogeneity within counties, states, and metropolitan regions that make up the megaregion. Variability within the megaregion demonstrates that different variable combinations actually generate different social vulnerability profiles for each neighborhood. Greater understanding of the neighborhoods' social vulnerability will potentially shape policy interventions, foster opportunities for interdisciplinary research, and progress towards the reduction of societal impacts.

Kevin R. Cox, Ohio State University. Email: cox.13@osu.edu; *Urban Governance in Question*

Urban governance has become a major issue for both academics and local economic development professionals. The literature on the topic raises questions of a critically analytic nature, two of which are explored in this paper. In the first place, the paper questions the significance of urban governance as a problem in local economic development. The conclusion is that it is seriously exaggerated. On the one hand there has been a fixation on a set menu of 'solutions' at the expense of recognizing the innovative way in which agents cope with problems of governance in an ongoing way. On the other hand, assumptions about competition are also oversimplified. To the extent that firms compete in terms of cost then failures of governance could be problematic. But many firms don't, and their technical dynamism can offset local cost problems. The second major issue raised in the paper is that of the relation of governance to space. Problems of governance, to the extent that they exist, can by no means be limited to the urban. Rather the socio-spatial relations to be harmonized are often of a much more complex nature. Even if one accepts the 'urban' qualification it is far from clear that regulation of the urban has to be in the urban.

Keywords: urban development governance competition

Email: ; Laura Venn, West Midlands Observatory. Email: ; Helena Tuomainen, Warwick University. Email: ; *Greater than the sum of the parts? Unpacking notions of care within 'Alternative Food Networks'*

This paper draws on findings from a research project that has worked in depth with producers and consumers participating in six diverse 'alternative food networks' (AFN). In this research, which took us from pastures in Italian mountains to kitchen tables in the British Midlands, we were often engaged in discussions of care: care for people, places, plants, animals, soil, water and for relationships and ways of life. Notions of care permeated and saturated our participants' discussions of their involvement in AFN. Yet the notions of care that were drawn on were diverse and the things being carried for were various. Producers and consumers each constructed their own 'careful geographies' of consumption focused on different scales, objects and actors. However, while these geographies might appear to be competing - pitching care for the body against care for an environment, for example? they actually co-exist quite comfortably and actors in AFN seemed able to acknowledge and act on their own priorities while still respecting, and perhaps being influenced by, those of others. Recent literature has cautioned that discourses of care within consumption and retailing can be problematic and may undermine care for people and places out of sight whilst privileging those that are close by. This paper suggests that in some situations care for a variety of things creates an additive rather than a competing effect. The commitment of various actors to care about their different priorities can accrete to create a larger, overall ethical framework that AFN can work within.

Susan Craddock, Associate Professor, University of Minnesota. Email: craddock@umn.edu; *Antiretrovirals and the body politics of inequality*

The 1990s saw the convergence of two phenomena bearing equally critical impact on what Nicholas Rose has termed 'the politics of life itself' (Rose 2001). The first is the advent of antiretrovirals designed to prolong the lives of people living with AIDS by intervening in viral replication and destruction of the immune system; and the second is the simultaneous development of global intellectual property regulations largely preventing those same drugs from reaching the vast majority of those who need them. This reconfigured political landscape of preventable deaths from AIDS in turn points to a juncture where an array of global assemblages including pharmaceutical companies, international trade organizations, government trade representatives, scientists, and social movements both collide and collude. My intention in this paper is to examine this collision/collusion as a way of extending conversations on the new modes of citizenship that have emerged within the nexus of medical research, biotechnological innovations, bioethics, and privatization of medical capital. The kinds of governance and its contestation that has revolved around access to antiretrovirals, or ARVs, suggest new dimensions to discussions of how biological citizenship is defined and the players involved in shaping that definition and its experience.

Ruth Craggs, University of Nottingham. Email: lgxrc1@nottingham.ac.uk; *The Commonwealth Institute: Architecture and the geographies of optimism and decline*

Many engagements with ideas about the end of Empire, Commonwealth and multiculturalism in Britain in the sixties have focussed on the re-racialisation of Britain, race riots and arguments about immigration, alongside a persistent 'culture of decline'. In contrast, this paper considers one positive engagement with the idea of Commonwealth which occurred during this period. It argues that ideas about progress, cooperation, modernity and multiculturalism were made concrete through the construction and architecture of the Commonwealth Institute in Holland Park. This building, completed in 1962, provides an opportunity to understand London as a space in which competing ideas about Commonwealth were present which included optimistic visions for the future alongside more negative visions for the Commonwealth and nation. Discussions continuing today about the future of the building (which is in doubt) and the future of the multiracial nation illustrate the continued resonance of these debates.

Michael Craghan, Middle Atlantic Center for Geog. & Env'l Studies. Email: mcraghan@macges.org; *Springs, storms, suspended sediment, and sediment sizes in a salt marsh*

High tides and storm surge floods are the only opportunity for sedimentary material to be transported onto the high salt marsh surface. This research focuses on how suspended sediment concentrations and particle size distributions vary during the period of time a salt marsh surface is inundated. Suspended sediment samples were collected in a tidal creek and on the adjacent high salt marsh during four spring tide floods and two coastal storms. The relationship of suspended sediment concentration with tidal stage at this site is typical of relationships found at other salt marsh research sites. This research found that concentration varies with water height. At the start and end of inundation, concentration on the marsh is greater than at the highest flood levels. Particle size distributions of material in suspension also vary with water height. Size distributions show coarser material is not in suspension at the highest flood levels, but those particles reappear in samples as the ebb progresses. There is also a relationship between particle size and suspended sediment concentration. When larger sizes are in suspension concentrations are higher. When smaller sizes make up large proportions of the sample mass, then concentrations are lower, regardless of maximum particle sizes. At the highest water levels on the marsh, particle sizes are smallest and concentrations are lowest. Temporal changes to the sizes in suspension and to concentrations have implications for models of salt marsh sedimentary processes.

James Craine, California State University Northridge. Email: jwc53531@csun.edu; *See Your West: Standard Oil Markets Manifest Destiny*

In the immediate post-World War II period, Standard Oil of California launched its See Your West advertising program. The advertising was in the form of a series of collectable high-quality photographic prints of "scenic views of the West prepared for your enjoyment: to recall to memory certain favorite spots you visited in the past, and to help you visualize the beauties of those regions you yet to see." The use of famous photographers and writers increased the desirability of these prints enabling Standard Oil, in their effort to sell more products to our new and highly mobile society, to take advantage of the burgeoning westward movement of the population. By linking photographic images and ideas with specific places in the Western United States, Standard Oil could define the meanings of those identities and then reify those definitions by inscribing them onto the landscape through the use of the See Your West advertising campaign. This unique form of advertising had the power to change not only the way our landscapes are constructed, but also to alter how we relate to and consume those landscapes thus fetishizing travel to the West and fulfilling the long-standing doctrine of Manifest Destiny.

Jeremy Crampton, Georgia State University. Email: jcrampton@gsu.edu; *The Geographical Reinscription of Race*

In his work on governmentality and bio-politics, Michel Foucault argued that race-based divisions were central to modern governmental rationalities, not only in colonization, but provocatively also within colonizing societies themselves. However, the geographical component of race was never made explicit in his work. In this paper I examine archival papers from 20th century proponents of eugenics (such as American eugenics leader Charles Davenport and American Geographical Society board member Madison Grant) to bring forth how and why biological racism was produced cartographically and geographically. I show that maps at this time were essential in creating spaces for supposedly innately populations based on popular ideas of race and biology. Although decades

of anthropological research has shown that race divisions are arbitrary and have no biological component, then, as now, race was construed as the intersection of socio-biological traits, in which group membership was often circumscribed by geographical boundaries. Similarly, today's biological conceptions of race have geographic implications. The first race-based federally approved drug, BiDil, will be marketed in the South and in largely black urban areas. Companies such as African Ancestry in Washington DC offer home DNA kits in order to trace African ancestry to specific tribes despite the fact that DNA does not follow sharp linguistic or cultural boundaries. Comparing these events to those of a hundred years ago, I examine Foucault's claim that biological notions of race are necessary to government, and explore how the geographical reinscription of race may be countered and resisted.

Keywords: Race, Foucault, Bio-politics, Cartography

Nicholas Jon Crane, Masters Student, Ohio State University. Email: crane.61@osu.edu; *Improvement District Publics? Places of Accountability*

With this paper, I examine the 'place-of-accountability' operative in urban management strategies of emerging business improvement districts (BIDs). Through data from a case study in downtown Columbus, Ohio, I clarify the 'geographies of responsibility' (see Mason, 2001; Popke, 2003, 2004; Massey: 2004) produced by this sub-local strategy. Towards this end, I attend to BID boundary-making practices, indicating how these practices are informed by a spatial imaginary of (BID-) place, which governs managerial performances of accountability. Against this conceptualization of an inflexibly bounded place-of-accountability (bounded, that is, by the property of an investor-public), I imagine the place-of-accountability as spatially open, socially embedded, and historically constituted (see Massey: 1993, 2005). With this normative spatial imaginary, I implicitly call into question the adequacy of contemporary managerial performances of accountability, and I advocate a revision(ing) of accountability as "(shared) political responsibility" (see Young: 2003).

Keywords: geographies of responsibility, Business Improvement Districts, place-of-accountability, public formation

Randall Crane, UCLA. Email: crane@ucla.edu; *U.S. Housing Affordability and Crowding Trends, 1985-2005*

This paper will use the American Housing Survey to examine housing behaviors in the U.S., particularly among low-income households, over the last two decades. My focus is housing consumption and its costs. Several researchers have recently pointed out that the extent and even definition of the "affordability problem" is far from clear (Linneman and Megbolugbe, 1992; Hulchanski, 1995; O'Flaherty, 1996). In part the difficulty for policy analysts is that affordability is a reduced form measure of both supply and demand factors, like any market-determined price, rather than a simple and meaningful measure of need. For home buyers the confusion is somewhat worse, given the central roles of mortgage interest rates in determining housing cash flow, of property appreciation rates in determining net wealth effects, and of the down-payment constraint and credit history generally in determining access to financing. However, there is little comparative detailed knowledge at both national and local scales for low-income households in the metropolitan areas of the U.S. in recent years. Among the merits of the American Housing Survey for this purpose, beyond its panel structure and large sample size, are that data for 2005 are available today. I therefore plan to carefully examine and explain low-income housing trends in central versus suburban settings for all major metropolitan areas from 1985 to 2005. In addition to tracking interesting trends, over time and space, I will estimate panel models of housing consumption in order to explore the respective roles of alternative explanatory factors.

Keywords: housing consumption affordability crowding shelter

Mike A. Crang, Durham University. Email: m.a.crang@durham.ac.uk; *Displacing Destinations, Becoming Tourists*

Tourists are often noted but rarely figure favourably in imaginaries of mobility. Tourism tends to be taken as emblematic of a decadent mobility - as opposed to forms of movement seen as challenging, subversive and intellectually exciting. Looking at analyses of tourism they tend to suggest the reproduction of fixity and stability - with people travelling to stabilise and support their identities through visiting places circumscribed by the geographies of place marketing and package provision marked by a spatiality of containment from charter plane to inclusive resort to tour bus. All of which seems true at some level, but also replicates a hierarchy of taste in mobility that has long valorised exploration over travel, and travel over tourism. This paper will take a slightly different line located in an ethnography of tourists. It will look at the production and destabilisation of places through touristic imaginaries. Material will be drawn from Greek and Mediterranean tourism to ask how the subject of tourism is constructed through places and how their presence disrupts places. Taking the example of Kefalonia it will examine the multi layered geography of a landscape encoded by history, by a novel and film (Captain Corelli's Mandolin), the

performance of tourists and then the rather clumsy performance of tourism by ethnographers. This layered account will suggest rather more instabilities in both locating the places of tourism and accomplishments of becoming a tourist.

Ryan Craven, University of Western Ontario. Email: rj_craven@hotmail.com; Jason Gilliland, PhD, University of Western Ontario. Email: jgillila@uwo.ca; *Artists' Impressions of Creative City Strategies in London, Canada*

Creative city concepts of economic development popularized by Richard Florida have been widely accepted by planners and policy makers in cities throughout the developed world. Previous research on these concepts has focused heavily on the search for correlations among certain socio-cultural characteristics (e.g., diversity, tolerance) and indicators of economic performance in city-regions. In this case study of the creative economy in the city of London, Ontario, Canada, we seek to gain a better understanding of how creative city concepts are translated into actions by local governments, and how such actions are perceived and experienced by the core of the so-called 'creative class' (e.g., visual artists, musicians, dancers). In the first part of the presentation we will present the results of a content analysis of municipal government reports in order to identify official creative city strategies. In the latter part of the presentation we will present highlights from detailed interviews with local artists living/working in London's Old East Village (OEV) neighborhood. Using data from the interviews we are able to better identify specific community characteristics and government strategies that encourage/discourage the success of the creative class. This research seeks to fill the knowledge gap which exists between the policy makers (municipal, provincial and federal governments) and members of the creative community in terms of the elements required for fostering a stronger creative economy.

Keywords: creative economy, community development, artists

Altha J. Cravey, University Of North Carolina. Email: cravey@unc.edu; *Racialized Spaces: US labor recruitment from Mexico*

Recruitment of foreign labor in the US is highly contentious and contradictory. This paper examines the historical geography of recruitment from Mexico and argues that geopolitical and trade relationships have a profound influence on both official recruitment efforts and unofficial ones. I explore the interplay between these migratory flows in order to understand contradictions in the governments's guest worker programs and corporate labor recruitment strategies. An ethnography of Mexican transnational lives illuminates the way in which recruitment practices produce gradations of citizenship and sovereignty.

Christopher J. Crawford, Virginia Polytechnic Institute and State University. Email: ccrawf05@vt.edu; Lisa M. Kennedy, PhD, Virginia Polytechnic Institute and State University. Email: likennel@vt.edu; Carolyn Copenheaver, PhD, Virginia Polytechnic Institute and State University. Email: ccopenhe@vt.edu; *A Tree-Ring Record of Climate, Disturbance, and Tree Encroachment in a Southern Appalachian Grass/Heath Bald*

High elevation un-forested openings known as grass balds in the southern Appalachians have been the subject of vigorous scientific debate concerning their origin, maintenance, and future. Grass balds support a variety of endangered flora and fauna. Recent tree encroachment into these grass-dominated systems represents undesirable change to many land managers who value their unique biota and the scenic vistas they provide. At Craggy Gardens, a grass/heath bald on the Blue Ridge Parkway in western North Carolina, we used a combination of dendrochronology and aerial photography to investigate the spatial and temporal patterns of tree invasion of the bald. We cored trees within 5m-wide belt transects from the grass-forest boundary extending downslope into mature forest. A chronology (n=128) from the dominant canopy tree, northern red oak (*Quercus rubra*), revealed an inter-series correlation of 0.587 (ARSTAN provided standardization). Pearson's correlation analysis showed significant correlations with the previous year's May and June temperatures ($r = 0.25, 0.26$ respectively) and June precipitation ($r = -0.21$). The spatial analysis of *Quercus rubra* indicated two distinct periods of tree establishment: gradual recruitment from the 1760s in an open woodland habitat, and a period of heavy recruitment around the early 1930s, which continued to the late 1960s closing the canopy and then declining rapidly. Historical photos indicate livestock grazing before the 1930s and cessation of grazing after 1935 that we think is linked to heavy oak recruitment. Analysis of aerial photographs (1940s to 1990s) revealed substantial changes from open land to forest cover that support our interpretation.

Thomas Crawford, East Carolina University. Email: crawfordt@ecu.edu; North Carolina's Final Coastal Frontier: Land Cover Change Analysis for the Inner Banks, 1992-2001.

Media accounts report that North Carolina's inland estuarine region is experiencing dramatic land cover change described as the "coastal boom moves inland". This follows a history of development along the Outer Banks and other barrier island settings related to land scarcity along the oceanfront. The region is being actively promoted as the Inner Banks to attract economic growth and immigration. This paper uses multi-date land cover data from the National Land Cover Dataset to characterize land cover transitions and provide a baseline analysis of change during the period 1992 to 2001. A methodological extension to traditional transition matrix analysis is employed to separate systematic from random transition and highlight important signals of change on the landscape. Results are consistent with the inland coastal boom theme and demonstrate a systematic transition primarily from agriculture and secondarily from forest to developed cover. While much of the region remains in agriculture, forest, or wetlands, results suggest the need for continued monitoring and future modeling efforts to better understand drivers and impacts of land cover change which, if continued or accelerated above rates found during the study period, may have significant impacts on the region's rich natural resource base and sense of place.

Richard J. Crepeau, Appalachian State University. Email: crepeaurj@appstate.edu; Theoretical Issues and Practical Applications of Landscape Ecology for Geographers and Planners

Landscape ecology concerns itself with the structure, function and change of spatial units within a large area. In the 1930s, regional planning efforts in Europe incorporated issues of landscape ecology - at least conceptually. Ian McHarg has addressed the issues inherent in determining the impact that the built environment has on the natural environment, which is a focus of landscape ecology. This object of inquiry has made a resurgence lately among architects and planners. Within the past decade, landscape ecology has taken a decidedly quantitative turn. Building upon information theory, ecologists developed measures that describe the interaction of land types and relate their character of interaction with a phenomenon that is influenced by its environment. Planners have adapted the ecologist's perspective to the built environment and the landscapes in which we live. It is important at this stage to revisit the theoretical underpinnings of landscape ecology and discuss its practical applications, especially as it relates to issues of transportation and land use activity systems.

Tim Cresswell, Royal Holloway, University of London. Email: tim.cresswell@rhul.ac.uk; Mobility constellations - movement, meaning, practice

This paper develops an approach to mobility that consider the connections between aspects of moving that are normally held apart - the physical act of movement, meanings given to movement, and experience or practice of movement. The paper suggests that considering these aspects in tandem reveals "constellations of mobility" that are more or less stable and structured worlds of mobility that change spatially and temporally. The paper will trace the value of thinking in these terms for an historical geography of mobility.

Keywords: Mobility, Movement, Meaning, Practice

Tijs Creutzberg, Ph.D., University of Toronto. Email: t.creutzberg@utoronto.ca; Filling in the 'governance gap': The role of local strategic governance networks in resolving the challenges and problems of high-tech development in Austin and Toronto

This paper examines the role that informal regional governance structures play in resolving the many challenges associated with the development of a regional high-tech economy in Austin, Texas, and Toronto, Ontario. These structures, called 'local strategic governance networks', are animated by civic leaders, regional organizations and business associations, and shown to be increasingly important to resolving issues ranging from environmental degradation to growing social inequity within a particular locality. The comparative analysis traces the necessity of this mode of governance to the fact that many of these problems associated with high-tech development, require a multi-jurisdictional response, the result of which is a 'governance gap' whereby no one government entity can effectively attend to their resolution. Due in part to a higher degree of municipal fragmentation, this governance gap is shown to be more pronounced in Austin than in Toronto, though in the former, a more effective local strategic governance network has emerged to respond to this gap. Through mobilizing the necessary authorities and resources, these networks act to fill this gap and provide a degree of strategic attention to local public problems that are often beyond the policy horizon, or jurisdiction, of any one level of government. The analysis contributes to the understanding of how governance networks function by examining the types of actors that comprise the network,

and by linking their effectiveness to the formal institutional context in which they operate.

Keywords: Governance, networks, economic development

Bruce R. Crew, Michigan State University. Email: crewbruc@pilot.msu.edu; The Influences of Ancient Philistia's Military Strategy against the Israelites upon General Allenby's 1917-1918 Palestine Campaigns

This paper involves an examination of ancient Philistia's military strategy against the Israelites in relation to its influences upon General Allenby's 1917-1918 military campaigns in Palestine during World War I. In particular, it focuses upon the military strategy and objectives employed by Allenby against Ottoman forces as compared with the military strategy and objectives used by the Philistines against the ancient Israelites during the 11th-10th Centuries B.C. It explores the manner in which these two military campaigns closely resemble one another in a number of ways despite their chronological separation over a period of many centuries. Through the application of a principle known as 'internal self-consistency' to the study of Biblical and extra-Biblical texts, the paper consists of three main points. First, it demonstrates that the military strategy of "divide and conquer" used by the Philistines against the Israelites contains a number of similarities to the strategy employed by Allenby in his efforts to wrest Palestine from Ottoman rule. Second, it attempts to show how Allenby's use of ancient sources in planning and executing his military strategy against the Ottoman Turks permitted British forces to overcome obstacles that blocked earlier efforts to conquer the country. Third, it seeks to provide an example of how the application of spatial-temporal information from Biblical and extra-Biblical texts to develop a successful military strategy remains a viable option for this area of the world even in modern-day times.

Kelley A. Crews-Meyer, University of Texas. Email: kacm@uts.cc.utexas.edu; Kenneth R Young, PhD, University of Texas. Email: kryoung@mail.utexas.edu; Resilience and Stability as a Framework for Health: The Interplay of Social and Environmental Vulnerabilities

The importance of human health, particularly in developing countries, continues to demand response from scholars. Yet despite advances in population-environment interaction research, there remains a gap in the explicit expression of the interconnectedness of human health and ecosystem health. This research examines the nexus of these typologies of health through two potentially synergistic frameworks: ecological resilience / stability and vulnerability. Specifically, this work integrates social and environmental components of vulnerability to elicit, build, and test expectations regarding population-environment interactions in an urbanizing Amazonian environment. Preliminary enumeration and analysis indicate that social vulnerability is greatest in less accessible areas but which, in the case of ribereños communities, may be mitigated by stronger community networks; environmental vulnerability, however, appears highest in areas with less diverse endowments, whether access to white versus black water systems, white sands versus red clay soils, or to both floodplain and upland croplands. It is expected that social and environmental vulnerability may mitigate each other through the peri-urbanization process while varying with population group and household residence time, such that recent migrants (colonists) suffer the (relatively) highest levels of vulnerability, indigenous peoples experience moderate levels of vulnerability, and longer-term migrants (ribereños) undergo the lowest levels of vulnerability. These temporal trajectories are couched in the context of ecosystem resilience and stability to understand the potential longer term effects of viewing health as a good which is inextricably and simultaneously built around humans and ecosystems.

Lee Crookes, University of Sheffield. Email: L.Crookes@sheffield.ac.uk; Ethical issues in policy-relevant research: how much do we care?

Calls for more policy-relevant research in geography continue to resonate through the discipline. But exactly whose interests are served by policy-oriented research? With much of this work funded by government and with academics under pressure to generate research income, to what extent are the needs of policy-makers prioritised over community interests? In these circumstances, what responsibilities do/should geographers have to the community? These questions arise at a time when the notion of 'public geographies' is gaining some ascendancy (Ward, 2006) and when the moral and ethical dimensions of research are receiving increased attention. This increased commitment to reflexive and ethically-aware research, particularly evident in the fields of qualitative and participatory research, for example, serves to highlight the comparatively limited engagement with moral and ethical issues, both in the wider debate on 'relevance' and, perhaps, in the actual conduct of policy-oriented research. This

paper is therefore an attempt to begin to explore the ethical lacuna in funded, policy-oriented research. In particular it examines the Blair government's housing market renewal programme as an example of a research-driven, evidence-based policy that, in several instances, is leading to extensive housing demolition and the disruption and displacement of established communities. The paper contrasts the severity of these impacts and the apparent lack of ethical concern with the high levels of ethical reflection and insight that are commonly expected from researchers in other contexts that generally involve much less potential for doing 'harm'.

Keywords: ethics, relevance, public geographies

Mary Crooks, University of Oregon. Email: mcrooks@uoregon.edu; *A geographical look at students' experiences: cognitive maps of the University of Oregon campus*

This paper addresses how participation in different student groups on the University of Oregon campus affects students' cognitive maps of their spatial campus environment. Freshman students are a population that is overwhelmingly the result of recent in-migration. Consequently, many of their cognitive maps are newly formed and in the process of dramatic change, making it easier to look at influences on those conceptions. Cognitive maps of university freshmen students' show differences in campus features and the size of the campus as a whole, as well as the more complex spatial environment in which students' day-to-day experiences are conducted. There are many ways that students are introduced and oriented to the campus. Two important ways at the University of Oregon are through Residential Halls and Freshman Interest Groups, and both of these groups seek to help new students become better acquainted with other students and campus resources. Analysis of questionnaires, student-drawn cognitive maps and interviews with freshman students for this project helps fill in a gap in the literature on cognitive maps, campus life and migratory student populations. Scholars across a wide range of disciplines have become interested in the social effects of residential housing and university groups, such as the development of skills, group interaction, territoriality and social hierarchies. However, cognitive maps of campus are a prime situation to look at newly formed spatial realities and the effects of first year experiences on students' perceptions of the campus environment.

Email: ; *Marginalized Residents, Marginal Spaces: Female newcomers' experiences of mental health in Toronto's poorest neighbourhoods and implications for front-line health service providers*

Canada is a nation that receives immigrants from a variety of cultural and socio-economic backgrounds in order to meet labour market needs and stave off population decline. There is no guarantee, however, that the situations in which newcomers find themselves will be conducive to their well-being. This may be particularly true of recent newcomers' mental health needs; the disruption caused by the process of resettlement after migration can lead to the onset of stress disorders and other forms of mental ill-health, but the manner in which mental health services are offered, if and when they are, may not be culturally inappropriate. Female newcomers are particularly vulnerable to distress during this process. Upon arrival to Canada, they are more likely to experience isolation due to socio-cultural and linguistic barriers than are male newcomers, thereby placing them in a marginalized social position. Here we draw on the findings of in-depth interviews conducted with female newcomers from five cultural groups and front-line health service providers at two community health centres in Toronto, Canada. Both centres serve residents of the poorest neighbourhoods and are thus situated in some of Toronto's most marginal spaces. We focus on female newcomers' culture-specific experiences with respect to stress, well-being and mental (ill) health, and with the barriers they confront in seeking and using primary mental health care. We also reflect on the ways in which service providers consider perceived cultural needs when interacting with such clients. We conclude by considering the implications for primary health care providers.

Digital data acquisition technologies such as LiDAR (Light Distance And Ranging) topography have resulted in an increase in the volume and complexity of scientific data that must be efficiently managed, distributed and processed in order for it to be of use to the scientific community. Capable of generating digital elevation models (DEMs) more than an order of magnitude more accurate than those currently available, LiDAR data offers the opportunity to study earth surface processes at resolutions not previously possible yet essential for their appropriate representation. Unfortunately, access to these datasets for the average user is difficult because of the massive volumes of data generated by LiDAR. The distribution and processing of large LiDAR datasets, which frequently exceed billions of data-points, challenge internet-based data distribution systems and readily available desktop software. Our approach to the distribution and processing of LiDAR data capitalizes on cyberinfrastructure developed by the GEON project (<http://www.geon.org>) to harness distributed computing resources. We utilize a workflow-based solution, the GEON LiDAR Workflow (GLW), which begins with user-defined selection of a subset of point data and ends with download and visualization of DEMs and derived products. Users perform point cloud data selection, interactive DEM generation and analysis, and visualization all from an internet-based portal. Users may experiment with DEM resolution and DEM generation algorithms so as to optimize terrain models for their application. By using cyberinfrastructure resources, this approach allows users to carry out computationally intensive LiDAR data processing without having appropriate resources locally.

John A. Cross, Ph.D., University of Wisconsin-Oshkosh. Email: cross@uwosh.edu; *Teaching Hazards Geography: A Decade of Change*

This study reports the results of a survey of instructors teaching hazards courses that updates the findings of a similar survey conducted a decade ago. Utilizing a questionnaire containing many of the previously asked questions, the latest survey sought information regarding the topical content of undergraduate hazards courses taught throughout the United States and Canada. Well over one hundred instructors were questioned in particular about the targeted audience for their courses, whether they emphasize a discussion of the physical or social aspects of hazards, which specific topics are emphasized in their discussion of physical hazards and human responses, the particular hazards models or paradigms that are considered, and what aspects of the spatial patterns of hazard that are considered. The survey also provided information about the instructors' selection of textbooks and utilization of hazards maps and GIS software within the hazards classroom. Instructors were queried regarding the role that recent catastrophes, such as Hurricane Katrina, have played in the shaping of their hazards courses. Instructors were also questioned about their inclusion of material about terrorism and war hazards. Additional information was gathered about the education of the instructors and their involvement in hazards research.

Sean Crotty, San Diego State University. Email: crotty@rohan.sdsu.edu; *Westalgia in the Suburbs: Main Street Redevelopment in Suburban San Diego*

30 years ago Donald Meinig identified the "Main Street" as one of three symbolic American Landscapes (1979). Each of the three landscapes was idealized and based on an amalgam of landscape characteristics, taken from various urban areas throughout the United States. Despite the idealized basis of Meinig's symbolic landscapes they remain a powerful influence on the American landscape today. Today the Main Street landscape is recreated and preserved for the purpose of economic revitalization in urban areas throughout the United States. This paper critically examines the "Main Street" development/preservation projects in two suburban edge cities in San Diego County. Both La Mesa and El Cajon are located in eastern San Diego County. They share a similar, but not identical history. Yet both towns are heavily invested in the success of their Main Street preservation efforts, financially and emotionally. This paper compares the preservation efforts in terms of landscape and architecture, types of businesses that are "preserved", and the regulation of public space use in preservation areas.

Keywords: Historical Preservation, Urban Redevelopment

David Crouch, Professor, University of Derby UK. Email: d.c.crouch@derby.ac.uk; *creativity in lay geographies: gardening*

in this paper creativity is examined in terms of mundane activities, as performances, through which feelings of 'holding on' and 'going further' in individuals' lives, identities, are discussed. creativity emerges as potentially process that is engaged in the negotiation of self and inter-subjective identities, with tensions and opportunities alike. thus, gardening, as processual, rather than the familiarised notion of 'the garden' in geographical thinking, is considered as a means through which such processes may be understood. Individuals can thus be

creative in mundane practices and their performance. working with recent social science understandings of performance, and of dwelling [Thrift, Ingold, etc] this paper provokes Shotter's argument concerning practical knowledges/onotologies in terms of the making of space, or to deploy Deleuze's 'space-ing' as creative too. the emerging potential of modest creativity is considered also in terms of embodied semiotics through which individuals may make lay geographies, space as a conduit and 'product' of this process. Time and memory are also inferred in this discussion. the paper makes use of the author's work on gardening, but also of the mundane spaces and performances of artists.

Keywords: lay geography, performance, dwelling, space-ing, identities, mundane geographies

Ben Crow, University of California, Santa Cruz. Email: bencrow@ucsc.edu; *Emancipatory Urbanism? Women and Water in Rural Villages and Urban Slums*

As the global south becomes increasingly urban, livelihoods and living conditions in peri-urban slums become an ever more pressing concern. In some ways, cities set people free of rural ties, provide more social options and even offer the prospect of greater environmental sustainability. The realities of urban living for slum-dwellers and recent migrants, however, may provide little more than the hope of better lives. In this paper, I compare women's access to water in rural and urban areas. My principle points of reference will be Kenya and Bangladesh. In addition, I will draw on findings from other parts of the global south. The question that I want to explore is this. What are the social and natural constraints and opportunities that influence women's access to water and sanitation in slums and rural areas?

Keywords: gender, water, urban, slum, access, emancipation

Jeff Crump, Housing Studies, University of Minnesota. Email: jrcrump@umn.edu; *Whose Street? Our Street! Telegraph Avenue in the 1960s*

Running due east from the campus of the University of California at Berkeley, Telegraph Avenue is a colorful mélange of hippies, leftist politicians, bikers and assorted vagabonds attracted to the street life. Telegraph Avenue gained notoriety in the 1960s as the site for numerous anti-war demonstrations and often violent civil disorders. And Telegraph's reputation for violent confrontation was cemented by the People's Park demonstrations of May 1969 which resulted in numerous injuries and the death of James Rector at the hands of Alameda County Sheriffs who used shotguns on Telegraph Avenue against demonstrators and innocent bystanders alike. Telegraph was (and is) one of the nerve centers for the counterculture. During the 1960s it was the place where new left politicians rubbed shoulders with Hells Angels, street people came into contact with middle class students, and tourists gazed open mouthed at the wild variety of costumes and behavior. Telegraph was also a center of psychedelic art and alternative media as well as the location for unconventional forms of commerce that ranged from selling underground newspapers such as the Berkeley Barb to drug dealing. The purpose of this paper is to explore Telegraph from several viewpoints; as a center of alternative politics and culture, as a spatial system; a hearth of alternative media and a complex marketplace of legal and illicit commodities. Like Telegraph Avenue itself, this exploratory paper is intended to be an unruly mix of autoethnography, images, interviews, and archival research.

Keywords: 1960s, public space, counterculture

Gilbert Cuevas, M.A. Geography, Retired Educator. Email: flacorp@aol.com; *Immigration, Demographic Changes, and the Challenge for America*

Demographic Shift, Immigration, And The Challenge For America - The human exodus from Mexico and other Latin American countries, which began in the early 1970's and continues to the present day, poses a serious challenge for America. Unraveling the problems caused by a lax immigration authority in the United States and creating an effective immigration policy will now require major reforms in Mexico especially and difficult changes in the United States. Public pressure in the United States is increasing and demands are mounting for solutions. Why the ambivalence among government leaders? There have been great efforts in our history to limit immigration, and except for the seven census years from 1860 to 1930, we were successful. Until 1965 we also had laws that restricted immigration from all areas of the world - except Europe. Since 2000, our immigration picture has changed in significant ways: immigration has consistently remained at or above 10 percent of our total population per year, the immigrants are no longer European, and immigration, unlike the past, is now uncontrolled. What has caused these changes and how significant is it that the immigrants are now heavily Latin American rather than European? And, most critically, why have we allowed uncontrolled and illegal immigration? Americans must now squarely face the immigration problem. The only option that is not

possible for the United States, is to remain passive in the face of a situation that needs resolution.

Keywords: Immigration, Demographic changes

Kurt M. Cuffey, University Of California, Berkeley. Email: kcuffey@berkeley.edu; *Comprehensive Models of Climate and Ice Sheets: Uses, Abuses, Status, and Needs*

Comprehensive models of environmental systems are models that try to represent the totality of processes and characteristics that are quantitatively important for the evolution of the system. Global climate models and whole-ice-sheet models are two types of comprehensive models at the core of scientific debates about anthropogenic global warming and its impacts. I will review the status of these models (how good are they?) and outline the main challenges they face (how should they be improved?). This discussion will serve as a foundation for a perhaps opinionated overview of how models have been used and mis-used in the scientific debates (as opposed to political debates) about anthropogenic global warming.

Keywords: climate, global warming, ice sheets

Karen Culcasi, Syracuse University. Email: klcucas@maxwell.syr.edu; *Cartography and the Construction of the "Middle East"*

Cartography has the ability to produce and reproduce our geographical imaginations. By graphically articulating and representing social-spatial phenomenon, the production of maps and map discourses are vital to the creation, institutionalization, and naturalization of socially constructed geographical imaginings, such as world-regions. Coupled with concern that many map users construe maps as accurate, objective, and scientific representations of a static and uncontested world, it becomes evident that maps are part of powerful discourses that inform and construct our geographical imaginations of places. With this conceptual foundation, I examined how maps construct, naturalize, and at times even contest the basic geographical concept of world-regions. Specifically, I critically examined approximately 500 maps of the tenuously defined "Middle East" - including maps used to divide the Ottoman Empire during and following WWI, world and regional atlases, school textbooks and atlases, college-level geography books, and government funded surveys ? produced in the U.K., U.S., and Egypt from 1914 to the present. In this illustrated paper, I use these maps to show first that the "Middle East" was constructed within systematic and purposeful geopolitical and imperialist motives, and second that the conceptions, delimitations, and definitions of the region changed dramatically over both time and space. Through this narrative of the construction, legitimization, and alteration of a region that was practically nonexistent before WWI, I argue that these maps are an integral part of the wider discourses that produced this region as a part of our geographical imaginations.

Keywords: Cartography, Middle East, geographical imagination

Bradley T. Cullen, Univ of New Mexico. Email: bcullen@unm.edu; *'Out' Business Owners*

The obstacles facing small, sexual minority business owners are daunting. In addition to the problems facing all entrepreneurs (securing plenty of capital, researching consumer behavior and needs, marketing, location decisions, and competition from chain stores), sexual minority entrepreneurs must also contend with the burdens of prejudice and safety. Yet Yankelovich's survey in 1994 found that gays and lesbians were more likely to be self-employed than their heterosexual counterparts. This raises the following questions: What are the characteristics of sexual minority entrepreneurs? Why do they open their own businesses? What types of businesses do they own? And Where do they locate their businesses? The study area for this analysis of 'out' business owners was Albuquerque, NM. To answer these questions, a survey was administered to all the business owners listed in the Albuquerque Lesbian and Gay Chamber of Commerce's Buyers Guide. The respondents to the questionnaire tended to be older and experienced. The major motivating factors for becoming an independent entrepreneur were passion for the product/service and a desire for more independence. In addition, most of the business owners were 'out' and found being a sexual minority business owner an asset.

Keywords: sexual minorities, businesses, Albuquerque, NM

Rebecca Cumming, University of Victoria. Email: bmcbees@gmail.com; Ian J Walker, Ph.D., University of Victoria. Email: ijwalker@uvic.ca; *Morphodynamics and climate variability responses of macrotidal beach-dune systems, Haida Gwaii (Queen Charlotte Islands), British Columbia*

Macrotidal beach-dune systems that are exposed to extreme wind and wave climates are morphodynamically responsive to climate change and variability. These macrotidal systems are relatively understudied in the Canadian context and, on the West coast, their morphodynamics are responsive to extreme seasonal storms and known climate variability events (e.g., ENSO, PDO). This research examines and characterizes the morphodynamic regime of 2

geomorphically distinct macrotidal beach-dune systems in Gwaii Haanas National Park and Haida Heritage Reserve, British Columbia. Using regional wind data and Fryberger's sediment drift potential model we assess the potential for onshore sediment delivery via aeolian action. Using statistical analysis of annual mean and maximum water levels and climate variability indices, this study sheds new light on the response of macrotidal beaches in the NE Pacific to climate variability (e.g. increased storminess) and change (e.g. sea-level rise) impacts. This research has direct relevance for parks planning and management initiatives as well as for understanding one of Canada's most sensitive coasts to climate change and sea-level rise.

Keywords: coastal geomorphology, morphodynamics, aeolian, macrotidal beaches, climate variability

Steven Cummins, PhD, Queen Mary, University Of London. Email: s.c.j.cummins@qmul.ac.uk; Stephen Matthews, PhD, Penn State University. Email: matthews@pop.psu.edu; *Neighbourhood food environment and obesity: The PFFFI Study*

It is increasingly recognised that environmental factors may be related to obesity through the modification of diet and physical activity behaviors. However despite much conceptual work the empirical evidence for the contribution of the local food environment to obesity outcomes is still relatively poor. In this paper we present data collected as part of a study evaluating the impact on diet and obesity of the Philadelphia Fresh Food Financing Initiative, a \$40 million programme that seeks to encourage food retailers to location in underserved areas of the city. For this paper we investigate associations between features of the local food environment in Philadelphia (fast-food and grocery retail environments) and diet and obesity outcomes controlling for other confounding variables. The paper will seek to provide robust observational evidence for a role for plausible environmental predictors of obesity in a major urban center of the United States.

Keywords: neighborhood, context, diet, food, obesity, health

Mary Ann Cunningham, Vassar College. Email: macunningham@vassar.edu; Kirsten Menking, Vassar College. Email: kimenking@vassar.edu; *Effects of Landscape-scale Factors on Stream Water Quality in the Hudson Valley*

Stream water quality responds to environmental factors at a range of scales, including the riparian zone, landscapes, and watershed. Policies regarding water quality, however, are frequently implemented only at the scale of the riparian-zone, and analysis tends to focus on watersheds as a whole. Variables measured at intermediate, landscape-scales may also help explain stream water quality. We examined the effects of landscape-scale factors, represented here by nested sub-basins, in a small (31 km²) stream in eastern New York. Inputs from sub-basins strongly affected water quality parameters. Non-point-source pollutants were the most important contaminants. These pollutants result from landscape-scale land use conditions, rather than point sources or watershed-wide conditions. Salinity, our main contaminant, responded strongly to sub-basin impervious cover. Nutrients did not respond to impervious cover in the basin as a whole, but below a threshold of ~30% impervious cover, nutrients did correlate strongly with impervious cover. Past about 30 percent impervious, then, increasing density of development did not necessarily affect nutrient inputs to the stream. Impervious cover was strongly correlated with normalized difference vegetation index (NDVI), which may be more reliably calculated from remotely sensed data than impervious cover. We conclude from these measures that landscape-scale factors are useful predictors of common water-quality parameters in surface waters. Water quality in this region would be improved by concentrating impervious areas and roads and by leaving rural areas undeveloped. Managing landcover at the landscape scale, however, remains problematic, as it requires stronger planning and zoning than have, thus far, been acceptable here.

Keywords: Water quality, Landscape ecology, GIS, road salt, watersheds

Kenny Cupers, Harvard GSD. Email: cupers@fas.harvard.edu; *Tactics of Mobility, Strategies of Localization: The Spatial Politics of Street Vending in Los Angeles*

How do street vendors fit in the contemporary city? Are they remnants of traditional culture, inevitable by-products of modern economies, or signs of a novel global condition? In many Western settings, street vending tends to be understood as part of what is called the 'informal' sector: activities that are unregulated by the state, and thus untaxed and uncontrolled. This paper focuses on street vending in Los Angeles as a conspicuous example of such informal economic practices in an 'advanced' Western context. Despite the general prohibition on street vending in LA, the practice has been growing conspicuously over the last few decades. By investigating the public perceptions, discourse and political institutions that legalize, regulate and enforce street vending in Los Angeles, the research sheds light on the forms of urbanism that street vending as

a spatial practice creates. The premise of the paper is to show how street vending in Los Angeles illustrates a particular politics of urban space, in which mobility constitutes the main source of contestation and problem for contemporary urban governance. The paper examines three essential perspectives on this issue. First, there is the ambivalent rationale behind legislation on vending and the divergent reasons why it is prohibited and enforced against. Secondly, the paper traces the perspectives of the vendors by taking into account their personal experiences. Finally, the paper assesses some of the recent attempts, by non-profit organizations in collaboration with the city council, to regulate vending in restricted areas of the city.

Keywords: mobility, circulation, urban politics, street vending, Los Angeles

Andrew Currah, University of Oxford. Email: andrew.currah@ouce.ox.ac.uk; *Rip, mix, and burn: the emergence of user-generated innovation in the media and entertainment industries*

In this paper, I critically evaluate the emergence of 'user-led' innovation in the media and entertainment industries. There is a specific focus on audio-visual works, such as documentaries, motion pictures, music videos, and television; although the analysis also has general relevance to works from related sectors, such as music, publishing and video games. In a digital form, these creative works can be appropriated from multiple sources, re-combined into new forms, and then disseminated both online and offline. These are the essential hallmarks of the 'rip, mix, burn' culture. The paper has three broad objectives. First, I develop a conceptual framework for understanding user-led innovation in media and entertainment. Here, I argue that the Internet has brought about a profound shift in the material conditions of production, which is substantively different from the existing industrial system of 'producer-led' innovation. Second, I then provide an economic geographical analysis of the emergence of user-led innovation. In particular, I discuss the kinds of economic incentives that are driving users, as well as the commercial innovators that provide the business models necessary for this form of innovation to thrive. Third, I assess in greater detail the collision between user-led and producer-led forms of innovation in media and entertainment. I highlight the promise and perils of the emerging 'remix culture' from the perspective of economics, law and social welfare. Overall, the paper seeks to contribute to broader debates about the changing shape of creativity and cultural production in a digital economy.

Claude Curran, Southern Oregon State. Email: kimiakin@juno.com; *"Lake Sacramento" : Can it Happen Again?*

During the floods of 1861-62 several thousand square miles of California's Sacramento Valley were inundated. Storm events on the western Sierra Nevada mountains concentrated in a fifty-two day period beginning in December 1861 and ending in January 1862 produced flooding unparalleled since then. Sacramento endured destructive flooding. The Yuba River basin was identified for a case study. Historical precipitation data from numerous locations in the basin were gleaned from actual measurements, newspaper reports and eyewitness accounts. Conditions on the American River watershed were extrapolated from Yuba basin findings. Four significant storm periods occurred during that fifty-two day period. The greatest stream flows occurred on January 10, 1862. Peak flows were estimated at approximately 190,000 cfs at Englebright Dam site east of Marysville and 320,000 cfs on the American River at Folsom. Other researchers have estimated peak flow at Folsom at 265,000 cfs. (1862) and 295,000 cfs (1997). On January 10, a hydrograph in Sacramento recorded a three foot rise in river level already at flood stage. Several important factors apparently were discounted in previous studies: areal extent of bare ground, unusually cold temperatures which produced frozen ground followed by fresh snowfall up to thirty-six inches on the lower part of the watershed. Based on these factors it is probable that Sacramento is subject to future devastating floods. Agencies mitigating effects of deleterious flooding must find these results compelling.

Keywords: California floods (1861-1862), "Lake Sacramento", frozen ground.

Mary E. Curran, Eastern Connecticut State University. Email: curranm@easternct.edu; *Pequot in Performance: through the 'white man's looking glass'?*

In 1983, almost 350 years after the genocide known as the 'Pequot Massacre', the U.S. Congress granted tribal status to Connecticut's reconstituted Mashantucket Pequots. In 1998, the tribe opened a 308,000-square foot museum/research library on its Ledyard reservation, which is also home to the tribe's Foxwoods casino. The museum space re-presents 18,000 years of Native and natural history for predominately white audiences. Using the instigths of postcolonial theorists and Indian scholar and activist Vine Deloria, we interrogate the present-day Pequot identity that is asserted by the tropes that are spatialized and historicized in the museum in order to consider the problematics of

indigenous production of indigenous identity within the constraints of white representational systems.

Keywords: Pequot, representational systems, cultural landscape

Steven James Curran, Academic Staff, University of Wisconsin-Whitewater. Email: bullgoose1@hotmail.com; Nathan P Boerner, . Email: ; Climatology of Tornado Death and Injury: A New Way of Determining 'Tornado Alley'

Historically, investigations of tornado climatologies have focused primarily on patterns of seasonality, location and frequency of occurrence. This research has given the public a general knowledge of the timing and location of tornado season and tornado alley. However, the public's knowledge of areas with a high risk of devastating tornado development is lacking and little-to-no research has been done on this aspect of tornado climatology. Our study looked for a 'tornado alley based on human impact,' instead of the standard frequency-based tornado alley that runs from approximately Texas to Nebraska. This was done using a G.I.S. to locate the areas with the highest density for devastating tornadoes, which were classified as having caused 20 or more injuries or five or more fatalities, between the years 1950 - 2005. Once this was done, more traditional variables in tornado climatology could be investigated, including differences in decadal changes, seasonality, ENSO, and diurnal patterns. Preliminary analysis suggests that there is a higher prevalence for devastating tornadoes outside of the traditional tornado alley. The hypotheses for the potential causes for the geographical distribution include that there may be less awareness due to the lower frequency of occurrence, poor warning systems, or perhaps poorer quality of building construction. Keywords: Tornado, Tornado Climatology, Human Impact

Winifred Curran, DePaul University. Email: wcurran@depaul.edu; Alison Mountz, Syracuse University. Email: amountz@maxwell.syr.edu; "Mexico City is not New York": Rudy Giuliani and the New Urban Imperialism

Increasingly, national and local governments are pursuing urban strategies based on neoliberalism, the idea that the function of government is to facilitate for-profit economic investment in the urban environment. These strategies include public-private partnerships, quality-of-life campaigns, and marketing of urban spaces for private consumption. With urban strategies becoming increasingly international, it is important to examine how this "one-size-fits-all" approach to urban geography is worked out in distinct locations. México City, the second-largest city in the world, has a long history of crime and corruption. Into this context steps former New York City Mayor Rudolph Giuliani, famous for his zero tolerance crime reduction policies, credited by some as the transformative mechanism that turned the Rotten Apple into the Big Apple that once again attracts tourists and businesses alike. In October of 2002, the Giuliani Partners Group announced a \$4,000,000 contract with Mexico's wealthiest resident to apply Giuliani's home-grown model to the streets of Mexico City. This plan met with significant skepticism, given Mexico City's size, history of corruption, lack of confidence in the city police department, and distinct cultural contexts. In this paper, we question whether a neoliberal policy designed in one setting be realized in a different political, economic, and cultural landscape and what the geographical effects of transposing urban policy from one 'glocal' setting to another are.

Keywords: zero tolerance, policing, neoliberalism

Timothy Currie, Clark University. Email: tcurrie@clarku.edu; Weathered Livelihoods: Climate Change, Market Expansion, and Vulnerability in the Central Andes

Agriculturalists of extremely high altitudinal regions in the Peruvian Andes currently face new suites of land-use decisions hastened by arising vulnerabilities to interactions of climatic change and market expansion. Preliminary research suggests the altitudinal limit of cultivation in regions such as the Cordillera Vilcanota of Peru has risen in recent decades, with cultivation now practiced in increasingly high-altitude, marginal environments. Agriculturalists in the central Andes tend to be low-income subsistence campesino farmers for whom the uncertainties inherent in high altitude cultivation can be exacerbated by the omnipresent risks of disease, nutritional shortfall, hypoxic conditions, and extremely stressful regional climate. Contemporary research in the Andes has examined human-environmental change either in terms of livelihood practices and socioeconomic dynamics, or climatic regimes. A gap thus exists in how understandings, explanations, and predictions of change in such regions are theoretically and methodologically conceptualized and empirically examined. To address this lacuna an analytical framework of mixed-methods integrating livelihoods research with the capabilities of geographic information science is proposed. Ethnographic techniques are coupled with extant remotely sensed and climate data to identify or model land-use/cover-change, and the potential anthropogenic and biophysical drivers of such change across time and space. The

study elucidates how characteristics of land-use and cover change are identifiable in records of livelihood narratives and the composition, condition, and abundance of vegetation reflectance of remote sensed data; and extend the effectiveness of these methods to assess livelihood practices in terms of current vulnerability and under future scenarios of potential human-environmental change.

Nate Currit, Texas State University - San Marcos. Email: currit@txstate.edu; Land-use impact on LAI and combustibles in the Sierra Madre of Chihuahua, Mexico

The Sierra Madre of Chihuahua, Mexico is experiencing rapid land-use and ecosystem changes. The Ejido El Largo y Anexos is communally managed forest land with pine forests above 1800 m elevation. Logging is the primary land-use driver of forest change. Consequences of logging in this region include a reduction in suitable wildlife habitat and increased risk of wildfire. The goal of this project is to relate remotely sensed images to in situ measurements of leaf area index (LAI), and forest litter/combustibles. LAI and forest combustibles are randomly measured within plots of different logging practices. LAI is indirectly measured by measuring light penetration through the forest canopy. The mass of combustibles is measured. Regression-based techniques are used to model relationships between in situ measurements and satellite image reflectance values. Model parameters are then used to estimate LAI and combustibles regionally. These efforts produce spatially explicit estimates of LAI and combustibles that can be incorporated into Ejido El Largo y Anexos management plans to simultaneously protect existing habitat and reduce wildfire risk.

Giorgio Hadi Curti, San Diego State University. Email: cedarboot@rocketmail.com; From a Wall of Bodies to a Body of Walls: The politics of memory/the politics of war in Palestine/Israel

In this paper I examine impacts of the politics of memory and identity at the bi-national scale of the Palestinian-Israeli conflict. In approaching the land of Palestine/Israel as a landscape of memory, I take the position that memory and identity are simultaneously material and immaterial phenomena which cannot be detached from the emotions, movements, expressions, or creations of socialized and affective human bodies and their roles in the (re)constitutions of space and place. Two related and mutually constitutive emotional and affective corporeal manifestations serve as the focus of this paper - the construction of the West Bank separation wall(s) and bodies of Palestinian resistance. Through this focus, I argue that at the base of the conflict is an intricate and long standing fight over memory, forgetting and identity and demonstrate that the politics of memory are sometimes also the politics of war.

Keywords: Palestinian-Israeli Conflict, Politics of Memory, Identity, War, Emotion, Affect

Kevin M. Curtin, PhD, University Of Texas at Dallas. Email: curtin@utdallas.edu; An Analysis of Traveling Salesman Implementations in Geographic Information Systems

The Traveling Salesman Problem is arguably the most prominent problem in combinatorial optimization, and is regularly employed in a wide variety of applications. In this paper, an analysis is made of Traveling Salesman implementations in Geographic Information Systems (GIS). An investigation into the solution procedures used in four software packages is presented, and these implementations are tested against the optimal solution for a range of problem sizes. Computational results are presented in the context of a school bus routing application. This analysis concludes that no Traveling Salesman implementation in GIS is likely to find the optimal solution when problems exceed 12 cities. In contrast, optimal solutions can be generated with desktop linear programming software for up to 25 cities. Moreover, one GIS implementation consistently found solutions that were closer to optimal than its competitors. This research suggests that for some applications, the use of an optimal solution procedure is advised, and GIS implementations can benefit from the integration of more robust optimization techniques.

Keywords: Traveling Salesman, Network, GIS, Optimization, Heuristics

Andrew Curtis, LSU. Email: acurt1@lsu.edu; Katrina and Vulnerability: The Geography of Stress

Stress associated with Katrina, both "acute" in association with the initial rescue and evacuation to a shelter, and "chronic" in terms of living in an unfamiliar environment, the uncertainty of not knowing when to return, and what will be faced on that return, can manifest in a variety of negative health outcomes. The most vulnerable population from New Orleans suffered and continues to suffer disproportionately, both in terms of the stress load and the resulting poor health outcomes. Even within this vulnerable population, the susceptibility to stress is not evenly distributed. For example, not only is stress in

itself a harmful influence on pregnancy, but so too are many of the coping mechanisms (alcohol and tobacco use) frequently employed to alleviate that stress. Katrina related stress can be framed in terms of the geography of pre-storm location, the geography of immediate post-catastrophe experience and the geography of relocation / return. When this geography is combined with our understanding of how stress relates to health outcomes, a first step is made in understanding where future resources need to be targeted. This paper draws on experiences and data from the initial response to the storm, and an ongoing relationship with various state agencies and non-profit organizations focused on understanding the health consequences of Katrina.

Sarah Curtis, Durham University. Email: s.e.curtis@durham.ac.uk; Wil Gesler, Queen Mary, University of London. Email: ; *New Spaces of Inpatient Care for People with Mental Illness.*

This paper considers the implications for design of inpatient settings in the context of models of care and treatment of mental illness which emphasise care in the community. A community care model has not obviated the need for suitably adapted inpatient facilities for people with mental illness. In the UK, private-public partnerships under the Private Finance Initiative have provided the opportunity to construct new facilities which are intended to meet the needs of mentally ill patients under this care regime. Drawing on material from a study which explored the views of patients and staff from a new Psychiatric Inpatient Unit in a deprived area of East London, as well as NHS policy documents, we show how the combination of 'care in the community' and PFI strategies raise issues for the design of these new care spaces for mentally ill people. We discuss in particular: the emphasis on links between an acute inpatient facility and its local community; the tension between providing a caring and supportive institutional environment and ensuring that patients are returned to the community as soon as they are ready; the potential significance of the psychiatric hospital as a relatively stable feature in the otherwise insecure and unpredictable geographical experience of people with long term mental illnesses. We consider how these observations can be interpreted using relational geographical perspectives and ideas about risk and stigma. We argue for a stronger engagement with ideas from health geography in the design of new psychiatric inpatient facilities.

Keywords: psychiatric hospitals, relational geography, stigma, risk

John Cusick, University of Hawai'i at Manoa. Email: jcusick@hawaii.edu; *Place making, identity and resistance in East Maui, Hawai'i*

East Maui is a catalyst for considering the significance of place and the roles of protected areas in contemporary societies. Haleakala (3055m), a dormant volcano effectively separating Hana District from Central and West Maui, creates an ecological zonation from sea level to alpine habitats. The identity of East Maui as a center of biological diversity and cultural preservation is largely due to this geographic isolation. The relatively unsuccessful plantation agricultural economy in the late 19th century, coupled with the later arrival of Christian missionaries to East Maui, enabled the continuation of many traditional cultural and land use practices. Some residents continue fishing, gathering, and hunting activities in coastal waters and upland forests and maintain connections to the past for themselves, their families, and visitors to the small communities that are strung along the rugged East Maui coastline. Resident resistance to complete cultural assimilation into mainstream North American society has lessened, but not completely prevented, threats to both ecological and cultural integrity. The protection and restoration of cultural landscapes are underlying themes of resistance that reconfirm place identity and transform resident sense of empowerment. The situation in East Maui draws attention to rural Hawai'i in general, and to Kipahulu District of Haleakala National Park in particular, where the interests of resident, research and recreation stakeholders intersect. This paper situates a protected area in the context of its place, function, and image to explain reasons for and success of resistance to external forces of change.

Susan L. Cutter, University of South Carolina. Email: scutter@sc.edu; Christopher Burton, University of South Carolina. Email: burton@mailbox.sc.edu; *Social Vulnerability to Levee Failures in the Sacramento-San Joaquin Delta*

In the aftermath of the levee failures in New Orleans, there is considerable public interest in where the next catastrophe might occur. Many have pointed to the Sacramento-San Joaquin Delta region as a likely worst case scenario given the concentration of levees and potential mechanisms for initiating breaches (seismic activity, design and maintenance, extreme runoff). This paper examines the spatial variability in the social vulnerability of residents to potential levee failures or breaches from this worst-case scenario. To determine the likely flood exposure, the levee system in the region was mapped with a distinction made

between levees with US Army Corps of Engineers (USACOE) certification and those without. The flood inundation risk was mapped using existing digital Flood Insurance Rate Maps and making adjustments as warranted based on USACOE certification. Utilizing the existing methodological approach on social vulnerability metrics (Cutter et al. 2003), a social vulnerability index was computed at the tract level for San Joaquin, Sacramento, and Yolo counties in order to assess the relative vulnerability of residents. When integrated with the flood exposure data, there is a clustering of increased social vulnerability zones with high risk flood areas. While the spatial pattern is not uniform throughout the tri-county area, there are sufficient pockets of high levels of social vulnerability (largely based on race, class, and gender indicators) to warrant management concern about the disproportionate impact of catastrophic levee failures on these populations and the level of local, state, and federal preparedness to cope with such a catastrophe.

Keywords: social vulnerability, levee failure, flood hazards, California

Matthew P Cuiello, . Email: cuiello@email.unc.edu; Charles E, Konrad II, PHD, . Email: cek@email.unc.edu; *A Synoptic Climatology of Snowfall in the Piedmont Region of North Carolina*

The forecasting of frozen precipitation is perhaps the most challenging winter weather forecast problem in the Southeast. Modest variations in the vertical temperature profile, the precipitation rate, and the synoptic pattern can mean the difference between a heavy versus light snow or an event dominated by freezing rain or sleet. The amount of snowfall in an event is of particular interest because it is highly correlated with economic impacts and safety concerns. In this study, a synoptic climatology is developed that identifies relationships between synoptic weather patterns, vertical temperature profiles, and snowfall accumulations at Greensboro, located in the center of the North Carolina Piedmont. Six hourly surface analyses are examined manually to document the position, strength, and movement of anticyclones and cyclones during all winter weather events identified between 1958 and 1995. Radiosonde data are extracted to ascertain the vertical thermal structure and its evolution during each event. In particular, 1000-850 hPa and 850-700 hPa partial thicknesses are computed and plotted to quantify the strength of the low-level cold air dam (CAD) and the overlying warm nose, respectively, as these are two features that are commonly found in winter weather events across the region. A classification scheme is developed that relates the presence and strength of these synoptic and thermal features to the snowfall accumulation. In particular, an artificial intelligence routine is being explored to identify a model that best explains the variance in snowfall totals and also clearly reveals the physical connections between snowfall accumulation and the synoptic environment.

Email: fswanson@fs.fed.us; *Landscape-scale dynamics of wood in stream networks of the western Cascades, Oregon*

This study develops a network and patchwork dynamics approach to predict wood in a stream network in order to understand wood dynamics in river networks and address riparian reserve design for managed forest landscapes. We examined the effect of four factors on wood sources and transport: (1) forest harvest, removal of wood from streams, and creation of young forest plantations; (2) roads adjacent to or crossing the stream; (3) debris flows in tributary channels; and (4) capacity of the stream to transport wood by fluvial processes (i.e. floods). Wood volumes and numbers of pieces were surveyed along 25 km of 3rd- through 5th-order stream reaches in summer 2002 in a steep forested basin in western Oregon, and related to land use (forest harvest and roads) and fluvial geomorphic processes (debris flows and floods) recorded over the period 1948-2002. Wood patterns reflect 50-year legacies of land use practices, especially the conversion of old-growth forest to young forest near the stream, and the construction of roads alongside, or crossing, streams. In channels with low fluvial transport wood depletion was localized adjacent to harvest patches, but wood reductions were extensive in channels with high fluvial transport, or where debris flows have entered the mainstem. The configuration of harvest patches, road networks, and stream networks provide a landscape-scale basis to explain and predict patterns of wood in streams, and hence, the effectiveness of riparian reserves for sustaining wood in streams.

Keywords: legacies of clearcutting, riparian buffers, roads

Silvia D'Addario, York University. Email: silviad@yorku.ca; *Constructing Identities Here: (re)creating Italianess in transnational Toronto.*

This paper examines the ways that 'ethnic' identities are created in places. I look at how multicultural practices construct Toronto's landscape and how such places influence the (re)negotiation of ethno-cultural identities. In doing so, I use the idea of symbolic materialism, tangible everyday objects that work to elicit

sentiments and (re)produce place-based identities. The idea of symbolic materialism implies a very real sense of recreating memories that work to construct identity so as to draw (spatially) separate places into meaningful proximity with one another. The purpose here is to move away from a given 'global' space where ethnic identities are seen to be transported from locality to locality via the global medium of travel. Ethnic identities are not transported alongside one's passport, but instead are created in multiple localities. In this paper I look at the ways in which being Italian are created and negotiated in Toronto. Very few Italian-born or Italian-speaking people still live in Toronto's highly gentrified Little Italy. However, there are unique place-based processes that continually recreate Italianess in Toronto. At the same time, these place specific processes also shape and construct Toronto's transnational urban landscape.

Keywords: Identity, Multiculturalism, Symbolic Materialism, Italian and Toronto.

Bruce D'Arcus, Miami University of Ohio. Email: darcusb@muohio.edu; Sovereignty, Law and the Spatial Architecture of Rights: The Exceptional Spaces of Extraordinary Rendition

This paper examines the spatiality of the intersection of law, sovereignty and rights. I argue that liberal rights are in part defined through law which can be conceived as a space structured along two axes. First, traditional legal protections around privacy, in particular, define an uneven vertical terrain that protects individual rights through limiting where certain forms of statecraft may be applied within domestic space. Second, spatial distinctions of jurisdiction provide the horizontal limits to rights; simultaneously containing particular rights regimes, and excluding others. Indeed this very notion of spatial-differentiation is central to dominant norms of sovereignty. I present this argument through an analysis of recent Bush Administration tactics in the "War on Terror." Placing extraordinary rendition and other counter-terrorism tactics before the backdrop of the previous two centuries of American history, I suggest they represent a profound reordering of the spatial structures of liberalism. Such a reordering represents a flattening of the spatial distinctions that make legal rights possible, and demonstrate the deeply spatial implications of the contemporary state of exception.

Anne-Marie d'Hauteserre, University Of Waikato. Email: adhautes@waikato.ac.nz; Constructing Alterity? The Walt Disney Company and urban landscapes in the Paris Basin

"There is a will both to see order in the world and to impose order on the world" (Sibley 1998), though this commitment is more a rejection of disorder or of elements considered abject. Difference (alterity) disturbs the desirable order of social life. But, as we are pushed, unconsciously or not, to seek new ways of constructing urban areas (Dear 1999), who is imposing this order and for whom, in Val d'Europe? This presentation questions the orderly urban palimpsest that the Walt Disney Company embraces. Urbanisation by the Walt Disney Company of Val d'Europe (in the Eastern Paris Basin) is critiqued as a form of 'constructed spatial otherness' relative to the rest of the urban Francilian landscape. Has Marne-La-Vallée, whose area and heritage have suffered a wholesale 'resignifying', been 're-colonised'? This presentation will thus investigate a number of questions to determine whether Val d'Europe is constructed as a landscape of alterity. Does this alterity translate a need for respite from a chaotic, violent urban life, socially contrasted to be requited by a kind of mystical alternative urban 'becoming' that the Walt Disney Company champions? Or should Val d'Europe be characterised as a heterotopia of mindless decoration (Vattimo, 1992), a degraded universe of simulacra? Is the Walt Disney Company a major agent of the socio-spatial changes in Val d'Europe, or just one among so many others? Are the residents reduced to passive spectators or did they search for such a mediated utopia to frame their daily life?

Keywords: landscape of alterity, urbanisation, land use planning, private/public partnerships, urban tourism

Graziela Miot da Silva, Dr, Louisiana State University. Email: gdasilva@lsu.edu; Foredune Vegetation Patterns And Alongshore Environmental Gradients

This paper examines the spatial variation in foredune vegetation along Moçambique beach, a headland bay beach in southern Brazil. This embayment extends through 600 of curvature, and displays significant alongshore variations in exposure to the prevailing winds and waves, beach/surfzone morphodynamic type, type and dimensions of the dune systems, foredune vegetation cover and diversity. In order to assess the characteristics of the foredune vegetation, two surveys were carried out in contiguous quadrats of 1m² extending across 6 foredune profiles. The results show that the vegetation cover decreases from south to north, possibly reflecting the increasing exposure to wind and wave energy. Distinct patterns of species distributions occur along Moçambique beach,

such that different plant species are dominant in the southern, middle and northern ends of the beach. A cluster analysis demonstrated two associations: the first one is represented by the profiles located in the lower energy zone of the beach and the second association is represented by the profiles more exposed to wind and wave energy, sediment deposition and salt spray. There is a relatively higher diversity of species in the middle of the beach, and the lowest diversity occurred in the northernmost end of the beach, possibly influenced by the surfzone type, number of breaking waves and highest aeolian transport.

Keywords: foredune vegetation, coastline orientation, Brazil-southern

Carl Thor Dahlman, PhD, Miami University. Email: dahlmac@muohio.edu; Re-Orienting the Future of Europe: The EU External Dynamic in Southeast Europe

This paper critically analyzes populist contentions that enlargement has reached its limit. Instead, I argue that the European Union project of enlargement into Southeast Europe and further integration through the EU Constitution are no longer only captured by the internal dynamics of widening and deepening. These internal dynamics, which recently produced the rejection of the EU Constitution over anxieties relating to enlargement, have been complemented by the recent development of a robust diplomatic and foreign relations agenda by the European Commission, which operates relatively independently of the member states. This 'external dynamic' seeks not only to secure a European zone of peace and stability and to exert a European agenda in world affairs, but also to neutralize the negative internal effects of extra-European uncertainties, such as the transatlantic alliance, immigration, unstable border regions, and Middle East crises. In other words, the development of an explicitly EU foreign policy seeks to secure and legitimize the European project by quelling the external factors contributing to popular internal dissent within EU members states. In this capacity, the EU is reorganizing and 'reorienting' Southeast Europe, preparing for eventual enlargement while redrawing the discursive and physical limits of Europe.

Dennis Dahms, Department of Geography, University of Northern Iowa. Email: dennis.dahms@uni.edu; John Gosse, Dalhousie University, Halifax NS, Canada. Email: JCGosse@Dal.ca; Early- to Mid-Pleistocene Cosmogenic Exposure Ages for Moraines, Table Mountain, Wyoming.

Preliminary 10Be/26Al ages from moraine boulders on Table Mountain, Wyoming suggest the deposit may provide evidence for an early-to-middle Pleistocene glaciation in the Wind River Range. Cosmogenic nuclide exposure age-analyses of six granitic boulders on the same deposit generated ages that range from 270 to 736 ka (using estimated boulder erosion rate of 0.2-to-0.22 cm/kyr). Many of the generated ages are too young for the apparent age of the deposit, relative to adjacent moraines; this suggests that our erosion estimates are too low. One sample, however, could not have a higher erosion rate and still have amount of 10Be that was measured. Thus, it is obvious that some of the boulders were once buried and that we must consider not only the boulder erosion rate, but the rate of erosion of the moraine sediments as well. An accurate age estimate for this deposit then depends on at least three parameters: (1) how deep the boulders were buried in the moraine, (2) how long it took for the buried boulders to be uncovered by erosion (sediment erosion rate), and (3) what is a realistic erosion scenario for granitic boulders in this environment? These results suggest that the diamicton in which the boulders are imbedded was deposited between O-isotope stages 16 and 6. Final age determination must wait until the above erosion systematics can more clearly be estimated.

Keywords: Middle Pleistocene, moraines, Wind River Range

Dajun Dai, Southern Illinois University at Carbondale. Email: dljt@siu.edu; Tonny J Oyana, Southern Illinois University at Carbondale. Email: tjoyana@siu.edu; A genetic algorithm for cluster detection and analysis in both space-time and more complex hyperspace

Although increased exploration of large-scale databases has provided the impetus for better detection and analysis of spatial clusters, there is slow progress in developing clustering algorithms for classifying space-time multidimensional attributes and space-time-attribute interactions. The objective of this study is to enhance the genetic algorithm for detecting clusters in spatiotemporal or more complex hyperspace. Our motivation is guided by the idea of representing the gene structure using an elliptic cylinder allowing the detection and analysis of spatial clusters that have space-time components or space-time-attribute dimensions. A more sophisticated gene representation through elliptic cylinders can model variable of spaces of two dimensions and greater. To assess the method, we employed a published real-world dataset with known spatiotemporal clusters of brain cancer incidence in New Mexico. Experimental results are compared with the results obtained from the very popular cluster detection method, Kulldorff's space-time scan statistic. The results indicate that the proposed method provides a better representation of clusters in space-time and

space-time-attribute interaction at faster and more computationally efficient runtime than Kulldorff's method.

Simon Dalby, Carleton University. Email: sdalby@gmail.com; *Warrior Geopolitics*

Warrior Geopolitics: Gladiator, Black Hawk Down And The Kingdom Of Heaven - By Simon Dalby Carleton University sdalby@gmail.com The "war on terror" and remilitarization of political anxiety in the aftermath of September 11th in the West, is both facilitated and challenged by representations of geopolitical danger and the supposed necessity for warriors to fight wars in distant lands. Ridley Scott's three movies, "Gladiator", "Black Hawk Down" and most recently "The Kingdom of Heaven" explore the morality and identity of warriors. They do so in exotic landscapes and settings that emphasise the confrontation with danger as external and frequently unknowable and political violence as something that has complicated geographies. From the putative left in the case Michael Ignatieff and the Warrior's Honor or the right in the case of Robert Kaplan's Warrior Politics, the public discussion of the necessity for warfare and "intervention" is enmeshed in discourses of moralities, rights and "just war". The professional Western warrior, whether a special forces operative or garrison soldier in peacekeeping mode, is a key figure of the post September 11 th era, physically securing the West, and simultaneously securing its identity as the repository of virtue against barbaric threats to civilization. These themes are key to Ridley Scott's work.

Britt Dale, Dept. of Geography, Norwegian University of Science and Technology. Email: britt.dale@svt.ntnu.no; *Place Identity in the Rural-Urban Fringe*

The aim of the paper is to address questions around conflicts, resistance and negotiations over place and identity in a rural-urban fringe. It is based on a case study of a region west of Bergen in Norway, where relatively poor rural areas have been transformed into middle class suburbs over a rather short time period. Some of the questions that are addressed are: What kinds of images of the region as a home-place are dominating today? Do 'old' and 'new' residents express different values regarding the 'urbanity' versus the 'rurality' of their home-place? At which scale do different groups of residents define their home-place? (e.g. house, neighbourhood, region). The study rests on interviews with key informants and residents, registration and observation as well as secondary sources (local newspapers, local reports, statistics).

Keywords: rural-urban fringe, place identity, conflicts, negotiations

Brian Daley, University of the Virgin Islands. Email: bdaley@uvi.edu; *Virgin Island Land cover change analysis*

Virgin Islands Land Cover Change Analysis. Brian Daley, University of the Virgin Islands, Agriculture Experiment Station, RR 1 Box 10,000, Kingshill, VI. 00850. bdaley@uvi.edu We conducted a land cover change analysis of St. Croix, US Virgin Islands between 1992-2002 using Landsat imagery. A January, 2002 ETM+ image was classified into eight cover types (forest, secondary forest, coastal scrub, regenerating pasture, pasture/grass, rural residential, urban/industrial and water) using both supervised and unsupervised classification in Erdas Imagine 8.4. Cover type definitions and accuracy assessments were based on data collected from 254 training samples randomly distributed across the island. These same points were then overlaid on a 1994 aerial photograph, reclassified through photo-interpretation, then used to drive the classification of an August 1992 Landsat TM image. The classified images for both image dates were condensed into forest/non-forest maps and change trajectories were created. Additional change detection using continuous variables such as NDVI and tasseled cap were also used to show change in quality within cover types.

Patricia Daley, University of Oxford. Email: Patricia.Daley@Jesus.ox.ac.uk; *The Hierarchical Geographies of Peace and Security: Neo-liberal Post-War Reconstruction in the Central African State of Burundi*

Peace and security have become essential policy areas for development institutions operating in Africa. The paper examines the policies and practices associated with the promotion of the 'liberal peace' in the Central African state of Burundi, as they affect the state, the economy and the Burundian citizenry. The contention is that the liberal peace, as implemented in Africa, exposes the hierarchical geographies of peace that are embedded in global geo-political economy. The paper challenges claims that the 'liberal peace' can end direct and structural violence and enhance democratic accountability within the context of market liberalism. It argues that liberal policies of power-sharing, peace-keeping and security sector reform give legitimacy to insurgent violence as part of the political discourse and encourage the persistence of a culture of impunity.

Therefore, the liberal peace, inadvertently, reinforces the power of the genocidal state and reconstructs the conditions for the continued exploitation of the region's resources by global capitalism. The paper concludes that, despite its practice of electoral democracy, the liberal peace is non-transformative and seriously flawed as an avenue for the emancipation of the body politic. It calls for greater emphasis to be given to locally-articulated visions of peace, and a more geographically and socially inclusive concept of security; one that prioritizes the care of African bodies.

Sandy Dall'erba, University of Arizona. Email: dallerba@email.arizona.edu; Rachel Guillain, University of Burgundy, France. Email: guillain@u-bourgogne.fr; *Impact Of Structural Funds On Regional Growth: How To Reconsider A 6 Year-Old Black-Box*

There is still plenty of room for empirical estimations of the impact of structural funds on the convergence process. It is striking to realize that all previous estimations in this field are based on some form of the neoclassical growth model (Solow's model). This model is still used today despite the numerous critics it has raised (Quah, 1996) and its complete lack of consideration for increasing returns to scale at the origin of agglomeration and growth according to the endogenous growth theory and the new economic geography. In addition, few estimations have paid any attention to the nature of the cohesion objective under study. The expected impact of objective 1 funds, devoted to public infrastructures, is indeed theoretically and empirically very different from the one of, say, objective 3 funds devoted to long-term unemployed. As a result, this paper proposes a careful assessment of structural on the manufacturing sector in the context of a Verdoorn's law. Interregional linkages are considered by means of the usual spatial econometric techniques.

Kristin DallaPiazza, Virginia Tech. Email: klm0474@vt.edu; Korine Kolivras, Virginia Tech. Email: ; *Modeling the Risk of West Nile fever in Virginia Using a GIS Approach*

West Nile virus has become a major public health problem in North America, affecting humans, birds, and/or horses throughout the 48 mainland states, several Canadian provinces, and parts of Mexico. Since its first introduction to the United States in 1999, reports show it is responsible for over 20,000 human cases of infection and 782 deaths. Transmitted through the bite of a mosquito, humans and other mammals are considered dead-end hosts, whereas birds appear to be the principle reservoir harboring the virus. West Nile virus has spread much faster and further than expected showing officials the effect that mosquito-borne diseases can have on public health. Using remote sensing, GIS, vector surveillance, incident reports, and environmental factors, attempts have been made to monitor and model the prevalence of the disease. This study examines the approaches and methods used to assess the risk potential for exposure to West Nile virus and produces a model that represents areas with and without reported cases of infection within each county of Virginia using GIS and spatial analysis techniques. Results will be compared to a recent spatial study performed in Fairfax County, which is where West Nile virus was first detected in the state of Virginia and where the majority of cases have been diagnosed. The objective is to determine the similarities and differences between the neighboring counties that may account for lower rates of incidence.

Craig Dalton, UNC-Chapel Hill. Email: craig.dalton@unc.edu; *DisOrientations: Remapping the University*

This "Disorientation Guide" re-thinks cartography by mapping in a new way. It is a mode of investigation that seeks not to trace out representations of the real, but to construct mappings in ways that render alternative worlds. These ideas are based on the 'new cartography' of Foucault and Deleuze. Mapping in this way has two objectives. First, it aids in constructing alternate social and economic practices by allowing different approaches to thinking and performing Chapel Hill. Second, creating and using it teaches us about how the Deleuzeian approach to mapping can work. The guide itself maps UNC-Chapel Hill as (1) a factory, (2) a functioning body, (3) producing your world and (4) possible reorientations. Each of these themes maps Chapel Hill not as a bounded territorial space, but constructs a constellation of spaces and places that we can navigate every day. Examples include labor in the research triangle, international study through UNC, the social networks of Chapel Hill and local progressive organizations. The guide was distributed for free through classes, activist organizations and other local contacts in the fall of 2006. DisOrientations is part of a larger project, The Counter Cartographies Collective of UNC. It works within the trend of invigorating map-making to suggest or create critical interventions into everyday life. While this trend is emerging within Geography, it is being even further explored by groups working outside of the discipline and

the academy. DisOrientations works as a bridge between these different conversations about critical/counter activist mapping and social use.

Bent Dalum, Head of Department, Department of Business Studies, Aalborg University, Denmark. Email: bd@business.aau.dk; Growth and evolution of the Danish IT sector: geographical concentration, specialisation and diversity

The paper analyses the growth and spatial evolution of the Danish IT sector during the upswing of the 1990s as well as the early years after the 'burst of the bubble' in 2000/2001. The IT sector employment and the number of firms have more than doubled during a decade, but the evolution indicates a 'non random' agglomeration of the industry around urban areas. The paper focuses on dominant forces in shaping the growth and spatial evolution of the industry and analyses how industrial dynamics caused the industry to agglomerate mainly in the two largest urban areas. The paper also contains a detailed account of the development in the 16 Danish counties over the period of analysis. In previously published work we have focused on the 'C' within the Information and Communications Technology sector, ICT. This paper is focused on the IT, i.e. e.g. telecommunications is excluded.

Keywords: IT sector, industry evolution, clusters, specialisation

Ryan Danby, University of Alberta. Email: rdanby@ualberta.ca; David Hik, University of Alberta. Email: dhik@ualberta.ca; Plant Physiology Influences Landscape Pattern at Subarctic Alpine Treeline

Despite an absence of large natural disturbances, the white spruce treeline in southwest Yukon exhibits substantial variability at the landscape scale. We examined the causes of this heterogeneity at two focal scales. At a coarse scale we analyzed patterns of spruce distribution and abundance. Potential direct solar radiation was identified as the topoclimatic factor most responsible for treeline heterogeneity. Treeline was nearly 100m higher on south-facing slopes but stem density was greater on north-facing slopes. At a fine scale we examined growth and physiology of seedlings on opposing aspects. Soil temperatures were significantly warmer on south aspects and the snow-free period was longer. These seedlings had higher rates of above-ground productivity, but had reduced Photosystem II efficiency and experienced higher needle mortality. Thus, lower densities of treeline spruce on south-facing slopes appear related to cold-induced photoinhibition and winter desiccation which increase seedling mortality. The depressed elevation of treeline on north-facing slopes appears due to growth inhibition resulting from lower soil temperatures. We conclude that a reciprocal "top-down/bottom-up" interaction exists in this system: terrain-induced gradients of solar radiation result in fundamental differences in plant-scale biological processes which, in turn, structure vegetation pattern at the landscape scale.

Christina E. Dando, University of Nebraska-Omaha. Email: cdando@mail.unomaha.edu; "The Map Proves It": The Suffrage Map and the American Suffrage Movement

In the early 20th century, American suffragettes utilized maps showing the spread of suffrage on posters, pamphlets, and broadsides. Published by the National Woman Suffrage Publishing Company, "Six Arguments from the Suffrage Map" and "Votes for Women a Success: The Map Proves It" were part of a shift in tactics utilized by the suffrage movement. Leaving the parlors and taking to the streets, the suffragettes were claiming public space. The suffrage maps take this a step further, claiming national space for women and providing a strong graphic representation of their claim. This paper will explore the verbal and graphic rhetoric of the suffrage maps, as well as the politics of their placement, exploring how suffragettes molded and utilized these traditionally masculinist ways of knowing to advance their cause, not only to reach other women but also to reach a male audience. Further, the maps became iconic, referenced in speeches and reports and visually cued in cartoons, extending their message further. Their adoption of maps — "the quintessential symbol of masculinist ways of knowing, the ultimate representation of masculinist space" (Huffman 1997) — represents an adoption of "the master's tools" to advance their own interests (Lorde 1984).

William A. Dando, Indiana State University. Email: gedando@isugw.indstate.edu; Viewing Jerusalem from Above: New Technologies for Understanding the Bible in Context

Technologies available to gain insights into site and situation, geopolitical, and land use issues in ancient Jerusalem have increased markedly in the past fifty years. An expansion in the number of new technologies available to research Biblical topics, combined with easier access to geospatial data, hardware, and software, has opened new pathways for geographic investigations and city

monitoring. In tandem, these technologies provide scholars with deeper understanding of complex events and issues. A tool that has limited utilization by geographers in researching Biblical topics is the helicopter. Political tensions and civil strife have restricted the application of helicopters, equipped with high resolution remote sensing sensors, to selected sites. Believing that "the land speaks" and contending that land use, topography, climate, vegetation, and the urban development of Jerusalem serve as a podium to understand the message and the issues in Bible times, a visual archive and teaching tool now has been created. Combining Bible passages, archival data, and helicopter-based videography enhance understanding of the Bible in context.

Amy E. Daniels, University of Florida, Land Use & Environmental Change Institute, School of Natural Resources & Environment. Email: adaniels@ufl.edu; Environmental Services as Non-exclusionary Goods: The Role of Institutional Scale in Conservation

The concept of ecosystem services is not new but has become increasingly popular and institutionalized as a framework for environmental management and conservation in the last decade. Payments for Environmental Service (PES) programs serve as a tether linking people, property rights and goods received from the environment. In this paper I draw from theory on common property and ecosystem functioning to analyze PES programs from several sites in Latin America. Juxtaposing the spatial and temporal scales of operation for ecosystem services and resource-management institutions reveals important incongruities. Results suggest that effective management and provision of ecosystem services must consider the way in which property rights are superimposed on the spatio-temporal niches of ecological functions relevant for the provision of desired ecosystem services. I conclude with recommendations for policy instruments and management approaches that may contribute to more effective PES designs.

Keywords: ecosystem services, institutions, scale, conservation, payments for environmental services

J. Michael Daniels, University Of Wyoming. Email: jmd@uwyo.edu; Clem L. Rawlins, University of Wyoming. Email: rawlins@uwyo.edu; Historical and Paleohydrologic Information for Flood Frequency Analysis of the North Platte River, Wyoming and Colorado

The flood hydrology of the North Platte River headwaters is dominated by spring snowmelt runoff from surrounding mountain ranges. Downstream from runoff-generating areas near the drainage basin boundary, the North Platte River flows through North Park, Colorado, a low-relief synclinal basin. Further downstream it enters Northgate Canyon, a steep bedrock-controlled reach with confined channel boundaries. The existence of a USGS gage with a 90-year record of peak discharges at the transition from North Park to Northgate canyon provides the opportunity to couple historical flood frequency data with paleohydrologic information. The historical record of annual peak discharges (1916 to 2004) reveals a relatively flat flood frequency curve in which the magnitude of the 100 yr flood (~ 200 cms) is only 2.4 times greater than the magnitude of the 2 yr flood (83 cms). Field surveys of water surface elevations in Northgate canyon during the 2005 peak discharge event (147 cms, 11 yr return interval) combined with detailed cross-sectional surveys permit the development of a HEC-RAS hydraulic model that predicts stages associated known discharges. Paleo-stage indicators (lichen frequencies, granite weathering features and obligate hydrophytes) tied to predicted stages from the hydraulic model therefore provide necessary field-based data to justify extrapolation of the flood frequency distribution beyond the historical record.

Email: ; Perceptions of Wood by River Managers: Challenges for Stream Restoration

This study presents results from a survey undertaken in several regions of the United States to assess how people involved in river management perceive wood in rivers. Using a web-based questionnaire, river managers at the local, state and national levels were asked to evaluate images of streams and rivers with and without wood present. The respondents rated the images according to how aesthetically pleasing they appeared, how natural they looked, how dangerous they felt, and whether the scenes needed improvement. This study builds on a

survey undertaken in 10 countries to assess how students perceive of wood in rivers (Piegay et al., 2005), and complements similar surveys of river managers in France and Poland. The perceptions of river managers are discussed in light of challenges for stream restoration in mountain watersheds in the United States and elsewhere.

Peter W. Daniels, University of Birmingham. Email: p.w.daniels@bham.ac.uk; **John R Bryson, University of Birmingham. Email:** j.r.bryson@bham.ac.uk; *From global cities to global places: expertise-driven rural economies*

National and regional governments are often signed-up to the concept of a knowledge economy which they consider a key pillar of their policies for facilitating economic restructuring at a variety of spatial scales. The approaches they adopt are almost exclusively informed by research on the production of, and access to, knowledge and expertise in global and, to a more limited degree, second tier cities. It is suggested that this has caused the existing and potential capacity of rural communities around the edges of major city regions to function as expertise (knowledge)-driven economies to be overlooked, although there are some notable exceptions. This paper attempts to fill this vacuum using evidence from a study of the production of business and professional services in a rural county within the Birmingham city region, UK.

Stephen Daniels, Professor, University of Nottingham. Email: stephen.daniels@nottingham.ac.uk; *Art and environment in Sixties pop: Peter Blake's Americana*

British pop art addressed American culture and imagery in a variety of ways. The worlds of these art works, or to use the term of the time their "environments" (their visual complex of objects, images, scenery and personalities) are fabricated from an extensive field of mass and vernacular culture from both sides of the Atlantic. This paper considers the second phase of British pop art around 1961-62, which was crucial in transforming the 1960s into "The Sixties", and examines the early work of Peter Blake. Based on the author's recent interview with the artist, the paper explores the Anglo-American crosscurrents in Blake's iconic Self-Portrait with Badges (1961). It focuses on Blake's clothing, particularly his Levi jacket and jeans, then hard to find in British shops. It considers Blake's costume in terms of his awareness of older style populist American art movements, including those focussed on figures of working men in denim overalls, in the photographs of Walker Evans and the paintings of Ben Shahn.

Keywords: Pop Art, Sixties, Peter Blake, Americana, Levi jeans

Jeffrey J. Danielson, United States Geological Survey. Email: daniels@usgs.gov; *Implementing the Commercial Remote Sensing Space Policy (Helping Federal Users Obtain Imagery)*

Authors Pam Van Zee, Jeff Danielson, Elizabeth McCartney, Brenda Ellis SAIC, Contractor to USGS EROS Abstract: The U.S. Geological Survey (USGS) is implementing the President's U.S. Commercial Remote Sensing Space Policy (CRSSP) in partnership with the National Oceanic and Atmospheric Administration (NOAA), the National Geospatial Intelligence Agency (NGA), and other Federal civil agencies. NOAA leads the effort to document civil long-term Earth observation requirements that may drive the development of future commercial remote sensing systems. NGA chairs a senior management oversight committee and leads the effort to leverage Federal investments in commercial data and infrastructure, procurements and contracts. The USGS leads the near-term remote sensing data requirements process on behalf of the Federal government, with objectives include: ? Collecting the near-term land remote sensing data requirements of U.S. Federal civil agencies and provide query and report capabilities to help agencies leverage resources in areas of common interest ? Provide documented evidence for potential remote sensing funding initiatives ? Satisfy user requirements with existing data sources where possible ? Provide the commercial satellite and aerial industry with a snapshot of civil agency needs, thus allowing industry an opportunity to respond with accurate and specific data and services. The current USGS near-term requirements processes are being integrated with other data services to help government agencies meet more of their operational land imaging needs. Once data requirements are entered, searches will be performed to find existing imagery to meet the requirements. Customers will be connected to potential partners and contract vehicles to help acquire a solution to their remote sensing needs.

Stentor Danielson, Clark University. Email: sdanielson@clarku.edu; *Discourses About Wildfire In New Jersey And New South Wales*

Australia and the United States have contrasting histories of wildfire management, but contemporary policies seem to show more convergence. Through an application of Q Methodology and a mail survey, this paper investigates the way residents of two case study sites, the Pine Barrens of New Jersey and the outer suburbs of Sydney, New South Wales, think about how wildfire should be handled. In general, the outlines of the debate in both countries were similar. Rather than sharp disagreements over particular management techniques, discourses took differing views on which characters in fire management, and what aspect of the policymaking and implementation process, are central.

Keywords: wildfire, risk perception, New Jersey, Sydney, discourse

Sarah K Danielsson, Assistant Professor, City University of New York. Email: danielssonsarah@hotmail.com; *Mapping the Organic Nation: Ratzel, Richthofen, Kjellen and German Imperial Geography, 1885-1933*

Friherr Ferdinand von Richthofen's pet project was the expansion of German Lebensraum into the East. As one of the most prominent German geographers he trained his students to continue his pan-German and imperialist legacy both in Asia and in Africa. Within the same context of German geographical schools of thought we find the work of Friedrich Ratzel and Rudolf Kjellen, geographers who unabashedly married their geographical pursuits with particular demographic and imperialist aims. Ratzel had been an important influence on Richthofen. Kjellen, in turn, was one of Ratzel's most prominent intellectual heirs and it was he who had the most profound influence on concepts such as Lebensraum. The developing pan-Nationalism - which went beyond the nation-state - and the invention of the concept of geopolitik - which entailed the expansion of an "organic nation" - guided this particular brand of geography. The radical demographic restructuring entailed in these concepts trained some German geographers, especially of the Richthofen school, to use their geographical work in the service of "the racial nation." As a result geographers played an important role in arguing for policies that would turn genocidal in nature. The paper argues that there is a direct link between this geographical school of ideas and genocidal policies pursued by the German empire in southwest Africa and on the European continent.

Amrita G. Danieri, University of Toronto, Departm. Email: amrita.daniere@utoronto.ca; **Anchana NaRanong, NIDA, Bangkok Thailand. Email:** anchana@nida.nida.ac.th; *Tangible and Intangible Civic Spaces in Bangkok*

This paper combines research on community spaces in Bangkok with an in-depth discussion of the use and control of an important intangible civic space, i.e., community radio. Civic space is usually conceived of in physical terms or is described as an actual venue. The existence of community radio, however, illustrates that civic space (places where people come together and share information and knowledge) can sometimes also consist of airwaves, particularly, if access to radio is inexpensive and free of governmental and corporate control. Communities have been inspired to invest and build community radios, following a new set of regulations that opened up these opportunities as a result of Thailand's new constitution, and yet have almost immediately run into state opposition. The Thai state is currently undersupplying traditional kinds of community facilities as well as clamping down on the prevalence and openness of community radio. The clear desire for access to the communication possible via community radio on the part of many slums is a strong indication of the importance of civic space in Thailand as it moves towards enhancement of public participation. The paper ends with specific policy recommendations regarding community space provision within these struggling communities.

Mike Danson, Professor, University of Paisley. Email: mike.danson@paisley.ac.uk; **John Lee, Volunteer Development Scotland. Email:** john.lee@vds.org.uk; *Addressing the Ageing of the Workforce and Population through Encouraging Volunteering as an Element of a Sustainable Lifestyle: The Role of Employee Supported Volunteering*

How people can and should be encouraged to continue to play full and active roles in society and the economy are addressed in this paper, the specific role of employer supported volunteering within the European and Scottish contexts are analysed especially. Most countries are facing a declining and ageing population and strategic options to address these developments have been widely discussed and debated in recent years. Speculation and reactions have ranged across many dimensions of public and private concern, including pensions, the size of the workforce, the capacities of the health and social services. Increasingly, promoting a prolonged, healthy and active life has come to the fore of many

agendas, with moves towards well-being and inclusion assuming greater significance in public policy objectives. Strategies are being adopted which support the 'third age' being a period where instead of a precipitous transition into inactivity on retirement, there is a better balance between continuing employment, leisure, domestic duties, civic involvement and volunteering for several years. As part of this evolving movement, this paper draws on evidence from Scotland and Europe to explore these issues. It catalogues direct policy responses to demographic changes at global, European, and Scottish levels, stressing the economic and labour market contexts. In particular, it examines policies to encourage employers to support volunteering by older workers as part of a wider approach to active ageing.

Keywords: Ageing, Volunteering, Population

Gerald A. Danzer, University of Illinois. Email: gdanzer@uic.edu; *Picturing Chicago through Historic Maps: Developing Visual Literacy and Geographic Understanding*

This paper explores the relationships between historical cartography, visual literacy, and geographic understanding as exhibited in *Picturing Chicago*, a curriculum project by Mark Newman and Costas Spirou funded by the National Endowment for the Humanities. Visual literacy pushes viewers to look beyond the things that first meet the eye. Maps provide a useful way to help students develop this habit of searching further because they challenge the quick look. When a person picks up a map, for almost any purpose, there is usually a pause to get oriented to the image. Maps seldom provoke instant responses. Instead, they invite readers to slow down and figure out what they are looking at. Then, once the readers are fully engaged, maps push them to extend their range of vision, consider various options, and develop new possibilities. Thus maps of the city of various types and from different periods, present unique resources for developing visual literacy and geographic understanding. A curriculum demands order and sequence. The five themes of geography can offer this structure and provide a convenient way for students to reflect on the message and meaning of any map. The five themes can also help us spell out some major aspects of visual literacy, broadly conceived.

Kate Darby, School of Human Evolution and Social Change, Arizona State University. Email: kate.darby@asu.edu; *Reconceptualizing Local Food: Implications of Food Production in Phoenix, AZ*

Local food systems are part of a rapidly growing community food security movement in the United States. Local food system projects utilize a variety of mechanisms including community gardening, community supported agriculture, and farmers markets. They aim to ensure that residents have access to an adequate amount of healthy food while also decreasing the environmental impact of the community's food consumption. Recent scholars have suggested that this notion of "local" food is uncritical and romanticized. These concerns gain particular salience in desert regions of the U.S. Southwest, where urbanization and a limited water supply complicate local food production. In this paper, I explore the social, ecological and political-economic issues associated with food production in the Phoenix, AZ metropolitan region. Changing ecological conditions make agricultural production difficult, while agriculture simultaneously exacerbates some local environmental problems (e.g. particulate pollution) and mitigates others (e.g. urban heat island). I also explore the social implications of local food production through an environmental justice lens. Through the framework of metabolic rift and a discussion of current economic incentives for agricultural production in AZ, I explore the political-economic issues of local food systems. In investigating these issues, I begin to develop new ideas of what effective local food system projects could look like in the Phoenix metropolitan area.

Keywords: local food, Phoenix, agriculture

Joe T. Darden, Michigan State University. Email: jtdarden@msu.edu; *Does Black Residential Segregation and Black Demographic Dominance Enhance Black Business Ownership?*

The black population in the United States is highly residentially segregated in central cities. Most research has suggested that negative social and economic consequences are associated with such segregated patterns. Little research has revealed any positive consequences. The purpose of this paper is to determine whether black business ownership is enhanced by the high level of residential segregation and black demographic dominance in central cities. Data were obtained from the most recent United States Bureau of the Census Survey of Minority Owned Businesses and the 2000 Census of Population and Housing. The index of dissimilarity was used to measure black residential segregation in central cities and to compare cities with different demographic characteristics and different levels of computed black business participation rates. The results revealed the importance of black residential segregation and black demographic

dominance on black business ownership. Keyword: Residential Segregation, Black Business Ownership

Keywords: Residential Segregation, Black Business ownership

Ian Darke, University of Guelph. Email: idarke@uoguelph.ca; Robin Davidson-Arnott, University of Guelph. Email: rdarnott@uoguelph.ca; *Remote Monitoring of Beach Surface Moisture*

Surface moisture is known to be one of the most significant constraints on aeolian sand transport into the coastal foredune. However, acquiring accurate measurements of surface moisture that capture its spatial and temporal variability during a transport event is difficult and time-consuming. Using readily available digital photography and common software a new method for mapping beach surface has been tested in the field. The method, which is non-destructive of the beach surface, is based on the tonal change of beach sand with increasing moisture. Two digital video cameras were mounted at the top of a 5 metre tower at Greenwich Dunes, Prince Edward Island, Canada, and continually take photographs of the beach surface. The brightness of the resulting digital images are corrected for ambient light conditions by comparison with a white card and the resulting corrected images have been calibrated against simultaneous measurements of gravimetric moisture content. It is anticipated that by combining measurements of wind speed and direction with simultaneous data on surface moisture content improved modelling of sediment transport from the beach surface into the foredune can be achieved. This paper describes the monitoring system and calibration in detail and presents results from an application over a one month period.

Keywords: digital photography, beach surface moisture, aeolian sediment transport

Jonathan Darling, University of Durham. Email: j.m.darling@durham.ac.uk; *Becoming Bare Life: Asylum, Hospitality and the Politics of Encampment*

This paper examines the politics of contemporary encampment and enclosure within the UK with reference to the positioning of asylum seekers as a group subjected to a biopolitical logic of compassionate repression. The paper opens by examining the utility of presentations of the asylum seeker as an exemplar of Agamben's (1998) figure of the 'homo sacer'. I argue that whilst such a positioning holds resonance with contemporary political formations, it also consigns the asylum seeker to a position of perpetual hiatus, a liminal state of indeterminacy from which a self-fulfilling biopolitical logic of confinement denies any space for political transformation and casts action only as regulated by ethical sensibilities. The paper then questions such a post-political stance by firstly critiquing the diverse uses to which such a conceptual frame has been applied, and secondly by suggesting the need to (re)engage with political theories which draw the political as always already an ethical practice in itself. Here I argue that the politics of the camp needs to be reconsidered from a stance which takes the encamped liminality of the asylum seeker as its originary referent rather than its inevitable conclusion. I therefore conclude by sketching an ethico-political disposition conceptualised around the notion of opening space for the asylum seeker as a hospitable, and political, practice. Such practice may be actualised in everyday encounters through ethical acts of critical responsiveness which seek to question, and intersubjectively transform, repressive logics of camp thinking.

Keywords: asylum seekers, encampment, ethics

Ashok Das, University of California, Los Angeles. Email: adas@ucla.edu; *What is success in slum upgrading? Comparing Indian and Indonesian experiences from participatory projects*

Providing basic urban services to the poorest - slum dwellers and squatters ? continues to be a challenging task in developing countries. Over the years, slum upgrading (SU) has emerged as a viable urban policy and planning tool for extending essential infrastructure and services to such informal settlements. Following the implementation of decentralization policies in developing countries, SU is increasingly becoming a locally initiated, funded, and managed intervention. It is also believed that the successful implementation of SU hinges upon supportive institutional alliances among the public, private, and nonprofit sectors, as well as strong grassroots participation by the clients of such projects ? the urban poor themselves. Two such programs ? the Slum Networking Project (SNP) and the Comprehensive Kampung Improvement Program (CKIP) ? were initiated in India and Indonesia, respectively, in post-decentralization eras. Both programs are considered to be quite successful. However, using a comparative case study approach, this paper shows that while some program outcomes are indeed encouraging, in different ways, two key elements for the success of SU programs ? scaling-up and sustainability ? are much less promising because a) they have been not been able to stimulate the nonprofit sector's participation enough; b) the institutional frameworks governing SU are more rigid than flexible; and c) community participation is less than desirable. A combination of macro-level

regulatory frameworks, local governance characteristics, and socio-cultural idiosyncrasies can be considered as contributing to these shortcomings.

Keywords: slum upgrading, participation, decentralization, India, Indonesia

Robin E. Dattel, California State University - Sacramento. Email: dattel@csus.edu; *Patterns of the Foreign Born in Sacramento, California*

Sacramento's foreign-born settlement patterns suggest the presence of directional bias as described by John S. Adams in 1969. Historically, the foreign born were found in numerous small rural settlements and in a large multiethnic quarter in the West End of Sacramento city. The West End immigrant neighborhoods were destroyed by postwar urban renewal and freeway building and by the opening up of housing in suburban areas to immigrants of all races. Subsequent outward moves of various immigrant groups created clear sectoral patterns. These were shaped in part by earlier ethnic rural settlement patterns, but also by the timing and spacing of house and apartment construction that created an uneven map of opportunities for moving "up and out." The most recently arrived immigrants, some now going straight to the suburbs, have both reinforced these established sectors and created new patterns. Asian groups have shown a preference for the south side, although Asian Indians are something of an exception. Sacramento's Latino foreign-born population has both north side and south side concentrations and an important rural component. Recent Russian and Ukrainian refugees have gone to the noticeably "whiter" eastern suburbs. Immigrant businesses and institutions locate in immigrant residential areas, but draw patrons from across the metropolitan area, consistent with many other cross town movements in the galactic city.

Ayona Datta, PhD, London School of Economics. Email: a.datta2@lse.ac.uk; *Home, Migration, and the City: East European Construction Workers in London*

Since EU-enlargement a large number of East Europeans (mainly from Poland) have arrived in the UK and it is now estimated that more than 50,000 work legally or illegally in the construction sector. This paper focuses on the experiences of these migrant workers in London who work within the construction sector and mainly on residential projects. Through semi-structured interviews and participatory photography, this paper will discuss the connections between home, experience of migration, and everyday movement through London for these migrant workers. In particular, this paper is interested in exploring the importance of architecture and of place in the migrant experience as they construct homes away from homelands in London. The participants were recruited through snowballing techniques and an initial interview was conducted to learn about their experiences of home, migration, and the city. They were then provided with disposable cameras to capture their movement through London in pictures, after which a second interview was conducted where these pictures were discussed with the participants. This research illustrates how these men perform versions of 'laddish' masculinity in the workplace, while simultaneously performing domestic roles as equal partners in their houses. While these men build houses for others in London, they also evaluate the significance of home and draw connections to their homelands. Participant photography also illustrates how spatial perceptions of their workplaces, houses, and of London, shape attitudes towards their homelands, towards building (as a verb), and towards movement, and create hybrid identities in this moment of post-EU enlargement.

Keywords: Eastern Europe, migration, home, city, masculinity, construction workers

Eric H. DAUDE, CNRS- University of Rouen. Email: eric.daude@univ-rouen.fr; Emmanuel H. Eliot, CNRS/Universite Du Havre(France). Email: emmanuel.eliot@univ-lehavre.fr; *Circulation And Diffusion Of The 1831-32 Epidemic Of Cholera In Normandy (France)*

Among the epidemics which spread throughout the European subcontinent during the 19th century, the cholera is original for two reasons. First, it is characterized by a set of waves, which regularly and severely affected the populations through the century. Second, the disease produced many reactions and debates inside the society in a context of growing circulation of men and goods. This presentation focuses on the first wave (the 1831-32 epidemic) in France, and especially in Normandy. It examines the spatial course of the epidemic from different sets of data and by combining different methodologies. First, the presentation explores the components of the diffusion by using a multi-layer cellular automata. This model allows both to explore the structural effects of networks in the diffusion process and to compare the propagation waves between different periods. Second, based on the analysis of the medical and political discourses, the presentation proposes to trace the role of power in pathologizing groups (migrants, communities) and places and in constructing a specific response to the epidemic, which integrates its own way of interpreting space and places.

Keywords: Epidemic, Cholera, Diffusion, France, 19th century

Evangelia Daughtrey, Missouri State University. Email: edaughtr@drury.edu; *Economic Development in Mid-Sized Cities and the Relevance of Quasi-Governmental Entities*

This paper is part of the author's ongoing research on the rise of the Creative Class as defined by Richard Florida in the context of mid-sized cities. The city of Springfield, Missouri, serves as the case study and the reference point in terms of applying and analyzing theoretical frameworks. More specifically, in this paper traditional vehicles of economic development will be examined; mainly the Springfield Area Chamber of Commerce and secondarily initiatives by the City of Springfield. In this process, several questions arise: a) how relevant are traditional structures regarding economic development in the context of the knowledge economy? b) have institutions such as Chambers of Commerce and other public or quasi public entities evolved enough to offer meaningful solutions to modern problems, or are they trying to combat 21st century problems with Fordist solutions? c) do they work with or independent of the creative class? What is more, the nature of economic development in mid-sized cities and Springfield specifically will be analyzed. In summation, economic development efforts by institutions such as Chambers of Commerce and other public or quasi public entities will be evaluated.

Fiona M. Davidson, University Of Arkansas. Email: fdavidso@uark.edu; *Reds and Greens: The Diverging Politics of Scottish Cities*

The shift to proportional representation for Scottish parliamentary elections (and soon for Scottish council elections) has allowed previously under-represented political parties to flourish in Scotland in the last decade. Within the major Scottish cities in particular the emergence of alternatives to the standard fare of Labour, SNP, Liberal Democrat and Conservative candidates has greatly increased the range of political choices available to voters. In Glasgow and Edinburgh, this has created an unlikely divergence as Glasgow's disaffected voters have turned to the Scottish Socialist Party and Edinburgh's to the Green Party. This paper analyses voting behavior at the ward and constituency level for both these cities over the past thirty years to uncover the spatial and temporal shifts that have led to the emergence of these unconventional parties as viable alternative choices for the voters. While it is fairly clear that in Glasgow a long history of traditional Labour voting has been disrupted by the emergence of "New Labour", leading to political space for a new far left party to emerge, the situation in Edinburgh is rather different where it appears that the failure of any conventional party to address middle class concerns about the environment has energized a section of the population that was previously unrepresented in the political arena.

Keywords: Scotland, political parties, devolution

Mark A Davidson, Ph.D., Dartmouth College. Email: mark.davidson@dartmouth.edu; *Spoiled Mixture - Where does state-led 'positive' gentrification end?*

Over the past decade, policy makers in North America, Europe and Australia have introduced host of 'social mixing' initiatives that have sort to address urban social problems by de-concentrating poor and working class communities through attracting the middle classes back to the city. Such a policy objective clearly 'smells like gentrification'. However, some commentators have warned against being critical of these policies, pointing out that the types of inner city redevelopment generated by them is different from classical gentrification, and that state-led gentrification offers benefits for many poor and working class communities in much-maligned inner city neighborhoods. This paper draws upon research conducted in London, UK, to demonstrate how, despite having many applaudable aspects, pro-social mixing policy agendas carry with them significant threats of displacement - in its many forms - for lower income communities. The paper also argues that due to the mutating nature of gentrification these threats are increasingly context-bound, varying significantly from neighborhood to neighborhood. In conclusion, the paper calls for researchers to remain highly critical of gentrifying urban change since those state mechanisms which might 'manage' the unjust aspects of gentrification are inadequate to deal with the threat.

Ronald A. Davidson, California State University, Northridge. Email: rdavids@csun.edu; *A Thin Green Line? Frederick and May Rindge and the Morality of Keeping "The Malibu" Private, 1887-1941*

Battles between coastal home owners and the public over rights to the beach have a long history in Malibu. In the late 19th and early 20th centuries 27 miles of "the Malibu" (as it was then called) coast belonged to the Rindge family, which strove to keep the growing regional public out of their idealized personal arcadia. For (husband and wife) Frederick and May Rindge, Los Angeles represented urban-based modernity, the seat and product of what seemed to them immoral,

economically-driven developmental processes, while the Malibu was a redoubt of nature and morality. To complicate matters, Frederick Rindge was a successful businessman and owned a second house in West Addams. Using Frederick's memoirs and other archival sources, this paper explores and evaluates the Rindges' claims to moral superiority in seeking to withhold the public from the Malibu.

Andrew Daniel Davies, University of Liverpool. Email: a.d.davies@liv.ac.uk; *Tibetan (Trans)nationalisms: Maintaining and Fragmenting Identities across space and place*

This paper examines the varied and contested ways in which nationalist ideologies are both created and modified across different spatial arenas. Examining Tibetan nationalism, it will explore how a discourse of nationhood is mobilised in order to hold together a diasporic exile community, but more importantly, will look at how this mobilisation works in practice. Following from Haldrup et al's (2006) article in *Geografiska Annaler* which examines 'Banal Orientalism' as a method of constructing an 'Other', the paper will look at the employment of a number of key issues in the establishment of a Tibetan form of Nationalism. Substantively building from ongoing PhD research, the paper will look at the building of a discourse around a few key symbols of 'Tibetanness', but crucially, its modification as it is mobilised in different spaces, such as its production amongst Western media, its reproduction in sites (and sights) of protest across the world and its enactment in sporting events such as the Tibetan National Football team. It will argue that simply examining nationalism as a discourse is not enough, instead calling for a more networked and situated account of the creation of an ideology.

Keywords: Tibet, Nationalism, Resistance

Caroline P. Davies, PhD, University of Missouri-Kansas City. Email: daviesc@umkc.edu; *A Geospatial Analysis of Airborne Particulates and Asthma in Kansas City: Implications for Environmental Health and Social Disparity*

Despite much research, the causes of asthma and the reasons for increasing rates of asthma cases remain largely unknown (Kinney et al., 2002). High levels of ground level ozone have been associated with respiratory illness, yet Kansas City does not rank in the top 25 US cities with the worst ozone air pollution (American Lung Association, 2005). Kansas City also does not rank in the top 25 for particulate pollution. Yet it does rank in the top ten US cities for asthma (Sperling's Best Places, 2003; CNN 2004). This research examines the spatial distribution of airborne particulates at street level across the urban core over several weeks in summer 2006. Collection of particulate data in six size classes ranging from 10 μm to 0.3 μm using a Lighthouse handheld particle counter occurred during peak morning and afternoon rush hours. Data was collected along major boulevards and residential side streets to examine particulate distribution from source area, penetration into urban residential neighborhoods, and schoolyard exposure. Asthma patient data by zip code are examined for the same geographic area and summer sampling period. The geospatial analysis of these variables explores the environmental factors and potential socioeconomic implications for environmental health disparity.

Keywords: asthma, airborne particulates, PM10, PM2.5, social justice

Gail Davies, University College London. Email: gdavies@geog.ucl.ac.uk; *'Always look on the bright side of life?' Biotechnology, affect and the bio-politics of humour*

In this paper, I want to argue it is not only academics that are turning their attention to the dark side of biopolitics. Biotechnology companies are increasingly speculating about the future of biotechnology in a darker vein. Speculation is central to the business of biotechnology. The growth of scientists as entrepreneurs, gaining from short-term rises in stock value, means there are incentives to make strong claims about the future. And whilst hope remains a central discourse in the formation of biotechnological expectations, this is increasingly linked to discourses of fear. There is a perhaps a new rationality of life being forged in the response of biotechnology companies to what Melinda Cooper has termed the 'biological turn in the war on terror' (Cooper, 2006). Security is defined in human and biological terms, and so biotechnological hopes and fears are defined in concert. It is in this context I want to argue that humour may be a political strategy in opening up the politics of contemporary biotechnology. Speculation is a central performative repertoire in the contemporary bio-economies that cannot easily be discounted, for its reality operates precisely in the realm of potential, which is the potential to materialise new markets. Thus, in engaging with affective economies of hope and fear, affect becomes a political strategy and, I want to suggest, humour, irony and ambiguity might just be productive ways to open up spaces to perform the politics of biology differently.

Keywords: biotechnology, biopolitics, speculation, affect, humour

Jonathan J Davies, University of Cambridge. Email: jjd27@cam.ac.uk; Alastair R Beresford, University of Cambridge. Email: arb33@cam.ac.uk; *Distributed, vehicular computation for map generation*

Modern vehicles have sufficient levels of computing power and communications capabilities to enable a range of new applications. These applications will involve the large-scale collection, processing and dissemination of data, in which vehicles may participate as sources, processors or sinks. We focus on one such application: the collection and processing of vehicles' location data to automatically generate up-to-date digital road maps. We propose an algorithm to begin to achieve this and discuss the issues involved with how it could be deployed across a large scale. Existing map-making techniques are costly so are often slow to cover changes to the road network: new roads being opened, old roads being closed, or existing roads changing their shape. Some mapping companies use fleets of probe vehicles to explore areas which may have changed. Instead, our application makes use of vehicles owned by members of the public to quickly discover these changes and reflect them in the map. The algorithm makes use of techniques from image processing and graph theory to convert sets of GPS traces into road maps intended to be suitable for use for in-vehicle navigation units. The deployment of the application will involve the participation of many vehicles and may require some infrastructural support: perhaps dedicated processing servers or public data caches. We draw from work in compilation and task assignment to examine the various potential architectures and discuss how the application could automatically determine the most appropriate architecture for delivering maps that are both of high spatial quality and up-to-date.

Brittany Davis, The University of Georgia. Email: brittany.y.davis@gmail.com; Priscilla McCutcheon, The University of Georgia. Email: pmccutch@uga.edu; *Colorism on Campus: Intra-racial attitudes among undergraduate African American students in the Atlanta Metropolitan Area*

This paper uses a geographic lens to examine the relationship between the racial makeup of a university and the ways that color attitudes are reproduced therein. While colorism is an important topic of social inquiry, there is little, if any, research on the relationship between place and colorism in African American communities. Colorism is not solely an historical artifact. Indeed many aspects of it persist within the United States. Scholars have noted the effects colorism has on the self-esteem of African American children (where generally more "European" features are associated with attractiveness) and have studied the life outcome of African Americans of different skin tones as it relates to their income and choice in marriage partners. How does the particular university setting influence (if at all) students' perceptions of the importance of color? We hypothesize that the African Americans who attend a Historically Black College or University (HBCU) may be more aware of color differences, in contrast to African American students attending predominantly white institutions. Using data gathered from surveys and focus groups at both a HBCU and a predominantly white institution in the Atlanta Metropolitan Area, this paper scrutinizes attitudes about color and analyzes the potential correlation(s) between these attitudes and the racial makeup of the university.

Diana Davis, PhD, DVM, University of Texas, Austin. Email: geovet@mail.utexas.edu; *Potential Vegetation maps of North Africa*

Drawing on nineteenth-century precedents in French botanical geography, ecologists and botanists in colonial North Africa developed potential vegetation maps based largely on questionable environmental narratives. Using a combination of relict vegetation assessment and deductions from descriptions and histories of the region dating back to the ancient classical world to bolster their preconceived notions, these men assumed a great deal that contemporary paleoecological and ecological research has shown to be inaccurate. These colonial vegetation maps continue to be used to the present day, helping to create projects that all too often fail ecologically as well as socially. This paper analyzes the way the potential vegetation maps of Algeria, Tunisia, and Morocco were constructed during the colonial period. Further, it overviews many of the projects that have used, or been based on, these vegetation maps and examines their social and ecological outcomes.

Edward H. Davis, Emory & Henry College. Email: ehdavis@ehc.edu; *Christian Proselytizing in Muslim North Africa: A Geographic Analysis*

Christian evangelism has long been practiced in Muslim North Africa, through a wide range of approaches. In the twentieth century, many of the more liberal churches and individuals have refrained from such attempts. The ecumenical movement among Catholics, Methodists, Lutherans, Presbyterians and other mainline churches was never a high priority for the leadership of these

churches, yet it promulgated a kind of unspoken peace treaty with Jews and Muslims, and channeled nearly all overseas evangelical efforts toward those areas of the world where only tribal or animist religions prevailed. But in recent decades, the determination of some evangelical Christians has led to new approaches to their goal of converting Muslims. Meanwhile, the governments of many countries have become more explicit in their efforts to protect their countries from such campaigns. This paper describes the geography of the evangelical Christian campaign in Muslim North Africa since 2000. The data is a sample of reports from several global mission organizations, as well as reports from the U.S. Department of State. The results indicate the presence of at least one proselytizing campaign in every North African country. The current and future cultural and political geographic impacts of such campaigns are worthy of further research.

James A. Davis, Brigham Young University. Email: james_davis@byu.edu; Richard H. Jackson, Brigham Young University. Email: richard_jackson@byu.edu; Isoepa: Polynesian Heritage Site in the Utah Desert

Heritage sites important to members of the Church of Jesus Christ of Latter-day Saints (the Mormons) are scattered across the United States. The most famous is Temple Square in Salt Lake City. A much more obscure site, Isoepa, is located in a desert valley west of Salt Lake City. Isoepa was a settlement of Hawaiian converts to the Mormon faith established in 1889 and abandoned in 1917. It was abandoned when plans for a Mormon temple in Hawaii were announced and most of the residents returned to the islands to help with its construction. Ignored until the centennial anniversary of its establishment, Isoepa is emerging as a heritage destination for Polynesians in the Utah region. The factors explaining its emergence as a heritage site are associated with a growing Polynesian population in the West and their recognition of the role early Hawaiians played in settling the region. The focal point of the site is the annual Memorial Day celebration when many people come to honor and celebrate the early Hawaiian pioneers. This paper examines the reasons Isoepa has turned into a heritage destination, its importance to the collective memory of Utah Polynesians, and how the cultural landscape of the sites has changed over time.

Keywords: heritage tourism, religion, Polynesians, collective memory

Jason Davis, Ohio State University. Email: davis.1937@osu.edu; Scientists' roles in negotiating hybrid relationships

Antarctica is home to biota which has over long periods of time evolved to survive in the icy environment of the continent. It is those unique adaptations which have drawn the interest of scientists, politicians, and capitalists interested in extracting commercial applications from the genetic and biochemical properties from these life-forms. How to go about doing this in a legitimate way is currently the subject of debate and negotiation among scientists and policy-makers. The negotiation of bioprospecting regimes therefore takes place in a world of in-betweens: a hybrid object that incorporates and mediates between science, commerce, policy, and geopolitics. There has traditionally been much critical focus on how policy-makers and capitalists negotiate these types of regimes, the role of scientists has been neglected. I will examine how scientists influence how these relationships are negotiated, as they are the primary actors who interact with the biota.

Keywords: Science Policy, Geopolitics, Bioprospecting, Antarctica, Hybrids

Jason Davis, U.C. Santa Barbara. Email: jdavis3691@hotmail.com; The Effect of Remittances on Fertility, Conspicuous Consumption, and Agricultural Change

The exponential growth of remittance flows among nations promises to expedite development in poorer nations as migra-dollars will benefit disproportionately the underprivileged. Since these flows are often directed to rural communities that exist in close proximity to biodiverse habitats, such development will have consequent - possibly severe ? effects on crucial environmental resources. The paper takes a step-down approach to the subject of worker remittances and their effects on conspicuous consumption, human fertility, and agricultural change ? three factors that have direct and indirect environmental effects. This paper comprises a review of the literature that encapsulates previous findings on the effect of worker remittances on local fertility, conspicuous consumption, and agricultural change with a special emphasis on Central America and the Caribbean. Through the analysis of a Guatemalan national human condition dataset, this section will also present basic data identifying in what economic sectors remittances are being invested in local communities, with a particular focus on amounts that are channeled to further agricultural production, and will examine data relating remittances to fertility rates. The second section of this paper will present a basic statistical analysis of antecedent factors that may predispose household members to migrate and remit money back to

their local communities.

Keywords: remittances, international migration, fertility, agricultural change, conspicuous consumption, Guatemala, Latin America

Jeffrey Sasha Davis, University of Vermont. Email: sasha.davis@uvm.edu; Nature takes over: Constructing terra nullius and scales of control

When social landscapes are destroyed, either quickly through disasters or slowly through the forced removal of the population, the resulting landscape tends to be conceptualized as becoming "natural." This powerful rhetorical label can serve to erode the legitimacy of the remaining (or former) residents as viable actors who should determine the place's future reconstruction. Effectively erased from the landscape, the voices of these local populations often go unheard. In addition, this designation of the place as a "blank slate" serves to justify planning initiatives inconceivable when the landscape was filled with the structures and activities of a vibrant populace, thus changing the scale at which reconstruction is imagined and managed. These new discursively constructed natural places then serve as important sites in the global economy as they are treated similarly to the so-called "empty frontiers" exploited in the heyday of imperial capitalism. Empirically this paper will draw on the examples of military dispossession and annihilation on Vieques, Puerto Rico and Bikini Atoll, Marshall Islands as well as destruction and capitalist-driven reconstruction caused in Central America in the wake of Hurricane Mitch.

Keywords: disaster, political economy, political ecology, dispossession, militarism

Jerry D. Davis, San Francisco State University. Email: jerry@sfsu.edu; Biogeomorphic Riparian Assessment and Salmonid Habitat Enhancement in a Suburban Landscape: San Pedro Creek Watershed

San Pedro Creek is a perennial stream in a 2070-ha basin in Pacifica, California, a suburb south of San Francisco, which provides a degraded but still viable habitat for threatened anadromous steelhead (*Oncorhynchus mykiss*). The watershed, home to approximately 17,000 Pacificans, is approximately 33% built out with low to moderate density housing and services; most of the undeveloped land is protected as county, state, or federal land. The two largest subwatersheds - that drained by the culverted North Fork (614 ha) and that of the relatively undeveloped Middle and South forks (total 624 ha) ? exhibit expected contrasts in storm-flow time of concentration and sediment yield, related to contrasts in impervious surface area. Stream channel bed and bank materials and morphology reflect a history of 200+ years of agriculture (channelization and relief water diversion structures) and 50+ years of basin and stream-side suburbanization (impervious surface expansion and armoring with concrete, riprap, and gabions), with concomitant downcutting and bank erosion. Up to 4.5 m of vertical degradation below bridge culverts has created barriers to steelhead migration. Biogeomorphic analysis of bed and bank materials, sediment systems, channel morphometry, and related salmonid habitat elements has guided ongoing restoration projects aimed at reversing degradation and enhancing habitat.

Kathryn Davis, San Jose State University. Email: kdavis@email.sjsu.edu; Development, Health, and Housing in the Guatemalan Highlands

Guatemala has, for a variety of reasons, failed to provide adequate housing for its citizens especially those who live in the highlands far from the capital. The difficulty of providing adequate housing in Guatemala is the result of a multiplicity of problems that include insecurity of land tenure and extreme levels of poverty. These two factors have conspired to limit access to the housing market or collateral to borrow money. The displacement of thousands as a result of Hurricane Stan in 2005 has exacerbated the problem. Substandard housing has serious negative effects on the physical, mental, and social well-being of a population. Housing is an economic resource, a space in which people conduct their lives, and often a place of productive labor. Research has demonstrated that substandard housing can result in future negative health consequences as well as immediate problems. The typical materials for self-constructed homes in Guatemala are clay and wood with earthen floors. These houses often lack sanitation facilities and access to clean water. Decent housing protects people from chronic and communicable disease, accidents, and injuries. It also promotes healthy social interaction, limits often debilitating stresses, and ensures good health. This paper looks at the relationship between these factors and decent housing in the highlands of Guatemala.

Lisa Kim Davis, MPH, PhD, UCLA, Department of Geography. Email: davis@geog.ucla.edu; *Urban Redevelopment, Cultural Policy and the 1988 Seoul Olympic Games*

This paper explores how urban neighborhood redevelopment and the national cultural policy of promoting 'sex, sports, and screen' in South Korea became twin pillars of a new military government's attempt to gain legitimacy after the assassination of the previous dictator Park in 1979. By then, Seoul was the preferred address of the rapidly industrializing country as workers continued to flood the cities, resulting in a worsening housing shortage. The '3 S' cultural policy, as it is known, was created to draw attention away from public dissatisfaction over the latest military coup, especially in the months after the Kwangju Massacre by the military in May 1980. At this time, the government began to bid in earnest for the 1988 Olympics. The method of research involves review and analysis of print media texts, government documents, and existing literature. Both the massive overhaul of urban housing and the new cultural policy of this period had lasting effects on the urban geography of Seoul well into the 21st century. While South Korea is often held up as an exemplary model of capitalist industrialization, the centrality of both urban questions in constructing the nation, as well as the national political and economic motivations which shape the city, need to be scrutinized and acknowledged.

Mathew Davis, MArch, MLA, Temple University. Email: mjd@temple.edu; Michele Masucci, PhD., Temple University. Email: masucci@temple.edu; *Finding Lost Place: GIS and the Re-emergence of Community*

Urban design as a participatory and collaborative process, must embrace the evolving network information infrastructures in the context of the traditional physical planning. This paper reflects ongoing collaborative research and proposals for an inner-city neighbourhood in Philadelphia that has suffered from disinvestment, poverty and blight for decades. Working with a local community-based organization, the authors present a collaborative model for urban redevelopment in North Philadelphia using GIS technologies to respond to the myriad challenges facing post-industrial areas of our cities. We review the community efforts to implement a technology initiative that is intended to serve as an impetus for redevelopment. A university-community partnership was formed to address technology infrastructure needs to support implementation of the community technology initiative. Elements of the partnership include: (a) designation of a community fellow to coordinate shared projects, (b) development of a community geographic information system and data sharing mechanisms, (c) creation of an internship program to support neighbourhood housing assessment activities and (d) implementation of a youth education program to link community knowledge with information and community technology training. Outcomes of the partnership have included creation of a set of shared data resources, neighbourhood development plans and curricular materials.

Email: oliverf@colorado.edu; Patrick J. Michaels, University of Virginia. Email: pjmx8x@virginia.edu; *Observed Changes in North Atlantic Hurricane Frequency and Intensity Using a Multivariate Model*

Previously we demonstrated that sea surface temperatures (SST) and tropical cyclone intensity in the North Atlantic basin are not as closely linked as has been implied in several recent papers. Here, we broaden our investigation to examine aspects of the tropical environment beyond SST that have known impacts on tropical cyclone development, including, among others, vertical wind shear, vertical lapse rate, and layer-average specific humidity. We determine the monthly average value (upper air variables calculated from the 6-hourly data from both the NCAR-NCEP and the ERA-40 reanalysis data, SST data from NOAA NCEP ERSST) within 2.5° latitude x 2.5° longitude grid cells covering the

North Atlantic basin region. Within each hurricane season, we calculate the areal extent of critical values of these variables, both individually and in combination, to determine how conditions critical for tropical cyclone development have evolved in the Atlantic basin over the past three to five decades. When we examine the relationship between these environmental variables and tropical cyclone intensity and frequency, we find that although SSTs contribute significantly to tropical cyclone activity, their influence varies markedly over time, as does the importance of variables such as vertical wind shear and lapse rate. The variation of these influences indicates complex behavior over time, and do not suggest that human influences, acting on SST alone, can explain the recent increase in Atlantic hurricane activity. These findings highlight the complex nature of hurricane development and counter arguments of a simple cause-and-effect relationship between rising SSTs and stronger North Atlantic hurricanes.

Carrie Davis Todd, Purdue University. Email: davis120@purdue.edu; Jacob Napieralski, University of Michigan - Dearborn. Email: jnapiera@umd.umich.edu; *A Tale of Two Cities: Does Geographic Setting Influence Student Learning??*

An undergraduate applied geomorphology course, designed by instructors from Purdue University and the University of Michigan-Dearborn, incorporated a variety of activities and projects in which the students apply course content to investigate and solve real-world problems. The course structure and materials used by both instructors were relatively identical. Our hypothesis was twofold: (1) an engaging approach to learning geomorphology would increase student knowledge retention and content application and (2) the geographical setting of the university (i.e. rural or urban) would influence the type of content students retain and emphasize on independent projects and activities. In this study, pre- and post-tests were used to assess and compare student knowledge at the beginning and the end of the semester. Results from the tests were quantified using a rubric to award points based on the inclusion of vocabulary words, sketches, or key phrases that indicate their level of comprehension. Pre-tests from each student were compared against their post-test results to measure learning and retention at the end of the semester. A statistical analysis was then performed to select the factors, including geographical setting, gender, and program of study, that most influenced the degree to which content and applications were retained. Results from this study illustrate the importance of understanding student background when developing a course and can assist in the integration and adaptation of course material created at other universities.

Teresa Dawson, University of Victoria. Email: tdawson@uvic.ca; *Teaching College Geography: A Resource for New Teachers*

Being a beginning teacher at university or college can be an intimidating and sometimes overwhelming experience. In reality new instructors often have little time to prepare before the course begins. Therefore the main goal of Teaching College Geography is to provide practical and supportive assistance for new instructors and teaching assistants in a just-in-time manner that mirrors their evolving needs. Each chapter of the volume is designed to build skills from designing the syllabus and making the most of the first day of class to getting feedback that improves teaching. Other chapters support particular professional development interests as instructors move from teacher-focused to student-focused practitioners. These include teaching and learning for diversity, GIS teaching, designing field studies, and assessment of geographic learning. In each case the author outlines some key concepts for consideration, shares tips based on collected experience in various geography departments across North America and supplements this practical advice with exercises for improving skills. In this short interactive paper presentation, one chapter will be used to illustrate the conceptual approach to practical materials development used by the authors in the volume and participants will receive a preview of the associated skills development exercise for subsequent comment and feedback by the participants.

Rosemary J. Day, Dr, University of Glasgow. Email: r.day@socsci.gla.ac.uk; *The Outdoor Practices Of Older People In Western Scotland*

This paper will present some findings from a study of older people in three neighbourhoods in the Glasgow area of Scotland. The neighbourhoods encompass varying levels of socio-economic prosperity and different types of urban landscape, but all have an above average proportion of people aged over 60. Interviews with older people and field observation in each area were carried out, allowing examination of the everyday outdoor practices of older people in these different settings. Taken as a whole, these practices reveal some common themes, for example the importance of time spent enjoying natural elements; and of opportunities for informal social interaction with acquaintances out of

doors. Differences in practices between the three neighbourhoods highlight how elements of the outdoor environment, both physical and social, may provide opportunities or constraints for the promotion of older people's well-being. Constraints include design features, upkeep, and the practices of others. These findings speak to a need for greater recognition of older people in outdoor spaces. They also challenge certain policy agendas: for example, the research found that the older people in all three neighbourhoods would often choose to segregate themselves as a group in time and space, preferring to be around other older people. Such a practice calls into question an assumption that cohesive mixed communities may be facilitated through the provision of quality outdoor space, without further interventions to achieve such mixing.

Joao Francisco de Abreu, de Abreu, J.F., Catholic University of Minas Gerais-Brazil. Email: jofabreu@pucminas.br; Pasteur Ottoni Miranda Junior, Catholic University of Minas Gerais/Brazil. Email: jofabreu@pucminas.br; Mapping "Geographical Voices", with an application of Hagestrand's space-time model

Peter Gould and Forrest Pitts, in the introduction of the remarkable book *Geographical Voices* - Fourteen autobiographical essays, wrote: "For those familiar with Torsten Hagerstrand's space-time diagrams, in which people trace out graphically three - dimensional daily paths, we saw in our imaginations "life lines" starting at different places and different times, generating quite different personal experiences, yet all merging in the project we call geography". This paper aims precisely at mapping those lines. For such, software in Delphi language was developed, to trace the three-dimensional lines and map the paths. This entirely interactive program allows the import of Excel tables and basic MIF and SHAPE maps, besides the export of JPEG- and BITMAP-generated graphics. The paper maps the fifteen voices (Peter Gould's path is also mapped) as a homage to the great work of those geographers and of the book authors.

Ariane De Bremond, Ph.D., University of California. Email: ariane.debremond@gmail.com; Regenerating Conflicted Landscapes: Land, Environmental Governance, and resettlement in Post-war El Salvador

This paper traces the history, process, and outcomes of the Programa de Transferencia de Tierras (PTT) in El Salvador, the post-war land transfer initiative that brought together Government of El Salvador and the Farabundo Martí National Liberation Front and numerous international aid agencies to implement a state-market hybrid land reform in the wake of a twelve-year civil war. The PTT evidenced an approach to land transfer that has become standard practice globally, emphasizing agriculture as the chief path to reinsertion, and thus to peace, in post-conflict situations, and conducting land transactions and post-transfer assistance largely through market-mechanisms. A qualitative instrumental case study was used, focusing on the social dynamics of land transfer and parcelization, livelihood construction, and governance of ecologically sensitive resources by returned refugees and ex-combatants in El Salvador. Results suggest that the 'developmentalist' project of land reform sets parameters, material and discursive, spatial and imaginary, that limit or potentiate how people might configure livelihood strategies and shape the ecologies with which they live.

Karen De Bres, Kansas State University. Email: karendb@ksu.edu; The Geographies of Power and Privilege at Plains Land-Grant Colleges 1862-1918

Karen J. De Bres, Department of Geography, Kansas State University, Manhattan, KS 66502 Internet: karendb@ksu.edu The Geographies of Power and Privilege at Plains Land-Grant Colleges 1862-1918 American "land-grant" colleges, established by the 1862 Morrill Act, lifted what were then called the "industrial classes" into higher education. Emphasizing applied subjects at the expense of traditional college courses, many of the new institutions focused upon agriculture, mechanical arts (engineering), ROTC, and soon, women's courses (home economics). In this paper I argue that land-grant colleges served to keep poorer white men and women as well as African-American students in their "place" and that the new college buildings reflect those intentions. Early buildings at land-grant colleges that were not their state's "flagship university," particularly in the Plains, conveyed the utilitarian spirit of their curriculum as well as conservative social messages. Tim De Chant, University of California, Berkeley. Email: dechant@nature.berkeley.edu; Maggi Kelly, University of California, Berkeley. Email: mkelly@nature.berkeley.edu; Barbara Allen-Diaz, University of California, Berkeley. Email: ballen@nature.berkeley.edu; Forest Gaps Through Time: Using Object-based Image Analysis to Examine Canopy Changes in the Wake of Sudden Oak Death

Sudden oak death (SOD) is a disease of epidemic proportions, sweeping through many coastal hardwood forests in California. Since 1999, *P. ramorum* has produced overstory mortality in China Camp State Park (CCSP) and the surrounding open space, creating a number of gaps which effectively alter the structure of the forest. In the following four years, ADAR high-resolution (1 m) multispectral imagery for CCSP was acquired. We segmented and classified this existing imagery using object-based methods to identify gaps within the forest mosaic. We also tested a variety of object-based segmentation parameters on one image to determine potential error resulting from segmentation. Once the gaps were identified, they were measured for area, perimeter, and Euclidean nearest neighbor. We then compared these spatial measures of variation to temporal ones, creating a time-sequence of gap formation and the resulting gaps' closure or persistence. Between 2000 and 2001, 910 gaps within China Camp contained one or more trees dead from *P. ramorum*. Preliminary results indicate that the majority decreased in both size and perimeter while the distance between them grew. Those that increased in size, however, were smaller on average than those that decreased, a potential consequence of the spatial distribution of SOD. This research provides insight into changes in the canopy structure at China Camp following *P. ramorum* mortality. Furthermore, it also illustrates the necessity of object-based methods in tracking changes in forest gaps over time.

Lee De Cola, United States Geological Survey. Email: ldecola@usgs.gov; Using Graph Theory to Model the Spatial Structure of Land Cover

New data structures and algorithms are enabling the 300-year old science of graph theory to shed light on such disparate topics as the Internet, biochemical pathways, and ecological networks. This analysis can also demonstrate links between ecological processes and the landscapes on which they occur. Land cover data are tessellations of nominal-valued cells regionalized into homogeneous patches whose arrangement is an underlying landscape pattern that can explain the propagation of biological signals. Consider four levels of analysis. At the CELLULAR level the frequency distribution of the classes characterizes not only the study area and period but also the choices made by the classification protocol. The PATCHES themselves can be described by the (usually scaling) size distribution of their areas and the lengths of their perimeters, which reflect spatial complexity (e.g. fractal dimension). A GRAPH results when the patches are represented as vertices and an edge exists when two patches share a boundary. The degree of the vertices describes how connected a type of land cover is to others. Finally, the DISTANCE MATRIX (the lengths of trails linking vertices through intervening vertices) reveals such characteristics as: which land cover classes are more frequently associated, multiscale autocorrelations, and fragmentation of the pattern. These measurements can then be related to how animals migrate, plant species invade new regions, or pathogens spread from one community of hosts to another.

Maria de Jesus Diaz-Perez, Salud Family Health Centers. Email: mdejesus@saludclinic.org; Deborah Thomas, University of Colorado, Denver. Email: deborah.thomas@cudenver.edu; Tillman Farley, Salud Family Health Centers. Email: ; Assessing Gaps in Service for a Community Health Center System

Colorado's health indicators are better than the rest of the nation. However, this positive profile masks health and healthcare disparities based on socioeconomic position, race/ethnicity and geographic location of population in the state. For example, in 2003 approximately 17% of the state population was uninsured, and those Coloradans at highest risk for being uninsured included people living in poverty; young adults, Hispanics, people working for employers with fewer than 100 employees, and people with lower educational attainment. To provide health services for populations with the highest need, low-income, uninsured, and underinsured, the federal government supports the Community Health Centers (CHCs) program. Careful analysis of CHC's service areas and population is necessary to improve access to care to populations with the highest need. This study uses GIS to assess access to healthcare services provided by a CHC system in north and northeastern Colorado, Salud Family Health Centers (Salud). Specifically, this study looks to identify gaps in services using CHC's patient data along with Census information. Gaps in healthcare service are defined as Census block groups with high need but low access to services. Within the defined Salud service area, those 'high need' block groups with low actual patient population would be considered a gap. Outside of Salud's service area, gaps in health care service are identified as those high need block groups that are not

served by another CHC. The findings directly inform policy on the financing and/or organization of CHCs, which ultimately impacts health care access for vulnerable populations.

Bart de Jong, Utrecht University, Faculty of Geosciences. Email: b.dejong@geo.uu.nl; Governing Amsterdam Airport Schiphol: how to become a more decisive actor in a complex network society

Amsterdam Airport Schiphol is a dynamic node, where the space of places and space of flows meet. This makes it a complex entity. A growing number of public and private actors tries to influence the spatial situation to their advantage, making the decision-making process much more difficult and no longer solely the domain of governments. This difficulty is fed by a climate of distrust as a result of lack of communication between the concerning actors. The aim of this paper is to formulate innovative intervening strategies and create - or give initial impetus to - new forms of governance that may help to overcome these difficulties. To do so it will use the Actor Network Theory in combination with regime theory and global production networks theory to analyze existing and potential networks and regimes within the Schiphol region. By not approaching Schiphol exclusively as a physically, infrastructural, spatial-economic or environmental phenomenon, but more from the driving forces and motives of the decisive actors behind these phenomena, insight is gained in a possible more social, institutional and cultural embedded development of the airport. I will explain how Schiphol evolved from a simple airport into a many-headed monster, with lots of actors and different interests. I conclude that a more actor-oriented approach is necessary to come to new forms of governance and tame this many-headed monster.

Keywords: Amsterdam Airport Schiphol; governance; decision-making, actor network theory, global production network, regime theory, airports

Carolyn De La Pena, Associate Professor, American Studies, UC Davis, University of California - Davis. Email: ctdelapena@ucdavis.edu; "Sweeten My Life a Little": Saccharin, Politics, and Pleasure in the "Other" America

In March 1977 the FDA announced their intention to ban saccharin. Over the next six months they received 100,000 protest letters from consumers. This presentation makes two arguments about the cultural importance of this "saccharin revolt." First, saccharin enabled white working-class female consumers (many of them from rural regions or the midwest) to exercise political power denied to them in other forums. Many of these women quite literally told the FDA, the Congress, and in some cases President Carter to "go to hell." Many mention that they are tired of hearing about "everyone's else's rights" and paying high taxes. In demanding that the government "leave them alone," saccharin protesters classify themselves as the virtuous restrained pleasure seekers, counterpoising the "evils" of Washington and "freeloaders" to the hard-working locality of their families and towns. Second, support for saccharin in middle-America and de-industrialized urban areas (Allentown, PA; Detroit, MI) enabled consumers to reinvent a chemical as a health food. Consumers repeatedly question the FDA's science in their letters; many argue that sugar causes obesity and obesity is a far greater health risk. In these arguments they frequently assert that risk is impossible to avoid and this is a risk they "choose." This assertion has implications for how consumers understand "healthy" food (as perhaps a place for appropriate risk in contrast to environmental risks) as well as how those understandings are impacted by region (particularly in regions employing industrial/chemical agriculture).

Keywords: saccharin, political protest, health, pleasure, rural, midwest, whiteness, consumption

Juan David De Lara, University of California, Berkeley. Email: jdelara@berkeley.edu; Mapping Development: Leisure and Race in the Palm Springs Valley

The Coachella Valley, including Palm Springs, is one of the fastest growing regions in the country. My research focuses on how the racialized discourse of development is linked to the production of particular landscapes. It's an attempt to connect culture to the material production of space and place. The production of a place always requires a new cognitive map. One that sees beyond the landscape as it exists. It is a map of possibilities. A map of imagination that conjures up how the world could be. Part of that conjuring involves the creation of the social relations that need to exist in order for the map to come alive. Palm Springs developers have created a cognitive map that clears the way for a certain kind of development; one rooted in the needs of a leisure class. The map naturalizes the desert as a golf oasis. It makes the formation of a golf landscape all but an obvious choice for the desert geography. The expansion of a golf-based leisure economy and a middle-class housing market into the eastern Coachella Valley has gone hand-in-hand with the erasure of working class Mexicans from the landscape. This racialized discourse of development and progress is part of

creating a particular landscape; one that remakes a former agricultural, poor, Mexican space, into a place suitable for the mostly white leisure class. The discursive and material production of the Palm Springs Valley highlights how class and culture are invoked in the material production of space.

Sarah de Leeuw, Queen's University. Email: 2lsnd@qmlink.queensu.ca; Needful Altruisms, Disingenuous Philanthropy: Colonial Constructions of Other and Self within the Intimate Geographies of 'Indian' Residential Schools in British Columbia, Canada

Although Canada has never been a colony of the United States of America, American boarding school policies pertaining to Aboriginal peoples nevertheless permeated Canada by forming the foundation of Canadian Indian residential schooling policy. The transference of American colonial policies into Canada, documented in Nicolas Flood Davin's 1879 Report on Industrial Schools for Indians and Half-Breeds, demonstrates the importance vested by colonial regimes in the intimate geographies of children and school rooms as sites through which to undertake the assimilation, civilizing, and acculturation of Indigenous 'others'. Consequently, a strong linkage exists between 1) American imperial conceptualizations and constructions of Indigenous peoples and 2) the manner in which Canada intervened into the lives of First Nations both through the production of small, intimate school geographies and through the subsequent confinement of First Nations children within those educational boundaries. Beginning with Davin's uptake of American boarding school policy, this paper explores colonial imaginings about Indigenous peoples, the subsequent materialization of those imaginings as school buildings and curricular mandates, and the ensuing efforts of colonial educators to inscribe their ideologies into and onto the minds and bodies of First Nations children. I conclude the paper by observing that the micro-geographies of residential schools were multifaceted places where, just as colonialism and empire grounded themselves and touched down, so too did Indigenous peoples touch and transform colonists and propagators of empire.

Keywords: Intimate geographies; First Nations and Indigenous peoples; Residential schools; Colonialism

Luc de Montigny, University of Washington. Email: ldem@u.washington.edu; How Injection Drug Users use Public Space: a Behavior Model

A significant number of injection drug users (IDUs) in the US and Canada have little or no access to private space, particularly for the acquisition and use of drugs. Because treatment options are often limited and the power of addiction very strong, such users rely heavily on public space: to raise money to buy drugs, and to buy and even inject drugs. These activities have negative effects—on the communities that host them and on IDUs themselves—that could be mitigated by public health programs. However, effective harm reduction efforts, for example the management of public injection and provision and disposal of injection equipment, require a better understanding of the spatial behavior of IDUs. Building on criminology, substance abuse, and geography literature, this paper develops a behavioral model to conceptualize the factors influencing the territories and spatial decisions of IDUs. Key factors in the model include personal characteristics and preferences, environmental knowledge and perception, territorial anchors, and actual choices sets and the characteristics of those spaces. The model has been developed for use in a larger study on the spatial and temporal distributions of discarded needles, and an assessment of safe disposal programs implemented in Montréal, Canada.

Miguel Diego de Oliver, Ph.D., University of Texas at San Antonio. Email: miguel.deoliver@utsa.edu; Democratic Imperialism: Keeping Perspective in the Era of Democracy's International Triumph

Acknowledging the historical and readily overlooked *raison d'être* of democracy is critical in the contemporary era of democratization. Despite popular fixation on its civic virtues, democracy has been historically linked to the institution of empire due to the fundamental acquisitive underpinnings that they both share. Given its elemental function as guarantor of individual possession for the common citizenry, the democratic state in the international arena serves as an acquisitive collective of private property. It is no surprise that the materially successful and, thus, stable democratic states that lead the world system are/have been favorably linked to the structure of imperialism. Any conception of an emerging era of democratic 'peace' must accommodate the coercive imperialism of old. Consequently, the growing democratization of the world system of polities of the late 20th century is the political rearticulation of autocratic imperialism within a democratic world order.

Keywords: Democracy, imperialism

Mark De Socio, The University of Akron. Email: desocio@uakron.edu; 'Creative cities' and urban regimes: An empirical inquiry

In recent years there has been renewed attention to the role of culture in the economic restructuring of cities in the United States and elsewhere. This 'cultural turn' in urban studies has taken shape most recently in the form of the 'creative cities' thesis. It is widely noted that the most successful of contemporary cities are economically anchored by cultural industries regarded as the vanguard of a "new new economy". A singularly prominent argument advanced by Richard Florida suggests that cities comprising particular mixes of economic activities deemed cultural or "creative" are today much better off economically and socially than cities with more traditional economic bases comprised mostly of manufacturing and/or services. Such 'creative' cities are regarded as having progressive political and social environments where tolerance of gay and lesbian lifestyles combine with a mix of cultural activities and a vibrant nightlife to establish creativity-inducing environments coveted by creative workers. This paper explores apparent links between Richard Florida's creative cities thesis and the middle-class progressive regime typology identified in urban regime theory (URT). Multiple cities identified as having middle-class progressive regimes are also identified as creative cities. This suggests that local economic structure plays a significant role in shaping the political character of urban regimes. Conversely, URT may inform Florida's thesis by offering a more nuanced view of urban politics. Municipal coalitions promoting supposed creativity-inducing urban spaces for purposes of economic development, for example, have nothing to do with progressivism as opportunities for low-income residents and/or neighborhoods.

Christopher Anthony De Sousa, M.Sc.Pl., Ph.D., University Of Wisconsin - Milwaukee. Email: desousa@uwm.edu; Changshan Wu, Ph.D., University of Wisconsin, Milwaukee. Email: cswu@uwm.edu; *Assessing the impact of brownfields redevelopment on residential property values and real estate conditions*

Over the last decade, the redevelopment of urban brownfields has gained widespread support in the US as it is considered an important element for fostering more sustainable development. The focus of brownfields efforts has, thus far, been largely on industrial and commercial redevelopment that garners "jobs and taxes" directly, while other uses such as green space and housing are perceived as less desirable because little is known about their direct and indirect monetary implications. This research project measures and compares the impact of different forms of brownfields redevelopment (green space, industrial, office, retail, and residential) on nearby residential property values and real estate conditions in Milwaukee and Minneapolis. The research approach incorporates both quantitative and qualitative methods. That is, a hedonic method is used to quantify nearby property value effects accruing from brownfield redevelopment projects (pre- and post-redevelopment), while interviews with relevant public and private sector stakeholders are used to gather information on the perceived impacts to local real estate conditions. The impact of different features of brownfield redevelopment projects (e.g., project size, project value, public funding, location) on surrounding property values is also examined. In all, the research adds to a small, but important, body of literature in this field and will help policy makers and other stakeholders better understand the nature and scope of the aggregate benefits ensuing from alternative forms of brownfields reuse.

Keywords: brownfields, hedonic model, development, sustainability

Leith A. Deacon, University of Western Ontario. Email: leitha@uwo.ca; Jamie Baxter, Ph.D, University of Western Ontario. Email: jbaxter6@uwo.ca; *Environmental Equity Discourses in Canada*

While a substantial amount of environmental inequity research concerns American experiences (Paulido, 1996; Anderton 1994, Mohai and Bryant 1992, United Church of Christ 1987), research from a Canadian viewpoint is far less developed (Jerrett 1997, Jerrett 2001). In this paper, we conduct a content analysis that examines the environmental inequities in Canada as reported by the two national daily newspapers (The National Post and The Globe and Mail). Key words and phrases (e.g. environment, justice, equity, perception, discourse, pollution) are used to construct a thematic illustration of injustice as one method to identify 'inequity hotspots' in Canada, but more generally to build discourses of inequity that possibly crosscut regions. Both will help with larger objectives which include examining the perception, meaning, and everyday experience of pollution hazard exposure to residents in inequity hotspot communities. Recent federal policy has moved to support strong, fair and sustainable places and the implications of these findings on such federal policies will be discussed.

Richard Deal, Edinboro University of Pennsylvania. Email: rdeal@edinboro.edu; *The Effects of the 2006 Independence Referendum on Tokelau*

Tokelau, a dependency of New Zealand comprised of three atolls with a combined population of 1500, has seen numerous changes in its governance over the past 40 years, as the island's traditional political and economic systems have adopted many Western features. In February 2006, a referendum on independence in free-association with New Zealand was rejected by voters in the country. This paper briefly examines the changes in governance since the 1960's, with particular reference to the New Zealand policy of preparing Tokelau for eventual independence. Next, the proposed constitution and the potential impacts of this document will be analyzed. The results of the election will then be studied, with individual's reasons for voting for or against independence being analyzed. Finally, conclusions will then be drawn about the results of the referendum on the governance of the islands.

Keywords: political geography, Pacific Islands

Denis J. Dean, Ph.D, Colorado State University. Email: denis@cnr.colostate.edu; *A Comparison of Genetic Programming and Linear Discriminant Analysis Techniques to Recreate Expertly Identified Natural Hazard Zones*

This study compares the accuracy of two alternative techniques to recreate maps showing landslide hazard ratings. The original maps were created by experts who subjectively evaluated landslide hazards using both field observations and mapped data. We evaluated two alternative techniques to recreate this map based on digital cartographic data. The first technique used a linear discriminant analysis (LDA) approach while the second used genetic programming (GP). In three of the four cases evaluated, the GP approach did a better job of replicating the expert's hazard ratings than the LDA model. Furthermore, even in the remaining case, the LDA model only outperformed the GP model by a small amount. However, the GP model's final performance were found to be highly sensitive to a number of model development parameters. Issues regarding the development of GP-based spatial models are discussed.

Brad Dearden, University of Maine Farmington. Email: brad.dearden@maine.edu; *A Test of Demographic Transformation as an Explanation for Internal Migration Trends in Western Germany, 1991-1997*

In the 1970s the United States and several European nations experienced counterurbanization, a regional deconcentration of the population. This pattern constituted a "turnaround" from traditional processes of urbanization. Many developed nations that experienced the turnaround of the 1970s then underwent a "turn-back-around" in the 1980s as population concentration tendencies resumed. During the 1990s developed countries exhibited patterns of concentration and deconcentration. Migration tendencies in West Germany in the 1970s and 1980s were similar to those experienced by other developed countries. Research on western Germany during the early-to-mid-1990s suggests a 'new turnaround' occurred, a resumption of migration trends that favored intermediate- and small-sized regions. This study examines the 'demographic transformation' hypothesis as a possible explanation for trends in western Germany's internal migration and employment for the 1991-1997 post-unification period. Demographic transformation assesses the lead-lag relationship between regional migration change and employment change, where the former leads the latter; as such, it has also been dubbed a process of 'jobs follow people'. The demographic transformation hypothesis also maintains that individuals frequently exercise preference for and migrate to low-density rural areas that are environmentally attractive. This research employs demographic shift-share analysis and a multivariate statistical model to test the demographic transformation hypothesis in western Germany for 1991-1997, a period when internal migration favored small regions over large and intermediate ones.

Keywords: migration - internal, demographic transformation, western Germany

Debjani Deb, Purdue University. Email: ddeb@purdue.edu; *Estimating Environmental Exposure to Livestock Hormones Using Spatial Data Analysis and Geographic Information Systems*

Steroid hormones are constantly being produced and excreted by animals into the environment and consist of both naturally produced ones and those which are used for growth promotion and reproductive control. Intensive livestock operations generate livestock manure containing appreciable amount of hormones which can potentially contaminate surface and groundwater resources. The presence of hormones in surface and subsurface waters is a concern because these contaminants are thought to cause significant biological responses at concentrations as low as 10-100 ng/L. These contaminants may reach the state and nation's waters through surface runoff or by sub-surface leaching. Drinking water plants downstream of such water sources may be drawing water contami-

nated with trace levels of hormones and their metabolites (by-products) which are unlikely to be removed by conventional drinking water treatment. Understanding the environmental fate and toxicological behavior of these agro contaminants is essential in order to address concerns regarding potential adverse impacts of these compounds on the environment and human health and to design appropriate abatement strategies. The NAPRA WWW system has been adapted to model and estimate hormone losses to water. Livestock hormone loss probability maps for Indiana at 5%, 10%, 25%, and 50% values were created to demonstrate potential water quality impacts when livestock manure is applied to cropland at agronomic rates. This will help in appropriate and responsible decision making that impact agricultural operations and practices.

Keith Debbage, University of North Carolina - Greensboro. Email: kgedbbag@uncg.edu; Zhi-Jun Liu, UNC at Greensboro. Email: z_liu@uncg.edu; Locational determinants of major US air passenger markets by metropolitan area

An improved understanding of the geography of large air passenger markets is of critical importance for predicting growth and decline in the US airlines industry in the years ahead. In this study, we seek to reveal some of the most influential metropolitan characteristics in determining the locations of FAA-defined major air traffic markets in the United States. This study shows that in general the likelihood of a major air passenger market locating in any given metropolitan area (MA) is primarily determined by the MA's population size and overall propensity for air travel. On average, a major air passenger market has over 3 million people while minor markets have a population base of about 760,000. The propensity of a population to fly is a function of a number of social and economic indicators, including employment in certain sectors, such as information technology, professional/management, and finance, insurance and real estate. On average, major markets have a significantly higher percentage of the MA's total workforce in these three sectors than do less significant passenger markets. The employment in the professional/management sector appears to be the most significant indicator of a MA population's propensity for air travel. Secondary factors, such as weather-related events, play a role only when the primary factors reach certain critical levels.

Keywords: Air passenger markets; airlines; logistic regression analysis; metropolitan areas

Anne-Marie Debbané, Department of Geography, York University. Email: amd@yorku.ca; Fertile Fields: Power, water, and agrarian change in the Western Cape, South Africa

In 1998, the South African government passed new water legislation that fundamentally transformed and neoliberalized the regulatory architecture governing water resources. On the one hand, water resources have been nationalized, giving the state greater control over the allocation of water resources and signaling a radical departure away from riparian ownership of water. On the other, the emphasis on fiscal discipline and water use efficiency has strengthened the role of market mechanisms and the private sector in water management decisions. This paper draws on political ecology to situate South Africa's water reforms in the context of a historically racialized and uneven waterscape and of contemporary processes of agrarian change. Focusing on the Ceres valley, the heart of the country's deciduous fruit production, I examine the significance of water's geography in the unfolding waterscape. In particular, I look at how anxieties over diminishing water supplies prompted white commercial farmers to initiate land reform deals with black farmers as a means to secure state support for the development of new water resources. What emerges is a complex multiscaled political process that reconfigures state-nature-society relationships and reinforces understandings of the neoliberalization of water as a heterogeneous, transient, and deeply contested project.

Wendy Michelle DeBoard, Indiana University Purdue University Indianapolis. Email: wdeboard@iupui.edu; Spectral and Spatial Enhancements in Urban Tree Canopy Classification

Urban tree canopies are increasingly recognized for their importance in the health and vitality of cities. Trees contribute to quality of urban life by providing improved environmental health, reduced noise, and enhanced aesthetics, among a host of additional benefits. As development continues to expand, it is important to monitor the relationship between growth and natural resource systems such as the urban tree canopy. Remote sensing technology has been an important tool in urban tree canopy evaluation and can be used to develop data on canopy extent and its changes over time. Recent improvements in spaceborne remote sensing systems offer promising advancements in the ability to measure and monitor urban tree canopies. Commercial satellite systems such as DigitalGlobe's QuickBird sensor provide multispectral spaceborne imagery with enhanced spatial and temporal resolutions. Historically, researchers have used various methods of

classification to estimate tree canopy coverage from aerial photographs and moderate resolution satellite imagery. However, further research is needed on the most appropriate methods of mapping urban tree canopy with higher resolution satellite imagery. The purpose of my research is to analyze the utility of including spectral and spatial enhancements in the urban tree classification process. The goal is to determine what contributions these enhancements can make in mapping urban tree canopy cover. This information can then be used to monitor the spatial and temporal trends of urban tree canopy which are likely to have a significant impact on resource management.

Lisa M. DeChano, Western Michigan University. Email: lisa.dechano@wmich.edu; Natural Hazards, Newspapers, and Perceptions: A Content Analysis and What Can Be Learned

Newspapers are an important source of information about natural hazard events locally and around the world. Because of easy access to newspapers, it is a basis for information regarding natural hazard events and subsequent possible effects on perceptions of hazards. The nature of newspaper articles tends towards human interest rather than scientific information. Therefore, not all of the pertinent information is presented to make the reader well informed about all aspects of a particular event, thus skewing their perception of the event. This paper investigates articles in several newspapers to analyze the human and physical geography included regarding specific natural hazard events. Other information noted are the dates of the articles, the types of articles (news, regional, news, opinion/editorial, etc.), and people quoted in the articles (local residents, meteorologist, USGS personnel, geographers, etc.) Those data are important in how people's perceptions of natural hazard events evolve based on the information presented in newspaper articles. The analysis also provides insight into whether geographers could contribute more to newspaper print media and the content which the contributions could present.

Jody F. Decker, Associate Professor, Wilfrid Laurier University. Email: jdecker@wlu.ca; Concepts of Health, Disease and Illness and their Implications for Health Geographies

This paper will explore where our ideas come from that capture the different aspects of ill health, how they have evolved, as evidenced, in part, from a ten year empirical study of student responses to a 'disease game', and their implications for data comparability, cross-cultural studies, ethical considerations and notions of place.

Keywords: disease concepts, geographies of health

Juan Declet-Barreto, School of Geographical Sciences, Arizona State University. Email: reguerete@gmail.com; People's Vulnerability to Technological Hazards in México-United States Border Cities: the Case of Ambos Nogales

Environmental changes due to economic and urban development are rapidly impacting human-environment systems on a global scale. Industrial development, mass migration, and transnational capital flows are reshaping the economic and urban landscapes of many regions across the globe, but especially those of developing countries. Developing countries often lack the physical and institutional infrastructure necessary to successfully accommodate rapid population growth and the environmental impacts on the air, water, ground and people brought about by industrial and urban development. People and places along the México-United States border region increasingly experience social and environmental stresses associated with rapid industrialization and urban settlement. The proliferation of industrial manufacturing along the border brings with it toxic materials, chemicals and wastes that are discarded in?and transported through?dense residential corridors of the region. Increased cross-border trade and industrial activities in the border following the implementation of NAFTA create socio-environmental conditions that interact to render people and places vulnerable to technological hazards. The effects of these conditions on either side of the border, are, however, highly differentiated. The administrative boundary between the two countries effectively serves as a dividing line between people who are vulnerable to hazardous industrial activities, and those who possess the material and informational resources to minimize their vulnerability. This paper uncovers vulnerability to technological hazards in Ambos Nogales, a binational border community. It combines a GIS-based assessment of exposure, resilience, and adaptive capacity of residents with a local stakeholder-informed narrative of the role of NAFTA in increasing vulnerability along the border.

rck.forster@geog.utah.edu; *Time Series of Snow Water Equivalent (SWE)*
Evolution Derived Using Radar Remote Sensing

Radar remote sensing and interferometry have a unique ability to differentiate between different snowpack conditions (i.e. wetness, surface roughness, ice layers, and grain size). Previous research has shown a relationship between interferometric phase of a radar signal and changes in snow water equivalent (SWE) for dry snow. A near-daily time series of SWE evolution is constructed for an Arctic Alaskan snowpack (Kuparuk Watershed, Brooks Range, Alaska) in March of 1994. Despite having no direct SWE measurements within the study area, data from meteorological stations (e.g. temperature, wind speed/direction, and precipitation) are used to interpret the spatial variation of the change in SWE maps over 3-day periods. A significant precipitation event is recorded within the time series and compared to a time period depicting little to no snow as precipitation. Promising results within this study area have deemed the need for additional research sites in the Western United States where (1) the repeat interval of a satellite brackets a precipitation event and (2) meteorological stations (e.g. SNOTEL sites) exist directly measuring SWE.

James_DeFilippis@baruch.cuny.edu; Siobhan McGrath, University of
Manchester. Email: siobhannigrath@yahoo.com; *Immigration, the State,*
and Domestic Labor in the Neo-Liberal City

In this paper, we examine domestic work and child care in urban labor markets in the US, with particular emphasis on the organization of the industries of domestic work and publicly subsidized child care in New York City, and the experiences of employees in those worksites. Domestic work and child care, in our study, includes several different occupations and organizations of work processes. These include: live-in workers who provide both child care and housekeeping services; live-out full-time child care providers (who sometimes also do housekeeping); live-out part time domestic workers (who maybe regular, though not full time, child care providers, or housekeepers) and; child care providers who are paid by the government as part of the child care subsidies associated with welfare reform. In this paper we demonstrate that there continues to be a persistent and willful exclusion of this work from regulation, as well as systematic violations of the regulations which do, de jure if not de facto, govern the work. It should be noted that the workers paid by the government are not exempt from this finding, but fit very clearly into this larger pattern. This illustrates the problematic transformation of domestic space, and communities more broadly, into spaces of wage labor in American cities. It further serves as a powerful re-assertion of the denial of the value of "women's work."

Keywords: informal economy, domestic work, welfare state restructuring

vdelcasi@csulb.edu; *Sex, Drugs, and the Sexuo-Spatial Politics of HIV*
Prevention in the U.S.

Geographers have intermittently addressed the complex spatialities of the HIV/AIDS epidemic over the past 25 years. In that time, they have mapped the spatial distributions and diffusions of the epidemic, examined the complex socio-spatial politics of living with HIV and AIDS, and interrogated the discursive and material practices of HIV education and outreach programs. Despite this, geographers remain, for the most part, on the margins of the larger discussion of the historical and quotidian geographies that mark this particular disease and syndrome. The limited engagement of geographers with the HIV/AIDS epidemic is due, in part, to the discipline's myopic understandings of both sexual practices and identities. This lacuna is further complicated by the discipline's minimal interest in the practices associated with various 'legal' and 'illegal' drugs. If the discipline of geography is to become 'relevant' to the broader HIV/AIDS research and activist communities, it must continue to engage with the larger scholarly and activist debates regarding sex, sexuality, and drug use. This paper serves as both a call to take up these concerns and offers one empirical example of how geographers might better engage in these broader discussions through an investigation of HIV-related risk and drug use among self-identified gay and bisexual men in Southern California. In conclusion, this paper suggests how geography might become more 'relevant' not only to the academic community of HIV/AIDS researchers but also to the activists communities that try to mitigate against the spread of HIV transmission on a daily basis.

Kate Julia Del Vecchio, Student, Clark University HERO. Email:
kdvecchio@clarku.edu; *The effects of land development on water use, social*
integration and sense of community in Ipswich, Massachusetts.

Residential development is one of the leading causes of anthropogenic landscape transformation in the United States. There are a variety of environmental and social impacts associated with this process, particularly when the transformation assumes a low-density, or "sprawl"-like form. One such impact is the increasing frequency and duration of residential water-use restrictions ("suburban drought"). Low-density development is the likely underlying cause of these problems, as precipitation has been above average during this time period. Another impact is a homogenized human landscape, which is associated with a failure to successfully promote the development of affordable housing. In the Boston metropolitan area, both of these impacts have become evident in recent years. The purpose of this research, focused on the metropolitan Boston town of Ipswich, Massachusetts, is to identify 1) how development patterns have affected household water use, and 2) how development patterns have affected socio-economic integration and traditional neighborhood design in Ipswich. Household-level water consumption data, along with measurements of social diversity, integration, neighborhood design for high and low-density residential developments will be compared. Methods for data collection include neighborhood tours, interviews, and census data. The results of this work should therefore inform water and land-use planning in growing metropolitan areas throughout the United States, thereby hopefully leading to more efficient natural resource use and more socially sensitive residential design.

Keywords: land use, development patterns, diversity, integration, residential water use

American Empire? Economic Subjectivities and the Local Politics of
Microfinance in Vietnam

Marxist studies of imperialism have long focussed on the role that global finance plays in the reproduction of capital in the West through exploitation of the global South. While recent cultural studies of imperialism have pointed towards the nuanced micro- technologies that are used to cement international systems of power, there has been relatively little thought given to the role that local financial systems play in American imperialism. Drawing on governmentality literature, I explore how microfinance programs have been employed as a technology of government, and how the various practices that constitute recent shifts in rural banking create new forms of economic subjectification within increasingly neoliberal rule. First, I examine how the discourse of the international microfinance movement, based primarily in Washington DC, has been designed with a target of forming poor, liberal subjects that are at once self-reliant and cooperative. Second, I explore how microfinance programs have played out in rural Vietnam, with a focus on how the historical shift to and from socialism has crafted and recrafted rural economic subjects through the extension and control of local financial markets. Finally, drawing on

ethnographic work in two villages, I examine how competing visions of the rural economic subject manifest within the local politics of contemporary Vietnamese microfinance programs. I close with an exploration of this contested notion of the economic subject and reflect on the naturally incomplete and fragile nature of American empire.

Zack DeLaune, Louisiana State University. Email: jdelau1@lsu.edu; *Unwelcome New Neighbors? The Industrialization of Lake Charles, Louisiana, 1940-1960*

This paper focuses on the industrialization of Lake Charles, Louisiana during World War Two and the resulting shifts in pollution-related policy and public perceptions of pollution. A major impetus for the industrialization of the South was federal investment during the war. This is especially true for Lake Charles, a city where industrial agglomeration began with war-time financing of manufacturing plants to combat the shortages of aviation fuel and rubber. By tracing the public response to offensive pollution and the resulting shift in public policy, this paper will reveal a fundamental conflict between development-minded government institutions and a population interested in protecting natural resources.

Keywords: industry, refinery, petroleum, Louisiana, pollution, Lake Charles, industrial waste

Irene Delgado-Fernandez, University of Guelph. Email: idelgado@uoguelph.ca; Robin Davidson-Arnott, University of Guelph. Email: rdarnott@uoguelph.ca; *Vertical Distribution of Aeolian Sand Transport on Beaches*

Sand transport studies indicate that, among the three processes of wind blown sand drift, saltation is the principal mode of movement, representing three quarters of the transport. The total distribution of transport rates is a function of height. Our understanding of vertical flux profiles thanks to wind tunnel studies is improving, and we know that the sand flux over a sandy surface increases with height in the very near surface layer, but then decays exponentially. Several theoretical models of saltation have been published, in particular on the higher portion of the sand trajectory, but none of them have proven to be applicable at a wide range of sites. We do not have much data on field measurements of the distribution of transport with height above the bed. More experimental work is needed if we are to refine our predictions of total sediment transport rates. This study reports on the results of the measurement of vertical aeolian transport in the field. We analyze the temporal and spatial variability of the saltating cloud over several wind events, along the line of the main wind direction. A tower of Saffires, properly calibrated and distributed at specific heights, is located at different points on the beach. The data is combined with the measurements of total sand transport and wind characteristics. Results allow us to critically assess the measurements of saltating grains taken with Saffires, and the convenience of locating them at certain heights in order to obtain a better representation of the saltating cloud.

Keywords: saltation, field study, aeolian transport, flux profile

Tracy L. DeLiberty, University of Delaware. Email: tracyd@udel.edu; *Sea Ice Thickness and Mass Balance in the Southern Ocean*

Changes in the sea ice cover due to climate change will manifest as increases or decreases in ice extent, concentration and/or thickness affecting the mass balance of sea ice in a given area. Recent results from the Arctic indicate a substantial reduction in both sea ice thickness and extent over the past several decades, while trends in the Antarctic are ambiguous. Thickness information is only available from ship observations that do not provide large-scale spatial coverage and temporal sampling. A potential data source providing continental coverage is the US National Ice Center (NIC) weekly ice charts. An evaluation is performed of the weekly ice chart dataset with in situ sea-ice thickness observations from the ASPECT (Antarctic Sea Ice Processes and Climate) program during the 1995 to 1998 time period to ascertain the ice chart quality for use in monitoring sea-ice thickness and mass balance changes in the Southern Ocean. This evaluation will be emphasized in the presentation. A climatology dataset is developed for monitoring sea-ice thickness and mass balance changes. Using the NIC charts, the sea-ice extent, seasonal and interannual thickness distribution, and the mass balance are derived. Analysis of the NIC sea-ice extent in the Ross Sea, for example, in June 1995 and 1998 reveals differences in spatial extent with an increase northward towards the maximum extent in September. Analysis of this type is underway for the 4-year time period and for the other regional seas in the Southern Ocean.

Françoise Delisle, INRS. Email: francoise_delisle@hotmail.com; Shearmur Richard, INRS. Email: richard.shearmur@ucs.inrs.ca; *Human Capital Migration and Regional Income Differentials: Do Regional Income Levels in Canada Affect Internal Migration Flows?*

In this study we propose to explore whether migration flows of 'human capital' tend to respond to differences in regional income levels and in differences in the local presence of cultural industries using a gravity model. To the extent that they respond to differences in initial income levels this will corroborate the 'traditional' theory (that human capital migrates towards higher incomes) and will tend to undermine the Florida thesis (who argues that they generate income differences). To the extent that the flows respond to differences in cultural endowment, this will tend to support Florida's thesis. Studying flows across 382 Canadian spatial units covering the entire territory, we apply the gravity model to university degree holders (whom we assume to embody higher levels of 'human capital') and to non-degree holders (whom we assume to embody lower levels of human capital). We then introduce variables that measure differences in mean income between origins and destinations, and differences in 'cultural' endowment. We expect to provide answers to the following questions: - do migration flows still respond to differences in regional income levels (given that there exists a correlation between income levels and urban size)? - do migration flows respond to differences in cultural endowment? - do migration flows respond more strongly to the presence of other industries? - do the results differ depending on whether graduates or non-graduates are examined? - do migration flows respond more strongly to initial (t) or to final (t+1) income differences?

Keywords: migration; economic geography; human capital; Canada

Veronica Della Dora, UCLA. Email: veroniki@ucla.edu; *Circulating Landscapes and 3-D Maps: Towards a Phenomenology of Historical Spatial Representations*

Materiality and performance have recently attracted increasing scholarly interest. Challenging traditional 'textual' readings, some cultural geographers have started to approach physical landscape via a revisited phenomenology and everyday embodied practices. Landscape in the sense of pictorial representation, on the other hand, has remained pretty much out of such debates. Privileged 'spatial windows' on different historical periods, landscape paintings, maps, and other graphic spatial representations generally continue to be appreciated for what they 'show', rather than for what they 'are'; as 'fixed' bi-dimensional visual representations to be gazed and interpreted, rather than three-dimensional artefacts moving across space and time and interacting with the subject both physically and emotionally. Informed by ideas of performance and circulation, as well as by recent explorations of images as material objects in cultural studies, I suggest a re-conceptualization of historical maps and landscape representations as three-dimensional travelling objects that are at once visual and material. Looking at a historical image on a computer screen is profoundly different from looking at the same image as a print pasted in an album. This is equally true for 1930s yellowed postcards and foldable street maps piled on a dusty flea market table, but also for 19th-century alabaster peep-eggs embedding exotic sceneries, or chorographic maps painted on the doors of a Renaissance wooden cupboard. Medium is not a neutral support for spatial images: it is rather a constitutive property, conditioning their 'social' and 'affective lives' and circulation, and therefore the circulation of place itself in popular geographical and historical imagination.

Keywords: Landscape; Maps; Non-representational theory; materiality

Eric Delmelle, University of Idaho. Email: delmelle@uidaho.edu; Alan Murray, The Ohio State University. Email: murray.308@osu.edu; *Spatial Sampling and Location Modeling*

Spatial sampling exhibit an interesting analogy with a specific class of location problems known as dispersion models. In an initial sampling stage, measurements are generally spread out across the study area to capture the global variation of the variable of interest. Collecting measurements at two nearby locations is not helpful unless they exhibit co-variation. Dispersion models, in the context of spatial sampling, seek to maximize the minimum separation between any pair of samples. At issue is the correspondence between spatial sampling optimization and optimal dispersion of sample sites. This paper will explore the similarities and differences between these two spatial analytical approaches.

Alan M Delmerico, MA, Center for Health and Social Research; University at Buffalo Department of Geography. Email: delmeram@buffalostate.edu; William F Wiczorek, PhD, Director, Center for Health and Social Research. Email: wiczowf@buffalostate.edu; Ten Year Differences in Alcohol Availability in Erie County, New York

The purpose of this study is to assess alcohol availability in Erie County, New York between 1995 and 2005. Alcohol availability is a primary correlate of a variety of negative health outcomes such as DWI arrests and accidents, domestic violence, and illicit drug use. Where previous studies have primarily explored spatial and cross-sectional aspects of alcohol availability, this study will examine the dynamic evolution of access to alcohol over time. Ten years of alcohol outlet data will be obtained from the New York State Liquor Authority and will be geocoded in a GIS using New York State ALIS Street layers. The data will be used as points and will then be aggregated to a variety of sub-county census units to explore the changes in alcohol availability over time. Additionally, the data will be segregated by outlet type (on and off-premise) in order to explore their differences in space and time. Patterns of spatio-temporal changes in alcohol availability over the course of the ten year study period will be examined and evaluated with particular attention paid to the influence of aggregation to the various areal units. Innovative visualization methods will then be employed to depict these changes over time.

Keywords: Alcohol-availability, health, GIS

Dydia DeLyser, Louisiana State University. Email: dydia@lsu.edu; "Flight is the essence of the spirit." Gender and mobilities among early women aviators.

Reflecting upon her career as a record-setting pilot during the 1920s and '30s, Louise Thaden observed that, "Being? a woman pilot had tremendous built-in disadvantages. Basically we were usurpers in a man's exclusive world. The penalties were severe? [But t]here were also advantages. Women pilots were oddities and therefore? more 'newsworthy' than were the male counterparts.? [Still,] over the earlier years the public seemed to have the impression that the entirety of us were tramps." Despite, or perhaps because of these obstacles, during the 1920s and '30s Thaden became one of the most famous pilots of the era: she held international records for speed, endurance, and altitude, she won the first Women's Air Derby in 1929, and in 1936 she became the first woman to win the Bendix Transcontinental Air Race. Thaden's description of her achievements points to what she accomplished, but also to the interconnected issues of gender and mobility faced by women pilots like Thaden: despite winning races, she was still called a "tramp;" and for her achievements she was seen as a usurper of something that could, or should be done by a man. This paper explores the ways pilots like Thaden used both their gender and their mobilities in complex socio-spatial situations.

Keywords: gender, mobilities, aviators

Michael N. DeMers, Ph.D., New Mexico State University. Email: mdemers@nmsu.edu; The Geomorphological Basis for Ecosystem Mapping: Lessons from the Chihuahuan Desert

A common method of ecosystem mapping involves the classification of vegetation communities directly from satellite remote sensor data. While the recent experiences of the gap analysis program (GAP) have shown the utility of this approach in many parts of the United States, a similar level of success has proven elusive in desert grassland environments. This paper outlines an alternative approach in ecosystems where vegetation is patchy, exposing large amounts of soil background to the satellite sensor. I demonstrate how visual interpretation of band ratioed Landsat TM imagery to classify landforms can indirectly derive the ecosystems with substantially more accuracy than direct satellite classification. By employing ecological niche theory in the Chihuahuan Desert of New Mexico we derived a reliable triage-level ecosystem mapping suitable for rangeland managers in arid grassland environments.

Keywords: ecosystem mapping, ecosystem management

Ali Demirci, Fatih University. Email: ademirci@fatih.edu.tr; Will Geography Education Make a Giant Leap in Turkey? Development, Implementation and Assessment of the New Secondary School Geography Curriculum

The secondary school geography curriculum in Turkey was dramatically altered in 2005 with the intent of creating a geography curriculum which would be more student centered, activity based and skill development oriented. In contrast to the previous curriculums, this new curriculum revolves around standards which detail the particular skills and knowledge that students should acquire at each grade level. The development of this new curriculum has caused concern among educators and students but has also initiated a debate on the problems in implementing and the usability of the curriculum. Some preliminary impressions among geography teachers are that the new curriculum is very difficult to understand and there is an absence of teacher resources and textbooks. Acerbating the new curriculum's problems are insufficient physical conditions of

schools and classrooms and the lack of interest of school administrators and the implementation of the new curriculum. These barriers have already forced many teachers to return to the previous geography curriculum in their classes. To ascertain the specifics of some their problems with the curriculum and the methods they are using to overcome these difficulties, the author surveyed geography teachers at different schools with the primary objective being to understand the effectiveness of this new curriculum in meeting the needs of geography education. The paper will first introduce the development and implementation of the new secondary school geography curriculum in Turkey and then present the findings of the survey with emphasis on the effectiveness of the new curriculum over the last year.

George J. Demko, Dartmouth College. Email: demko@dartmouth.edu; Killian P Ying, California State University, Los Angeles. Email: kying@calstatela.edu; Joan F Ying, Southern California Permanente Medical Group, Kern County. Email: joan.f.ying@kp.org; Breast Cancer: A Geographic Perspective

Breast cancer is the leading form of malignance for women around the world and, although technology for detection has improved, it has done so differentially over space. This study focuses on a number of spatial/geographic questions regarding the incidence and mortality rate of breast cancer as well as some treatment options, primarily in the United States. In the United States 40,000 women die each year from breast cancer - the leading form of cancer in women after skin cancer. The lowest incidence rate internationally is found in Asia at about 27 per 100,000 women and the highest in among U.S. women at 97 per 100,000. In the United States the highest rate is found in the northern states with significant clusters. This study will focus primarily on three issues: (1) The spatial patterns of breast cancer incidence and mortality in the United States, (2) an exploration of various theories in explaining race and ethnicity and breast cancer risk, and (3) rural vs. urban locations and treatment options (lumpectomy vs. mastectomy). Maps of breast cancer incidence and mortality in the United States will be examined for spatial patterns, and data for international comparison will be provided. In addition, the issue of women's migration to the United States, particularly Asian women, and breast cancer rates will be discussed and explained.

Keywords: medical geography, breast cancer, United States

Jessica Anne Dempsey, University of British Columbia. Email: jdempsey@interchange.ubc.ca; Tracking grizzly bears through environmental struggles in British Columbia

Traditional analyses of environmental politics in British Columbia, Canada have tended to characterize struggles as occurring between stakeholders, institutions or 'interests' like First Nations, environmentalists, industry and the state who each mobilize and draw from various kinds of information and 'facts' in their advocacy efforts. This approach leaves humans as the sole agents in environmental politics and science as a resource simply used in political struggles. Differently, in Rule of Experts Timothy Mitchell re-works agency as something not flowing from human autonomy or purpose, but something made through connections or encounters among humans and non-humans. Inspired by this approach, this paper traces the agency of the coastal grizzly bear within environmental politics as it becomes co-joined with various human and non-human entities such as field biologists, tracking devices, Geographic Information Systems, ecological models, environmental activists, and Home Depot. I focus on how the coastal grizzly bear becomes entangled in new forms of spatial calculation through mapping technologies and Conservation Areas Design, which help identify and map preferred habitat areas over a large region. The grizzly bear becomes increasingly powerful through this mapping, connecting with environmentalists and Home Depot buyers, and eventually links up with and transforms the political economy of forestry and the forest itself, opening some political avenues for social change on the coast and sharply closing others.

Keywords: British Columbia, grizzly bears, environmental politics, conservation planning, market campaigns

Kara E Dempsey, University of Wisconsin-Madison. Email: kedempsey@wisc.edu; Performance, monuments and identities: Spanish-Galician regional tensions

The purpose of this paper is to explore how enactments that take place within monuments or the spaces surrounding them may be used to examine contemporary regional identities in Europe. More specifically, the paper focuses on how landscapes are "stages" on which the efforts to manipulate or influence a community are openly performed and contested. The formal and informal performative activities that take place within these sites as well as the reactions and sentiments of those who visit and use these facilities can be useful barometers of the direction of social and cultural change. The comparison of the Cathedral

and the Cidade da Cultura monuments in Galicia, Spain offers a unique opportunity to explore and gain a better understanding of the tensions and divisions regarding identity, power and meaning that currently exist within Galicia. Since its construction, the Cathedral has been the structure on which official Galician performances and annual celebrations take place. But the new Cidade da Cultura complex proposes to create spaces for the formal and informal public performance of Galician culture and identity in an attempt to both modernize and solidify a “unified vision” for the region. The paper ultimately seeks to investigate regional identity formation and contestation by revealing the connection between the use of built environment and the larger political facets of European regionalism, culture, and identity.

Keywords: regional and cultural identities, performance, Spain, political and cultural geography

Julie Demuth, National Center for Atmospheric Research. Email: jdemuth@ucar.edu; Rebecca Morss, National Center for Atmospheric Research. Email: ; Jeff Lazo, National Center for Atmospheric Research. Email: ; Alan Stewart, University of Georgia. Email: ; *Assessing People's Understanding of, Use of, and Preferences for Weather Forecast Uncertainty Information*

In the past few years, there has been increasing attention within the meteorological community to the provision of uncertainty information in weather forecasts. This growing interest is not surprising given the inherent nonlinearity and complexity of the atmosphere, which makes uncertainty an inevitable part of weather prediction. A compelling reason for providing weather forecast uncertainty information is the potential benefit to stakeholders who could use the information to make better decisions based on their personal circumstances and thresholds for action. However, before moving toward a new paradigm of uncertainty-explicit weather forecasts, there are many unanswered questions to be addressed regarding people's understanding of, uses of, and preferences for uncertainty information. This study takes a step toward answering some of these questions via a survey of the U.S. public. Among the survey questions related to weather forecast uncertainty are those that assess people's (a) perception of uncertainty in deterministic forecasts, (b) interpretations of probabilistic forecasts, (c) preferences for receiving forecast uncertainty information, and (d) use of forecast uncertainty information to make decisions. The survey also includes questions about people's consumption of weather forecast information, how people value weather forecast information, and how weather affects people's daily lives. These questions, as well as demographic information, will be used to analyze variations in people's responses regarding weather forecast information and uncertainty information. This presentation will include some preliminary analysis of the survey results and information about the next steps of this work.

Keywords: weather, forecasts, uncertainty

Yongxin Deng, Western Illinois University. Email: Y-Deng2@wiu.edu; Xianfeng Chen, Slippery Rock University. Email: xianfeng.chen@sru.edu; Multi-scale linkages between topographic attributes and live fuel indexes in a mountainous landscape

This paper used Pearson's r and Moran's I to detect relationships between nine local/non-local topographic attributes and two remote-sensed live fuel (vegetation) indexes NDVI, NDII, and their seasonal changes (between May, July, and September). Aggregation of data resolution from 10 m for DEM derivatives and 30 m for NDVI/NDII to 20 coarser resolutions below 1500 m supported a multi-scale analysis. Elevation, slope, and “southness” were identified to have consistent correlations (e.g. $0.2 < r < 0.6$) with vegetation variables at multiple observation scales. Change of scale caused change of r and Moran's I , and scales with higher (peak) correlations exist, but at much coarser scales than the data scale. After human-controlled landscapes were masked off, Moran's I of vegetation indexes between natural mountains and the entire study area appeared to be similar in May, but increasingly different from July to September.

Keywords: Topography, NDVI, NDII, correlation, autocorrelation

John C. Dennis, Environmental Dynamics Program, University of Arkansas, Fayetteville AR. 72701. Email: jdennis@uark.edu; Stephen K. Boss, Department of Geosciences, University of Arkansas Fayetteville AR. 72701. Email: sboss@uark.edu; Dynamic Beach Environments: Comparisons of Non-engineered and Engineered Shore Segments of Yellowstone Lake, Yellowstone National Park, Wyoming

Using high precision laser surveying equipment and sediment grain size analysis, we documented and quantified geomorphic differences between engineered and non-engineered shore segments of Yellowstone Lake, Yellowstone National Park. Visual observations and surveyed shore profiles show that non-engineered shore segments display relatively wide beaches composed of sand to fine gravel with gently sloping, concave-up shore profiles. Engineered shores

typically display narrow or non-existent beaches, coarse sediment texture (gravel to coarse gravel), with steep upper (landward) profiles associated with shore protection structures and flat lower (offshore) profiles. Thus, engineered segments of the Yellowstone Lake shore exhibit morphological features similar to those associated with hard stabilization of marine and Great Lakes coastal settings and are suggestive of enhanced erosion and shore degradation at engineered shore sites when compared to adjacent non-engineered shore segments. Understanding potential differential responses of non-engineered versus engineered shores to physical processes in the lakeshore zone over short temporal scales will inform park planning and management in developing strategies for long-term conservation of the Yellowstone Lake shore. Along with an increased understanding, these strategies may prove useful in managing the shore zone of other large lakes as well as other coastal settings. At the least, it will assist national park personnel in developing a comprehensive shore management plan aimed at preserving geologic and other natural resources of the lakeshore as well as lakeshore cultural resources (i.e. archaeological sites), while also ensuring the quality of visitor experiences at a world heritage site and more importantly, the world's first national park.

Lorraine Dennis, University of Ulster - Coleraine. Email: l.dennis@ulster.ac.uk; Everyday Life in the Irish Border/lands

The constitutional status of the Irish border continues to dominate the British-Irish political agenda. Established in 1921, the border separates the contested area of Northern Ireland from the Republic of Ireland. Whilst the territorial and political partition of the island has undergone significant analysis, the impact of the border on the lives of those in its immediate vicinity has not attracted similar investigation. This imbalance will be redressed by examining the historical geography of the Irish border/lands in the years after partition. Rather than concentrate only on the border's territorial implications for the political entities it demarcates, this paper explores the impact of the Irish border on everyday lives. The ‘line on the map’ cut through a region with significant historic and cultural connections, represented through territorial units such as townlands and parishes. The paper examines how the border was experienced, both temporally and spatially. Through the use of material uncovered in ethnographic and historical archives, an empirical narrative of borderland lives will be presented. Following the delineation of the Irish border, the county of Fermanagh was almost surrounded by an international frontier. In this examination of the years between 1921 and 1945, the different ways in which the border was negotiated in the county are summarised. While the authorities sought to regulate the permeability of the border, the cultural connections of the region meant the Irish border was experienced by those along its length as both bridge and barrier.

Keywords: Ireland, Britain, borders, partition, everyday lives

Philip E. Dennison, University of Utah. Email: dennison@geog.utah.edu; Max A Moritz, University of California, Berkeley. Email: mmoritz@nature.berkeley.edu; Evaluating predictive models of chaparral live fuel moisture for wildfire season forecasting in Southern California

In Southern California, regional susceptibility to high wind conditions is determined by live fuel moisture. Seasonal drought causes a decline in live fuel moisture through the summer and fall, and once live fuel moisture passes below a critical threshold, wildfire danger increases. Recent studies have shown that remote sensing measures are strongly correlated with chaparral live fuel moisture, and that remote sensing may offer a means for monitoring live fuel moisture over time. These studies have not evaluated the ability of remote sensing measures to predict live fuel moisture levels. Historical fire and remote sensing data were used to determine a live fuel moisture critical threshold, below which large fires were more likely. Models containing early-season live fuel moisture, meteorological, and remote sensing variables were evaluated for their ability to predict the date that live fuel moisture dropped below this critical threshold. A model that accurately predicts the timing of chaparral reaching the critical threshold could improve preparation for fire season and the allocation of regional fire fighting resources.

Micheala C. Denny, Ph.D. Candidate, Florida State University. Email: mcd012@bucknell.edu; Not So Sexy? ‘Big Girls’ and Shopping Space

This paper discusses the trend of spatial segregation of plus sized women's clothing in major department stores in the United States. Drawing on the literature of the geographies of the body and exclusion as well as a sample of three different case study sites, I argue that the division of women's shopping space into sections based on size serves as an example the physical and social isolation of the human body and that this is perpetuated by images in the media that compartmentalize certain body attributes as being desirable while and others

as unattractive. Further, I argue that these spaces of isolation contribute to the social construction of what is sexy, and in this case, what is decidedly un-sexy.

Keywords: women, media, bodies

Curtis James Denton, University of North Texas. Email: curtisdenton@hotmail.com; *A Model for Estimating Buruli Ulcer Prevalence*

Mycobacterium ulcerans is sweeping across sub-Saharan Africa, but little is known about the mode of transmission and its natural reservoirs. Since the only effective treatment is excision of the infection and surrounding tissue, early diagnosis and treatment is the only way to reduce the havoc associated with Buruli Ulcer. Using data from a national case search survey and suspected risk factors, this paper presents a model to estimate the prevalence of Buruli Ulcer in the southeastern region of Ghana. An area comprised of 53 districts. Results suggest that prevalence is directly related to the degree of environmental modification, proximity to water sources, vegetation type, and certain demographic factors of the area.

Ben Derudder, Ghent University. Email: ben.derudder@ugent.be; Frank Witlox, Geography Department, Ghent University. Email: frank.witlox@ugent.be; *Airline Data for World City Network Research: Refining Existing Approaches*

Information on air passenger flows is potentially a prime data source for assessing spatial patterns in the world city network, but previous analyses have been hampered by inadequate and/or partial data. The ensuing analytical deficiencies have reduced the overall value of these analyses, and this presentation examines how some of these deficiencies may be rectified. First, we review the rationale for using airline data to analyse the world city network. Second, we assess the data problems encountered in previous research. Third, we elaborate on the construction of datasets that may circumvent some of these problems. The proposed refinements include the omission of the hub function of major airports and ways to extract relevant business flows from the data.

Keywords: world cities, urban geography, transportation geography, airline data

Vandana Desai, Royal Holloway & Bedford New. Email: v.desai@rhul.ac.uk; *Cultural Change, Globalisation and the Role of NGOs in urban poor*

Ongoing processes of globalisation necessitate a reassessment of the services provided by NGOs. How is the role of NGOs changing? Are NGOs able to provide new services for the emerging needs? Liberal market solutions to poverty include more efficient use of labour markets in developing countries. Unavoidable globalizing processes expose marginalised individuals to fresh ideas and values, forcing them to re-evaluate social identities (especially the young and the old). There are sections of the population who feel left out of the developmental processes of economic changes induced by the changing labour market produced by the processes of globalisation. The key issue is how we turn the effects of globalisation into action for social change. Are religious NGOs better at catering to the needs of the poor in the context of globalisation?

Keywords: NGOs, globalisation, cultural change

Gene L. Desfor, York University. Email: desfor@yorku.ca; *Institutionalizing Industrial Nature: The Formation of the Toronto Harbour Commissioners*

During the final decades of the nineteenth century and the first of the twentieth, new relationships between nature and society emerged in Toronto, as was the case in many European and in North American cities. These new relationships simultaneously shaped and were shaped by a society and its economy that was rapidly moving toward industrialization. Among the relationships were new visions for the city's place in a Canadian urban system, major advances in health science that would alter the understanding of disease control, new forms of government, the growing availability of less expensive forms of energy, the growth of new economic production sectors, establishment of new financial and investment mechanisms, and massive construction of technological networks. The city's waterfront figured prominently in many of these changing nature-society relationships. Large infrastructure projects were planned and constructed, which were material expressions of modern technological accomplishments that made possible a wide range of transformations associated with industrialization. In this paper I focus on the formation of the Toronto Harbour Commissioners in 1911 and its waterfront plan as the resolution of years of political and economic struggles. I argue that the Commission and its plan represented an institutionalization of nature-society relationships that was a central element within a network that constructed an industrial landscape on the waterfront.

The study of lake sediments can provide valuable insights into lake history and climate variation throughout time. In-depth studies have been carried out at Lake Miragoane, Haiti and in high and mid-elevation sites in the Dominican Republic, but to date little has been published on prehistoric conditions in other coastal areas of Hispaniola. Laguna Alejandro (~18.31°N, 71.03°W) on the southwest coast of Dominican Republic is one of several lakes we are investigating to expand our knowledge of long-term environmental history in this region. This ~25 hectare lake is separated from the Caribbean Sea by a 100m-wide limestone ridge about 3-5m tall. We recovered two consecutive cores (0/100 cm, 100/185.5cm) close to the limestone barrier to investigate the potential for paleotempestology and other paleoenvironmental reconstructions. Three AMS ¹⁴C dates indicate that the lake is ~1000 years in age. Sediment analyses revealed three major shifts in sediment composition and particle size at 74/77.5cm, 150.5/153cm, and 183.5/185.5 cm. The two lower shifts represent deposits that are composed of sands consistent with nearby beach sands, while the upper deposit contains quartz and a precipitate that we think relate to a fluvial event and distinct changes in lake geochemistry. Sediments contained a variety of invertebrates that we think will help to document lake history. Four distinct strata containing Serpulids, and several pockets of *Anomalocardia brasiliana* and other mussels are providing insights on changes in salinity and water levels. Continuing research may help us relate these changes to climatic shifts.

Mathias Detamore, . Email: mathiasd@yahoo.com; *Finding the Appalqueer: Rural Geographies, Spaces of Sexuality, and Mapping Invisibility in the Landscape of Eastern Kentucky*

There has been little work done to understand the relationship(s) between rural identities and sexual identities and how those form geographies, even if in camouflaged ways. This paper begins to develop a theoretical framework for studying the spatial practices of sexual minorities and lays out the methodological approaches for engaging the stories and experiences of people's everyday lives as a narrative ethnography within an Appalachian context. Working through the more current literature on Appalachia as a problematic site of identity, shot through by multiple scales and influences (largely related to postindustrial consumption capital), homosexuality is (broadly speaking) a thoroughly contested site for identity. On the one hand, contemporary popular discourses circulating through the landscape have wrested loose the opportunity to identify with homosexuality and potentially create a location for resistances. On the other, staunch and often strident regionalisms of an idealized Appalachian identity buttressed by conservative religious movements have made any attempt to be "out" difficult if not dangerous. By using Michael Brown's work on the closet as a spatial, as well as, a symbolic metaphor; I seek to show how the spatial practices of the closet in Appalachia simultaneously disrupt and frame the

metaphor so that the emancipatory moment is constantly shrouded in secrecy and the subversive moment is reproduced into specific geographies that operationalize an Appalachian community. The idea is to understand that while discursive practices are inscribed in the rural landscape, transgressive identities do emerge and coalesce around those even if they enact themselves under the radar.

James E Detwiler, Penn State University. Email: detwiler@essc.psu.edu; *Adult professionals online versus undergraduates in the classroom - comparing performance in a GIS programming and customization class*

Educators and non-educators alike commonly assume that online courses cannot match the effectiveness of their traditional, face-to-face counterparts. This paper describes a comparative study of the performance and study habits of two groups of students in a course in Geographic Information Systems (GIS) software programming and customization: one delivered online to adult professionals working asynchronously; the other delivered in a blended, online/face-to-face environment to upper-level undergraduates in residence. Course grades show that the undergraduate cohort underperformed in comparison to the online cohort, in spite of the fact that their version of the course included face-to-face lecture and lab time in addition to the online course materials. To explore differences in the study habits of the two groups, all students were asked to keep a diary of the time they devoted to coursework. Information from these diaries suggest that a student's ability to meet learning objectives is less dependent on the course content delivery mechanism than it is on the student's motivation, maturity and time management skills.

Keywords: online education, GIS education, GIS programming, learning outcomes

Kate Deutsch, University of California Santa Barbara, Geography Department. Email: deutsch@geog.ucsb.edu; Kostas Goulias, PhD, University of California Santa Barbara, Geography Department. Email: Goulias@geog.ucsb.edu; *Integrated Activity-Travel Behavior Surveys*

Travel behavior analysis today is dominated by approaches that incorporate ideas from time geography and behavioral geography. The analysis requires increasingly more detailed activity diaries and household questionnaires. As these new methods evolve, other determinants of behavior including values and norms, attitudes and other social circumstances are also used to explain the behavior of individuals and households. This raises a variety of issues regarding the types of data we collect, the questions we ask, and the burden to the respondents. In this presentation we first offer a comprehensive review of surveys aiming at measuring attitudes and predispositions, personality, motivation, and ultimately time use in space. We also review measurement of location, space, and place perceptions for activity-based travel surveys. Then, we report on a small scale experiment employing different methods of combining survey components and emphasize the comparison between two methods with different degree of respondent burden to collect time use data. The presentation concludes with recommendation and a plan for future studies.

Establishment of a petroleum refinery in 1916 near the headwaters of Bayou Trepagnier in Louisiana, with subsequent dredging of the bayou resulted in spoil banks containing high levels of Pb. A large cypress-tupelo swamp abuts the eastern bank of the bayou. Cores were taken from 15 baldcypress trees growing in the swamp at various distances along a 610 m transect (9 trees) and a 183 m transect (6 trees) running perpendicular from the spoil bank. The cores were crossdated, annual rings were measured, and five year segments of the cores were prepared and analyzed for heavy metals. Soil samples were collected along one transect and analyzed for metals. Levels of Pb in Bayou Trepagnier swamp trees were compared to levels in baldcypress trees growing along Stinking Bayou, a reference area 35 km north of Bayou Trepagnier. Baldcypress trees in the cypress-tupelo swamp soil with (10-425) mg/kg Pb, concentrated much more Pb than trees growing on the heavily polluted bank. The greater uptake of Pb by trees in the swamp is discussed in terms of soil dynamics and Pb sources.

Keywords: baldcypress, Taxodium distichum, pollution, metal uptake

Geoffrey DeVerteuil, University of Manitoba. Email: geoff_deverteuil@umanitoba.ca; *Struggles over Deconcentrating the Homeless: Case Study of Skid Row Los Angeles*

The geography of homelessness is very much structured by the geography of homeless services. In American cities, the geography of homeless services is inequitably patterned: the majority of services are forced to locate in marginal spaces. In the 1980s, many homeless service hubs were dismantled under pressure from downtown redevelopment and gentrification. The few that survived are now being threatened by a more systematic menace: the shift towards deconcentrating poverty as the primary policy response to inequality. Poverty deconcentration involves reconfiguring zones of extreme poverty by encouraging the inclusion of higher-income groups and housing. I illustrate some of these tendencies by examining the struggles around efforts to deconcentrate, if not dismantle entirely, the largest service hub still in existence in the United States - Skid Row in Downtown Los Angeles. Comprising 50 blocks and saturated with homeless residents and social services, Skid Row is perceived to be detrimental to the revitalization of downtown Los Angeles. Using case study material from the past five years, I trace the evolution of struggles over deconcentration of Skid Row through (1) police action and (2) housing displacement. In each of these cases, I pay particular attention to how the rights of homeless people -to low-cost housing, to being free of police harassment, to sleeping on the sidewalk- are being articulated.

Keywords: homelessness, Los Angeles, poverty, housing

Ryan Devlin, Department of City and Regional Planning, University of California, Berkeley. Email: rdevlin@berkeley.edu; *Street Vending, Informality and the Regulation of Space in New York City*

New York is often characterized as the quintessential neoliberal city, where, among other things, aggressive redevelopment efforts have led to the exclusion of undesirable actors from spaces of middle class consumption and entertainment. Given New York's characterization as such, the current street vending situation in the city seems like an anomaly. There are roughly 12,000 vendors doing business on the sidewalks of the city, with nearly half of them operating without licenses. Their presence is strongly opposed by large scale, politically connected real estate interests. Yet street vendors, most of whom are immigrants with little traditional political power, remain on the streets. The presence of vendors might be explained by bureaucratic inertia, or it may mean that New York is a more inclusive city than is often portrayed, however, I argue that neither of these explanations is appropriate. The current situation cannot be conceived of as a lack or failure of regulation, but rather, as a different form of regulation. This paper will demonstrate that through the production of informality the state finds a flexible, cost effective and politically feasible means to regulate vending and exclude certain vendors. Most of our theories of spatial regulation under neoliberalism are derived from examples of straightforward spatial exclusion. In reality, these instances are few and far between. The case of street vending in New York demonstrates that, in the intervening moments between instances of outright repression, spatial regulation and exclusion in the neoliberal city take more subtle and complex forms.

The different patterns of subsea, MPLS, ATM/FR and other Internet cable networks are based on the location of its major users. These users who need high-tech communication networks are converged on specific places. Places where governmental institutions, universities, producer service firms, and other advanced service firms are merged together. The existing 'soft' (i.e. social) network at such places demands a widespread 'hard' (i.e. cable) network. The aim of this paper is to study and map one of these hard networks. Based on the cable network of a very important communication (Internet) service firm [BT], a network of important connections places comes to the fore. BT is a global service provider helping multi-site organisations communicate and collaborate, any time, any place, through any device. They are building the world's most advanced global IP network, and provide a wide range of connectivity options for voice, video, data and converged communication services. An expected outcome of this study is that the sketched cable network corresponds with the global city network. Therefore, we compare the BT connection network with findings of the Global and World City (GaWC) Network and Study Group. Some interesting results and comments on this comparison lead to a better understanding of the similarities between the hard networks and the global city network.

Deana DeWire, University of Montana. Email: deana.dewire@umontana.edu; Anna E Klene, University of Montana. Email: anna.klene@mso.umt.edu; John S Kimball, University of Montana. Email: johnk@ntsg.umt.edu; *Forecasting and hindcasting snowpack in the Rattlesnake Creek watershed, Montana using the BIOME-BGC model*

Mountain snowpack is a critically important resource for the communities and natural ecosystems throughout the western United States. The Rattlesnake Creek watershed in western Montana functions as a microcosm for the water resource issues facing the West, such as habitat maintenance, reliable drinking water, and irrigation water allocation. Typically, snowpack monitoring is done at SNOTEL point locations or at established snow courses. However, distributed, basin-wide information will become increasingly important as climate warming affects snowpack and its associated water resources. Modern technology allows for the use of spatially distributed models to monitor current snow resources and estimate past and future changes. BIOME-BGC is a full ecosystem process model that contains a simplified snow model. The snow portion of BIOME-BGC, version 4.2, was run over the Rattlesnake Creek watershed. The model was driven with basic meteorological data, available at several weather stations near or adjacent to the study area. Outputs were assessed against snow course and SNOTEL measurements for the winter 2006-07. Additionally, model outputs were used to analyze changes in snow resources since 1950 and examine the impacts of several climate change scenarios on snowpack by 2050.

John-David C. Dewsbury, University Of Bristol. Email: jd.dewsbury@bris.ac.uk; *The 'Show' of Dance: the Univocity and the Refrain of Multiple Singularities.*

Pulling away from the tension between the regulated body of the dancer and the dance itself, not to dismiss such tension but in order to play it up, this paper argues that it is the dance itself that counts. Dance is more than the somatic encompassing cognitive, intuitive and felt dispositions that involve beliefs, values and feelings. However, to say that no movement is 'natural' is to miss that vital aspect of the visceral and open force that is being choreographed in the 'show' of dance. Dance is not only a scripted self-contained conversation but one which exposes humanity to its negotiation with this outside affective force that is both 'more-than-representational', anti-representational and still inherently non-representational. As such dance makes legible what other modes of discourse cannot. There is then in dance a presentation (its 'show') of the intangible sense of being-more-than-individual (univocity) - that light fantastic, affective intensity (the refrain) that sets you (the subject/self) asunder (multiple singularities). Thus, it is argued territories are materialized in dance via empathetic connections with which a new 'commune' of association and understanding is possible. Whilst it may be argued that such alliances may only be ephemeral (imminent) and imagined (immanent) moments, the inhabitation of dance, what it puts into conversation outside of discourse, educates something more permanent. The paper will exhibit its arguments through research done on the 'show' of dance in the work of The Cholmondeleys and the Featherstonehaughs.

Raymond J. Dezzani, Ph.D., University Of Idaho. Email: dezzani@uidaho.edu; Salvatore Babones, Ph.D., University of Pittsburgh. Email: sbabones@pitt.edu; *Measuring the Transmissivity of Economic Inequality Using Canonical Weighting Schemes with Gaussian Markov Random Fields.*

Following Babones (2005) and Dezzani (2001,2002) we examine the geographical propagation of factors and effects of economic inequality measures such as the Gini index contingent upon spatially-related covariates. We develop spatial weights using multivariate canonical forms and extracting distance and connectivity measures for use with a hierarchical Gaussian Markov Random field model (GMRF). In this research we extend ideas of connectivity to include integrative economic and political processes as well as various forms of geographical proximity and connectivity. We examine the assumptions and benefits of using GMRFs in spatial econometric analysis and specifically, for modeling diffusion processes. Results of Bayesian inference of the GMRFs are presented.

Keywords: spatial analysis, weighting schemes, inequality convergence, Markov random fields

Adam Diamond, Ph.D, USDA. Email: adam.diamond@usda.gov; *New Opportunities for Smallholders? The Growth of Farmers' Markets Amidst Agricultural Consolidation*

While farm consolidation has continued unabated in the last 15 years, as it has for the last century, recent data points to the emergence of a divided highway

in the agricultural landscape of the United States. Data from the USDA's Economic Research Service indicates that farm size has shifted towards very small and very large farm size classes. The growth of very small farms is facilitated by the expansion of alternative marketing mechanisms that bypass traditional wholesale distribution networks. Farmers' markets, serving more than 70,000 farmers in 2005, with more than 20,000 marketing exclusively through farmers' markets, are becoming significant, albeit niche players in the United States food distribution system. Recent data from a national survey of farmers' markets conducted by the USDA and Michigan State University indicate the prevalence of small producers at markets. 62% of markets surveyed reported that at least 51% of vendors had sales of no more than \$10,000. Furthermore, markets reported that the smaller the vendor, the less distance traveled to market. And a regional breakdown suggests that farmers' markets provide unique opportunities for farmers belonging to ethnic minorities, enabling them to sell niche products with little start-up capital to specific consumer segments. Farmers' markets represent a powerful alternative marketing stream. They reduce social and physical distance between producers and consumers while simultaneously carving out economic space for small producers and providing consumers with abundant quantities of unprocessed food. The question remains, however, whether they can serve as a primary source of income for farmers.

Keywords: food systems, agriculture, alternative marketing

Rolando Enrique Diaz Caravantes, . Email: diazrol@email.arizona.edu; *Water Management, Sustainability and the Challenge of Drought: Geographies of Conservation in Northern Mexico*

Across Latin America and much of the developing world, the expansion of protected natural areas for ecosystem conservation has often been showcased as a success of global environmentalism (Zimmerer, 2006: 63). In Mexico, the 1996 formation of the national Commission for Natural Protected Areas signaled growing political and environmental support for the conservation area approach. Recently, influential Mexican ecological policymakers proposed the expansion of natural protected areas as a key tool in protecting endangered watersheds (Carabias et al 2006: 57). Despite the importance of natural protected areas in the watershed management discourse, the subject has received very limited scholarly attention. Additionally, some scholars argue that conservation areas may be the vehicles for increasing the control over natural resources (Zimmerer 2003, Robbins 2004). However, these areas may also create the conditions for developing new opportunities. Exploring this possibility, Young (2003) studies how ecotourism has been touted as a means to link development with conservation in the fishing communities of Northern Mexico. Following this, I examine how conservation and development plans interact in the local communities within the Natural Protected Area. The Sierra de Alamos-Rio Cuchujaqui watershed in the northern Mexican community of Alamos, Sonora is an area where marginalized small producers live in a severely drought-affected tropical deciduous forest area designated as a natural protected area in 1996. In this paper, I examine the claims for improved watershed management in the context of severe drought and water scarcity based on two communities within the protected Sierra de Alamos area.

David DiBiase, Penn State University. Email: dibiase@psu.edu; Khusro Kidwai, Penn State University. Email: khk122@psu.edu; *Wasted on the young? Comparing the efficacy of instructor-led online education in GIScience for post-adolescent undergraduates and adult professionals*

Online distance education is an increasingly common mode of instructional delivery in U.S. higher education in general, and in geography in particular. This paper reports a unique empirical comparison of the efficacy of distance learning for two separate student cohorts in identical introductory courses in geographic information science. The average age of 101 students in an undergraduate cohort was 21 years, while the average age of 178 students in an adult professional cohort was 35. With few exceptions, undergraduates were enrolled full-time and resided on or near campus, while older professionals studied part-time, and were dispersed around the U.S. The theory of andragogy predicts that the younger cohort was less well prepared for the independent learning required in an

asynchronous online class, despite undergraduates' presumed affinity for information technologies. Empirical evidence indicates that although younger and older students performed equally well on identical project assignments, the undergraduate cohort devoted about one-half less time to their studies overall, and participated in voluntary class discussions only half as frequently as their older counterparts. Undergraduates withdrew from the online class at a much higher rate, and those who completed the class reported significantly lower levels of satisfaction. The study confirms that differences in student engagement and satisfaction were associated with differences in student age and motivation. Findings suggest that geographers who serve as instructors of distance education classes should be proactive in stimulating younger students' participation in class discussions, and should evaluate explicitly the tacit learning that discussion fosters.

Amie Dickinson, University of North Texas. Email: famousamos83@yahoo.com; Murray Rice, University of North Texas. Email: ; A spatial-temporal analysis of retail relocation and clustering: a case study of Port Huron, MI

Over the past two decades, urban populations and land areas have both expanded, leading to greater suburbanization of people and businesses. In the midst of this urban growth, some cities, such as Denver and Minneapolis, have been able to maintain their downtowns as vital retail and residential centers. In other cities, downtowns have suffered as malls and big-box retail have decentralized. The suburban location of new retail development appears to have drawn other businesses to the suburbs as well. In geographic research, gravity is often associated with the draw of people to a location because of a specific attraction, such as a store. The present study modifies this perspective slightly to study the gravitational attraction of businesses to a location, such as a new suburban mall. This poster investigates the spatial movement of retail in a small, midwestern city, focusing on the introduction of national mass merchandisers and a 100+ store mall just outside the city limits of Port Huron, MI. The purpose of this research is to track new retail locations and the gravity draw of mass merchandisers to other retail. This study monitors and assesses change in retail location over time.

Keywords: downtown, retail, business relocation, gravity model

James Dickinson, Rider University. Email: dickinson@rider.edu; Susan A Mann, University of New Orleans. Email: samann@uno.edu; A Thousand Points of Blight: Fixing Up Worn-Out Cities

In this paper I track the fate of less privileged, less glamorous spaces within Philadelphia, a city which has seen substantial redevelopment of its urban core in recent years as well as unprecedented growth of its suburbs, but whose inner-city neighborhoods still remain zones of extraordinary blight and neglect. I identify and discuss four strategies currently pursued in Philadelphia to control, manage, or otherwise domesticate degraded urban spaces, thus sustain them in the interim until future development can secure their permanent rehabilitation. These include (i) official anti-blight programs such as the recently implemented Neighborhood Transformation Initiative which aim to clear away unsafe structures and create land parcels large enough to attract private developers; (ii) urban greening initiatives such as those promoted by the Pennsylvania Horticultural Society which, in co-operation with community groups and organizations, aim to transform empty and neglected lots into community gardens, parks, and green spaces; (iii) the systematic covering of exposed walls and surfaces throughout the city with large-scale mural artworks under the auspices of the Mural Arts Program; and (iv) various projects and proposals incorporating public art into community redevelopment, urban greening, and other neighborhood enhancements. For each strategy, I discuss its relation to and origin in traditional urban planning perspectives; methods of recruiting, mobilizing, utilizing, or interacting with community groups and interests; the feasibility and likelihood of success; and viability and expected lifespan of interim spaces so created.

Keywords: industrial landscape, urban blight, urban renewal, public art, urban greening

Alexander C. Diener, Pepperdine University. Email: alexander.diener@pepperdine.edu; Projected Social and Ecological Impacts of Mongolia's Trans-State Highway

Once the heartland of Genghis Khan's vast empire, the former Soviet satellite state of Mongolia is now poised to emerge as a major trade corridor in Northeast Asia. The means by which this will be achieved is a two lane trans-state roadway deemed the "Millennium Highway." With only 11.9% of Mongolia's roads presently paved and no railroad spanning the state from east to west, this 2,400 kilometer transportation artery will catalyze a redistribution of both human and livestock populations with profound impacts on the environment. This paper explores various scenarios of ecological and socio-cultural change that

may occur as a result of this road-building project. The historical trend of Mongolian pastoralism involves a reduction in seasonal migrations and the increasing of herd densities. The impact of peri-urbanization is already evident in the capital city of Ulaan Baator. This trend is hypothesized to continue and increase with the building of the Millennium Highway and radically alter the socio-cultural paradigms within this long isolated nation-state. If this change is unaccompanied by sound foresight and best-management policies, then environmental degradation (particularly in terms of water quality) will almost certainly occur.

Keywords: Transportation, Road, Environment, Mongolia,

James T. Dietrich, Texas State University - San Marcos. Email: jtdietrich@txstate.edu; David R. Butler, Texas State University - San Marcos. Email: db25@txstate.edu; Constructing a stereo-panoramic repeat photography system for environmental change detection in Glacier National Park, Montana

Repeat photography is an important tool for change detection in geography. Faithfully reconstructing the location and conditions of historical photographs can, however, be difficult. Errors in taking precise repeat photographs can lead to incorrect perspectives, scale, and coverage that can make side-by-side comparisons or quantitative analyses complicated. This project is an attempt to revise the methods of repeat photography from fire lookouts in Glacier National Park, Montana (Butler and DeChano 2001) by constructing a platform that can more faithfully recreate the original conditions of the 1935 panoramic photographs of Lester M. Moe. The main problem in recreating Moe's photographs is that several of the fire lookouts used to take the photographs have been razed, so recreating the perspectives afforded by the lookouts is difficult. The goal is to construct a portable, yet robust, system that could reproduce the same perspectives used by Moe. The main components of the system are a lightweight surveyor's tripod, vertical extension rods, a camera platform, two Nikon Coolpix 5700 cameras and a remote shutter release. This system can be configured two separate ways for different applications; the camera platform can either be placed directly on the tripod for ground level photographs or raised on the vertical extension rods to gain the perspective of the former fire lookouts. By using stereoscopy and more accurately recreating the conditions in the original panoramic photographs we hope to produce more accurate photogrammetric measurements of various indicators of environmental change.

Keywords: repeat photography, environmental change, mountain geography, stereo photography

Susan A. Digby, PhD, Olympic College. Email: sdigby@oc.ctc.edu; Collage as a Research Method for Historical Geography

Collage is both a powerful research methodology and an effective discourse that has applications within geography. Collage is particularly suited to a discipline inextricably intertwined with the development of maps. Maps are themselves a form of collage as they combine images, symbols and descriptive text to produce a whole that is more than the sum of the parts. Collage is useful within historical geography, especially in areas such as biography where materials are diverse and fragmentary. Salvaging stories from the drifts of assorted materials, contradictions and mysterious voids that comprise biographical resources is often a daunting task, particularly for lesser-known individuals. Collage-making can be a productive approach to sorting and organizing disparate biographical materials. Through this tactile act, story lines can emerge from seemingly unrelated parts. Additionally, visual materials help to anchor contemporary analysis within past popular cultures. The resultant collages have a second set of functions; they become a means to convey information to reader-viewers. Collage is a frequently used art technique, yet it is neglected within geography, despite continued calls for alternative approaches. Although collage is unlikely to replace written discourse it provides an additional tool that has considerable potential.

Keywords: Collage, Research methodology, Historical geography, Cultural geography, biography

Gertjan Dijkink, . Email: g.j.w.dijkink@uva.nl; The Idea of a European Core: Geometry versus Vision

Since the establishment of EU the idea of a European core has frequently been put forward. The idea is based on diverse arguments: the role of cores in the history of state integration; the miracle of French-German cooperation after a century of enmity; the variable geometry of the EU in which some states have adopted a more advanced level of integration (Euro, constitution, etc.); the stimulating role of growth poles, etc. Most of these arguments could be refuted by pointing to specific contradictory events or conditions: fear among new members of a dominant centre, non-core members are not particularly lagging behind in adopting integrative measures like the Euro, the French-German economic motor stalled for some time, etc. Setbacks in the integration process like the rejection of the EU constitution in two national referendums in 2005 evoked new calls for

action by core-Europe. The latest call (by Italian and Belgian political leaders) curiously placed its hope on France as an important core country although it was one of the two culprits in the referendum crisis. This seems to demonstrate belief in an established geometry rather than a realistic appraisal of the European vision of member states. In this paper I will argue that there is one vision that naturally appeals to most countries of the traditional core and other member states as well: a critical attitude to globalisation and neoliberalism. This, however, will also produce a new fault line in future Europe.

Keywords: political geography, Europe, international conflict, ideas

Martin Dijst, Utrecht University. Email: m.dijst@geo.uu.nl; Christa Hubers, Utrecht University. Email: c.hubers@geo.uu.nl; Tim Schwanen, Utrecht University. Email: t.schwanen@geo.uu.nl; Temporal and spatial fragmentation: conceptualization, methodology and empirical evidence

In literature it is hypothesized that the use of Information and Communication Technologies (ICTs) will cause the fragmentation of daily activities across times and spaces, thereby blurring the boundaries between the previously separated life domains of work, care and leisure. Lacking in this discussion is a clear conceptualization of what fragmentation is and is not, and how it can be measured empirically. As a consequence, there is as yet little empirical support for these notions. The goal of this paper therefore is twofold: (1) to propose a methodology for measuring fragmentation, and (2) to empirically assess the extent to which ICT usage is associated with temporal and spatial fragmentation. We will analyze fragmentation for total daily activity patterns and separately for work, shopping and leisure. For the analysis, we will employ questionnaire data on e-shopping behaviour and two-day travel diary data from approximately 800 respondents in four different types of municipalities in the Utrecht region, the Netherlands.

Keywords: temporal and spatial fragmentation, ICT, the Netherlands

Julie Dillemath, University of California, Santa Barbara. Email: julie@geog.ucsb.edu; Current Approaches to Map Design in Personal Navigation Systems

Personal navigation systems for drivers and pedestrians are available and growing in popularity with consumers. But research on effective representation for small, digital maps is lacking. With no cartographic guidelines yet for these types of maps, it is of interest to know how current commercially-available systems have approached map design. What kinds of maps are actually being used, and how much variation is there among maps from different navigation systems? This research presents a cartographic assessment of six popular navigation aids for PocketPCs, with a focus on interface and design elements. Results indicate that, beyond general commonalities of interface options, there is wide variation among the six programs. Interface elements that vary include map display size, whether the map moves or the cursor moves, and the range of zoom levels and map scales. Design elements that differ among these programs include color, labeling and road symbology. The implications for users are discussed in terms of the potential impact on map interpretation and use. There are cartographic violations; for example, a scale bar in an oblique "3D" view, or an orthogonal map with no scale bar at all. Other considerations include the relation of zoom level to real-world area and travel time. As academic research in mobile cartography progresses, it is important to understand map design practices in currently available systems. Current systems are shaping user experiences and expectations with regard to mobile maps, and assessments like this can highlight areas for research priority.

Keywords: personal navigation systems, cartography, scale, map reading

Leo Dillon, U. S. Department of State. Email: dillonli@state.gov; History and Current Activities of the Office of The Geographer in the U.S. Department of State

Established in 1921, the State Department's Office of The Geographer - currently titled the Office of The Geographer and Global Issues - has been a small but influential organization in the United States Government's geographic community. It has evolved into the U.S. Government authority on geographic policy matters such as the depiction of international boundaries and foreign territorial sovereignty issues, and has held leadership roles in the development of such institutions as the U.S. Board on Geographic Names and the United Nations Convention on the Law of the Seas. This paper traces the history of the Office and describes how it has changed in size and function to meet the Government's needs for geographic information and analysis, from establishing country-specific immigration quotas in the 1920s to providing GIS-aided analysis of complex international emergencies today.

Lary M. Dilsaver, University Of South Alabama. Email: ldilsaver@usouthal.edu; What Constitutes a National Park: A Case Study of California

California contains 24 of the national park system's 390 units, more than any other state. Yet more than 120 other California areas have been proposed for inclusion as natural, historical or recreational parks. These proposals have come from a variety of sources including members of congress, wealthy benefactors, special interest groups, city councils, ordinary citizens and the National Park Service itself. The reasons why they failed to become units of the system include the significance of their resources, land acquisition problems, cost, and opposition from individuals and groups. In this paper, I survey the types and spatial pattern of suggested units, who proposed and supported them, why they were not established, and what these events say about the national park system, the National Park Service, and the public's ideas about sacred space and the protection of American heritage.

Keywords: national parks, sacred space, California

Thomas E. Diltz, University of Nevada Reno, Department of Geography. Email: tdiltz@unr.edu; Reclaiming Nevada: Comparing the Ecological and Visual Function of Post-Mining Landscapes using GIS and terrain metrics

Sometimes appearances can be deceiving. Numerous examples exist where an aesthetically pleasing landscape is not the same as an ecologically functional landscape. While landscape function and visual objectives are both goals for land managers, understanding the potential conflicts that can arise between the two is important. Up front explicit identification of the differences between ecological function and visual function affords land managers the opportunity to determine the appropriate corrective action in order to achieve the goal of an aesthetically pleasing environment that is also ecologically healthy. Visual Resource Management is used by the Bureau of Land Management to assess a project's impact upon visual resources and determine the appropriate level of mitigation required. In Nevada, Visual Resource Management objectives have helped determine the design of waste rock dumps and heap leach pads resulting from large-scale gold mining operations. Traditional relief designs of waste rock dumps have employed a slope and bench pattern resulting in the creation of linear features that differ in appearance from the surrounding topography. Newer designs aim to achieve shapes that blend in with the surrounding environment. My research investigates whether differences in ecological function exist between relief designs that utilize Visual Resource Management objectives and traditional methods. I use a Geographic Information System, terrain metrics, and multivariate statistics to develop models that consider both ecological and visual function of reclaimed mine lands.

Keywords: Ecological function, Visual Resource Management, Geographic Information Systems, GIS, terrain metrics, multivariate statistics, mining, mine reclamation, revegetation

Stelian S. Dimitrov, Sofia University "St.Kliment Ohridski". Email: stelian@gea.uni-sofia.bg; GIS implementation in the Bulgarian regional planning system: problems and potential solutions

Geographic Information technologies have become increasingly important for many aspects of our life and business, especially in regional and spatial planning. In fact GIS and related technologies became popular in Eastern Europe and Bulgaria relatively late, after the fall of the communism, when those countries were enforced to conduct dramatic and painful reforms of their economies and administration. The so called "Central planning system" was terminated and the new approaches to spatial and regional planning were introduced. The new approaches needed new tools and GIS naturally became popular among the planners. But because of many factors, the process of implementation and using of GIS has been accompanied by some serious problems, which became crucial not only for the development of the GIS, but affecting the whole planning system and reducing its effectiveness. The purpose of this paper is to make an attempt to shortlist the major issues concerning the efficient and practical use of GIS solutions within the Bulgarian planning system. We would like show some of the potential and innovative solutions which could contribute for more efficient and vital planning in the context of EU integration.

Keywords: GIS, Regional and Spatial planning, GIS implementation, Bulgarian regional planning system

Joshua S Dimon, Phd Student, University of California - Berkeley. Email: jdimon@nature.berkeley.edu; Institutional Coordination and the Long-Term Construction of Petroleum Access in Mozambique

There is a more complex matrix of dynamic institutions creating, molding, reproducing and legitimating the specific structures necessary for oil exploration and production than is commonly recognized. This matrix is highly adaptive, responding to often rapidly and severely changing local, national and international environments. The International Oil Working Group (IOWG) at the University of California at Berkeley has traced the evolution of this system

through the history of oil exploration in Eastern Africa which has only recently begun to produce oil. This paper uses an analysis of these dynamic institutional processes in Mozambique (a state not yet producing oil) to reconcile the seeming disjuncture between the short-term time frame of corporate decision-making, and the often very long-term processes of the broader institutional matrix which undergirds the global oil economy and facilitates systems of access. A more sophisticated understanding of the dynamic and long-term relations between key institutions in the global oil economy can better inform strategic policies, regulations, and resistance aimed at ending the pattern of destructive oil development ubiquitous in Sub-Saharan Africa and other South States.

Guoxiang Ding, Ohio State University. Email: ding.45@osu.edu; Mei-Po Kwan, Ohio State University. Email: kwan.8@osu.edu; Activity-Based Qualitative Modeling Using Spatial Choice Data

Spatial knowledge is often communicated and processed through linguistic descriptions. However, current geographic information systems (GIS) are largely designed for the analysis of quantitative data and for building analytical models, which are still limited in their capabilities in handling linguistic variables of spatial relations. Performing qualitative reasoning on spatial relations in GIS to support language-based spatial query and intelligent interpretation remains a challenging task. Recently, detailed activity-travel data at individual level become available with the aid of location-aware, wirelessly connected devices. This kind of data, as a result of human perception and spatial decision, provides opportunities for examining activity-based qualitative spatial reasoning. In this research, a fuzzy reasoning approach is employed to investigate human perception on proximity and scale based on observed spatial choices data to improve the efficiency of activity-based qualitative reasoning. Circulation data collected from 42 public libraries in Hamilton County (Ohio, USA) in 2003 are used in this study. Decision rules are constructed with two linguistic variables based on the implication of the famous gravity model: distance (impedance) and the floor space (attractiveness) of the library. Perception on proximity and scale of library are constructed for library choice activities.

Keywords: Qualitative modeling; fuzzy clustering; decision rule identification

Adam Dinham, BA(Cantab) MA(AppSocSt) PhD(Lond), Anglia Ruskin University UK. Email: a.dinham@anglia.ac.uk; A Third Way Church? - the Church of England's 'Faithful Cities' as a clarion call to what?

The landmark Church of England report, 'Faith in the City' (1984), was always going to be a hard act to follow, a fact made all the more acute by the timing and provenance of the follow up, 'Faithful Cities' (2006). That it sees itself as standing in the tradition of that great "call to church and nation" is made clear from the outset - the 1984 report is mentioned in the very first paragraph. But what is less clear is how that somewhat radical report, with the 'Marxist' undertones of which it was accused, has been inherited in this new 'commission on urban life and faith'. This paper critically examines the commission's report in terms of the key political, theological and social messages it contains, and the relationship between them and the central notion of the 'faithful city'. In doing so it argues that the report accepts a 'New Labour' logic of the synthesis of markets and social justice whilst at the same time seeking to call to 'action' people of faith in cities everywhere. It is argued that this results in a confusion of purpose and method which fails to grapple with the strong and (itself) confused policy matrix currently put forward by the UK government for faith communities, and thereby misses an opportunity for disentangling the policy strands in the direction of better practice

Keywords: faith, policy, third way, uk

Laura B Dinitz, United States Geological Survey. Email: ldinitz@usgs.gov; Challenges of Integrating Geospatial Data on Multiple Natural Hazards for the Land Use Portfolio Model: Ventura County, Calif., Case Study

U.S. Geological Survey Geography Discipline scientists developed the Land Use Portfolio Model (LUPM), an interactive, GIS-based decision-support system that uses the mathematics of financial-portfolio theory with geospatial natural-hazard, land-use, and socioeconomic data to analyze, visualize, and compare natural-disaster risk-reduction policies. Financial-portfolio theory offers a method for evaluating alternative, regional-scale investment choices on the basis of their estimated distributions of risk and return. The LUPM requires information on hazard-event probabilities, planning-time horizons, community assets at risk, dollar values and/or vulnerability of assets, spatial-damage probabilities, and costs and effectiveness of possible risk-reduction strategies. The user selects a portfolio of locations and/or measures in which to invest a limited budget for loss mitigation. The LUPM estimates total cost, number of locations selected, expected loss, and mean and standard deviation of return-on-investment and community wealth retained. The user can repeat the process, defining, comparing, and ranking multiple policies according to the user's preferences. Our

research goal in Ventura County, Calif., has been to develop the LUPM to function for multiple hazards including liquefaction, landslides, floods, and wildfires. The purpose of this paper is to report on the challenges and lessons learned trying to acquire and integrate the geospatial information necessary to use the LUPM. These include differences in how science research for different hazards is presented, such as the use of different scales of space and time; differences in community impacts of these hazards; level of community involvement; methods for assessing values at risk; spatial dependence of hazards; and spatial dependence of failure sites.

Keywords: natural hazards, risk, portfolio, LUPM, DSS, model

Peter Dirksmeier, Dipl.-Geogr., University of Bremen. Email: peterd@uni-bremen.de; Urbanization of rural areas as a perspective for the explanation of growth and shrinkage of cities

The lecture throws light on the discussion of urban growth and decline in Germany from the countries perspective. The lecture does not deny the importance of centre-periphery differentiations for any understanding of the spatial order of society. Cities are the centre of society in terms of concentration of political power, economic actions or religious activities. From this point of view, the perspective of urban geographical research seems appropriate. But nevertheless, urban geography is to often apt to look on urban growth and decline just from an urban perspective. Such kind of view does not include the inhabitants of the country, which are weaved with the city into a whole. A qualitative study in rural Bavaria forms the basis of an alternative approach. It aims to explain the dichotomy of growth and decline of cities in terms of the growing influence of urban attitudes and values in the society as a whole. This proceeding picks up on a gap in contemporary urban geography. The counterurbanization research carried out in the 1970s can be seen as the last examination of this subject. Against this background, the lecture initially develops an empirical approach based on the attitudes of the rural population towards the urban, in order to elaborate the considerations and explain processes of urban growth and shrinkage, like gentrification and geriatification, from the point of view of the country.

Keywords: urban geography, growth and decline of cities, Germany

Jason N Dittmer, Georgia Southern University. Email: jdittmer@georgiasouthern.edu; Ezekiel's Geographies: "Left Behind" and the Popular Geopolitics of the End of the World

This paper will begin by outlining the history of the American theological movement known as premillennial dispensationalism, including its basic tenets. The paper will then introduce the series of books known as the "Left Behind" series, a bestselling narrative of the Endtimes as interpreted by the authors, Tim LaHaye and Jerry Jenkins. These books enact a particular kind of geographic imaginary, which is rooted in an emphasis on the particular over the universal. This results from several places on the Earth's surface being elevated in geopolitical importance because of the prophetic value associated with them. Conversely, attempts to construct global identities are thwarted by associations with evil and the Antichrist. The paper concludes with a discussion of connections between the American Evangelical movement and policy makers, and thus the connections between popular geopolitics and practical geopolitics.

The most important maintenance vector for West Nile virus (WNV) in the northeastern US is *Culex pipiens*, an urban/suburban mosquito that feeds predominantly on birds. The intensity of WNV transmission in urban areas is spatially heterogeneous. We examined whether differences in *Cx. pipiens* infection rates (a measure of WNV transmission) of mosquitoes collected in 21 CDC miniature light traps in southwestern CT were associated with certain landscape patterns, the abundance of reservoir-competent bird species, or an index of bird diversity. We also determined the source of *Cx. pipiens* blood meals in a subset of 4 sites and related them to bird relative abundance to determine whether feeding habits were selective. Our best model for infection rate, as determined by the lowest Akaike Information Criterion, included mosquito abundance, several landscape metrics, and the proportion of three bird species. The predicted and observed infection rates had a 95% correlation. We also found that *Cx. pipiens* fed preferentially on American robins, as has been found in

previous studies, but the degree of preference varied with the area of highly urbanized land use around the sampling site. Our study shows that landscape affects all components of the transmission cycle: mosquitoes, birds and the contact rate between them and that should be considered when estimating transmission rates among birds and, potentially, transmission to humans. Future work includes combining mosquito distribution maps generated for our study area with variables predictive of transmission intensity to help direct surveillance to high risk areas and guide control measures.

Email: ; *Effects of Temperature Variation on Suicide in Five U.S. Counties, 1991-2001*

Effects of weather variables on suicide are well-documented, but there is still little consistency among the results of most studies. Nevertheless, most studies show a peak in suicides during the spring season, and this is often attributed to increased temperatures. The purpose of this study is to test the relationship between monthly temperature and monthly suicide, independent of months or seasons, for five counties located across the United States. Harmonic analysis shows that four of the five counties display some seasonal components in the suicide data. However, simple linear regression shows no correlation between suicide and temperature, and discriminant analysis shows that monthly departure from mean annual suicide rates is not a useful tool for identifying months with temperatures that are colder or warmer than the annual average. Therefore, it appears that the seasonality of suicides is due to factors other than temperature.

Megan Dixon, University of Oregon. Email: mldixon@uoregon.edu; *Paths through St. Petersburg: the function of repetition in 'place.'*

This paper will examine the processes marginalizing certain conceptions and enactments of place in St. Petersburg, Russia. Massey has recently proposed a networked vision of space (2005, 2006) that consistently discourages the idea of 'place' as stability. One way of reexamining the privileged view of flux that results from her arguments is to study repetition in daily enactments of 'place.' This repetition requires consideration of flux and stability simultaneously, since daily routes entail flexibility and multiplicity but also depend on stable points of reference. Work done by John Urry and the Russian cultural geographer Kagansky offer an opening to hypothesize that study of repeated and shifting movements between stable points of home, work, and other destinations (certain kinds of circumscribed movements) should be included in a fuller conception of 'place' before we reject the aspect of stability in our discussion of a politically acceptable 'space.' Material provided in the presentation will demonstrate how the daily routes and experiences of St. Petersburg residents are constrained as well as enabled by the decisions of the city's elite. A changed transportation landscape changes the possibilities for repeated daily routes and thus for articulation of a localized identity, prompting residents to improvise as well as resist. Daily routes described in extended interviews reveal multiple and competing notions of place, and suggest that more study of material constraints and conditions is needed before we assume the possibility of negotiated juxtaposition to which Massey looks with hope.

Richard Ohwofasah Djukpen, Geography Department, University of Illinois, Urbana IL. Email: djukpen@uiuc.edu; *Understanding the Pathways of HIV/AIDS Transmission in Nigeria: A Study of Benin City*

This paper is a two-stage study, first, at the macro level using results from exploratory spatial data analysis (ESDA) techniques of GIS in understanding the HIV/AIDS infections in Nigeria. The national spatial pattern of HIV/AIDS infections shows marked differential distribution in Nigeria. Second, we shall focus on the micro level of a city within Nigeria to understand the dynamics of the infections using in-depth interview, focus group discussion research methods. A number of questions are being investigated using the ESDA: Is there a significant spatial clustering of HIV/AIDS infections in Nigeria? What factors could provide a justification for the spatial distribution? Are there social, cultural practices and economic conditions and HIV/AIDS knowledge discrepancy across the geographical regions? Are there specific pathways of HIV/AIDS transmission that are peculiar to these areas of high prevalence that demand serious attention? The use of the ESDA techniques in HIV/AIDS management, in a Geographic Information Systems (GIS) environment provide public health practitioners with better insight into the spatial variations and peculiarity of the disease. The exploratory spatial data analysis approach provides a stage for proffering effective and acceptable preventive measures that are culture specific, and people or community oriented. It will assist policy makers to design HIV/AIDS management strategies focused on the regional characteristics in Nigeria.

Petra L. Doan, Ph.D., Florida State University. Email: pdoan@garnet.acns.fsu.edu; *The Myth of Queer Spaces: The Changing Geography of LGBT Residential Areas in the Atlanta Metropolitan Region*

A substantial literature documents the evolution of counter-hegemonic queer urban spaces (Lauria and Knopp, 1985; Bell and Valentine, 1995; Valentine, 2000; Forsyth, 2001) which provide sites of resistance to the hetero-normative patriarchy (Ingram et al. 1997). However many of these studies describe late 20th century residential location patterns, that may be changing rapidly. In recent years the increasing visibility of queer residential zones has been accompanied by increasing commodification as well as increasing property values which have attracted young urban professionals and forced less affluent LGBT populations to explore alternative locations. Have queer residents been priced out of "queer" space? Are new queer spaces evolving at the metropolitan fringe? Following Adler and Brenner (1993) does income remain the critical influence on residential location patterns for gay men versus lesbians or are other factors at work? If the nature of the gay neighborhood has changed, what have the effects been on GLBT residential choices, perceptions of comfort and safety, and neighborhood imageability? Do GLBT people still need, desire or value the queer neighborhood? In this paper we examine the residential choices and neighborhood perceptions of LGBT people living in the Atlanta metropolitan area and present the results of qualitative interviews with GLBT and straight residents of established neighborhoods with high concentrations of gay and lesbian partners according to the 2000 census. Additional interviews with residents of less well-known yet intentionally diverse neighborhoods, that might be better termed "granola" neighborhoods, will be used to examine the location decision-making processes of LGBT people.

Keywords: LGBT, Queer space, gay, lesbian, homonormativity

G. Rebecca Dobbs, Emporia State University. Email: grdobbs@email.unc.edu; *Archival Data to Geographic Knowledge: Reconstructing the Colonial Settlement Landscape in the North Carolina Backcountry*

While the colonial South has an enduring reputation as a town-poor region, Southern backcountry regions experienced an urban revolution in the mid 18th century, when towns and settlement systems sprang up in a short space of time. This process is not well understood and has generally been approached in terms of meso- or macro-scale processes. In contrast, I have approached this problem by assembling a vast quantity of microscale archival data in the form of landgrant records and using historical GIS to transform it, first, into geographic information with the spatial attributes of shape and location; second, into geographic knowledge in the form of mesoscale pattern analysis within the GIS; and finally into a geographic understanding of the Southern backcountry urbanization process in North Carolina by means of a two-scale model that includes both town formation and settlement system development. This paper presents an overview of the Southern urbanization problem and the nature of the archival data, then examines the process of converting that data to geographic information,

geographic knowledge, and finally geographic understanding.

Keywords: historical GIS, settlement development, Southern backcountry

John F. Dobosiewicz, Ph.D., Kean University. Email: jdobosie@kean.edu; *Quantifying Water Quality Impairments and Developing Management Initiatives for a Priority Stream Segment of the West Branch of the Elizabeth River in New Jersey*

The West Branch of the Elizabeth River is an impaired stream in NJ Watershed Management Area 7, the Arthur Kill Metropolitan Watershed, and has been targeted by the NJ Department of Environmental Protection for water quality evaluation and a subsequent priority stream segment management initiative. Water quality in the West Branch of the Elizabeth River is poor, with severe impairment in most water quality indicators, primarily from non-point source pollution. The water quality parameters of concern include coliform bacteria, nutrients, dissolved solids, and dissolved oxygen. These water quality impairments and the land use characteristics of the watershed are consistent with water quality impairment and land use in urban watersheds. Local scale spatial and temporal variability in water quality was determined from samples collected at six sites under base flow and storm conditions. Sites were selected to compartmentalize the priority segment into sub-segments that represent different land use and stream corridor impacts. ArcMap GIS is used to analyze watershed characteristics for the entire priority stream segment and surrounding each site. A site-specific management initiative is developed for each site based on the results of the water quality sampling and the GIS analysis. Preliminary suggestions to reduce impairment at specific sites include the restoration of native species, buffering the stream corridor, evaluation of fertilizer use in residential areas and on nearby golf courses, geese management plans, storm drain marking, and education.

Keywords: urban watersheds, water quality, non-point source pollution

Cory Dobson, University of British Columbia. Email: ; David F. Ley, University of British Columbia. Email: dley@geog.ubc.ca; *Can Gentrification be Stopped?*

The onward march of gentrification in post-industrial cities with a large and growing white-collar work force appears relentless. Not only is there enthusiasm from the private sector but in many cities gentrification is being expedited by public regeneration policies. The consequences are clear: we are moving toward the re-creation of a pre-industrial urban form with elite concentration at the core, and displacement of the poor to less accessible sites. Can gentrification be stopped? Assuming a public will, affordable housing gains can be made but they require levels of market intervention which seem ideologically unlikely at this historic moment. A more pragmatic route is to ascertain those locations avoided by gentrifiers and try to establish policies that may slow or even block gentrification in these neighbourhoods. This research examines the pattern of gentrification in Vancouver during the 1971-2001 period and seeks to understand where the advance of gentrification has been delayed or diverted, and why.

Keywords: Gentrification, Vancouver,

Jerome E. Dobson, University of Kansas. Email: dobson@ku.edu; *The New AGS Bowman Expeditions*

It is fitting that the American Geographical Society (AGS) and the Office of the Geographer should join to honor Bill Wood. The two organizations have been linked historically since "The Inquiry" commissioned by President Woodrow Wilson in World War I. The AGS was responsible for running that crucial, multi-disciplinary study of European geography (language, ethnicity, boundaries, etc.) in preparation for the Versailles Peace Conference. Subsequently, that legacy and the massive collections of geographic information resulting from it became the foundation of the Office of the Geographer. Recently, the AGS has renewed its commitment to inform the public and the government about foreign geography in support of better policy making. Specifically, we proposed to send Bowman Expeditions to gather geographic information, conduct place-based research, and combat geographic ignorance. Our motivation is a deep concern that American foreign policy is increasingly driven by geographic ignorance among voters, analysts, journalists, and politicians of both parties. We relate this to the abandonment of geography from 1948 onward and associated lack of support for foreign fieldwork by geographers. To date, our prototype expedition to Mexico has been underway for two years, and another expedition is funded and ready to begin in the Antilles Region. We describe the design, progress, and results of the AGS Bowman expeditions and demonstrate how our research, purpose, and funding relate to foundational scholarship and sense of duty held by kindred geographers during the developmental stages of the discipline in the United States.

Katarina Z Doctor, George Mason University, Fairfax, Virginia. Email: katarina@doctor.com; *Using GIS to determine the probability of sinkhole formations in Frederick Valley, Maryland*

Urban development is rapidly occurring in the karstic terrain of Frederick Valley, Maryland. Sinkholes are an inherent feature of the landscape; they present hazards and engineering challenges to the development of residential commercial and industrial infrastructure. In order to determine the relative likelihood of sinkhole formation, several factors that contribute the occurrence of sinkholes need to be examined: locations of nearby sinkholes, geologic structure, rock type, proximity to impervious surfaces and surface drainage patterns. A sinkhole dataset and geologic map was obtained from the Maryland Geological Survey. Nearest-neighbor analysis will be performed on the sinkhole location data to determine statistical probability of sinkholes within the study area. Using GIS and statistical methods these results will be related to the factors listed above to identify those which may be the most important controls on sinkhole formation in this region. These results may be a guide for future development activities in this region and others like it.

Keywords: karst, sinkhole development, GIS, spatial statistics, nearest-neighbor analysis

Klaus J Dodds, Professor, Royal Holloway, University of London. Email: k.dodds@rhul.ac.uk; *Popular geopolitics, Hollywood and the Visualization of the War on Terror*

This paper is concerned with the visualization of September 11th 2001 attacks and the subsequent declaration of a Global War on Terror by the George W. Bush administration. Using film productions such as Fahrenheit 9/11, United 93 and World Trade Center as a starting point, the manner in which terror is represented is critically considered alongside an analysis of how that might link to particular identity narratives and moral grammars. Finally, the reactions of trade press reviewers and online fandom sites is used to further contextualise the reception of these films alongside recent television productions such as The Path to 9/11.

Keywords: popular geopolitics, Hollywood, Global War on Terror, visualization

Richard N. Dodge, Ph.D, Cochise College. Email: richarddodge2@msn.com; *United Nations Security Council Reform: A Geographic Approach*

Numerous proposals for U.N. Security Council reform have been set forth by individual nations, by the Secretary General, and by others. None has received general acceptance. The proposals of independent nations tend to be based on power relations whereas the Secretary General's proposal would expand membership to the extent that the current permanent membership is unlikely to be in favor of it. A geographic approach that is based primarily on population and representation from major world regions and subregions is suggested here. A fifteen to eighteen member Council with no permanent membership or veto is proposed. Ten would be selected by a system of rotation with two each coming from five major world regions. There would membership guarantees from additional subregions. If democracy is a desirable value in the governing of nations, then a United Nations which is democratic will go a long way towards promoting this value in the world at large. If the world can have a Security Council which actually provides protection from acts of war, then all nations will be able to spend less time on the building of alliances, political intrigues, promoting or suppressing terror, and increasing their armaments. Consequently, nations could apply more resources to their economic, social, and environmental concerns.

Keywords: political geography, United Nations

David Dodman, University of the West Indies. Email: david.dodman@uwimona.edu.jm; *Commerce and Cruises: a comparative study of Caribbean waterfront transformations*

The economies of the small island developing states of the English-speaking Caribbean are heavily dependent on revenue generated through the tourism industry. The most important natural resource for this industry is the Caribbean Sea, and coastlines around the region have been extensively modified to take advantage of this asset. A key aspect of this modification has been the transformation of urban waterfronts into districts designed to encourage business (especially through the development of new commercial districts) and tourism (particularly in the form of cruise shipping). Drawing on case studies from Trinidad and Tobago, St Lucia, Antigua and Jamaica, this paper explores the ways in which urban waterfronts have been transformed in these islands. The creation and ongoing management of these waterfronts involves the negotiation of a complex set of power relationships between stakeholders operating at a variety of scales, including national governments, tour operators, citizens and tourists. In several cases the redevelopments have involved the creation of semi-autonomous

government agencies with far-reaching development powers, whilst in other cases they have involved the provision of incentives to private developers. The cultural meanings of these transformations are shaped by the ways in which tourists and locals alike use the redeveloped spaces, whilst the process of waterfront transformation reflects and shapes broader changes in urban management and governance in the region.

Keywords: Waterfronts, Caribbean, Governance, Tourism

Belinda Dodson, University Of Western Ontario. Email: bdodson@uwo.ca; Gender, Migration and Remittances in Southern Africa

Transnational migration to South Africa from its neighbouring countries has a long history. For over a century, remittances from migrant workers have formed an important component of national economies and household livelihoods. Since the end of apartheid, cross-border migration has undergone both expansion and diversification, including growing feminization. Recent surveys conducted by the Southern African Migration Project (SAMP) shed light on the gender dynamics of contemporary regional migration flows and related remittance behaviour, demonstrating the increasingly important role of women's migration. Comparisons between male and female migrants reveal differences in their demographics, economic activities, and migration patterns. In terms of overall numbers, migration is still male-dominated. Female migrants are engaged largely in activities such as informal trading or domestic service, while male migration is still dominated by the mining sector. These differences affect the nature and volume of their remittances. Comparisons across the different source countries surveyed, namely Botswana, Lesotho, Malawi, Mozambique, Swaziland and Zimbabwe, demonstrate how the particular forces driving migration from a source country produce strongly gendered outcomes. The Zimbabwean case is especially interesting, with the country's ongoing political and economic crisis pushing significant numbers of people - men and women, skilled and unskilled - to leave the country. Migrant remittances are shown to be not only an established source of income and assets for many households but also an important contingency strategy in times of crisis. The paper concludes by suggesting changes to national migration policies to better reflect these regional realities.

Keywords: migration, gender, remittances, Africa-Southern

William W. Doe III, Ph.D., Colorado State University. Email: bdoe@cemml.colostate.edu; Robert G. Bailey, US Forest Service. Email: rgbailey@fs.fed.us; Global Military Operating Environments: Ecoregional Mapping of U.S. Military Deployment Areas

The natural environment of a region - generally defined by its climate, weather and landforms, shapes the geographic space in which military forces operate. Every environment presents different considerations for military planning and engagement. Understanding the effects of the physical environment on soldiers and equipment, and how to adapt to their influences, is a critical factor in operational success. U.S. military forces are dispersed world-wide to meet global threats to national security. Current and anticipated operations in the Middle East, Central Asia, Africa, Indonesia and Central/South America present the military with a complex range of natural environments, including deserts, tropical jungles, high altitude plateaus and mountain ranges. U.S. forces must adapt to those environments which vary from those they have historically trained or operated in. A revised regional and geographic framework, entitled Global Military Operational Environments (GMOE), is developed to characterize the natural settings of military operational environments world-wide. The framework is used to characterize the natural environments associated with Army installations in the U.S. and to compare them globally with geographic analogs found in other parts of the world where U.S. military forces are deployed. The GMOE framework is adapted from Robert Bailey's ecoregions classification system (USDA-Forest Service). The framework integrates climatic criteria with other physical factors (e.g., vegetation, terrain and soils) to define ecosystem characteristics. Fifteen unique operational environments are mapped world-wide. Their distribution and significance to the five regional areas of responsibility assigned to U.S. combatant commanders is analyzed.

Keywords: military geography, ecoregions, geographic analogs

Marcus A. Doel, Professor, Swansea University. Email: m.a.doel@swansea.ac.uk; Dialectical materialism, value theory, and inconsistent multiplicity: From David Harvey to Alain Badiou

The paper assesses the fate of dialectical thinking in human geography in the wake of poststructuralism, with particular reference to value theory and its spatial expression. The paper begins by sketching out one of the most accomplished forms of dialectical analysis in human geography: David Harvey's account of historical-geographical materialism. It then advances a critique of this form of dialectical thinking by drawing upon the arguments of Jacques Derrida and Gilles Deleuze, each of which precipitates an affirmative and innumerable 'swerve' away from dialectical thinking. The paper ends by contrasting the rendering of the multiple in the work of Derrida, Deleuze, and Alain Badiou, and outline's how

'multiplicity' might inform a re-conceptualization of value theory and its spatial expression in contemporary human geography.

Keywords: Poststructuralism, dialectics, deconstruction, value theory, multiplicity, David Harvey, Alain Badiou

James Doerner, University of Northern Colorado. Email: james.doerner@unco.edu; Robert Brunswig, University of Northern Colorado. Email: ; A High-Resolution Paleotemperature Record from La Poudre Pass Fen, Rocky Mountain National Park, USA

Proxy data recovered from the La Poudre Pass fen provides a high-resolution record of Holocene paleotemperature change in Rocky Mountain National Park. The fen is located at 3107 m in the subalpine spruce-fir forest on a col between the Colorado River and La Poudre Pass Creek. The site was deglaciated prior to the initiation of peat formation beginning sometime before ca. 9700 yr BP. The area experienced post-glacial warming in the period from ca. 9700 to 9000 yr BP. Temperatures increased and then fluctuated during the interval between ca. 9000 and 6800 BP. The warming that occurred during this period is interrupted by a cold and/or dry period (ca. 7950 to 7450 yr BP). The climate warmed steadily from ca. 6800 to 4900 yr BP before regional climatic deterioration brought colder and drier conditions the site. Cold, dry conditions (Neoglacial cooling) persisted until ca. 2300 yr BP. After ca. 2300 yr BP warming began again and more mesic conditions returned. This late Holocene warming is disrupted by a short-term cool episode which may correspond to "Little Ice Age" cooling. These results suggest that proxy sediment records may be more sensitive and respond more quickly to environmental change than other proxy indicators such as pollen.

Sara Dolan, Student. Email: dola0074@umn.edu; Do Socio-Economic or Demographic Factors Correlate with the Physical Location of ARMY Recruiting Offices?

The purpose of this poster is to provide geographic insight into the existing locations of United States Army recruiting offices within the Twin Cities Metro area (Minneapolis/St. Paul, Minnesota). Specifically, it will provide a visualization of whether the physical location of Army recruiting offices correlates to socioeconomic (income levels) and/or demographic factors (age, race, gender). This poster sheds light upon the question of whether or not the Army is interested in recruiting members from specific demographics or populations. One of Michael Moore's claims in the film Fahrenheit 911 is that the military intentionally targets members of low-income populations. Upon consideration of this I wondered if this claim was in fact true and the best way I could imagine exploring the question would be analyze data within a map pertaining to socioeconomic factors. I chose to study only the placement of Army recruiting offices for this project (versus the Marines, the Navy, etc.) because the Army is the largest branch of the United States military.

Rebecca Dolhinow, California State University Fullerton. Email: rdolhinow@fullerton.edu; Making Space and Making Home: Mexican Immigrant Community Activists

If La Gran Marcha of March 25th, 2006 and its sister marches are any kind of indicator it would appear immigrants in the US are speaking out for their rights in loud and clear ways. Yet it is not equally clear that the majority of the US population has heard their message in any meaningful way. While debates rage on over immigration policy in the US, much of the US economy continues to rely on the undervalued labor of migrant workers from Mexico and other countries. This paper examines the communities in which migrant labor, agricultural field labor in particular, lives in much of the southwest. These communities are called colonias. Colonias will be examined as they are produced as racialized neoliberal spaces. Colonias house hundreds of thousands of farm workers in settlements lacking the most basic infrastructure, such as potable water and wastewater services. These majority Mexican communities are produced as "Mexican" spaces both by residents and non-residents alike, but to very different ends. While non-migrant locals create discourses of filth and disease colonia residents are re-producing their communities as safe and healthy rural spaces. Through this seemingly anti-racist activism colonia leaders can also be taking part in state sponsored development projects that produce their communities and themselves as neoliberal political subjects. Through ethnographic examples this paper will speak to the complexity of the processes that are neoliberalism in the US today and their local manifestations.

Betsy Donald, Queen's University. Email: betsy.donald@queensu.ca; From *Growth Machine to Ideas Machine: the new politics of local economic development - Boston and the Biosafety lab controversy*

In this paper, I review the literature on the political economy of place with particular attention paid to how the politics of local economic development has shifted over the years, especially within the context of an increasing knowledge-intensive urban economy and society. I argue that economic and occupational change in the new economy is having an impact on local economic development politics. Most notable has been a shift in the politics from a 'growth machine'-type of politics to what I am calling an 'ideas machine' one. In this ideas machine, the university and medical sectors are playing a more active role in the strategic direction of the economics and governance of a city. This enhanced role has implications for how we traditionally think about our theories of urban political economy and also has implications for the kinds of policies we privilege in the planning of our cities. Drawing upon insights from a research study in Boston and in particular through the controversial example of Boston Universities' 'biosafety level 4' lab, I show how the politics between the use versus exchange value of land are still relevant, but arguably more complex with more intense 'socio-spatial' and 'scalar politics'. The politics isn't only about creating skilled jobs - or about addressing equity and justice issues in the citing of the bio lab. It also becomes an intense political debate over the global war on terrorism and in particular on the public health security and preparedness of the nation and beyond.

David Donato, United States Geological Survey. Email: didonato@usgs.gov; David Donato, U.S. Geological. Email: didonato@usgs.gov; *Computational resources and techniques for modeling watershed-wide urban growth with SLEUTH*

Effective application of the SLEUTH urban-growth model to an entire major watershed requires both the availability of an up-to-date parallel-processing capability, and also modifications to the SLEUTH computational code to improve speed and reduce memory requirements. The U.S. Geological Survey (USGS) implemented SLEUTH on a Web-accessible, Linux-based computational cluster and modified SLEUTH code to reduce memory requirements by more than 40% and to improve throughput by an approximate factor of five. This parallelized and modified version of SLEUTH has been used for calibration runs for 15 sub-regions of the Chesapeake Bay Watershed. In conjunction with the migration of SLEUTH from a 32-bit operating system to a 64-bit operating system, USGS adaptations enable use of SLEUTH in modeling urbanization in relatively large geographic regions (with some caveats about the effect of scale on model predictions). The USGS provides benchmarks and technical proposals for the kind of SLEUTH modifications needed to allow SLEUTH to be integrated with finer-scale growth-allocation models.

Mary Donegan, University of North Carolina - Chapel Hill. Email: mdonegan@email.unc.edu; *Urban Inequality in the Knowledge Economy and Institutional Policy Responses*

Scholars of economic development have long promoted the knowledge economy as a means to sustain economic competitiveness. Many urban areas? fueled in part by Richard Florida's theory of the creative class? have tried to follow this advice by recruiting and retaining key creative people, with the idea that these talented workers can in turn drive local, knowledge-based economic development. Yet these same scholars have noted that both the knowledge economy and talent recruitment efforts have created unintended economic consequences, such as rising earnings inequality. In this sense, the rise of the knowledge economy has created a paradox: it has provided a potential solution for struggling urban economies, but at the same time has intensified the problem of urban inequality. Earlier quantitative work suggests that there is indeed a strong relationship between creative workers and earnings inequality within a region. Yet it has also shown that, in some cases, progressive labor market institutions are effective at narrowing the earnings gap. Building on these results, this paper presents three regional policies aimed at mediating inequality in creative cities: local living wage campaigns (particularly as a stepping stone to higher statewide minimum wages); collaboration with businesses and labor associations to increase service industry unionization; and integrating immigrant communities into labor market institutions. Each of these regional policies is explored by using both theory and case studies from the literature. The paper concludes by suggesting that beyond reducing inequality, these policies may help improve local workforce skills, potentially improving regional long-term economic performance.

Francisco Donez, University of California - Berkeley. Email: fjdones@alum.mit.edu; *Black Rocks and the Big Bend - Energy Production, Wilderness, and Development on the U.S.-Mexican Border*

Between the middle 1980s and the mid 90s, two large coal-fired power plants (2600 MW combined capacity) went online in the Mexican town of Piedras Negras, Coahuila, a short distance from the Texas border. From 1993 forward, these plants (nicknamed Carbón I and II) became the objects of intense criticism from governments and activists in the U.S., because of their perceived role in contributing to sulfur oxide haze at Big Bend National Park. The situation was complicated by the fact that the Mexican government was then in negotiations to sell Carbón II to a partnership of Mexican and U.S. utilities, as part of a broad drive to attract private energy investment. This paper will situate the Piedras Negras power plants within the overlapping contexts of (1) collisions between industrial development in northern Mexico, tourist development within the Big Bend, and protection of Big Bend National Park and nearby protected areas; (2) energy sector privatization within Mexico and integration across the Texas-Mexico border; and (3) the history of Mexican-U.S.-Texas relations, particularly regarding energy and environment issues.

Keywords: air, pollution, border, texas, mexico, coal, haze, wilderness, environment, national parks, tourism

Shanon Donnelly, Indiana University. Email: sdonnell@indiana.edu; *Legal Structure and Land Cover in Intentional Communities in the Eastern United States*

The type and spatial patterns of land tenure can have important effects on how individual land cover choices aggregate to landscape outcomes. From its inception, land ownership in the United States was designed to promote private ownership. The simple dichotomy of private versus public, however, ignores sources of institutional diversity that are important for the resilience of linked social-ecological systems. This research will examine the diversity of ways in which contemporary intentional communities in the United States structure land ownership and the relationship of those structures to forest patterns at the community and landscape scales. The body of research emerging from the study of linked social-ecological systems provides a useful theoretical framework for examining the ecological role of intentional communities. Broadly defined as groups of people that have chosen to live and own land together, the concept of intentional communities encompasses a wide range of institutional arrangements ranging from tenancy in common to land trusts to non-profit corporations. Emphasizing the spatial relationship between the legal structure of the communities and their potential effect on landscape fragmentation, this research employs land cover data derived from remote sensing, digital cadastral data, and interview data collected from the communities. Findings of the research include that the legal structure chosen by the community does affect land cover fragmentation primarily through the capacity of the community to subdivide its holdings and whether decisions require individual or collective approval. Especially in exurbanizing landscapes, communities that protect land from subdivision may prove important for landscape connectivity.

Keywords: landuse, landcover, land ownership, intentional communities, complexity

Christopher Donnermeyer, Northern Arizona University. Email: cd74@nau.edu; Samantha Arundel, Northern Arizona University. Email: sam.arundel@nau.edu; *Carnegiea Gigantea Population Density and Structure at Two Sonoran Desert Mountain Ranges*

Carnegiea gigantea population density and structure were examined at two mountain sites in the Arizona Sonoran Desert. Pedestrian survey was conducted to record C. gigantea location with a GPS, height, existence of a nurse, and number of arms. Data analysis was conducted using both spreadsheet and GIS software. C. gigantea density and juvenile recruitment rates were found to be highest on south-facing slopes at both sites. Also, the percentage of individuals with nurses does not necessarily decline with decreasing vegetation cover. This study also found that C. gigantea density does not always decrease linearly with increasing elevation. GIS analysis of population structure found that clustering does exist at both sites. The results of the Global Moran's I show that clustering exists when height, nurses, and number of arms are considered. Lastly, the results of Anselin Local Moran's I showed where clusters do exist based on the three input variables. Clusters of juveniles indicate clustering of nurses whereas clusters of adults suggest a similar germination period. Individuals with dissimilar heights suggest that the taller individual(s) within the cluster have outlived their contemporary neighbors and that juveniles have replaced this population. Both juveniles and adults without a nurse suggest that juveniles are not as dependent on nurses to establish and survive as indicated in the literature. Clustering based on either similar or dissimilar arm counts supports the same conclusions as does clustering based on height.

Anne M Donovan, Kansas State University. Email: donovan@ksu.edu; *Tentacles? Testicles! A sampling of perceptions on uneatable food items among undergraduate students.*

The literature on food preferences and psychology is rich, as is the literature on culture-based food preferences and cuisine. Little exists on food choices - specifically the disgust with certain foods? at the regional level within the US. In this initial survey, students at a major university in the Midwest were asked to identify a food item that they had been offered but refused to eat, something they deemed uneatable. They were also asked to describe the setting and the reasoning behind refusing the otherwise edible food. Since 87% of undergraduates are registered as in-state residents, survey results reflect the Midwestern attitudes for this student demographic. This paper discusses the general themes evident in the data. Among these is the rather large proportion of students that had been offered Rocky Mountain oysters (calf testicles), which relates to the cattle culture that exists in the Great Plains. Another is the disgust with calamari (fried squid) and sushi, which corresponds with a continental location and the unfamiliarity with common coastal foods, especially those linked to unfamiliar ethnic cuisines. Given that the responses to the question are open-ended, a wide variety of foods were reported. Additionally, the situations in which the foods were offered could be useful for making comparisons with other regions in future research.

Keywords: Food preferences, disgust, Midwest, qualitative research

Courtney Donovan, University of Washington. Email: cjdono@u.washington.edu; *Reproducing Postcolonial Realities in the Paris Banlieue*

At present, there is a paucity of rigorous empirically grounded geographic research in postcolonial studies. While some scholars have considered the relevance of spatial and geographic concepts within postcolonial research, a great number of these studies rely solely on spatial metaphors. Overlooked are the lived experiences of postcolonial subjects and the role of space in reproducing postcolonial realities. In lieu of this paucity, I offer an empirically based analysis of the role of space in the prenatal and maternal health experiences of North and West African women living in the Paris banlieue. Home to many immigrants from former French colonies, the banlieue serve as sites for highlighting the materiality of French postcolonial relationships. Furthermore, a consideration of prenatal and maternal health helps to identify the places that may be ignored when thinking of the boundaries of postcolonial geographies. The experiences of North and West African women in the clinics and maternity wards of the Paris banlieue materialize the postcolonial tensions in French immigration debates.

Keywords: postcolonial, space, Paris, banlieue, immigrants, prenatal and maternal health

Gregory T Donovan, City University of New York, Graduate Center. Email: gregory@gregorydonovan.org; *Campaign-casting: An Evaluation of Candidates' Online Spaces In The 2005 NYC Mayoral Election*

The aim of this paper is to evaluate the online spaces generated by mayoral candidates during the 2005 election in New York City. Beginning with the first official debate of the primary season (08/16/05) and ending on Election Day (11/08/05), the mayoral candidates' websites, emails, web advertisements, text messages, blogs and physical mailings (triggered by online activity) were monitored and archived. This study applies both content and discourse analysis to the candidates' mobilization messages and the virtual spaces in which they were shaped. The analysis indicates that, despite the noticeably absent participatory functions of the online environments, attempts were made by the mayoral campaigns to present a veneer of participation through interactive imagery - simulating a sense of presence, population and place.

Andy Doolen, University of Kentucky. Email: andy.doolen@uky.edu; *Writing the Geography of Empire in Martin Delany's "Blake: or the Huts of America"*

U.S. cultural history generally casts the historical novel as an auxiliary to national progress, a narrative that establishes a unique American character and advances essential elements of political ideology. The American historical novel, like the nation itself, reflected the anti-imperial ideals of republicanism. Measured against this universal standard, the African-American author Martin Delany fares poorly in American cultural history. Valued more as an autobiographer and sociologist, because of his first-hand accounts of slavery in the mid-nineteenth century, Delany is generally undervalued as novelist, labeled a black nationalist more concerned with the laws of economic than the laws of fiction. In contrast, my paper will examine the significance of international spaces in Delany's novel, *Blake; or the Huts of America* (1861-62). As I argue, Delany demonstrates in *Blake* how a dynamic between space and historical narrative was essential to the exercise of U.S. imperial power throughout the western hemisphere. Conventional Romance theory has always held that history in the

American historical novel was an act of escape; the author left both the self and the present to imagine the nation's mythical birth. Delany, on the other hand, while never heralded as pioneer of American fiction, treats history as vital to his narrative method. Travel is the dominant metaphor for history in *Blake*, which reflects and draws upon Delany's own investigative journey through the southern slave states. For Delany an alternative history was transnational, obeyed no national boundaries, and resisted imperial ideology.

Mathew A. Dooley, Ph.D., University of Wisconsin-River Falls. Email: mathew.dooley@uwrf.edu; *A Multi-Disciplinary Approach for Mapping and Dating Alluvial Surfaces in Southwestern Arizona*

The timing and sequence of depositional events in southwestern Arizona serves as an indirect measure of climate change throughout the Quaternary. The reconstruction of depositional events, however, relies on our ability to develop and constrain relative surface chronologies. Dateable Pre-Columbian artifacts and roasting features that occur on alluvial surfaces in southwestern Arizona provide a valuable source of information that can be used to constrain relative surface chronologies at a precision that is not typically offered by conventional relative dating methods alone. This paper presents methods for developing, mapping, and temporally constraining alluvial surface chronologies using conventional relative dating methods, geospatial technologies, and surface archaeological data. Two spatial scales are considered. First, focus is placed on three portions of southwestern Arizona mapped by the Arizona Geological Survey. Next, I consider three smaller areas in and near the Crater Range Mountains, northwest of Ajo, Arizona. The results of this study suggest that surface archaeological data in southwestern Arizona, when used in combination with conventional relative dating methods, offer valuable information for temporally constraining alluvial surfaces that post-date the Pleistocene-Holocene transition. Furthermore, this study suggests that these methods are useful at a variety of spatial scales.

Sarah Dooling, University of Washington. Email: sdooling@u.washington.edu; *Ethnographies of Urban Homeless: Bare Life in Green Spaces*

Using Agamben's (1998) notion of bare life as my theoretical frame, I explore two issues: (1) the disconnection between notions of home articulated by people living in green spaces and the codified notions of homeless espoused by government and planning agencies; and (2) the tensions in green spaces between squatters who have choose to live there because all other options are not viable and the codified notions of green spaces espoused by the city parks department, who manage these spaces, and by the local, housed citizenry who participate in planning for future green spaces in the city. I present the notion of ecological gentrification, which I define as the process of organizing space that purposefully neglects the lives of the most vulnerable while espousing an environmental ethic. I conclude by asking: how can the practice of urban planning resist the production of bare life for homeless people, and present four recommendations.

Keywords: Homeless, Agamben, Green Spaces

William E. Doolittle, University of Texas. Email: dolitl@mail.utexas.edu; *Diversity Among Spanish Era Aqueducts in Mexico*

Aqueducts built in Mexico during the 16th through 18th centuries vary considerably in architecture and engineering. As similar as they may appear to be at first glance, they are actually quite different. Materials used in construction range from rock rubble to cut masonry blocks. Some were mortared, others were not. Some are quite sophisticated whereas others are rudimentary. Some were built by Spanish-trained craftsman, others were built by native craftsman using indigenous New World techniques. No clear correlation exists between any of their numerous characteristics. The locations of more than 50 extant aqueducts are mapped, and a sample of photographs illustrates the differences. Preliminary research is used to propose some hypotheses to explain variations.

David J Doran, Georgia State University & The University of Georgia. Email: ddoran1@student.gsu.edu; Michael T. Mitchell, Georgia State University. Email: michaeltmitchell@hotmail.com; *The Atlanta Beltline & Added Greenspace: The Emerald Necklace & New Urbanism in the South*

The Beltline and Emerald Necklace, string of city parks, will bring connectivity and recreation to central Atlanta. The metropolitan Atlanta area possesses the lowest population density in the U.S. and ranks tenth in population at 4.1 million. Compared to other major cities it has a very inefficient transit system and ranks 50th in square acreage of greenspace. Sources include multi-government and consultant reports obtained through the Atlanta Regional Commission (ARC), Atlanta City Council, Fulton County, The Trust for Public Lands, and Alex Garvin & Associates. The ARC recommends smart growth with mixed-use development, land use planning, and multi-modal transportation at

various urban transit nodes. Multiple governments of North Georgia need to collaborate in unison to achieve this success in new urbanism. The Beltline light rail service will be constructed along 22 miles of existing, untraveled CSX railroad tracks, connecting 49 in-town neighborhoods, 24 parks, and six prestigious universities. The estimated cost of this urban blueprint exceeds 20 billion dollars, which will be spent on mixed-use development including affordable housing which will occur around transit station villages similar to Lindbergh, Midtown, and Cabbagetown. Completion is projected for 2030 and will be the benchmark for new urbanism in the American South.

Teaching Information Technology Skills to Urban Youth Through Disability Studies

Philadelphia's population is older and experiences higher rates of disability than most other American cities. The past forty years is seen the departure of manufacturing from the inner ring neighborhoods, where they have been replaced by low paying jobs in the service sector. As a result the city faces a critical shortage of housing that is accessible and affordable. According to a 2003 study, "there are at least 30,000 fewer affordable housing units in Philadelphia than needed for rental households with incomes below \$20,000." North Philadelphia high school students see disability on a regular basis. Wheelchair users, for example, are much more visible in their neighborhoods than in more affluent parts of the city. But these young people rarely have an opportunity to research the experiences of the disabled population, let alone imagine empowering solutions to the barriers they face. Faculty of the Information Technology and Society Research Group and the Urban Education Program at Temple University partnered to develop a Disability Studies curriculum tailored to interests and background of these students. This paper describes the development and implementation of this curriculum as part of a summer intensive program in information technology and geographic information science. Through lectures, laboratory exercises, guest speakers and field work students learned to examine familiar landscapes through an unfamiliar lens.

Integrating geographic weathering theory and cultural preservation on public lands

That prehistoric cultural sites worldwide are imperiled is well understood. Cultural resource management (CRM) has developed as a professional specialization and career path in response to this fact. Phrases such as "Saving the Past for the Future" are widely used by both CRM and academic archaeologists as soundbites to illustrate aspects of the relevance and goals of the profession. Perhaps the greatest risk to the richness of the archaeological record comes from the daily loss of rock art where anthropogenic factors and natural erosion continue to result in the destruction of countless numbers of motifs engraved or painted on rock surfaces. In recognition of this problem, federal legislation exists to develop a center for rock art research; yet no reliable methods now exist for such a future center to identify the most endangered rock art. This is where geographical weathering theory can rise up from the obscurity of Introduction to Physical Geography classes into national prominence. Rock weathering researchers internationally have dozens of strategies to measure weathering, but this paper explains that no single easily-learned approach could be used by to conduct a non-destructive "triage" of the tens of thousands of rock art panels in the western United States and in the developing world. This paper goes on to explain why geographical weathering theory is sufficiently mature in its understanding of environmental-rock interactions to develop a non-destructive method usable by the non-specialists inevitably assigned to CRM projects.

Tourism Geographies: a Renaissance in the 21st Century

Geography departments are seemingly well positioned to take advantage of the growth in the popularity of tourism as a field of study. The ever-growing international reputation of the journal *Tourism Geographies* is a good case in point if we can use this journal's success as an indicator of this trend. This paper aims to evaluate and discuss the impacts of academic managerialism and capitalism and related processes to the development of programs, both academic and professional, relating to the geography of tourism, the geography of tourism and hospitality, and to the professional development of tourism. Concrete and recent examples of the aforementioned program types will be drawn from program development efforts in both California and Connecticut. These 'case studies' will be examined and used to illustrate their significant impacts on the growth of this field within geography. Additional comments and conclusions will be taken from one of last year's panel discussions on a different but related topic

entitled: 'Tourism geography: lost realities and prospective opportunities,' which sought to assess the current situation and future trends in the academic tourism geographer community in its ability to meet the needs and challenges of the tourism and hospitality industry and of academia.

Worker Peasant and the Entrepreneurial Peasant in Postsocialist Romania

This paper aims to analyze the mechanism of agrarian differentiation in two villages in postsocialist Romania. While one of the villages has been collectivized during socialist times, the other never knew any collective farming. In this paper I argue that for both villages the mechanism of differentiation were conditioned by access to off-farm jobs in socialist times. For both villages off-farm jobs played an important role in getting access to substantial income. While the villagers from the former collectivized village worked in a car factory, the villagers of the non-collectivized village were involved in commerce during socialism. This difference created different skills and perceptions in the two villages which influenced the postsocialist process of agrarian differentiation. After 1989, in the context of land restitution, the formerly collectivized villagers continued to work within the car factory and referred to do agriculture as a "part-time job". They focused mostly on maintaining their off-farm jobs. By contrast, in the other village some of the already differentiated actors focused on the most lucrative economic activities: rural tourism and, linked to that, dairy production. In conclusion, I argue in this paper that the historical background is important in understanding the mechanisms of agrarian differentiation in postsocialist villages. Landed property may not assume the significant role attributed to it in other regions.

Risks of a Stalemate of European Integration and the Public Opinion: Challenges and Conflicts of Differentiated Integration

The paper provides an analysis of the public opinion in the enlarged European Union (EU) on issues of differentiated integration. Issues of differentiated integration can be grouped in three subcategories: (i) multi-speed integration, (ii) variable geometry, and (iii) a la carte integration. Current public opinion in the EU25 indicates that there are serious risks to fail in creating a balance between widening and deepening projects of the European integration process. The EU is conceptualised in this paper in terms of an inter-state confederal consociational system that is lacking a new well-integrated supra-national European polity. Macro-geographical structure of the current EU is examined in order to derive basic explanatory assumptions that assess the current fragmentation of the EU electorate in 25 polities in terms of national socio-economic situation and pressures of globalisation. The differentiation across the enlarged EU in the public opinion supporting or opposing current stage of differentiated model (such as membership in the Euro-zone compact) is explained with the help of structural and public opinion variables. Statistical explanatory analysis (LISREL procedure) of the current articulations of the public opinion (Eurobarometers 2005 and 2006) current or future models of the differentiated integration process shows the importance of a complex opinion assessment of positive and negative opinion on widening (i.e. enlargement) and deepening (i.e. political union) of the EU. The analysis shows emerging public political opinion cleavages across the enlarged European Union of the old and new member states and indicates emerging complexities of core - periphery patterns in the continent.

Keywords: EU, public opinion, differentiated integration

Markus Dotterweich, Prof. Dr., University of Koblenz-Landau. Email: mail@markus-dotterweich.de; *Anthropogenic Impacts on Erosion and Accumulation Processes during the Holocene in Germany*

Spatial and temporal surface changes during the Holocene are strongly correlated to landuse, climate, and extreme weather. In Germany, catchments were selected which possessed well preserved geoarchives. Stratigraphic, sedimentologic, and pedologic parameters were determined and sediment & soil formations were dated by physical & archaeological methods. Historical and contemporary resources provided information about landuse, settlement, and climatic history. These, combined with archaeological investigations were used to reconstruct the ecosystem development. From Neolithic through Early Medieval, ecosystem development was driven by several phases of varying landuse intensity and duration, consisting of small woodlot clearings over a limited time span for agriculture. Forest soils dominated. In Roman Times, increasing agriculture and extreme rainfall events resulted in more than 1 meter of erosion. Through High Medieval Times, the catchments were almost completely deforested and utilized for agriculture or settlements. However, sheet erosion was low and gullies developed along pathways with confined water flow. During Late Medieval Times, extreme rainfall events and extended landuse led to intense erosion. Gullies, 100 m in length and 6 m deep developed. Single erosion events removed fertile soil, exposing underlying stones. Except for small vineyards and hops fields, the area was abandoned and naturally reforested. From the 1500-1700's landuse increased, gullies lengthened, and lower parts of gullies filled. After the 1800's, landuse intensity and soil erosion intensity decreased continuously. Gully erosion occurred only along pathways. Since the 1950's almost all the highly degraded areas are under pasture or forested.

Jamie Doucette, Department of Geography, University of British Columbia; Visiting Researcher, Institute For Democracy and Social Movement Studies, SungKongHoe University, Seoul. Email: jamie.doucette@gmail.com; *Neoliberalism and the Korean Post-Developmental state.*

This study analyses the transition of the Korean state from a developmental model towards what Ong (2004) has labeled a 'post-developmental' model of East Asian state, a model with strong neo-liberal inflections. In order to get at some of the constitutive relations that underlie this transition I treat the Korean state within an extended geographic field. Previous accounts have focused more on elite relationships between the state and business groups that fashioned industrial policy and failed to anticipate the role that social movements, neoliberal-oriented bureaucrats, and industrial and financial capital would/did play in refashioning the developmental orientation of the state. Hence, this study attempts to better gauge the agency of these groups in the transition by analyzing some of the subtle sets of interactions that inform them. The state's strategic deployment of different caring and punitive practices in response to crisis and opposition, the insulation and protection of pockets neo-liberal expertise within the state, and the effects of the valorization of various worker, nationalist, migrant subjectivities on state policy (and policy-makers) are considered as key factors mediating and inflecting the neo-liberal transition of the Korean state. This set of interactions includes exchanges not simply in the economic sphere, but in a wider traffic of symbolic and political goods that have informed and set limits on the capacity of post-developmental state: especially in terms of the extent of democratic consolidation and participation in the area economic policy, where key cleavages on the basis of class, gender, and ethnicity continue to exist.

Percy H. Dougherty, Kutztown University of Pennsylvania. Email: doughert@kutztown.edu; *Wine Production in Apulia, Italy? Changes in an Ancient District*

Apulia or Puglia is located in the extreme southeast of Italy extending along the east coast from the Promontorio del Gargano in the north to the Salento Peninsula, often called the Spike or heel of the boot, in the south. If Apulia were a country, it would be the sixth largest producer of wine in the world. Known for its production of Primitivo, Negroamaro, Malvasia Nera, Aglianico and many other grape varieties, not grown widely elsewhere, Apulia has had a reputation of quantity rather than quality. Many of the grapes are throwbacks to the early Greek settlements that once covered this area. The impact of zonazione, the Italian equivalent to terroir, is well illustrated. This is an area that differs from the stereotypical Italian wine district in that it is an area of low relief with very arid conditions caused by its windward location on the mountainous peninsula. Great changes have occurred in recent years that differentiate Apulia from other Italian regions including the development of extensive vineyard holdings in which agribusiness produces huge amounts of wine in large, modern, technologi-

cally advanced wineries. Changes in the viticultural practices and the type of wines produced are also explored.

Kirstin Dow, University of South Carolina. Email: Kdow@sc.edu; Richard Murphy, Univ of South Carolina. Email: rlmurphy79@gmail.com; Greg Carbone, Univ of South Carolina. Email: greg.carbone@sc.edu; Jinyoung Rhee, Univ of South Carolina. Email: rheej@mailbox.sc.edu; *User Evaluation of Drought Mapping*

As a chronic hazard affecting large portions of the country, drought is one of the costliest threats facing the US. The slow evolution and long duration of a drought means that ongoing monitoring of conditions can inform a range of adaptation decisions as the threat emerges, worsens or lessens. Under these circumstances, real time mapping of drought conditions offers a valuable option to minimizing potential impacts. Designing such an effective risk communication strategy requires relevant, timely, credible information, but those climate information needs and the relative utility of such information have received little attention. This paper reports on one effort to evaluate the relevance of various drought mapping formats. A survey queried drought managers in South Carolina about the utility of spatial information at different scales. They evaluated maps delimited by river basin, climate divisions, county, and drought management regions to determine the value of multiple forms of spatial information. This exercise allows us to explore the notion that higher spatial resolution is consistently preferable.

Keywords: Drought, Risk Communication, water resources

Lorraine Dowler, Penn State University. Email: lxd17@psu.edu; *The Final Frontier: Gender, Militarization and the Mercury Space Program*

This paper is situated in the frontlines of The Cold War: the space race. On June 17, 1963, Soviet cosmonaut Valentina Tereshkova became the first woman in space. There were suitable American candidates two years prior to Tereshkova's flight, when thirteen female pilots, recruited by the private Woman in Space program, surpassed the men's scores in both the physical and psychological exams. At the time, two reasons prohibiting women from being sent into space were suggested: 1. Space flight is a form of militarization therefore all pilots need to have proven themselves as military pilots prior to entering the space program. Since women were restricted from flying in the U.S. Air Force they would naturally be disqualified. 2. Ideologically, the loss of an American woman, especially a mother, in space would have translated into a loss of The Cold War.

Keywords: Gender, Cold War, Space Race

Robyn Dowling, Macquarie University. Email: rdowling@els.mq.edu.au; Pauline McGuirk, . Email: Pauline.mcguirk@newcastle.edu.au; *Planned residential environments in 'the neo-liberal city'*

New residential environments, in Australia, the United States and elsewhere, have been substantially reconfigured by forces of privatisation and privatism. In the Australian case, privatisation has been most obviously manifest in master-planned estates in which a private development corporation carries out activities that have historically been the purview of the state: planning, infrastructure provision and facilitation of community development. In this paper we cast a critical eye over this presumed process of privatisation. Based on interviews with development, planning and property organisations we explore the myriad, potentially contradictory, motivations and influences producing master-planned estates. Rather than evidence of the all-encompassing grasp of neo-liberalisation on the contemporary city, we find a complex enactment of privatisation through which new geographies of sociability and sustainability are being embedded.

Keywords: urban neoliberalism, residential environments, privatisation

Victoria S. Downey, University of Kansas. Email: vdowney@gmail.com; *Representations of Waikiki: An analysis of tourism through hotel brochures*

Tourism dominates the Hawaiian economy, and the economic stronghold of the tourism industry is Waikiki. Waikiki contains more rental units than anywhere else in the state and in 2002 was responsible for 55.6 percent of hotel rental units statewide. This presentation will focus on the various representations of Waikiki through textual analysis of brochures from hotels in the area. Throughout history representations of the Pacific as a whole were romanticized in part to draw colonial settlers to the area. Waikiki continues to be depicted as both a familiar and exotic entity in mainland United States tourism advertising. Over time, the development of Hawaiian tourism has been possible through this appealing dualism. Through the investigation of this cultural construction, this presentation will explore such representations of Waikiki from a postcolonial perspective and investigate the specific ways these representations are contributing to Waikiki's tourism development. This research will contribute to a larger

body of literature which considers the ways postcolonialism and tourism might intersect.

Keywords: Hawai'i—Waikiki, tourism, representation, postcolonialism

Joni A Downs, The Florida State University. Email: jad05m@fsu.edu; Mark W Horner, The Florida State University. Email: mhorner@fsu.edu; The Flight Leg Allocation Problem (FLAP) for Modeling Pathways of Migratory Birds

Selection of individual sites in a network of nature reserves is a strategic decision that considers trade-offs between monetary costs associated with habitat acquisition and the benefits of biodiversity preservation. Conserving habitat for migratory birds presents a unique set of challenges, because birds that cannot complete migration in a single flight must stopover at intermediate sites. Therefore, multiple reserves distributed across space may be required for complete protection of a single species. We developed the Flight Leg Allocation Problem (FLAP) to identify optimal configurations of stopover habitats for migratory bird conservation. FLAP, a network flow problem, finds the optimal migratory pathway that requires use of the fewest number of stopovers in the shortest distance, given that flocks of birds are limited by maximum daily flight capabilities and constrained by carrying capacities of individual habitats. We first present the FLAP model formulation and describe results of an empirical test for a large wetland dataset. Then, we briefly discuss conservation implications for using FLAP to identify priority conservation sites for migratory birds in nature reserve networks.

Peter Downs, Stillwater Sciences. Email: downs@stillwatersci.com; Maia Singer, Stillwater Sciences. Email: maia@stillwatersci.com; Re-establishment of physical and biological integrity in fragmented rivers lacking a credible reference condition: lower Merced River, California

In many rivers regulated by large dams, changes to the river's morphology, hydrology and sediment regimes are so profound, and longitudinal and lateral disconnection so complete, that no credible reference reach exists as the basis for restoration. In these fragmented rivers, restoration must use exploratory field data along with predictive and empirical models to improve system integrity. The lower Merced River is both disconnected from its upper watershed, and further fragmented in the "dredger tailings reach" (DTR) from historic gold mining which has laterally disconnected the floodplain. The DTR is now a focal reach for restoration planning because upstream fish passage restrictions make it a primary spawning area for anadromous fall-run Chinook salmon and, potentially, the endangered Central Valley steelhead. Restoration planning has necessarily involved "naturalization": the establishment of a new ecosystem where morphological and ecological configurations are designed to be compatible with contemporary altered flow and sediment transport regimes. There are four primary restoration challenges for the DTR: 1) stimulation of an effectively "paralyzed" river channel, 2) improvement of highly sub-optimal habitat for native aquatic species, 3) re-establishment of native flora and fauna on a floodplain comprised of unconsolidated dredge tailings, and 4) protection of the ecosystem from the potential mobilization of bioavailable mercury. Baseline studies and numerical modeling were used to develop restoration proposals that acknowledge ecosystem creation and the management commitment required to sustain the improvements. A rigorous monitoring plan has been devised to evaluate the project, and also to maximize the transferability of the learning experience.

Email: r.taylor@kingston.ac.uk; Podcasting to enhance geographical field-based teaching and learning

Podcasting is a rapidly developing area of e-learning. On-screen software (such as iTunes) and mobile devices (such as the iPod or a palmtop computer) provide the opportunity to communicate recorded information any-where at any-time. Podcasting has huge potential for geographical teaching and learning because it extends the students learning environment, facilitates mobile learning and encourages widening participation. In the fieldwork context, this means that students can access site-specific information to enhance and test their understanding of geographical phenomenon. We present the findings of a range of podcasting initiatives undertaken Kingston University (London, UK) 2005-present: (i) Geographical iWalks - spatially referenced podcast guides to support fieldwork. Examples are given for guides developed for fieldwork in the UK, Spain and Malta. (ii) Technique specific podcast - 'how to do' podcast guides providing mobile reference guides to fieldwork techniques. (iii) Podcasting as an

assessment tool - students create their own video-documentary podcasts of independent field research projects. An example of fieldwork in South Africa is provided. The student and staff experiences are evaluated, barriers to entry are considered and recommendations proposed: students respond to a variety of podcast experiences, welcome 'quality' production and are switched-on to the flexible learning opportunities they facilitate (e.g. occupying 'dead-time' in transit between field-sites). We observe that, in this initial experimental phase, the demand and market for geographical podcasts as an aid to teaching and learning is huge. We anticipate future developments (notably, technology convergence) and highlight the commercial implications of this research.

Martha Dowsley, PhD Candidate, McGill University. Email: martha.dowsley@mail.mcgill.ca; The Effects of Inuit Conceptions on Polar Bear Conservation

Inuit and polar bears have long been co-apex predators of the arctic environment. With the advent of mechanized transport and firearms, Inuit improved their position relative to bears and increased their bear harvest in response to the emerging monetary economy. After quotas and a sport hunt were developed in the Northwest Territories of the Canadian arctic during the 1960s and 1970s, the Inuit-polar bear relationship changed dramatically. Inuit communities were restricted in their harvest, but were given the opportunity to vastly increase monetary returns per bear. The change in understanding bear populations as independent from human hunting pressure to viewing them as a finite resource is ongoing in arctic communities and includes many cultural intricacies. The shift is further complicated by concerns over climate change and contaminants, and by the creation of the new Inuit-majority territory of Nunavut. This presentation explores how Inuit conceptions of polar bears influence discussions in Nunavut co-management settings.

Aaron Doyle, Carleton University. Email: adoyl2525@rogers.com; Kevin Walby, Carleton University. Email: kwalby@connect.carleton.ca; Imagining the Other Place: Examining Public Fears of Assorted Urban Spaces

Drawing from open-focused interviews with residents of differing urban neighbourhoods in Ottawa, Canada, this paper discusses the interplay of risk, fear and place in people's lives, examining how certain urban spaces, sometimes seemingly innocuous or little known by the interviewee, come to be understood and constructed as "other" places to be feared and shunned. The interviews provide the empirical context to re-examine various ways of theorizing feared places such as notions of deviance, alterity, stigma, risk, purity and dirt, and abjection.

Keywords: risk, fear, mobility, alterity, stigma, abjection

Brian J. Doyle, United States Military Academy. Email: brian.doyle@usma.edu; Wind, Tides and Current - the Key to the Defense of West Point

This paper will examine the role played by the wind, tide and currents in the defense of West Point during the Revolutionary War. Both the British and Continental Forces identified the Hudson as the key to controlling the continent. Early on the significance of West Point was recognized due to its location at a major bend in the river. The continental forces occupied and fortified this location in their attempt to maintain control of the river and thus ensure New England remained linked to the remainder of the colonies. The defense of West Point was primarily centered around a battery of cannons positioned at the critical bend in the river, and placed so as to shoot directly across the water and into the hull of any passing vessel. To assist in slowing down the vessels, and thus enable the cannons to hit their target, a chain was forged and stretched across the river. Some contend that this chain would have easily been snapped, given the force of a hull against it. This paper will argue however, the variables of wind, tide and current at this location on the Hudson would make it extremely unlikely that a sailing vessel could gain the required speed to break the chain, or even, in many cases, round the bend. A historical record will be built of wind and current speed, as well as tidal range, to establish the number of days when a vessel could even attempt to round this obstacle in the Hudson.

Jason Doyle, Salem State College. Email: jasond14@msn.com; Analysis of Landcover Change in South Florida's Everglades

Water management has been a hot topic of debate and scrutiny in south Florida due to onset of urbanization and ever-escalating population that thrives there. The effects of water management, in order to meet societal demands, have infringed upon and critically altered the once untouched Everglades National Park. I will be analyzing these effects, which have changed the ecology and

overall characteristic in this region. This research will be done utilizing Landsat TM and ETM data, over the past twenty years, from the mid-1980's to the present. This research utilizes a variety of land change techniques to see the effects, on the land, caused by these water management practices. The Everglades has forever been an integral part of the south Florida's ecology. It has come to characterize the ecology of this region, distinguishing it from other places due to the array of wildlife that call it home. Water management practices have altered this ecology, but changes have been made and are constantly in process to reverse these effects. Florida's Everglades National Park is such an important piece of Florida's history, culture, and economy, but most importantly is home to a multitude of species of wildlife that are struggling to survive there.

Stephanie Drabble, Manchester Metropolitan University. Email: s.drabble@mmu.ac.uk; *Exploring de-centred spaces of creativity in Manchester, UK.*

This paper critically discusses Florida's (2002) notion of the creative class, which presupposes that creativity is located within particular social groups and neighbourhoods, explicitly defined by certain class based tastes and consumption preferences. This powerful idea has certainly influenced cultural regeneration strategies which tend to favour middle-class interests and privilege the city-centre as the primary site for creative production. Such approaches however, overlook the potential for suburban forms of creative practices and the contribution they can make in terms of both social and economic benefits to local development. It is being increasingly recognised that there is genuine need within the UK to promote the development of suburban regeneration (ODPM, 2004). This paper therefore, examines how creative practices within two suburban locations in Manchester (UK) have contributed to sustained economic and social development. The research reveals the value of private and collective forms of intervention in producing networks of exchange essential to support local development. The paper concludes with the assertion that the exploration of de-centred and vernacular spaces of creativity provides a valuable insight into potential models of suburban regeneration.

Christine Drake, Ph.D. University Professor of Geography, Old Dominion University. Email: cdrake@odu.edu; *Indonesia: a decade of extraordinary change*

Indonesia has experienced enormous changes over the past decade! Politically, the government has moved from Suharto's military rule to a democracy with a directly elected president and devolution of power to the regions. East Timor has become independent and the civil war in Aceh is now over. Economically, Indonesia suffered through the serious SE Asian economic crisis of 1997-98 and has spent the ensuing years recovering. Socially, the country has added more than thirty million to its population, and ethnic and religious tensions have grown and erupted into violence on a number of occasions. Indonesia's environment has experienced both severe natural calamities including the great tsunami of 12/04, earthquakes, and volcanic eruptions, and human-caused disasters such as greater deforestation, mudslides, floods, and the destruction of coral reefs. This paper analyses these changes in more detail, based on both statistical evidence and recent field research.

Keywords: Indonesia, environment, change

Dawn M Drake, University of Delaware. Email: dmdrake@udel.edu; *Examining the Issue of Maldistribution of Physicians through GIS: A Case Study of Retina Specialists in the United States*

The location decisions of physicians in the United States have significant impacts on the cost of, quality of, and access to health care for Americans. Many parts of the country remain largely underserved, while metropolitan areas have an overabundance of doctors. By studying the location of physicians and their practices within the GIS, one can detect these pockets of underserved and over served populations. This presentation looks at the distribution of physicians in one sub-specialty of ophthalmology, retinal medicine, by mapping the locations of the members of the American Board of Retina Specialists. The results find that cities like New York, New York, Los Angeles, California, and Dallas-Fort Worth, Texas are well attended by their retina specialist populations, while Buffalo, New York, Kansas City, Kansas, and Phoenix, Arizona remain largely underserved. Only by obtaining a visual image of the physician population can the United States fully appreciate the maldistribution problem and seek proper remediation.

Keywords: GIS, medical geography, retina specialists, maldistribution

Mark H. Drayse, California State University. Email: mdrayse@fullerton.edu; *Regional Dynamics of Canadian Furniture Manufacturing in an Era of Globalization.*

Economic liberalization has created opportunities and challenges for Canadian furniture manufacturers. On the one hand, a favorable exchange rate and more open American market contributed to rapid growth during the 1990s. In fact, between 1994 and 2003, the furniture industry was the fastest growing manufacturing industry in Canada, almost doubling employment. On the other hand, firms face greater competitive pressure from imports, especially since the emergence of the Chinese furniture industry. This paper addresses the following questions. How have Canada's regional furniture producing centers been integrated into continental and global economies? To what degree are firms competing by developing supply networks in China and Pacific Asia, and distribution networks based in the United States? How have regional institutions and assets influenced the industry's recent development? These questions are addressed using secondary data, the results of a survey, and interviews with managers of Canadian furniture firms.

Keywords: Canada, Furniture Manufacturing, Globalization.

Dusan Drbohlav, Charles University, Prague, Czech Republic. Email: ddrbohlav@quick.cz; *Illegal Economic Activities of Migrants in the Czech Republic*

The Czech Republic has quickly been shifting towards western migratory/integration models well-known from the developed World. The given issue of economic activities of illegal/irregular migrants has not yet been researched into too much in the Czech Republic. Nevertheless, it is one of the key migration policy goals declared by the Czech Government. The presentation is based on results of a research project sponsored by the Ministry of Labour and the Ministry of Education. A team of members of the Department of Social Geography and Regional Development, Faculty of Science, Charles University in Prague, has been involved in tackling the given issue in 2005 and 2006. The presentation introduces results of three different research activities in the given field: First, results of a questionnaire survey among 70 Post-Soviet illegal economic migrants who operate in Prague, results following from an analysis of interviews with 47 illegal economic migrants (both those who still operate in the country and those who have been caught by the Police) and results of a Delphi method with 32 migration experts. The results bring new pieces of information on this important phenomenon, inter alia, on reasons for migration, basic characteristics tied to migrants, their living style, and their probable future behaviour. One of the most important goals was to ascertain impacts of migration policy measures upon migrants and, vice versa, an impact of migrants' illegal/irregular activities upon various social substructures of Czech society.

Keywords: illegal immigration, economic activities of migrants, Czech Republic

Christine M. Drennon, Trinity University. Email: cdrennon@trinity.edu; *Redefining Political Community on the Balkan Peninsula*

Ethnic cleansing and genocide (especially as practiced on the Balkan Peninsula) remove all traces of ethnic difference or diversity from the landscape. Yet the very presence of that diversity alludes to a past that must have been organized very differently to allow such diversity to flourish and persist. In fact in some parts of the world, the 20th century formulation of the nation-state redefined group identities by the territorial limits of the sovereign state, replacing other older forms of political identity with one that is territorially defined. There is a sense that this inclusivity is highly democratic; however, this universalism can also be understood as quite exclusive since those whose private or group identities fail to align with that of the spatially-circumscribed majority frequently lack some of the rights guaranteed by the state. Iris Marion Young theorizes this tendency toward intolerance of difference as a more generalized process that produces homogeneity within any formally identified group. So what if we identify a different or alternate group identity such as a social movement to privilege as public rather than location? What would happen in the spatial domain? Would diversity once again be tolerated? In this paper I propose a theory of territoriality and group identity that may help us make sense of ethnic cleansing and genocide. Data from the multi-ethnic, pre 20th century Balkan Peninsula is used to illustrate this proposed theory.

Keywords: political identity, territoriality, Balkan Peninsula.

Wolfram Dressler, Dr., Lecturer, University of Queensland, AU. Email: wolfram_dressler@hotmail.com; Bram Buscher, Mr., PhD Researcher, Free University, Amsterdam, Netherlands. Email: ; *Market Triumphalism and the CBNRM 'crises' at the South African Section of the Great Limpopo Transfrontier Park.*

Abstract Transfrontier conservation has taken Southern Africa by storm. The modus operandi remains simple and intuitive: by dissolving boundaries, local benefits grow as peace, conservation and development spreads regionally.

However, in the case of South Africa's section of the Great Limpopo Transfrontier Park, political economic change redirects benefits to support 'modern' economies at the expense of rural livelihoods through community-based natural resource management (CBNRM). Neo-liberal agendas promoted by government derail efforts at decentralizing CBNRM initiatives beyond markets and state control. In sequence, national officials draft and implement guidelines for devolved conservation, conjure up poverty relief or 'social responsibility' projects, which the private and public sector implement as "tertiary production" for regional development. Results suggest that 'CBNRM' programs and projects related to and independent of transfrontier conservation support private sector interests rather than the resource base of rural livelihoods. The paper concludes by offering insights into how and why CBNRM often fails to support the livelihoods of resource users who reside at the western edge of the Great Limpopo Transfrontier Park.

sblue@niu.edu; Subcontractors and Undocumented Immigrants in La Nueva Orleans

Following hurricane Katrina, New Orleans became a 'new destination' for Latino migrants in the American South. Tens of thousands of Hispanics from across the United States and from Mexico, Central and South America came to take part in the reconstruction and clean-up or to work in the hospitality industry. In our paper we discuss two aspects of Latino migration to New Orleans in detail: the consequences of large-scale undocumented migration, and the role that subcontractors are playing in bringing Latino migrants to 'new destinations' like New Orleans. A survey we conducted of Latino workers in New Orleans reveals that undocumented migration and labor subcontracting go hand in hand. Employers wanting to avoid the legal repercussions for hiring undocumented workers rely on subcontractors for procuring false documents and social security numbers as well as bearing the legal responsibility for the hiring of the workers. In our paper we explore this important relationship. We discuss the consequences of subcontracting on Latino settlement geographies, the degree to which subcontracting relationships appear to be exploitative and the manner in which this emerging phenomenon challenges traditional theories of immigration and integration.

Fluctuations in the onset of reproduction of a Sonoran Desert cactus over its range and implications for lifetime reproduction

The saguaro cactus becomes reproductive at a height of about 2.2 m at Saguaro National Park (SNP), which has been assumed to be fairly consistent over their range, although growth rates are extremely variable across the range of the species. In this study, I determine if the onset of reproduction is related to age or height, and I determine whether this varies over 4 environmentally different sites over the species' range. The tallest non-reproductive saguaros and shortest reproductive individuals were sampled at each site and age was estimated on an established model. One-way ANOVA was employed to check for differences in height, and then in age, across the 4 sites. The onset of reproduction at SNP was near the earlier recognized estimate, at an age of about 52 years. By comparison, individuals at the most arid site (with the slowest growing individuals) become reproductive at an average age of about 106 years! Although individuals grow more slowly, reproduction actually begins at a taller height, at about 3.28 m. Thus, flowering and fruiting is significantly variable both by age and height. Although only four sites were sampled, the pattern coincides with the summer rain belt. In more arid areas, growth is very slow, and reproduction begins much later in an individual's life.

Seeking Shangri-La: Domestic Tourism in Yunnan, China

Thanks to rising personal incomes and paternalistic government policies, a significant number of Chinese citizens have begun to explore their country's scenic sights. As a result, domestic tourism in China has had exponential growth in recent decades. Yunnan province, in the Southwest, is one of the most sought-after destinations of Chinese tourists who can afford to travel there. Its appeal is multifaceted exoticism that is grounded in the familiar: ethnic minorities defined by their relation to the Han Chinese, foreigners as role players in controlled and safe theater, rugged topography that births major rivers and frames familiar cultural attractions, jade fashioned into typical jewelry and souvenirs, and well-known medicinal herbs and flowers of supposedly greater purity or beauty. The Chinese government has added to the exotic appeal by recently designating Zhongdian County, in extreme northwest Yunnan, as Shangri-La. There is no historic basis for this official designation, but there is the practical reason of

attracting more tourists to Yunnan and drawing them westward and upward from the main city of Kunming to the wild boundary with Tibet. This paper focuses on the Chinese tourist and discusses the nature and meaning of their encounters with the following places: Kunming, Dali, Lijiang, Tiger Leaping Gorge, Jade Dragon Snow Mountain, and Zhongdian.

mrx43@psu.edu; Discourses of (re)development: imagining alternatives for East Biloxi post-Katrina

In this paper, we critically examine the dominant planning discourses informing the redevelopment of East Biloxi, Mississippi in the wake of Hurricane Katrina, and imagine alternative discourses that would create different sets of political and material possibilities. The community of East Biloxi faces a unique set of challenges to rebuilding post-Katrina, including new FEMA requirements for flood insurance, land speculation, and rapid commercial casino development due to relaxed regulations. Local government leaders have adopted community plans that privilege economic growth in the form of tourism and casinos over all other potential community values. Using a discourse analysis approach, we identify the various planning discourses, and analyze whether and how multiple alternative discourses are interacting from the perspective of collective action. Next, we identify which actors are enabled or constrained within that discourse. We ask, who has access to what resources within the dominant discourses? How have issues been framed at different scales, and how do those scalar frameworks enable or constrain some actors? Finally, we imagine alternative discourses for rebuilding East Biloxi, and look critically at how and whether these alternative discourses create new political possibilities.

Keywords: Katrina, redevelopment, discourse analysis, collective action

Sheldon Drobot, University of Colorado. Email: drobot@colorado.edu;
Eve Gruntfest, UCCS. Email: ; Charles Benight, UCCS. Email: ; Why Do People Drive Through Flooded Roads?

Motor vehicle-related deaths account for more than half of all flood fatalities, but to date, very little is known about why people deliberately drive through flooded roads. Therefore, this talk will quantify the major risk factors associated with driving into flooded water, and then used these risk factors to develop a binary logistic regression model. Data for this project are based on mail-in surveys conducted in Denver and Austin in 2005. Roughly 1000 responses were obtained and respondents were coded as those who would drive through flooded roads or those who would not based on a "driving scenario". The potential risk factors were coded either as dichotomous or continuous variables, and the analysis focused on determining whether there was evidence to conclude that there was a significant difference in a potential risk factor between those who drove through flooded roads and those who did not. Subsequently, all the constructs that showed significant differences were used in a stepwise binary logistic regression model to determine if the probability of driving through flooded roads could be determined. The presentation will discuss the findings and implications of these results.

The piedmont region of southeastern North America experienced intensive land use after colonial settlement in the early 1700s. Thomas Jefferson's Monticello Plantation provides a well-documented opportunity to examine the long-term response of forests to past plantation agriculture typical of this region. Using dendroecology, repeated forest surveys, and land surveys drafted by Jefferson, we reconstruct the ecological history of three forest stands at Monticello Mountain. Tree-ring data from *Pinus* and *Quercus* species provide estimates of tree establishment and successional pathways beginning in the 1700s. Subsequent canopy disturbance events within these forests are determined using time series analysis with intervention detection, which identifies outliers in the growth rates of these trees over the past two centuries. Current species composition and density are compared with field data from a 1935 Master's Thesis set at Monticello. Surveys and correspondence from Jefferson are also used to estimate forest condition during his tenure. Collectively, these data sets show the combined effects of past land use, life history attributes of tree species, and aspect on the growth, composition, structure, and extent of forests at

Monticello.

Dorothy W. Drummond, Independent Scholar, Indiana State University. Email: dd2@indstate.edu; *Israel, Al-Qaeda, and the Koran: Geopolitical Issues*

The roots of Arab antipathy to Israel lie as much in the Koran as in territoriality. Although the Koran is ambiguous concerning Jews ("Jews are People of the Book and must be honored as such," "The Jews are enemies of Allah, the Prophet, and the Angels") Muslims everywhere grow up with a bias against Jews. Moderate Muslims strive to overcome this in-bred antipathy in the interest of cordial human relations. But fundamentalist Muslims, many of them poorly educated and led by Islamist imams, are easily guided toward activism. The stance of Hamas and Iran's president Ahmadinejad, that Israel should not exist, reflect views deeply held by their followers. Bin Laden, schooled in Wahabbi teachings, was originally committed solely to ridding sacred Arab soil of the presence of American troops. But by the mid-1990s Bin-Laden had come to adopt for his own widening cause the one issue that he saw as uniting all Arabs (and eventually all Muslims): the presence of the state of Israel, and the support of Israel by the United States. 9/11 is the direct result of this thinking. al-Zawahiri, who came out of Egypt's Muslim Brotherhood movement, and since the mid-1990s has been Al-Qaeda's intellectual leader, sees opposition to Israel and the United States as a means to an end, not as an end in itself. By opposing Israel and the United States, Islamist intellectuals will win to their cause the masses of disaffected Muslims, whose support they will need if Salafist aims are to be reached.

Lisa B W Drummond, PhD, York University. Email: drummond@yorku.ca; Lien Thi Nguyen, MA, University of Natural Science, Hanoi, Vietnam. Email: lienhus@yahoo.com; *Uses and Understandings of Public Space among Young People in Hanoi, Vietnam*

It is almost now a cliché to assert that contemporary Vietnam, especially contemporary urban Vietnam, is experiencing rapid social change. The impact of the 1986 doi moi (economic renovation) open door policy, slow to start, had by the late 1990s allowed the formation of an urban generation of young people increasingly almost as much attuned to the external flow of ideas/culture/opportunities as to internal imperatives of Party/culture/tradition. In part this can be attributed to Vietnamese culture's long history of the assimilation of foreign ideas, but nevertheless in a society with over two-thirds of the population under thirty this generation may well represent more of a rupture than a continuity-by-assimilation. Part of a larger project to investigate the uses and meanings of public space in Hanoi, the political and cultural capital of Vietnam, the research presented here focuses on young people's understandings of the term 'public', the types of spaces they consider public spaces, and their uses of public space. A city's public spaces both construct and are constructed by social practices, state concerns, and collective memory. This paper examines the ways in which young people are taught and socialized to understand what and who constitutes 'the public' and appropriate public behaviour, how young people practice these understandings, and how these uses express, support, or transgress contemporary social norms. As such, this research offers an insight into the everyday lives of urban youth at a moment of what appears to be profound social change.

Mark A. Drummond, United States Geological Survey. Email: madrummond@usgs.gov; *Scenario-based Modeling and the Driving Forces of Land Change in the Central U.S., 1920-2020*

This paper examines the causes and patterns of historical, contemporary, and future land change in the central U.S. The Great Plains has experienced widespread clearance of grassland and fluctuations in land use that vary regionally. To understand change, contemporary land use and land cover was documented between 1973 and 2000 using Landsat satellite data and a statistical random sampling strategy. Three future scenarios of land cover were identified and modeled based on regional trends and the primary driving forces of change. Scenarios were used in a spatially-explicit model to provide a practical method to examine the effects of land use change in response to divergent forces. Using available land use information and an understanding of historical trends and environmental patterns, the 1920 land cover was also reconstructed. The purpose of this research is to understand the land change dynamics and vulnerabilities of the region in response to socioeconomic and environmental driving forces. Results indicate substantial regional differences in land cover dynamics that depends on the prevailing socioeconomic factors, natural resources, and

climate. The 100-year span of land cover is being used to assess the consequences of land cover change on climate variability.

Alasdair D. Drysdale, University Of New Hampshire. Email: drysdale@christa.unh.edu; *Oman's fertility transition*

Oman has conducted two censuses in modern times: in 1993 and 2003. During that period there has been a sharp decline in fertility from 6.9, among the highest in the world at the time, to only 3.7. The share of the population under 15 has fallen from 52 percent to 41 percent. This paper examines some of the reasons for this dramatic transition, which coincided with the introduction and implementation of an ambitious birth spacing program that has made a wide range of modern contraceptives readily available through government health clinics. Although the birth spacing program has been modestly successful, its precise contribution to fertility decline is difficult to separate from other broad changes in Omani society, whose cumulative effect has been to reduce rates of reproduction. These include a massive expansion in female education at all levels and greater participation of women in the labor force. There has been an especially large drop in very early marriage, greatly increasing the age at which Omani women first give birth.

Keywords: Oman, population, Middle East

Jessica Dubow, University of Sheffield, U.K.. Email: j.dubow@talktalk.net; *'Minima Moralia' or The Negative Dialectics of Exile*

Orienting its argument around Theodor Adorno's collection of brief essays based on the journal he kept in his years of exile from Nazi Germany, this paper considers the relation between the body of the 'unhomely' subject and the dynamics of critical thought. In this it seeks not only to read Adorno's America as the location from which to launch his analysis of the catastrophic logics of Enlightenment Europe. More importantly, it emphasises the ways in which the making of a critical consciousness may be seen as the analogue of that sharper dilemma which is the perceptual and somatic experience of exile. I thus argue that the radical insufficiency between self and space that attends the traumatic affects of geographic displacement not only informs Adorno's injunction against the 'false ego' of all identificatory impulses but creates the conditions for conceiving the broader architecture of his negative dialectics. 'Minima Moralia: Reflections from Damaged Life', in short, is not merely the broken narrative of a writer in exile. It is about the impossibility, but critical potential, of thinking any authentic reconciliation between body and environment; it is about the necessity of the self made imperfect by the failure of all clarifying classifications. It is, in short, about the very making of the critical subject; one that might learn to carry its home on its back.

Keywords: body, affect, exile, negative dialectics

Sophie Dubuisson-Quellier, Centre de Sociologie des Organisations, Paris (CNRS/Science Po). Email: s.dubuisson@cso.cnrs.fr; *What kind of consumers' involvements in alternative food systems?*

The spread of various food systems which claim to address the issue of sustainable development and to translate it into practices (fair trade, short circuits, and organics labelling schemes) can be assessed as avenues for consumers' involvements in what can be called sustainable consumption. We will present some preliminary results of a European project which focuses on this question and involves several academics in geography, sociology and political science. Several field studies have been conducted in France, Belgium and the United Kingdom, to analyze various forms of alternative food networks, especially fair trade (based on international labelling schemes) and local food networks (linking producers and consumers around box schemes), but also different kinds of collective mobilization on alternative consumption (responsible and sustainable consumption). The contribution focuses on three different kinds of consumer involvements on which these alternative definitions of consumption are based. The first type can be defined as a delegation regime and is based on market devices such as labelling schemes (for fair trade products or organic food); the second may be called a negotiation regime and relies on specific contracts between producers and consumers; and the third kind of involvement can be described as an empowerment regime in which consumers enter some deliberative arenas around production, distribution, and consumption of food. We want to stress out that these several consumers' involvement regimes are often blended with each others within one type of alternative food network instead of being typical from one of them.

Keywords: alternative-food-network, consumer, sustainability

Emily Duda, University of Oklahoma. Email: Emily.J.Duda-1@ou.edu; Courts, Abbeys and Forests: Marie de France's Places of Belonging

An earlier presentation applied Yi-Fu Tuan's *Landscapes of Fear* to medieval literature. It examined how the medieval poetess Marie de France redefines the landscape of the forest through *lais* which, unlike the poetry of her contemporaries like Chretien de Troyes or the Gawain poet, suggest a dangerous court versus a fulfilling wild. This message comes through most prominently in poems such as "Lanval," "Guigemar" and "Bisclavret" among others. Marie transforms the forest and its denizens from dangerous to noble and civilization becomes suspect. However, Marie also uses a third setting, a religious one. Poems such as "Le Fresne" and "Eliduc" involve both abbeys and abbesses which play principal roles in defining the female characters. Although her identity is uncertain, some scholars surmise that she was an abbess. Thus her religious station might have influenced her view of a secular setting versus a religious or a pastoral one. This paper goes on to examine the sense of alienation from society and the alternative places in which those who did not fit in with society could take refuge. It not only examines this third form of place, but also considers the origins of such a reinvention in the literary tradition and how it might relate to the sense of alienation in her poetry. There was a need to a safe setting and a noble setting which was unfulfilled by the court for Marie, so it was defined elsewhere in her poems.

Nicole Marie Dufour, University of Alaska - Fairbanks. Email: ftmnd@uaf.edu; Overthrowing the Humans: The Construction of Cat and Dog Identities in Web Pages Written from the Pet's Perspective

The perception of dogs as loyal companions and cats as sneaky, self-centered beings is frequently portrayed in western popular culture media. From comic strips to pet food ads, the anthropomorphism of pets has become so common that the characteristics attributed to different species in mass media affect how we as humans perceive our own pets. As with popular media, the perceived characteristics of different species play a major role in the ways that individual pet owners construct online identities for their animals. This is especially true for cats and dogs whose identities are constructed and displayed in personal web pages written from the first person-pet perspective. Using methods of discourse analysis this paper compares the ways in which people construct online identities for pet cats and dogs as displayed in the language used by pets in web pages written from the pet's perspective. Focus is placed on the comparison of terminology used by these pets in the construction of 'self' and on those terms used to describe members of the pet's own species and members of other species. In sum this paper will show that the construction of online cat and dog identities is often comparable to the identities created for cats and dogs in western popular culture with dogs identifying themselves as loyal, trustworthy pets that have concern for other animals and cats often portraying themselves as uncontrollable, self-centered creatures with superiority complexes.

David M. Dugas, Associate Professor, Virginia Tech, College of Architecture and Urban Studies. Email: ddugas@vt.edu; Mythic Main Street: Collective Memory and the Marketing of Urban Space

One of the more distinctive characteristics of recent urban development in the United States is the mobilization of cultural myth in order to secure public acceptance and embrace of new development. Gone are the approaches to urbanism that formerly consisted of the forcing of a utopian modernist space past an unwitting public that so often resulted in the well-documented destruction of the American city eulogized by Jane Jacobs. Urban development is now far more tuned to an awareness of public desire, collective memory, and its role in the marketing and production of urban space. This paper will critically examine this trend and in particular the mobilization of the cultural myth and memory of "Main Street" as a key element in the ideology and marketing of urban space.

Keywords: urbanism, myth,

Jiunn-Der (Geoffrey) Duh, Portland State University. Email: jdudh@pdx.edu; Monte Carlo Simulation for Characterizing Computational Complexity in Geographic Optimization

Geographic optimization problems usually rely on rule-based heuristic algorithms to find optimal solutions because of the complexity associated with the combinatorial patterns and interactions between geographic locations. A heuristic algorithm good for one class of problems might be bad for another class of problems. This paper presents an approach to estimating the computational effectiveness and efficiency of optimizing a land allocation problem using different heuristic rules. I developed a Monte Carlo simulation method that generates random walks, constrained by three heuristic rules: 1) Complete Random, 2) Contiguity, and 3) Compactness, in the solution space of the land allocation problem. The problem sought the most compact landscape patterns

with a fixed proportion of two land-cover types. Two indexes: Correlation Function and Mean Walks to a Local Optimum, quantify the ruggedness of the random paths. A heuristic rule that produces rugged paths in a solution space is expected to have poor performance when used in optimization. The premise of relating ruggedness to computational performance is that a smooth solution space favors the trial-and-error local search mechanism ingrained in a heuristic algorithm. Empirical data collected from benchmark experiments based on the simulated annealing algorithm confirmed this approach. Such a spatial simulation approach could be used to design and evaluate heuristic optimization algorithms for spatial decision support systems.

Keywords: Monte Carlo simulation, spatial optimization, simulated annealing, ruggedness, compactness, spatial decision support systems

Oliver Duke-Williams, University of Leeds. Email: o.w.duke-williams@leeds.ac.uk; The geographies of student migration in the UK

This paper examines the recent migration behaviour of students in the UK. The manner in which information about students was captured in the 2001 Census of Population differed in a number of respects from the approach used in earlier Censuses; these differences are described and the implications discussed. The 1991 and 2001 Censuses are then used to illustrate the spatial patterns of student migrations, with differences that have occurred between the two Censuses being highlighted. The 2001 data are then used to examine in detail recent patterns of student migration in the UK. Where are students migrating from, and which regions are they going to? Do Census data permit us to identify places where studentification is occurring? How do patterns of student migration differ from the movement patterns of the rest of the population? Can we infer anything about movements of students after graduation? A specific focus is placed on the geographies of students in Scotland. Census data in Scotland includes information about journeys to places of study, and thus allows the relationship between migration and travel to be explored. How far do recent migrants travel to study? Does this differ from those who are not recent migrants? Finally, the role of households in the geographies of students is also considered: what sort of households do students live in, and who else do they live with?

Lake Nicaragua is the largest tropical lake in the Americas. The lake has a surface area of approximately 8,000 km², but is relatively shallow with water depths no deeper than ~40m. To date, little paleoenvironmental research has been done on sediments from Lake Nicaragua, and none has been published. A coring expedition was carried out on Lake Nicaragua in May-June of 2006. Thirty-five gravity cores were taken throughout the basin, as well as five long piston cores. The goal of the project is reconstruct climate variability, natural hazards events, and human land use patterns throughout the Holocene. The multi-proxy approach used by our interdisciplinary team includes: magnetic susceptibility, grain size, pollen analysis, charcoal analysis, diatom analysis, geochemistry, seismic imagery, radiocarbon dating, and tephrochronology (by ICPMS). Here we present preliminary results from our first field season.

Keywords: paleoecology, paleoclimate, Holocene, Nicaragua

Brian W. Dunbar, M.A., California State University, Northridge. Email: BrianWaldo@aol.com; Occupational and Residential Moves of Zapotec Immigrants in Los Angeles

This study looks at the growing community of indigenous Mexican migrants in Los Angeles, specifically the Zapotec-speaking people from the central valley and mountains of Oaxaca, Mexico. My objective is to examine to what extent this community is improving its position vis-à-vis mainstream society in economic and residential terms. In order to explore these trends, I conducted one-on-one interviews with immigrants in order to generate a history of employment and residence in Los Angeles County. In order to measure mobility in employment, I then coded respondents' various jobs using the Warren-Hauser Occupational Prestige scores, to demonstrate trends over length of residence in Los Angeles. Similar trends in residence were examined by locating census tracts of respondents over time. While this community has improved their occupational lot over time, with slow but steady progress, there is little proof of upward mobility in the residential context.

Identities: Negotiations in Contemporary Spaces

People construct their identities around a myriad of different references, from socially constructed categories, such as gender, sexuality, disability and ethnicity, to the institutions and social discourses through which these constructions are expressed and controlled. These may include social venues, subcultures, dress codes, the media, consumerism and the global world. There are, however, competing arguments over the meanings, definitions and experiences of identities. As such, identities are constantly being renegotiated and redefined, both personally and socially. Identities are based on inclusions and exclusions, borders and boundaries, both 'who we are' and 'who we are not'. It is well documented that the internet has enabled people to construct their own spaces, through which renegotiations of old identities and new ones can be forged. The relationship between gender and the internet is an important and contemporary one. Non-visual representations of gender, the use of gendered language and the negotiation of borders and boundaries which 'govern' this space are all important issues within this developing relationship. With specific reference to the relatively new concept of metrosexuality, this paper not only explores how common terms of identification have been renegotiated and redefined, but also how the trademarks of these terms are 'flux', 'fluid' 'flexible' and 'fast' as well as, 'mail' and 'femail'. Within this context, metrosexuality will be explored in relation to how space defines subjectivity, what the term includes and excludes and what the borders and boundaries of a metrosexual identity are within this negotiation of contemporary space.

Soviet and Post-Soviet Spatial Strategies for Controlling the Homeless

The last Soviet-style labor rehabilitation camp for the criminally homeless and unemployed closed in 1993. However, the state continues to round-up, exile or incarcerate homeless individuals, most notably during international events such as the G8 Summit or the Goodwill Games. This paper explores the complex definition of homelessness in Soviet and Russian society and the role of space in state practices of regulating and controlling homeless populations. I argue that in the contemporary post-Soviet moment, homelessness operates at an intersection of neo-liberal and authoritarian techniques of government. While neo-liberal reforms have hollowed out Soviet socialist structures and ideologies, they have not necessarily transformed the authoritarian techniques of government.

Elisha Jasper Dung, Dept. of Geography, Okstate, Stillwater, OK. Email: jasperdung@yahoo.com; Mahesh Rao, Department of Geography, Oklahoma State University. Email: mahesh.rao@okstate.edu; *Spatial Analysis Of Conservation Reserve Program (Crp) Tracts In The Central High Plains Of The U.S.*

Abstract: In the last two decades in the United States, public funding of agro-environmental programs has nearly tripled, with programs that retire highly erodible and other environmentally sensitive land from crop production accounting for more than 85 per cent of Federal conservation expenditure. In 1986 the Conservation Reserve Program (CRP) began converting highly erodible and other environmentally sensitive land from crop production to perennial grasses and trees. Moderate Imaging Spectrometer (MODIS) images from 2000-2006 were used to produce maps of cultivated land and grassland in the Central High Plains of the U.S. using the unsupervised classification technique in ERDAS IMAGINE. The supervised classification technique was then used to determine areas converted to CRP. This was done to evaluate structural changes in the landscape. Patch Analyst, an extension of ArcView GIS was used to determine the number of patches, patch size, patch density, and nearest neighbor distance. Area covered by grassland and cultivated land was also calculated. The results were subjected to spatial statistical software, GeoDa for exploring the data and obtaining spatial patterns of the CRP tract characteristics. Results showed a 9% increase in grassland area and a 30% decrease in number of patches, and an increase in patch size from 25 hectares to 40 hectares in CRP enrolled areas. In addition, patch density and nearest neighbor distance did not change significantly. Changes in landscape structure were analyzed and it found that the CRP can potentially improve the quality and quantity of wildlife habitat

Susan Dunham, University of South Carolina-Columbia. Email: slk1998@yahoo.com; Gregory J. Carbone, Associate Professor, University of South Carolina-Columbia. Email: greg.carbone@sc.edu; *A comparison of drought stage determination methods for South Carolina*

Drought is difficult to define and no one index provides sufficient information to meet the diverse needs of multiple sectors impacted by drought. Yet,

frequently national, state, and local jurisdictions must establish standard measures of drought intensity. For example, South Carolina has established a set of criteria using a combination of indices including the Palmer Drought Severity Index (PDSI), the Crop Moisture Index (CMI), the Standard Precipitation Index (SPI) and the Keetch-Byram Drought Index (KBDI) to determine drought stages ranging from incipient to extreme. Drought stages are established for each measure using a specific range of values. However, since these measures are based on different criteria, the stage indicated by one measure could be different than others. This study compares several drought measures using a geographic information system-based approach to look at differences in drought stage during the period, 1950 to 2005. This approach will provide a graphical display that identifies the spatial and temporal patterns associated with drought intensity differences. It is hoped that this technique will yield better drought estimates that can be applied to other states to help determine drought stage and modify drought management plans.

Decline of small rural service centers across the Northern Great Plains and Prairies is well documented. In many small towns, the want of social contact among the few remaining residents has kept the beer parlour or saloon alive while almost all other services have ceased operation. Within the context of the oft-identified rural decline issues of depopulation, population aging, and social isolation, we examine the place of the Canadian beer parlour and the American saloon in the contemporary plains landscape. Several examples of these institutions, and the surrounding areas they serve, are documented as illustrative remnants of fading community. The geographical concept of 'borderlands' enters the discussion when we question the nature of regional and national identity by revealing shared experience within a region where the existence of an international boundary has little impact on the evolving rural landscape.

Keywords: Great Plains, Prairies, rural decline, landscape, borderlands, beer

James R Dunn, University of Toronto. Email: jim.dunn@utoronto.ca; *Reflections on 'Revitalization' in Toronto's Regent Park: A Healthy Community by Design?*

Regent Park is the largest and oldest public housing development in Canada and one of Toronto's most significant concentrations of urban poverty. Although originally planned as a "garden city" - a car-free, spacious island of greenery - the neighborhood has high rates of poverty, crime and ill-health. Over the next 12-15 years, the Toronto Community Housing Corporation (TCHC), the agency responsible for public housing in Toronto, will demolish and re-build the neighborhood into a socially mixed community, in which 1/3 of residents will be subsidized tenants and 2/3 will be owners of market condominiums and townhouses. TCHC also expects the design of the social and built environments, and the institutions they create to allow for resident participation in community governance to create harmonious social relationships and mitigate the poverty of residents. According to TCHC, "the vision is one of vibrancy, diversity and sustainability? in building types, designs and heights, incomes, uses, community services, recreation spaces, learning facilities and activities. In short, a healthy community shaped by the residents of this community". Many previous efforts to engineer social environments have failed and become symbols of the naïveté of the modernist project. This raises a number of questions that will be discussed in this paper, including: "just what is the evidence that design, social mix and community governance interventions may improve health?", "what is the theoretical basis for these beliefs and are they cogent and robust?", and "what research questions will be able tell us if the new Regent Park 'works'?"

Kevin Mark Dunn, University of New South Wales. Email: k.dunn@unsw.edu.au; *Public discourses about hijab-wearing in Australia*

This paper reports on a unique empirical assessment of popular attitudes to hijab, or Islamic headscarf, in Australia. Rights to cultural expression and ideas about national identity were the major discursive terrains of public opinion on hijab in Australia. Public sentiment against the hijab was driven largely by discourses about nationalism, specifically assimilationist impulses. A mostly unstated aim of this assimilationism was a Christian-Australia or secular Australia, invoking certain narrow gendered constructions of Australian-ness. There was also a minor strain of concern that headscarf wearing was emblematic of inappropriate gender relations. Stereotypes about Islam, and other bases of western Islamophobia, had a marginal purchase within debates about hijab in Australia. However, there was an impressive level of public support for hijab wearing. Tolerance of hijab drew upon normative statements about the nature of

Australian society, including references to freedom of religion, individual liberty, and democracy. These assertions about Australian-ness are largely uncontested, they possess a political robustness, and are political resources that could be deployed more widely in contemporary debates about cultural diversity and national identity. The hijab-wearing Australian woman is a performance of nationalism that is facilitated by these political resources.

Lesley-Ann Dupigny-Giroux, University of Vermont. Email: ldupigny@uvm.edu; Wetland monitoring using AirMISR imagery

Surface moisture stress and vegetation condition can be assessed from spectral vegetation indices including the ratio of NIR/blue wavelengths. Multiple view angles (MVA) of this ratio were created from airborne, moderate resolution (27.5 m) AirMISR data for the Howland Forest in central Maine, a region dominated by boreal-northern hardwood transitional forest and palustrine wetlands. Results indicate that the MVA NIR/blue ratio discriminated among moisture-driven land use-land cover (LULC) variations, wetland types and moisture stress extent. Cover type separability was best captured by forward view angles and the ratio was sensitive to variations in species type and vigour, water/vegetation proportions and moisture gradients across emergent wetlands. Lowest NIR/blue ratios at all angles denoted water bodies, while water-dominated wetlands with low vegetation contents had bowl-shaped anisotropy with slightly higher ratios. Very large NIR/blue ratios were associated with dry, estuarine vegetation, open land and moisture stress in certain wetlands. Darkspots at the forward view angles were related to moisture stress in palustrine forested wetlands and an upland needle-leaf forested wetland. This presentation will summarize these findings as well as the optimum MVA ratio for wetland monitoring.

Keywords: remote sensing, multi-angle imaging, wetlands, surface moisture

Rebecca Dupont-Coutu, Salem State College. Email: rjdupont55@hotmail.com; Vegetation Change due to Human Activity

At 19,340 feet, Mt. Kilimanjaro stands as Africa's tallest peak. The Kilimanjaro Forest Reserve was established in 1921 and a National Park created in 1973. UNESCO has also declared the area a World Heritage Site. The mountain and surrounding region is in peril. Irrigation schemes have increased the availability of water for farmers and ranchers. The flow of the Great Ruaha River has already been greatly affected. Have these changes encouraged farmers and ranchers to invade the surrounding forests to increase their yields? Also, have these human activities infringed on the native vegetation? This study will analyze the change in land cover use by comparing landsat data from February of 1987 to February of 2000.

Keywords: Africa, Remote Sensing, Vegetation change

E. Melanie DuPuis, University of California, Santa Cruz. Email: emdupuis@ucsc.edu; White Food: Milk, Race and the History of Nutrition

This paper will show that nutritional advice on dietary practices in the United States has been highly racialised. The rise of US nutritional professionals and their dietary advice, in particular the promotion of a Northern European dietary practice centered around milk, was part of a "racial formation," which sought to resolve two sets of tensions: white middle class status anxiety and food producer anxieties over sufficient income. Nutrition as a profession rose in the context of these two tensions. Diet, therefore, is more than the determination of what is healthy for the body. It is a form of negotiation between bodies and between the body and the country. As a result, American nutrition advice became a mirror of whiteness, fashioned to work with the rise of professionalism and the rise of food industrialization. A look at the pioneering nutritionist and farm interest statements on milk as the food of a superior race show how this commodity functioned as an ideological mirror, not merely of racism but of the intimate ties to particular geographic relationships, namely the new city-country alliance between industrial agriculture and urban economic growth. The final sections of the paper will show how theories of racial formation — as both embodied and territorialized — parallel theories of justice. Specifically, it is possible to see the relationship between milk as a perfect food and the critique of perfectionism from both whiteness and justice perspectives, in which one commodity and one way of life is presented as "the good life."

Joshua Durkee, University of Georgia. Email: jdurkee@uga.edu; The use of Tropical Rainfall Measuring Mission to estimate South American mesoscale convective complex rainfall

Mesoscale convective complexes (MCCs) are large, long-lived, highly organized assemblages of thunderstorms capable of producing substantial rainfall over large areas. While these storms have been extensively documented in the United States, few studies have investigated their occurrence in South America. Results from those studies found that South American MCCs are often much larger with longer durations than North American systems. Despite these

findings, no studies describe the characteristics of MCC rainfall across South America. A likely reason for the lack of South American MCC precipitation studies is due to the inadequate radar and sparse rain-gauge networks across the continent. The focus of the current study is to address this problem by employing Tropical Rainfall Measuring Mission (TRMM) satellite data, particularly over the subtropical region. Advancing our knowledge of these heavy precipitation events over this region is especially important due to its social and economic ties to the La Plata Basin. This basin provides various navigable waterways for shipping industries, numerous sources of hydroelectric power along the Uruguay, Paraguay, and Paraná Rivers, and helps sustain a large portion of agriculture and farming in South America. Based on the evidence from previous work, South American MCCs possess both the hazardous and beneficial potential of producing greater rainfall amounts across larger areas. By utilizing TRMM, a first look at MCC rainfall across subtropical South America is established.

Keywords: South America, mesoscale convective complex, precipitation, TRMM

Jeffrey Olani Durrant, Brigham Young University. Email: jodurrant@byu.edu; Evolution of the BLM's National Landscape Conservation System? A Focus on Utah's San Rafael Swell

The vast public lands of the American West are undergoing a transformation both in their use and management policy. Prior to the past several decades, public lands were visited by relatively few people beyond ranchers and occasional miners. Today many areas of public land are popular sites for campers, hikers, river runners, off-road enthusiasts, climbers, and other recreationalists. Increasing uses have been paralleled by more restrictive management policies from federal land managers. In particular, areas managed by the Bureau of Land Management (BLM), the largest federal land agency, are becoming more restrictive as land managers attempt to control the burgeoning uses and as activists work to establish large-scale Wilderness areas, National Conservation Areas, and National Monuments. Perhaps no area has been as caught up in these trends as the San Rafael Swell, a million acre up-thrust of sandstone formations, narrow canyons, and sparse grasslands in southeastern Utah. While many other areas have also seen an increase and evolution of uses; are facing increasing restrictions on uses; and have been designated as Wilderness, NCAs, and National Monuments; perhaps no other area has had so many proposals and counter-proposals for these designations during the past decade? all to no avail.

Keywords: public land, western landscapes, BLM

Nichole Dusyk, University of British Columbia. Email: nichole.dusyk@gmail.com; Emergent Action Within Energy Networks

Reducing energy use has been on the public and political agenda since the 1970s. Much of the effort has focused on energy efficiency that is either regulated via technologies and utility service providers or promoted via incentives and moral suasion. Energy efficiency programs have reduced the overall growth rate of energy use in Canada and the United States, however they have not had as large an impact as hoped or expected. This may, in part, be due to a consumer-based model of participation that presupposes energy is a commodity, energy choice occurs at the individual level, and the collective impact of energy decisions is the aggregate of individual decisions. This paper critically examines the consumer-based model of energy use and argues that it is inadequate for understanding the realities of energy use or devising strategies for attaining sustainability. The rational choice model of energy efficiency programs does not account for action emerging from networks of humans and non-humans, as represented in energy systems, nor does it sufficiently describe the relationships between individual and social action. As an alternative, theories of negotiated action within sociotechnical networks offer a more robust conceptual tool for understanding both energy use and the potential for emergent, sustainable action at the level of everyday practice.

Keywords: sustainability, emergence, networks, energy, sociotechnical systems

Dominique Duval-Diop, Ph.D, Louisiana State University. Email: dddforjustice@yahoo.com; Post Hurricane Recovery and Rebuilding: The Geography of Regulation, the Geography of Success

The recovery efforts following Hurricanes Katrina and Rita have created a complex web of interdependent development needs and priorities in the Louisiana Gulf Coast. Government response to the great challenges posed by this web is complicated by the competing interests of both the private and public sectors. The complexity of recovery is increased by the fact that decisions regarding policies are made at differing geographic scales (local, regional, state, and national). Policies are defined by differing regulations and recovery goals, and fundamentally by the definition of what constitutes a successful outcome at each of these scales. These competing ideals, definitions and regulations conflict significantly, constrain recovery timeframes and determine what is possible in

terms of both the design and implementation of rebuilding policies and programs on the Louisiana Gulf Coast. Lastly, the institutions themselves that govern many of the recovery programs and that influence the policy outcomes are in a state of transformation. The fluidity of these institutions and the resistance of certain institutions to change also serve to create the potential for an uneven landscape of redevelopment. Understanding the ultimate impact of recovery and rebuilding efforts in the Louisiana Gulf Coast within this context can be greatly enhanced by the application of geographic concepts. This paper therefore harnesses the discipline of geography to examine the morphology of the interaction between the regulatory surfaces and outcome surface.

Keywords: institutions, recovery programs, regulation, rebuilding policies, geographic scales, Katrina, Rita, outcomes

Chris S. Duvall, Michigan State University. Email: csduvall@wisc.edu; *Are African baobab groves at settlement sites anthropogenic?*

Researchers have long assumed that settlement establishment and reproduction of the baobab tree (*Adansonia digitata*) are spatially and temporally dependent because baobabs are abundant in many settlement sites in semi-arid Africa. This paper tests the spatiotemporal relationship between baobab and settlement distribution. In a study area of 183 km², 1240 baobabs were located and mapped, their diameters measured, and habitat characteristics recorded for each individual. Second, all occupied (n=7) and abandoned (n=80) settlements were located and mapped, and occupation dates for each site were determined through interviews. Point-pattern analysis tested independence of observed point patterns of baobabs and settlements, including paired point sets consisting only of certain settlement age-classes and baobab size-classes. Baobabs and settlements are attracted at most distances, but this attraction is significant only at distances of less than c.500 m. Young settlements are not significantly associated with large baobabs. There are three main conclusions: 1) Settlement leads directly and indirectly to the development of baobab groves at settlement sites. 2) Baobab habitat preferences suggest that baobab abundance in settlements is not caused simply by human seed dispersal, but also by other aspects of settlement practice that ensure dry, fire-protected settlement sites. 3) The results suggest humans have introduced baobab to southwestern Mali, and possibly other parts of Africa with similar ethnobotanical and environmental conditions.

Devin Dworkin, Salem State College. Email: devindworkin@hotmail.com; *An Urbanization Analysis and growth projection of greater Guangzhou City, Guangdong, China, 1990, 2000 and 2010*

The Rapid Growth of China has given ample illustrations of how fast cities can grow. Using LandSAT TM and ETM data from 1990 and 2000 this research will analyze the change in urban area in this quickly developing region of the world. As this area is undergoing rapid urbanization it presents a unique opportunity to determine the physical, geological, and social characteristics of urbanization. Using various noise reduction and transformation techniques the data sets will be normalized, as they come from two different sensor systems. Various change detection tools will be used to assess change in the region. A prediction for 2010 urbanization extent is given as well as analysis of potential consequences.

Claire Dwyer, PhD, University College London. Email: cdwyer@geog.ucl.ac.uk; *Muslim state-funded schools: Contested spaces of faith and citizenship*

Within the context of renewed public and political debate about the relationship between faith communities, religious institutions and the state in the UK much attention has focused on the position of Muslims. While Muslims have gained support for the incorporation of faith-based institutions, such as state-funded schools, on the basis of parity with other religious groups, they have also been constructed as different from other faith communities and opposed by those who advocate a strong version of secularism (Modood 2005). This paper returns to earlier work on the debates surrounding the establishment of state-funded Muslim schools (Dwyer 1993, Dwyer & Meyer 1995) to re-evaluate how such schools, now funded and implicitly supported by the state/Labour government, remain contested sites for understandings of religious and political citizenship. The paper draws on preliminary work from a new research project 'National Identity, citizenship and religious difference' (<http://www.bristol.ac.uk/sociology/leverhulme>) which examines public and political discourses of national identity and religion.

Keywords: Citizenship, Muslims, education

Caitlin S Dyckman, Ph.D., J.D., Clemson University. Email: cdyckma@clemson.edu; *A Rational Disconnect and a Role for Planners: California Residential Landscape Aesthetic and (Lack of) Water Conservation*

Land use and water supply planning have been traditionally separate disciplines, despite their power to constrain one another. Water invokes traditional planning tensions; namely, technological and engineering versus demand management solutions to scarcity. This paper explores the role for planners in instituting water conservation measures through the development approval process, and explicitly assesses residents' reactions to water conservation, planners' roles in water conservation, and the landscape aesthetic that influences water consumption in California. The author developed and administered a survey instrument to assess residents' knowledge of water conservation measures in the City of Santa Rosa. Through the survey, the author obtained data on residents' landscape aesthetic, self-reported water consumption behavior, water consuming appliances, household water use, and perspectives on local government's role in water supply. The survey responses were then combined with corresponding household water consumption data to expose behavioral contradictions and opportunities for change in municipal water conservation programs. Interviews with planners, the water provider, developers, residents and homeowner associations, and the regional water wholesaler further augmented the findings from the survey. For geographic contrast, the author conducted similar interviews in the Irvine Ranch Water District service area. Both research methodologies suggest that planners have considerable opportunities to promote more rational water use in built form, using regulatory mechanisms to bridge the rational disconnect between landscape aesthetic and water conservation behavior. They are uniquely situated to bring an integrated approach to the economic, legal, engineering, and landscape design fields associated with managing water.

Keywords: water conservation, landscape aesthetic, California, residential, planning

James M. Dyer, Ohio University. Email: dyer@ohio.edu; *Incorporating Fine-Scale Topographic Variation and Soil Moisture into Climate Models: Assessing Biotic Response to Climate Change in the Appalachians*

In modeling biotic response to climate change, emphasis is increasingly focused on fine-scale processes; these processes (e.g. dispersal, competition) can modulate distributions defined by coarse-scale climate patterns. However, a corresponding reduction in scale has not been employed with biologically-meaningful climatic variables. This research will incorporate fine-scale topographic and soil variability to produce bioclimatic maps to assess biotic response to altered climate. Two main questions inform this research: 1. Can fine-scale variation in topographically-controlled radiation load (and therefore evaporative demand) and soil available water capacity be incorporated into bioclimate modeling? 2. How does soil moisture vary in complex topography, and how will this influence vegetation response to climate change? Explicitly incorporating moisture demand and supply provides more realistic change scenarios, by allowing temperature and precipitation to change while maintaining critical soil and topographic conditions at each site. The study area consists of the Appalachian Highlands, extending from Maine to Alabama. The area's topographic diversity offers significant challenges to modeling biotic response to climate change. Bioclimate models are developed for the study area at a 10-meter resolution within a GIS; input variables are obtained using the finest spatial resolution datasets available for the study area, including gridded monthly climatic normals at 800-meter resolution, and soil available water-holding capacity derived from 1:12,000 scale maps. Topographic parameters are derived using 10-meter digital elevation models (DEMs); DEMs will also be used to compute monthly radiation values. These data enable the computation of the monthly water balance for each ten-meter cell.

Keywords: Climate Change, Forests, Species Ranges, Water Balance

Jamie Dyer, Dr., Mississippi State University. Email: jamie.dyer@uga.edu; *Evaluation and Comparison of Current Precipitation Data Sources Over Northwest Mississippi*

The Mississippi River floodplain in northwestern Mississippi and eastern Arkansas (a.k.a., the Mississippi Delta) is highly agricultural, due in large part to the climate of the region. The region receives roughly 130 - 150 cm (50-60 in) of precipitation annually, which is a critical factor in local agricultural production and hydrologic stability. The region is unique in that there are currently three sources of precipitation measurements available: (1) radar-derived precipitation estimates from National Weather Service (NWS) doppler radars, surface observations from NWS recording stations, and surface observations from US Department of Agriculture (USDA) Soil Climate Analysis Network (SCAN) recording stations. In terms of meteorological and climatological precipitation research, quantitatively defining the biases associated with available precipitation data sources is critical in choosing which source to use for a given application, such as meteorological, hydrological, and agricultural studies. Results of this project show a varying bias between the surface precipitation observation

networks and the remotely sensed radar-derived precipitation data depending on season and precipitation type. The bias is caused by the superior spatial coverage of the radar precipitation estimates such that convective-based precipitation patterns, as normally occur in the summer over the Mississippi Delta, are better recognized by the radar. Conversely, in the winter where more stratiform-type (widespread) precipitation dominates, the surface networks are more precise. Understanding these biases is critical in research utilizing precipitation data in similar regions in the southeast US.

Keywords: precipitation, Mississippi

Judith Dykes-Hoffmann, Texas Lutheran University. Email: jhoffmann@tlu.edu; "Tubin and Groovin along a Texas River: Contested Spaces and Conflict over the Comal River in New Braunfels, Texas"

The Comal River, the shortest navigable river in Texas, spews forth from the largest springs in Texas. Hundreds of thousands of river enthusiasts every summer flock to the river that flows through the town of New Braunfels. Today many townspeople rely on the river for their livelihood, but this is nothing new. From 19th century grist mills to today's Schlitterbahn, the largest water park in the United States, people have used this river for economic gains. As the tourist industry grows in this small Texas town, there is growing concern over increased river use and those who use it. This paper is part of the preliminary investigation for a larger study examining the groups battling for control over the Comal River. After a brief overview of the historical geography of the river, it presents the four major groups negotiating its usage: those who live along the river, those who make a living from the river, those who govern the river and finally those who seek to enjoy the river. An examination of these differing views through interviews, surveys, blog sites, and other printed materials shows how these groups are at extreme odds with each other and that as the river's usage increases over time the New Braunfels community will continue to battle over this contested space. Left unresolved, the battle threatens to spill beyond the riverbanks further dividing and seriously disrupting a community that relies heavily upon tourism.

Gary A Dymski, University of California - Riverside. Email: gary.dymski@ucop.edu; Will Liberating the Informal Sector Save Capitalism? An Exploratory Spatial Model of Urban Growth

This paper explores the impact of the increasing expansion of the informal sector on the political economic viability of contemporary cities, especially developing-world megacities. A structural model is developed which shows how challenges of governance and legitimacy are posed by the unbridled growth of peripheral settlements outside of formal urban boundaries. In this model, a growing informal sector affects governmental expenditure-tax balances, households' tax burdens and cash-flows, and capital accumulation. This model combines elements of macro modeling with micro-market detail, and pays special attention to the relationship between the demand and supply of public services and the nature of income-generating activity. Comparisons of different scenarios suggests these preliminary findings: (1) continuing shifts of rural households to megacities in search of employment may, in the absence of sustained tradable-sector growth, lead to tax revolt and/or the exhaustion of urban governments' fiscal capacity; (2) without adequate industrial growth, the formalization of newly-settled areas may not be fiscally supportable, and the space occupied by the reproducible formal sector may shrink; (3) the informal sector can become an alternative center of accumulation, undercutting the fiscal basis of government-provided services and creating profound questions of governance and political legitimacy; (4) unbalanced structural relationships in cities with formal and informal sectors can themselves generate "urbanization without growth"; (5) Hernando De Soto's idea of revitalizing developing-world growth through informal-sector accumulation thus deserves skeptical scrutiny.

This study compares capability of Neural Network (NN) and physical based method in estimating snow using SSM/I passive and QuikSCAT active microwave as well as NDVI data. NDVI data represent the landcover variation and characteristics in a quantitative way. For the neural network method, three different approaches were investigated: A) input consists of only SSM/I channels; B) input consists of SSM/I channels plus NDVI data; C) input consist of SSM/I, NDVI, and QuikSCAT-Ku. The analysis of neural network results showed that The ANN model shows satisfactory results in dependent estimation of snow cover. Also, adding NDVI data as additional input does not increase the accuracy of the

estimates significantly, but it improves accuracy in estimating SWE. In addition, the model trained by ground truth data of SNODAS had better results compared to the model trained by station data. Adding QuikSCAT-Ku increases the accuracy of the estimated SWE by neural networks. The most important limitation of NN model is the high dependency to training dataset. On the other hand, the physical based model shows more consistent results compare with NN model. The physical based model shows consistent improvement in both correlation coefficient and RMSE.

Keywords: swe, microwave, SSM/I, snow, NDVI

Stephanie Eady, Texas Christian University. Email: s.s.eady@tcu.edu; Karen L McKee, PhD, USGS-National Wetlands Research Center. Email: karen_mckee@usgs.gov; The effects of snail grazing and environmental factors on expansion of mangroves into salt marshes

Coastal wetlands are ecosystems that provide goods and services critical to our way of life. As dependent as we are upon these features, our understanding of their responses to global factors such as climate, sea-level rise, and eutrophication is limited. The transitional community where tropical mangrove meets temperate salt marsh is an ideal setting to test hypotheses about vegetative shifts caused by environmental changes. Black mangrove (*Avicennia germinans*) is at its northernmost boundary within the Gulf of Mexico where it commingles with smooth cordgrass (*Spartina alterniflora*). The purpose of this study was to examine what role grazing by the marsh periwinkle (*Littoraria irrorata*) plays in the competitive interactions between smooth cordgrass and black mangrove. This study centers on coastal Louisiana where black mangroves have been expanding for the past fifteen years. To examine effects of snail grazing and environmental factors, field and greenhouse experiments were conducted. Our results indicate that environmental stressors such as nutrient deficiency or salinity have a greater impact on mangrove-marsh competition than snail grazing in healthy cordgrass stands, but that grazing effects are important in stands already stressed by environmental factors. These findings are consistent with recent observations that mangrove expansion increased following large-scale dieback of salt marsh in Louisiana due to drought-related stress.

Julie Earls, MSPH, University of South Florida St. Petersburg. Email: jearls@mail.usf.edu; Barnali Dixon, PhD, University of South Florida St. Petersburg. Email: bdixon@stpt.usf.edu; Evaluation of Drainage Basin Delineation: ArcHydro & the Soil & Water Assessment Tool (SWAT)

In hydrologic and environmental research, there is a need to accurately and inexpensively delineate drainage boundaries for study areas. The use of Geographic Information Systems (GIS) to determine such drainage areas makes the process relatively quick and simple. This research studies the differences in the delineation of drainage basins for the Alafia & Hillsborough Rivers in West Central Florida, U.S.A. The Alafia River is located within Hillsborough and Polk Counties and drains to the Upper Tampa Bay. The Hillsborough River also drains to the Upper Tampa Bay. The Alafia River has been largely impacted by phosphate mining and agriculture and some urbanization, while the Hillsborough River is largely urbanized and has some agricultural areas. Digital elevation models (DEMs) were obtained from the Environmental Protection Agency (EPA) Better Assessment Science Integrating Point & Non-point Sources (BASINS) website at 300m, 90m and 30m resolution. We use the ArcHydro model and the Soil & Water Assessment Tool (SWAT) model to draw comparisons. First, we use 3 different resolution DEMs to evaluate the differences between the two models and see how the resolution change adjusts the drainage basins and streams due to the changing input data (DEMs). Secondly, we compare the actual area within the drainage basin and stream network delineated and see how equivalent they are to each other. This study will be performed on two basins to determine if the differences are contingent upon the local environment of the individual basins or if there is a trend.

Richard Eathorne, Northern Michigan University. Email: reathorn@nmu.edu; Geographical Thinking: A Critical First Step to Teaching Geographic Writing

Good geography writers are good geography thinkers. Teaching undergraduate college geographers to write competently about geography, as well as the world around them, requires they first develop capabilities to think geographically. If students of geography can not incorporate the foundations of geographical thinking, then no amount of formal writing pedagogy will move them forward in their geography education. When used alone, the traditional, linear, tri-fold formula of prewriting, writing and revising is doomed to student frustration, and frequently failure. In order to succeed at developing creative and critical geography writers, the process of writing must be grounded within the multidimensional, holistic, nonlinear dynamics of geographical thinking. To write with competency, the student must develop the aptitude for an almost unconscious,

habitual geographical thinking process. To do this, students must engage in exercises that develop geographic thinking paradigms which help them recognize that addressing issues of war, poverty, repression, injustice, discrimination, environmental degradation, natural hazards, human rights, gender inequalities, terrorism, globalization, and new economic orders, for example, are not to be assigned to nor claimed by the sectarian domains of individual academic disciplines. Geography students need to not only decipher and research and write about traditional "geographic data," but must be challenged to critically observe and think geographically about any physical or human phenomena which constitute the thing we call Reality. Only then can we hope to improve the geography student's ability to write down their geographic thoughts about how to improve the world around them.

Emily Eaton, University of Toronto. Email: emily.eaton@utoronto.ca; *From Red to Green? The Contemporary Politics of GMOs in the Historical Context of Agrarian Populisms in Saskatchewan, Canada.*

Much of the resistance to genetically modified (GM) crops in Canada has played out in Saskatchewan where grain farming dominates the rural landscape, and (perhaps not so coincidentally) where a form of radical agrarian populism has characterized the not-so-distant past. Motivated by the political organizing of the early 2000s that culminated in Monsanto discontinuing breeding and field level research of Roundup Ready Wheat, this paper investigates the processes, practices, interactions, and actors that have contributed to political contestation over GM crops in the context of contemporary and historical struggles over food and agriculture in Saskatchewan. More specifically, the paper asks whether and what sorts of connections can be drawn between the agrarian populisms of the early 1900s and the current politics around GM crops. To answer this question the paper draws on interviews with actors that have been involved in the political contestation over GM wheat including farmers (organic and conventional), farm organizations, state scientists, consumer and environmental organizations and biotechnology lobby groups.

Flavia Echánove, Instituto de Geografía, Universidad Nacional Autónoma de México. Email: echanovef@yahoo.com; *Agroindustries and contract farming: vegetable exports from Mexico*

This paper explores the characteristics of contract farming, under which system broccoli, a non-traditional product, is exported, in the case of the present study, for its consumption in U.S. restaurants. This labor regime, whose expansion is linked to higher food quality requirements, the expansion and strengthening of the agroindustrial firms and other distributors, and the application of structural adjustment policies, has become one of the livelihood strategies of the small-scale producers. The effects (positive and negative) that this contract farming has had on these farmers, who participate in the studied agro-food chain, is analyzed. We find that, even under this labor arrangement, they have had to diversify their sources of income, finding themselves in a vulnerable situation and subject to the variable circumstances of the global markets.

Keywords: contract farming, smallholders, livelihood strategies, Mexico.

Elsie Echeverri-Carroll, University of Texas at Austin. Email: e.carroll@mail.utexas.edu; Sofia G Ayala, University of Texas at Austin. Email: sofia_ayala@mail.utexas.edu; *High-Technology Agglomerations and Wage Inequalities*

This paper's main assertion is that the high-tech industry and its tendency to agglomerate geographically play an increasingly influential role in urban wage inequality. Previous research assumes that regional economies characterized by conditions related to rising inequality at the national level should be associated with high local levels of inequality as well. These studies, however, do not identify the local conditions that make some cities more susceptible to the national inequality trends. In this regard, we call attention to studies that suggest that geographically-bounded knowledge externalities and amenities affect workers' productivity and wages over space. Using Various statistical Models and PUMS data from the 2000 Census of Population, we measure the effect of high-tech agglomerations on the "skilled premium" after controlling for observable characteristics of workers and of metropolitan areas and after addressing problems of endogeneity in the context of multilevel models. We find that high-tech agglomerations play a key role in explaining the skill gap across cities after controlling for other possible sources of inequality. Social polarization is an increasingly important issue in the United States, and this paper sheds light on the degree to which it emanates from the spatial concentration and labor demand characteristics of high-tech firms.

Keywords: inequality, labor market, skill premium, high-technology

Roberts, Geography Department and Institute for Computational Earth System Science, University of California at Santa Barbara. Email: ; *The "Day" Fire at Night: Improving Subpixel Measurements of Fire Sizes and Temperatures from Nighttime MODIS Images*

The Moderate-Resolution Imaging Spectroradiometer (MODIS) sensors on NASA's Terra and Aqua satellites image most of the Earth multiple times each day, providing useful data on fires that cannot be acquired practically using other means. Unfortunately, current fire products from MODIS and other sensors leave large uncertainties in measurements of fire sizes and temperatures, which strongly influence how fires spread, the amount and chemistry of their gas and aerosol emissions, and their effects on ecosystems. This study shows how multiple endmember spectral mixture analysis (MESMA) can retrieve subpixel fire sizes and temperatures from MODIS and other sensors, and overcome many limitations of existing methods for pixel-level and subpixel fire measurements. This study also shows how sensors with high spatial resolution, such as the Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER), can provide data for validating subpixel retrievals of fire properties from MODIS. For example, this study compares MESMA retrievals from simultaneously acquired nighttime MODIS and ASTER images of California's "Day" fire, which burned from approximately September 4 to October 2, 2006. Prior to this work, few studies, if any, had validated subpixel retrievals of fire size from nighttime MODIS images. Results show that MESMA works for daytime and nighttime images, but is particularly useful for fires at night because endmembers need not account for reflected solar radiation. Subsequent research will explore how MESMA retrievals can improve fire spread modeling and forecasting, reduce hazards that fires pose to property and health, and enhance scientific understanding of fires and their effects.

David W. Edgington, University Of British Columbia. Email: edgingtn@geog.ubc.ca; *The Kyoto Research Park and Innovation in Japanese Cities The Kyoto Research Park and Innovation in Japanese Cities*

Kyoto is well-known as a historical city in Japan associated with culture, history and craft industries, and more recently with high technology and innovation. It is also the only Japanese city to boast a privately operated research park in its downtown district. Thanks to local businesses initiatives, the Kyoto Research Park is home to a new generation of high-tech ventures, with nearly half of its 240 tenant companies coming from the new media and information technology sectors. In this paper I examine the recent programs of the Kyoto city government, local universities and commercial enterprises to build an industrial cluster associated with sophisticated design and software industries. Information was collected through field research conducted in 2005. The results are set alongside broader policy changes in Japan leading to new approaches to regional development based on the 'regional innovation systems' model. The effectiveness of the Kyoto Research Park is judged mainly by its ability to form linkages with other sources of innovation at the local, national and international levels.

Keywords: Japan, Kyoto, innovation, research parks, regional innovation systems

Robert M. Edsall, Arizona State University. Email: robesall@asu.edu; Kelli L. Larson, Arizona State University. Email: klarson3@asu.edu; *Testing the Usability of Visualization in a Semi-immersive Virtual Environment for Decision Making*

The Decision Theater (DT) at Arizona State University is a multimillion-dollar semi-immersive virtual environment facility purported to help policy makers and the larger community in making decisions about scientific issues and in visualizing output of predictive and scenario-based models. The DT has, like

other virtual environments and related technology, generated interest and excitement, and its power is strengthened with evidence of its utility for the facilitation of scientific inquiry. We conducted a series of human-subjects tests with students, educators, and policy makers in which we evaluated the influence of the DT on aiding understanding, altering mental models, and correcting misconceptions. We compared responses of subjects saw a presentation about environmental issues in the DT to those of subjects that saw the same presentation on a flat screen in a classroom. We also compared, within subjects, a pre- and post-test, the differences between which address the degree to which the presentations influenced the subjects' conceptions of the problems and the hypothetical decisions that they were asked to make. Preliminary analysis shows that some, but not all, of these dependent variables showed significant differences between groups, indicating a limited (but present) effect of the DT environment on decision making.

Brandon Edwards, M.S., Louisiana State University. Email: bedwar4@lsu.edu; *Small-scale variability in surface moisture on a fine grained beach*

Surface moisture content is known to strongly influence aeolian transport, but little is known of the spatial distribution of surface moisture on real world beaches. In this paper, small-scale spatial variability in surface moisture was investigated on a fine grained beach. The sampling scheme involved collecting measurements of surface moisture content on a 40x40 cm grid at 10 cm intervals (25 observations). 44 sets of measurements were collected in a variety of sub-environments (intertidal, berm crest, back beach, dune) representative of the range of moisture conditions found on the beach. Preliminary results show that within-grid variability is smallest for very dry and very moist areas, and largest for areas with intermediate moisture contents. Regression analysis indicates that the mean moisture content of a grid is the strongest predictor of within-grid variability. These findings can be used to refine beach surface moisture maps and provide improved baseline data for aeolian transport modeling.

Keywords: beach, aeolian, surface moisture

Kate Edwards, University of Wales, Aberystwyth. Email: cte@aber.ac.uk; *Seeing Like a State or Producing a Possible India: The Nation-building Conclaves of the transnational media in India Today*

Established geographical accounts of the relationship between territory and the nation emphasise the manner with which states control particular territories in the name of the nation. Yet, reproductions of the nation and the territories envisaged by nation-building projects are not always controlled solely by the state. Reproductions of nationalism then need not be tied to centralised state power, but work in diffuse and varied ways throughout society. Anthropologists have been the forerunners in arguing that in order for us to understand the socio-cultural complexity of the manner with which the nation is reproduced in transnational times we need to acknowledge that reproductions of the nation in decentred locations do not merely communicate and transmit nationalist ideas, but actively produce, rework and disseminate ideas of the state and nation to audiences far beyond the borders of national territories. This paper seeks to examine the decentred production of India in the context of the India Today® Conclave, a forum established by Living Media International, for the exchange of ideas among cosmopolitan decision makers aimed at charting a new future for India. News organisations in India such as Living Media International embody what Appadurai and Breckenridge call the "public culture of the Indian state" and Anderson terms "the unbound serialities" of the nation and offer up the means with which to contribute to, critique and contest state and nation-building projects by official institutions.

Brian Egan, Carleton University. Email: began@connect.carleton.ca; *'More English than the English': Cultivating White Society and Nature in Victoria, British Columbia*

The 'fashioning' of the colony of Vancouver Island?the result of a long period of imperial extension and accommodation?laid the groundwork for the planting of a White settlement in this remote outpost of the British realm. Fort Victoria, built on southeast Vancouver Island in 1843, was the site chosen for this settlement. Extending White settlement beyond the confines of the fort required dispossessing Native peoples of their land, and its repossession by White settlers. The eventual result of this process of appropriation was the partition of British Columbia into two vastly unequal parts, with Aboriginal peoples confined to a tiny fraction of the territory and the rest made available to White society. Drawing on ideas from postcolonial geography, social nature, and legal geography, this paper examines early stages of this colonization process, paying particular attention to the mobilization of notions of English nature and culture in the establishment and expansion of White settlement around Fort Victoria. Reproducing ideas of English nature and culture?in the garden and the country house, for example, or through the garden party?served to delineate the line between the 'civil' and 'savage', between 'wild' and 'domestic', and to legitimate the appropriation of Aboriginal lands and resources. The reproduction of an English legal regime?particularly laws related to property in land?was central to the cultivation, and delineation, of English nature and culture in this place. The paper concludes with a discussion of the persistence of notions of English nature and culture in representation of present-day Victoria.

Kristine Egan. Email: ke1034@txstate.edu; *Geographic Analysis Of The 'Terrorscape': The Spatial Pattern Of Risk To The Urban Terror Threat*

A difficult task for a terrorism researcher is to compare the relative potential terrorism risk of such varied sites as abortion clinics, caf  s, courthouses, military bases, etc., within a large urban area to assist in prioritizing counter-terrorism planning activities. Hazards research theoretical foundations and methods can be adapted for use in potential terrorism risk research and subsequent planning activities. This research adapts the hazards research 'hazardscape' concept and risk probability, context and consequence concepts for use in terrorism research. The 'hazardscape' concept expands hazard analysis from one specific location to a landscape susceptible to multiple hazards. Thus, the 'terrorscape' concept expands terrorism analysis from a single site to a regional landscape of the hazards of terrorist activities. A terrorism risk index is calculated as the product of the 'probability' of a terrorism event occurring at possible terrorism (context) targets and some measure of the hazard event (negative) 'consequences'. The five major categories of probable terrorism targets introduced in the research are: critical infrastructure, military installation, tourism, large population, and single issue. Following the identification of probable terrorism targets, is the identification or assignment of values to seven potential consequence categories (population presence, property value, symbolism, service area dependency, restoration time, revenue loss, and security level) for each site. Using GIS, a surface is generated for each potential consequence category, which is then combined with the other surfaces to produce a 'terrorscape' risk index. The risk index is then available for further 'terrorscape' analyses designed to assist in prioritizing counter-terrorism activities.

Stephanie Egan, NUI, Galway. Email: stephanie.egan13@gmail.com; *(Bio)Politics and Power: Resistance with Palestine and the IPSC*

This paper traces Israeli processes of control in the West Bank in their legal, administrative and military aspects. A combination of checkpoints, physical obstacles and the continued building of the security wall, all form a series of restrictions generally known as the 'closure system', which controls and restricts the movement of more than 2.3 million Palestinians living in the West Bank. Israeli aspects of territorial and population control are advocated by the IDF as necessary mechanisms employed for the continued security of the state of Israel. These bio-political controls are negligible concerns in a wider debate concerned with focal issues of peace talks, final borders and the status of refugees. The Ireland Palestine Solidarity Campaign (IPSC) are a solidarity movement based in Ireland which draw awareness to the relations of power embedded within the geopolitical discourses of the Israel/Palestine conflict as well as their potentially contestable nature. They introduce the possibility of alternative dialogue drawn up in opposition to the dominant political discourses of the conflict. The IPSC are weaving a discourse of resistance through their discussion of Israeli bio-political controls by using popular articles from a variety of sources to address their concerns of poor reporting of the conflict. In short, they are attempting to transform the debates surrounding the Israel-Palestine conflict by

highlighting 'academic' issues such as bio-politics and examine them in a non-academic manner thereby accessing a wider public audience.

Keywords: biopolitics, resistance, palestine

Siri Eggebraten, University of Southern California. Email: seggebra@usc.edu; Clara Irazábal, University of Southern California. Email: ; *A bridge over troubled water: Crossing the schismatic nature of stakeholder participation in the Los Angeles River Revitalization Process*

Los Angeles turned its back on the Los Angeles River over several decades from the late 1800s through the 1960s, ultimately encasing the river in concrete. In recent years, environmental and political leaders have ignited interest in restoring the river as the city's "front door." Using the Los Angeles River Revitalization Master Plan case study, we examine the planning process, identifying obstacles to cross-sectoral collaboration and public participation in complex governance problems. Through critical analysis based on participant observation, professional involvement, interviews, and focus group discussions, we illustrate that the process is a covert reassertion of deceptively non-participatory, hierarchical planning methods. Insufficient levels of participation are attributed to participatory methods that are ill suited to engaging diverse stakeholders with interdependent, but disparate physical, economic, and social concerns. Addressing the causes of such problems, we propose the institutionalization of "meta-collaboration" to design, monitor, and evaluate participation. "Meta-collaboration" is conceived as a system of technologies that capacitate and mobilize autonomous stakeholders and frame and coordinate their interdependence in complicated governance problems. The aim is to attain participatory processes that bridge difference and lead to more equitable, legitimate, and efficient outcomes.

Meleia Egger, M.A. Student, Michigan State. Email: Eggermel@msu.edu; *Cultivating Social Capital: Community Gardens in Lansing Michigan*

On October 17th 2006, the U.S. population hit the 300 million people mark and 87% of Americans are urban dwellers. The United Nations predicts that 50% of the world's population will live in cities by 2007. As urban centers become larger, the environmental challenges they present will accelerate. The urban, now more than ever, deserves the attention of researchers and policy makers. Within growing cities, green spaces can offer an environmental and social reprieve. City green spaces can be profound areas of active civic and social engagement, serving multiple functions for communities. Community gardens are one form of green space transforming urban neighborhoods. These gardens are a creative and exciting example of how green space can offer many valuable benefits and uses within urban ecosystems. One such potential benefit is that community gardens can increase and maintain social capital for the neighborhoods in which they are located. The link between community gardens and social capital needs to be explored and better understood. This paper investigates the community gardens of Lansing, Michigan, and their role in enhancing and maintaining social capital.

Istvan Egresi, University of Oklahoma. Email: iegresi@ou.edu; *The Determinants of FDI Location Patterns: The Case of Romania*

Until 2003, FDI flows to Romania had been limited, especially when compared to other countries in Central Europe. In 2004 annual inward investment increased by 228% compared over 2003 and in 2005 increased by an additional 46.5% to reach over US \$7.5 billion, a level comparable to the annual FDI inflows of the leading Central European countries. This was partly the result of the privatization of several strategic companies and also the realization of a score of greenfield projects especially in the automotive and telecommunication sectors. There are now more than 120,000 foreign-owned companies in Romania, although these companies are unevenly distributed within the country's eight development regions. The purpose of this paper is to explore the factors influencing the geographies of foreign direct investment in Romania. Both economic and non-economic factors are considered.

Horowitz, Physical Scientist, NOAA/Geophysical Fluid Dynamics Laboratory (GFDL). Email: Larry.Horowitz@noaa.gov; *Transport Pathways Contributing to North American CO Concentrations*

Carbon monoxide, CO, is produced by natural and anthropogenic processes including biomass burning and fossil fuel usage and affects atmospheric chemistry through its roles as a sink for the hydroxyl radical (OH) and as a precursor to ozone. As the primary atmospheric sink for OH, which is responsible for chemically destroying numerous air pollutants, CO concentrations impact the concentrations of other pollutants. Here we use CO as a tracer for polluted air masses by examining the transport of CO to and from North America. CO is an ideal tracer for atmospheric and climate modeling because it is well-understood and well captured due to its simple chemistry and long lifespan. By employing MOZART, a numerical global tropospheric chemistry model, we seek to address the nature of air pollutant transport and establish the role of episodic versus mean transport on CO concentrations. We define three main transport pathways of CO over North America and identify episodic flux events by comparing model results to INTEX-NA flight observations taken the summer of 2004 in cooperation with NASA, NOAA, and the ICARTT campaign. The main pathways of CO transport over North America are eastward, aloft import from Asia; northward, surface import from Africa, attributed to heavy biomass burning in summer; and eastward export from North America, at the surface and aloft. Understanding these pathways for CO transport is a key step towards understanding how polluted air masses evolve and can provide insight into the extent to which local air quality is influenced by intercontinental transport.

Victoria Ingrid Einagel, Dept. of Sociology and Human Geography, University Of Oslo. Email: v.i.einagel@sgeo.uio.no; *Reconfiguring belonging in the aftermath of war*

The experience of surviving war is responsible for dramatic shifts within individual and group perceptions of 'self', 'other' and 'belonging', the memories of which are embodied, inscribed into readings of past, present and future, and passed on from one generation to the next. Individuals make sense of such dramatic events and the emotions attached to them, whilst enacting everyday lives, especially through the narratives/stories they tell one another and the friendships they engage in (Ochs and Capps 2001). In doing so they perform and rework memories, identities and belonging largely shaped by dominant political ideologies and their commensurate narratives of group and place belonging. Navigating and negotiating belonging is a common aspect of the restoration of everyday lives in the aftermath of war. Which belongings are enacted-sustained, contested or reconfigured-is largely dependent on which 'politics of belonging' continue to give shape to the post-war social and political landscape. Importantly, as Yuval-Davis (2006) points out, various 'politics of belonging' articulate with various scales of 'belonging' and 'not belonging', and impact differently on various individuals, groups and communities within (but also across) nation-state boundaries. In this paper, the author explores which memories, notions and scales of 'belonging' are important for Sarajevans in the aftermath of the Bosnian War (1992/1995) (which killed and displaced people on the basis of ethnolnational and religious belonging), the contemporary 'politics of belonging' steering the country, and how contested notions of belonging are navigated and negotiated or resisted in the restoration of lives after war.

Karen S. Eisenhart, Edinboro University of Pennsylvania. Email: keisenhart@edinboro.edu; *Structural changes to woodlands in western Colorado as a result of widespread mortality of pinyon pine trees in response to drought*

Extensive tree mortality in southwestern Colorado since 2002 has diminished the cover of two-needle pinyon pine on some sites, with greatest impact appearing toward the lower-elevation limit of the species. In contrast, co-dominant tree and shrub species were less impacted by drought. Plots were established in 2003 to monitor tree mortality over time. All live and dead trees were mapped by species, and inventoried again in 2005 and 2006. Results indicate that where significant pine mortality occurred, cover-dominance has shifted from pine to the co-dominant tree, or else to the shrub layer. In contrast to mature pine trees, the census showed pine saplings to be less impacted by drought and to maintain dominance in terms of stem numbers. Consequently, a site may visually be dominated by juniper trees today, but advance regeneration of pinyon pine may facilitate recovery such that in future decades cover may shift back to pine dominance as saplings grow larger. In addition to survival of saplings, recovery may be enhanced by new regeneration resulting from a mast of cones that reached maturity on surviving pinyon pine trees during the 2005 growing season. Pine production was recorded in plots during 2005, and new establishment was

sampled in 2006. Both newly established and existing seedlings (< 20 cm tall) were marked in order to monitor future survival.

Arctic indigenous communities hold unique expertise and historical knowledge on the local effects of environmental change on the landscape and ecological communities. Although climate change is potentially of concern to every community on the planet, Arctic communities have a particularly urgent interest in understanding and addressing potential changes. The Iñupiat have observed gradual, rapid, and catastrophic natural changes in the landscape during their lifetimes. We present a Barrow/Atkasut GIS showing environmental changes that are based on interviews with Iñupiat elders and other local experts. Their knowledge and expertise has been indispensable in developing GIS layers that address community concerns and interests, as well as scientific research. Our interviewees offered invaluable observations on landscape and climate change, as well as fascinating accounts of their cultural traditions and personal history. Many of the elders indicated that landscape changes are occurring at a rapid rate. They have identified thaw lakes that have drained, areas where the permafrost thaw has been extreme, and places where sea and river bluffs are eroding. Areas have been identified where anthropogenic activity related to oil development has resulted in severe thermokarst. We have been able to corroborate a number of their observations using site visits, aerial photography, and satellite imagery. We visited traditional dwelling and hunting areas with several elders, and videotaped their explanations of past landscape processes. The material obtained greatly exceeded the scope of our science project, moving into wider realms: life stories, cultural history, human impacts on the land, and environmental ethics.

Hamid R Ekbia, Ph.D., Indiana University. Email: hekbia@indiana.edu; Changing GIS to Accommodate Change: A Technical-Critical Approach

Current GIS have limited capabilities in modeling and visualizing time-varying phenomena such as moving objects, changing shapes, and dynamic processes. These limitations can be explored at three different levels: conceptual, methodological, and technical. Conceptually, the limitations derive from a naïve realism that considers representations as passive and mirror-like reflections of a given reality. Methodologically, they originate in the cartographical view of change as the difference between snapshots (as captured in the notion of "layer" in current GIS), rather than the continual accrual of change from state to state. Technically, they are the consequence of the utilization of tools and technologies that deal with static collections of data manipulated according to the rules and constraints of geometric, topological, or relational data models. These limitations enable practices that tend to be totalizing, deterministic, and fixative in character, and should therefore be of concern to critical GIS. One of the ways to overcome them, I argue, is to move toward frameworks that link micro- and macro-levels of analysis (e.g., agent-based modeling). In addressing these issues, I adopt a technical-critical approach - a kind of approach that examines the taken-for-granted categories, hidden assumptions, and governing metaphors in a discipline in order to discover their limits (Agre 1997, Ekbia 2007). This approach, which is in resonance with the growing trend in critical GIS toward constructive criticism (Harris and Harrower 2006), discourages the binary utopian and dystopian views of technology that prevailed in the 1990's (Schoorman 2000).

Michael Ekers, Student. Email: michael.ekers@ouce.ox.ac.uk; Reconstructing Hegemony in the Forestscape: Deviant Working Class Masculinities and Workfare

This paper explores the reconstruction of patriarchal-bourgeois hegemony in British Columbia, Canada, during the Great Depression. The 'hungry thirties' as they were popularly described and experienced, entailed a series of economic, social, moral and ecological crisis that rippled across the B.C. sociocultural fabric - in short, what Gramsci would have referred to as an 'organic crisis'. In 1936, after six years of relief camps that failed in the eyes of both the government and militant and reformist trade unions, the government initiated a series of workfare and training programs that were intended to modernize the forestry industry and remake unemployed men in body and soul. In this respect, forestry projects were part of project of reconstructing hegemony, which on the one hand, aimed at

removing deviant and degenerate men from urban centers and putting them to work in rural environments on the presumption that the men would rediscover their 'true' masculine identities as independent and hard working men. On the other hand, the labour-power of the young men served to modernize the resource base of the economy in an attempt to the rescue B.C. from economic ruins and renew the basis for expanded capital accumulation. Thus the delicate construction of hegemony out of the tumultuous Depression was both a class and gender project that had a particular sociocultural form. However, the forestry projects continued to be ripe with contradictions and strikes and dissent continued unabated and ultimately the onset of WWII provided the most malicious solution to the 'hungry thirties'.

Stuart Elden, University of Durham. Email: stuart.elden@durham.ac.uk; Soja Territory

In 1971, Edward Soja published a paper on the "The Political Organization of Space" for the Association of American Geographers. While some elements have not aged well, such as the behaviourist assumptions in the linkage between human and animal territoriality, other suggestions remain fundamental to a study of the notion of territory. Soja proposes a tripartite analysis of resource, power and social organisation, which repays careful thought. One of the things that is notable in Soja's analysis is his claim that while all societies have spatial dimensions, few operate in territorial ways, thus implying that territory is more historically and geographically limited than is often assumed to be the case. Revisiting Soja's paper after three and a half decades and comparing it to studies by Jean Gottman (The Significance of Territory) and Robert Sack (Human Territoriality), this paper demonstrates the continued relevance of Soja's analysis. Drawing on my own ongoing research into the history of the concept of territory, the paper concludes by suggesting ways forward in thinking both the past and contemporary meanings of this contested concept.

Glen Elder, Dr, University of Vermont. Email: Glen.Elder@uvm.edu; Race, Gender, and Queer Geography

Queer geographies have tended not to theorize sexuality, gender and race as mutually constituted processes. While "putting queers on the map" and theorizing queers in space and place rendered some queer lives visible, aspects of this body of literature have also silenced and marginalized other kinds of queered space and practice. It would be an overstatement, however, to assert that concerns about race and gender have been absent altogether in queer geographies. We draw from limited but potentially rich veins of "queered" contemporary Anglo geography in order to seek points of overlap and engagement with so called "new queer studies". Our review will be threefold: Geographies that examine race, gender, and sexuality as mutually constituted spatial processes, Geographies of race that highlight the intersections of sex and gender, and finally an emergent literature about lives that people whose spatial practices challenge gender/ sex binaries.

Keywords: Queer geography, the body, gender, race

Paul Ell, Queen's University. Email: paul.ell@qub.ac.uk; A unifying technology: Multimedia GIS in the Humanities and Arts

Geographical Information System technology is still predominately deployed in the physical sciences. While there are outstanding examples of the use of GIS in the Humanities and Arts, these are relatively few with the balance of work based around resource development rather than the use of GIS in research. Moreover, following from the historical background of GIS, Humanities and Arts applications have tended to concentrate on quantitative data, often drawn from censuses of one type or another, linked to polygon based geographies. These approaches have limited the development of Humanities GIS in a number of ways. Recent developments suggest that GIS may enter a new phase of utilisation in the Humanities. First, GIS software is increasingly easy to use. Second, the software can now cope well with multimedia materials. Third, there has been an exponential increase in e-resources in the Humanities and Arts and resources in a variety of multimedia formats. Finally, there are concerns that humanists are beginning to suffer from 'information overload' and are not able to access and use existing e-resources. This is reflected in concerns on the level of usage that e-resources are receiving, and the need to develop a practical humanities e-Science approach to allow the Data Grid to link fragmented and disparate resources. Virtually all Humanities and Arts research sources can be related both spatially and chronologically. There is the potential to develop Humanities spatio-temporal e-Science based around GIS technology that will result in interlinked e-resources, and new scholarship. This paper discussed the potential.

Characterization of fire intensity, frequency, and biomass burning emissions from satellite observations has been demonstrated in numerous studies. Recent investigations of the radiative energy liberated during combustion have offered an approach to directly estimate the rate and total biomass consumption, as well as the associated emissions of aerosols and trace gases. To provide the most effective product for climate modeling, emission estimates and any corresponding algorithmic coefficients should have broad applicability; from regional to global scale. We present the results of our analysis using the MODIS fire climate modeling grid (CMG) product and a MODIS derived aerosol estimate of organic and black carbon (OC and BC, respectively) emissions from biomass burning. The relationship was examined for a single year of data (2001) using 14 discrete regions to stratify the Earth's terrestrial surface. Analysis was performed at the CMG resolution of $0.5^\circ \times 0.5^\circ$ and monthly intervals. Correlation between fire intensity and OC-BC particulate emissions varied between regions with the strongest agreement in the Southern Hemisphere of Africa (SHFA) ($R^2 = 0.94$). Regions with primary or abundant fire activity occurring in savanna/shrubland landcover demonstrated a strong relationship between emission factors and the mean ratio of Aqua-Terra FRP ($R^2 = 0.80$). The results offer promising insight to explain regional variability of emissions based on landcover and the temporal pattern of fire energy. Future efforts will focus on investigating the relationship between the Aqua-Terra ratio and total time integrated fire energy (FRE); for which the ratio may serve as a proxy.

Grant Elliott, Department of Geography, University of Minnesota. Email: ellio176@umn.edu; Evan Larson, Department of Geography, University of Minnesota. Email: lars2859@umn.edu; *Stand structure and dynamics of an old-growth pine-hardwood forest in northeastern Minnesota*

Currently, eastern white pine (*Pinus strobus*) forests occupy a small fraction of their pre-European settlement habitat in northeastern Minnesota. As a result, scattered old-growth white pines typically exist within a matrix of second-growth, mixed-hardwood forest. We studied stand structure and dynamics of a relatively undisturbed 15 ha pine-hardwood forest in northeastern Minnesota, approximately 70 km southwest of Duluth. The forest canopy consists of isolated white pine within a nearly continuous tract of northern red oak (*Quercus rubra*), sugar maple (*Acer saccharinum*), and basswood (*Tilia americana*). The understory is composed of balsam fir (*Abies balsamea*), sugar maple, ironwood (*Ostrya virginiana*), and red maple (*Acer rubrum*). We reconstructed the stand history of this area, including age structure, forest composition, and disturbance history. Our data indicate that over the past 150 years the forest canopy has transitioned from dominance of pine-oak to dominance by northern hardwood species. If stand conditions remain relatively stable, pine will likely be excluded from this forest. The current stand structure and composition also suggest that the stand has not experienced widespread disturbance, such as fire, since the early- to mid-1800s. Reintroducing fire as a disturbance agent would favor white pine regeneration, but with the accumulation of understory ladder fuels, such as balsam fir, the survival of existing white pines would be unlikely during a fire event without some form of mechanical thinning. Overall, this forest provides a unique opportunity to study the complex relationships between stand structure and dynamics of a pine-hardwood forest in northeastern Minnesota.

Andrew W Ellis, Arizona State. Email: dellis@asu.edu; Robert C Balling, Arizona State University. Email: robert.balling@asu.edu; Timothy W Hawkins, Shippensburg University. Email: TWHawk@ship.edu; Patricia Gober, Arizona State University. Email: gober@asu.edu; *Impacts of Potential Climate Change on the Phoenix, Arizona Water Supply*

The combination of rapid population growth, recent climate change, and future climate uncertainty has yielded important questions concerning water resources and sustainability in metropolitan Phoenix, Arizona. To assess the impacts of potential climate change on the water supply of Phoenix, we adapted a climatic water budget model to simulate monthly runoff on the two watersheds that are the sources of a significant proportion of the water supply. After simulating runoff over much of the past century, we tested the sensitivity of the watersheds to annual and seasonal changes in temperature and precipitation. To assess the possible impacts of future changes in climate, we input extrapolations of current climate trends and predictions by popular climate change models into the model. We applied predicted changes in temperature and precipitation by the years 2020 and 2050 to the measured historical data to re-simulate the record of runoff for comparison with historical values. The results indicate that runoff from the watersheds decreases by 6 percent for every 1 degree Celsius air temperature increase, and runoff decreases by 20 percent for every 10 percent decline in precipitation. On average, increases in air temperature and decreases in precipitation are predicted for the region within which the watersheds lie, and this translates to an 8 to 13 percent decrease in runoff under 2020 conditions and a 16 to 36 percent decrease under 2050 conditions. This could have dire consequences for a rapidly growing metropolitan area with few if any new supplies of water.

Keywords: water, climate change, Arizona

Erle C Ellis, Associate Professor, University of Maryland - Baltimore County. Email: ece@umbc.edu; *Assessing the Regional and Global Impacts of Local Land Use Changes across Rural China*

China's densely populated rural landscapes have been transformed over the past fifty years by population growth, social restructuring and technological change. The global environmental impacts of these changes are undoubtedly significant, yet investigation of their causes and consequences remains a challenge because they are mediated by hundreds of millions of rural households acting locally across an area of more than 2 million square kilometers. Using a regional sampling and upscaling design, we integrated high-resolution landscape change measurements, soil and vegetation sampling, household surveys and elder interviews at five field sites across rural China to estimate long-term ecological changes, circa 1945 to 2002, across China's densely populated agricultural regions. These methods revealed net increases in impervious surface area caused by housing construction that are similar in magnitude to the total current extent of China's cities. More surprisingly, these changes were associated with net increases in woody vegetation and tree cover caused by tree planting and regrowth around new buildings, the introduction of perennial agriculture and improved forestry, and the abandonment of annual crop cultivation. These observations demonstrate that fine-scale changes within anthropogenic landscapes can contribute substantially and in unforeseen ways to global changes in biogeochemistry, biodiversity and climate. Sampling and upscaling methodologies that facilitate the coupling of local observations with regional data and models therefore play a critical role in efforts to assess and mediate the regional and global impacts of land use changes in densely populated landscapes.

Jean Taylor Ellis, Texas A&M University. Email: jean@geog.tamu.edu; Characterizing Saltation Events

This research investigates unsteadiness in a turbulent wind field and pulses in a sand transport field on a beach near Shoalhaven Heads, New South Wales, Australia. Microphone-based saltation sensors, "miniphones," and thermal anemometers were co-located (0.02 m separation on center) and deployed between 0.01 and 0.0225 m above the bed, and sampled at 6000 Hz. Five runs totaling 2050 seconds of wind and saltation data were analyzed. The first goal of this research was to identify wind and saltation events. The continuous wavelet transform, using the Morlet wavelet base, was used to analyze the wind and saltation records. Wind and saltation events were discerned by selecting wavelet power coefficients between wavelet scales of 0.4 and 3.0 seconds and with coefficients exceeding the 95% confidence interval. The wavelet method allow for wind and saltation event duration and event spacing to be determined. The second goal of this research was to characterize the coherent structures in the wind field. The average event spacing measured in this research was compared to the empirical-based model presented by Rao, Narashimha, and Narayanan (1971). The correspondence between the model and this research strongly suggests that bursting-type coherent structures were present. Integral time scales, calculated using normalized auto correlation and power spectral density analysis, were approximately two seconds for the wind and saltation systems. The temporal coincidence of the integral time scale estimations and the event durations for the wind and saltation system strongly suggests that wind events are driving sand transport events.

Rowan Ellis, University of Washington. Email: rowansue@u.washington.edu; Of Broadband and Cheap Rice: IT development and youth politics in Tamil Nadu, South India.

This paper is about the changing nature of youth politics in South India. Specifically, I focus on how youth have responded to the contradictory and uneven results of development in the Information Technology sectors in Chennai, Tamil Nadu, South India. Although there has been much recent scholarship on geographies of youth, especially in relation to economic change and globalization, there has been little attention paid to the political party as a site for the formation of post colonial youth identities. Further, other works on contemporary geographies of youth have failed to treat youth as intentional and effective political actors. This piece will address these holes in the literature while reflecting on what youths' formalized political activity can tell us about post colonial politics and economic relationships at the scale of the city.

Greg Elmer, Ryerson University. Email: gelmer@ryerson.ca; Greg Elmer, Dr., Ryerson University. Email: gelmer@ryerson.ca; Disaggregating the Web: The Space of Tags

This paper offers a disaggregated geography of the web. As the web continues to undergo a process of information centralized and aggregation where a select number of info-providers, (typically portals and search engines, but also consumer related sites such as Amazon, Ebay and social networking sites such as MySpace) accumulate and categorize content and users profiles, new possibilities for web research emerge at the level of web code. Disaggregating code from information powerhouses such as Google typically requires the development of research software, know as 'code scrapers' or 'rippers'. Researchers at the Govcom.org Foundation or the Infoscape Research Lab (Ryerson University) have developed a number of such 'scrapers' for the academic community. Such small scale experimental software programs, in short, scrape or parse all the 'tagged' information categories found on a site, sorting them into spreadsheet formats for subsequent analysis. For this paper, we are particularly interesting in disaggregating geographic tags from the top tier of information aggregators. What can such tags tell us about the dissemination or the origin of aggregated web content? Do geographic tags mask or otherwise obscure web users knowledge of the geographic information economy?

Gregory A. Elmes, Ph.D., West Virginia University. Email: greg.elmes@mail.wvu.edu; Application of Potential Accessibility Surface Concepts to Criminal Investigation.

The potential accessibility surface concept is applied to explore spatial relationships between suspected offenders, incidents and victims by extending Hagerstrand's (1970) time geography to three-dimensional representation (Kwan 2002, Kwan et al. 2003, Harvey 2005a, 2005b, Shaw and Yu, 2004.) A road and trial network is encoded with time-distance is combined with route finding and service area algorithms to calculate the potential accessibility area from known coordinates in time-space. Elapsed time is encoded on each network segment, which is initially displayed in two dimensions as isochrones. Using elapsed time as the third dimension, the suspect's behavior is displayed as a potential accessibility

volume. Time-space volumes may be displayed for suspect's unknown behavior before an incident or for possible subsequent behavior after an incident. Intersection of known incidents and the potential accessibility areas of suspects may be used to exclude certain individuals from further investigation. Furthermore, the technique may be used to intersect victim's known trajectories for coincidence with suspect's potential movements. Data obtained from WVU Police Department were masked for confidentiality. Temporal and spatial uncertainty in the data is found to be a severely limiting constraint for use in small area studies.

Keywords: Space-time, Potential Accessibility Surface, Crime

Rebecca Elmhirst, University of Brighton, UK. Email: R.J.Elmhirst@brighton.ac.uk; Multi-local Livelihoods and Agrarian Transformation: Reflections From a Longitudinal Study in Indonesia.

Contributions to the literature on rural livelihoods in Asia over the past couple of decades have noted their increasing diversification away from agriculture and away from income generated within the immediate locality. It has been suggested by some that a radical rethink of 'pro-poor' rural policy is required to account for shifts in the association between land, agriculture and poverty. The aim of this paper is to further examine this prospect, by focusing on a case study that reveals disjunctures and reversals in the trajectory towards non-farm employment and remittance livelihoods in rural spaces. Evidence is drawn from a longitudinal multi-method study of livelihoods in a transmigration resettlement area in Lampung province, Indonesia, an area marked by both land redistribution policies and substantial government and external support for smallholder farming. During the course of the study period (1994 - 2005), conflict, insecurity and a collapse of governance led to the withdrawal of institutions purportedly delivering agriculture-oriented pro-poor development. The paper discusses the impact of this withdrawal, and the emergence of informal institutions that have effectively recast both rural power relations and gendered livelihoods in the area in unexpected ways.

Joseph Elms, Miami University. Email: elmsja@muohio.edu; Battlefield Itaewon: American Soldiers, Army Regulations, Public Space and Tactics of Resistance

The United States Army is an institution that regulates every aspect of its soldier's time, space and identities. This is especially apparent in the Itaewon district of Seoul, South Korea where the Army restricts the movement and identities of the soldiers by imposing time and space regulations through the use of a curfew and by placing many of the entertainment establishments off-limits to American soldiers. Interviews conducted over three weeks in June and July of 2006 with twenty soldiers and civilians in Itaewon illuminate how soldiers negotiate the time and place restrictions and how the mechanisms of compliance and resistance are manifested by the soldiers in the spaces of Itaewon. Research shows that the soldiers interpret the Army's regulations in a variety of ways and through their personal interpretations justify compliance or dissent. Through the simple act of graffiti or consciously disobeying the Army's regulations by staying out past curfew or entering off-limits establishments, soldiers in Itaewon use space to construct or maintain their identities of self while at the same time maintaining their identities as soldiers.

Sarah Elwood, University of Washington. Email: selwood@u.washington.edu; Mobile meanings or moving target? Community organization responses to shifting resources, priorities, and partners in urban governance

Hallmarks of urban governance include a dizzying expansion in the institutions, organizations, and actors involved in revitalization, policy making, and service delivery; and constant change in potential partners, funding priorities, and validated strategies for urban revitalization. For community organizations and other institutions of civil society, recent research in urban geography has demonstrated how this shifting political and institutional landscape of urban governance produces a multitude of constraints: Revitalization priorities defined by state or market 'partners', prescription of acceptable activities by funding agencies, and dwindling diversity in understandings of what community or economic development might entail. In this paper, I will consider the role and engagement of community organizations in urban governance from a slightly different vantage point: What are the forms of agency that community organizations cultivate to try to navigate this shifting environment, and who are the key agents producing mechanisms that enable these organizations to continue to play an active and influential role? I will show how some community organizations develop a strategy of producing highly mobile and flexible meanings and priorities around people, place, and community that may be

adapted to try to mobilize resources and influence in very different state, market, or civic contexts. The success of this strategy rests heavily upon the activities of individual actors who produce and perform these mobile discourses of local needs, priorities, and urban revitalization practices. I also consider some of the limits to such an approach.

Michael Emch, University of North Carolina at Chapel Hill. Email: emch@email.unc.edu; *Developing a Cholera Early Warning System Using Environmental Information*

While past cholera research has enhanced our understanding of the disease, prevalence remains high and it has recently spread to many new areas of the world. Furthermore, no predictive model has yet been developed that government health departments can use as a tool for prevention. The goal of this project is to develop cost-effective cholera epidemic control strategies implemented in areas with pre-defined epidemic risk indicators at regional and local levels. This paper first describes the global seasonality patterns of cholera using World Health Organization Morbidity and Mortality Weekly Report data collected during the past 30 years. It then describes the spatio-temporal fluctuations of cholera incidence during the past 20 years in three local study areas in Hue and Nha Trang, Vietnam and Matlab, Bangladesh using detailed health and population surveillance data. Recent studies have suggested that cholera is influenced by environmental variables that can be indirectly measured using satellite imagery. This study investigates relationships between cholera incidence and satellite-derived sea surface temperature, sea surface height, and chlorophyll concentration and in-situ temperature, rainfall, and river discharge. Associations between these environmental variables and cholera incidence are measured and the results are being used to develop predictive tools for predicting future epidemics. Initial findings show that the seasonality of cholera varies in different areas of the world; it is highly seasonal at higher latitudes, especially in the northern hemisphere. Ocean chlorophyll concentration peaks are related to cholera epidemics but the process is mediated by sea surface temperature and river discharge.

Charles W. Emerson, Western Michigan University. Email: charles.emerson@wmich.edu; *An Object Oriented Remote Sensing Analysis of Agricultural Land Use Changes in Inner Mongolia*

Da'erhanmaomingan Banner in China's Inner Mongolia Autonomous Region is economically depressed and has a heavy dependence on animal husbandry. Despite governmental efforts to protect the environment since the 1978 economic and political reform, the local solution to poverty has been to intensify agricultural and husbandry activities. This investigation coupled GPS-based ground truth surveys, multi-date Landsat imagery, agricultural statistics, and surveys of farmers, herders, and local officials to characterize the biophysical and socioeconomic implications of alternate land management strategies. Supervised land cover classification of Landsat imagery was performed using both traditional per-pixel maximum likelihood classification and an object oriented approach that incorporates expert knowledge, texture, shape and topological relationships. Analysis of the changes in land use using both classification techniques show a strong short-term dependence on seasonal rainfall patterns and a steady increase in areas devoted to irrigated silage crops. A general trend of increased levels of overgrazing in areas not designated as ecological set asides was particularly evident in the analysis of imagery classified using object oriented methods. Although some loss of local land cover details was noted, the object oriented ability to incorporate texture and shape characteristics of imaged objects led to smoother classified images and easier post classification change detection with fewer "salt and pepper" anomalies.

Marla R. Emery, US Forest Service. Email: marla.emery@uvm.edu; *Nontimber Forest Products: A Project for Postindustrial Political Ecologies*

Despite assumptions of its demise, gathering is decidedly alive in the postindustrial world. Approximately one quarter of the northern New England population gathered one or more wild edibles, medicinals, etc. (collectively referred to as nontimber forest products, or NTFPs) between 1999 and 2004. Across the Atlantic, roughly the same proportion of the Scottish population collected NTFPs in a similar time period, while nearly 60% of the Finnish population picked berries in the final decade of the 20th century. Much ink and energy has been expended by the small group of researchers who study NTFPs in postindustrial contexts as to the meaning of these activities. Are they predominantly recreational, economic, or something in between? Do they represent a retreat from the modernist world or evidence of the continuity of spaces outside capitalism? Might they more usefully be understood within deCerteau's construct of practice? Meanwhile, policy makers and land managers in the postindustrial

world have seized upon tropes that originated in international development discourse about social and ecological virtues of NTFPs, largely without benefit of critical insights. The paper discusses scholarship on NTFP use in postindustrial nations within Robbins' political ecology framework and calls for a political ecology of home advanced by McCarthy, St. Martin, and Schroeder. Study of NTFPs in the United States, Canada, and Europe offers fertile theoretical and empirical ground. A research agenda, illustrated by examples from a decade of work on the subject, is proposed as a means to advance political ecology theory and inform forest management practice.

Chad F. Emmett, Brigham Young University. Email: chad_emmett@byu.edu; *Bribes and Aid as Agents of Missionization: The Case of Indonesia*

Methods of religious dissemination vary across time and space. Historically religions have spread via missionaries as well as via trade routes and routes of conquest. Other more subtle methods are also used, particularly in areas where traditional proselytizing is restricted. Two of these missionizing methods include the use of bribery and humanitarian aid. Bribery may be used to procure hard to obtain missionary visas or to circumvent restrictive laws and legal punishments that impede missionary work. Humanitarian aid can build bridges and soften hearts. It can also be used to disseminate religious tracts and to bring in additional missionary helpers. These are delicate topics that are seldom openly discussed for fear of exposing some or finding ulterior motives in others. As a case study, this paper will look at the use of bribery and humanitarian aid as agents of missionary work in the country of Indonesia.

Keywords: missions, Indonesia, religion

Vanessa Empinotti, University of Colorado - Boulder. Email: empinott@colorado.edu; *Rain and River: is that "just" about water?*

What would be the impact of managing water at different moments of the hydrological cycle? Rain and river, how differently do these two biophysical forms of water influence civil society organizations' participation in watershed management? The hydrological cycle is one of the classical approaches of observing the dynamic of water in the planet. In that, water is observed in different forms: rain, rivers, aquifers and others. Usually, human geographers do not recognize how water management approaches prioritize some models of development depending on the specific moment of the hydrological cycle. By considering water management from water harvesting to river management, different civil society organizations created their own models of development and water management. At the same time, these different views of development models are re-shaping government initiatives in promoting decentralized water management in developing countries. This paper aims to understand how civil society organizations' perspectives on how water should be managed are influencing their participation (or not) on watershed committees. To this end, it presents and discusses an empirical study of the São Francisco River Watershed Committee, more specifically looking at the discourses of civil society organizations' members and non-members of this institution and how their models of water management are influencing the construction of ideas to manage water in this area.

Georgina Endfield, University of Nottingham. Email: georgina.endfield@nottingham.ac.uk; *"Where Africa's swamps and mountains meet at every hand": British perspectives of Uganda in the late nineteenth century*

The letters, personal papers and journals written by British missionaries, medical missionaries and explorers to Central East Africa in the nineteenth century are used to investigate how British knowledge of African environments, climates and their perceived salubrity, was applied, tested and developed. In keeping with nineteenth century European conceptualisations of those parts of the world assumed to be tropical and sub-tropical, continental Africa was imagined and represented in popular and scientific discourses both positively, as luxuriant and exotic, and negatively, as a pathologically dangerous space for Europeans. This paper explores the degree to which this paradox can be recognised in the correspondence and diaries of individuals working for the Church Missionary Society in Eastern and Central Africa, and some of the reports produced by members of British led expeditions to and through the region in the second half of the century. The accounts reveal the development of a perceived spatially-varied pathological geography of the region, and also highlight the changing attitudes towards the healthiness of place in this part of Africa around the turn of the twentieth century.

Matthew Engel, University of Nebraska. Email: geogmatt3@yahoo.com; *Perceptions of Prison Siting and Impacts in the Midwest*

To cope with agricultural decline and manufacturing losses, the leaders of some small towns in the Midwest have turned to the corrections sector to offset economic downturn. In the past, many people would consider prisons noxious facilities, and while this is still true in economically healthy urban areas, a shift in this line of thinking has occurred in small towns over the previous three decades. Surveys and interviews from communities in the central and western Midwest demonstrate an overall acceptance by residents with a prison in their midst, and the elites of these communities express a greater degree of comfort with the facility. However, some individuals from each town are less than enthusiastic about hosting a prison, and their concerns are usually expressed in locally rooted grievances, rather than broader concerns with the growth of prisons nationwide.

Keywords: cultural geography, small towns, prisons

Ruth Engel, River Hill High School. Email: ru416@yahoo.com; *Historical Vulnerability to Droughts and Floods in Baltimore, MD*

In the coming years, climate change will change Baltimore's weather patterns significantly. The city will be subjected to extended periods of drought interspersed with heavy rains. Parts of the city are unprepared for the effects of climate change. Currently, weak parts of Baltimore's infrastructure cause flooded homes, blocked streets, and a lack of useable water, depending on the weather. Residents need to prepare for the future, and must be aware of Baltimore's vulnerability to climate change in order to do so. This study examines Baltimore's sensitivity to extreme weather hazards and its ability to cope with its new climate. To determine sensitivity, past reactions to flooding and drought were determined through archival research. The city's ability to handle extreme natural hazards was detailed through descriptions of flooding of homes, weakening of dams and bridges, and inability to provide residents with water. This historical analysis was used in combination with information about the city's current plans for repairing its infrastructure to form indicators of Baltimore's vulnerability. The indicators helped to identify parts of Baltimore's infrastructure that require repair in the face of climate change. The data was used to form an online archive as well as recommendations for the city government and residents as to what should be done to prepare for extreme weather hazards. The study helped Baltimore anticipate the extent of the damage that could arise from climate change and the amount of work needed to prepare for the future.

Keywords: Baltimore, Vulnerability, Drought, Floods

Salvatore Engel-DiMauro, SUNY New Paltz. Email: engeldis@newpaltz.edu; *Protecting diminishing forested area through long-term anti-colonial struggle: the case of Menominee forestry*

Academic and policy-making circles concerned with environmental degradation often portray sustainable resource extraction among indigenous communities as a successful example of community-based conservation and of reconciliation of indigenous peoples' interests with sustainable development projects, including in the establishment of protected areas. Depictions of this sort overlook historical processes of colonial expropriation and self-determination struggles and remain blind to the multiple-scale processes that enable or constrain context-specific environmental practices. The case of Menominee sustainable forestry demonstrates how resource conservation is predicated on long-term and ongoing anti-colonial resistance, especially through alliance strategies. This has allowed for the mitigation of losses with respect to resource control and access, despite colonial encroachment, and the reconstitution and maintenance of cultural traditions, despite alternating assimilation and extermination policies at different levels of white settler institutions. The outcomes of this struggle can be further clarified by considering concurrent changes at multiple scales, including the inter-imperial rivalries of an expanding Eurocentric capitalist system. In the case of Menominee forestry, the maintenance and development of sustainable environmental practices has been contingent on resolving internal social contradictions in a colonial situation and in seizing alliance opportunities facilitating self-preservation, which were not achieved in other communities in the same region, especially after the US Government's 1954 Termination Act. The experiences of indigenous peoples living under (still existing) colonial oppression shows that the maintenance or conservation of resources, such as forests, results from the outcomes of both anti-colonial and intra-community struggles rather than from voluntary participation in conservation projects.

Mike Engelmann, UO InfoGraphics Lab. Email: engman@uoregon.edu; Nick Martinelli, UO InfoGraphics Lab. Email: emartin2@uoregon.edu; *Re-Inventing the Wheel: Migrating transportation map production from CAD to GIS*

In recent years the Oregon Department of Transportation (ODOT) has increasingly turned to GIS tools to meet a wide range of planning and data analysis needs, such as pavement conditions, freight routing, accident locations,

and threatened/endangered species impacts. For mapping purposes, however, ODOT's GIS unit is working to reconcile the promise of GIS with the institutional resistance of the highway division's engineering legacy in relying on CAD products. One solution being implemented is migrating production of their city/county map series from CAD to GIS to reduce the inefficiency of maintaining parallel workflows which create redundant data layers and output products in both GIS and CAD formats. Another advantage of this data-driven approach is leveraging the ongoing statewide efforts to develop standardized GIS "Framework" layers, which in turn will more easily feed into other GIS/mapping projects downstream. The challenge for the finished product is meeting the expectations of a broad user base both within and outside ODOT which is accustomed to their long-standing city and county planning map series. The UO InfoGraphics Lab is assisting ODOT in developing both the methodology and supplemental data required to replicate the established design standards of their CAD maps using ESRI's ArcGIS software. Our work has focused on converting and editing multiple layers of GIS attributes and annotation to more effectively support the desired cartographic representation, while minimizing the need for custom symbology and application programming in order to avoid creating an additional implementation and maintenance burden on ODOT's GIS infrastructure.

Kim England, University of Washington. Email: england@u.washington.edu; *Geographies of Home, Neoliberalization and Paid Care Work*

A range of commentators have raised the alarm about a mounting care crisis. The cost, quantity and quality of care for children, the elderly, and people with illnesses and disabilities are of increasing concern. The care crisis is having profound effects on the relationship between states, markets and households, the parameters of citizenship, and the responsibilities of the collective and the individual. Using the case of Canada, I explore two 'solutions' to this crisis. The first is the Federal Government's program designed to bring 'qualified live-in caregivers' (most of whom are women from the global South) to Canada because apparently there are insufficient Canadian citizens or permanent residents available for this sort of work. The second is the shift in the provision and delivery of home health care in Ontario as part of the province's cost-containment strategy of hospital closures and mergers, fewer beds and shorter hospital stays. I reflect on these 'solutions' to think about how the spaces of responsibilities and care are shaped by the ways the relational geographies of actually existing neoliberalisms work out on the ground. I argue that care work is multiscalar and encompasses interplays of various processes and relations that unfolding in a range of scales, sites and spaces.

Marcia England, University of South Carolina. Email: marcia@sc.edu; *"Please Don't Feed the Homeless": The effect of civility laws on rights to the city*

This paper examines the role of "civility laws" on conceptions of urban citizenship, especially those which seem to target marginalized groups, such as the homeless, prostitutes and chronic public inebriates. Focusing on Atlanta, Georgia, a city recently voted as one of the "meanest" in the United States by the National Homeless Coalition, this paper looks at how these ordinances specifically target the homeless and limit access to, and the right to be in, public space. These edicts include prohibitions against public urination, allow police to ban certain people from public parks, criminalize the feeding of homeless persons in public parks, keep people from sitting on sidewalks and bar aggressive panhandling. Many homeless, and others in need of social services, find it harder to get the help they need while facing harsher treatment under these civility laws. These ordinances, increasingly implemented in cities across the United States, have been a source of controversy since their inception on the basis that their enforcement unjustly and unconstitutionally targets racial minorities and the homeless.

Email: haggerty-cathy@norc.org; *Using Mental Maps to study Neighborhood Movement in the Inner-City: Formal vs. Informal Definitions*

Making Connections is a longitudinal in-person survey that focuses on urban issues affecting families with children in ten inner-city neighborhoods across the US. Wave 1 respondents (2002-'04) were asked to sketch the boundary of what they considered to be their 'neighborhood' on paper base maps. NORC subsequently digitized the sketched neighborhood boundaries to permit analysis with GIS. NORC then attempted to interview wave 1 respondents wherever they resided in wave 2 (2005-'07). We found that more than half of wave 1 respon-

dents had left their original housing unit by wave 2. This paper explores the issue of movement within and from the inner-city by determining if people are more likely to leave formal boundaries (such as of neighborhood, city, or county) or their own informal or 'custom' neighborhood boundary. In so doing it compares the extent and degree of movement from and within the formal neighborhood boundary to that defined by the respondent. Such research is significant in that it addresses two pervasive issues in urban survey research: the data capture and analysis of abstract concepts ("neighborhood") and the considerable movement of inner-city residents over short time-periods.

Ryan Engstrom, The George Washington University. Email: rengstro@gwu.edu; *Simulating Carbon Fluxes in the Arctic Coastal Plain Using the Arctic BIOME BGC Model*

It is important to understand the impacts of a warming climate on the carbon balance of Arctic tundra ecosystems due to the potential for the large stores of soil carbon held within permafrost to be released, adding a positive feedback to global warming. In previous research the widely used ecosystem process model, BIOME BGC was modified to incorporate the unique conditions in Arctic ecosystems, including non-vascular vegetation, the presence of permafrost, and large spatial variations in soil moisture. The model modifications resulted in a new model, Arctic BIOME BGC, which significantly improved the water cycle representation and evaporation estimates in Arctic ecosystems. However, the impacts of these modifications on the carbon portion of the model have never been examined. Therefore, the purpose of this study is to determine the impacts of the modifications made to Arctic BIOME BGC on carbon fluxes and compare these estimates to observed data from eddy flux towers in Arctic coastal plain ecosystems. Preliminary results indicate that Arctic BIOME BGC carbon flux estimates are similar to the original model BIOME BGC model, and correspond well to observed values from eddy flux towers.

Keisuke Enokido, University of the Ryukyus. Email: kenokido@ll.uryuky.ac.jp; "Get Back to Where You Once Belonged": Okinawa's Pursuit of Increased Substate Autonomy through Return-Visit Tourism

The return visit of emigrants to their former homeland is a distinctive form of tourism in which identity plays a principal motivating role. For this reason, such travel may be characterized as a form of transnational behavior. For substate nations seeking greater autonomy from their national governments (such as Okinawa, in Japan), finding and strengthening economic, political and cultural ties with outside partners is often a priority. Investigating the nature and function of emigrants' return visits to substate nations is critical for two reasons. First of all it enables us to understand why and how such transnational travel patterns are generated, and secondly, it permits us to explore the dynamic behavior of substate nations and their international impact. Located in the periphery of Japan and consisting of small islands, Okinawa is a distinctive form of substate nation from which many people have emigrated since the end of the 19th century. Currently, tourism is attracting increasing attention among local Okinawan communities as a promising industry, and the promotion of transnational return visits is on the rise in these local areas. However, the formation of transnational political and economic linkages has, thus far, had little effect on Okinawa's pursuit of autonomy. It is still too early to conclude that the return visit has no power to promote the political and economic autonomy so desired by the Okinawan people, but I argue that they are steadily becoming aware of its potential and of the need to exploit it more strategically.

Keywords: Okinawa, transnationalism, return visit, tourism, substate nation

Nicholas Enwright, Undergraduate Student, University of North Texas. Email: nme0012@unt.edu; *West Nile Virus in Dallas-Fort Worth, Texas, 2006: A Geographical Approach*

Since West Nile Virus first arrived in Texas in 2002, this mosquito-transmitted disease has become seasonally endemic to much of Texas. According to Texas Department of Health, from 2002 to 2005, 888 human cases of West Nile Virus were diagnosed with a case fatality rate of 8%. Due to the etiology of West Nile Virus, mosquito control has become a concern for cities and municipalities in the United States. Major cities in the Dallas-Fort Worth region rigorously set traps in suspected mosquito habitats and breeding pools and send any mosquitoes caught to the Texas Department of Health for West Nile Virus testing. Upon finding a positive West Nile Virus mosquito pool or finding a high density of mosquitoes in traps, a city will commonly spray the respective area with insecticides to prevent further spread. The objective of this study is to explore the geography of human West Nile Virus cases of the Dallas-Fort Worth region in 2006. Using the Human Ecology of Disease Model as a conceptual framework and GIS, the study probes the relationship between West Nile Virus cases and environmental variables such as elevation, proximity to streams, distance from positive mosquito pools, and demographics including age,

education, income, age of housing, and population density. The results provide a methodology for accurately targeting risk areas for efficient mosquito control.

Bruce Erickson, Faculty of Environmental Studies, York University. Email: bge@yorku.ca; *Regimes of whiteness: Wilderness and the production of abstract space*

Whiteness as a category of identity relies upon a regime of visibility whereby physical marks of the body are coded to signify a meaningful marker of status. This discursive logic needs to be constantly rearticulated in order to sustain the force behind its pronouncements. Behind the reading of the body as a racial text lies the context which makes our bodies legible to systems of power. Understanding this context includes examining the role that space plays in constructing a regime of visibility for the body. In this paper I argue that the physical markers of whiteness expand beyond the boundaries of racial bodies to encompass the production of nature around them. Using the story of Grey Owl, an Englishman who became an important spokesperson for the Canadian Parks Service through the assumption of a First Nations identity, I will examine the production of whiteness in Canada. While working for the government Grey Owl published fictional accounts of his life in the Canadian wilderness. These texts become an important way that race and nature have been articulated within Canadian conservation circles and indeed through larger national narratives. In these discourses the physicality of Canada, following the regime of visibility that stems from whiteness, attempts (but ultimately fails) to present the wilderness of Canada as a marker of a white nation. Key to the production of this white wilderness is the use of leisure to produce an abstract space, free from any social context, that connects to the ahistorical nature of whiteness.

Kelly Marie Erickson, UW-Eau Claire. Email: erickskm@uwec.edu; Ross Guida, UW-Eau Claire. Email: guidarj@uwec.edu; Tyler Moe, UW-Eau Claire. Email: moetg@uwec.edu; Derek Hagen, UW-Eau Claire. Email: hagendc@uwec.edu; *The Cultural Atlas of Wisconsin: A Prototype*

This poster displays a sample of the work that has been done in an ongoing research effort to produce the Cultural Atlas of Wisconsin. The Cultural Map of Wisconsin, upon which the atlas is based, was published in 1996 by the University of Wisconsin Press and drew national attention and acclaim. In general, the map displays 1200 important cultural and historical places in the state with 400 descriptive text blocks and 800 icons identified in an accompanying booklet. The initial goal of the project was to produce a companion guide to the Cultural Map of Wisconsin, but in the summer of 2003 the University of Wisconsin Press agreed to publish it as a stand-alone cultural atlas. The Cultural Atlas includes more in-depth coverage of these places in addition to graphics, such as maps, tables, and historic photographs. The Atlas is organized into six individual chapters, representing six regions in the state: The Northwoods, The Driftless Area, the South Central region, the Eastern Ridges and Lowlands, the Southeast, and the Central Plains.

Camilla Eriksson, Stockholm University. Email: camilla.eriksson@natgeo.su.se; Michael Gentile, Stockholm School of Economics. Email: michael.gentile@hhs.se; *The Plight of the Internally Displaced Population in Rustavi, Georgia: from War to Urban Marginalisation*

Based on fieldwork in Rustavi, Georgia, this paper uses a combination of cartographic and qualitative methods in order to explore the current conditions of the IDP's (Internally Displaced Persons or internal refugees) originating from the breakaway conflict regions of Abkhazia and South Ossetia. First, we use complete data obtained from the IDP section of the department of social affairs

of the city of Rustavi on the previous (pre-flight) and current (2004) addresses of the registered IDP's in order to map and analyse the characteristics of their housing situation. Second, we zoom into the day-to-day lives of the refugee population by presenting some insights from a series of unstructured interviews with IDP's living in different environments (the refugee-occupied Soviet-era hotel, the venerological dispensary, the former hostel of the city's chemical fibre plant, etc.), highlighting their daily coping strategies within a context of general poverty, social stigma and spatial marginalisation.

Keywords: Georgia, Internally Displaced Persons, Former Soviet Union, urban geography, housing

Madeleine Eriksson, Umeå University, Department of Social and Economic Geography. Email: madeleine.eriksson@geography.umu.se; "People In Stockholm Are Smarter Than Countryside Folks"

The purpose of this study is to explore a neglected and masked uneven contemporary socioeconomic climate in Sweden that (re)produces subordinate and privileged regional identities. Due to the nation's centralized and urbanized structure the "stronger" regions are represented to be the larger urban centers, first and foremost the region of the nation's capital Stockholm. The "weaker" regions are represented as the rural areas, primary embodied by Norrland, the northernmost two-thirds of the nation. Norrland is characterized in this discourse as a region in need of financial support and as a region incapable of managing on its own. The discourse of Northern Sweden as essentially "different" and "backward" has been (re)produced in literature, politics and science since the colonization of parts of the region, and has subsequently been reinforced by processes of restructuring in industry and unsuccessful social engineering that proceeded in the trails of industrial modernity. The issues of unemployment and dependency on subsidies became associated with Norrland and distorted into discussions of "culture" and lifestyle choices. Drawing upon past and present representations of Norrland in popular culture, media and research I show how representations reinforce and perpetuate the colonial and asymmetrical association between what has naturally come to be viewed as the peripheral rural North and the urbanized centre South

Rikard Eriksson, Umea University. Email: rikard.eriksson@geography.umu.se; Urban Lindgren, Umea University. Email: ; Cluster Mobility - Impacts of Inter-Firm Labour Mobility on Firm Performance

The ability for firms and regions to absorb and generate knowledge is a central part of being competitive in today's economy. In an increasing number of studies on cluster dynamics, it is assumed that firms in clusters are particularly competitive because the concentration of similar and related firms both facilitates firm exchange and the generation of new knowledge. However, there are divergent opinions on how clustered activities support knowledge diffusion and knowledge creation. Scholars either advocate collaboration or rivalry between firms, whereas others emphasise the sociability and local mobility of individuals. In this study we address the role of local labour market mobility in the process of knowledge diffusion and knowledge creation in localised clusters. The purpose of the paper is twofold; to present a method of defining clusters and to evaluate the method. Based on a unique data-set, covering all workplaces and workers in Sweden, we use observed local job mobility to connect workplaces into regional networks of mobility clusters. In order to evaluate the notion of mobility clusters, multiple regressions are used to analyse the relationship between cluster mobility and firm performance in terms of value added and income levels at workplaces while controlling for other determinants on firm performance identified in literature.

Keywords: Cluster definition, Labour mobility, Knowledge diffusion

Christine M. Erlien, University of North Carolina - Chapel Hill. Email: erlien@email.unc.edu; Characterizing landcover dynamics at the community level in the northern Ecuadorian Amazon

The spatial pattern of land cover impacts biodiversity, climate change, carbon budgets, and ecosystem functions. The Northern Ecuadorian Amazon (NEA) has experienced intense land cover change over the last forty years, with the discovery of oil, attendant road construction, and spontaneous migration of colonists seeking land. This research examines land cover change in the NEA through the perspective of direct impacts of the NEA's focal communities on the surrounding landscape. Direct impacts are defined as land cover changes observed as communities establish and expand. For each community, land cover changes are examined for the sectors (census administrative areas) in which the community is located. This research employs multiple Landsat images (1986, 1989, 1996, 1999, 2001), spatial analysis, and pattern metric analysis. Results are expected to show significant differences in direct impacts of communities on their surrounding landscape related to population, community age, transportation corridors, or level of development. Additionally, results are expected to show that

trajectories of rate, pattern, and extent of land cover change seen in study communities are comparable among particular size and age classes (e.g., the smallest communities will exhibit similar patterns as the youngest communities, while the oldest communities and the largest communities will exhibit similar patterns through time).

Keywords: remote sensing, pattern metrics, Ecuadorian Amazon, communities

Ruth Errington, Canadian Forest Service. Email: rerringt@NRCan.gc.ca; Dale Vitt, University of Southern Illinois, Carbondale. Email: dvitt@plant.siu.edu; Peatland development along a climatic gradient in west - central British Columbia, Canada

Climatic influences on peatland development at both temporal and spatial scales were studied in five bogs distributed along a gradient from coastal to continental climates in west - central British Columbia. Macrofossil analysis was used to determine the sequence of peat types present during the development of each bog. The bryophyte component of the macrofossil record was also used, with an extensive 'surface' database, to reconstruct pH and height of the peatland surface above the water table throughout each core profile. All peatlands were seen to initiate under climatically controlled conditions. Sites in the continental and transitional climatic regions developed during the Early Holocene Xerothermic Interval while peatlands in the coastal region developed later, by paludification, as temperatures and precipitation increased. Apart from the allogenic, climatic, controls on peat initiation, peatland development closely followed an autogenic successional sequence from minerotrophy towards ombrotrophy. Despite the general autogenic trend, evidence of allogenic factors can be seen. For example, moistening of the climate at approximately 4000 yBP caused a reversion from the autogenic trend, delaying the autogenic successional sequence at the site by approximately 1000 years. From this study it is evident that, temporally, climate has been an important factor in the initiation of peat formation. However, once peatlands have been established, autogenic factors exert a stronger control on peatland development. Spatially, climate is also seen to be an important factor as coastal sites exhibit markedly different development patterns from those in the continental and transitional climate regions.

Murat Es, University of North Carolina at Chapel Hill, PhD Candidate. Email: es@email.unc.edu; Becoming Visible: Cemevis and the Negotiation of Public Space in Turkey

This paper investigates the emergence of cemevis (houses of gathering) in urban public space of Turkey. Cemevis emerged as cultural and religious centers for Alevis ('ethnic and religious' communities comprising one forth to one third of Turkey's population) during the post 1980 period, serving as institutional sites of Alevist mobilization increasingly from the 1990s on. Presently, the legitimacy of cemevis as places of worship plays an important role in the restructuring and the negotiation of Alevi identity. Claims to such status are posed by Alevist groups and contested by the state and the Sunni majority. I argue that the integration of Alevis/m into state discourses and increasing interaction with Sunnis in urban context have been decisive in the inscription of Alevism in public space. Construction of cemevis concomitantly expresses Alevis communities' claim to visibility in public space and their challenge to the state to recognize Alevis as legitimate members of the public and as citizens with equal rights to that of the Sunni majority. My analysis suggests that gaining visibility in public space involves multiple levels of negotiating difference on the side of marginalized groups. These groups themselves are simultaneously transformed in the process as they negotiate the hegemonic definitions and categories with regard to public space. Findings of the research are based on a combination of fieldwork, which involved participant observation together with in-depth and semi structured interviews, with an analysis of the published material on Alevism, Alevis and cemevis.

James Kweku Eshun, M.S., Department of Geography, University of Cape Coast, Ghana. Email: james_eshun@yahoo.co.uk; Poverty mapping in the Cape Coast municipal area of Ghana

One of the greatest challenges facing developing countries is rapid urban growth. Closely associated with rapid urban growth and change is urban poverty - now considered as a global problem of huge proportion. The relationship between urban poverty, growth and change in a medium size town in Ghana is analysed in this study. Historically, poverty in Ghana has been assessed using expenditure patterns. But poverty goes beyond income. The present analysis critically evaluated the current paradigm under which poverty is conceptualized. The general objective of the research is to provide an understanding of the nature of urban poverty and the relationship between urban poverty and urban change. The

research was carried out in July-August 2005 and involved the administration of a questionnaire to 800 households, five in-depth interviews of municipal authorities and six focus group discussions to determine the urban change and poverty situation in the municipality. Results indicate that poverty situation in the low income areas has deteriorated over the past decades and policy response and programme by the municipality to reduce urban poverty has not been adequate. A new framework for urban poverty reduction for the municipality has been proposed.

Keywords: urban growth, poverty mapping, Ghana

Mohammad Eskandari, Clark University. Email: meskandari@clarku.edu; Bitter Sugar: Changing Politics of Agricultural Development in Southern Iran

This paper tries to understand how tensions between national plans and local realities are played out under different political climates. This research focuses on Iran's largest agro-industrial project in the South West province of Khuzistan. In 1989, the government of Iran embarked on a massive project of sugar-cane plantation in 80,000 hectares of land surrounding the city of Ahwaz. The environment-saline and alkaline soil and little rainfall?was all but suitable to sugar-cane plantation. Besides land confiscation and displacement, the project involved mobilizing technical, human, and financial resources at an unprecedented scale. How did the local communities and local institutions?universities, newspapers, local branches of national ministries, etc.? react to this national project under different political climates? By comparing the time of presidency of Akbar Rafsanjani (marked with intensive policing of dissenting voices) and Mohammad Khatami (with a platform of strengthening civil society institutions), this paper discusses the changing tactics and aims of local communities and civil society institutions vis-à-vis the project. Based on archival work and interviews with local participants, this paper claims that far from being passive recipients of centralized plans, these communities and institutions showed an in-depth knowledge of local environment and agriculture and a committed interest in the project, and utilized every available venue to voice their dissent and challenge the project. A change in political climate of the country gave these communities new channels for expressing their views and this resulted in a change of the behavior on the part the project managers.

Aude Esperbé, MS in Geology, Geography department, San Diego State University. Email: aude.esperbe@gmail.com; André Skupin, PhD, Geography department, San Diego State University. Email: skupin@mail.sdsu.edu; A High-Resolution Self-Organizing Map Based on Physical and Human Attributes of Geographic Space

The self-organizing map (SOM) is a powerful method to detect complex relationships in n-dimensional space. A SOM built from population attributes was previously introduced to visualize similarities among census block groups. This poster extends that approach towards a more comprehensive representation of n-dimensional relationships by simultaneously incorporating human population attributes as well as physical environmental attributes. These are combined in a high-resolution SOM consisting of several thousand neurons. This poster details the creation of a SOM using more than 60 attributes as inputs - based on both population and physical attributes? for each of approximately 200,000 census block groups within the conterminous US. The census data consist of population, household, family information, age structure, sex, race and marital status. Meanwhile, the physical data consist of climate, land use, elevation and geology data. Once the data are gathered, they are transformed within a standard GIS environment. Numerous transformations are applied, including rasterization of polygonal sources and interpolation of point data. A large number of zonal operations are then used to average the data per block group or to find percentages for categorical data, like land use or geology. Finally the resulting data are standardized and enter a process of neural network training and visualization. Results of this visualization and possible applications of this new type of comprehensive model of geographic space will be presented.

Keywords: self-organizing maps, geographic space, artificial neural network, census, physical environment, GIS, n-dimensional data

Jamey Essex, University of Windsor. Email: jessex@uwindsor.ca; Deservedness, development, and the state in USAID's framework for foreign aid

The institutions, practices, and supporting discourses of US development policy and foreign assistance are currently undergoing profound changes. Central to these has been the creation of a new framework for foreign aid, built around a complex taxonomy of developing states and governance issue areas, with geographic and governance categories predicated on notions of state stability and fragility, strategic geopolitical position, and development progress. Given its long-standing position as the primary federal agency responsible for development and foreign aid, the US Agency for International Development (USAID) has

played an important role in designing these policy changes, even as its political status and standing have suffered in recent years. Thus the new framework is beset by contradictions, stemming both from the problematic relationship between development, security, and trade in agency rhetoric and strategies, and from intensive restructuring processes affecting USAID's internal character and external relations. This paper investigates the new framework for foreign aid, linking internal restructuring at USAID to broader trends in state development strategies. I argue that the current shifts in US development and aid policy - toward emphases on "transformational development" abroad and centralization over strategic decision making domestically, crystallized in the new framework? reflect both continuity and change in the geographic understandings and structures that underlie USAID's work. I look particularly at the ways in which the allocation of development aid is based in a contradictory discourse of deservedness and in neoliberal understandings of the state's appropriate role in development processes.

Keywords: development, foreign aid, US Agency for International Development (USAID)

Jurgen Essletzbichler, University College London. Email: j.essletzbichler@ucl.ac.uk; David Rigby, UCLA. Email: rigby@geog.ucla.edu; Modeling Economic Evolution in Space

A simple model of economic evolution is offered that rests on population dynamics. The population of interest comprises firms that may be differentiated in terms of technology and behavioral routines governing accumulation and investment in the search for new technology and new routines. A process of selection differentially allocates profits across these firms on the basis of production cost. Accumulation and investment in search are funded from profits. Technology is defined by a pair of capital and labor input coefficients and the search for new technology involves processes of imitation and innovation. The price of capital is fixed along with the rate of growth of the labor force. Wages vary with the employment rate. With this model we show how technological change is a function of the variance of technologies in use and we show how relative prices affect the direction of technological change. We go on to explore how the trajectory of technological change varies across regions defined by populations of firms with different characteristics. Finally, we examine uneven development as an outgrowth of competition among plants spread across different regions.

This paper explores the links between the production of regional state/space and the valorisation of capital(ism). Set within the context of UK 'regional policy' this paradox is set to work by discussing the relationships between city-regional competitiveness, work-welfare regimes?those policies and strategies dealing with labour market governance and welfare state restructuring?labour market inequalities and low pay. Ongoing research on the Sheffield City-Region is used to explore the ways in which the state apparatus is embroiled in the complex geographies of economic value.

Keywords: Space, Value, City-Regions

Nancy Ettlinger, Geography, Ohio State University. Email: ettlinger.1@osu.edu; Theorizing Democracy in New Orleans

I develop a critical normative framework that links economic diversity and governance with social difference from the vantage point of postHabermasian radical democracy in an urban context. Post-Katrina New Orleans presents an interesting case because planning in the wake of physical wreckage suggests the possibility of designing a new system from the outset. Consistent with Iris Young's recent book, I take undoing segregation as the major problem in tackling problems of inequality. Yet this and related frameworks tend to be silent on the economy and offer little guidance towards policy and collective action. Further, well intentioned plans that engage social issues such as housing and schools, namely mixed neighborhood designs, are often frustrated by the social reproduction of segregation at finer scales, within 'integrated' neighborhoods and schools. Far beyond locational sensibilities, integration requires strategic overlap of social,

economic, and political networks in “communities of practice” in which people associated with different groups work with and learn about each other (and in the long run inculcate knowledge across generations) to dissolve the ignorance that produces discrimination, and in turn, segregation. Implementing such a system requires proactive interaction among citizen/community groups, government officials, and businesspeople. But groups such as ACORN need to demand not just jobs but assistance and cooperation towards small firm development among those otherwise tied to minimum-wage, Taylorist workplaces; further, the local potential economic profile needs to be assessed not in terms of preexisting industries but in terms of talents of previously disenfranchised New Orleansians.

Keywords: postHaabermasian radical democracy, communities of practice, relational capital, postKatrina New Orleans, new citizenship, policy

Adrian Bruce Evans, Dr, Cardiff University. Email: evansa18@cardiff.ac.uk; *Drinking smoke and eating tea: Towards a performative understanding of the consumption of foreign commodities in eighteenth-century England.*

During the eighteenth century there was an enormous increase in both the quantity and variety of foreign goods entering England. Foreign imports included items such as; mahogany, silk, tea, coffee, sugar, tobacco, lemons and chinaware, to mention but a few. This influx of foreign goods and the associated changes that they engendered in the material worlds of early modern consumers has received a great deal of attention from historians, such as Walvin (1997), Schivelbusch (1993) and Camporesi (1998). However, the majority of research in this area has tended to draw on elite literary source materials to focus on the explicit meanings and abstract imaginings associated with foreign commodities, whilst neglecting their more practical and ‘affectual’ impacts. In this paper I draw on the works of contemporary theorists of practice (including; Bourdieu 1998, Deleuze and Guattari 1988) in conjunction with empirical information collected from over 1000 probate inventories of shops and domestic interiors to provide an alternative account of the consumption of foreign goods. Moreover, I examine the extent to which it is possible to reclaim some of the more embodied, non-reflexive elements of past consumption practices (see Miller et al 1998, Hermes 1993, Glennie and Thrift 1995). In particular, I show how the everyday descriptive language used in inventories can reflect the appraisers’ sensual/perceptual understandings of objects and I show how information relating to the ‘spacings’ of objects within the home can yield insights into the different practices through which they were experienced and consumed.

Keywords: Historical Geography, Consumption, Practice

Andrew J Evans, University of Leeds. Email: geoaje@leeds.ac.uk; *Fuzzy/Vague and Cognitive GIS: Are we asking the wrong questions?*

Over the past decade or so there has been a considerable literature dedicated to the construction of GIS systems to deal with objects in a way that matches that used by human beings. This literature ranges from the philosophical (in what sense do objects exist?) to the mechanical (how do we store an object?). Specifically, much of the literature revolves around notions of ontology (how do we place objects in a flexible categorical framework?) or spatial algebra (how do we store such objects so we can discuss their spatial relationships?). In some senses, these are not the most interesting questions. Metaphysical questions are rarely resolved to everyone’s satisfaction, and technical solutions generally evolve over time. A more immediate problem, which has political and scientific facets, is: what can we actually do with such data? This presentation centers around attempts to utilize cognitive-fuzzy/vague entities (“high crime areas”) both by themselves and in comparison with more standard datasets, discusses the problems which need solving, and the relationships between the two types of data.

Keywords: Fuzzy Vague Cognitive GIS Ontology

Bethan Evans, Manchester Metropolitan University. Email: b.evans@liv.ac.uk; *‘The first generation where children die before their parents’: emotion, affect and the embodiment of the war against obesity*

This paper responds to Horton & Kraftl’s (2006) suggestion that childhood may be considered an ‘affective condition’ through considering how recent work in geography on emotions, affect and embodiment can be used to interrogate the centrality of children’s bodies in public health campaigns. It does this through analysis of policy and media reporting, and of informal conversations with those involved in the implementation of policy strategies surrounding, and framed within, a drive to halt the growth of childhood obesity in the UK. The paper suggests that the emphasis on children in obesity discourse is reliant on a particular notion of adult embodiment as static, and as the end point on a fixed trajectory of corporeal development. This is contrasted with an understanding of children’s bodies as fluid, malleable, soft and not-yet-fixed, or becoming. The paper argues that obesity discourse reproduces and utilises particular risks, fears and hopes inherent within such understandings of children’s bodies, through particular manipulations of the affective nature of childhood (Horton & Kraftl,

2006). The paper then questions the implications of this in relation to the use of such discourses to justify practices responding to fears about the health of children’s future bodies despite concerns about the possible negative consequences for children’s current mental and physical health.

Keywords: children, bodies, obesity, emotion, affect

Josh Evans, McMaster University. Email: evansjd@mcmaster.ca; *Normalizing Deviance? Exploring the Social Space of a Harm Reduction Environment*

The concept of ‘addiction’ has a long and complex history. While addiction has generally been organized under the purview of mental health, it has remained somewhat under examined by geographers studying mental health and disability. This presentation seeks to address this gap by examining the impact of a new supportive housing environment on the recovery experiences of chronically homeless individuals living with severe alcohol dependence. This service-delivery setting, located in Hamilton, Ontario, is unique in the way it integrates 24-hour supportive housing and primary health care with a harm reduction, alcohol-maintenance program. The harm-reduction strategy was formulated to address the barriers faced by ‘street drinkers’ who are highly stigmatized and have found little success in abstinence-only, zero-tolerance programs. Many of these individuals have cycled through rehabilitation programs suffering through harmful withdrawal symptoms without achieving full recovery or attaining stable housing. In addition, many of these individuals live with impairments and chronic illness related to their dependence on alcohol. Using qualitative data gathered through interviews with program residents and staff and participant observation within the new environment this presentation will examine the complex negotiations of care and control that shape the social space of this unique service delivery setting.

Keywords: addiction, harm reduction, recovery

Martin Evans, University of Leicester. Email: mne5@le.ac.uk; *Flexibility in Return, Reconstruction and Livelihoods in Displaced Villages in Casamance, Senegal*

The paper presents preliminary research on the return of displaced populations in Casamance, Senegal, scene of West Africa’s longest-running civil conflict. Amid improving but still problematic security conditions, it reports on recent fieldwork in three villages with different human displacement histories, analyzing the dynamics of reoccupation and exploitation by villagers of their former habitable and agricultural spaces. In all three cases such activity remains constrained to varying degrees by insecurity, landmines and neglected infrastructure. The fears of return to sites of former violence are also evident. In this setting, flexibility is evident in two ways. First, in ongoing changes of village form, reflecting security issues and returnees’ changed expectations of settlement layout and house design after years of urban living. Second, in quotidian patterns of economic activity, often operating at a small scale as households and individual villagers negotiate the microspaces of daily life in response to complex interactions of material, security and psychological factors. However, flexibility has long been noted in studies of livelihoods in the developing world, even if it has been described in other terms. The paper therefore concludes that the situation described represents a continuum rather than a clean break with villagers’ previous states, both before and during displacement.

Keywords: Senegal, West Africa, conflict, human displacement, livelihoods, flexibility, post-conflict reconstruction

Kyle T. Evered, Michigan State University. Email: ktevered@msu.edu; *Pipelines as Development: The Baku-Tbilisi-Ceyhan Pipeline and Promises of Prosperity in Turkey*

Since the collapse of the Soviet Union, the post-socialist republics of the Caucasus and Central Asia became a focal point in the evolving geopolitics of global energy resources. Associated with this region’s renewed significance in the eyes of the west, Turkey also emerged as an important actor. In general, this study examines the evolution of Turkey’s position in the global geographies of energy resources, the varied and often-competing interests that are at play at various geographic scales, and the most visible manifestation of these new geographic relationships in the world - the Baku-Tbilisi-Ceyhan (BTC) pipeline. In particular, this project initiates a political ecology study of the BTC pipeline within Turkey by exploring the promises made to local communities and inhabitants where the pipeline will pass through, on the one hand, and alternative perceptions and experiences with this project, on the other hand. In doing so, this research situates the present example of the BTC in a context that also considers comparatively other examples of mega-projects (e.g., other pipelines or the dam and irrigation schemes of Southeastern Anatolia) in order to better examine both the promises for development and the actual experiences of local communities that live in their vicinities.

Keywords: Baku-Tbilisi-Ceyhan pipeline, energy resources, natural gas, oil, Turkey

Yvonne Everett, Dr., Humboldt State University. Email: everett@humboldt.edu; In Search of Transparency and Participation: Tsunami Relief in Sri Lanka

In Sri Lanka the December 26, 2005 tsunami killed 30,959 people, made 552,601 people homeless. In the process of relief and reconstruction, challenges of all kinds have arisen. Yet few of the critical issues had not previously been noted in the disaster literature. The research reported on here focuses on defining such recurring problems and understanding why they arise again and again in order to work toward breaking this cycle in future. Experience in other disaster situations and in community development indicates that resolution of critical issues is more likely with transparent and participatory approaches. The assumption is that if disaster survivors understand how and why decisions are being made and have the opportunity to participate decision processes, the outcomes will be better informed and participants will be more likely to agree with them. This paper analyses the degree to which transparency and participatory approaches have been applied in post-tsunami relief and reconstruction in Kalmunai, a community on the East Coast of Sri Lanka. The paper is based on the experience of a Sri Lanka non governmental organization that has been working in the community since January, 2005. It is further informed by a needs and livelihood survey of 1836 households carried out by the author and the NGO to assist with relief and reconstruction. The paper finds transparency and participatory approaches lacking and suggests avenues for improving the situation in future that may have relevance beyond this particular case.

Keywords: tsunami, disaster, transparency, participation

Jean Evers, University of Hawai'i at Manoa. Email: kinie@hawaii.rr.com; KU's journey into the West: A Hawaiian image in space and place

The legendary Kū tiki is a popular souvenir for tourists visiting Hawai'i and has become one of the most ubiquitous images used to create a Hawaiian sense of place in popular media. The original Kū image is located in the Bishop Museum in Honolulu, Hawaii where, until a recent exhibition, the statue was mislabeled and severed from its Hawaiian meanings. This paper explores the journey of Kū from its place of ritual birth through its assimilation into the Western style museum collection of Pacific artifacts and the role this representation played in the contemporary symbol of place. From my analysis of archival material, historical records, and display practices, I argue that Kū's appropriation as a souvenir commodity paralleled the museum's commodification of the image as it was used to attract visitors during the 1960s. Objects of cultural heritage in museum settings are displayed in situ and consequently are dissociated from their original meanings. The separation of artifacts from their original context is an implication of the adoption of a particularly Western style colonial episteme. Renegotiated meanings of the Kū have become embedded in the image through their continual commoditization and appropriation by market oriented reproductions. The process of re-linking cultural artifacts with their traditional knowledge and within their indigenous episteme is an important element of the decolonization project. This paper therefore seeks to deconstruct the symbolic colonization of Kū by investigating the historical trajectory of Kū from its indigenous meanings to its contemporary re-presentation as a symbol of place.

Keywords: cultural heritage, sense of place, Hawai'i, tiki

Derek Eysenbach, University of Arizona. Email: dereke@email.arizona.edu; Neoliberalism and Urban Community Development: A post-mortem of public participation

Scholars have well established that a new era of urban governance is upon us. Neoliberalism, as both theory and practice, has radically altered socio-political relationships within the city, and a bevy of compelling case analyses has discussed these "actually-occurring neoliberalisms." Too often, however, these cases have become discussions of what the neoliberal urban condition 'is,' rather than a discussion of the ongoing changes in everyday practice that create new paradigms of urban theory. This paper examines urban neoliberalism through the changing discourse of public participation and community development. I consider the life and death of a Tucson, AZ neighborhood association that had been involved in participatory aspects of community development for over three decades. A vibrant life of activism, created in the progressive ideals of the "War on Poverty," met an untimely demise and collapsed in the face of a blistering debate on land use. The neighborhood's governmentality could not endure the discursive shift that has redefined community development in economic terms and limited the political roles that citizen activists may play.

Keywords: urban theory, neoliberalism, Foucault

Sara Irina Fabrikant, University of Zurich. Email: sara@geo.unizh.ch; Daniel R. Montello, University of California Santa Barbara. Email: montello@geog.ucsb.edu; Stacy Rebich, University of California Santa Barbara. Email: rebich@geog.ucsb.edu; Seeing through small multiple map displays

A recent review of the cognitive literature on animated graphics suggests that animations are not superior to a series of static displays for conveying complex dynamic processes (e.g., Morrison and Tversky, 2001). These cognitive scientists argue that experimental studies reporting advantages of animation over static displays lacked equivalence between animated and static graphics in content or experimental procedures. Utilizing the eye-movement data collection method to track people's viewing behavior, we investigate whether static small-multiple map displays are indeed equivalent in information content compared to non-interactive animated maps, as claimed by above cognitive scientists. In an ongoing experiment we first ask novice participants to study a series of small multiple maps showing monthly ice cream consumption for an average year for different states in a fictitious country, and then answer a number of questions about these maps. The test questions (within-subject independent variable) vary in type and complexity. We prompt viewers to think-aloud while performing spatial inference tasks. Digital audio recordings of their verbal statements while answering the test questions permit joint analyses with accuracy of response, and participants' eye movement recordings (dependent variables). With the collected empirical evidence we hope to provide better understanding of how people use static small multiple displays to explore dynamic geographic phenomena, and how people make inferences from static visualizations of dynamic processes for knowledge construction in a geographical context.

Keywords: geographic visualization, eye movements, empirical studies

Maria Fadiman, PhD, Florida Atlantic University. Email: mfadiman@fau.edu; "Starvation taught me art": tree poaching and wood curio carving in Zimbabwe.

This study looks at forest use in Victoria Falls, Zimbabwe, Africa, with particular emphasis on wood "curio" carving. Although the local people, Ndebele and Shona, have been making utilitarian and decorative carvings throughout their history, they now face the challenge of a weakened economy and thus more people than ever are turning to wood sculpting as a form of livelihood. As one man said "starvation taught me art". However, the surrounding woods, both on communal and national park land, has been heavily deforested due in large part to carvers poaching trees. Locals are now even poaching lower grade trees, because of previous over collection of the preferred wood sources. As more people turn to making crafts in an attempt to earn a living, the sustainability of curios seems to deteriorate. However, people are looking into how to support more sustainable harvesting and carving practices. In an effort to maintain Victoria Falls National Park and the surrounding communal lands, Ndebele and Shona are experimenting with carving smaller items so as to be able to earn more profit from less wood, utilizing naturally fallen branches instead of the heartwood from the main trunk, making use of scrap wood from lumber mills, reducing the middlemen, and to implement reforestation programs.

Email: Godstimejames@umkc.edu; Assessment of Coastline Changes in the Niger Delta Using Remote Sensing and Geographic Information System

The Niger delta region of Nigeria has a coastline that spans about 500 kilometers and extends from the Benin River to the Imo River estuaries. Coastline changes are due mainly to natural processes that are also highly affected by human activities. Such natural and human processes include deep-water wave energy; near-shore wave transformation and circulation; morphological adjustments and feedbacks; dredging, infrastructure and physical development; mineral exploration, ports construction, removal of backshore vegetation etc. In this study, satellite imagery and ancillary data were employed to map, analyze and identify the changes along the coastline of the Niger Delta. Landsat Satellite data for two time periods of 1986 and 2003 covering the Niger-Delta coastline were used. Pre-processing include image enhancements to produce sharper images; difference images (change detection analysis) were generated between the baseline images (Landsat TM) and the post-change images (Landsat ETM+). Visual analysis and comparison of the difference images with the original images was used to identify areas of accretion and erosion. The GIS operations include digital extraction of identified areas of changes and coastlines for the years of study and area calculation in order to determine the spatial extent of the changes (in km²). Along the entire coastline, coastline erosion was observed to be

dominant over accretion. The total area of observed changes along the coastline was 46.5 sq. km. Of this, 27.7 sq. km. constitute eroded area, while 18.9 sq. km. of the area showed coastal sediment accretion. Field verification studies were carried out in June 2006.

Keywords: Coastline, erosion, accretion, remote sensing, Niger delta

Todd D. Fagin, University of Oklahoma. Email: tfagin@ou.edu; Bruce Hoagland, Dr., University of Oklahoma. Email: bhoagland@ou.edu; Historical Vegetation Change in the Arbuckle Mountains, South-Central Oklahoma

The Public Land Survey of Oklahoma began in 1870 and included the Chickasaw Nation, western Oklahoma, and land held by smaller tribes in the northeast. Unlike other states surveyed by the General Land Office, all of Oklahoma was re-surveyed in the 1890s, presenting an excellent opportunity to evaluate the impact of early settlement on land cover in the state. In this study, we digitized plats from the 1871 PLS to serve as a baseline for comparison with digitized plats from the 1897 survey. All mapped features were assigned to categories (e.g., agriculture, vegetation, hydrology, settlement, transportation) and digitized using ArcGIS. In addition, bearing trees were recorded into a spatial database and plotted onto the landcover map. Changes between the two survey periods were substantial. The number of agriculture patches increased both in number and in size, while grassland and wooded areas decreased in area but increased in number of patches. The results is increasing fragmentation of forest and woodland habitats. Analysis of bearing tree data showed a decline in woody plant density and a shift in size class distribution.

Frances Fahy, Ph.D., National University of Ireland, Galway. Email: frances.fahy@nuigalway.ie; Micheál Ó Cinnéide, Ph.D., National University of Ireland, Galway. Email: micheal.s.ocinneide@nuigalway.ie; The Reality of the Locality: Exploring Spatial Aspects of Quality of Life in Galway City, Ireland

Quality of life is increasingly recognised as an essential component of sustainable urban development. Indicators are used to assess quality of life and to monitor progress towards sustainability over time. An emerging body of literature contends that these indicators should be derived in close consultation with target populations in order to optimise the extent to which they capture the real determinants of quality of life in particular places. Furthermore, quality of life considerations vary significantly across urban neighbourhoods and consequently the spatial scale at which such studies are conducted may have significant implications for the results obtained. This study focuses on spatial variations in quality of life within Galway City, a city of circa 70,000 people situated on the west coast of Ireland. Galway is reported as having an exceptionally high quality of life and indicators that capture this multifaceted complex of variables contributing to this have been derived. However, significant variations in quality of life are found to exist across city neighbourhoods. Factors contributing to this spatial pattern are explored in detail. The results obtained in respect of Galway City are discussed in the context of related studies in urban centres in the United States and other countries. An important lesson emerging from this study is that quality of life indicators derived at the neighbourhood level are of the utmost importance when assessing the reality of living in different urban settings.

Linda S. Fair, Ph.D., Department of Geography, Binghamton University. Email: fair@binghamton.edu; "Why Can't I Get Married?" - Denmark and the 2002 "Twenty-four Year (Marriage) Law"

In response to the perceived problem of "arranged marriages" or more specifically, "forced marriages," Denmark enacted the "24 year (marriage) law." A section in the Aliens Consolidation Act addresses marriage by Danish residents to individuals from outside Denmark and the Nordic countries. In order for a residence permit to be granted to a spouse or cohabitant, both the Danish resident and the spouse or cohabitant must be over the age of 24 years. Enactment of this law has been criticized both within and outside Denmark. One main criticism is that it violates international human rights agreements such as the Council of Europe's Convention for the Protection of Human Rights and Fundamental Freedoms. The "24 year law" has had a direct impact on the family lives of immigrants. Interviews with refugees and asylum seekers granted residence permits in Denmark revealed that many of them were suffering from the consequences of the enactment of this law. Many were unable to bring spouses into Denmark either because of the age restriction or because of other requirements in the law such as the need to provide a financial security of DKK 50,000. Ironically, it is not only immigrants who have been negatively affected by this law. It has also had an impact on native Danes. This paper provides a description of the law, a discussion of the human rights criticism, a look at the

consequences of the enactment of this law and a first-hand look at the impacts on refugees and asylum seekers.

Keywords: Denmark, immigrants, human-rights, arranged-marriages, immigration-laws, ethnicity, refugees, asylum-seekers

Liza D. Fallon, University of Tasmania. Email: liza.fallon@g-f.com.au; Global governance and the constitution of a space of international action: observations on the Coalition of Legal Toothfish Operators

The extension of longlining into the Southwest Atlantic during the 1980s led to the rapid expansion of a commercial Patagonian toothfish fishery across the Southern Ocean that grew substantially during the 1990s. Patagonian toothfish (*Dissostichus eleginoides*) is heavily exploited in regions of the Southern Ocean, and commercial extinction of some stock under the highest pressure may occur. Much of the pressure on this stock derives from illegal, unreported, and unregulated (IUU) fishing, which also profoundly undermines the 1959 Antarctic Treaty and the 1982 Convention on the Conservation of Antarctic Marine Living Resources. It also brings into question the capacity of international networks of government, non-government and private stakeholders to discipline dissident actors using international diplomacy and compliance activities. This paper reviews a range of challenges to the protection of the Patagonian toothfish by drawing on qualitative in-depth interviews with senior scientists and bureaucrats. In particular, it makes a novel contribution to the field by focusing on the values and actions of executives of international fishing companies who have recently formed a new organization, the Coalition of Legal Toothfish Operators (COLTO), concerned with protecting the Patagonian toothfish from over-exploitation. Our work also adds to debates in the geographical literature on the effects of non-government organizations (NGOs) as political players who work at various scales by building up 'globalised' networks of engagement and affect the nature of global governance in their wake.

Chuncui Fan, University of California - Los Angeles. Email: velmefan@ucla.edu; Peter V. Hall, Simon Fraser University. Email: ; Geoffrey Wall, University of Waterloo. Email: ; Migration, hukou status and labour market segmentation: the case of hi-tech development in Dalian, China

This paper examines the relationship between migration and labour market segmentation in the north-eastern Chinese city of Dalian. Several authors have stressed the importance of institutional arrangements in shaping the opportunity structures confronting migrants to China's urban areas. In particular, the 'insider status' defined by the hukou or household registration system has been implicated in differential access to housing, schooling, health and other benefits, as well as employment. Our examination of the role of the hukou system in shaping employment outcomes in three hi-tech industrial sectors of Dalian does not challenge this general finding. However, it reveals important variations among different industrial sectors. While employment and earnings are still strongly associated with hukou status overall, this is not the case within the software and biotech industries. Hukou status also appears to be declining in significance within the formerly state-owned enterprises of the digital manufacturing sector. In all these industries, the increasingly decentralized decision-making of local economic development policy and shortages of skilled workers are leading to a selective relaxation of the hukou system, at least for some migrants. The conclusion highlights the implications of these changes for labour market outcomes and hi-tech industrial development.

Cindy Fan, UCLA. Email: fan@geog.ucla.edu; Rural-Urban Migration and Urban Transition in China

For more than three decades, Professor Clifton Pannell has analyzed cities and urban transition in China. His work is marked by a high sensitivity to history, changes, and a multi-dimensional understanding of cities. His conceptualization highlights demographic, structural and spatial shifts in the Chinese economy as the key forces that drive urban transition. In this paper, I focus on the relationship between rural-urban migration and urban transition. I review the recent literature on migration in China and assess the extent to which this large body of work advances theoretical understanding of Chinese cities. The findings show that the accomplishments of the migration literature are highly uneven. More attention on structural transformation such as employment shifts and demographic perspectives such as labor pool is needed for a better understanding of the role of rural-urban migration in China's urban transition.

Hurricane Katrina shocks the world with its extreme devastation, and pours question to governors, the public and scientists on the return period of such supper hurricane. The question cannot be answered by examining the short-term (several decades) accurate instrumental observations, because recurrence intervals of rare but most destructive hurricanes are usually over century or millennial scales. The newly burgeoning paleotempestology attempts to tackle the question by extending history of hurricane activities through geological records. The Yangtze delta is highly vulnerable to global changes and prone to typhoon strikes. The deadliest typhoon in the last century claimed for over 26,000 lives with a straight strike on the delta in 1905. Accurate instrumental records of typhoons can only be dated back to 1949 in China, and those of storm surges can be traced back to not more than 100 years in Shanghai. In this paper, we developed multi-proxies of organic carbon isotope ($\delta^{13}C$) and TOC/TN ratio, together with typical sedimentary structures and storm sequence, to diagnose single typhoon-produced layers in a 10-m long coring section. Geochronology was constructed by employing Pb-210 dating. The data shows that the 19th century had more extreme intensity typhoons than the 20th century, influencing the Yangtze delta. The conclusion, however, need further attested by comparison with documental records of landfalling typhoons in the Yangtze delta. Keywords: hurricanes, typhoons, paleotempestology, Yangtze delta

Peilei Fan, Dr., Michigan State University. Email: peilei@alum.mit.edu; Developing innovation capability: A comparison study of India and China's biotechnology industry

With an annual growth rate of 20-35%, India and China both have achieved significant revenue growth in biotech industry in the last five years. In this paper, I review the development of India and China's biotech industry, with a special focus on the development of innovative domestic biomedical companies, such as Shantha Biotech and Bharath Biotech in India and Hisun and Sibiono in China. I intend to understand why India has successfully nurtured a group of innovative domestic companies that have achieved globalization in terms of production and R&D; whereas with a few exceptions, most China's domestic companies have failed to build their competitiveness and been confined within the domestic market. The role of institutions in shaping the development pathways will be highlighted.

Based on the statistic agricultural data with a county resolution for the time period of 1985~1987 and 2002~2004, the changing regional distribution of grain production in China in recent 20 years has been examined in this paper. It is found that, (1) Grain productivity indicated by grain yield per unit cropland has increased in more parts of China, except for the marginal zone of summer monsoon; (2) The difference that grain productivity in eastern China is much higher than that in western China has remained obviously; (3) The difference in grain productivity between northern China and southern China has reduced for the sensitive increase in grain productivity in North China; (4) The main grain-producing areas that has the stability of output of surplus grain have shifted from the south to the north of China.

Maria Fannin, University of Bristol. Email: m.fannin@bristol.ac.uk; Le corps morcelé et l'usine à bébés: Health care reform and midwifery in France

Beginning in the 1970s, a policy of stringent minimum requirements for hospital personnel and facilities led to a series of hospital closures and the spatial reorganization of maternal health care. By the late 1990s, "regionalization" policies that classified facilities into three separate levels began to categorize pregnancies based on fetal risk of prematurity. These policies were an attempt to improve France's rates of maternal and infant mortality and morbidity and altered the landscape of health care in France. In an era of increasing pressures on states with relatively strong social welfare systems, such as France, the effects of rationalization policies such as the regionalization of health care are felt in the day-to-day practices of health care professionals in heterogeneous ways.

Attempts to measure the extent of changes in midwives' work have focused in part on the "technicization" of the profession, on the introduction of obstetric technologies into the practice of midwifery and on the increasing responsibilities assumed by midwives that accompany these technologies. I examine midwifery within the context of recent reforms to health care in France, specifically how midwives narrate transformations to the health care system through the use of two metaphors linked to the sites and spaces of midwives' work: the body and the hospital or clinic.

Caroline Faria, The University of Washington. Email: cvf@u.washington.edu; Gendering the New Sudan: The transnational politics of body and state

The murders of three Sudanese women living Canada and the US in the last year has led to a heightened discussion of gendered violence and the shifting gendered norms, roles and responsibilities that have occurred within resettled Sudanese refugee communities. My work examines these shifts, highlighting how the politics of the body are increasingly connected to a gendered, yet unstable and contested, imaginary of the 'New Sudan' following the 2005 signing of the Naivasha Peace Accords in Kenya. I am particularly interested in these connections across scale between the body and the state and the ways in which these are often articulated as forms of 'long distance nationalism'. These gendered discourses both reflect and are materializing in evolving efforts by resettled women and men to gender imaginaries of the New Sudan in progressive and productive ways.

Matthew Farish, Department of Geography, University of Toronto. Email: matthew.farish@utoronto.ca; Northern Fencing: Canada, the United States, and the Distant Early Warning Line

Sovereignty disputes, resource-extraction opportunities, and ecological crises have recently directed substantial international attention to the region north of the 66th parallel. This fascination with the Arctic, however, is not novel. During and after the Second World War, the Canadian and American governments suddenly focused on the North as a zone of value, launching an era of extraordinary Arctic activity, much of it bearing the distinctive stamp of military funding and supervision. Of the numerous bi-national Cold War Arctic initiatives, none was more significant than the Distant Early Warning (DEW) Line, completed in the late 1950s. It was considered a triumph of scientific design and logistical planning, but the Line was also a speculative project - a string of radars, ultimately stretching from Alaska to Greenland, enrolling the Arctic into a continental defense grid. The implementation and maintenance of the Line was made possible by a complicated series of alliances between Canadian and American political, military, and industrial interests, and the result was a 'fence' or 'rampart' that profoundly altered the cultures and environments of the north. It also attracted substantial media attention in both countries, although the tone of this coverage differed, as American strategic discourse was tempered by Canadian concerns over sovereignty. This paper, then, will consider the DEW Line as an important example of North American cross-boundary geography, moving from the abstractions of diplomacy and defense plans to the very specific landscapes of radar sites.

Brandie L. Fariss, UNC-Chapel Hill. Email: bfariss@unca.edu; Exploring the Effects of Grazing on Biodiversity in Peru's Huascarán National Park

Highland ecosystems are immensely diverse and important given that they make up a relatively small percentage of our total land area globally. High biodiversity, monumental scenery, and a growing recognition that the health of mountain ecosystems influences the health of all other ecosystems, both lowland and coastal, have led to the establishment of many protected areas charged with the conservation of mountain biodiversity and the preservation of unique mountain environments. Huascarán National Park (HNP) is an exemplary protected area charged with conservation and development, and one that is experiencing the common challenge of achieving both. Although there is little question that what was first recognized as a global treasure in 1973, is indeed a

cultural landscape shaped by a long history of human activity, the sustainability of traditional land use is now in question. The objective of this study was to test the prevailing assumption of over-grazing in the park by exploring the effects of grazing on native plant biodiversity. Multi-level models were fit from vegetation samples, community surveys, informant reports, and topographic analyses conducted using a Geographic Information System (GIS). The integration of statistical modeling and GIS creates a powerful tool for quantifying and visualizing the conservation threats resulting from changing land use and resource management scenarios. Findings suggest that historic grazing patterns have maintained native species richness, yet the changing land use patterns developing due to the region's increased market involvement may have negative and irreversible effects on its biodiversity.

Streams act as an integrator of the effects of landscape change within watersheds, and the differences between alternative land use systems are reflected in concentrations of dissolved nutrients. We examined the effects of afforestation of grassland watersheds by sampling soils and stream water in eight paired watersheds in Uruguay. We anticipated that plantation forestry would result in decreased soil pH and soil base cation concentrations due to base cation uptake by trees. We found that pH and exchangeable base cations were significantly lower in afforested soils compared to grassland soils. These changes were reflected in streamwater chemistry, with pH, base cation concentrations and alkalinities that were significantly lower in streams draining afforested watersheds compared to streams draining grassland watersheds. Our data suggest that repeated cycles of harvesting and replanting will negatively impact the soil store of base cations at these sites and contribute to an impairment of downstream water quality.

Eugene Farrell, Texas A&M University. Email: ejfarrell@geog.tamu.edu; Douglas Sherman, Texas A&M University. Email: sherman@geog.tamu.edu; *Wind tunnel simulations of saltation: Is close enough, good enough?*

This paper examines the scaling up process of aeolian sand transport models from wind tunnels to beach and desert environments. Most experimental work is carried out at small spatial scales due to reductionist approaches and/or logistical and financial constraints. However, the application of these small scale experimental results to real world problems has been largely unsatisfactory. This paper demonstrates that airflow - surface relationships and subsequent transport models derived from wind tunnel studies should not be applied to natural systems without scaling corrections. Specifically, the scaling constraints of wind tunnels impact aeolian processes in two ways: (1) wind tunnel geometry inhibits the development of turbulent coherent flow structures and, thus, particle trajectories are reduced in height and length, and (2) the saltation enhanced roughness is much smaller in wind tunnels; probably for the same reason. Until these process scaling issues are explicitly addressed in wind blown sand studies, the accuracy of transport models will continue to be poor except by accident. The verification and validation of empirical and theoretical methods for correcting the results of small scale process studies to predictions at larger scales remains an important consideration for the discipline of aeolian research.

Heinz Fassmann, . Email: heinz.fassmann@univie.ac.at; *Growth and Decline: two industrialized cities (Linz and Baton Rouge) in comparison*

The paper compares two industrialized cities, their demographic development and their intraurban structures. Linz in Upper Austria as well as Baton Rouge in Louisiana are of the same size (200,000 inhabitants), are characterized by a traditional oil and steel industry and both are capitals of their state. But more important are the dissimilarities: Baton Rouge is a growing city consuming much more space for the same number of inhabitants. For all basic needs (housing, transportation, retail, industry) more space is spent than in the compact city of Linz. Exact statistics of the different land use pattern will be demonstrated. Also the different pattern of settlement structures within the cities will be shown. The high segregation by race, social status and age in Baton Rouge

is in contrast to the much more even distribution in Linz. The different mechanism of the housing market and the diverge ideas how people should live will be used for explanations.

Todd Faubion, University of Washington. Email: tfaubion@u.washington.edu; *HIV/AIDS in South Africa: The Impact of Decentralized Development on a National Treatment Program*

South Africa's HIV/AIDS epidemic continues to increase in prevalence, with most estimates placing the total number of individuals with HIV or AIDS at between five and six million people. Given concerted efforts to reverse this trend and despite the rollout of an antiretroviral treatment program, the epidemic continues to intensify. While a modest, somewhat fractured treatment plan has been undertaken, necessary treatment is still out of reach for approximately 600,000 people who could benefit from an antiretroviral regimen. I explore the possibilities for a holistic treatment program and, more broadly, the possibilities for truly addressing the epidemic in South Africa. Contextually, I examine South Africa's present 'development' policy and argue that the current method of governance will be incapable of addressing an epidemic this generalized and of this magnitude. The government has long resisted a broad treatment program; I argue that through decentralized development policy and a subsequent lack of resources distributed from the national government, the capacity to effectively treat the disease and prevent future infections is severely limited. I suggest that the policy of decentralizing development alleviates much of the national government's responsibility to individual citizens in a depoliticized manner and will further undermine efforts to implement a cohesive and effective national treatment program.

James Faulconbridge, Lancaster University. Email: j.faulconbridge@lancaster.ac.uk; *Comprehending and negotiating dynamic national business systems: insights from global law firms*

The distinctive national business systems/varieties of capitalism that exist throughout the world are well recognized but there remains a number of important and unanswered questions about the way processes of change occur as firms attempt to reproduce systems overseas and learn from the experience. This paper offers insights into the peculiarities of this process in the somewhat understudied service sector and examines the practice used by global law firms to negotiate the overseas implementation of their business models in jurisdictions with diverse 'varieties of profession system'. Using empirical material, the paper first identifies a number of key practices including expatriation and the recruitment of lawyers with experience in the US or UK. The benefits of 'being there' these provide are noted in terms of understanding the peculiarities of the different national systems. It is then shown how such understanding is used to inform negotiations between contending parties and allow pressure to be exerted on elements of the business systems discovered to be convergent or less institutionalised and more likely to change. The paper describes how different forms of global convergence, 'hybridity' and 'fragmentation' exist in business systems across time and space as a result of these negotiations. In conclusion suggestions are made about how these insights might help us understand wider negotiations about changes in national business systems and the extent to which forms of 'strong' and 'weak' convergence develop.

Keywords: varieties of capitalism; globalization; law firms

John M. Faustini, Oregon State University. Email: Faustini.John@epa.gov; Philip R. Kaufmann, U.S. Environmental Protection Agency. Email: kaufmann.phil@epa.gov; *Land Use Impacts on Stream Bed Substrate Influenced by Geology in the John Day Basin, Oregon*

Human land uses and land cover modifications (e.g., logging, agriculture, roads) can alter runoff and increase sediment supply to streams, potentially degrading aquatic habitat for benthic organisms and fish. This study used synoptic stream habitat survey data from a regional assessment (N=58) to quantify stream channel substrate characteristics and relate these to human disturbance within the riparian zone and upstream catchment at local to whole-catchment scales inferred from field observations and remote sensing data. We assessed potential excess fine sediments using several indices of bed stability and excess fine sediments based on the difference between observed particle size or fine sediment abundance and empirically predicted values for least-disturbed sites. Bedrock lithology was an important natural control on the relationship between streambed substrate and human disturbance. Bed stability was significantly negatively associated with a field-based index of local human riparian disturbance in catchments underlain by resistant rock types, but only weakly negatively associated with riparian disturbance in catchments containing a significant proportion of erodible rock types. In contrast, bed stability in resistant basins was significantly positively associated with catchment-scale road density, but strongly

negatively associated with road density in basins underlain by erodible bedrock. Our results suggest that roads are an important form of (or surrogate for) human disturbance in this landscape, and that geology may play an important role in determining the response of stream channel substrate to human landscape and riparian disturbance. Disclaimer: This is an abstract and does not necessarily reflect EPA policy.

Keywords: fine sediments, bed stability, stream habitat, anthropogenic disturbance, roads

Laura Fayollat, . Email: lfayollat@hotmail.com; Title: "Doing Women's Work": Gendered Workspaces and Gender Expectations

This qualitative study investigates how a diverse group of women employed in the same gender-specific job as grocery store product demonstrators perceive their gender roles in their everyday lives. The research proposed that a cross section of older white American, African American, Latina, and immigrant women employed in this gender-specific job would feel confined and/or influenced by traditional gender roles more than younger, ethnically diverse women holding the same position. The participants taking part in this study work in the St. Louis Metro East Area and are between thirty and eighty years old. After exploring and analyzing the data from twenty semi-structure, in-depth interviews, this yielded surprising similarities between women in different ethnic groups and age brackets. Data analysis showed that traditional gender-specific roles have shaped the lives of older generations of women more readily than their younger counterparts. However, younger women whom strongly expressed having modern gender roles in their interviews still find themselves confined to some similar traditional roles that older participants have in the home. Younger generations of women were still less active in gender-specific household chores and activities than their older counterparts, but their focus on the family remained the same. Among various ethnicities, a Latina woman and three immigrant women from East Asian countries were most likely to emphasize home over work. At the other end of the spectrum, the four African American women interviewed emphasized the independence of women. The white women fell across the spectrum in their perceptions of gender roles and expectation.

Melanie Feakins, Dr, University of South Carolina. Email: feakins@gwm.sc.edu; Offshore in the Core: Offshore Outsourcing of Software to Russia and the Onshoring of Services and Sales in the US

Offshore outsourcing has become the buzzword of the IT community and the popular media that writes about economic change in the current era of globalization. Although it is used broadly, it refers specifically to two forms of externalization: spatial and organizational. From the organizational side it suggests sourced and sub-contracted relations for production and services that extend beyond the boundaries of the contracting entity (outsourcing); spatially, it designates relations and contracts that cross national-state borders where the contractors are located (offshoring). This paper reverses the perspective and position from which offshore outsourcing phenomena are routinely analyzed. This reversed perspective demands a concept that captures the particular inversions at play. The label I have given is 'onshoring'; Onshoring encompasses practices that require corporeal, legal, and/or representational presence of the offshore in the core. The onshoring concept is developed with research material from fieldwork conducted with IT firms in St Petersburg, Russia, their affiliates in the US, and their clients in the US. The paper documents and analyzes the practices and materialities employed in onshoring strategies by firms whose development workforce is in Russia. These onshoring strategies and processes constitute expanding, if liminal, elements of economic globalization. The paper shows that onshoring is a prism through which the larger phenomena of 'offshore outsourcing' can be framed and scrutinized to reveal the complex flows that constitute the expanding geographic trends.
