In 2005 something in the order of 75,000 cosmetic surgery operations were undertaken in the UK and so widespread is the interest in such surgery that the Department of Health has issued guidelines for patients considering cosmetic operations. Face lifts, breast enlargements, nose reduction and fat removal, once the preserve of the rich and famous are now considered part of normal, everyday beauty procedures for a large section of society. This paper briefly details the extent and nature of the commercialisation of the body surgery through the cosmetic industry. It then goes on to explore the role of cosmetic surgeries in opening up questions about body parts and the transformational possibilities of new technologies. It argues that an examination of cosmetic surgery can make an important contribution to theoretical and empirical work in Geography on subjectivity and the body, destabilising boundaries between the body and the self and repositioning ideas of nature and the biological body in questioning the logic of identity. The paper also notes the ways in which particular assemblages of body parts retain such power within fluid and discursive forms of gender identity.

GIS/T researchers use commercial GIS/T software to test their concepts for many years. Occasionally available commercial GIS/T software is not suitable for their needs especially in the field of spatial-temporal transportation research. The spatial-temporal transportation research topic is a cutting edge subject and widely accepted and fully tested standards are not yet available. Most researchers overcome this deficiency by trial and error practice. The commercial software companies are also waiting for the standards or can not maintain pace with the research efforts. Therefore, many spatial-temporal GIS/T functionalities are missing in the software. GIS/T researchers spend significant time to solve fundamental problems such as incompatible data structures. This severely limits the time that can be devoted to developing analytical tools appropriate for spatial temporal transportation research. The available commercial software is designed to be as flexible as possible so the researcher can customize their application under its development environment. However, under certain situations, advanced research topics require a more flexible development environment than the commercial software to test their assumptions. A test bed built on open source library is useful for this purpose. It is flexible, powerful and also accessible. There are many open source GIS applications and libraries on the internet. This presentation will review a few packages which are used to build the GIS/T test bed. The libraries include QT, GDAL, CGAL, GEOS, BOOTS, PROJ, and NETWORK. This presentation also includes a live demo of the Spatial-Temporal GIS/T build from open source libraries.

Desheng Liu, The Ohio State University. Email: liu.738@osu.edu; Maggi Kelly, University of California, Berkeley. Email: mkelly@nature.berkeley.edu; Peng Gong, University of California, Berkeley. Email: gong@nature.berkeley.edu; A new simulation approach to testing independence between non-stationary spatial point patterns

In detecting attraction and repulsion between spatial point patterns, a random toroidal shift is often applied to simulate independence between point processes. However, the random toroidal shifting test for independence is not applicable to non-stationary spatial point processes because the random toroidal shifting method assumes stationarity for the underlying sub-processes. In this paper, we present a new simulation approach to testing the independence of the non-stationary spatial point process. This approach can preserve the original structures of sub-processes and yield independent joint realizations of the marginal non-stationary processes. Both simulated and real non-stationary spatial point data were used with this approach for independence test. The results showed that the new approach was very effective and robust in detecting both attraction and repulsion between non-stationary point processes.

Modifying the built environment may increase opportunities for physical activity, promote nutritious diet, reduce caloric intake, and reduce sedentary lifestyle. We present results of a pilot study examining interplay between the built environment, space-time activity patterns, and potential effects on physical activity and obesity. The project approaches behavioral and clinical data with innovative methods of geospatial analysis and spatial statistics, at scales ranging from the individual through the neighborhood to the metropolis. The research aims are: (1) Test methods for continuous GPS tracking of travel behaviors for youth ages 10 to 11 and, (2) Use GPS tracking to identify, measure, and explore environmental exposures as mediators for sex and race differences in physical activity and overweight. Aim 1 will be accomplished by using GPS and GIS to collect (via inobtrusive direct observation) and assess large amounts of human exposure data. Aim 2 will be achieved by conducting multilevel modeling and spatial analysis of the relation between built environment, socioeconomic status, obesity-related behavior, and obesity-related outcomes. The analysis will focus on frequently observed, but inadequately understood, sex and race differences in physical activity and childhood overweight. Clearly obesity is determined by a complex interaction between genetic, cultural, and environmental factors. We speculate that cultural and environmental exposures affect diet and activity levels, increasing risk of obesity, but these mechanisms are not proven. In order to develop effective interventions, we need a better understanding of how exposure to factors such the built environment or neighborhood poverty mediate physical activity and dietary behavior.

With the advent of high resolution topographical information acquired by airborne LIDAR and InSAR system, it has become possible to detect and delineate subtle micro terrain features through numerical processing of digital elevation data. In this paper, we present an innovative method to extract the geometric information of river channels from Airborne LIDAR data. The continuous, connected stream network is first derived, and the geometric properties, including channel width, depth, cross-section area, and central line, have been numerically derived for each section of river channels. The method has been successfully applied to a number of regions of Harris County watersheds in Texas.

The goal of this study was to examine the scaling-up effect on examination of seasonal variations in the relationship between landscape pattern and land surface temperature based on a case study of Indianapolis, United States. The integration of remote sensing, GIS, and landscape ecology methods was used in this study. Four Terra's ASTER images were used to derive the landscape patterns and land surface temperatures in four seasons in the study area. The original images were resampled to total eight spatial resolutions: 15m, 30m, 60m, 90m, 120m, 250m, 500m, and 1000m. The variances of spatial and ecological characteristics of landscape patterns and LSTs across the scales were examined by the use of landscape metrics. The best level of equalization between land use and land cover map and corresponding land surface temperature map was determined on the basis of a minimum distance in the landscape metric space. The distances were measured by a standardized Euclidean distance and computed at all levels of spatial resolutions. Current result shows that the patch percentages of different land surface temperature zones in four dates were not apparently affected by scaling-up process. Their patch numbers and shape indices remain constant when spatial resolutions are less than 90m, and then, starting from 90m, decrease as the increase of cell sizes without distinct seasonal changes. Fractal dimension, aggregation, and connectivity show sensitivity to scaling-up process. The research is of benefit to the study of regional land surface temperatures and the relationship with landscape pattern in situ area.

Spatial data mining is the most important method in finding the distribution characteristics of large amount of data. GIS is one of the essential ways in spatial data mining. This article use spatial clustering method to analysis the distribution of over 200,000 corporations in the suburb of Beijing, China. First, we located the position of each corporation in GIS by its address and got over 200,000 location points. The attributes of points include economical information of corporations, such as industry; income lever, amount lever of employee, type of investor, and so on. The points got together and no characteristics of distribution could be found. The spatial clustering method was performed. There were two parts of cluster. One was to cluster points by positional distance to get cluster regions. Quantitative measured the regions by corporation attributes and clustered regions by the attributes. The distribution analysis of regions was followed. Three clustered distribution areas were divided, named region 1(close to center of city), region 2(in middle) and region 3(far from center of city). Industry of corporations' distribution showed that the percentage of service corporations in region 1 was 17.17% higher than in region 3, and the percentage of manufacturing in region 1 was 28.39% lower than in region 3. The results indicate that the spatial clustering is an effective method in studying the distribution of large amount of point data.

Keywords: data mining, spatial cluster, corporations distribution, Geographical Information System

Jian-Yi Liu, Montana State University. Email: jliu@montana.edu; Urban Development in China: The Changing Landscape, 1985-2005

Since the early 1980s, China has been in the rapid transformation from a poor agricultural society to a strong industrial country. One of the results of the rapid national economic growth is the great urban development and urban landscape change. In 1985, the urbanization level of China is only 32 percent, but the number is jumped to 54 percent in 2005. In the same period, the number of officially defined cities has increased from 263 in 1985 to 686 in 2005. Along with the rapid increase, the physical changes of all Chinese cities are dramatic. In 1985, the majority of the houses and buildings in Chinese cities were old and poor, with dark colors, urban streets were narrow and crowded by bicycles and people with uniform blue/grey colors. In 2005, however, the image was replaced by a different landscape, dominated by new, high, colorful and beautiful architectures, wide city streets filled with diversified automobiles, and beautiful green landscaped spaces. To illustrate the rapid urban development and urban landscape changes, Shanghai and Guiyang of Guizhou Province are selected as samples and some photos from 1985 and 2005 are used for comparison.

Email: jagger@stat.fsu.edu; Using Hurricane Ivan as a Modern Analog to Calibrate Paleohurricane Intensity Estimates in the Proxy Record

The catastrophic landfall of Hurricane Ivan in September 2004 at Gulf Shores on the Alabama coast offers an extraordinary opportunity for paleotempestology research. We re-cored the Shelby lakes and used Ivan's sedimentary signature as a modern analog to calibrate the intensity estimates of paleohurricanes derived from the proxy record. Stratigraphic data from 52 new cores collected in 2005 and 2006 show that Ivan, a cat 3 hurricane at landfall, left a distinct sand layer in Little Lake and Middle Lake but not in Lake Shelby. Thus the three Shelby lakes have different paleotempestological sensitivities. Accordingly, proxy data from Little Lake and Middle Lake can record hurricanes of cat 3, 4, and 5 intensities, whereas those from Lake Shelby are sensitive to cat 4 and 5 hurricanes only. These new findings support proxy evidence showing 7 events (sand layers) in Little Lake during the past 1200 years, compared with only 2 events in Lake Shelby during the same period. The proxy estimates are consistent with results from a hurricane risk model developed from historical data that relates hurricane return levels (intensity) with return periods (frequency) for the coastal segment within a 25 nm (45 km) radius from Lake Shelby. The model results suggest that the return period of 318 years estimated from the Lake Shelby proxy record corresponds to direct hit by a hurricane with 139 kt winds [95% CI (124 kt, 151 kt)], or a high cat 4-5 hurricane according to the Saffir-

Simpson scale.

Weidong Liu, Chinese Academy of Sciences. Email: liuwd@igsrr.ac.cn; Patterns and Dynamics of Town Development in China: A case study of two towns in Sichuan Province

In the 1980s and 1990s, one eye-catching economic phenomenon in China was the fast development of rural industries (i.e. township and village enterprises, TVEs). The TVE sector was developed mainly based on local resources and rural labors, i.e., it represents a bottom-up model of development. Since TVEs absorbed a lot of rural surplus labor and stimulated the "birth" and growth of many towns, the bottom-up TVE-driven model of town development has been believed to be the right track to solving the problem of huge rural surplus labor and transfer the rural into urban. Since the late-1990s, however, the circumstance of rural industrial development has changed markedly. This indicates that the sustainability of the bottom-up TVE-driven model of urbanization needs to be carefully examined. This paper, based on in-depth investigation of two towns in Sichuan Province, will examine the new patterns and dynamics of town development in China. In the paper, I would argue that the bottom-up model has lost its value as a strategic pathway to town development in China, and a new a top-down model is becoming the main dynamics.

Email: ; Predicting Forest Successional Stages with Multitemporal Landsat Imagery and Forest Inventory and Analysis Data

Forest succession is a critical ecological process that has profound biophysical, biological and biogeochemical implications in terrestrial ecosystems. Therefore, information on forest successional stages over an extensive forested landscape is critical for us to understand ecosystem processes, such as carbon assimilation and energy interception. This study explores the potential of using FIA plot data to extract forest successional stage information from remotely sensed imagery with three widely used predictive models, linear regression, decision trees and neural networks. The predictive results in this study agree with previous finding that multitemporal Landsat TM imagery can improve the accuracy of forest successional stage prediction compared to models using a single image. However, due to the overlap of spectral signatures of forests in different successional stages, it is difficult to accurately separate forest successional stages into more than three broad age classes (young, mature and old) with reasonable accuracy based on the age information of FIA plots and the spectral data of the plots from Landsat TM imagery. Given the mixed spectral response of forest age classes, new approaches need to be explored in order to improve the prediction of forest successional stages using the FIA data.

XiaoHeng Liu, San Francisco State University. Email: xhliu@sfsu.edu; Geodetic distance transformation and its application in ocean boundary delimitation

Current implementation of distance analysis in GIS is mainly based on Euclidean geometry despite geographical features are located on ellipsoidal earth. This paper uses international maritime boundary delimitation as an example to illustrate the limitations imposed by this strategy and offers a solution based on geodetic distance transformation. An algorithm which enables buffering and Voronoi diagram generation on the ellipsoidal surface of the earth is presented, which has the following characteristics: (1) distance is computed on geodetic reference ellipsoid instead of maps, thus avoids the distortions imposed by map projections; (2) buffer generator and Voronoi generators can take any arbitrary shape and varying weights; (3) error is bounded and the computational cost is relatively low. The application of the algorithm on ocean boundary delimitation such as Economic Exclusive Zone (EEZ) and median line is illustrated. Its implication on some of the principals in the current international maritime boundary law is also discussed.

Zhi-Jun Liu, University of North Carolina at Greensboro. Email: z_liu@uncg.edu; Dan Royall, University of North Carolina at Greensboro. Email: pdroyall@uncg.edu; Anita Henderson, University of North Carolina at Greensboro. Email: aahender@uncg.edu; Long-term Dynamics and Downstream Propagation of Urban Influences on Hydrologic Regime

The purpose of this study is to investigate the long-term influences of urbanization on hydrologic regime and their downstream propagation by analyzing and comparing the patterns of streamflow of an urban stream in the city of Greensboro, NC and downstream rural areas. This is a pilot study for a larger project that aims to understand the dissipation of urbanization impact on a stream after a certain distance removed from an urbanized area and the lag between the time of urban development and the time when the urban influences appear in streamflow and channel morphology. Three U.S. Geological Survey stations on this stream and one station on a nearby rural stream (as control station) provide flow data for analysis. Daily streamflow data from the four stations are analyzed for hydrological effects of urbanization using (1) annual maximum discharge adjusted for watershed size (discharge per unit area), (2) flow duration curves, and (3) the fraction of a year that daily mean discharge exceeds the annual mean discharge. Annual maximum discharge increases in response to urban development in a watershed. The variation of flow duration curve increases with increasing intensity of urbanization. The percentage of days in a year that daily mean discharge exceeds the annual mean flow decreases with increased urban development. Both annual maximum discharge and the variation of flow duration curve decrease downstream of the urbanized area, while the fraction of a year that the annual mean discharge is exceeded increases downstream.

Zhilin Liu, Cornell University. Email: zl44@cornell.edu; Low-income housing policy in a marketization context of urban China: The case of the economical and suitable housing program (ESHP) from a principal-agent perspective

This paper adopts the principal-agent framework to examine the political economy of a major affordable housing policy in China, i.e. the economical and suitable housing program (ESHP, or in Chinese, jingji shiyong zhufang zhengce). I argue that issues of housing affordability and low-income housing policy in China must be understood within the context of marketization. This not only involves the creation of market institutions, but also a project state building, through which the state needs to transform itself into a regulatory state, as well as to restructure the inter-governmental relationship. Yet decentralization often creates a principal-agent relationship between central and local governments especially when implementing certain social policies. In this paper I argue that the ESHP, initiated by the central government and implemented by local governments, possesses a typical weak principal-strong agent dynamic, which contributes to many of its unintended consequences. In particular, conflicts of economic and political interests of the principal, as well as the incomplete process of marketization, create a certain level of institutional ambiguity. This leads to a more powerful position of the agent, i.e. local governments, who pursue their own interests often at odds with the principal. Research for this paper combines qualitative analysis with game-theoretical modeling, aiming to advance the understanding of the complex dynamic among key stakeholders in the process of housing marketization in China. First and second-hand data sources include field observations, interview notes, official statistical data, and archival materials, collected during multiple field trips in various Chinese cities during 2004 and 2005.

Kari Liuheto, Pan-European Institute. Email: kari.liuheto@tse.fi; Attracting Foreign Investment into the Russian Enclave with Administrative Benefits: The Special Economic Zones in the Kaliningrad region

The foreign investment inflow into Kaliningrad has been modest. By the beginning of 2006, the accumulated foreign investment stock amounted to some USD 160 million. Kaliningrad's FDI stock per capita is seven times higher in the Russian Federation on average than in Kaliningrad. The difference becomes even more visible when comparing Kaliningrad with the nearby countries. The FDI stock per capita, for instance in Sweden, is nearly 200 times higher than that of Kaliningrad. The difference between Kaliningrad and Estonia is close to 80-fold. Here, one should not forget that some 15 years ago both Kaliningrad and Estonia belonged into the same country, i.e. their starting point for the economic reform was not so dramatically different. When analysing the FDI performance of Kaliningrad, one should not forget that at least a third of the FDI in Kaliningrad is Russian by origin, which makes Kaliningrad's FDI performance even less flattering. In order to attract more foreign investment into the Kaliningrad region, a new federal law on foreign direct investment was passed in the spring 2006, and therefore, at the moment, two special economic zone regimes exist in Kaliningrad. This paper aims at studying what is the impact of these SEZs on the

foreign investment inflows to the economy of the Kaliningrad region?

Keywords: Kaliningrad, foreign investments, FDI, special economic zones, SEZ

Diana M. Liverman, University Of Oxford. Email: diana.liverman@eci.ox.ac.uk; Politics, the new carbon economy and post 2012 negotiations

As capital flows into the new markets for carbon established by the international climate regime the politics of the post-2012 are becoming more complex and contentious. This paper will focus on the politics of developing country involvement in the climate regime, especially the status and future options for the Clean Development Mechanism. The options include avoided deforestation, clustered and sectoral projects, and the alternatives offered by voluntary offset markets. I will examine the debates such as those over additionality, transaction costs, 'gold standards' and monitoring and identify the various interests in rewriting the regulations that govern the emerging rules of the carbon economy. The paper will illustrate the politics of post 2012 negotiations through a particular focus on the roles of non state actors and on Latin American countries and will draw on theoretical frameworks developed by my collaborators in the Tyndall Centre (www.tyndall.co.uk) and James Martin 21st century school at Oxford University and on case studies undertaken by postgraduate students.

David Michael Livingston, Indiana State University. Email: dlivingston@indstate.edu; Basil Gomez, Indiana State University. Email: bgomez@indstate.edu; Controls on Longitudinal Profiles: Waipaoa River Basin, New Zealand

Rivers adjust their gradient to discharge and the character of the rock or sediment that forms the channel boundary. Accordingly, as J.T. Hack demonstrated, rivers of similar size flowing across comparable substrates tend to have similar profiles. The neighboring 222 km² Mangatu and 239 km² Upper Waipaoa catchments of the Waipaoa River basin, New Zealand, offer an ideal setting to examine the interaction of these and other variables on river profiles. These catchments are under laid by similar lithologies, have been subjected to a similar climatic regime and have experienced a similar rate of uplift during the past ~15 kyr. There is little difference in total-relief, drainage density and distribution of slope angles, or in the median size of sediment present along the main stream channels. Despite the similar conditions, the profiles of the Mangatu and Upper Waipaoa rivers are quite different. The Upper Waipaoa has a gentler gradient and the upper reaches of the stream are ~80-m lower than adjacent reaches of the Mangatu River. These differences are attributed to how discharge increases in a downstream direction along the two rivers which serves to emphasize that the distribution of energy in the stream-channel system is dependent on the structure of the drainage network, and that an orderly empirical relationship between drainage basin area and main channel length may not always apply.

Steven Livingston, PhD, The George Washington University. Email: sliv@gwu.edu; NGOs As Intelligence Agencies: The Empowerment Of Civil Society By Commercial Remote Sensing

In 2002, as the Bush administration strained to draw world attention to Iraq's alleged WMD programs, the Institute for Science and International Security (ISIS) in Washington announced that it had detected two nuclear processing facilities in Iran. They were located following the release of information in August 2002 by an Iranian opposition group called the National Council of Resistance of Iran. Relying on information provided by this group, ISIS purchased Digital Globe satellite images of the two sites. ISIS's disclosure forced the Bush administration to acknowledge the Iranian program, something it did not want to do while it focused attention on Iraq. This and other similar cases will be explored to illustrate the democratization of epistemic power in international affairs. As intelligence agencies have faltered, CRS has strengthened NGOs ability to offer countervailing technical analyses. CRS imagery supplements the NGO's more common moralistic rhetoric of ought with a technical analyses of is. This constitutes a major shift in the epistemic balance of power between civil society and the state. This in turn affects the nature of democratic accountability in foreign policy. These considerations are explored in this paper.

Keywords: GIS, Remote Sensing, Iran, Nuclear Processing Facilities

Emily Thomas Livingstone, UNC Charlotte. Email: lululivingstone@hotmail.com; *An Examination of Contemporary Gentrification Processes in Charlotte, North Carolina*

After years of a "theoretical logjam," Loretta Lees (2000) proposed that gentrification scholars examine contemporary aspects of the process in order to propel the debate and our understanding of the complexity of the process forward. One avenue deemed worthy of study was the presence of 'supergentrification' in London and New York City, two quintessential, top tier global cities. This paper explores the applicability of 'supergentrification' down the urban hierarchy in Charlotte, North Carolina, a mid-sized globalizing city that has not experienced gentrification in the "traditional" manner. Indeed, Charlotte's 'first stage' gentrifier was a bank, NCNB now Bank of America. As headquarter home to two of the nation's largest banks, Bank of America and Wachovia, Charlotte stands only second to New York in terms of financial strength. In this context, 'supergentrification' appears to be occurring in Charlotte's city core. Wealthy global financiers are engaging in "intense investment and conspicuous consumption" (Lees 2003, p. 2487) as they regentify the urban core in ways suggesting luxury and exclusivity, as well as initiating 'new-build' gentrification, reminiscent of Lees' work in New York City and London. Using statistical, survey and field site data, this paper offers a pilot study of a process that has previously been examined in elite global cities. As such, it offers further evidence of contemporary aspects of the process that will add to the 'geography of gentrification,' and will position Charlotte as an appropriate lens through which to learn more about the role of globalizing cities in gentrification research.

Keywords: 'supergentrification', 'new-build gentrification', 'geography of gentrification'

Christopher A Lizotte, Middlebury College. Email: chrislizotte@gmail.com; *Rural Mental Health and "Mezzo-Scale" Rural Space: Resituating Societal Constructions of Deviance*

Policymakers are taking a closer look at mental health service provision in the rural United States based on a closer understanding of changing demographic and economic circumstances. Elsewhere, Wolch and Philo (2000) have documented the approaches that geographers have taken towards examining the spaces of mental health and ill-health, noting that a certain disconnect exists between theory and practice; in the rural context, for example, while it is understood how the large-scale changes occurring in contemporary rural space might affect mental health service provision and utilization, local ethnographies of mental ill-health tend to limit themselves to the immediate community setting. This paper begins to answer Wolch and Philo's call for a "third wave" of mental health geography by synthesizing a theoretical framework for examining the presence of mental ill-health in the rural context. Drawing on existing literature, it theorizes that the rural landscape forms an especially powerful backdrop for marginalizing mental health consumers and providers because norms of acceptable behavior are constructed within a "mezzo-scale" rural space; notions of community care and responsibility are thus undermined by concerns for conforming to larger ideas of what rural places should be like - safe havens from urban stresses, repositories of enduring values, or sites of recreation. The final section of the paper provides several recent examples of such contradictions in communities' attitudes towards mental health, and outlines a possible methodology for a future in-depth study linking one of these cases to the phenomenon of the mezzo-scale rural.

C P. Lo, University of Georgia. Email: chpanglo@uga.edu; *Geographically Weighted Regression Approach to Population Estimation*

Land use information derived from satellite images has often been used to estimate population in a city. A common approach is to use the global regression model or ordinary linear regression (OLS) to relate residential land use area with population size. Research has revealed the spatial variability in the relationship between population and land use so that the global regression approach is not appropriate, and a regional regression approach may be more suitable. This paper reports a research to apply geographically weighted regression analysis, which can deal with the problem of spatial non-stationarity, to population estimation in Atlanta at the census tract level. Because of possible errors in computer-assisted classification, residential land use may not be completely and correctly identified. A four-variable model consisting of high-density urban use, low-density urban use, cropland, and forest is adopted to evaluate the suitability of the GWR for population estimation. Initial results reveal that low-density urban use, cropland, and forest exhibit significant spatial variability while high-density urban use does not. The coefficient of determination of the GWR model using the four variables is 0.77 compared with 0.61 for the global regression model. The accuracy of population estimated using the GWR model gives a RMSE of ± 1484.46 or a mean relative error of -10.67% compared with a RMSE of ± 2302.13 or a mean relative error of ?18.12% for the global model. This represents an improvement of 36%.

The GWR model produces parameters that can help in dasymetric mapping application in areal interpolation.

Keywords: geographically weighted regression, population estimation, urban land use, Atlanta

Lucia Lo, York University. Email: lucialo@yorku.ca; *Does Ethnicity Matter In The Geography Of Consumption?*

Intense waves of international migration in the last two to three decades are rewriting our cities and economies. Two trends are notable especially in immigrant gateway cities: the growth of immigrant-owned businesses and the diversified structure of some ethnic economies, and the accelerated ethnic marketing efforts of mainstream firms. They raise an interesting research question. Specifically, how do urban consumers choose between businesses owned and operated by ethnic minorities and those in the mass market? More generally, how does ethnicity interplay with accessibility in the geography of consumption? This question is intriguing given many of today's immigrants are socio-economically different from their predecessors, and that little differentiation can occur between an ethnic business and its mass counterpart in terms of their size and product/service variety. This paper explores this question with a case study of grocery shopping behavior. Revealed preference data were obtained from a questionnaire survey administered to residents in two study areas in the suburbs of Toronto, Canada. These two study areas are similar in that they house a sizable Chinese immigrant population. Yet one contains a large number of Chinese supermarkets (note: not grocery stores) while the other has only one. The consumption behavior of the Chinese is compared to that of the non-Chinese population. The results have implications on the geography of consumption.

Keywords: consumption, ethnicity

Linda Lobao, The Ohio State University. Email: lobao.1@osu.edu; *Neoliberalism at the Subnational Scale: Local Governments' Growth and Redistribution Policy in An Era of Decentralization*

This paper examines decentralization of welfare reform, public provision, and economic development activities under the unfolding of neo-liberalism. I focus on variations in response to neo-liberalism at the subnational scale, using the case of county governments. I question the degree to which state processes characterized as the "roll-out of neo-liberalism" have emerged and affected county governments and citizens' well-being. The paper addresses three questions. 1) To what degree do counties' economic development and social service responses correspond with theories about the neo-liberal drift? 2) Are counties racing to the bottom in social service responses and community well-being? 3) To what extent is inequality among local governments arising? To ground these answers theoretically, I situate them within three contrasting perspectives, neo-liberal, radical political economic, and a more spatially sensitive approach. Data are from a unique survey of county governments. Analysts widely assume that communities are pursuing a trade-off course between redistribution and growth activities: cutting back social services while increasing private sector business development. I found little evidence of a trade-off course: county governments report increasing both social service and business development activities. Decentralization is occurring but communities bear the cost through increased financial pressure on local governments. Devolution also has a spatially uneven effect, with poorer and rural communities falling further behind. The findings support both the radical political economy framework and the spatially sensitive approach that locally provided social services and economic development activities create no gain for populations and reinforces past spatial inequalities in social service provision.

David Lobell, Lawrence Livermore National Lab. Email: dlobell@stanfordalumni.org; *Multi-year crop yield mapping at high spatial resolutions*

Advances in global agricultural monitoring will likely someday result in accurate maps of crop yields at high spatial resolutions for all major growing regions. While such information is motivated in large part by the need for real-time crop production forecasts to guide food trade and aid decisions, there are many other potential applications of these datasets in the research and policy community. This presentation will discuss applications of ~30m resolution crop yield maps derived from remote sensing over multiple (5+) growing seasons, drawing on experience from research in Mexican wheat systems. Specifically, multi-year yield maps can be used to identify regionally important constraints to crop yields, to better quantify the risks of yield loss faced by farmers, and to target extension efforts and soil degradation assessments. These likely represent only a subset of the potential value of repeated monitoring and analysis of the spatial distribution of crop types and productivity.

Keywords: remote sensing, agriculture, GIS

Angela L. Loder, University of Toronto. Email: loder.angela@gmail.com; *Shifting edges and Moving Up: Green Roofs and the Nature/City Divide*

The green city movement has seen a gradual shift from only minimizing harm to ecosystems to increasingly trying to harmonize urban and natural processes. Part of this process has seen city planners, the green building industry, and activists argue for the re-greening of the densely-built downtown cores of cities. Though adding greenspace to cities has been a common, and often desirable, feature of the Anglo-American urban landscape since Frederick Law Olmstead's urban park movement, recent movements in urban greening projects have seen cities begin to add vegetation to hard urban landscapes in previously unused spaces. Green roofs, living vertical walls, and roof gardens, often part of green buildings, are re-defining the traditional edges and boundaries between 'nature' and the city. Underlying their implementation, however, are narratives and values on what kind of 'nature', and what kind of green roof, is desirable and appropriate in the city. Both Chicago and London are currently embarking on significant green roof implementation, and they are using very different justifications, narratives, and policy tools to achieve their goals. Using these two cities as case studies, this paper explores the intersection of the discourses surrounding the implementation of green roofs and their contextualization within the sustainable city and Anglo-American narratives on nature and the city.

Mahtab A. Lodhi, University of New Orleans, Department of Geography. Email: mloaddi@uno.edu; *An Interaction Between Religion and Politics: A Case of North Western Frontier Province of Pakistan.*

Islam has always played a major role in the governance of Pakistani society. In recent years, however, Pakistan has become a major center of radical fundamentalist Islamic political parties and ideas, especially in the North Western Frontier Province (NWFP), the Federally Administered Tribal Areas (FATA) and the province of Baluchistan. This is largely because of the policies of successive military, as well as civilian, governments toward Afghanistan and the disputed region of Kashmir. The Islamic fundamentalist alliance known as Muttahida Majlis-e-Amal (MMA) that won the legislative elections in 2002 is now the ruling party in NWFP and Baluchistan. In the federal parliament, the MMA forms a coalition opposition. Ideologically the MMA, especially its major member party, the Jamiat Ulema-e-Islam (JUI), is regarded as the ultra fundamentalist party insisting on the enforcement of strict Islamic Sharia law and has aspirations to establish a complete theocracy in the country. The rise of radical religio-political parties and the impact they are having on Pakistani society in some areas of the country is the prime focus of this paper. The author's recent travel to northern Pakistan is the basis of this paper. He photographed smiling faces of women and men on billboards in Rawalpindi and the capital city of Islamabad, but found defaced faces of women on billboards or 'male-only' billboards in Peshawar, the capital of NWFP.

Alex Loftus, Royal Holloway, University of London. Email: alex.loftus@rhul.ac.uk; Michael Ekers, Oxford University. Email: michael.ekers@ouce.ox.ac.uk; *The Power of Water: Developing dialogues between Gramsci and Foucault*

Recent work on the politics of water poses fundamental challenges to our understandings of the production of space and nature. Whilst taking us to the cusp of a consideration of the reproduction of social formations and the production of subjectivities, such work has not yet dealt with these themes explicitly. We mobilize insights from, and generative tensions between, Antonio Gramsci and Michel Foucault in order to take this research agenda forward. In turn, we contribute to an emerging debate about the compatibility of these wide-ranging theorists. Work on the politics of water provides fertile terrain for exploring this debate.

John Logan, Brown University. Email: john_logan@brown.edu; *Access to Housing in Urban China*

People are connected to their communities in urban China in two ways that have been strongly affected by state policy. The first is their housing tenure. Do they obtain shelter in family households or in collective settings, and on what terms do they procure housing? The second is their residence status, which involves not only their nativity (whether they live in the place where they were born or, if they are migrants, how long they have lived there) but also their legal position (how they are classified in China's household registration system). Using data from the Chinese census of 2000 this study analyzes the relationship between these two dimensions of incorporation in eight large cities, taking into account also people's class position and life cycle position. It documents the marginal housing situation of the "floating population" that has been given much attention in research conducted during the current period of market reform. It

also evaluates what characteristic of this particular social category, comprised of recent migrants with a rural registration status, is most determining of their disadvantage, and it identifies substantial differences among people with other combinations of nativity and registration status.

Jerome L. Lohry, University of Nevada - Reno. Email: jlohry@yahoo.com; *The View from Here: The Missouri Frontier Perception of the California Emigrant Trail*

After stalling at the Missouri frontier for over twenty years, the building of the western American empire began anew in the 1840s. This buildup at the eastern edge of the Great Plains created a specific launching point for those headed west to the new Pacific Arcadia, a place where supplies and information could be acquired before heading into the interior of the continent. The information gained about the trail ahead helped shape the emigrants' geographic perception of the interior West, which would have been used to make important decisions such as the route to be taken, mode of travel, and supplies needed. This perception was, in fact, more important than the reality of the trail for the purposes of planning the journey ahead; the reality would not be known until the crossing was finished. As the portion of the California Emigrant Trail through the Great Basin could also be the most difficult, it is important to understand the factors that caused the emigrants to approach this region as they did between 1840 and 1850. Many 1840s frontier sources, both formal and informal, would have played a role in creating an image of the road ahead. Through an analysis of maps, emigrant guides, newspaper articles, and other sources of period information, we can reconstruct a portion of this historic perception, so that we may better understand the decisions made on this empire-building migration.

Fire management plans require a full understanding of fire regime variability and the ability to assess current departures from "natural" conditions. Despite recent advances in southern California chaparral fire ecology, temporal perspectives on fire regime variations and changes in this type are relatively short. Most chaparral fire history research spans only portions of the 20th century when documentary records are available. Unlike many other woody species of the semi-arid western United States, chaparral is usually not directly suitable for traditional dendrochronology. Thus, a set of novel dendrochronology approaches is needed. We hypothesize that fire primarily spreads between patches of bigcone Douglas-fir (*Pseudotsuga macrocarpa*) via the surrounding chaparral and that synchrony of fire events between these patches would support this premise. Using *P. macrocarpa* stands that exist as scattered islands of forest in a chaparral matrix across the southern California landscape, our goals include the evaluation of fire regime changes, and the effects of climate on these fire regimes — particularly foehn winds and inter-annual to decadal-scale climate variations. Replication of our sampling plan at multiple scales will allow us to create a regional fire-scar network that can be compared with known fire events derived independently from the 20th century fire atlas maintained by the three National Forests. Analysis of preliminary data suggests that there is an abundance of fire scarred *P. macrocarpa* dead standing trees and downed logs. The sampled trees contained 5-600 year records and had evidence of five to ten fires during their lifespan, including recent documented fires.

Keywords: chaparral, fire history, dendrochronology, fire ecology

Jonathan K. London, Ph.D., UC Davis, Department of Human and Community Development. Email: jklondon@ucdavis.edu; *Towards a Rural Pattern Language*

For those who care about rural places the inadequacy of analytical frameworks for understanding and therefore intervening in rural change is troubling. Alternately framed as an immaterial anachronism in an increasingly dominant metroscape; a victim of over-determined and extractive structures of modernity, capitalism, and globalization; a romanticized lost agrarian world, or an uncritical site of local progress, the dominant rural discourses provide little basis for satisfying intellectual or political projects. Nearly all of the available discourses locate rural in a marginal, peripheral and/or residual category of the urban, the regional, the national, or the global. The space allowed by any of these discourses is so narrow as to make rural studies, as a field, nearly as marginal as the rural places it studies. Such limitations have stunted both the field of rural studies and

the practices of rural change. This is unfortunate and unnecessary as the possibilities for rural community change and, likewise, its scholarly analysis are profound and compelling. Rural places and their change dynamics represent critical components of larger economic, political, cultural and social systems and are therefore important and vital subjects of study and action. Communities of practice are themselves reframing and reshaping rural realities through innovative community and regional development strategies. Theories of rural development, by largely focusing on deficits, have at best missed, and at worst masked, the possibilities for positive rural transformation. This paper provides for needed progress in rural studies by helping theory "catch up" with the frontiers of rural practice.

Colin Long, University of Wisconsin Oshkosh. Email: longco@uwosh.edu; Alisa Hass, University of Tennessee. Email: ; Patrick Bartlein, University of Oregon. Email: bartlein@uoregon.edu; The response of forest vegetation to multiple disturbance agents in the Central Cascades Oregon

This study presents evidence of the effects of volcanic activity (e.g. tephra deposition) and fire on two watersheds in the Central Cascade Range in Oregon. We used pollen analysis of lake sediment cores to reconstruct the long-term vegetation history and examine the effects of tephra deposition on forest composition at Tumalo Lake, located at the upper limits of the Ponderosa pine vegetation zone of the central Cascade Mountains of Oregon. We also used macroscopic charcoal analysis of lake sediment cores from Tumalo Lake and Three Creeks Lake, approximately 10 km northwest of Tumalo Lake in the Mountain Hemlock vegetation zone, to reconstruct the fire history for both locations for the last ca. 12,000 years. Tumalo Lake pollen data show a shift in forest composition ca. 4600 year ago from a pine dominated forest to one with a greater presence of fir and spruce. Pollen data also show a repeated decline in non-arboreal taxa immediately after tephra deposition with recovery to pre-deposition levels in ca. 40-70 years throughout the record. Charcoal data indicates changes in long-term fire history but no consistent relation between shifts in fire frequency and tephra deposition. These findings suggest that these disturbance agents have different impacts on forest vegetation and imply that, despite dramatic short-term variations in forest stand structure, long-term regional climate has been a major factor controlling forest composition.

Esther G. Long, Morehead State University. Email: e.long@moreheadstate.edu; Civic Education in Post-Taliban Afghanistan: A Case Study of Nation-building at Work

Prior to the 2005 parliamentary election in Afghanistan, the international community and the new Afghan government engaged in widespread civic education campaigns to prepare the population for voting. One of these civic education efforts was an outreach campaign funded by the United States government in which 41,000 digital audio players with pro-democracy messages were distributed in rural areas to inform potential voters about the election and encourage them to vote. The project was evaluated several weeks after the election using surveys, focus group discussions, and individual interviews, and results suggest that this novel approach to civic education could also have other productive applications. This paper examines civic education - and the audio player project in particular - in the larger context of nation building that was being engaged in during the post-Taliban era in Afghanistan, and shows how civic education was used to consolidate the power of the central state.

Joanna C Long, Queen Mary, University of London. Email: j.c.long@qmul.ac.uk; A 'particularly political diaspora': Palestinian students in the UK

This paper discusses political identities and activities among Palestinian students in a diaspora context. Drawing on interviews and focus groups conducted with fifteen undergraduates and postgraduates in England, I discuss how students' identities as Palestinians interact with the social and political context of the UK, increasing their knowledge about the 'homeland' and heightening their sense of being Palestinian. I also discuss how, for some students, the freedom to be Palestinian carries a moral burden to be a 'good Palestinian', to perform an idealised image of themselves in order to combat negative stereotypes of Palestinians within persistent orientalist discourses. As such, students' personal commitments, to their family and their research, often coincide with their political commitments to Palestine, meaning that their family life is political life and their academic work is their political work.

Joshua Long, University of Kansas. Email: joshlong@ku.edu; The Coffee Ritual: From Ancient Ceremony to Contemporary Consumer Fetish.

Throughout history coffee has been revered as a social enabler, physical stimulant, and at times, spiritual conduit. This piece examines the historical significance of coffee and the coffee bean in ritual, ceremony, and society, focusing on coffee's changing role from sacred object to ritualized stimulant. This essay briefly traces the changing role of coffee in society from its origins in Ethiopia, to its diffusion throughout the Ottoman Empire and Europe, to the contemporary American coffeehouse. Particular attention is paid to the secularized?but still venerated?role that coffee plays in today's society as an object of consumer fetishism. Finally, this paper will draw similarities between the historical veneration of coffee and contemporary fetishism of coffee and coffeehouses. Keywords: coffee, coffeehouse, ritual, consumer fetishism.

Michael W. Longan, Valparaiso University. Email: Mike.Longan@valpo.edu; Centrality and Diversity in Online Representations of Northwest Indiana

This paper explores the dynamic tension among political, economic, and cultural forces at work in the representation of places in Northwest Indiana on the World Wide Web. Interviews with governmental, chamber of commerce, organizational, and independent web designers reveal information about intended audiences as well as motivations for constructing place-related web sites. Some designers hope to use the global reach of the web to attract new businesses and tourists to their cities while others address resident citizens in order to increase government efficiency, express pride in local culture and history, or strengthen local democracy. Site designers who understand the web primarily as a marketing tool sometimes express frustration with the mosaic nature of the web that allows for multiple representations of place. Competing representations potentially threaten carefully constructed civic branding campaigns. These designers succeed in controlling and centralizing the representation of place to the extent that few alternative representations of place exist on the web. Other site authors welcome and even seek to exploit diverse representations of place. This later group expresses an ethical commitment to creating accurate place representations through public discourse about place. Overall, the interviews reveal the ways that respondents negotiate the potential contradictions involved in producing web sites that simultaneously express local culture, support local democracy, and commodify place.

Robyn Longhurst, Professor, University Of Waikato. Email: robynL@waikato.ac.nz; 'Mum's the word': coming out as pregnant at work

This paper addresses some of issues surrounding women 'announcing' to co-workers and/or their employer that they are pregnant. Interviews with 19 first-time pregnant women conducted in Hamilton, New Zealand in 2002/2003 indicated that it can be difficult negotiating the subject position of Pregnant Woman at work. I use the metaphor of 'coming out of the closet' to discuss this issue. Initially, the closet might seem like an unusual, and perhaps even inappropriate, choice of spatial metaphors to use to discuss the experiences of pregnant women. After all, when women become pregnant they are doing the very thing that (heterosexual) women are so often revered for - performing the 'sacred duty of motherhood'. And yet, for some women, in some spatial contexts such as the workplace, announcing their pregnancy can feel painful, risky and even shameful. Fears of co-workers' and/or their employer's response to the news, of having to disclose intimate bodily details to co-workers and/or their employer, and of their bodies 'sexualising' the workplace can lead pregnant women to remain in the closet at work for as long as possible even though they may be 'out' in other places. For some women at work 'Mum's the word', that is, they keep their pregnancy secret for as long as possible.

Keywords: pregnancy, workplace, closet, secret, fear

Maarten Petrus Julia Loopmans, Institute for Social and Economic Geography, Catholic University of Leuven. Email: maarten.loopmans@geo.kuleuven.be; Urban development between the local and the global: exploring spaces of relevance for gentrification researchers

This paper applies a state-theoretical perspective to a historical analysis of gentrification and urban policies in Antwerp, Belgium. In the 1950s and 1960s the city was called the 'modernist mecca of the low countries', with a hegemonic social-democratic government pursuing urban development policies characterised by slum clearing, peripheral high-rise social housing construction and inner-city office development. After moving through a period of non-hegemony from the 1970s through the 1980s, with intense debate and struggle about urban development, the city is now referred to as the 'Barcelona of the north'. Gentrification (in a somewhat revanchist guise) has become the centrepiece of a new hegemonic discourse on cities in Antwerp, Belgium. A historical state-theoretical approach

shows how this move has been the consequence not solely of global market pressures, but also of local institutionalisation and political conflicts (not least the political reactions to attempts by the extreme-right populist party Vlaams Belang to seize City Hall). The recent surprising electoral victory of a social-democrat mayor (nicknamed the 'brick mayor' because not since the modernist period has there been so much building activity in the city) furnishes evidence of the new hegemony gaining ground. The analysis of local political and institutional mediation of what appears a global tidewave of gentrification policies can serve to detect 'entrance points' and 'spaces of manoeuvre' to enhance relevance for public policy research(ers).

Keywords: relevance, gentrification, urban policy, urban politics, Belgium, Antwerp

Anna Carla Lopez, San Diego State University. Email: ac_lopez2002@yahoo.com; John R. Weeks, Ph.D., San Diego State University. Email: john.weeks@sdsu.edu; David L. Carr, Ph.D., University of California, Santa Barbara. Email: carr@geog.ucsb.edu; Using a political ecology framework to understand socio-economic and environmental spatial inequalities in urban areas of developing countries.

Political ecology is a broad term often invoked by geographers studying human-environment relationships. Its use has been applied to a wide variety of studies with emphasis ranging anywhere between the political to the almost purely ecological. Despite the plethora of applications, political ecology has overwhelmingly remained rural, leaving urban ecologies nearly untouched. Political ecology has ignored one of the most blatant human imprints on our landscapes: urban areas. Nowhere else can the effects of human natural resource use and environmental manipulation be so strikingly seen as in our cities. High rates of urbanization across the globe (but more particularly in developing countries where urban growth has occurred unplanned and unevenly) have created a need to better understand urban systems and the populations which exist within these "concrete" environments under the context of political ecology. The political ecology framework can be a powerful one to explain the geographical distributions of different socio-economic groups and their resource use. Themes regarding inequality, health, and sustainable development, which are already strong in the political ecology literature, can take fresh applications within the urban sphere. Using data from diverse resources such as census, survey and remote sensing imagery, I explore the ecological and socio-economic spatial variability in the urban landscape using Accra, Ghana as my case study. A political ecology framework will be applied to identify and understand visible patterns of environmental and economic inequality among the urban population.

Santiago Lopez, University Of Texas at Austin. Email: santilopez@mail.utexas.edu; Rodrigo Sierra, University of Texas at Austin. Email: rsierra@mail.utexas.edu; Land use and land cover in indigenous territories: the Shiwiar and the Achuar groups of the Ecuadorian Amazon

Much of the theory on land use/land cover change in tropical rainforests has been drawn from the analysis of external or non-indigenous agents (e.g. colonists). In contrast, despite their growing populations and extensive territories, less research exists on the nature and magnitude of land use/land cover change associated with indigenous resource management. In an attempt to understand how different indigenous groups modify forest cover and use land, this paper compares land use between Shiwiar and Achuar indigenous territories of the Ecuadorian Amazon. Quantitative, qualitative, and geospatial methods were used to obtain information on resource use, land use and land cover, hunting zones, and infrastructure development. Digital photomosaics and mobile geographic information systems allowed detailed mapping of land uses. Based on this information, t-student tests use a sixty household sample to test the hypothesis that there is no significant difference between how the Achuar and Shiwiar people allocate land. Regression analysis analyze the relationship between land use characteristics and the spatial context (e.g. soils, slope) at the household management unit level. This project is part of a larger conservation initiative funded by the Gordon and Betty Moore Foundation, with additional support of a National Science Foundation Dissertation Improvement Grant.

Keywords: tropical rainforest, Ecuadorian Amazon, mapping, land use, indigenous

Tania Lopez, PSU. Email: tdl131@psu.edu; Vulnerability, local understandings, and flood management in eastern Puerto Rico

The risk and vulnerability reduction literature emphasizes the importance of increasing the resilience and adaptive capacity to natural hazards of exposed groups. In Puerto Rico, floods are the most recurrent natural hazard and are responsible for the greatest loss of property and economic damages. Nevertheless, there are few studies that address what are the factors that influence people's vulnerability and adaptability to floods. This paper compares community and risk managers' perceptions of floods and how these perceptions influence adaptive capacities and risk management in two exposed communities in eastern Puerto Rico. Concept maps were used to elicit perceptions of floods as related to their causes and effects. Participatory mapping, pairwise matrices, and semi-structured interviews identified factors that influenced their capacity to adapt to floods and to discuss possible flood management practices. The analysis revealed many similarities between community members and risk managers in how they conceptualized the causes and effects of floods, but there was less agreement on the factors that influenced vulnerability to floods. There were also differences in their suggestions on actions to increase adaptive capacity. Although such disagreement could negatively affect the generation of more resilient and less vulnerable communities, the results provide the basis for discussion and dialogue among stakeholders. Incorporating different views and understanding differences in flood perceptions and management is an important step towards searching for common strategies to enhance communities' adaptive capacity and resilience.

Keywords: Vulnerability, adaptive capacity, floods, floods management, Puerto Rico

Email: elkruger@facstaff.wisc.edu; Using geostatistics to compare spatial patterns of transpiration across forest transitions

Using geostatistics we have shown that whole tree transpiration for aspen (*Populus tremuloides*), and alder (*Alnus incana*) varies spatially across a transition from forested wetland to upland characterized by a gradient in soil moisture. Measures of sapwood area used to scale sap flux to whole tree transpiration have been identified as the primary driver of the spatial variability. The aim of this paper is to determine whether similar spatial variability exists at transitions between stands of sugar maple (*Acer saccharum*) and red pine (*Pinus resinosa*), two other dominant species in the region. Sap flux data was collected using a cyclic sampling design in 2005 at two 1.5 ha sites near the WLEF AmeriFlux tower in the Chequamegon National Forest near Park Falls, Wisconsin. A forested upland-wetland transition dominated by aspen and alder was sampled for 30 days from late May to early June, and an upland transition dominated by sugar maple and red pine was sampled for 30 days from late July to early August. Preliminary analyses revealed less total variation in soil moisture, and no spatial variation in sapwood area. Therefore we hypothesize that there will be no spatial variation in whole tree transpiration across a sugar maple-red pine transition. Typical approaches for scaling up transpiration estimates ignore potential differences in plant functionality at the edges of ecosystems, assuming a crisp boundary exists at these interfaces. Differences in spatial variability of transpiration have broader implications with regard to scaling transpiration estimates to the stand and landscape level.

Wright, Ph.D., Department of Geosciences, Oregon State University. Email: dawn@dusk.geo.orst.edu; Marine GIScience for satellite telemetry tracking: Analyzing the individual animal

Current marine management practices focus on the designation of static marine protected areas. While such a model is appropriate for regions of historical or cultural significance or for the protection of sessile species, pelagic species continue to rely on more mobile protection such as the Marine Mammal Protection Act or the Endangered Species Act. For these animals, critical habitat is a moving target; a target that will be even more variable with climate change. Fed by years of systematic survey data, the concepts of home range and and bioclimate envelopes draw probable boundaries around these species. Yet, the movements of individual macroinvertebrates can range beyond these lines in the water and outside of management and protection. An understanding of the decision processes of individual animals can aid in spatially dynamic management of large marine predators. Satellite telemetry provides a wealth of information to

explore these decision processes and the environmental preferences of individuals. This study demonstrates methods for the interpolation of individual movement paths from ARGOS satellite telemetry and for the aggregate analysis of these individual paths to find mesoscale environmental factors in the movement walks of marine animals. To focus on the individual, spatial database structures are adapted to relate each individual animal to field observations, telemetry, and remote sensing. Time-sequence is maintained to reconstruct The marine manager is enabled to apply seasonal or daily information to direct current economic activity or disturbance mitigation to best protect vulnerable populations in their current likely locations rather than in their historical home range.

Mark Lorenzen, Copenhagen Business School. Email: mark@cbs.dk; Florian Taeube, Imperial College London. Email: ; A tale of Two Film Cities: Urbanization Economies in the Hollywood and Bollywood Film Industries

The paper promotes our knowledge of the nature and interdependencies of localization and urbanization, through carrying out a comparative study of the world's largest two film clusters: Hollywood in Los Angeles (USA) and Bollywood in Mumbai (India). Since Marshall's early focus on economic externalities, economic geographers have frequently, in order to account for geographical clustering of economic activity, referred to localization and urbanization as two basic types of positive externalities. Generally defined as externalities arising from regional specialization (co-location of related economic activity), and diversity (co-location of non-related activity) respectively, the two analytical categories remain relatively opaque. In order to help overcoming this problem, the empirical analysis presented in the paper seeks to open the black box of externalities arising from co-location, carrying out a systematic mapping and comparison of the effects of regional specialization and diversity in Bollywood and Hollywood. Presenting original and novel data on Bollywood, the paper demonstrates how this film cluster relies significantly more on urbanization than Hollywood, and how localization economies in the two clusters are very different.

Hayden Lorimer, University of Glasgow. Email: hayden.lorimer@ges.gla.ac.uk; Eric Laurier, University of Edinburgh. Email: Eric.Laurier@ed.ac.uk; Barry Brown, University of Glasgow. Email: Barry@dca.gla.ac.uk; Moving memories: things people share in cars

Personal pasts contribute to the rich social life of car travel: whether as very recent or most distant events, whether dredged up as hazy memories or recounted as stories for dramatic effect. Drawing on film footage documenting the ordinary circumstances of journeys made by car, this paper considers the shared phenomenon of remembering past events aloud. We will examine the properties of recollection in conversation among different combinations of drivers and passengers, and talkers and listeners. More specifically, parents driving their young children home from school instruct them in how to recall the day's events, car pooling colleagues tell institutional histories, and runners recollect competing in past races as they travel toward future ones. Remembering can be occasioned by the changing view visible from the car, and focus on the familiarity or peculiarity of topical resources available along a regular route. And recollection is bound up with other conversational practices in the enclosed setting of the car: reflection, reminiscence, confession, joking and more. Finally, collective remembering shows a mutual attunement to narrative forms and emplotments, where descriptions of previous events are arranged episodically, or anecdotes shaped to fit features of the journey. In the collection of clips on show, the sharing of memories reveals how the car is produced as a meaningful place to dwell on the road.

Jamie Lorimer, University of Oxford. Email: jamie.lorimer@ouce.ox.ac.uk; Encountering elephants: tracing the ethics of (post)colonial British visitors to Sri Lanka 1850-2007

This paper reports some early findings from ongoing research into the persistence of (post)colonial modes of encountering elephants in Sri Lanka. It traces the changing character of the embodied practices and affective ethics that surround encounters between British visitors and elephants, from the mid-nineteenth century to the present day. It compares the results of two analyses: i) close and in situ readings of the diaries and archived accounts of elephant hunters in Ceylon in the 1850s; and ii) a series of in-depth interviews with and participant observations of contemporary 'scientific ecotourists' working as volunteers on elephant conservation projects in Sri Lanka. The paper concludes by identifying some striking continuities, as well as obvious differences, and makes some more general observations about the potential of such embodied historical geographies.

Keywords: Cultural/historical geography, nature conservation, Sri Lanka

Julia Lossau, Humboldt University Berlin. Email: julia.lossau@geo.hu-berlin.de; Creativity in the public realm: lessons from a furniture recycling workshop

In the last decades, pieces of 'flagship' public art have become instrumental in politics of urban regeneration and place marketing. At the same time, there is a variety of less prestigious artistic practices in the public realm. Often related to everyday, unaware or unprofessional forms of creativity, such 'ordinary' art projects usually work on a small scale. Nevertheless, they can matter greatly in terms of their intended, or indeed non-intended, outcomes. Taking an artist-run workshop based in Edinburgh as a case study, the present paper aims at discussing the difference that (supposedly) vernacular forms of creativity make. In the workshop, artists seek to involve young ex-homeless people in the artistic construction of furniture from otherwise useless and discarded materials. The project is intended to provide a supportive place where the participants can meet in a both relaxing and creative atmosphere. Drawing on narrative interviews with one of the artists involved, the paper proceeds in two steps. First, the cultural and social politics of the workshop will be examined. Secondly, and departing from the specific conditions of the workshop, more general aspects of the relationship between (different forms of) creativity and (alternative forms of) cultural policy will be discussed.

Keywords: creativity, public art, cultural policy

The tiger is the world's largest terrestrial predator, but rapid habitat loss and intense poaching jeopardizes its survival. We analyze the tiger's range contraction over the past decade to identify landscapes where tigers still have a chance to persist. Our analysis synthesizes a unique data set built upon the best land cover data available and more than 3,000 tiger point locations collected by 163 researchers over the past 10 years. These data layers are then combined with threat assessments such as the human footprint that represent how human influence constrains potentially usable tiger habitat to identify the extent of potential tiger habitat. The resulting synthesis is then compared with a previous range-wide tiger habitat analysis, and with estimates of the historic range, to detect changes in the extent of tiger occurrence. We estimate that tigers use 41% less area today than what was estimated 10 years ago, and they now survive in a mere 7% of their historical area. We identify and prioritize 76 landscapes where tigers still have a chance of survival, but to maintain the tiger's presence within these landscapes, high level government commitments for in-situ habitat protection and control of the illegal trade in tiger parts are urgently needed.

Renee Pualani Louis, University of Hawai'i. Email: mapdr@earthlink.net; Margaret Wickens Pearce, Ohio University. Email: pearce@ohio.edu; *Incorporating depth of place in Indigenous cartographies*

Indigenous communities have successfully used geospatial information technologies since the 1970s to protect tribal resources, document territorial sovereignty, create tribal utility databases, and manage watersheds. The use of these same technologies to represent place-based cultural knowledge, including storied place names, has proved more challenging because of differing ontologies and epistemologies. While Indigenous concepts of place are best represented by traditional Indigenous cartographic practices, the adaptation of Western mapping techniques has proven to be a critical step for protecting the cultural sovereignty of these places by communicating their importance to people outside the community. We assert that the inappropriate use of Western geospatial techniques and technologies for the representation of Indigenous place and storied place names is a key barrier to the expression and preservation of cultural heritage and cultural survival. This is not to imply that these techniques and technologies are inherently inappropriate for Indigenous cartographic representation; rather, we perceive them as flexible and capable of being adapted to suit traditional Indigenous cultural geographies if used in an informed and appropriate way. This paper explores that potential and provides insight to the future possibilities geospatial technologies possess to represent Indigenous cartographies.

Keywords: Indigenous mapping, cartography, place

W. George Lovell, Queen's University. Email: lovellg@post.queensu.ca; *Translation and Transformation: Creating an English-Language Edition of Severo Martínez Peláez's 'La patria del criollo'*

First published in 1970 and reprinted in scores of editions since, Severo Martínez Peláez's 'La patria del criollo: Ensayo de interpretación de la realidad colonial guatemalteca' has served legions of students throughout Central America, but especially in Guatemala, as the bedrock text upon which to base an understanding of the nature of the colonial experience. Vast, sprawling, and unapologetically Marxist in its analysis, 'La patria del criollo' is as polemical in its treatment of "colonial Guatemalan reality" as it is idiosyncratic, presenting a formidable challenge to rendering the book of utility and use for an English-reading audience. Work to date on translating 'La patria del criollo' is reviewed, with an attempt made to situate Martínez Peláez's magnum opus not only in the context of his life and times but in the schema of recent research findings, particularly those of interest to historical geographers.

Nichola Lowe, University of North Carolina-Chapel Hill. Email: nlowe@email.unc.edu; Maryann Feldman, University of Georgia. Email: mfeldman@uga.edu; *"The Eggplant that Ate Chicago": Translating Technology Fear into Regional Entrepreneurial Advantage*

In 1976, Cambridge Massachusetts and Berkeley California responded to growing community concerns about the environmental and health effects of 'genetic engineering' by adopting identical ordinances to regulate recombinant DNA research. Scientists and entrepreneurs in both cities came to view these regulatory interventions in distinct ways. While the East Bay biotechnology community considered adoption of the ordinance by Berkeley as proof of the city's "technology ignorance" and "political arrogance," their counterparts in Cambridge embraced this regulation which entailed a community review process and frequent facility inspections as a mechanism for reducing industry risk and uncertainty and as a source of regional entrepreneurial advantage. How similar regulatory actions came to be perceived differently by the scientific community subsequently affected the course of entrepreneurial growth and development in these regions. This paper uses semi-structured interviews and documentary analysis to explore the mediating factors that explain these different outcomes. Three inter-related factors are central to the story: structural differences in regional university governance and regulatory lines of authority; cross regional differences in the initial move towards entrepreneurship and thus, distinct regional learning periods; differences in the role and professional credibility of technology "translators" for mediating exchanges between and training members of the local scientific and activist communities. This paper concludes by drawing lessons for other regions that are seeking to use legal mechanisms to regulate today's unproven or controversial technologies. It suggests ways that contemporary regulatory responses can result in a constructive and deliberative (rather than combative) approach to promoting entrepreneurial and scientific accountability.

Sarah Marie Lowry, University of Denver. Email: slowry@du.edu; *"Ground-penetrating Radar for Stratigraphic Mapping Lake and Fen sediments, Grand Mesa, Colorado"*

Ground-penetrating radar antennas placed in a fiberglass canoe and on top of the frozen lake ice were used to collect reflection profiles of the lake bottom and sedimentary sequences up to 5 meters thick at South Mesa lake and also on marshy sediments at Kannah Creek fen in western Colorado. These GPR reflections differ in amplitude and geometry depending on changes within the physical and chemical constituents of preserved sedimentary units. In collecting stratigraphic data it is possible to determine the past fluctuations in lake and fen position. Reflection profiles show a detailed map of the lake bottom and changes in sedimentary levels. These profiles, when sedimentary units can be tied to core and auger data, are useful for paleoclimatic research by producing three-dimensional control of sedimentary sequences. The ground penetrating radar data provide unique and valuable information that can be used by researchers to determine optimal locations in fens and lakes for coring obtaining sediment cores.

Jenna M. Loyd, Syracuse University. Email: jloyd@maxwell.syr.edu; *Slow Death Comic: Militarism, Popular Critique, and the Limits of 'Health' Geography*

In opposition to the Vietnam War, Another Mother for Peace coined the compellingly simple slogan, 'War is not healthy for children and other living things.' This statement is an apparent truism, but even the act of counting war dead is politically contentious. Beyond the battlefield, how does one account for premature deaths that result from preparations for war-making? The manufacture and testing of weaponry creates toxic hazards for workers and local residents, while military spending could be diverted to infrastructural investments that enable healthy living. The afflictions of war-making are not evenly shared. Antiracist and feminist activists and scholars the world over have shown that communities of color suffer from the use of their lands as testing grounds as well as the structural violence perpetuated by militarism whereby inner city neighborhoods have been abandoned through economic disinvestment and destruction of the welfare state alike. Medical and public health professionals have also researched the fatalities of war and war-making, but such subjects have rarely caught the attention of health geographers. Why is this so? I argue that despite health geography's growing attention to the social production of health inequities and the dialectical connections between bodily well-being and broader scale places, 'health' remains an excessively individualized and biomedical conception that is abstracted from material violence. To illustrate, I analyze an underground comic series, entitled *Slow Death*, which offers a popular critique of the embodied effects of militarism and an alternative way of understanding how premature death is produced.

Keywords: political geographies of health, militarism, premature death, violence

Tanja Löytynoja, Department of Geography, University of Oulu. Email: tanja.loytynoja@oulu.fi; *Tourism development in the national periphery: Discourses of the Finnish-Russian border in the process of region-building*

Border areas are often characterized by remoteness, sparse population, and economic underdevelopment. However, this traditional conceptualization of borderlands is challenged by a new regional structure where many borders have become zones for active cross-border cooperation. In northern Europe, the Finnish-Russian border is an example of both these functions. It has been a relatively closed border but, in the post-Cold War period, the border has opened up for economic and socio-cultural cooperation. In many cases, tourism has been used as a tool for development. Especially since Finland's entry into the European Union and the border becoming an external border of the EU, a number of development plans and projects have been established on various spatial scales. In this paper, different manifestations and meanings of the Finnish-Russian border in the context of tourism and regional development are discussed. The border is examined as a socio-spatial construction, which is historically produced, discontinuous and represented through different practices and discourses. Because of its specific location between East and West, the Finnish-Russian border has strongly affected tourism and regional development. The border has transformed

the regionalization of tourism in eastern Finland, and as a result of development projects, even new administrative structures and tourism regions have emerged. This can be understood as the manifestation of new regionalization. By using institutional documents like tourism development plans, project reports, brochures and interviews of regional tourism developers as material, this study focuses on analyzing the region-building processes on the Finnish side of the border.

Keywords: tourism development, regional development, border areas, region-building, new regionalization, the Finnish-Russian border

Kang Shou Lu, Ph.D, Towson University. Email: kshoulu@towson.edu; Jeffery S Allen, Ph.D, Strom Thurmond Institute. Email: jeff@strom.clemson.edu; Thomas Potts, Ph.D, Clemson University. Email: tpotts@clemson.edu; Integrating GIS with Database Systems to Identify and Analyze Feeder Market Places of Second-Home Based Tourism

This study proposes a framework that integrates GIS and database techniques to identify temporal segments, geographic origins, typological association, and spatial determinants of the feeder markets of second-second homes in a coastal tourist destination area in South Carolina. The feeder markets are classified based on the types of second-home owners: (1) historic owners who have been residentialized; (2) existing owners who each currently own a second home; (3) committed owners who each own a parcel yet to be built; and (4) prospective owners who have sent queries about the housing information. The feeder market places are measured using the origins of the second-home owners. Their spatial distributions are mapped in the 5-digit zip code based on the address information derived from a cadastral file, census data, and a query database. Both autocorrelation and Spearman rank correlation are used to respectively examine the spatial patterns of the distribution and typological associations among the four feeder markets aggregated at three different geographic units. A multiple regression model is used to determine the relationship between total numbers of second-home owners and spatial predictors. The results indicate that there are strong statistical correlations in number of second-home owners among the four different market segments. Spatially, they are concentrated around major urban centers in the host state, adjacent states, and Northeastern and Great Lake industrial regions. Travel distance, urban origins, snowbird migration, and coastal orientation were identified as the major geographic factors that determine the locations of the feeder markets.

Max Lu, Kansas State University. Email: maxlu@ksu.edu; One Hundred Years of Population Distribution Change in the United States

In 1890, the U.S. Census Bureau announced the closing of the American frontier. The event marked the end of the westward expansion in the United States, but not changes in population distribution. The population geography of the United States has been changing continuously as a result of internal migration, uneven settlement patterns of immigrants, and, to a lesser extent, spatially differential fertility and mortality rates. This study examines the changes in the U.S. population distribution at the county level in the last 100 years using the historical decennial census data and GIS. It identifies different trajectories of change and discusses the social and political implications of such changes, especially with regard to population vulnerability.

Yongmei Lu, Texas State University - San Marcos. Email: yl10@txstate.edu; Learning by Doing: Teaching a Group Project Based Undergraduate GIS Course

This paper reports on the observations the instructor gained through teaching a capstone undergraduate GIS course in the past few years at the Texas State University - San Marcos. This is the 4th undergraduate GIS course required for the undergraduate students in Geographic Information Science BS program. It is also the last required course for the GIS certificate program. After finishing the other three required GIS courses, the students taking this course work as groups throughout a whole semester on real-world projects. The projects are selected for various geographical and related applications; common to these projects is the effective application of GIS techniques and team work skills to solve the real world problems. By taking this course, students learn / enhance both their specific GIS techniques and the general transferable skills that are significant for them to develop their GIS careers. This paper will summarize the observations as related to the teaching and learning process and effectiveness of such a GIS course.

Kelly L Lucas, University of Southern Mississippi, Gulf Coast Geospatial Center. Email: kelly.lucas@usm.edu; Greg A Carter, University of Southern Mississippi, Gulf Coast Geospatial Center. Email: greg.carter@usm.edu; The use of remote sensing to assess plant species richness on Horn Island, Mississippi

Mississippi's barrier islands are protected from development but remain vulnerable to pollution, species invasions and the impacts of climate change. These influences may be linked with an apparent decadal-scale decline in plant species diversity. Consequently, there is a pressing need to develop methods for rapidly assessing island biodiversity. This study determined the extent to which plant species richness on Horn Island, Mississippi, might be estimated using hyperspectral (airborne HyMap) and multispectral (Landsat TM5) remote sensing. Image data from both sensors were acquired in October, 2003. HyMap provided coverage throughout the 450-2500 nm spectrum at a ground sample distance (GSD) of 3 m and spectral resolution of approximately 15 nm. GSD of the TM5 data was 30 m. To correspond with the image data, plant species richness was sampled for 95, 15-m transects established at random locations. Mean spectral reflectance of each transect was computed along with, for the hyperspectral data, a spatial coefficient of variation (CV) per band. Richness within each of several habitat-types was significantly ($p = 0.05$) related to hyperspectral reflectance band ratios and CV, as well as some first and second spectral derivative band ratios, when near- and mid-infrared bands were incorporated. In contrast, richness correlated significantly with TM5 data only in marsh habitat. Results indicate a clear advantage of high spectral and spatial resolution and a predominant importance of the near- to mid-infrared spectrum in assessing plant species diversity on Horn Island.

Susan Lucas, Edinboro University of Pennsylvania. Email: slucas@edinboro.edu; Patrick Patrick Heidkamp, University of Connecticut. Email: Christian.Heidkamp@huskymail.uconn.edu; Lattes, Croissants and Gourmet Dog Treat Stores: Landscapes of Consumption and Gentrification in New England Port Cities

Waterfront revitalization is a process in which the port-city interface, formerly a space of production, is transformed from a dilapidated, largely neglected industrial area to a space focused on consumption. As a space of consumption revitalized waterfronts are built upon the commodification and selective re-creation of maritime culture and heritage through references to specific historical events, people, and places (Hewison, 1987; Goss, 1996; Norcliffe et al. 1996). Such revitalization, like gentrification rests on both the consumer preferences of the middle-class and the reinvestment of capital in the built environment. Heidkamp and Lucas (2007) show that waterfront revitalization often causes the gentrification of nearby residential areas. The purpose of this paper is examine the evolution of the transformation of New England's smaller port cities form landscapes of production, through a period of crisis and underutilization, to landscapes of consumption. Through a number of case studies (Portland, ME; Portsmouth, NH; Newburyport, MA; Newport, RI, and New London, CT) we outline some of the spatial manifestations related to this transformation and try to (re-)establish the link between waterfront revitalization and gentrification.

Candice R. Luebbering, Virginia Tech. Email: candice@vt.edu; Laurence W. Carstensen, Jr., Virginia Tech. Email: carstens@vt.edu; Geospatial Analysis by Experts: High-Resolution Monitors and Improved Performance

Multiple monitor configurations provide an attainable, low cost way for individuals to create large, high-resolution desktop displays. While this increased screen real estate is useful for many different applications, it should be of particular utility for viewing and interpreting rich and complex geospatial datasets. Map context and amount of detail can be simultaneously increased, reducing reliance on virtual navigation such as panning and zooming. Our experiment involved 57 subjects completing a map reading test incorporating both raster and vector data on three different monitor configurations: one monitor, four monitors, and nine monitors. A computer program monitored subjects' performance by: capturing mouse click locations, viewing areas, tool usage, and elapsed time, writing shapefiles, and storing question responses. A questionnaire obtained subjects' feedback about the displays and experiment in general. Overall, the results showed that subjects do perform more efficiently under larger monitor conditions (four and nine) as shown by a reduction in elapsed time to complete the test and in the number of mouse clicks used. Tool usage also differed among monitor conditions with navigation tools dominating on the single monitor while selecting tools (tools used to provide answers) dominated on the nine monitor setup. While these overall results pointed towards the effectiveness of the larger displays, analyses conducted at the task level showed that the larger displays were not better for all tasks. Instead, they were most useful with more complex maps and imagery, while the single monitor

display was sufficient for more basic map reading tasks.

Email: ; Sylvester Galaa, The University of Development Studies, Tamale, Ghana. Email: ; Matthew Nkrumah, The University of Development Studies, Tamale, Ghana. Email: ; Daniel Bagah, The University of Development Studies, Tamale, Ghana. Email: ; *Environment, Migration, Health and Food Security in the Upper West Region of Ghana*

The key objective of this study is to examine the linkages among migration, gender, health and household food security in the Upper West Region of Ghana. The Upper West is the poorest region of Ghana and has long served as a cheap reservoir of labour for the fertile farmlands of the Brong-Ahafo Region, the main food producing region in Ghana, and to mining towns. In recent years, these migration patterns appear to be both intensifying and changing due to a combination of forces which include: environmental degradation made worse by protracted declines in annual rainfall, failed economic recovery programs, and a declining mining sector. Preliminary research conducted in 2006 suggests that the deepening impoverishment and food insecurity in the Upper West urgently requires attention. This study presents the findings of interviews and group discussions that were conducted with farmers in the Brong-Ahafo. One of the main challenges faced by newly arriving migrants to the Brong-Ahafo is how to raise the initial capital to lease fertile farmlands. The farmers are also confronted with poor storage and transportation facilities, which frequently results in the loss of sizable portions of their foodstuffs. Many of the migrants send back food to their families in the Upper West, and have effectively become the life-lines of their families back home. With declining environmental conditions and the rising migration of young people, this study has implications for policy interventions as well as for regional initiatives such as the creation of farmers' cooperatives and networks.

Keywords: Environment, Migration, Health, Food Security, Upper West Region, Ghana.

April Luginbuhl, The Ohio State University. Email: luginbuhl.6@osu.edu; *The Carbon Economy in the United States: Theoretical implications from multiple carbon reduction programs*

The initiation of multiple programs and policies concerning greenhouse gas reduction throughout the United States provides an opportunity to examine the construction of the carbon economy. All of these efforts in the US are developing without the leadership of the federal government, resulting instead from individual states' efforts and initiatives within the business community. The result is diverse attempts by private industry and state governments to define the rules of the carbon economy as well as exert power in the ultimate policy formation expected at the federal level. The array of programs provides an opportunity to see the inner workings of the carbon economy and allows for an examination of the relationships between economics, the environment, power, and science. The trend in carbon programs across the US appears to focus more on economic, rather than environmental, policy. The type of policy chosen has implications for incorporating physical science into the carbon economy. Additionally, the discourses provided by these groups, and the statements from individual participants allow for the examination of economic motivation for the creation of regional emission reduction mechanisms. This paper will address the implications carbon reduction programs in the US have for the commodification of nature, the circulation of capital, and the creation of power differentials between scales of government for both the economic and environmental policy that is the carbon economy in the US.

Oleg Lugovoi, . Email: lugovoy@iet.ru; Oleg Lugovoi, IET. Email: lugovoy@iet.ru; *Determinants of Economic Growth of Russian Regions*

The paper has two general objectives. First, to consider the 'deep determinants' of economic growth of Russian regions. Here, we test the role of geography, infrastructure and institutions in regional growth and regional disparities. For this purpose, we develop econometric simultaneous equations model of regional growth. Empirical results suggest importance of climate and geography as an important factor of regional growth and regional disparities. In addition, such factors as quality of infrastructure, agglomeration and institutions seem to be significant. Second, we investigate convergence process across Russian regions using spatial econometrics methods. The supplementary objective of the study was to test whether models that take account of geographical connectivity of different locations are adequate for determination of growth factors in Russian regions. Our results suggest weak sigma convergence and weak unconditional beta convergence, and strong, about two percent a year, conditional beta convergence

across 77 Russian regions. Spatial correlation between regions seems to be statistically significant.

Keywords: Economic development, regional growth factors, regression model, Russian regions

Nik Luka, School of Architecture / School of Urban Planning, McGill University. Email: nik.luka@mcgill.ca; *Embedding urban agriculture within (and through) urban design and planning*

Urban agriculture (UA)—the growing of food within cities and metropolitan areas—is increasingly occurring in the US and Canada as city residents of all stripes self-organize to counteract food insecurity and/or to reclaim control over the quality of their food intake and local environments. Montréal, for instance, counts thousands of allotment gardens along with farmer's markets and community-driven soil remediation initiatives. In these respects UA offers great hope for 'sustainability' writ large (e.g., what the 'end of cheap oil' may mean for food security in energy-hungry North America). Nevertheless, municipal authorities are prone to discourage it for reasons—or 'hangups'—that are deeply rooted in Anglo-American culture. This presentation explores how these hangups are telling of an irony-fraught worldview placing human activity 'in here' (within urban areas) while 'nature'—including food production—is 'out there' (presumably beyond some imagined edge). Examining why UA tends to be viewed with suspicion, skepticism, or at best mild curiosity, I suggest that our hangups about it owe much to the ways in which it defies 'natural' Anglo-American categorizations of landscape and urban form. Against this critical backdrop is then presented the notion of 'embedding' UA within and through planning and design orthodoxies, reporting on a multi-year research-action project based at McGill University: 'Making Edible Landscapes'. Its core premise is that if UA is to succeed on a large scale it must be embraced by planners, engineers, and architects, who play instrumental (if not necessarily powerful) roles in the management and (re)building of cities.

Timothy W. Luke, Virginia Tech. Email: twluke@vt.edu; *"Not to be Missed" Weapons of Mass Destruction: Displaying the Enola Gay*

In this piece, I can discuss the representations of power, geopolitics, and nuclear WMD in the USA grounded on the 1940s paleo-technics of the Manhattan Project in the contemporary American context (1994 to 2006), which focuses on the 1995 controversial showings at the NASM on the Mall and the more low-key rollout of the restored B-29 bomber at the new NASM Annex out by Dulles International Airport during December 2003. Both of these events would be contextualized against the backdrop of current representations of hidden, and then partially discovered, indirectly detected or still missing WMDs in the new axis of evil states during the Bush (43) administration. How does that work for both activities as cultural and political geography?

Keywords: political geography, geopolitics, cultural representation

Chris Lukinbeal, PhD, Arizona State University - Department of Geography. Email: lukinbeal@asu.edu; *Mapping Segregation in Three Latino Neighborhoods: A Comparative Analysis*

With this presentation I perform a comparative analysis of Latino segregation in Chicago, Miami and Phoenix. I argue that a robust understanding of segregation requires the use of multiple segregation indexes across racial and ethnic groups, as well as within ethnic groups. Employing multiple indexes can highlight different types of segregation, like spatial evenness and spatial exposure. Furthermore, the socio-spatial dialectic must be extended onto segregation: segregation produces and reproduces space and scale, and is produced by space and scale. By spatializing and visualizing indexes through the use of GIS, segregation can be mapped within cities highlighting neighborhood differences and power relations. A comparison of segregation between Latinos and Non-Latinos in Chicago, Miami and Phoenix shows how using a single index leads to an incomplete picture of segregation. I show that for two indexes segregation is highest in Chicago, but for other indexes Miami is the most segregated. This research is part of the larger Human and Social Dynamics, National Science Foundation project, "Comparative Civic and Place Engagement in Three Latino Enclave Neighborhoods in Transition."

Anna L. Lumsden, Syracuse University. Email: allumsde@syr.edu; T Katherine McLeod, Wilfrid Laurier University. Email: kmcleod@wlu.ca; Ring Width Sensitivity of White Spruce in the High Subarctic Forest-Tundra of Northwest Canada

Dendroclimatologists use ring width chronologies to produce reconstructions of past climate. Ring width sensitivity, that is, year to year variability between ring widths, is thought to increase with latitude. Data for *Picea glauca* (Moench) Voss from the High Subarctic Forest-Tundra of the Anderson River Valley, in northwest Canada do not fit this generalization. I analyzed ninety-three cores from two sites with a 12 minute latitudinal difference. Two sensitivity measures are calculated for each site: (1) "Site Sensitivity," the mean of the sensitivity values for each core; and (2) "Chronology Sensitivity," for which ring width indices for each year are averaged, and sensitivity is calculated for the resulting single chronology. Chronology length of the northern site was 468 years (1527-1994), and for the southern site 200 years (1723-1994). After removal of the age related growth trend, site sensitivity calculations indicate that the north site has higher overall mean sensitivity than the south site, but chronology sensitivity for the same time period is reversed. The contradictory nature of these measures indicates an ambiguity in the interpretation of the mean sensitivity statistic. Or, it may reflect the effect of statistical procedures which emphasize within - site variation in the compilation of the site mean statistic, versus the smoothing of these within ? site effects during chronology compilation. In either event the results indicate that latitude may be less important than stand age in determining ring width sensitivity.

Keywords: Tree-ring sensitivity, subarctic forest tundra, white spruce, picea glauca

Ronald W. Luna, M.A., University Of Maryland. Email: ronaldi@umd.edu; Salvadoran Ethnic Churches

The Salvadoran Evangelical Protestant Churches (SEPC) has become a "transnational institution" in the United States. SEPC have become cultural spaces created by the process of transnationalism. SEPC became transnational institutions in the early 1900 as American Protestant missionaries began arriving to El Salvador, they became transnational agent or transmigrants as they created networks between the United States and Central America. During the 1980s as the civil war broke out in El Salvador and hundred of thousands of Salvadorans fled their homes to the United States, so did the SEPC traveled with them. This presentation will examine the linkages that helped make the SEPC a transnational institution in the Washington D.C. Metropolitan area.

Linda J.T. Lundmark, Umea University, Sweden. Email: linda.lundmark@geography.umu.se; Nature based tourism - some economic linkages revisited

The development of commercial tourist services is usually considered to improve the economic multiplier effect in the local community and thus stimulate employment development. The purpose of this study is to revisit some of the economic issues touched upon in the body of literature regarding the connections between outdoor recreation and nature based tourism as well as the connections that have been made between nature based tourism and local and regional development. Many have concluded that different types of tourism give different impact on the local and regional context. Among the positive impacts identified are that tourism might help alleviate problems of unemployment and out-migration caused by general restructuring and globalization and also introduce positive images of the rural. The negative impacts are often associated with leakage caused by external ownership and non-local supplies, as well as seasonality and non-local labour. Preliminary conclusions are that although the institutional and geographical settings are identified as factors for successful nature based tourism and local and regional development the implications have so far been neglected.

Keywords: Outdoor recreation, nature based tourism, local and regional development

Elizabeth Lunstrum, University Of Minnesota. Email: luns0026@umn.edu; State Making, State Unmaking, and Landscapes of Borderland Violence: Apartheid South Africa's War of Destabilization in Rural Mozambique

This paper examines the politics of state-making in borderlands in the context of war. By turning to Apartheid South Africa's war of destabilization of Mozambique in the 1980s and 1990s, I examine how South Africa worked to maintain its own state power and economic privilege by helping to destabilize and literally deterritorialize Mozambique, its newly-independent and resolutely anti-apartheid neighbor. Such deterritorialization was accomplished through systematic and highly symbolic social and ecological violence which shut down government and forced people to flee entire villages throughout rural

Mozambique. This, I argue, is an example of one country's state-making through the territorial unmaking of another. I focus in particular on the effects of this type of state making (through deterritorialization) on Mozambique's Massingir District. The district is located along the South African border and lies primarily within what is today the Great Limpopo Transfrontier Park (GLTP), a tri-national park shared by Mozambique, South Africa, and Zimbabwe. As the GLTP was officially declared a "Peace Park" upon its creation in 2002, I examine the legacy of South Africa's war of destabilization in this borderland and its significance for establishing the GLTP as a transboundary Peace Park.

Inter-city cooperation is a new phenomenon in today's globalizing world. Under the perspective of networking, this paper examines inter-city cooperation in the Yangtze River delta (YRD) region, using the case of Forum for the Coordination of Urban Economy of the YRD Region. After tracing the process of cooperation formation and actors' interaction, this study reveals that inter-city cooperation is a process from information exchange, thematic cooperation to the establishment of common market. In addition, based on empirical studies in the YRD region, five types of inter-city cooperation are identified in this study, including developmental cooperation, promotional cooperation, coordinate cooperation, resource-based cooperation, and strategic cooperation. Such inter-city cooperation is an outcome of governance realignment and a new mode of regional governance in China. The policy implications for regional planning and inter-city cooperation are discussed and some problems facing the inter-city cooperation in the YRD region are also highlighted.

Eric Lutz, Department of Earth Sciences, Montana State University. Email: elutz@montana.edu; Teresa Cohn, Department of Earth Sciences, Montana State University. Email: tcohn@montana.edu; Lisa J. Graulich, Big Sky Institute, Montana State University. Email: lisa@montana.edu; Science and Society Fellows: A GK-12 Program at Montana State University

Montana State University NSF GK-12 Fellows are engaged with research addressing the science underlying the complex trade-offs in managing the Greater Yellowstone Ecosystem. Yellowstone is the largest pristine ecosystem in the continental USA. As such, Yellowstone is a natural laboratory for the study of predator-prey interactions, invasive species, watershed processes and, the impacts of exurban development on ecosystem processes. In the lives of the rural communities surrounding Yellowstone, environmental and natural resource issues occupy center stage. Through the NSF-funded GK-12 Program, fellows work with rural teachers and students to capitalize on students' interest in nature to motivate scientific learning. In our poster, we describe two exemplary projects. Teresa Cohn collaborates with Mark Roy, Gene Meier and Ft. Washakie School on the Wind River Indian Reservation (WY) to better understand the complex cultural and ecological role of the Wind River watershed in the Greater Yellowstone Ecosystem. Eric Lutz collaborates with Jeremy Harder, Dave Neal, and Dr. Anne Marie Mistretta of Ophir School (Big Sky, MT) and with local ski areas to implement service learning projects that foster 1) an appreciation for the uniqueness of Big Sky's mountain environment and 2) a strong understanding of the complex interactions between the natural landscape and human activities. Through field and classroom activities the 4th grade is developing inquiry-based investigations of various themes in mountain geography and the 5th and 6th grades are developing and implementing a local avalanche awareness program.

John Lyman, Department of Geography, University of Missouri - Columbia. Email: jlddbd@mizzou.edu; Exurbanites vs. Ruralites: How mobility effects environmental perception and the sense of place that exists in Columbia County, WA

For many Americans, there is a stereotypical image of what it means to be "rural." Typically, this image is far from reality. An ever increasing awareness of rural life has made it important to understand just how rural communities think about their lives and their surrounding environment. Located in the Columbia River valley in southeastern Washington State, Columbia County is home to some 2500 residents, with the majority of that population centered around the county seat, Dayton. Predominantly a wheat farming community, Dayton and the surrounding areas in Columbia County exemplify what many Americans would consider to be the "rural lifestyle." This study used resident-employed photography to determine what residents of Columbia County thought of their lifestyle and how they viewed the rural landscape around them. A number of residents who left Columbia County for college or work have now returned; analysis of their photographs led to interesting results suggesting that, despite slow economic growth and associated rural problems, residents continue to find value in the region as they construct 'rurality' with reference to their past experiences in urban areas.

Elizabeth A. Lyon, Member. Email: elizabeth.a.lyon@erdc.usace.army.mil; Christian Sandvig, PhD, University of Illinois Urbana-Champaign. Email: csandvig@uiuc.edu; "Wireless Networks Detected: Right-Click Here for More Options:" Predictable Clustering in Wi-Fi

"Wi-Fi" Wireless Internet devices are low-powered radios that anyone can buy without a government license. The literature on wireless communication assumes that the diffusion and use of unlicensed transmitters like these is unpredictable. In this thinking, a license is an agreement about what a user will do with a radio. Without such an agreement in advance there must be chaos, causing headaches for the regulation of the electromagnetic spectrum. While Wi-Fi use is a series of individual decisions, this study finds that overall use is predictable, and yet it differs in important ways from reasonable expectations. By constructing Wi-Fi data collection devices, researchers surveyed Wi-Fi networks in three Chicago neighborhoods over a period of three years (N = 851,939 observations). Spatial statistics, exploratory spatial data analytics, and Monte Carlo simulation indicate that there is significant local clustering of Wi-Fi activity. While the previous scholarship on unlicensed systems and Wi-Fi has worried about free riding and interference as major constraints for how the system grows, we find no support for these concerns. For instance, the existence of plentiful unencrypted Wi-Fi in urban areas has been forecast to suppress further deployment (if you can free ride on your neighbor's network, why buy your own?). At the same time, interference between Wi-Fi devices is an expected barrier to growth (above a

density threshold, it has been predicted that Wi-Fi should stop working due to congestion). We find neither of these effects, and we discuss the implications of this for public policy.

Sarah Wynard Lyon, Blenheim Palace. Email: flaw@flaw-lyon.freemove.co.uk; UNESCO's World Heritage Mission In Europe At The Beginning of The Twenty First Century.

In the thirty five years that have elapsed since the signing of the United Nations Convention on World Heritage the total number of World Heritage sites has risen inexorably to over eight hundred. The procedure for nomination and inscription has been refined. Attempts have also been made to rectify imbalances in the number of properties between developed and undeveloped countries. Above all there has been encouragement to ensure proper protection conservation and presentation of the sites. To this end UNESCO recommends the production of a management plan. However the varied nature of World Heritage sites precludes a standard set of recommendations from UNESCO for each site. UNESCO recommends sustainable management and needs scientific and cultural insights of practitioners and researchers. The purpose of the paper therefore is to provide insights relating to two European sites, one in England and one in France. Blenheim Palace and Fontainebleau were inscribed in the nineteen eighties. A comparative analysis is based not only on stakeholder involvement at each site but also on legislation in the two countries affecting the sites. The conclusions, which are qualified by the number and location of the sites provide a positive contribution to a twenty first century view of world heritage.

Michal Lyons, Prof., London South Bank University. Email: lyonsm@lsbu.ac.uk; Antonia Nossia, Dr., London South Bank University. Email: anoussia@lsbu.ac.uk; Maintaining boundaries: public space and the spatial integration of new migrants

The wide recognition in contemporary migration studies of a diversity of migrant cultures and practices suggests that analysis of difference among migrant groups in their appropriation and negotiation of public space is timely. Although migrants may appropriate space and manage social networks with similar ends in mind, culture is an important influence on modes of sociability and activities undertaken in the public domain. This is clearly reflected in the changing patterns of migration in Southern Europe, where relatively small cities, with a strong urbanistic tradition, have become the destination of a multiplicity of nationalities and types of migrants. Focusing on parts of the commercial centre of Athens, this paper seeks to explore the apparently harmonious coexistence of several migrant groups within a small radius in order to understand the location and importance of migrant territories and to explain the negotiation, definition and expression of territoriality and boundaries among migrant groups and between migrants and hosts. The research has provided qualitative evidence on the use of the area and has identified a series of locales, a 'chain' of spaces used by migrants as they gradually develop their ties with their local migrant groups. The different migrant groups maintain distinct spatial boundaries within overlapping areas through public behaviour and modes of socialisation; and access to distinct spaces is negotiated over time within those groups. It is suggested that the temporary-ness and transitory character of migrants' experience leads to the creation of liminal spaces, intimately associated with personal moments and movements of transformation.

Michael M'Gonigle, JSD, University of Victoria. Email: mgonigle@uvic.ca; Academia that isn't merely academic: reflections of a scholarly activist

It is sometimes said that the commitment to "rationality" is a trait increasingly peculiar to the academy?the real world just doesn't work that way. If so, activism is a beneficial complement to scholarly work; active theory has much to teach passive theory. In this presentation, these themes will be discussed in light of the lessons learned from over two decades of activist/academic work. Drawing on extensive international and regional environmental campaigns and research, particular attention will be paid to the lessons learned from recent activism/research on the transformative potential of the "planetary university." Consciously shaping itself as a local model/catalyst of planetary sustainability, such a university would learn from and contribute to the geographer's research on space and place.

Jianguo Ma, Ph.D., University of South Florida. Email: jm252@cornell.edu; Norman Scott, Prof., Cornell University. Email: nrs5@cornell.edu; Stephen DeGloria, Prof., Cornell University. Email: sdd4@cornell.edu; A Web-based Spatial Decision Support System for Utilizing Organic Wastes as Renewable Energy Resources in New York State

Recently there has been a renewed interest in farm-based anaerobic digestion using organic waste (animal manure and food waste) as feedstock. To date there are very limited data and tools available to help identify, locate and evaluate these resources. In addition, it is important to find a way to estimate food waste production from a variety of generating sources. Lastly, an economic model/tool is desirable to assess the costs and benefits of potential on-farm co-digestion projects. To address these issues, a web-based spatial decision support system (SDSS) is developed by integrating GIS, the Internet, and modeling. This system consists of three modules: (1) Dynamic Mapping and Querying; (2) Food Waste Estimator; and (3) Co-digestion Economic Analysis. Module 1 is designed to help users dynamically explore the map of resources by displaying, zooming in/out to any extent, and selecting any combination of information layers. Users can also create and print out customized maps. In addition, users can retrieve various data through queries that might be helpful in their decision making. Module 2 is designed to estimate food waste production from a variety of generating sources including: food processing facilities; supermarkets; fast food franchises; correctional facilities; restaurants; colleges / universities; K-12 public schools; hospitals; and nursing homes. Lastly, Module 3 is designed to provide a preliminary economic analysis for on-farm anaerobic digester systems, particularly using dairy manure and food waste for co-digestion. This paper provides a description about the framework, design procedures, features, and results of the web-based spatial decision support system.

Jielai Ma, University of Texas at Dallas. Email: jxm034100@utdallas.edu; Vijverberg Wim, University of Texas at Dallas. Email: vijver@utdallas.edu; Space and Time autocorrelation: Forecasting U.S. Regional Unemployment Rate

Vector Autoregressive (VAR) modeling has been widely used in many time series studies. VAR model has a very flexible form which encompasses many familiar models in the literature. This paper augments the VAR model in a spatial dimension, namely where a vector y is observed across time and regions. We use spatial weight matrices to simplify the VAR parameter structure. A similar idea can be found in Giacomini & Granger (2004). We explore the model's characteristics of interaction between space and time with different Monte Carlo simulations. Impulse response functions of the models are described. The result is applied to forecasting U.S. regional unemployment rates. A comparison of the performance of the optimal ARIMA model and various VAR models is given for different regions.

John Zhongdong Ma, Hong Kong University of Science and Technology. Email: sojohnma@ust.hk; Recent Movements of Talented Chinese between Asia and North America

Regarding talented immigrants, Chinese societies are the largest source whereas North America is the largest receiver. In this paper, we will first integrate recent censuses of China/HK/TW/Canada/U.S. and then study the movements of talented Chinese between the two regions. Preliminary findings show the simultaneous surge of immigration to N. A. and that of return migration to Chinese societies. Immigrants and returnees are concentrated in large cities in respective regions. Onward migration from Canada to U.S. improves income of talented immigrants whereas return migration to HK improves both the income and odds to a managerial position of the returnees. Interesting, U-type return migration (to the Chinese mainland) via an entrepot city (HK) has become

increasingly popular. The return of talents is critical to economic and technological development of the region. Further study on factors of return and onward migration will help us better understand talents' international movements.

Keywords: Talent, immigration, return migration

Kin M. Ma, Grand Valley State University. Email: makinm@msu.edu; Classification Accuracy Analysis of selected Land Use and Land Cover Products in a portion of West-Central Lower Michigan

Humans in the 20th century have dramatically transformed the earth, by clearcutting forests for agriculture/housing. Satellite images have been used for land-cover mapping since 1970s. However, the spatial mis-registration of land cover maps can affect the true estimates of land use/land cover (LULC) changes. Michigan's Lower Peninsula has experienced LULC change, though what are the spatial patterns, magnitude, and cover-dependency of classification uncertainty associated with MI's LULC products? Two LULC products were compared: 2001 Integrated Forest Monitoring and Assessment Project (IFMAP) and a 1998 Muskegon River Watershed (MRW) Michigan Resource Info Systems LULC classification maps. The 2001 IFMAP was co-registered to 1998 MRW image. 2001 IFMAP and 1998 MRW-LULC maps had spatial accuracies of $\pm 12/\pm 12.19$ m. LULC classification codes were re-assigned to 12 Anderson I/II LULC codes. 826 stratified random Accuracy Assessment Points (AAPs) were generated in LULC codes of the 1998 MRW map for verifying accuracy of 2001 IFMAP, and classification accuracy (59.32%). Error matrices/distance function analyzed the classification inaccuracies. ArcGIS 'near' function calculated the distance of the misclassified IFMAP AAPs to the nearest polygon edges in the IFMAP and 1998 MRW maps. For the 2001 IFMAP analysis, 143 MRW AAPs (17.3%) and 245 IFMAP AAPs (29.7%) were located 30m or less from the closest 1998 MRW and 2001 IFMAP LULC polygons. The polygons surrounding these misclassified AAPs were within the 2001 IFMAP and 1998 MRW spatial accuracies of ± 12 and ± 12.19 m. When evaluating LULC classification maps, spatial mis-registration accuracies, partial kappa coefficients, distance of AAPs to polygon edges, and classification definitions are critical to interpreting uncertainty of classification maps in Michigan and elsewhere.

Juliana A Maantay, Ph.D., M.U.P., Lehman College/CUNY. Email: maantay@lehman.cuny.edu; Andrew R Maroko, Lehman College/City University of New York. Email: armaroko@gmail.com; Perfecting the Denominator: Developing a Cadastral-based Expert Dasymetric System (CEDS) in New York City

This paper discusses the importance of determining an accurate depiction of population distribution for urban areas in order to develop an improved "denominator," allowing for more correct rates in GIS analyses involving public health, crime, and urban environmental planning. Rather than using data aggregated by arbitrary administrative boundaries such as census tracts, accuracy is improved by the use of dasymetric mapping, an areal interpolation method using ancillary information to delineate areas of homogeneous values. Specifically, a new methodology called the Cadastral-based Expert Dasymetric System (CEDS) was designed and implemented in order to provide vital population data at the tax-lot level, a geographic unit roughly 350-times smaller than the census tract in New York City. This model is particularly suitable for urban areas, using specific cadastral data, land use filters, modeling by expert system routines, and validation against various census enumeration units and other data. Previous and traditional disaggregation techniques are compared with CEDS to assess efficacy. The dasymetric mapping technique is presented through a case study of asthma hospitalizations in New York City, and shows the impact that a more accurate estimation of population distribution has on a current environmental justice and health disparities research project, and its potential for other GIS applications.

Jacob Andrew Maas, Texas State University-San Marcos. Email: jm1816@txstate.edu; Spatial Analysis of Nitrate Contamination of Groundwater in the Niagara Escarpment Region of Dodge County, Wisconsin

Nitrates are the most common groundwater contaminant in the United States. The Environmental Protection Agency's (EPA) maximum contaminant level (MCL) of nitrates in drinking water in the United States is 10 mg/L. Agriculture is the source of up to 90 percent of all nitrates found in Wisconsin's groundwater. Dodge County has over 2,200 farms totaling 428,000 acres and is one of the leading agricultural counties in Wisconsin. This research focuses on nitrate contamination of groundwater in the Niagara Escarpment region. The Niagara Escarpment region has soil to bedrock depths of less than 50 cm, with various land use and land cover overlying the region. Previous research at the county level has shown elevated nitrate levels in this region's groundwater. However, the research showed that the county wide model had underestimated nitrate contamination levels by as much as 24 mg/L in the Niagara Escarpment

region. The purpose of this research is to use multivariate statistical analysis and spatial statistical analysis tools to better understand nitrate contamination occurrences in the groundwater of the Niagara Escarpment region of Dodge County, Wisconsin.

Keywords: Spatial Analysis, Nitrate Contamination, Niagara Escarpment

Regan M. Maas, MA, PhD Student, University of California Los Angeles. Email: rmmaas@ucla.edu; *Adult-child to aging-parent proximity relationships: Recent trends and underlying mechanisms.*

Two main schools of thought have arisen from the discussions regarding family caregiving for older adults. The structural-functional argument essentially states that family members will inevitably become more isolated from one another in an economically developed society. Newer schools of thought support the idea of intergenerational cohesion. As opposed to a strictly economic framework, intergenerational cohesion emphasizes the social and cultural factors which bind family members together. The form of interactions between adult children and their parents becomes an important factor when considering the predicted growth of older adult populations in the years and decades to come. If the relationships between adult children and parents take on a more structural-functional form, significant affects may be felt by older adults, especially as they become ill. The goal of this investigation is to determine the change in proximity of adult children to their parents across the United States, using data from the National Survey of Families and Households between the sampling periods 1992 to 1994 and 1999 to 2000, in relation to the two proposed schools of thought. Conclusions from this analysis suggest that the processes behind adult child-parent proximity are not an either-or proposition. Both structural-functional and intergenerational cohesion influence proximity both coincidentally and individually at varying points across the life course. By understanding the motivations and mechanisms which create greater distance between adult children and their parents, we are better able to influence planning and policy to counteract this emergent trend.

Email: longcore@urbanwildlands.org; Shawna Dark, PhD, California State University Northridge. Email: shawna.dark@csun.edu; *Inductive and Deductive Habitat Models Predict Historic Distribution of Western Snowy Plover on the Central Coast of California*

Biogeography provides essential guidance for biodiversity conservation and is a fundamental element of conservation biology. It acquires progressively more significance as statistical techniques and GIS tools become more powerful. Detailed ecological data analyses and syntheses over multiple spatial scales and models of actual and potential geographical distributions of species are critical components of the science of conservation biogeography. Species distribution models can inductively predict distribution based on known presences, or make deductions based on generalized habitat preferences. If currently occupied habitats are marginal compared to historic sites, inductive approaches may underpredict potential distribution. We developed deductive and inductive models for the California central coast distribution of federally listed Western Snowy Plover (*Charadrius alexandrinus nivosus*), a small shorebird restricted to a fraction of its former distribution. Niche-based deductive models based on recorded preferences of the species throughout its range described the habitat potential of a given location. GIS techniques incorporated suites of environmental variables with both ambiguous and absolute dimensions. When habitat suitability is modeled using optimal-state similarity, model theory and logic require non-stochastic uncertainty integration, thus fuzzy categories where gradients define species' response to variables logically represent traditional and modern niche concepts. A series of inductive models based on existing known presences was then developed using a series of statistical approaches. Each model generated a habitat suitability map. We compared inductive and deductive approaches and tested the ability of each model to describe known occupied habitats by comparing suitability scores of occupied areas against average suitability value for all habitats.

Fraser MacDonald, Dr, University of Melbourne. Email: fraser.m@unimelb.edu.au; *Geopolitical Aesthetic: the photographic modernism of Paul Strand*

This paper is about the role of visual art - specifically American photographic modernism? as a domain of Cold War geopolitical contest. Critical geopolitics, I will argue, has been slow to think about art practice as an arena for the enactment and reproduction of geopolitical power. While this is not 'popular geopolitics' as it is conventionally understood, I aim to broaden this field of

scholarship by showing how one self-consciously 'high' modernist engaged with 'folk' culture as form of Cold War political dissidence. The paper attempts a close visual exegesis of the photography of Paul Strand (1890-1976), drawing a series of connections between Strand's 'dynamic realist' aesthetic, his Communist-aligned political allegiances and the geopolitics of his photographic practice. Moving away from 'art historical' readings of photography, I prefer instead to reflect upon the business of looking, or what we might call 'observant practice'.

The northern peatlands contribute significantly to atmospheric variations in methane and carbon dioxide and will likely be sensitive to future global warming. The peatlands could provide both positive and negative feedbacks to warming. We have used georeferenced collections of radiocarbon dates on peatland development to examine their sensitivity to climate change and their role in past variations in atmospheric methane and carbon dioxide. An analysis of 1516 radiocarbon dates from the circumarctic indicates that northern peatlands expanded quickly in concert with warming at the close of the Younger Dryas (12,000 cal yr BP). This contributed to a sustained peak in atmospheric methane and drawdown of atmospheric carbon dioxide between 12,000 and 8000 cal yr BP. To understand the modern carbon status and climatic sensitivity of northern wetlands on a regional scale, we focused on carbon accumulation trends in the West Siberian Lowlands (WSL) over the last 2,000 years. Carbon assays and radiocarbon ages reveal that the peatland carbon sink over recent millennia has been strongest in the very large peatlands of the southern portion of the WSL. Spatial extrapolation of our point-data using GIS suggests that ~40% of West Siberia's peat carbon may be less than 2,000 years old. Because these southern peatlands have been a strong historic carbon sink, interruption of their carbon sequestration ability owing to ongoing climatic and hydrological change could have a critical influence on the net carbon status of one of the world's largest wetland region.

Susan M. Macey, Texas State University. Email: sm07@txstate.edu; *Air Pollution and Aging: A Spatial Analysis of the Distribution of Emissions and the Elderly Population in Texas*

Several recent studies have noted that air pollution can have a significant impact on the health of older individuals, particularly related to respiratory and heart related problems. This study examines the spatial distribution of several subcategories of the elderly population in relation to air pollution emissions from various sources in Texas. Data on emissions including those from utility and nonutility point sources, as well as onroad, nonroad and area sources from the U.S. Environmental Protection Agency's National Emission Inventory were combined with block group level age category data from Landview using ArcView geographic information systems (GIS) software. Specific air pollutants discussed in this study include carbon monoxide, nitrogen oxides, particulate matter (PM10 and PM2.5), sulfur dioxide, and volatile organic compounds. Statistical analyses of the association between age classes from 55 years to 85 years plus, and both source and level of specific pollutants were conducted. Though weak in strength, significant associations were found between emissions from several sources and age category. Implications of these associations for elderly population subgroups will be presented.

Keywords: air pollution, elderly population, emissions

Erin Machell, University of Oregon. Email: emachell@uoregon.edu; NGO Development Landscapes in Contemporary Nicaragua

This paper examines the changing interactions between development NGOs, communities, and the state in Nicaragua. As government support for basic services such as adequate schools, roads, and potable water continues to diminish, Nicaraguans have increasingly turned to an array of mostly small nongovernmental organizations to fill these needs. NGO projects are invariably both needed and appreciated. However, the emerging NGO-based development landscape raises questions about the relationships and interactions between NGOs and communities in the development process, about dependence, and about what kind of long-term effectiveness a web of independent NGOs can provide as a solution to Nicaraguans' problems. This paper attempts to address these questions on the basis of interviews and participant observation conducted in urban and rural Nicaragua in the summer of 2006. Preliminary findings suggest that Nicaraguans are developing a new survival in response to the proliferation of development NGOs. They are organizing themselves into groups in the hope that they will attract NGOs and become a target community for projects and dollars. Though much literature has pointed to NGO failures, particularly in terms of participation and accountability to communities, I have found that, under some circumstances, NGO-community relationships can be strong and mostly positive, and they can include meaningful community participation. However, even in these positive cases, a deeper concern in thinking about real change in the context of development is the scale and the piecemeal nature of such interventions.

Elizabeth Mack, Indiana University. Email: elmack@indiana.edu; Tony H. Grubestic, Ph.D, Indiana University. Email: tgrubesi@indiana.edu; Erin Kessler, Independent Researcher. Email: ernthms_17@yahoo.com; Indexing and Regional Competitiveness: A Comparative Analysis

Attempts to explain regional similarities and differences have led to the development of various indices to explain regional disparities in economic activity. Over the years a variety of indices have been developed to explain regional homogeneity and heterogeneity with a focus on regional industrial concentration and composition. This study will compare and contrast existing indices of regional activity, constructed from county level economic and infrastructure data for the coterminous United States. These data are offered as alternatives to industry or company level data, which are often suppressed and impede meaningful regional comparisons. Further, the use of infrastructure data in an index of regional homogeneity addresses the issue of accessibility which previous studies have failed to address. Each index will be analyzed in both a statistical and spatial context, with a focus on the utilization of both global and local indicators of spatial autocorrelation to evaluate significant spatial patterns in the indices. Results suggest the inclusion of infrastructure data is a necessary component of regional indices of economic activity. The spatial analysis of county level economic activity demonstrates these indices should not be considered in an aspatial context.

Keywords: regional competitiveness, indices, regional disparities, county economic activity, spatial autocorrelation

Taylor E. Mack, Louisiana Tech University. Email: tmack@latech.edu; Cultural Convergence Along Honduras' Caribbean Shore

Culture contact has been a prevalent theme in the historical geography of the eastern Caribbean Coast of Honduras, from Trujillo Bay into Mosquitia, including Cabo Camarón and the mouth of the Río Negro. This area with a diverse physical environment has a long history of cultural interaction and adaptation among many culture groups, creating a complex cultural landscape. Archival research based on contemporary documents and maps document the many culture groups that have converged in this region of Honduras. Pre-Columbian culture groups that met in the area included groups referred to as the Maia and Taia, plus the cultural contact between indigenous Honduran natives with a nearby city of Nahuatl speakers. The geographic conditions along this stretch of coast in Honduras has proven quite favorable for culture contact among a variety of groups since the arrival of Columbus to this shore in 1502. Groups that plied these waters included not only Spanish treasure fleets, but ships from England, France, and Holland, as well, many who were on privateering voyages. Settling along this shore were groups as diverse as the English and Spanish settlements at Black River/Río Tinto, the Garifuna and Miskito peoples, English mahogany cutters and Honduran Ladinos. Today this region is still experiencing ongoing cultural interaction as Ladino agricultural settlements push the frontier forward into indigenous lands.

Kruger, University of Wisconsin - Madison. Email: elkruger@wisc.edu; Correlation between leaf phenology and leaf physiology in northern temperate mixed forests

Phenological variations impact water and carbon fluxes, and are thus critical for understanding how vegetated land surfaces affect seasonal and interannual weather and climate. Correlations between flux rates and phenology are poorly understood and mechanistic connections are in their infancy. Some data suggest that stomatal conductance and photosynthesis increase through or beyond full leaf expansion. Moreover, in conifers, the interaction of phenology and physiology is more complicated than in deciduous trees because needles are retained for several years. Using continuous sap flux data and a coupled photosynthesis-transpiration model we estimated reference canopy stomatal conductance, G_{sref} , and leaf area index, L , for seven dominant tree species in the region, including red pine (*Pinus resinosa*) and trembling aspen (*Populus tremuloides*), spanning a period from just prior to the start of leaf expansion to just after leaf senescence. G_{sref} for red pine increased from 105 to 179 mmol m⁻² leaf s⁻¹, which represented a 37 to 50% increase in G_{sref} after accounting for maximum possible changes in L . After full leaf out, the trembling aspen were almost immediately defoliated, and then reflushed after three weeks. Model estimates of L reflected this pattern and were consistent with measurements. However, G_{sref} never exceeded 45 mmol m⁻² s⁻¹ prior to defoliation, but peaked at 112 mmol m⁻² s⁻¹ after reflushing. These results suggest that regional mapping of phenological changes using remote sensing should be augmented with improved models of physiology to accurately represent the vegetative boundary in hydrologic and atmospheric models.

Devolution and Transport Policy in the United Kingdom

UK devolution is characterised by its asymmetrical nature in terms of the different powers granted to the different devolved jurisdictions and the absence of an explicit constitutional framework to govern institutional relations. Transport provides an illustrative example of the difficulties of policy making under devolution, since here the transfer of powers from the UK government to the devolved assemblies has been especially partial and complex. Yet the powers of the devolved authorities, coupled with the different transport conditions and needs found in the different jurisdictions, gives considerable scope for policy divergence across them, although other factors may militate in favour of convergence. This paper assesses the extent of transport policy divergence, informed by extensive policy analysis and interviews with key actors. Outside of the radical experiments in road user charging undertaken in London, policy divergence has been rather limited in practice. Similar policies have been introduced in Scotland, Wales and Northern Ireland, reflecting the common adherence to an integrated transport agenda, the limited policy-making capacities of the devolved

Phillip Gordon Mackintosh, PhD, Brock University. Email: pmackintosh@brocku.ca; Imagining the Park: Bourgeois Expectations and Urban Green Space in Toronto, circa 1900

It is well known that urban reformers earnestly sought out parks and green space for the revivification and restoration of a street-weary citizenry in the modern cities of late Victorian and Edwardian northern North America. We are, however, learning that Victorians believed nature, and parks particularly, obtained aesthetic properties that like "Art" could alter the soul and "improve" behaviour. The park, when seen as a tutor of aesthetics, assumed a moralizing place in conceptions of public space at a time when bourgeois city people increasingly impressed their opinions on the urban landscape. This embrace of the nature-as-social-reformer ideal was so firm that some bourgeois reformers, park designers and builders, were regarded as "Municipal Artists" engaged in "Municipal Art." This paper links the bourgeois geographic assertion of Nature's morality to the beautification impulse in modern industrial Toronto. Concern for the slovenly condition of Toronto's Queen's Park reveals the presence of a powerful park ideology, marked by a simple environmental determinism that was not only accepted uncritically. It was advanced as an anodyne for the ills of a modern city, whose reformers saw only social disorder, bruised infrastructure and unruly public space.

Paul J. Mackun, U.S. Census Bureau. Email: paul.j.mackun@census.gov; *Guidance on Uses of Metropolitan and Micropolitan Statistical Areas*

In June 2003, the Office of Management and Budget (OMB) announced new metropolitan and micropolitan statistical area definitions and has issued subsequent updates in December 2003, November 2004, and December 2005. This paper offers guidance on the uses of these areas and discusses how selected federal statistical agencies are implementing the new definitions. The paper begins by briefly reviewing the OMB standards review process and defining the statistical area terminology associated with the standards. It then describes the building blocks, titling conventions, and recommended abbreviations for the new areas. The paper subsequently discusses the analysis and presentation of metropolitan and micropolitan statistical area and principal city data, update schedules and associated documents, current and historical definitional files, and relevant websites. It concludes by providing examples of how selected federal statistical agencies, such as the U.S. Census Bureau, employ the new definitions in their data products.

Keywords: metropolitan statistical areas, micropolitan statistical areas, guidance

Virginia W. Maclaren, University Of Toronto. Email: maclaren@geog.utoronto.ca; *Indicator Empires: Canadian Experiences with the Nationalization of Community Indicators*

Most of the research on community indicators to date has used local or regional case studies to investigate indicator contributions to learning, evaluation and decision-making. Less attention has been paid to national community indicator initiatives, which tend to place greater emphasis on decision-making rather than the other two functions of indicators. In Canada, two of the most notable attempts to nationalize community indicator movements are a top-down, quality-of-life indicators initiative sponsored by the Federation of Canadian Municipalities (FCM) and a new bottom-up initiative known as Vital Signs, sponsored by the Community Foundation of Canada. With contributions from 20 municipalities, the primary purpose of the FCM initiative is to influence urban public policy and government financing in critical areas. It is top-down because it originated with a national organization and imposes the same set of indicators on all municipalities. The primary purpose of Vital Signs is to assist in identifying funding priorities for Foundation expenditures. It is bottom-up because it started as a local indicator initiative in Toronto and has now expanded to three other cities, using a mixture of national and locally-derived indicators. Based on a series of key informant interviews with report authors and users, this paper explores how the two indicator initiatives evolved, their unique characteristics, to what extent they have impacted decision-making and whether they conflict with or complement existing stand-alone local indicator initiatives. The paper concludes with an assessment of the power of nationalized community indicator initiatives to effect change.

Ken MacLean, Post-Doctoral Fellow, Emory University. Email: kmaclea@emory.edu; *Enclosure and the Emergence of Regulatory Authority Along Burma's Riverine Systems*

This paper explores how areas on the edges of conflict zones in eastern Pegu Division of Burma were rapidly transformed into sites of intensive resource extraction during the late 1990s and where regulated forms of violence have since largely replaced lethal ones. This transformation is all the more striking as counter-insurgency campaigns, which continue to use the brutal methods previously employed by the British in colonial Malaya and the United States in Republic of Viet Nam, have failed to bring the eastern part of the division fully under the military regime's control. The paper will examine on the division's waterways, which link the plains with the steep hills to the east, and then describe the ways these geographic features help shape struggles by different state and non-state actors to control access to timber, non-timber forest products, gold, and hydropower. Special attention will be focused on how military battalions and private business interests alternately compete and collude with one another to exert their authority in the effort produce a compliant labor force in and around areas where coveted resources are extracted. The data, drawn from research conducted in the area between 2001 and 2005, demonstrates how ethnic forms of identity are erased at some moments and re-inscribed at others. The findings also highlight some of the contradictions that have accompanied military efforts to consolidate centralized state control of Burma's more remote regions, even those spatially quite close to the capital such as eastern Pegu Division.

In recent decades, welfare reform in the United States has increasingly been based on a political imperative to reduce the number of people on welfare. This has in large part taken place through the establishment of a 'workfare' state, in which the receipt of state benefits requires a labour input. Designed to reduce expenditure on civil social services, welfare-to-work programmes have been introduced with this in mind. Simultaneously, the restructuring of US defense provision has seen the 'military-industrial complex' emerge as a key beneficiary of state expenditure. Both these trends can be characterised, the paper argues, as manifestations of neoliberal thinking - whether in the form of the 'workfarism' that is undertaken to bolster the U.S. economy, or the 'defense transformation' that has been intended to enhance U.S. war-making capacity. Whilst these two aspects have been analysed in detail independently, the aim of this paper is to probe the similarities, connections and overlaps between the workfare state and the new American emphasis on high technology warfare and precision weapons. It does so specifically by detailing the U.S. state's increased investment in private war-related industries, their increased role in public service provisions and, in particular, workfare state programmes. In doing so this paper attempts to bridge critical security studies and geographies of work-welfare by building an awareness of the social basis and impacts of US defense stratification.

Gordon MacLeod, University Of Durham. Email: gordon.macleod@durham.ac.uk; *Gated Communities and the 'Securitization of the Habitat': Privatizing the Urban Political Realm?*

Ever more people are choosing to live in gated residential housing developments. Invariably these residents are literally buying into not just a customized portion of real estate but a relatively secluded 'lifestyle' premised upon physical enclosure, the privatization of what would ordinarily be public space, and the private provision of civic responsibilities like police protection and street maintenance. It seems that in these neighborhoods space is being deeply commodified in accordance with a neoliberal urbanism and everyday life increasingly insulated against a plethora of risks and anxieties ranging from the maintenance of property values to the assurance of personal safety. Nikolas Rose (1999) terms this the 'securitization of the habitat'. However, in practice this securitization of private 'gated communities' involves them being contractually governed through extraordinarily restrictive rules and regulations on personal behavior, thereby calling into question the extent to which they can be routinely interpreted as a product of unadulterated neo-liberalism. Furthermore, the very idea of a residential 'community' implies some degree of collective organization: albeit this is ordinarily quite removed from conventional understandings of 'collective action', often indeed being expressed through 'homeowners associations' whose objective is to secede from the collectivizing and socializing institutions of formally elected city government. All of which heralds some profound changes in the conduct of urban politics and the nature of the urban realm and, in turn, our very conceptualization of these processes. This paper examines these themes, drawing on evidence from a variety of places in the north of England.

Roy Maconachie, Dr, The Institute of Development Studies, Sussex, UK. Email: Roymaconachie@hotmail.com; **Adrian Wood, Prof, Huddersfield University, UK. Email:** a.p.wood@hud.ac.uk; **Alan Dixon, Dr, Otago University, NZ. Email:** ; *Decentralization, institutions, and wetlands: New agricultural frontiers in Ethiopia and Sierra Leone?*

In many desperately poor countries in sub-Saharan Africa, the environmental and social significance of wetlands is increasingly being recognised in a development context. If managed sustainably, wetlands can produce large amounts of food and other commodities necessary to sustain rural livelihoods. A variety of economic and social development indicators suggest that Ethiopia and Sierra Leone are currently two of the poorest countries in the world, so rebuilding and maintaining food security and safeguarding livelihood portfolios are vital processes for alleviating poverty and achieving rural development in both countries. As both Ethiopia and Sierra Leone are currently undergoing profound social, political and environmental transformation, many households have responded by endeavouring to safeguard their livelihoods through the intensification of wetland use. At the same time, recent decentralization policies in both countries have seen the government strengthen its position at the local level, with new opportunities emerging for interaction between state and community institutions. Drawing upon recent field-based evidence from Ethiopia and Sierra Leone, this paper explores the dynamics and characteristics of community-based organisations, local government institutions and their interactions in the

development of management regimes for wetlands. The paper is concerned with community management of natural resources in the context of progressive decentralization and contributes to debates about the utilisation and conservation of wetlands.

geoadm@acsu.buffalo.edu; *The recent growth performance of U.S. firms in the industrial design sector: an exploratory study.*

This paper assesses the competitive factors associated with company growth in the U.S. industrial design sector. This small but technologically advanced sector delivers critical innovation inputs to firms that produce durable goods. Evidence from a survey of 85 U.S. design companies suggests that competitive success hinges upon service diversity. Specifically, the most commercially buoyant companies have diversified their service offerings beyond product or component design. These firms have developed strategic competencies in fields such as contract research, prototype development, product testing, technological forecasting, market analysis, and even advertising. Although most U.S. design companies are small-to-medium sized enterprises (SMEs) that employ fewer than 20 workers, successful firms do not differ from their less successful counterparts in terms of employment size, occupational structure, age, regional location, or market focus (client sectors). Instead, the key differences lie in service diversity and the quality of human capital. The paper concludes with a brief discussion of the implications of the empirical findings for future research on the dynamics of the design industry.

mmadden@uga.edu; Thomas Jordan, Cetner for Remote Sensing and Mapping Science (CRMS), Dept. of Geography, University of Georgia. Email: tombob@uga.edu; *Conflicts of Conservation and Access in National Parks*

The National Park Service Act of 1916 defined the mission of the United States National Parks to conserve scenic, natural and historical resources of specially designated lands while providing for the enjoyment of said resources in a way that will leave them "unimpaired for the enjoyment of future generations." Managers increasingly are faced with conflicting options and must weigh National Park conservation goals against the desires and needs of public use. Researchers at the Center for Remote Sensing and Mapping Science (CRMS) at The University of Georgia have worked cooperatively with the National Park Service since 1994 to develop digital resource databases and use geospatial tools to assist in monitoring, management and decision making. Community-level vegetation distributions, off-road vehicle and airboat trail networks and fire fuel models, for example, have been created for 21 National Parks, Preserves, Home Sites and Battlefields in the southeastern United States from high-resolution remote sensing data and Global Positioning System (GPS) enabled field surveys. The digital data have provided resource managers and scientists with information on rare communities, invasive plants and animals, risk of disturbance and human impacts. Geovisualization techniques such as 3D perspective views and fly-through animations have been used to assess vegetation patterns and communicate Park values and concerns to users and administrators. Historical remote sensing data also has established development trends beyond Park boundaries and identified threats encroaching on cultural and natural resources. Together these techniques greatly enhance sound

j.f.maddern@dundee.ac.uk; *Biometric Geographies of Interoperability/Inequality*

The paper seeks to conceptualise the meeting point between fleshy corporealities and technopolitical strategies of transnational governance through automated code. It investigates the new 'geographies' created through the burgeoning introduction of biometric technologies. The proposed introduction of biometric technologies (most commonly fingerprinting systems, facial measurement and iris scanning technologies though any physical or biological feature that can be measured can be used as a biometric indicator) at national border points has been heralded as a panacea to many of the security problems we are now facing. Whilst much research has explored the technological capabilities of the technology (Ashbourn, 2000; Jain et al., 1999) less academic research has predicted the potential impacts on society of the 'the body as password' discourse. In mobility studies, some work has argued that such systems are central to the neo-liberal separation of different types of mobile publics through for instance, 'bypass immigration' based on biometric IDs which create a processing time differential between the 'kinetic elite' such as business travellers and other social groups such as standard travellers, asylum seekers, refugees and migrants.

Through interviews with producers and consumers, this research looks at the realities of biometric systems and unpicks a 'biology of culpability' that structures the supposedly neutral technology, which fractures populations along the lines of class, race, gender, age and ability.

Grief can be experienced and expressed in spatial terms, often marked in the landscape in the form of individual or collective memorials and rituals. This paper studies two particular historical (foundational) Christian sites in the Isle of Man and Scotland, examining ways in which grief and consolation have been marked and overwritten by both the continuity and disruption of collective faith in these symbolic and aesthetic places. Particular attention is paid to the emergence of individualised practices of grief and consolation and how these reflect changing views of sacred space, including 'secular-sacred' space.

Fluvial geomorphologic field studies provide useful information on rates and processes of channel formation and evolution; however, they are typically confounded by a myriad of variables. In contrast, flume studies can control variables to provide a stricter experimental design, but the scale of water and sediment must be adapted to laboratory conditions. In this study we used a flume experiment to track changes in sediment transport and channel storage following large sediment inputs. In a 12-m long, 0.75 m wide flume, water discharge and flume slope were held constant, but the sediment feed rate varied to initiate cycles of aggradation and degradation cycle. We used a laser microtopographic scanner to measure bed topography and elevation. Channel response to increased sediment loads followed a similar trajectory of change that had been documented in field studies of Redwood Creek, California. Initially the channel responded to increases in sediment load by textural changes in the channel bed (a fining of the bed surface). As the aggradational cycle continued, bedform size and form roughness decreased. Mean depth decreased slightly during moderate sediment feeds, but decreased much more rapidly during high sediment feeds. Locally, secondary channels formed, although the channel pattern never became fully braided. As the sediment pulse was processed by the channel, the channel reverted to a single thread system, bedforms became more pronounced, channel roughness increased, and channel armoring became stronger. Overall transport rates increased during aggradational phases and decreased during degradational phases.

rebeccamadgin@hotmail.com; *Re-constructing the Identity of Place: The Role of Industrial Heritage in Manchester, England, 1970-2000*

I will take Castlefield in central Manchester to show how the re-use of this area of industrial heritage has re-constructed the identity of place. The paper will show how Castlefield managed to achieve a new, positive identity as a result of transforming its image and appearance. The area, as a result of restoration and re-use, went from being a declining, forgotten part of Manchester to a rejuvenated, vibrant, mixed-use area at the heart of the city centre. In short Castlefield went from being a marginal space to a place. Indeed Castlefield, following on from the concept of the Urban State Park in Lowell, Massachusetts, became Britain's first Urban Heritage Park in 1982. Castlefield's identity has always come from its industrial buildings whether during the British industrial revolution or in its dilapidated state of the 1970s. Today the area's identity still rests with its industrial heritage but changes to the appearance and function have regulated how the area is perceived and how it is identified. As a result of these changes Castlefield is now identified as a cosmopolitan area which has used its industrial history to power its future. This new identity is one that Manchester itself aspired to reach. Manchester city centre has used, and is using, its industrial history to attract in both people and investment and to secure a prosperous future for the city. Therefore, restoring and re-using industrial buildings in Castlefield has had a profound affect on both a relatively small locale and on the city as a whole.

Email: dagriffith@utdallas.edu; *A comparison of spatial filtering, spatial random effects, and GWR Poisson model specifications*

Although studies of georeferenced data increasingly incorporate spatial correlation among model residuals to improve precision and reduce bias, to date most analyses reported in the literature assume global associations that are constant and independent of location, an assumption coming under increasing scrutiny in the quantitative geography literature. Here we review and contrast three approaches for the estimation of and inference for spatially heterogeneous effects (i.e., associative factors whose impacts on the outcome of interest vary throughout geographic space). Specifically, we provide an in-depth comparison of both geographically weighted regression (GWR) models (which allow covariate effects to vary in space but only allow relatively ad hoc inference) and variable coefficient models (which allow varying effects via random effects and provide model-based estimation and inference, but require more advanced computational techniques) with spatial filtering models (which allow covariate effects to vary in space as well as provide model-based estimation and inference). We compare these approaches with respect to underlying conceptual structures, computational implementation, and inferential output, augmenting the comparison already furnished by Waller et al. (forthcoming) with a spatial filter one using their Houston crime dataset.

Flow regulation induces hydrologic, geomorphic and ecologic changes in impounded river systems, and tributaries may mitigate the effects of flow regulation by altering the flux of water and sediment into the flow-regulated mainstem. To capture the effects of channel bed changes and of tributary influences we use long-term discharge and cross-sectional data to assess the geomorphic and hydrologic impacts of impoundment on a flow-regulated river. In addition, we evaluate the use of the short-lived cosmogenic radioisotope ⁷Be (half-life 53.4 days) to link the geomorphic impacts to benthic macroinvertebrate community structure. We find that ⁷Be activity of transitional bed load sediment is highly seasonal and reflects both sediment source and residence time. Benthic populations also exhibit a strong seasonal variability. The mainstem radioisotope signal and benthic community composition change abruptly at tributary junctions. In the spring, neither the ⁷Be activity of the sediment, nor the benthic population exhibits a clear relationship with sample site location. However, during the summer the ratio of Ephemeroptera/Trichoptera, representing benthic community structure, decreases below tributary junctions. In addition, increases in filter-feeding/shredder Trichoptera abundance strongly correlate with recently ⁷Be tagged sediment at the confluences. The results show that tributaries are impacting the flow-regulated mainstem. Moreover, we propose that the tributaries are exacerbating the effects of impoundment due to the reduced competence and capacity of the mainstem.

Housing development in the Republic of Ireland is controlled by the planning authorities but provided by private entities, e.g. property developers. Dense housing development in the form of 'estates' occurs in areas zoned for

residential purposes. Housing development in Ireland is proceeding at the highest rate in Europe. This paper focuses upon the implementation of planning policies that regulate private housing estate development in Ireland, in the context of growing concern about whose interests are being best served by the planning process. It looks particularly at the practice of 'handing over' of completed estates by developers, and the implementation of appropriate management structures to ensure their ongoing maintenance. Evidence suggests certain administrative and accountability deficits in how this is undertaken, with many developers not complying with the planning conditions granted to them, and a perceived reluctance on the part of the planning authorities to enforce these conditions. Using case study evidence from County Galway (West of Ireland), this paper traces the interaction of key stakeholders (planning authorities, developers and residents) in the matter of completion and management of housing estates. It explores the impacts for residents of a lack of transparency in the planning process, and the difficulties in compelling developers to fully complete developments, particularly in terms of residents' ability to establish a management role in what is ultimately their neighbourhood. It considers the implications for developing a sense of local empowerment and 'ownership' of their place of residence, and promoting a sense of local community and civil engagement.

Thomas K. Maersperger, LP DAAC Scientist, SAIC, Contractor to USGS-EROS. Email: tmaersperger@usgs.gov; *The Essential Characteristics and Varied Uses of MODIS Land Products from the LP DAAC*

The U.S. Geological Survey's Center for Earth Resources Observation and Science (USGS EROS) is the site of the Land Processes Distributed Active Archive Center (LP DAAC), one of eight original DAACs established by the National Aeronautics and Space Administration (NASA) as part of its Earth Observing System Data and Information System (EOSDIS). The LP DAAC promotes interdisciplinary study and understanding of Earth's integrated systems by providing data for the investigation, characterization, and monitoring of biologic, geologic, hydrologic, and ecologic patterns and processes. To meet this mission, the LP DAAC ingests, processes, distributes, and archives data from land-related EOS sensors, and provides the science support, user assistance, and outreach required to foster the understanding and use of these data within the land remote sensing community. LP DAAC holdings include a large collection of land products derived from Moderate Resolution Imaging Spectroradiometer (MODIS) satellite data. MODIS products are derived from algorithms developed and validated by NASA science investigators, with data quality improvements implemented via a series of complete reprocessing campaigns during the mission. Approximately 70 different land product types and 14 million individual MODIS scenes are available through the LP DAAC at no charge to the end user. This poster describes the essential characteristics of the MODIS land product suite, and provides recent examples of the varied uses of these data.

Kelly Main, Student. Email: kmain@ucla.edu; *The Remaking of MacArthur Park: Place-meaning, control, and contestation in a contemporary ethnic landscape*

Many U.S. metropolitan areas are characterized by rapid changes in the physical form of cities and their populations. There is a new spatial order in cities as immigration flows culturally and physically change the urban landscape. What effects do these changes have in the way the different groups relate to their physical environment in these new culturally diverse ethnic landscapes? How has local planning practice related to land use responded to these changes? How have these responses and contestations of these responses affected the way group identity is formed, particularly as it is symbolized in the local physical environment? This paper seeks to answer these questions with a case study of three immigrant groups?from Mexico, Guatemala, and El Salvador?in the MacArthur Park neighborhood of Los Angeles, a culturally diverse environment to which there has been a significant local planning response to control the park/neighborhood's atmosphere and influence immigrant groups using the park. The study explores the emotional relationships to place experienced by neighborhood residents and visitors who use the park, the symbolic and otherwise meaningful nature of the local physical environment, and local planning practice's attempts to affect the meaning of and responses to the neighborhood/park through the appearance and use of the physical environment.

John K. Maingi, Miami University. Email: maingijk@muohio.edu; Lucy W. Ndegwa, Miami University. Email: wandegwa@gmail.com; Monitoring Forest Cover Change on Mt. Kenya Using Multitemporal Landsat Data

In recent years, there have been many reports in the Kenyan media of massive destruction of Mt. Kenya Forests. Destructive activities in the forests include illegal logging for timber and charcoal production, forest encroachment for cultivation of marijuana and other crops, and livestock grazing. Aerial surveys and visual interpretation of Landsat TM data undertaken between 1999 and 2002 confirmed this trend of continuing deforestation. In the current study we used Landsat TM and ETM+ images acquired in 1987, 2000 and 2002 to produce forest maps and evaluate several change detection techniques for mapping change. Among the change detection techniques evaluated, multitemporal PCA resulted in the highest accuracy (86.9%). Change detection techniques based on vegetation indices including NDVI, SARVI, KT Greenness and KT Wetness appeared to capture differences in forest vigor rather than actual biomass changes.

Susan P. Mains, University of the West Indies-Mona. Email: susan.mains@uwimona.edu.jm; Locating Movements and Moving Stories: Narrating Jamaican Migration

Mobility and identity are woven together through the process of narration and translation. The production of narrative is an inherently spatial process: it is a practice that situates stories, events, and feelings while creating new places and relationships. Narrative also provides a sense of direction and temporality, orienting the reader, viewer, or citizen towards an understanding of place as "becoming" in a particular way. As a practice that grapples with the rapidly shifting terrains of home, citizenship, and community, migration is interlinked with storied spaces and the production of narratives that often challenge dominant stories of mobility. In this paper I explore the ways in which Jamaican migrants' narratives of mobility, home, and political activism provide new ways of understanding transnational relations and spaces. Through an examination of interviews conducted with members of the Jamaican diaspora in New York, London, Toronto, and Miami, I examine the means by which spatial stories provide a process through which identity and place are (re)located. In addition, I analyze the relationship between migration, narrative, and translation highlighting the ways in which these practices can reinforce, and challenge exclusionary practices. Both narrative and translation transform identity and place through ongoing transformations, displacements, and the interweaving of multiple lives, and as such offer important entryways for understanding the complexities of migration.

Claire Major, . Email: majorclaire@sympatico.ca; Vulnerable Labour: SARS and Toronto's Hospitality and Healthcare Workers

As care becomes commodified and assumes the characteristics of precarious work, it departs from the Standard Employment Relationship. It becomes affective labour associated with immaterial production, work typically performed by women and immigrants in the global city. In this paper, I examine how the 2003 outbreak of SARS impacted on nurses in hospitals and housekeepers in hotels, two racialized, immigrant, and gendered workforces who were subject to neoliberal efficiencies prior to SARS (in the case of healthcare) and in the hospitality industry restructured using SARS as the catalyst. This work is part of SARS and the Global City: Severe Acute Respiratory Syndrome (SARS) in Toronto, a project lead by S. Harris Ali and Roger Keil, funded by the Canadian Social Sciences and Humanities Research Council (SSHRC). Starting broadly with the characteristics of the Standard Employment Relationship (SER), I then discuss affective, immaterial, post-Fordist, non-SER labour as typically performed by gendered and racialized workers in Toronto. Using data gathered in interviews and focus groups with nurses, hotel workers, union representatives, and

associations, I incorporate the voices of immigrant and racialized women who were engaged with SARS and impacted through the disruption the outbreak had on their working and personal lives. "Standards", such as standard employment relationships, the regulation and standardization of healthcare delivery, and the cleaning of hotel to "brand standards", are foiled by the actual messy and complex experiences of social, economic, and corporeal risks that SARS exposed.

Keywords: SARS, Toronto, Labour, employment relationships / standards, hospitality, healthcare

Niall Majury, Queens University Belfast. Email: n.majury@qub.ac.uk; Making space for transparency: ideas, their encounter and the construction of markets

The concept of 'transparency' is a pervasive one within contemporary policy discourses on economic globalisation and the associated re-configuration of social and economic space. Yet its entry into the lexicon of securities regulation is relatively recent. It was not until the 1990s that the term became hitched by regulators to how markets were being transformed historically. New technical capacities offered the possibility of re-configuring concrete market formations as 'distributed transparency devices', becoming what they 'should be' in both legal and economic disciplinary understandings of them. This paper examines the discursive power of 'transparency' as a regulative principle and the insights to be gained from a relational understanding of the spaces in which the idea is encountered and translated in practical arrangements. It focuses on an initiative by Canadian securities regulators to make sense of developments in Canada and elsewhere associated with 'on-screen' trading. This culminated in proposals to re-configure the prevailing market architecture as a 'market for marketplaces'. Analysis of how 'transparency' is enacted suggests that as a strategy for the government of conduct (enabling exchange and rendering markets regulable), it signifies not so much the devolving of 'authority itself' through 'the market', as the emergence of new ecologies of knowledge formation and a more variable, multi-institutional form of economic regulation. The outcome is not the radical 'decentring' of authority that some have suggested, but rather particular forms of visibility, patterns of organisational significance and regulatory strategies whose geographies need to be delineated and better understood.

Yasuyo Makido, Michigan State University. Email: makidoya@msu.edu; Joseph P. Messina, PhD, Michigan State University. Email: jpm@msu.edu; Ashton Shortridge, PhD, Michigan State University. Email: ashton@msu.edu; Testing the randomness using sub-pixel land cover mapping

Mixed pixels remain one of the great challenges of land cover mapping from remotely sensed images. While much research has focused on attempting to identify the proportion of land cover types at sub-pixel scales, relatively little attention has been devoted to the spatial allocation of land cover types within a pixel. Atkinson introduced pixel-swapping algorithm for predicting sub-pixel land cover distribution for binary landscapes. This algorithm iteratively changed the spatial arrangement of sub-pixel values based on a distance weighted function (i.e., attractiveness, O_i) of each sub-pixel in order to maximize the spatial correlation between neighboring sub-pixels. By employing the notion of attractiveness, we created the simultaneous categorical swapping technique, which is applicable to multiple classes. Using a pseudo-random number generator (PRNGs), the algorithm randomly allocates class codes to sub-pixels. Then, the algorithm simultaneously examines all pairs of cell-class combinations within a pixel to determine the most appropriate pairs of sub-pixels to swap resulting in a predictably autocorrelated landscape. As PRNGs create deterministic approximations of random number sequences, and have inherent biases, we recreated the standard suite of PRNGs in a custom software implementation. We demonstrate the impact of PRNG type on the initial allocation and apply our simultaneous method to increase the degree of contiguity. The generated images are used to characterize to model the error distribution.

Email: kmr@cccmyd.net; Climate Variations Reflected in Changing Sediment Fluxes to Tidal Marshes of San Francisco Bay from Rivers Draining Regions in Northern and Southern California

This research has focused on changing fluxes of mineral sediments to tidal marshes surrounding San Pablo bay in the San Francisco Estuary from the three major source regions: the Sacramento river watershed, the San Joaquin river watershed and local streams that drain to San Pablo bay. Sediments are trans-

ported by river inflow, and variations in the fraction of sediments from any region relative to the others reflect changes in climate patterns over the state. A suite of 26 elements were measured in sediments collected from source rivers to characterize the potential end-member sources. Sediments were collected from marshes surrounding San Pablo Bay and cores were then collected from 4 tidal marshes. The pattern of sediment flux from the identified source end members has changed over time. Each marsh site reflects a large input from the watershed regions outside the Delta, but also a significant input from the local tributaries to San Pablo bay. Two longer cores, from Petaluma marsh and China Camp marsh, show that on long timescales, climate variability has impacts on the sediment fluxes to the Bay marshes. Of particular interest, the longer records reveal more variability between the two watershed regions draining the Sacramento and San Joaquin systems - an increase in some cores of 20%. An intriguing indication of overall decline in mineral sediments delivered to these marsh sites is apparent in the China Camp record occurring during the period of the Mediaeval Climate Anomaly, and an increase is apparent during the Little Ice Age.

Edward Malecki, Ohio State University. Email: malecki.4@osu.edu; *China and India in the World Economy*

China and India are becoming more integrated into the world economy. These two countries, each with over 1 billion population, are engaging with the global economy in very different ways. China has become a major participant in nearly all manufacturing sectors, and is a growing contributor to scientific research. India's more limited world-class capabilities are focused in two sectors: information technology and pharmaceuticals/biotechnology. How these two countries evolve in their engagement with large corporations and the production networks in place will likely affect diplomacy and security policy. China and India are reacting to globalization, the role of transnational corporations, and global interdependence as embodied in the Internet from distinct perspectives that necessarily disrupt conventional views. This research systematically examines the place of China and India in two dimensions: first, in the technological activities of Indian and Chinese participation in production and research networks of global corporations and, second, in the connections of the two countries and their major cities to the global Internet. This project continues a long-term concern with shifts in the economic and technological power among the world's nations.

Nick Malleon, University of Leeds. Email: N.Malleon06@leeds.ac.uk; *An Agent-Based Model of Burglary in Leeds*

Occurrences of crime are complex phenomenon. They are the result of a vast number of interrelated elements which can include environmental factors as well as complex human behaviours. Traditionally crime occurrences have been modelled using statistical techniques and computer models (such as spatial interaction modelling). Although such approaches are useful, they face difficulties with providing predictive analyses and the integration of behavioural information. Agent-based modelling is a new modelling paradigm and has spurred a considerable amount of interest. An agent is an independent component of a system which interacts with other agents and its environment. Thus large systems of agents can be created to mimic real scenarios. Most importantly, the agents can incorporate behavioural information to determine how they should achieve their goals. An accurate agent-based model which incorporates human behavioural factors and detailed environmental components could have a number of uses. Not only could it be used to analyse offender travel but also provide "what if" analyses, such as the effect that new environmental developments or

crime reduction initiatives might have on a local area before their implementation. This will have a significant impact on local councils, town planners and the police. Although simple, the agent-based model built for this project yields interesting results. It indicated that certain areas in Leeds have a much lower burglary rates than would be expected. It also demonstrates that agent-based modelling is an excellent tool for these types of analyses and should be extended further.

Katri Mallory, University of Maine Farmington. Email: katri.mallory@maine.edu; *There Goes The "T": Measuring The Connectivity Of Boston's Public Transportation*

In the 1820s public transportation became prominent in urban areas around the globe. In the northeastern coast of the United States, public transportation remains central to historical and contemporary urban areas. It influences the varied political economy of the cities as well as the spatial dynamics. However, there are persistent flaws within public transportation, disproportionate access being one of the foremost concerns. This research addresses the question of access by presenting an analysis of the frequency of spatial distribution of stops and scheduled times of bus, subway, and light rail lines in defined economically differentiated boundaries within contemporary Boston and adjacent suburban areas. The analysis explicates the spatial processes of access to public transportation with regard to economic indicators and connectivity, using the beta index.

Gunnar Malmberg, Umea University. Email: gunnar.malmberg@geography.umu.se; *Imaging an Attractive Countryside - on migration and place-making in South Sweden*

In focus of the study is the interaction between migration and place making in a rural area in southern Sweden; how and by whom the place is defined and imaged. The place-making process is analyzed on the basis of official data, text and images. The area in focus has been known to outsiders as a backward region, as a periphery in a modernisation space and as a unique rural idyll attracting the cultural elite. The story starts in the early part of the 20th century when urbanization accelerated in Sweden and the rural youth looked for income, education, amusement and modernity in towns and cities, while simultaneously the urban middle-class internalised new ideals of the rural idyll and started their "return" to the countryside. This return included the selection of exclusive and unique places in the countryside. The area of this study was one of the selected. It was renamed ("Österlen") and redefined by the cultural elite, especially the painters, and converted into a unique rural idyll, attracting tourist, second home owners and to some extent immigrants from the urban areas. But it has remained a region of out-migration, unemployment and low education level.

Virginie Mamadouh, University of Amsterdam, The Netherlands. Email: v.d.mamadouh@uva.nl; *Establishing a Constitution for Europe while enlarging? Visions of Europe in the referenda campaigns in France and the Netherlands*

In referenda in France (May 29, 2005) and the Netherlands (June 1, 2005), citizens of these Member States rejected the EU Constitution and consequently blocked the ratification of the Treaty establishing a Constitution for Europe. This paper explores the public debate in these two countries to disclose how Europe is imagined and re-imagined in a period of rapid territorial and institutional changes (both enlargement and deepening). The paper compares the main issues raised in the debates and the arguments put forward by proponents and opponents. It focuses mainly on the way the 2004 enlargement and future eastwards enlargements (Bulgaria, Romania, Turkey, etc) were envisioned. Dissatisfaction with a lack of say in the enlargement process, fears related to the impact of the enlargements, combined with anxiety about the changing nature of the European project, often affected negatively opinions about the constitutional project. These findings are compared to polls data about the opinions of citizens about the institutional and the territorial shape of the European Union to assert whether the preoccupations of Dutch and French voters are representative for the preoccupations of citizens in Old Europe, defined either as the Six of Shumania, EU15, or according to Donald Rumsfeld.

David Manahan, PhD, California State University, Sacramento. Email: dmanahan@csus.edu; *A Critical Pedagogy of Place: Rethinking the Teaching and Learning of Geography in Higher Education*

In our inter-connected world, geographic knowledge is vital to understanding the complex geo-political and economic relationships, increasingly problematic environmental issues, and inequalities prevalent in all human populations. In this

study, I evaluate the teaching and learning of geography in higher education on many fronts. First, I outline the need for a geographically literate public. Second, I demonstrate Americans' geographic illiteracy and apathy, and third, discuss and critique possible reasons: disconnected lifestyles, lack of geographic exposure and value, ineffectual classroom pedagogy, and disciplinary confusion. Fourth, I embed these reasons into scales of influence, from individual (folk pedagogies) to institutional (disciplinary culture) to societal (master narratives). And fifth, I address avenues of possible change based on the educational literature and the wishes of geographers, and focusing on institutional and societal shifts from the Teaching Paradigm to the Learning Paradigm. In four community college geography classrooms, I implemented a critical pedagogy of place (Gruenewald, 2003). Developed from place-based education and critical pedagogy, a critical pedagogy of place embraces progressive pedagogies, classroom democracy, community relations, and eco-social justice and equality. Through multiple qualitative and quantitative assessments, the students demonstrated increased conceptual learning and skills development, felt educationally and personally empowered, indicated an increased sense of geographic awareness and interest, more intimately connected to their communities, and generally enjoyed the learning process. These positive results support my notion that geographers should adopt a critical pedagogy of place as a theoretical and practical construct for the teaching and learning of geography in higher education.

Jennifer L. Mandel, Ph.D., University of Wisconsin - Platteville. Email: mandelj@uwplatt.edu; *Women's Empowerment & Spatial Mobility in Porto Novo, Benin*

According to Lourdes Beneria globalization has produced two parallel processes feminization of the labor force and feminization of poverty. The result for women is that they have a greater number of and a myriad of different income generating opportunities, but also often more financial responsibilities. Not all women are equally impacted, however. We need to understand better what processes produce these differential patterns in women's livelihood experiences because this knowledge may point the way to assisting those who are only surviving at present. In this paper I will show that while many frequently inter-related factors shape women's livelihood opportunities including: reproductive responsibilities, access to capital, education, etc., another often under-explored issue is spatial mobility. I argue that increased spatial mobility substantially increases women's opportunities for creating profitable livelihood strategies.

Bertie Mandelblatt, Royal Holloway, University of London. Email: b.r.mandelblatt@rhul.ac.uk; "Two and a half pots of manioc flour, or three cassavas": the Code noir, the consumption of slaves and slaves' consumption in the ancien régime French Atlantic"

This paper investigates the conflict between the embodied practices of slaves' food consumption, and their personal commodification in the plantation societies of the French Caribbean. Placing slaves at the centre of the history of sugar, and of the French Atlantic, shifts attention to the massive labour force on which sugar, and the French new world societies that grew up around it, depended. Placing slaves' food practices at the centre of their own history means reconceptualizing them as consuming bodies, underscoring the conflict that this presented to their dehumanisation as slaves. This paper focuses on the Code noir, the Louis XIV's 1685 edict that regulated slavery in the French colonies in the Americas, and how food consumption figures in its legal framework. The Code outlines the precise parameters of the objectification of slaves. However, several of these articles claim to treat the duty of slave-owners towards their slaves in terms of food: stipulating minimum food requirements that slave-owners were to provide, the legal recourse slaves had in cases of non-compliance, etc. After historically contextualizing the Code noir, this paper studies these articles and considers their implications for a sustained study of slaves' food consumption. The Code noir is useful because it sets out the larger cultural patterns - the place of individual foodstuffs (manioc, salt beef), and the role of markets and provision grounds? within the contradictory context of slave as consumer/slave as commodity. These contradictions signal the ways studying consumption can lead to new historical geographies of the Atlantic world.

Keywords: French Atlantic, consumption, slavery, material culture, food studies, Code Noir

Tina Mangieri, University of North Carolina at Chapel Hill. Email: mangieri@unc.edu; *Fashioning faith in a transnational city*

The mutability of East African coastal identity has a long literature, emphasizing variable moments in which African, Arab, Swahili, or other salient category is declared or debased given current local conditions. Based on fieldwork conducted in Mombasa, Kenya in 2004 and 2006, this paper explores the myriad ways in which these fluid identities are fleetingly "fixed" by apparel, while

attentive to economic and cultural links making these appearances possible. Changes in coastal dress, particularly a shift away from public consumption of "local" cloth among Swahili women and the increasing presence of veiling, are noticeable in both observation of city streets and in an examination of recent manufacturing and trade data. With the end of domestic textile and apparel production for local consumption in Kenya, new patterns are emerging for the importation of clothes. While a woman's choice to veil (or not) is partly implicated in these recent changes, a focus on the clothing of Swahili men offers an alternative entrée into discussions of local issues of identity as these articulate with global forces. Swahili men's public clothing is less proscribed than women, giving their daily choice of dress wider berth. Socio-spatial constructions of identities as "Islamic," "African," "Western," evidenced by the decisions Swahili men make in their everyday appearance, highlight that clothing perceived in these terms is neither "fixed" nor the same in East Africa, the Middle East, nor elsewhere in the world.

Becky Mansfield, Ohio State University. Email: mansfield.32@osu.edu; *The Social Nature of Natural Childbirth*

This talk argues that "natural" childbirth (birth without medical intervention) is a "social" model of birth. It also suggests that perspectives from nature-society relations should augment the focus on place and space in critical health geographies. The argument draws from my analysis of books for women considering natural childbirth. Authors commonly use nature-oriented words such as "trust" and "instinct," yet they also emphasize that "instinct" needs very social support to make it happen. My findings are that natural childbirth requires active learning, physical and emotional preparation, and social support beforehand; requires the woman and her caregivers to perform a variety of activities during labor; and requires the proper physical and emotional environment. That is, natural childbirth replaces medical intervention with other social practices. The significance of this is that the socio-natural character of natural childbirth provides an alternative interpretation of problems in childbirth. From both medical and purely natural perspectives, problems in childbirth are the fault of women and their bodies (i.e. women's nature). But if childbirth is a socio-natural relation, problems may be because the social practice is not perfect; even when attempting natural childbirth, women may not have everything they need to succeed. Seeing natural childbirth through this nature-society lens highlights that natural childbirth is not just a nostalgic attempt to "return" to nature, but is a political movement that challenges the medical model of birth by developing social practices that treat women as active, strong, and trustworthy.

Ginger S Mansfield, University of Oregon. Email: gmansfie@uoregon.edu; *Canadians Among Us: Brain-Drain Immigration, Whiteness, and Identity in the Twin Cities Urban Area*

This paper discusses the migration of Canadians to the United States, concentrating on post-NAFTA migrants in the Twin Cities metro region in Minnesota. There are more than 8500 documented Canadians living in this area, though little research has been conducted by geographers on their settlement patterns or on the political processes that influence their migration. In this paper I explore the economic and political forces that drive the migration of Canadians to the United States, specifically how NAFTA has contributed to the brain-drain of highly-skilled, top-wage earning immigrants. Additionally, I question whether 'normalized whiteness' in Canada has influenced settlement patterns in the United States and the Canadian migration experience in general. Writing by geographers and other scholars on the issue of normalized whiteness will further inform this research (Kobayashi, 1993; Peake and Ray, 2001, and others). Questionnaire responses and informal interviews from the Canada Day picnic

held in Bloomington, MN in July, 2006, will shed light on the migration experience of Canadians living in the Twin Cities.

Keywords: Migration, Canadians, Identity, United States

Steven M. Manson, University of Minnesota. Email: manson@umn.edu; Tom Swanson, University of Minnesota. Email: swans990@umn.edu; Shipeng Sun, University of Minnesota. Email: sunx0170@umn.edu; Linking Complex Models to Simple GIS or Simple Models to Complex GIS?

Geographic complexity - the explicit integration of complexity research with space and place ? increasingly leads practioners to combine Geographic Information Systems (GIS) with complex modeling approaches such as agent-based models, cellular automata, or neural networks. Integrating GIS with complex models touches on both emerging and longstanding areas of inquiry: the role of open source verses proprietary software, semantic interoperability, high performance computing, loose versus tight coupling, and the simultaneous treatment of spatial and temporal dynamics. We present several case studies on these issues based on linking agent-based models to GIS to model land change.

Keywords: geographic complexity, GIS, model coupling

Anna Mansson McGinty, University of Wisconsin-Milwaukee. Email: mansson@uwm.edu; Alternative Femininities and Sisterhoods among Muslim Women. Ethnographic Approaches to Gender and Identity

Departing from two different ethnographic studies, the paper will focus on the emergence of alternative femininities and "sisterhoods" as well as the various gender discourses that Muslim women draw on in their identity formation. In a just finished long-term project on Swedish and American women who have converted to Islam I analyze the particular meaning they assign to Islam and the seemingly irreconcilable "Muslim" and "Western" discourses on gender that they appropriate as Swedish Muslim women and American Muslim women, respectively. In a current project on Muslim sisterhood, drawing on extensive personal interviews with Muslim women and participant observations within a Muslim women organization in an American mid-Western city, I study the notions of "sisterhood" that emerge in women-only activities and the various gendered identities that are constructed through the personal space fashioned by the hijab. There is an increasing body of literature on Islamic feminism and discourse analysis of the feminist rereading of Islamic scriptures, but fewer are the studies that take a look at how these feminist interpretations are implemented in Muslim women's everyday life and identity-making. The argument of the paper is that by looking at the personal meaning assigned to various discourses on gender and to the highly disputed hijab we can gain a better understanding of cultural change and continuity, in this case regarding gender roles and relations among Muslim women in the West.

Keywords: muslim women, identity formation, islam in the west

Maya Manzi, Clark University. Email: mamanzi@clarku.edu; A Political Ecology Perspective on Beekeeping: The Case of Honey Gathering in the Community of Arica Viejo, Peruvian Amazon.

For thousands of years honey gathering has been practiced by indigenous communities in many different parts of the world. Environmental change and market integration have fostered in some cases, a process of honey bee domestication, and in others, a resurgence, intensification, or re-adaptation of indigenous apiculture. Studies on community-based natural resource-use management have often overlooked the contribution of beekeeping to poverty alleviation and environmental conservation. This study is based on qualitative and quantitative data gathered through in-depth household interviews (n=40) conducted in 2001, 2003, and 2005, in the community of Arica Viejo, located along the Ucayali River, Peruvian Amazon. Comparison between our case study results and other studies on community beekeeping reveals some important environmental, socioeconomic, and political implications of beekeeping as a commercial livelihood practice among resource-dependent communities. Promises and challenges of beekeeping in lowland Amazonian environments are also discussed.

Liang Mao, SUNY - Buffalo. Email: liangmao@buffalo.edu; Ling Bian, SUNY-Buffalo. Email: lbian@buffalo.edu; Intervention strategies in an individual-based spatially explicit model of epidemiology

The spread of disease within a population is an intrinsic spatio-temporal process. Few intervention strategies have explicitly taken this into consideration. In this proposed study, we use the individual-based spatially explicit model to represent spatial heterogeneity in the disease transmission, and explore its effects on intervention strategies. In this model, the discrete individuals, their interactions and mobility are formulized in a network specified by six parameters. These parameters describe the properties of individuals, the properties of links, and the

topology of the network. By adjusting these parameters, several intervention strategies are defined in terms of different targeted populations or social networks. Each intervention scenario is then introduced into the model and simulated to evaluate its efficacy of achieving herd immunity. The impacts of spatio-temporal heterogeneity on intervention efficacy are discussed by comparison. These results provide insights for real-world intervention design and public policy making.

Keywords: intervention, individual based modeling, spatial heterogeneity, communicable diseases

Hanna Maoh, Dr., McMaster University. Email: maohhf@mcmaster.ca; Pavlos Kanaroglou, Dr., McMaster University. Email: pavlos@mcmaster.ca; Hejun Kang, PhD Candidate, McMaster University. Email: kangh3@mcmaster.ca; A New Approach to Modeling the Spatial Distribution of Population Using Public Data from the Canadian Census: An Application to Halifax, Nova Scotia

This paper reports on the development of a demographic model that is part of a simulation model designed to evaluate the interactions between the land use and transportation systems in the CMA of Halifax, Nova Scotia. The devised framework makes use of two components: the Rogers multi-regional population projection model and the multinomial logit (MNL) model. The former uses age and sex-specific vital statistics on fertility, mortality and inter-regional migration to project the progression of population in 8 geographic areas including the CMA of Halifax. Following the classification scheme of the census data, census tract population is modeled as a composite of two population groups that include non-movers and movers. Non-movers are people who survived and remained at the same residence over 5-years time period. Movers, on the other hand, comprise four population subgroups that include intra-urban movers, intra-provincial movers, inter-provincial movers and external migrants. A binomial logit model is estimated to determine the number of non-movers in each census tract. Such information is aggregated to the CMA level and combined with the outcome from the Rogers model to determine the total number of movers. Those are then distributed to census tracts using a destination choice MNL model. Census tract data are used to formulate the explanatory variables of the described logit models. Besides using a multiregional population projection model, a major innovation of the proposed framework is its reliance on publicly available data to explain the mobility behavior of people and to perform small area population projections.

Keywords: Halifax, demography, mobility, migration, Rogers model, logit model

Jennifer Mapes, University of Southern California. Email: jmapes@usc.edu; Jennifer Wolch, University of Southern California. Email: wolch@usc.edu; Exploring 'sustainable' new communities

There is increasing recognition that urban sprawl is harmful to America's natural environment and its socio-economic fabric. But short of prohibiting growth all together, what can be done to prevent further degradation? Among proposed "solutions" to sprawl include concepts of smart growth and sustainability. Some developers are now seeking to incorporate notions of sustainability into their designs for new communities. In this paper, we examine the successes and failures of developments that have won awards for their sustainable or smart growth achievements. We describe the broad range of characteristics of these communities and consider their ability to address multiple scales of sustainability, as well as their attention to a broad range of sustainable practices ? environmental, social, and economic. Our analysis suggests that while a few of these communities have made great strides in moving toward theoretical goals of sustainability, many developments focus on creating a marketable community rather than one that provides for a sustainable future.

Keywords: sprawl, sustainability, planned communities

Email: Fiona.Smith@brunel.ac.uk; Emma Wainwright, Dr, Brunel University. Email: Emma.Wainwright@brunel.ac.uk; Skilling down/training up: women migrants' experiences of and participation in the neo-liberal learning market in West London

In recent years, the UK Government has increasingly stressed the role of lifelong learning in eradicating social exclusion and improving the productivity and skills base of the country. Further, with a clear neo-liberal rationale that emphasises waged work as both a civic duty and a necessity for various social entitlements, groups of unemployed individuals are being offered (re)training to make them 'work-ready' and to 'encourage' them to take responsibility for themselves and their families. Women with low qualifications have been particularly targeted for training and work in the low paid- and feminised care sector. Our research in West London shows that many migrant women, some of whom have high levels of education and qualifications in their countries of origin,

have also been attracted to these types of courses. Drawing on focus groups which explored women's attitudes towards and access to training, we argue that whilst the current UK Government's training policy encourages immigrant women to fill in the skills gap in the care sector, notably in childcare, many of these women resist such stereotyping in both the career trajectories they envisage for themselves, and the motivations they have for undertaking training in these areas. The paper, therefore, examines how these women negotiate the British neo-liberal learning market and the norms pertaining to their gendered and racialised identities. It also attempts to shed light on how they manage the relationship between productive and reproductive roles (Kofman and Raghuram, 2006; Zontini, 2004), work and training, past experiences and future careers.

Keywords: training, gender, migrants

Anthony Marca, University of California, Santa Barbara. Email: marca@geog.ucsb.edu; On Surfari: Surf Tourism Flows from California

Growing research on surfing tourism reflects the rise in global popularity of surfing and the emergence of a commercial industry that caters to a niche market of travelers. Various surfing tourist typologies, tourism management techniques, and environmental impacts on surf destinations have been identified in previous studies, yet the spatial patterns of surfing trips have not been investigated. As part of a Master's thesis in geography, I collected data on surf trips taken by California surfers in 2005 using an internet-based questionnaire. Results from a descriptive analysis of surf trip distances suggest that distance decay influences the majority of surfing trips; however, some prominent surf destinations have enough attractive power to interrupt the theoretical decay curve, as illustrated by secondary modes at distances corresponding to Hawaii and Costa Rica. Flow maps reveal consistent directional flows of California surf tourists, with some minor seasonal shifts. Surf trips originating in California generally remain in the Pacific Rim and are focused within California and along the Baja peninsula. During spring and summer months, when swells decrease in the northern hemisphere, the number of visits to destinations in the southern hemisphere increased.

Keywords: surfing, tourism, flow maps, distance decay

Michael J. Marchman, University of Kentucky. Email: marchman@uky.edu; Driven to the margins: neoliberalism, taxi drivers, and tourism in the Caribbean

Taxi drivers working in the tourism industry in St. Lucia, West Indies, are struggling to survive economically and to maintain their status as independent, self-employed workers. As the tourism industry has grown, the government of St. Lucia has adopted (sometimes grudgingly) neoliberal reforms aimed at meeting the demands of transnational capital and economic and political changes associated with the anticipated creation of the Free Trade Area of the Americas. In the process, the tourism-taxi sector, which was traditionally structured around associations and cooperatives of self-employed taxi drivers, has come under increasing threat from multinational tour operators, cruise ship lines, and local destination management companies. These challenges pose serious threats to the ability of tourism-taxi drivers to continue to earn livelihoods through taxi work and to retain their position as self-employed entrepreneurs. Taxi drivers are increasingly forced into competition with a growing number of private companies attempting to capture ever-increasing shares of the market and generating intense competition among taxi drivers. This paper examines these processes of change and the ways taxi drivers are responding to them on individual and collective bases.

Keywords: neoliberalism, economic, tourism, taxis, Caribbean

Alan P. Marcus, Ph.D. Candidate (ABD), University of Massachusetts, Amherst. Email: amarcus@geo.umass.edu; Debunking Pan-Latinamericanisms: The "Hispanic/Latino" Category. Brazilian Immigrants and (another) American Ethnic Dilemma

The increasing visibility of the terms Hispanic and Latino has (re)produced a monolithic Spanish-speaking and racialized framework for understanding populations from the geographical realm named Latin America. As all categories stem from socially constructed ideas, I interrogate the transformation of the terms Hispanic/Latino into a powerful "reality" within the United States at the cost of Brazilian immigrant invisibility and the misappropriation of a multi-dimensional geographical realm. This interrogation process is an integral part of this paper. For example, the U.S. Census does not consider Brazilians to be Hispanic (as of 1980) or Latinos (as of 2000), and yet within both English and Spanish-speaking intellectual and public discourses, the two terms are used loosely to ascribe populations from Latin America. I draw on previous studies on Brazilian immigration to the US and on preliminary research conducted by the author in Framingham, MA. I call for more attention to the lack of discussions within social spheres (public, popular, and intellectual discourses) of Brazilian national/cultural identity. Ramifications include methodological and epistemological flaws and confusion within intellectual, political, and public discourses that address all things that pertain to Latin America or that include the terms:

"Hispanic/Latino".

Keywords: Brazilian immigration, identity, borders, ethnic geography, latin america

Isabelle A. Maret, Ph.D., University of New Orleans. Email: isathomas45@hotmail.com; Vulnerability and risk: Can we rebuild a safer New Orleans?

Since the 1992 Kyoto conference, urban vulnerability has become a global concern. As climate change due to human activity increases the rate of potential natural disasters, numerous studies have begun to focus on urban vulnerability. A decade-long reflection led urban researchers to identify risks, to analyze their causes and to advance some comprehensive solutions. Disasters or disruptions are no longer conceived as acts of God or haphazard events but as the results of human activity. In many cases, urban planners question land use in order to understand how the city dwellers' social and geographical distribution interacts with disasters. Over the past few years, several hurricanes have struck American cities and the costs due to the disasters have risen dramatically. Though these losses could be ascribed to the ever more expensive infrastructures, this view point would elude the true problem: urban sprawl in America entailed people to dwell in hazardous areas. Even though, they are shielded by protection systems, these can be deficient as in New Orleans. Hurricanes Katrina brought about the biggest natural disaster ever occurred in an American city. This presentation will examine the relationship between the New Orleans's urban growth patterns since the 1920's, and the city's increased vulnerability. It will present the spatial landscape of the devastation due to Hurricane Katrina. At last it will scrutinize the different rebuilding strategies and their impact on the revival speed of the neighborhoods. New Orleans' recovery may be an opportunity to find a better way in urban development.

Florence Margai, Ph.D., Binghamton University-SUNY. Email: margai@binghamton.edu; Malaria Morbidity and Treatment Seeking Patterns in Depressed Communities

Malaria continues to be a prevalent parasitic disease that threatens the lives of over 500 million Africans each year. An additional 100 million people live in epidemic-prone areas with limited immunity and greater risks for deaths and disabilities when outbreaks occur. This study examines the prevalence rates of malaria and the modes of treatment utilized by residents in the Kroo Bay Community in Freetown, Sierra Leone. This community was selected because of elevated risks, high poverty rates, and limited access to health services. Also, residents in this community underwent traumatic experiences during the brutal civil war (1991-2002) in Sierra Leone. Using data obtained from 780 subjects in 2006, this paper i) examines the level of awareness of malaria prevalence, knowledge and use of cheaper treatment alternatives; ii) examines ways to improve access to these drug alternatives; and iii) analyzes the efficacy, costs/benefits of using complementary and alternative treatment therapies. The results provide meaningful information for the spatial characterization of community risk profiles and the development of interventive programs aimed at reducing the disease burden.

Ananthakrishna Maringanti, University of Minnesota - Minneapolis. Email: marin013@umn.edu; Clean cities, messy politics: Geographies of evictions in India

Since the mid 1990s, as part of its economic reforms, the Government of India has pursued an aggressive policy mix that simultaneously accords nominal autonomy to local state institutions and forces them to access finances from capital markets for urban development. In this context, local state institutions have been increasingly resorting to revenue increasing measures through selling, leasing, or converting Government owned land into equity in public-private partnership ventures. This shift in the government's role vis a vis land - from custodian to entrepreneur - relies on regularizing land records, settling sociospatial claims rooted in local histories in favor of a universal property regime based on clear titles and digital maps, and producing clean and green cities. A number of housing rights campaigns in India have documented the violence that this shift wreaks on women, children and older people by evicting existing informal settlements. Based on collaborative work with a housing rights campaign in Hyderabad, India this paper first explores the different strategies of resistance and accommodation adopted by Housing Rights campaigns in India. Based on this exploration, it will then explain why formal rights discourses have a mixed success in bringing onto the agenda of clean cities, the very messy claims arising from particular meanings of home, labor, household, community and self help that underpin informal settlements

Bernadette M Marion, The Florida State University. Email: berniemarion@gmail.com; Mark W Horner, PhD, The Florida State University. Email: mhorner@fsu.edu; *Extending the Dissimilarity Index to Measure Jobs-Housing Balance*

The classical dissimilarity index is an enduring measure of segregation that is readily understandable and applicable to a range of comparative ecological analyses. Recent enhancements made by geographers have extended the explanatory power of the index to incorporate more explicit elements of spatiality. One-overlooked potential applications area of the index is that of measuring urban jobs-housing balance. In this modeling exercise, we further extend the potential spatiality of the dissimilarity index by incorporating distance-decay concepts found in the accessibility literature in order to produce an effective measure of jobs-housing balance. Furthermore, we add functionality to the spatial measure by addressing the uniformity of segregation with a complementary global measure. Our technique examines the proportion of zones that demonstrate mismatched accessibilities to two population groups given a fixed value of dissimilarity. The developed measure complements the dissimilarity index-based analyses by evaluating the intensity of dissimilarity in a given proportion of zones. The indices are tested on a multi-city database of 26 U.S. metropolitan areas. Theoretical properties of the indices and empirical results provide evidence of their utility for measuring jobs-housing balance.

Keywords: Dissimilarity Index, Segregation Measures, Jobs-Housing Balance

Bryan G. Mark, Department of Geography, The Ohio State University. Email: mark.9@osu.edu; *Assessing climate forcing of recent and late-Pleistocene Andean glacier volume changes: from heuristic analyses to inverse modeling*

Tropical Andean glaciers are highly sensitive to climate changes over different temporal and spatial scales. Recent and ongoing recession has important implication for hydrological resources, while accurate understanding of the timing and nature of past tropical glacial advances is a crucial source of paleoclimatic information for the validation and comparison of global climate models. Both direct observations of recent glacier volume recession and reconstructions from late-glacial moraines in Perú have been used to test hypotheses about how these ice volumes respond to climatic forcing. Important insights are gained as the changes to ice mass (not just area) are derived and evaluated in specific topographic contexts. Examples are provided from two studies on different time scales in the Queshque massif of the southern Cordillera Blanca, Perú: (1) a heuristic analysis of the spatial variability of late 20th century glacier recession; (2) a reconstruction of late-Pleistocene paleoglacier volumes using a coupled mass-energy balance and ice flow model.

The Yindjibarndi people of northwestern Australia and Diné (Navajo) of New Mexico and Arizona live in similar semi-arid or desert environments, yet have very different languages and histories. How similar are the concepts that underlie the landscape terminology of these languages? Project researchers have conducted ethnographic field interviews, photo-response focus group, and ethnophotography protocols in the two areas. We also have quantitative GPS coordinates, and have used GPS and GIS data to integrate qualitative and quantitative information from a variety of sources. Particular research methods were developed and extended on each visit to the field, without much thought for how the observations might be analyzed. More than 40 hours of audio and many thousands of digital photographs presented a daunting interpretation challenge. It became clear that mixed methods, and especially Computer-Assisted Qualitative Data Analysis Software (CAQDAS) could help filter this information and see connections that might otherwise be missed. Using both ATLAS.ti and ArcGIS together to combine qualitative and quantitative data helps us to organize and analyze many varieties of data such as text, graphics, audio, and visual data files. The software can show the relationship among all of these data types. Although the main goals and paradigm of the research project are cognitive and scientific, mixed methods are providing a unique opportunity to link various types of qualitative information with geo-locational data. Results appear to provide insights into Indigenous geographic concepts that can help elucidate human relations to landscape and provide foundations to support Indigenous Geographic Knowledge Systems.

Keywords: GIS, qualitative methods, mixed methods, indigenous knowledge

Brian Marks, University of Arizona. Email: bmarks1@email.arizona.edu; *Cajun Rice in an Atlantic World*

African slaves brought the farming of rice to Louisiana in the early 18th Century. It thence hybridized into new, diverse forms by later adopters of this agrarian tradition. Louisiana rice farming is historically rooted in French colonial slavery and in subsistence production by Cajun, Native American, and African-American smallholders in the 18th, 19th and early 20th Centuries. Judith Carney's work on West African contributions to rice farming in South Carolina and Brazil demonstrates the important role of enslaved people as possessors of sophisticated agronomic knowledge and technology, not only labor, in the agricultural history of the Americas. Louisiana is a consequential case for applying Carney's findings about rice in the Americas. The work of Gwendolyn Midlo Hall and others provides a considerable literature on the slave trade. This work shows most Louisiana slaves came initially from the Senegambian interior. Numerous detailed historical descriptions of rice production landscapes exist, many by LSU geographers trained in the Sauerian tradition. Their thick descriptions, interpreted in the context of Atlantic basin exchanges, rework discrete cultural ecologies into a transcontinental historical political ecology of diaspora. Historical Louisiana rice farming bears strong resemblances to the floodplain and flood recession rice agriculture of the Inner Niger delta and its hinterlands where many enslaved Louisianians came from. The subaltern peoples of South Louisiana share a tradition of subsistence rice farming. Their differences in farming styles, rice processing technology, and cuisines show how this common African inheritance was negotiated with their pre-existent material cultural practices.

Ann Markusen, University of Minnesota. Email: markusen@umn.edu; *Consumption-Driven Regional Development*

Economic geographers generally hold an export base theory of growth and development, positing that the size of a local economy is constrained by the size of its economic base, i.e. its ability to export output to other regions. Import substitution has largely been rejected as a significant phenomenon. In this paper, I offer a consumption base theory of regional development, arguing that changes in consumption patterns can affect the number and quality of jobs in an economy. Such changes can be either secular in nature or policy-amenable. A model of consumption base change is constructed. As evidence of the significance of the consumption base, I show that nearly 80% of job growth in major metropolitan areas in the past twenty years has taken place in the residentiary sector. I also re-interpret the body of empirical studies on export base regional growth to suggest that the long-observed tendency for the size of the multiplier to increase with size of regional economy may be a result of shifts in consumption rather than simply economies of scale in the production of residentiary goods and services. I also address the body of work on amenities and regional development, noting that regional growth is in part a function of attracting footloose workers who are drawn to regions (or leave them) because of consumption preferences. I then use the case of cultural planning and policy to explore how different US cities and regions have used consumption as a job creation and development strategy.

Keywords: regional development, consumption, jobs, culture

Scott H. Markwith, University of Georgia, Geography Department. Email: markwith@uga.edu; Michael J. Scanlon, Cornell University, Department of Plant Biology. Email: mjs298@cornell.edu; *Multi-Scale Analysis of Hymenocallis coronaria Genetic Diversity, Genetic Structure, and Gene Movement Under the Influence of Unidirectional Stream Flow*

Understanding gene movement in unidirectional flow environments and its effect on genetic diversity and genetic structure is necessary for management of human manipulation of these systems, whether the impact is population extinction, gene flow barriers in the form of dams, or reintroduction programs. Application of hypotheses and models to explain patterns of genetic diversity, structure, and gene flow is rare and results are inconsistent in the riverine macrophyte literature. This study addresses Ritland's unidirectional diversity hypothesis, the one-dimensional stepping stone model, and metapopulation model at the within and among population scales. *Hymenocallis coronaria*, an aquatic macrophyte inhabiting rocky river shoals of the southeastern U.S., was sampled in the Cahaba, Flint, Savannah, and Catawba River basins. Significant isolation-by-distance within populations and among populations

This paper analyzes the trajectory of the twenty years of the Movimento dos Trabalhadores Rurais Sem Terra (MST or Landless Rural Workers' Movement), the main social movement engaged in the struggle for land in Brazil. It presents a series of arguments to demonstrate the relevance and the meanings of this struggle in the present time, based on statistical data, bibliographic reference as well as long direct research on social movements and the agrarian question in Brazil. It deals with the socio-economic and political context of the MST's formation and the major changes evidenced in this scenario in the past two

decades. It identifies the major processes that contribute to the recent re-emergence of the struggle for land and the new social actors involved in that struggle. It analyzes the positions adopted by the MST and its achievements at different points of the recent national political developments in order to highlight the MST's project and assumed political identities. One of the MST main conquests is to have placed land reform in the national political agenda, impacting our political culture. But this social movement has also carried out expressive actions in other fronts. The expansion of agribusiness and the power of destruction presented by it in the countryside vis-à-vis other forms of production and natural resources are responsible for a convergence between peasant resistance and environmental critique. The MST becomes aware of the existent convergence between its struggle and the struggles of indigenous peoples and traditional populations, linking itself to anti-globalization struggles.

Paul G. Marr, Shippensburg University. Email: pgmarr@ship.edu; *The King's Highway to Lancaster: A graph-theory analysis of colonial Pennsylvania's road network.*

William Scull's 1770 map of Pennsylvania is of interest to historic transport researchers due to the attention to detail in his representation of the landscape. In particular, major roadways and river crossings were drawn with remarkable detail and accuracy. This map was used as the primary data source for graph analyses in an attempt to reconstruct the transport landscape of colonial Pennsylvania. Although poorly located with respect to water transport, Lancaster was well situated relative to the colonial road system. As Philadelphia extended its hinterlands westward, Lancaster became a major inland entrepôt. From its position just east of the Susquehanna, Lancaster provided easy access to both the Cumberland valley via Harris' ferry and to the York plain via Wright's ferry. In this position it was located within the region of highest connectivity?meaning it was located such that it could take advantage of the road infrastructure, and within the region of highest accessibility?meaning it was in a location which minimized the distance to all other locations. The expansion of the road network westward, the attendant increase in the size of its hinterland, and Lancaster's role as inland entrepôt gave Philadelphia the means to secure its position as colonial America's most important mercantile city, a position it held until supplanted by New York at the beginning of the 19th century.

Keywords: Colonial Pennsylvania, graph analysis, transport geography

Melissa Marschke, Ph.D., York Center for Asian Research, York University. Email: marschke@yorku.ca; *Livelihood realities: an investigation into the disconnect between resource policy and rural life within Cambodian fishing communities*

In Cambodia, as is the trend throughout Southeast Asia, regulation and management over livelihoods and resources has significantly intensified. Such regulation is found in decentralization programs, coastal resource management programs, land titling and with donor conditionalities. Although the essence of decentralization and many donor programs such as community-based resource management are 'bottom-up' forms of decision-making or influence, little consideration is given as to whether such programs actually enhance rural life. Perhaps a disconnect exists between current policy and the ever changing economic, political and social processes that shape coastal livelihoods? This paper sets out to explore livelihoods in coastal Cambodia, and then examine if the national policy context adequately addresses the 'reality' of rural life. The paper begins by presenting a brief sketch of livelihoods in several fishing villages, with particular attention to diversification and migration strategies. Initial analysis suggests that the outcome of the current policy context related to resource issues results in resource protection measures rather than considering livelihood enhancement options or addressing pressing migration issues. This paper will then explore some of the reasons for this conservation emphasis and consider options that may better support coastal livelihoods.

Email: Thankappans@cardiff.ac.uk; *Dealing with Complexity and Contingency in the Geographies of Agri-food : from food regimes to sustainable food chains?*

Abstract of Paper for 'Critical Geographies of Food: theory and Practice' Terry Marsden and Samartha Thankappan School of City and Regional Planning and Centre for Business Relationships, Accountability and Society (BRASS) Cardiff University. Title: Dealing with Complexity and Contingency in the Geographies of Agri-food : from food regimes to sustainable food chains? With reference to recent evidence collected concerning public, private and consumer organisations the paper considers the new regulatory frameworks and relation-

ships which are developing at global and regional levels. In particular it sets out three major sets of dynamics and tensions associated with: private (corporate) and state and civil interests; economic globalisation and ecological re-localisation; and the competitive and contingent relationships between 'conventional' and 'alternative' forms of food innovation. Having outlined some of the key regulatory changes at global and regional levels, the paper will then address what these new forms of institutional complexity and contingency mean for different agri-food spaces at regional and local levels. This suggests the need to examine both new pressures facing agri-food systems and to do so by considering new socio-ecological processes through which particular spaces and scales become re-defined. The paper examines some evidence from China and Brazil in this regard- two regions where these tensions are at their most intense. In conclusion the paper will propose a revised conceptualisation of complex and contingent agri-food which attempts to link theory with practice.

Keywords: Agri-food, sustainable food chains,

Meredith Marsh, University of California, Santa Barbara. Email: merimarsh@yahoo.com; *Towards a Theoretical Base for a Grade-Appropriate Minimal GIS*

As GIS becomes increasingly heralded as a means to promote the explicit teaching of both spatial and geographic thinking in K-12 classrooms, the danger of teaching pointing and clicking procedures to obtain specified outcomes becomes quite high. Traditional GIS software packages that have often proven too complex for teachers and students to effectively learn spatial analysis must be replaced with pedagogical GIS. A "Minimal" pedagogical GIS would provide a support system for K-12 populations by implementing grade-appropriate spatial concept understanding to perform specific spatial analysis tasks. The Minimal GIS would span from low-technology, simple concept, simple spatial analyses for the lower grade levels to more complex concepts, tasks, and technology at the higher grade levels. This paper will propose a theoretical base for the Minimal GIS, describing grade-appropriate introduction of spatial concepts and tasks using current research; additionally, it will propose an experimental design for testing the effectiveness of the Minimal GIS.

Email: sperz@soc.ufl.edu; *Land Cover Change in the MAP Region, Southwestern Amazonia: Driven by Road Expansion*

An increase of road networks in the MAP region (Madre de Dios, Peru, Acre, Brasil, and Pando Bolivia, Southwestern Amazonia) will allow the extraction of forest products and increased cattle ranching through improved access to formerly remote areas. A detailed, spatially-explicit study of regional trends in land cover and changes resulting from road construction and expansion will be performed using a Landsat 20-year (1986-2006) time series. Traditional land cover classification analysis coupled with alternative analysis methods using continuous data will investigate land cover change in the MAP region. It is expected that with increasing distance from roads the amount of forest increases

due to restricted internal access and costs of road construction and maintenance, while the amount of pasture decreases due to restricted access and connectivity. Fragmentation of forest nearest roads is greatest in Madre de Dios than in Pando because of 'prospecting' whereby pioneer ranchers claim and clear lands before road construction and paving. Consolidated frontier clearing dominates in Acre due to the existence of the paved Inter-oceanic highway, which has allowed continual, historical access of people to clear forest for pasture and cattle ranching.

Keywords: Southwestern Amazonia, remote sensing, land cover change, road expansion

Navigation devices for the blind require some form of cognitive processing, as users must pay attention to, process, and act on the spatial information. This could be detrimental, distracting users from immediate needs and safety. To measure the cognitive demands imposed by the navigation interface, we imposed a secondary task: Users monitored an array that sent vibrotactile stimulation to three fingers and reported any instances of sequential stimulation to the same finger. Degraded performance in the navigation task under cognitive load would indicate competition with capacity required for the secondary task. In an experiment, blindfolded participants were guided along virtual paths and information was provided en route about the direction of the next turning point, either by spatial language ("left," "right," or "straight") or virtual sound (i.e., the perceived sound location indicated the target direction). We hypothesized that virtual sound, being processed at direct perceptual levels, would have lower cognitive demands than even simple language commands, which require cognitive mediation. The guidance modes were equivalent in a no-load condition; however, when the secondary vibrotactile task was added, participants navigating with spatial language showed an increase in distance traveled and time to complete a path. By indicating the superiority of virtual sound for guidance in the presence of additional cognitive load, as is characteristic of everyday navigation, these results have important implications for the design of future navigation and guidance systems for visually impaired persons or those needing to direct their primary attention elsewhere, e.g. when driving.

This paper concerns the delivery of specialist online Masters-level GIS modules into more than one institutional programme simultaneously, effectively allowing these modules to be shared between the participating institutions. Our programme was originally developed as part of an ill-fated UK e-learning initiative known as UK e-Universities (UKeU). Under the UKeU model we adopted a learning object-based approach to the authoring of materials, designed from the outset for potential repurposing and reuse. The UK universities of Leeds and Southampton, working together as part of the Worldwide University Network (WUN) were successful in obtaining UKeU funding to develop a new wholly-online GIS Masters programme with application-oriented pathways. After the demise of UKeU, the participating universities took on the programme as a collaborative venture. Collaborations within WUN led to agreement to share a Southampton-authored optional module "GIS for Analysis of Health" with the Pennsylvania State University GIS programme. Rather than require students to engage with multiple virtual learning environments (VLEs), we adopted a model whereby the same course materials are delivered simultaneously through different VLEs, each student working within their own institutional software environment. The Southampton-based tutor has simultaneously tutored students in Leeds, Southampton and Penn State. This presentation explains our experiences in the design and implementation of reusable GIS educational materials and key issues involved in this mode of delivery, including differences in assessment regimes, student expectations and access to resources. The module has now been well-received by three student cohorts and further educational research and develop-

ment needs have been identified.

Deborah G. Martin, Clark University. Email: demartin@clarku.edu; Christopher City, J.D., Clark University. Email: ccity@clarku.edu; *Legal Discourse in Urban Politics*

Theories of urban governance alternately emphasize the role of political economy, local elites, and urban activists in shaping urban politics and redevelopment. By comparison, law remains a relatively unexamined factor in local actions and discourses. Legal frameworks at the local, state, and federal levels influence contested issues of urban governance, including understandings of appropriate land uses and the use of key natural resources, such as water. In this paper, we use newspaper and observational accounts of a land use conflict and a water supply dispute in two municipalities in Massachusetts to trace the "legalization" of the issues, and how that legalization has shaped the terms of debates and outcomes of the conflicts. By "legalization" we refer to the ways that parties involved invoke local, state, and federal laws to define and advocate for certain understandings of appropriate land and resource use. Although scholars of law and geography point to important ways that legal decisions and interpretations shape local issues such as redistricting, segregation, and natural resource use, these findings have not been incorporated into theories of urban governance and the multi-actor, multi-scalar dynamics that shape it. We seek to address that omission by identifying how legal understandings and rhetoric influence, and may even determine, the terms of governance debates and decision-making.

Keywords: urban governance, legal geography, legalization, land use, water resources

John Jeffrey Martin, Ph.D., Jacksonville University. Email: jmartin6@ju.edu; *Determining A Relationship Between Two Circular Data Sets*

Direction is an important attribute for a wide variety of spatial phenomena. Analyses of such spatial phenomena are often achieved through statistical methods. However, since direction is measured in circular units many familiar statistical techniques cannot be applied. An example of this is Pearson's correlation coefficient which is a standard used to determine the relationship between two variables measured in linear units. If it is used to compare circular data the results will be erroneous. Here, a surrogate for Pearson's r is developed that quantifies a relationship between two variables measured on the circular scale. The technique evaluates the cosine and sine of subsequent directional observations. Ultimately the method provides a coefficient that expresses a value for the relationship between two circular variables within a range of 1.0 to -1.0, like Pearson's r . In this research the technique successfully determines a relationship in the direction of downed trees, measured in degrees, from two separate tropical events in Jacksonville, Florida.

Keywords: Circular data, correlation, Pearson's correlation coefficient r

Kallen M. Martin, ABD, St. Lawrence University; Syracuse University. Email: kmartin@stlawu.edu; *Life Along The Line: Places of Memory and Landscapes of Contestation*

Meanings of place and performative traditions often are symbolic of indigenous peoples' cultural practices. In many instances, the meaning of place and culture are quite inseparable, reflecting landscapes of healing, power, and social relations. In the early half of the 20th century, rivers were highways and borders were zones of uncertainty for the Mohawks of Akwesasne, leading to multiple subjectivities and landscapes of contestation between them and the emerging politics of Canada and the United States. This paper provides insight into that landscape in the context of the sweetgrass basket trade between Canadian-based Mohawk basket makers and American-based trading store owners uniquely situated in the centre of Mohawk territory. A brief historical overview of borders and boundaries along the St. Lawrence River foregrounds this analysis of place and landscape - as a people dispossessed of their land and river, and as producers of cultural representations that become exploited. Drawn from numerous interviews of Mohawks who lived by and along the St. Lawrence River between 1900 and 1950, the river and borders reflect their places of cultural importance. Competing discourses, however, disrupt the layered relationships that defined the Mohawks and landscapes of contestation.

Keywords: Mohawks of Akwesasne, St. Lawrence River, place, landscape, boundaries

Lauren Martin, University of Kentucky. Email: lauren.martin@uky.edu; *Violence, Neoliberalism, and Value: Gendering the Exception*

In this paper, I think through inclusion and exclusion in the context of neoliberalism and globalization. Despite critical insights into the nature of sovereignty and law, Giorgio Agamben's (1998; 2005) political theory neglects gender. In fact, identity categories (race, class, ethnicity, sexuality) are largely ignored, as his work concentrates on the mechanisms of liberal law from antiquity to the present. The implementation of neoliberal policies has

introduced market rationality to many public services and spaces, causing an understudied shift in practices of citizenship and state power. Neoliberal policies increasingly encourage differential valuation of citizens based on their labor market value. Feminist geographers have long argued that women are disproportionately affected by neoliberal policies and the processes of globalization. Notions public and private space, access to education and training, and wage levels continue to be articulated through categories of difference, and patriarchal notions of worth are increasingly supported by neoliberal policies. Thus, social and political value are increasingly tied to labor market value, and create new forms of inclusion and abandonment. I bring together Aihwa Ong's (2006) concept of neoliberalism as exception (an expanded notion of Agamben's state of exception) and Melissa Wright's (2004) analysis of value and female sex work to extend Pratt's (2005) critique of Agamben.

Keywords: gender, neoliberalism, violence, globalization, Agamben, labor theory of value

Patricia M. Martin, Université De Montréal. Email: patricia.martin@umontreal.ca; *Making visible the sites of gendered violence: towards a geography of femicide in Latin America*

Femicide, a term first coined by Jill Radford and Diana Russell (1992), is defined as the killing of women because they are women. As a concept, femicide advances three core arguments: it suggests that women are killed specifically in relationship to their female roles and identities; it insists that femicide is profoundly political, in that it forcibly maintains hierarchical gendered relationships; and it asserts that, in as much as the state generates conditions leading to femicide, "impunity" is also a gendered phenomenon. In Latin America the term femicide first gained prominence in relationship to the spectacular rise of violent female deaths in Ciudad Juarez, Mexico. Indications suggest, however, that the phenomenon of femicide is more geographically extensive than originally thought, both in Mexico and throughout Latin America. To address this emerging "geography" gendered violence, this paper will trace the contours of femicide in Latin America, both as a phenomenon and as a concept. It begins by providing an overview of the existing data related to femicide. It then will turn to a multiscaled analysis of the emerging policies initiatives around femicide, highlighting the discursive evolution of the term in institutional and activist circles. This analysis will provide, finally, an initial means for evaluating whether the deeply political implications of the term "femicide" have been neutralized in policy arenas.

Keywords: gender, violence, Latin America

Stacey Martin, MS, MA, Emory University. Email: stacey.martin@emory.edu; *Browse, Build, and Bank a Map of Southern Cultures and Histories: A subject based portal and its GIS service.*

This presentation captures the challenges and successes of building a subject based domain portal with a GIS service that enables expert and non-expert users to search, browse, build, and share maps with the Southern Studies community. Emory University's Woodruff Library is building on years of research to develop a sustainable portal environment focused on Southern cultures and history, named SouthComb. Even though building a portal environment is becoming easier, building a sustainable low-cost portal with GIS services raises new challenges. This case study reviews three services in development that include a location based mapping service, a series of browseable thematic maps and a spatial data repository built using the University of Minnesota's open source environment, MapServer, XML, and Java.

Keywords: GIS, MapServer, Southern History

Nicholas Martinelli, University of Oregon. Email: emartin2@uoregon.edu; *Information to Knowledge: How map and variable type relationships affect the movement of mapped information from working to long term memory.*

In many cases a map is meant to serve an educational purpose. The goal of the map is for the user to be left with some measure of recall about the subject presented. Using computer based instruments I will evaluate user recall of feature variables at select time points following viewing of a map. Multiple map type and variable type relationships will be tested. For example, I will look at the location variable of a feature on static, animated, and interactive map products. Map user accuracy is fairly consistent between map types for this variable in previous testing. By testing user accuracy at multiple, specific time intervals I will be able to assess the performances of various map types in stimulating the transfer of information into long term memory. By testing multiple map and variable combinations I will classify map and variable type relationships that support the most accurate long term recall for the map user.

Keywords: cartography, spatial, cognition, memory

Adriana E. Martinez, Texas A&M University. Email: adrianaemartinez@gmail.com; *Sediment Dynamics in a Dammed River System, Yegua Creek, Texas*

Dams have altered flow distributions and sediment transport in rivers everywhere, causing a host of changes in channel morphology and sediment dynamics. Although major changes in flow regime have occurred along Yegua Creek, Texas, since the closure of Somerville Dam in 1967, the issue of sediment transport has not been studied in detail, and the degree to which sediment is moving through the system remains unclear. This study assesses the extent to which sediment is being transported through Somerville Dam and downstream of the dam. Sediment characteristics are examined to test the working hypothesis that little sediment is passing through the dam. Analysis of aerial photographs further indicates the extent to which immobile sediments are forming depositional features. Results give insight into the consequences of stream impoundment. They also increase our understanding of the efficacy of sediment delivery into the Brazos River and ultimately to the Texas coastline. Because Yegua Creek is a major tributary to the Brazos River and an important source of water supply in the south-central region of Texas, increased understanding of sediment dynamics within Yegua Creek is especially important in a regional context.

Keywords: sediment, sediment transport, Yegua Creek, Somerville Dam, geomorphology

Andrew M. Marton, University of Nottingham. Email: andrew.marton@nottingham.ac.uk; *Producing Space in China's Lower Yangzi Delta: Rural Agglomeration and the Urban Echo in Kunshan*

This paper engages the notion of urban formation in China as a state project through an examination of spatial economic transformation in the lower Yangzi delta. The morphology of urban forms in this region arise from shifting local institutional structures, and how these are embedded in the reconfiguration and consolidation of political and administrative jurisdiction and space. The paper illustrates how areas within the extended metropolitan region of the lower Yangzi delta are repositioning themselves in the wider space economy by adopting functional specialisation. Major changes to the patterns of spatial change in Kunshan which occurred between 1998 and 2005 are discussed with a view to highlighting recent outcomes of urban development in the lower Yangzi delta. Borrowed from the Chinese literature, the notion of an "urban echo" is introduced to move towards re-conceptualising the resulting shift in the patterns and processes of urban transition. The paper extends this notion to illustrate how specific locally driven development strategies and policies, including economic repositioning and political/administrative restructuring - and how they manifest themselves in spatial terms, explicitly seek to globalise areas like Kunshan by leap-frogging places like Shanghai and Pudong by directly mobilising international investment, production linkages and commodity chains. The findings emphasise that local forces continue to play a critically important role in determining the contours of regional and urban development in concert with growing international forces which have accelerated global interactions and interrelationships in places like Kunshan.

Keywords: urbanisation, lower Yangzi delta, urban echo

Evan Martzial, Salem State College. Email: evan@martzial.com; *Analyzing the 2006 Oil Spill off of Lebanese Coast*

Due to the recent Israeli and Lebanese conflict, there has been a large oil spill off the coast of Lebanon. This research will analyze the extent and severity of this oil spill and how the catastrophe affects the Lebanese coast line and the greater surrounding Mediterranean area. This major environmental disaster needs to be studied and analyzed to fully understand the effects. This research will utilize, but not be confined to satellite imagery from the Center for Satellite Based Crisis Information. They have multiple DLR satellite images and MODIS time series data that will be used to analyze this environmental disaster. This research will attempt to bring to light the incredible impact this spill had on Lebanon and the Mediterranean, and what conclusions we can draw from this horrific event.

Keywords: Remote Sensing, Oil Spill, Lebanon

Matt Marx, Harvard University. Email: mmarx@hbs.edu; Debbie Strumsky, Harvard University. Email: dstrumsky@hbs.edu; Lee Fleming, Harvard University. Email: lfleming@hbs.edu; *Noncompetes and Inventor Mobility: Specialists, Stars, and the Michigan Experiment*

Several scholars have documented the positive consequences of job-hopping by inventors, including knowledge spillovers and agglomeration and the concentration of spinoffs. This work investigates a possible antecedent of inventor mobility: regional variation in the enforcement of post-employment noncompete covenants. While previous research on non-competes has been largely focused on California and Silicon Valley, we exploit Michigan's mid-1980s reversal of its noncompete enforcement legislation as a "natural experiment" to investigate the impact of noncompetes on mobility. Using the U.S. patent

database, we find that inventor mobility decreased by 40% in Michigan after the state reversed its policies. Moreover, this effect was amplified for “star” inventors and even more so for inventors with specialized technical skills. These results suggest that where noncompetes can be more fully enforced, employers take advantage of the opportunity to block the exit of key employees, indicating that noncompetes exercise a constraint on the labor market.

Keywords: non-competes, labor mobility, regional advantage, innovation

Luke J Marzen, Auburn University. Email: marzelj@auburn.edu; Toni A. Alexander, Auburn University. Email: alexato@auburn.edu; Greg Weaver, Auburn University. Email: weavegs@auburn.edu; Robert A Norton, Auburn University. Email: nortora@auburn.edu; Modeling Infectious Laryngotracheitis incidents in Marshall and Cullmann Counties, Alabama.

Infectious Laryngotracheitis (LT) is a highly contagious and pathogenic virus that results in serious economic losses in the poultry industry. LT outbreaks in the Southeast U.S. have substantially affected the commercial broiler industry, causing quarantines and depopulation losses from infected flocks. The goal of the research is to develop methods enabling resource managers to be able to project probabilities and locations of disease incidents, should more serious foreign animal disease outbreaks occur such as Avian Influenza (AI). LT is being used in the current model as a surrogate for AI, since the disease is already present in the US and data are available. The two viruses are also similar in several physical characteristics, both being readily transmitted via the air, water and soil. LT data for 2000-6, collected at the farm level by the Alabama State Veterinarian's Office are being used to develop models that attempt to explain and predict LT incidents. In this study, data for two Alabama Counties heavily involved in the poultry industry are utilized. The incidents are mapped for Cullman and Marshall County and then are compared to various explanatory factors in an attempt to provide a better understanding of the spatial-temporal interactions of LT in these Counties as well as to illustrate characteristics of the population at risk. Plans are also developed to use the data in a streaming 3D internet visualization portal in order to assist first responders in the event of an outbreak.

Michael Mascia, World Wildlife Fund. Email: michael.mascia@wwfus.org; C. Anne Claus, World Wildlife Fund. Email: annie.claus@wwfus.org; Social impacts of marine protected areas: a global review

Marine protected areas (MPAs) are one of the primary policy instruments used to conserve marine ecosystems. Relatively little research has examined the positive and negative social impacts of MPAs, yet social “performance” often determines the extent of local, national, and international political and financial support for MPAs. Based on a literature review and analysis of unpublished field data, this study reviews current social scientific knowledge regarding MPA social impacts. Several patterns emerge: ? MPAs transfer the benefits of resource use within and among resource user groups. ? Fishermen with fixed gear or informal fishing territories are more significantly affected by MPAs than transient fishermen employing mobile gear. ? MPAs often induce community-level demographic change; ? The social performance of MPAs subsequently shapes MPA evolution. “Successful” MPAs frequently spur site expansion, while “unsuccessful” MPAs often fuel efforts to revoke MPA designations. Four aspects of MPA governance- decision-making arrangements, resource use rights, monitoring and enforcement systems, and conflict resolution mechanisms - appear to play pivotal roles in shaping the social impacts of MPAs. These findings provide (1) a framework for designing MPAs that deliver positive social and biological outcomes; and (2) the basis for further research into under-studied areas of MPA social science.

Peter Maskell, DRUID/Copenhagen Business School. Email: maskell@cbs.dk; Projects and the Geography of Innovation: Successful transient inter-firm collaborations for knowledge generation

Because knowledge is usually distributed among different individuals, its mobilization as part of innovation efforts implies a degree of collaboration. Such mobilization is usually taken to be facilitated by the pre-existence of shared cognitive models of the world developed by collocation (clustering) or by continuous interaction (investment in pipelines or networks). The present paper extends this common wisdom by investigating the organization of knowledge creation through successful transient collaborative inter-firm arrangements or “projects” that dominate certain kinds of economic activity (e.g. construction, creative industries, biotech, IT). These arrangements differ across industries and regions on significant parameters such as stability, reach and diversity, but also on the allocation of power, property rights and profits. The paper adds to the discourse of geography of innovation by pursuing intuitions regarding the systemic nature of search for knowledge and solutions in particular in the

creative industries. It is based on an empirical study of the dynamic inter-relatedness between characteristics of the firm (like its choice of activities; products; organisational form; or strategy) and the industry it belongs to on the one hand, and the preferred form of market arrangements on the other.

Carmen Masó, US Environmental Protection Agency, Region 5 Chicago. Email: maso.carmen@epa.gov; NEPAAssist: A Web based Application for Environmental Assessment

NEPA, the National Environmental Policy Act, requires all federal agencies to: assess the environmental impacts of major federal projects or decisions such as issuing permits, spending federal money, or actions that affect federal lands; consider the environmental impacts in making decisions; and disclose the environmental impacts to the public. To simplify the process of screening proposals, a web-based interactive mapping application, NEPAAssist, was developed. This screening tool allows reviewers to take advantage of available geographic data and to integrate buffering analysis into their workflow. NEPAAssist is an easy to use web-based application that draws environmental data from Geographic Information System (GIS) servers within EPA and from non-EPA servers on the Internet. The application enables users to delineate a proposed project footprint on a map as a point, line or boundary, and view information on environmental resources in the locale of that delineated footprint. NEPAAssist was developed in cooperation with EPA Regional offices, EPA's Office of Federal Activities, EPA's Office Environmental Information and SAIC contractors. This presentation will provide an overview of the application, its implementation and future uses.

Peter F. Mason, Bechtel Corp. Email: pmason@bechtel.com; Sustainable Construction in a Carbon Constrained World

The engineering and construction industry assists customers with project development. Industry practice involves studying project costs within the context of market, environmental requirements, and sustainability goals. Within the last decade, however, with the rise of greenhouse gasses (GHG), global warming and related effects, the context for consideration of projects has changed. This change is a ‘carbon constrained’ world where global interests are moving in the direction of lowering CO2 output as a contributing factor to global warming. This has resulted in a change in energy infrastructure including: (1) shift to natural gas as a transitory measure rather than long term use, (2) nuclear energy, (3) ‘clean coal’ technology, (4) carbon capture and storage, (5) renewables, (6) advanced vehicle technologies, and (7) expanded green building and LEED (Leadership in Energy and Environmental Design) design activity. Future project decisions will include not only cost, schedule, safety and quality factors, but also climatic change as part of sustainability. Sustainable construction will reward more efficient construction including improvements in: (1) energy management, (2) resource management, and (3) minimization of carbon footprint. Positive outcomes include: (1) projects that best serve customers now and in the future, (2) reinforcement of a culture of project optimization and efficiency which rewards energy conservation and recycled materials, and (3) attraction of technical and professional talent for a sustainable construction industry in a carbon constrained world.

Keywords: sustainability, construction, energy, environment

Robert J. Mason, Temple University. Email: rmason@temple.edu; Evaluating “Quieter Revolution” Land-Use Programs

Environmental lawyers Fred Bosselman and David Callies characterized the early 1970s ascension of state and regional land-use regulatory programs as the “Quiet Revolution in Land Use Management.” But the revolution soon lost steam, with rather few new regulatory programs being put into place after 1980. Instead, softer, quieter approaches have taken root. Collaborative, place-based planning; the ascension of land trusts and watershed organizations; and “smart-growth” programs are typical of this new wave of land-use management approaches. While this may not collectively amount to a movement, the totality of these approaches is greater than the sum of their parts. How do we begin to understand the value of these emerging approaches? This paper proposes an evaluation strategy that incorporates, among other dimensions: ecological outcomes, cost effectiveness, civic engagement potential, institutional capacity-building, environmental/social justice impacts, and vulnerability reduction. This strategy is applied, in a preliminary manner, to three regional land-use management programs that are geographically proximate but rather different in style. The Adirondack Park's program is regulatory, the Northern Forest Land program in northern New York and New England is largely voluntary and incentive-based, and the Catskill-New York City watershed program is inspired by the avoided cost to New York City of water filtration. Physical outcomes vary considerably, while all three approaches—in varying measure—expand institutional capacity and

enhance civic engagement; this includes engagement of those directly opposed to the land-use programs.

Ghada A. Masri, Ph.D. Candidate, University of California, Davis. Email: gamasri@ucdavis.edu; *Myths of Beirut: The Politics of History and the Seeds of Memory*

Memories of carnage and massacre, from Lebanon's 16 years Civil War, were brought to the fore by civilians and international journalists alike, during the recent round of violence in the Israeli-Hezbollah war in the summer of 2006. Now that war is over once again, the nation's energies and resources are galvanized for yet another reconstruction even before the first reconstruction of Beirut is complete. Such interruptions in the city's reconstruction are not new. Even before the end of the Civil War in 1990, initiation of plans to restore Beirut as the "heart" of the nation and symbol of "modern" prosperity, were begun multiple times over in the spaces between death and destruction. Between 1990 and summer 2006, the Lebanese government, via Solidere, completed the reconstruction of Beirut's Central District (BCD) at the city's core. This reconstruction has been guided by the perpetuation of multiple mythologies?the most prominent of these being the myth of Beirut's golden era as "Paris of the Middle East." Intertwined with this narrative are the myths and memories of Lebanese national identity, long a site of conflict among the country's diverse communities. Based on dissertation fieldwork, I examine the contested narratives of Lebanese national identity as expressed in the touristic reconstruction of the BCD. I argue that after the Civil War, narratives of national identity not only remain unresolved, but that new imaginings constructing Beirut as "Manhattan" express a new relationship to global centers of power, creating links to an alternate imagining of nation and identity.

Jeffrey A Masse, University of Washington. Email: jmasse@u.washington.edu; *Commodity Fetishism, Buddhism, and Consuming Desire*

Reworking commodity fetishism via Buddhist philosophy helps us understand the construction of desire in regimes of intensive consumption. Marxian and cultural approaches to commodity fetishism explain the histories and social relations bound up with commodities. Buddhist thought seeks to understand the origins and historical specificity of desires, including desires that lead us to consume. We need both understandings to more fully engage with the politics of consumption. From a Buddhist standpoint, the reification of a commodity into a thing obscures understanding of the material and psychological roots of desire. When one's attention is directed towards acquisition of an object we are directed away from thinking critically about how we came to want that object in the first place. This distraction has great consequence; when desire is understood in unskillful ways we act thoughtlessly and are ill at ease, both personally and as societies. I illustrate a Buddhist approach to commodity fetishism with the example of bottled water. Product narratives define consumers and their lived environments as lacking in spatial and temporal ways. Labels and marketing define the 'good' as where and when the consumer is not. In bottled water marketing 'pure' is elsewhere, and if one wants to be 'pure' then one needs bottled water. By interrogating the ways geographies of lack and lack's resolution are reproduced through marketing discourse we highlight the constructedness of different ways of being, becoming, and desiring. We also open the possibility of desiring, and consuming, in other ways.

Keywords: consumption, bottled water, religion

Chris Massingill, University of Oregon. Email: cmassing@uoregon.edu; *Stream Restoration in the Sprague River Basin, Oregon: interactions of soils, water, plant communities, and land use*

In the politically contentious Klamath Basin, stream restoration has been seen as a large part of recovery efforts for endangered fish, water quantity and quality. Exclusion of cattle from riparian corridors has been proven to be a simple and cost effective way to improve water quality through physical protection of stream banks and filtration of surface runoff from adjacent pastures. Plant communities are typically quick to respond to relief from grazing pressure, filling in bare soil areas and stabilizing otherwise transient sediments, though sometimes in unexpected ways. This project was designed to document vegetation response to fencing and to investigate riparian vegetation response to fencing as a function of soil and hydrologic conditions. Transects were located in a variety of restoration sites, ranging unfenced and grazed, to a fence just being built, to a 15-year-old fence. Transects stretched from the upper limit of the riparian zone (typically into sagebrush), to the inside limit of vegetation, often within the wetted channel. Vegetation was documented by functional group, band width on the transect, and species when possible. Soil moisture and texture were described within 40 cm of the surface. Naturally resprouting woody vegetation

near the transect were identified and located. Preliminary results show considerable overlap between surface moisture and vegetation group types. Adjacent land use had a great impact on shallow ground water and riparian communities.

Joy Nystrom Mast, Carthage College. Email: jmast@carthage.edu; Lawrence Stevens, Ph.D., Grand Canyon Wildlands Council. Email: ; *Dendrochronological analysis of cottonwoods to determine variation in springtime flow in springs, Grand Canyon National Park*

Our study provided the National Park Service with a determination of whether regional groundwater pumping of the Redwall Limestone aquifer south of Grand Canyon may be exerting a negative impact on Fremont cottonwood (*Populus fremontii*) growth at springs emanating from the South Tonto Platform. We examined stand structure and collected tree-ring cores from 20 or more Fremont cottonwood trees in 2003 at the only four springs on the Tonto Platform that support sufficiently large stands of cottonwood trees to permit dendrochronological analyses: Burro Spring, Cottonwood Creek Spring, Pipe Creek Spring, and Slate Creek Spring. Recruitment appears to be limited at sites dominated by springflows (e.g., Burro Spring) but is abundant in sites dominated by surfaceflow (e.g., Slate Creek). Dendrochronological analyses were used to distinguish ring age (growth) and climate factors from chronic (interannual) stress imposed by reduced discharge since 1980. Using standardized annular growth data, we first assembled long-term climate data, next modeled growth and climate data effects on the standardized annular growth, then eliminated those age and climate traces from the tree-ring data, and finally contrasted adjusted annular growth during the period of record to 1980 with that from 1981 to 2002. Dendrochronological results indicate that two of the four springs (Burro Spring and Pipe Creek Spring) may be sustaining long-term declines in cottonwood growth that are not related to normal aging processes or climate. Our results indicate that groundwater pumping threaten South Rim springs.

Michele Masucci, Temple University. Email: masucci@temple.edu; *A framework for examining Information and Communications Technologies (ICTs), health and disabilities*

Healthy People 2010 states that fostering health literacy is a key to improving health outcomes and changing underlying health disparities. In response to this public health objective, many efforts to use information and communication technologies (ICTs) are underway, including examining how information and communication technologies such as e-mail, instant messaging, and Internet listserve can support a diverse array of health information delivery and access challenges. Such knowledge is critical to the advancement of the use of many ICT applications for advancing health care among individuals, families and communities. However, one aspect of the use of ICTs to eliminate health disparities and improve health literacy that has received little priority is the consideration of the health information needs of persons with disabilities and how ICTs have served to regulate access to health information and access to care for vulnerable populations. This paper will introduce a framework for examining the intersection of ICT, health information delivery and access, and concerns of persons with disabilities while also distinguishing among many facets of wellness that involve moving away from a "medicalized" construct of disabilities. Geographic implications relate to the embeddedness of ICTs in daily negotiation of space and place among persons with disabilities, which can produce odd paradoxes in how ICTs can alternately mitigate or exacerbate access to health information and care.

Jeffrey R Masuda, McMaster University. Email: masudaj@mcmaster.ca; *Understanding Spatial Inequities in Risk: Environmental Health Promotion and the Politics of Place in Land-Use Decisions in Hamilton, Ontario*

My presentation will focus on research that focuses on industrial facilities proposed near residential neighbourhoods in Hamilton. The success or failure of such proposals is often contingent upon policy and planning decisions that must balance economic development with citizen's concerns about the environment and health protection. In most cases, these decision-making processes are framed within risk assessment/management/mitigation discourses of which understanding and influence require a certain level of expert proficiency and are thus exclusionary to many citizen groups. Access to decision-making by citizen stakeholders thus appears to be closely bound up in 'environmental social capital' - defined here as the capacity of concerned groups (i.e. communities) to mobilize intellectual, financial, and other resources in order to influence policy decision-making. In my empirical work, I am tracing how environmental social capital contributes to the unequal allocation of environmental risks related to locally contentious environmental disputes as mediated through these formal risk discourses. From my theoretical work, I will propose how an environmental

health promotion perspective can help to re-orient decision-making away from 'risk' toward a more progressive stance of 'health supportive environments' which can ultimately lead to more effective and inclusionary policies and more equitable development trajectories on the urban landscape.

Keywords: Environment, risk, health, spatial equity, health promotion

Christine Mathenge, Indiana University. Email: cmatheng@indiana.edu; The 'Chiga' Vernacular Landscape and the Locality of Shared Symbols

Kigezi, for many Ugandans, conjures up images of well cultivated ridges and valleys with a unique patchwork of fields that appear green year around. For the Chiga, the landscape of Kigezi reflects both a long shared struggle to tame the land they inherited many generations ago and harness a livelihood and collective action to improve community infrastructure and living conditions. I reflect on collective actions that have yielded symbolic landscapes in different parts of Kigezi, the first marking the beginning of cooperatively-owned land in Kigezi in the 1970s and the second a more contemporary community response to economic hardship in the late 1990s. Vernacular landscapes arguably cumulate in symbolic features that encapsulate shared feelings and memories for local inhabitants, but whose significance and meaning is likely lost on external observers.

Keywords: symbolic landscapes, vernacular landscapes

Email: mathesonf@smh.toronto.on.ca; Rahim Moineddin, PhD, Department of Family and Community Medicine, University of Toronto. Email: rahim.moineddin@utoronto.ca; Richard H. Glazier, MD, MPh, Institute for Clinical Evaluative Sciences. Email: rick.glazier@ices.on.ca; A multilevel analysis of gender, neighborhood chronic stress, self-perceived stress, and body mass index

This study examined the contributions of individual-level self-perceived stress and neighbourhood-level chronic stress in explaining differences in body mass index for adult men and women living in 25 urban areas in Canada. Data from two cycles of the Canadian Community Health Survey (cycle 1.1 and cycle 2.1 collected in 2000/01 and 2003/04 respectively) were combined with census tract-level community data from the 2001 census. Results of multilevel analyses showed that men and women living in neighbourhoods with high neighbourhood material deprivation (chronic stress) had higher BMI than adults living in more advantaged areas. In general, men had higher BMI than women. Self-perceived stress was associated with higher BMI for both men and women. The cross-level interaction between gender and material deprivation was significant after adjustment for individual-level demographic and lifestyle characteristics; the average difference between males and females depends on the extent of material deprivation present in the neighbourhood with material deprivation being more detrimental for females than males. Women living in a deprived area have, on average, a BMI score of 2.6 points higher than women living in less disadvantaged areas. Being married and not having a high school diploma (SES) were associated with higher BMI. Lower BMI was associated with visible minority, current smoker, high fruit and vegetable consumption and high physical activity. Unexplained within- and between-neighborhood variance in BMI remained with most unexplained variation due to within-community variance.

Keywords: Gender, Body Mass Index, Chronic Stress, Material Deprivation, Urban Health

Rita R Mathew, University of Georgia. Email: ritmath@uga.edu; Learning Cultural Geography in a fishing village in southern India

Students from a college preparatory high school in South Georgia participate in an innovative service project to learn cultural geography while on a trip to a high school in a fishing village affected by the Asia Pacific Tsunami of December 2004. Issues such as sources of water pollution, impact of globalization on the local fishing industry, caste system and its role in identity formation, comparative study of school curriculum, judiciary system in Georgia and a state in India are addressed. As part of their service experience, the group set up a network for computers and trained teachers at the site. They have provided support through fund-raising, by paying for internet access and by helping to start an Internet Chapter. The local agenda to build a library is a cornerstone of the service project. The study abroad trip to Pallam, India turns into a life changing experience for the American students and staff alike as they develop an understanding of "privilege" vis-vis "entitlement." Highlighted in this case study is the positionality of participants when they meet "other" students while aspects of social construction of cultural identity in high school students are also examined. This participatory action research paper explores the theoretical issues involved in teaching cultural geography through an alternative mode.

Keywords: Cultural Geography, Identity, Pedagogy, Service Learning, Study Abroad, Asia, Globalization

Elizabeth S. Mathews, MA, National University of Ireland, Maynooth. Email: esmathews@yahoo.ie; Mainstreaming of Deaf Education in Ireland: An International Comparative Study of Policy and Practice

This paper presents early findings from a PhD project on policy and practice of deaf education in Ireland, in particular the move to mainstream services since the 1998 Education Act. This research hypothesises that the provisions made in policy are far from adequate in dealing with the complexities presented with deaf students and that even these minimal provisions are not being received in the classroom. Furthermore, lack of awareness, preparedness and training among staff has aggravated the difficult task of including deaf students in a mainstream classroom. Informed by findings on the cognitive and linguistic development of deaf children, critical pedagogy, geographies of disabilities, and concepts of normalcy, it assesses the legislative and practical aspects of deaf education in the Irish mainstream primary classroom through policy analysis, interviews with stakeholders, and case study observations. The under-representation of the adult deaf community in the education of deaf children is addressed by including a 'Deaf Voice' at all stages of the research process. The ultimate aim of the project is to highlight the difficulties facing deaf students, their parents and teachers while they try to negotiate services, and to begin to rectify these difficulties by reporting findings to the National Council for Special Education in Ireland and by proposing changes based on international best practice.

Keywords: disability, deaf, education, policy

Vanessa Mathews, University of Toronto. Email: vanessa.mathews@utoronto.ca; Multiple Constructions: Reconstituting the Distillery Historic District as Consumptive Strategy

In 1990 upgrades to equipment and a competitive global marketplace led to irreversible financial constraints for the Gooderham and Worts Distillery in Toronto and the site closed its doors to spirits production. Over a decade later, in 2003, the site -renamed the Distillery Historic District? was reopened and reconstituted as a seductive playground of wares and rares (art galleries, theatre and studio spaces, retail stores, boutiques, condominiums, and eateries). The construction and image of the site as a cultural entertainment quarter acts as a unifying banner for the purpose of capital accumulation. Although the site is owned and operated by a private real estate development company, it is a manifestation of a number of interconnected power relations that work to constitute / reconstitute space. Since the 1990s, urban redevelopment of old industrial spaces into planned cultural districts and/or festive spaces of consumption has intensified resulting in a greater need to extend theorizations of the process to develop an understanding of their effects. In this paper, I contribute theoretically to discussions of urban redevelopment through the notion of difference. I engage with difference at the Distillery in its multiple constructions as a commodity that purports value and as a space of possibility in order to map how these meanings and practices are operationalized, and how they co-exist.

Keywords: urban redevelopment, difference, Distillery District, Toronto, cultural geography

Kent Mathewson, Louisiana State University. Email: kentm@lsu.edu; Incidents Abroad: Notes on the AGS's 150 Year Record of Latin Americanist Sponsored Research and Publication

From its earliest years, the American Geographical Society has been instrumentally and intimately involved in Latin American research. For North American geographers, Latin America quickly came to have a special station and status among the world's geographical realms. Both simple propinquity and proprietary presumptions played a role in this development, but there have been other more significant affinities that have also contributed to this relationship. This paper reviews key episodes and enduring aspects of the AGS-Latin American interaction and exchange over the past 150 years. These include: the first map published by the AGS ("Map of the Republic of Paraguay?" 1852); the first annual address (M.F. Maury 1854) to the Society which stressed Latin American research opportunities; the AGS's advisory role in selecting trans-isthmian canal routes including Panama's; the AGS's Millionth Map of Hispanic America project; role of AGS publications in disseminating Latin Americanist research results; and the AGS's current Bowman Expedition project. From the 1850s to the present, the AGS has been a key promoter, pioneer, and practitioner of Latin American geographical research.

Timothy C. Matisziw, The Ohio State University. Email: matisziw.1@osu.edu; Alan T. Murray, The Ohio State University. Email: murray.308@osu.edu; *Assessing Nature Reserve Vulnerability*

Nature reserves are essential for protecting the habitat of vulnerable species. These reserves help mitigate threats to critical habitats in order to promote and sustain viable populations. Damage to reserves due to natural and manmade hazards, however, can jeopardize species persistence through habitat loss and fragmentation. One approach for safeguarding reserve species, is to identify areas of habitat vital to reserve operation. Once critical habitats are identified, reserve planners and managers can more effectively prioritize protection/mitigation measures to be administered in the event of a disaster. Alternatively, with regard to reserve design, one may wish to select an arrangement of sites least vulnerable to environmental disruption. This paper presents an approach for identifying reserve parcels critical to reserve operation. Application results are presented and implications are discussed.

Keywords: vital infrastructure, reserve design, spatial optimization

David S. Mattern, Parametrix, Inc.. Email: dmattern@parametrix.com; *Reader-friendly environmental documents - oxymoron or opportunity?*

Over time, environmental documents have become too technical and too lengthy (often hundreds and hundreds of pages) to effectively inform the public of project effects and benefits. While NEPA's clear intent is to provide this information to the general public, the common practice by agencies and their consultants has been towards cumbersome, jargon-laden, tomes that obfuscate issues and effectively exclude that audience. Environmental documents are almost always written to appease legal and technical reviewers. Conclusions, if stated, are often so qualified they are indecipherable. As a result, these documents fail to engage the audience we are to write for, the public and decision-makers. Although recognized and generally deplored by NEPA practitioners, this practice has only recently started to change. This paper summarizes recent efforts to improve the quality and readability of environmental documents. Examples include the Alaskan Way Viaduct and Seawall Replacement Project Draft EIS, which has received several awards for innovation and clarity. Basic principles and techniques for creating reader-friendly documents are summarized and the pitfalls and challenges of each are described. Current tools and resources for creating these documents are also reviewed. Efforts to improve the readability of environmental documents uncover inherent contradictions in environmental regulations and guidance. Further challenges lie in established agency practices and expectations. The author describes experiences, both positive and negative, preparing the EIS cited above and ongoing reactions from interest groups, bureaucrats, and lawyers. The paper concludes with a summary of continuing efforts to improve document quality.

Keywords: NEPA, EIS, environmental documentation

Olen Paul Matthews, University of New Mexico. Email: opmatt@unm.edu; *Are Water Rights Sacred, or Can they be Regulated without an Unconstitutional "Takings"?*

Those who have water rights in the western United States often feel their water right is "sacred". Somehow water rights must be better than property rights associated with land. Any action that might change the nature of the right brings out vitriolic rhetoric from right holders. Regulations that changes the volume available to right holders is perceived as unconstitutional or perhaps even an interference with a basic human right. In spite of the perceived holiness of water rights, they are in fact no better than any other property right, and they may not be as good. Water in the West has a continuing public interest which means the rights are never an exclusive private right. Also, water rights can be lost through non-use making them more contingent than land rights. In addition, water rights cannot be sold if third parties or the public interest are harmed. These restrictions on water rights make them less of a right than land rights. In spite of these limitations water rights are property rights protected by the constitution. But, water rights can be regulated. My paper explores the limits to these regulations in light of recent court decisions.

Keywords: Keywords: water rights, regulation, constitution, takings.

Doreen J. Mattingly, Department of Women's Studies, San Diego State University. Email: mattingl@mail.sdsu.edu; *Paradoxes of Gender and Identity in Indian Call Centers.*

The outsourcing of ITES work to India has created jobs for close to half a million Indian workers, many of whom work the night shift in call centers serving US and UK customers. Alternately portrayed as oppressed 'cyber-coolies' and catalysts for change, Indian call center workers embody at least two paradoxes. The first paradox concerns gender: although the occupation of telephone operator has been gendered as female, taboos on women's night work and high male unemployment have led to a mixed-gender workforce in India. The second paradox concerns national identity: in the name of national development, Indian workers spend their working hours immersed in US or UK culture providing service to Westerners. This paper draws on interviews with 23 Delhi call center workers to examine the ways that workers themselves make sense of these seeming contradictions. Specifically, the paper investigates the ways that workers' understandings of gender and national identity reinforce and/or challenge management practices and discourses.

Keywords: gender, labor, identity, globalization, outsourcing, call centers

Henrik Mattsson, Uppsala University. Email: henrik.mattsson@kultgeog.uu.se; *Innovating in Cluster / Cluster as Innovation: the case of Biotechvalley*

It has been noted that innovation seems to take place to a higher degree in clusters than elsewhere and we have lately seen a worldwide wave of emerging cluster initiatives and similar innovation policy projects. Some of these are realistic efforts based on existing regional strengths and partly existing cluster structures. Most, however, are grasping at straws. The latter is especially true when it comes to buzz technologies such as IT and biotech. We could subsequently add a new label - "pathetic clusters" ? to the already existing list of embryonic, emerging, world-class or stagnating clusters. However, although such clusters do not generate the same economic effects as complete Porterian clusters, they are reshaping economic landscapes at regional and local levels. They do so, this paper argues, in the form of local economic practices. Although economic geographers often tend to explain innovation (competitiveness) by looking at cluster dynamics, in such accounts, the cluster concept itself can actually function as an innovation, imposing similar effects on the economy as more familiar types of innovation would, by creating a local competitive edge. For example, 'pathetic cluster projects' induce local practices, which, in turn, create awareness among local actors about regional strengths and weaknesses, and mobilize action and cooperation. In the present paper, this function of the cluster is examined. Illustration of the potential and limits of pathetic clusters projects is provided in the form of a case study about a Swedish biotech cluster.

Elizabeth Mavroudi, The University of Exeter. Email: e_mavroudi@hotmail.com; *Postcolonial perspectives and the Palestinian / Israeli conflict: the view from Palestinians in diaspora*

This paper uses the case study of diasporic Palestinians in Athens and how they view the current (colonial) situation, Palestinian cause or struggle as well as their (postcolonial) visions and hopes for the future of Palestine in order to comment on the value and applicability of postcolonial theories to the Palestinian/Israeli issue. Palestinians in diaspora outside the Middle East, such as in Athens may be seen as experiencing colonialism from afar. Although they are not physically in the midst of conflict, they are very much attached to the current (and historical) situation in Palestine. It is only through recognition that the past, present and future are inextricably tied that the manifestations of the past can be actively dealt with. Postcolonial perspectives force past histories to occupy awkward positions in the present, so that the two occupy an uneasy co-existence, which can lead to (partial) recovery of alternative visions, memories, experiences and identities. Above all, perhaps, the relevance of postcolonial theories is their optimism and hope for social change and justice in the future through agency and resistance. However, although Palestinians may still be seen as experiencing colonialism, colonial and postcolonial worlds, identities and realities are constantly clashing and merging. This paper argues that in order for Palestinians to imagine and realise a socially just, postcolonial future for themselves, they need to understand their connections and similarities as well as differences, problems and power inequalities between Jews and Arabs rather than create binary colonial/postcolonial oppositions and us/them relationships.

Jared David May, M.Sc., University Landau. Email: may@uni-landau.de; Markus Dotterweich, University of Koblenz-Landau. Email: mail@markus-dotterweich.de; *Soil Archives, an example of Prehistoric and Modern Impacts on Erosion and Gully Formation during the Holocene from the Loess Hills of Northern Mississippi*

The Loess Hills of Northern Mississippi are underlain by Marine and Fluvial sediments deposited during the upper Cretaceous through the Paleocene. These deposits were subsequently covered by Loesses or by Forest and Grassland Soils throughout the Pleistocene and consist largely of materials with a particle size of fine-sand or smaller, and are above all, highly erodible. During the Holocene, these soils and sediments were repeatedly exposed, eroded, and trans-located via fluvial systems. Near Owl Creek Indian Mounds, we have discovered a valley fill sedimentation sequence which documents the entire Holocene. This Soil Archive allows us the opportunity to reconstruct the stages of Anthropogenic influences on the Landscape, beginning in the Middle Archaic, around 7,000 BP when the Native Americans first began to significantly alter the landscape. When reconstructing the Holocene landscape evolution, we utilize an interdisciplinary approach combining the fields of pedology, environmental geography, geoarchaeology, and archaeology. This includes: In depth soil profile descriptions and laboratory analysis, sampling for various dating techniques, former landscape & hydrology condition reconstruction, identification of pedological & geological processes, correlation with GPS/GIS data as well as historical material and images, and landowner interviews. We will present our most current findings in our efforts to reconstruct this unique Soil Archive. The results from North Mississippi will be incorporated into a collection of global data which we use to model and reconstruct long term soil erosion processes. These models increase our understanding of man's past and future influence in the emergence of fluvial systems.

Jeff May, MA, York University. Email: chucky_may@hotmail.com; *Exile on Yonge Street: Public Space and Homelessness in Toronto*

In 2005, the council of the City of Toronto passed its plan to deal with the city's homelessness problem entitled "From the Street into Homes" The plan was excellent in its understanding of reducing homelessness in Toronto, but contained troubling provisions which threatened the ability and the right of the homeless in Toronto to use the city's public spaces. The plan fits into a larger effort in North American cities to make public spaces inaccessible for public use and more specifically, for the use of the homeless. This paper examines three main themes. It analyzes the slippery identity of public space and homelessness. It illuminates the social, political, and physical methods used to inhibit the homeless from using public space on Yonge Street in downtown Toronto. Finally, it uncovers some of the creative techniques the homeless engage to make use of street space in the face of contravening plans.

Shoshana Mayden, University of Arizona. Email: smayden@email.arizona.edu; *Hunting for Turtle Eggs: the Use of Local Knowledge and Volunteer Tourism in Conserving Sea Turtle Nests*

Wildlife conservation programs increasingly identify themselves as "community-based," with some claiming to incorporate local knowledge into their work. In Latin America, there is also a recent trend for conservation projects to recruit volunteer tourists, who provide both labor and funding for the program. What happens when these two trends merge, bringing biologists, foreign volunteers, local people, and wildlife together? This paper draws on postcolonial theory and employs a political ecology framework to examine volunteer tourism and marine turtle conservation in the context of Costa Rica. Based on interviews and participant observation at one turtle-nesting program, I argue that there are differences among the conservation practices and self-reported knowledges of volunteers, biologists, and community participants. Initial research results point to a disconnect surrounding how these varying participants position local

knowledge. While volunteers appear to highly value the input of local participants, they perceive local knowledge as stemming from both past and current poaching by community members. This paper evaluates these participant discourses alongside how these knowledges play out on the beach as volunteers, community helpers, and the occasional poacher look for turtle nests.

Judith Mayer, Ph.D., Environmental Planning. Email: jmayer@humboldt1.com; *Prospects for Community-based Fire Management in Indonesia*

Community-based approaches help vulnerable communities in Indonesia protect their land and livelihoods against disastrous and chronic impacts of repeated fires. Based on extended research in some 20 villages in East and West Kalimantan, this study assesses the potential for communities to challenge “fire fatalism” by building local capacity to control, prevent, and use fire in changing landscapes and political contexts. The study draws on interviews and oral histories of fire, burning practices, and landscape change, narratives and participatory mapping of fire events and risks, corroborating remote sensing evidence, observation of fire management activities, summaries of nearby land development and resource exploitation, and analysis of changing fire policies and programs. Community based fire management efforts often support local struggles to retain or gain control over land and forests. Negotiations open opportunities for villages to cooperate with or to contest actions by regional officials testing newly devolved responsibilities, and by companies offering to help villages control fires, but whose own activities pose fire risks. Prioritizing international concerns about transboundary “haze” and atmospheric carbon loadings may concentrate Indonesia’s future fire efforts toward a limited range of prominent fire types (peatland fires; burning to expand corporate plantations), while abandoning approaches that address varied fire concerns and livelihood needs of many communities in fire-prone areas. Broadly applying the participatory and social justice principles of community-based fire management in the face of narrowing fire policy targets may help reassert locally-generated approaches to protecting land and livelihoods against unwanted fires with varied causes and impacts.

Gideon Mazinga, MSA, Loma Linda University. Email: gmazinga01g@univ.llu.edu; *Patterns of Satisfaction with Health Services in Malawi: Analysis using Geographic Information Systems Technology*

Malawi is among the countries in the southern region of Africa which is experiencing an increase in number of patients seeking health services as a result of the prevailing diseases including but not limited to HIV/AIDS. Spatial information is crucial in making effective policies to improve quality of health services to all Malawians. A growing number of health service agencies are discovering Geographical Information Systems (GIS) as a new way to help understand health and social problems, explain to policy makers and constituents the wide discrepancies between needs and resources, and to effectively and equally place those resources in communities (Mandayam, 2002). This paper attempts to address spatial patterns of satisfaction with health services in Malawi. Spatial autocorrelation test was conducted to find out if satisfaction with health services was randomly distributed in all districts across Malawi. Spatial autocorrelation was determined by Moran’s I measured on percentage of satisfaction by district for 26 districts. Results indicated that there was significant positive spatial autocorrelation of satisfaction with health services in Malawi (Moran I = 0.4045, $p < 0.05$). The results depicted spatial pattern of districts with lower percentage of satisfaction with health services in the central and northern region and spatial pattern of districts with higher percentage of satisfaction with health services in the southern region. These results are helpful to policy makers to consider providing equal and fair provision of quality health services to all people in all districts by targeting districts that are less satisfied with health services.

Soumya Mazumdar, University of Iowa. Email: soumyamazumdar@yahoo.com; *The effects of geocoding inaccuracies on the ability to recover relationships between environmental exposures and Health*

Positional inaccuracies and inability to match some addresses to digital street files influence the recovery of relationships between measures of environmental exposure and health. In most studies, the process that generates the geocodes controls the severity of these problems. In this research, using Monte Carlo simulations I experimentally controlled positional accuracy, level of completeness in geocoding addresses and hypothetical relationships between environmental exposure and disease. The test data include credible measures of contamination and likely magnitudes of health effects. The ability to detect a known level of relationship—statistical power?depends therefore not only on the modelled strength of the relationship but also on the level of positional accuracy and completeness of the geocodes. I analyze inaccuracies of geocoded addresses generated by three types of geocoding processes: a) Addresses located on readily available orthophoto coverages; b) Addresses located by commonly used TIGER (Topologically Integrated Geographic Encoding and Referencing system) files; and, c) E-911 geocodes (developed by local authorities for emergency dispatch purposes). Results calibrate losses in statistical power that depend on a decrease in the degree of geocoding completeness and a decrease in positional accuracy. Although these specific results cannot be generalized to other situations, the

computational method used to calibrate the sensitivity of the results can be used in any situation.

Michael Andrew Andrew McAdams, Fatih University, Istanbul Türkiye. Email: mcadams@fatih.edu.tr; *The Role of Urban and Inter-regional Transportation in South Eastern Europe*

South Eastern Europe is experiencing many challenges as it develops economically and integrates with the rest of Europe; among them is the development of an improved transportation network at all scales. The development of a good transportation is crucial to aid in its economic development. At the present time, the area’s linkages to Europe and Central Asia are inadequate to support the growing interaction between the regions. The urban transportation systems are also undergoing dramatic change due to increasing automobile ownership and rural-urban migration. There is an immediate impact on the environment, urban growth and long term effects on the energy supplies of the region. At both the inter-regional and urban level, there needs to be a balanced and sustainable approach. This paper will discuss past development of both urban and inter-regional transportation networks and explore future scenarios for a well-developed and integrated network.

Kathleen McAfee, San Francisco State University. Email: km@kmafee.com; *Global Markets in Environmental Services: The Missing Link Between Conservation and Development?*

Commodification of environmental services (ES) - carbon storage, water filtration, flood control, wildlife habitats, genetic diversity, and scenic beauty - has become a leading trend in international environmental policy. Although ES marketing discourse reflects a neoliberal ideal of private entrepreneurialism, market pricing, and efficiency, most actual ES trading schemes depend substantially on regulation, subsidies, and other support by public institutions. Multilateral and private agencies are developing programs for transnational trade in tropical and subtropical ecosystem services. Their advocates predict that they will generate vast new revenues for climate-change mitigation and biodiversity preservation. Some advance a more ambitious claim: by simultaneously fostering economic growth, conservation, and social equity, they say, the monetary valuation and commercialization of ES can provide the missing conceptual and practical link between conservation and development. This paper questions whether transnational ES markets can yield either net conservation or net equity gains. To the extent that transnational carbon markets make it easier to avoid GHG reductions at the source, they promote net environmental harm. Moreover, carbon sequestration, waste storage, or habitat maintenance are cheaper in global South because land rents, wages, and living standards are lower there. Thus, the pivotal premise of low-cost conservation by commercialization depends on the continuation of extreme socio-economic inequality. The discourse of global ES trading subsumes ecology within the smaller world of market economy. By leaving out the greater part of nature’s meanings and uses to the world’s poor majority, it radically discounts the existing and future values of ecological and eco-social production.

Collaborative research is underway in the San Juan Mountains to study the radiative and hydrologic effects of desert dust deposits on alpine snow. The component described here is the development of a synoptic climatology for winter and spring dust deposition to the alpine snowpack in the San Juan Mountains of southwest Colorado. The purpose of this study is to determine what types of meteorological and climatological characteristics generate the dust deposition events in the San Juan Mountains. A further understanding of the climatology of dust deposition events will provide insight into the interactions between deserts and mountains and facilitate seasonal to daily predictions of dust emission events. We analyze 18 dust deposition events that have been documented in snow in the San Juan Mountains of Colorado in winter and spring seasons of 2003 through 2006. The research explores antecedent precipitation, soil moisture, wind conditions, vegetation cover, pressure patterns at 500mb and the back trajectories of dust events and dust-free events. Data from the Southwest Climate Impact Meteorological Stations (CLIM-MET), the Moderate Resolution Imaging Spectroradiometer (MODIS), the Advanced Microwave Scanning Radiometer - Earth Observing System (AMSR-E) and the Stochastic Time-Inverted Lagrangian Transport (STILT) model are analyzed. Finally, existing correlations between ENSO and the San Juan Mountain dust events are investigated.

Anna McCall-Taylor, University of Washington. Email: amct@u.washington.edu; *Employer-Based Health Insurance and Gendered Employment*

The majority of non-elderly Americans rely upon employer-based health insurance (EBHI) to afford healthcare. Rising health care costs, the changing nature of American employment, and trends within the health insurance industry have made it more and more difficult for individuals and families to secure and maintain employer-based health insurance coverage. While scholars from other disciplines have explored some of the ways in which the quest for EBHI influences individual employment decisions, few have taken gender - or the gendered context in which employment decisions are made - into account. Within Geography, there is an unfortunate paucity of work on this issue of pressing topical importance and exciting theoretical relevance. I share the results of my analysis of the importance of married couples' need for EBHI to the gendered blurring of the lines between home and work and this phenomenon's reconstitution of gendered roles. I suggest that a study of employer-based health insurance has much to contribute to discussions of gender, work, and home, by speaking to household decision-making, care and neoliberalism, and Feminist Geographies.

Robert J. McCalla, Saint Mary's University. Email: robert.mccalla@smu.ca; *'Intermediacy' in Caribbean transshipment container ports*

It is estimated that, on average, 30% of all containers handled in ports are transshipped intramodally. Some ports, notably Tanjung Pelepas, Gioia Tauro, and Algeciras are almost 100% transshipment ports. Such ports rely heavily on their intermediate position relative to shipping lanes - a geographical situation factor - to attract transshipment business. Intermediacy can be shown by measuring deviation distance of the port from shipping lanes. The less deviation the more convenient - less cost - it is for large ships on deep-sea routes to transship containers to other deep-sea routes or short sea ones. An interesting case today is the competition for transshipment trade within the Caribbean Basin. At least six

ports - Freeport, Kingston, Rio Haina-Causedo, Colon, Cartagena, and Port of Spain-Point Lisas - can be identified in the "Caribbean Transshipment Triangle". This paper shows intermediacy properties of each port relative to six shipping routes passing through or near the area. Individually, no one port has the least deviation distance to all routes, but Colon because of its location at the entrance/egress from the Panama Canal is well-positioned with no deviation on three routes. In aggregate, the port with the least deviation distance to all routes is Kingston; the greatest is Port of Spain-Point Lisas. Given that the intermediacy property of the six ports is competitive, the paper concludes with a discussion of other factors - notably site ones - to account for the fortunes of these ports as transshipment points.

Keywords: Caribbean, containers, transshipment

Judith McCallum, York University. Email: judithmc@yorku.ca; *Truth Commissions in Time/Space*

This paper argues that Truth Commissions, as they have emerged in recent history, are examples of globalities that are generated in nonlocal fields and linked through the ideoscapes of reconciliation and democracy, with the implicit (and sometimes explicit) the goal of consolidating the nation-state (Whitlock 2001). In order to demonstrate this, the paper will first provide a definition of TCs, it will then provide a brief overview of their development and the current distribution of active and inactive TCs. The paper will then seek to provide what Doreen Massey (1999) defines as the "power-geometries of time-space" of TCs, and examine more specifically role of the nation-state in TCs. Finally it will respond to the call for a grounding of this approach to globalization in the everyday life, examining the performance of TCs in everyday, lived experiences.

This panel participation will address doctoral research on the landscape and livelihood effects of private land conservation, through conservation easements. Specifically, it examines aspects of the research concerning the role of migrant Mexican farmworkers on conserved Vermont dairy farms. Without legal status, these workers cannot move freely through the landscape they work to maintain and reproduce. Despite increasing support from the wider community, farmworkers experience the aesthetically prized Vermont countryside as a carceral landscape.

Keywords: land conservation, land trusts, migration, labor, landscape, livelihood, Vermont

Eugene McCann, Simon Fraser University. Email: emccann@sfu.ca; *Calculative Technologies and Global Circuits of Knowledge in Contemporary Urban Development: Toward a Theorization.*

Scholars across the social sciences are increasingly interested in how localities are constituted in and through global relationships and by flows of people, capital, and ideas. The foundations of this global-relational approach are numerous, but Harvey's notions of circulation, mobility, and fixity and Massey's conceptualization of a global sense of place clearly figure centrally. More recently, literatures on migration, global cities, policy transfer, and mobilities of various kinds have enriched this perspective. Yet, there is much to be done to understand what Lerner has called the 'apparently mundane practices' and 'messy actualities' through which localities are produced in global-relational context. This is certainly the case in the study of urban development. Questions remain about how - through which practices, inter-personal connections, travels, global assemblages of expertise, everyday routines, etc. - urban development gets done. This paper seeks to partially address this lack. Drawing on a synthesis of poststructuralist and political economy approaches, it will focus on two connected, but relatively understudied, aspects of the urban development process: (1) the calculative technologies through which urban governance and development actors understand their practice, their successes, and their position within wider fields of inter-urban competition; (2) the global circuits of knowledge which allow other cities to be learned from and which provide paths for the transfer of 'models' and 'best practices.' The paper will highlight aspects of both and argue that these apparently mundane technologies and practices must be positioned more centrally in contemporary studies of urban development.

Shannon McCarragher, Northern Illinois University. Email: smccarragher@gmail.com; *Photosystem Stress of Understory Balsam Fir (Abies balsamea) in Ontario, Canada as Measured by Chlorophyll Fluorescence*

The main goal of this research was to assess the health and stress levels of understory balsam fir seedlings and saplings within Lake Superior Provincial Park (LSPP) in Ontario, Canada. This was accomplished by testing the photochemical efficiency of their photosystem II, which measures fluorescence. The data

obtained provide an indication of the degree to which the seedlings and saplings are stressed due to various environmental factors such as high light intensity, low water availability, or limiting soil nutrients, to address whether this species will be impacted by future climate change. Four sites were sampled, with a total of 136 seedlings and saplings measured for their photochemical efficiencies. Morning (AM), Noon (Midday), and late-afternoon (PM) measurements were taken at these sites, with approximate four hour intervals between each of the three measurements. It was hypothesized that the sampled balsam firs would display little, if any, indication of stress because the researched area is located near the southern limit of balsam fir, which should therefore provide optimum growing conditions. Many factors (such as size class, location, and time of day) were statistically analyzed by running one way ANOVA, Kruskal-Wallis test, and t-test using the collected data. The greatest statistical significance was found when all sites were testing based on light condition and time of day.

Email: ; Risto Jalkanen, . Email: ; Andreas Kirchhefer, . Email: ; *Objective correction of tree ring stable carbon isotope chronologies for changes in the carbon dioxide content of the atmosphere.*

Tree ring stable carbon isotope ratios ($\delta^{13}C$) often display a decline over the industrial period (after AD1850) that is only partly explained by changes in the isotopic ratio of carbon dioxide and represents a response to increased atmospheric concentrations of CO_2 (pCO_2 , or ca). If this is not corrected, calibration of long tree ring stable isotope chronologies using the modern period, for which meteorological records are available, will be compromised. An objective correction procedure is proposed where temporal de-trending is restricted by two logical constraints based on the physiological response of trees. The first constraint allows a falling trend in $\delta^{13}C$, which exceeds that which could logically be attributed to a passive response to rising ca , to be retained. The second ensures that any increase in $\delta^{13}C$ is not removed. The procedure is tested using data sites in Finland and Norway. In each case it results in a substantial improvement in the correlation with local meteorological measurements.

John F McCarthy, PhD, Australian National University. Email: john.mccarthy@anu.edu.au; Contrasting Convergences: Smallholder engagement with the Oil Palm Boom on the Frontier of Malaysian Borneo and of Outer Island Indonesia.

Over recent decades a structural transformation has affected agriculture in frontier areas of Malaysian Borneo and Outer Island Indonesia with the rapid conversion of agricultural lands, fallows and formerly forested areas into oil palm. By comparing cases in each country, this paper will explore why, despite significant differences in systems of governance, frontier areas of Malaysian Borneo and Outer Island Indonesia appear to be converging around a particular mode of agrarian change during the oil palm boom. Both have similar positions in the international political economy of this commodity and have complementary resource endowments. Moreover, in both cases, in concert with neo-liberal principles, state agencies have facilitated development schemes and provided incentives for private plantations that involve the privatization of customary lands and the integration of smallholders into large blocks of land set aside for monocrop development. While indigenous smallholders are inclined to enter oil palm production where there is space for them to engage with the market on favorable terms, for many poorer smallholders the current transition is associated with uncertainty over incomes, land tenure arrangements, and economic structures and has raised environmental, social and political contentions. Contrasting how wider political and economic forces articulate with local legal and institutional mechanisms to shape outcomes in each case, this paper will explore the factors affecting how smallholders are either able to progress or are marginalized by the terms under which they engage with the agrarian transition.

Linda McCarthy, University of Wisconsin. Email: lmccarth@uwm.edu; Off the Mark? Economic Efficiency in Targeting the Most Marketable Sites rather than Spatial and Social Equity in Public Assistance for Brownfield Redevelopment

Brownfields are properties where expansion, redevelopment, or reuse is complicated by the presence of known or suspected hazardous substances, pollutants, or contaminants. The U.S. Environmental Protection Agency has estimated that between 500,000 and one million properties have a strong potential for contamination. Public-sector efforts to promote cleanup and redevelopment are faced not only with the burden of such a significant number of brownfields, but also with the challenge of limited public funds. As a result, targeting public-sector funding toward the most marketable sites is a commonly-

adopted approach in cities across the United States. Targeting public redevelopment funding toward the most marketable brownfields is viewed as an economically efficient use of scarce resources, because it may guarantee the greatest likelihood of success. But to what extent does this policy promote spatial and social inequities by neglecting contaminated sites in distressed neighborhoods containing minority and low-income populations? This case study of Milwaukee, Wisconsin identified that tracts with above average percentages of African Americans and Hispanics, although containing above average numbers of brownfields per square mile and higher percentages of brownfields compared to percentage of the city's area, had below average city-assisted redevelopments as a percentage of all brownfields. A policy implication is that, despite difficulties promoting brownfield redevelopment in distressed neighborhoods, in addition to economic efficiencies, more emphasis is needed for the social benefits of public assistance for brownfield redevelopment, including potential spillover benefits for surrounding neighborhoods, such as crime reduction and health improvements.

Mark McCarthy, BA, PhD, FRGS, Galway-Mayo Institute of Technology, Ireland. Email: mark.mccarthy@gmit.ie; John Towler, Galway-Mayo Institute of Technology, Ireland. Email: mark.mccarthy@gmit.ie; Tracing Irish Ancestors within Diverse Tourism Spaces: A Proactive Approach to Developing New Models of Genealogical Tourism Promotion and Management

There are over 70 million people of Irish descent scattered across the globe, forming a nostalgic Diasporic network that links Ireland to places such as the USA, UK, Canada, Australia, New Zealand and Argentina. While the concepts of cultural affinity and roots have long-served as 'pull' factors which have attracted sentimental ethnic tourists to Ireland, the advent of the Internet as a 'virtual' research tool for family history research and the ongoing reconfiguration of the tourism industry in general have raised countless questions about the future of its ancestral tourism industry. Using evidence gleaned from an online questionnaire and extensive fieldwork throughout the West of Ireland, this paper is concerned with the challenges and opportunities facing genealogy as a tourism product. Special attention is paid to the notion that tourism in the new Europe "needs to be managed with foresight, proactively rather than retrospectively responding to change" (Hall, Smith and Marciszewska, 2006). Following an overview of the current heritage management difficulties that exist in promoting genealogy tourism, we will attempt to illustrate how these may be best addressed by the development of new marketing strategies and work/organisational practices for the genealogy tourism industry as a whole - including the encouragement of dynamic activity within both 'real' and 'virtual' tourism sub-spaces.

Keywords: tourism geography, genealogy, Ireland

Erin McCarty, Graduate Student, Geography, Ohio University. Email: em348105@ohio.edu; Open-Space Preservation in Edinburgh and Baltimore: A Cross-site Comparison

Policy makers continue to develop ways to control sprawl, but the problem is growing. So too are problems related to human health problems, energy consumption, and environmental degradation. Planners need greater knowledge of the tools available to combat irresponsible development. Edinburgh, Scotland uses one such tool, the Green Belt, successfully. This study outlines the creation and current condition of the Green Belt around Edinburgh, comparing the U.K. city's experience with open space management in Baltimore, Maryland. Initial results show that cities should implement more regional cooperation in order to achieve open space preservation goals. This study is part of the ongoing Baltimore Ecosystem Study, a multifaceted, long-term ecological research project devoted to understanding how cities function as ecosystems.

Jessica L McCarty, Doctoral Candidate in Geography, University of Maryland Department of Geography. Email: mccarty@geog.umd.edu; Multi-temporal Crop Type Mapping for the Contiguous U.S. using 250m MODIS Data

A semi-automated decision tree classification approach was developed to quantify crop types in the contiguous United States. 250m Moderate Resolution Imaging Spectroradiometer (MODIS) 16-day time periods for the year 2003 were used to test a semi-automated decision tree classifier approach. The Landsat-based Cropland Data Layer (CDL) produced by the USDA NASS was used for training and validation data for the decision tree classifier. The tree models included both red (620-670 nm), near infrared (841-876 nm), and normalized difference vegetation indices (NDVI). Results were improved when the MODIS Vegetation Continuous Fields (VCF) percent tree cover was used to define non-crop areas as well as an initial grassland/pasture classification from the CDL product. Field data of crop locations for sampling and validation improved the remote sensing-based estimates of individual crops. The monthly crop type maps were adept at detecting crop rotation patterns, making this product adept for

both monitoring monthly crop growth and estimating fire-related emissions from agriculture.

Ron McChesney, Ohio Wesleyan University. Email: rmcches@owu.edu; *Global Exurban Development Patterns*

Exurban development is a component of metropolitan areas. Metropolitan areas consist of central cities, sprawling suburbs, fragmented exurbs and open space rural lands. Metropolitan areas exist in all world regions of the earth. The rapid diffusion of the spatial tool Google Earth allows for the average person to gain an impression of the human settlement pattern. A review of Google Earth images demonstrates that exurban development patterns are part of a global economic process, and can be observed in numerous locations.

Keywords: exurban, land use, Google Earth

Amy L McCleary, University of North Carolina at Chapel Hill. Email: alnorman@email.unc.edu; *Identification of Invasive Guayaba (Psidium guajava) on Isla Isabela, Galápagos Archipelago using Object Based Image Analysis Techniques*

The Galápagos Islands of Ecuador, located approximately 1,000-km off the coast of Ecuador, were only sparsely populated from their discovery in the 1500s until the 1980s. More recently, poor economic conditions on the Ecuadorian mainland combined with a fishing boom in the archipelago, and available service positions linked to the burgeoning ecotourism industry, have resulted in conflicts between people and the environment, possibly best exemplified by the pressure placed on the Galápagos National Park by the introduction of invasive plant and animal species that are replacing endemic flora and fauna. Guayaba (*Psidium guajava*), the invasive plant species of focus in this research, has become particularly aggressive within agricultural areas as it is rapidly replacing native grasslands and Scalesia forests. In this study, object based image analysis (OBIA) methods available in Definiens Professional 5 were applied to a high spatial resolution Quickbird image of Isla Isabela in the archipelago to identify the spatial location and pattern of guayaba in test areas. A multi-resolution segmentation method was first applied to the Quickbird image to create individual image objects, a hierarchical classification scheme was developed to identify patches of guayaba and non-guayaba, and the classification scheme was applied to the image objects. The resulting classification of guayaba shows a significant concentration of large and small patches within the agricultural zone, but also within the surrounding Galápagos National Park.

George Franklin, Jr. McCleary, University of Kansas. Email: mccleary@ku.edu; Christian Cooley, Unified Government of Wyandotte County / Kansas City, Kansas. Email: ccooley@wycokck.org; *Cartography, GIS, and Teaching the Geography of Wine*

Maps of wine-production areas abound in both scientific publications (books, reports, and journals) and "wine tourism" literature (from brochures and guidebooks to sheet maps and web sites). While some are excellent (e. g., James Wilson's book, *TERROIR*, and the map, "Vineyards of Yamhill County"), much of the tourism literature is extremely inefficient for navigation and misleading in the representation of the location and extent of wineries and vineyards. There are few maps that contribute satisfactorily to the integrated series of maps at many scales and levels of detail needed to teach a world-scale course in the geography of wine. The problems range from the simple to the complex. Solutions? Base maps of the principal wine-producing regions of the world have been developed on single pages (letter-size), all on the same projection and at the same scale - these can be overlaid easily, facilitating graphic comparison. For the global view, the Briesemeister Projection provides a better perspective than the rectangular projections usually employed. The technology of Geographical Information Systems can be structured to accommodate non-technical (and non-major) students in the class. A "template" (using ESRI ArcGIS) was developed, focusing on the wines of Italy (using Langhe as a local example), to encourage students in the class to examine more interesting, more complex, research problems.

Sherri A. McClure-Baker, Oklahoma State University. Email: sherri.a.mcclure@okstate.edu; *Using ArcIMS as a Tool for the RAISE GK-12 Program*

RAISE (Rural Alliance for Improving Science Education) is a GK-12 program developed through a partnership between Oklahoma State University and three local school districts. 10 OSU graduate students are partnered with teachers from these local schools. These partnered teams are working cooperatively to integrate GISci technology into the science curriculum. Geographic information sciences (GISci) offer a suite of useful tools such as GIS, GPS and Remote Sensing to help educators teach students about various subjects. As data

was gathered by the participating schools, there became a need for storing and accessing the data. The best way to accomplish this was through the use of an Arc Internet Map Server (ArcIMS). The RAISE ArcIMS Virtual Mapping Atlas was created to house data collected by the three participating schools in Payne, Noble and Kingfisher Counties in Oklahoma. In addition to the collected data, base data for the state of Oklahoma was also considered. Working with the teachers and scientists from each district to determine needs, data was compiled, manipulated and stored in an ArcIMS website. By using the VMA in conjunction with ArcGIS software, the teacher/scientist partners are allowed access to additional information collected by the other school districts as well as pertinent county data for their own district.

Keywords: GIS, GK-12, ArcIMS

Andrew T. McColgan, University of Memphis. Email: drubydoo@yahoo.com; *Rates and Forms of Tafoni Weathering from High-resolution Digital Elevation Data*

The quantification of temporal changes in geomorphic process-form relations are a critical factor in determining landform evolution. Weathering represents an integral component in the development of landforms. Tafoni weathering from three coastal platforms with different altitudes and different known emergence ages are examined to assess weathering rates from Nojima-zaki, Japan. The findings add an additional 15 years to the record of tafoni weathering at this site. Furthermore, the study is enhanced by the use of high-resolution terrestrial laser scanning (TLS) technology. TLS is used to image the rock surfaces as point clouds. The data are modeled and geomorphometric variables are virtually recorded for subsequent statistical analyses. Indices are developed from combined geomorphometric variables to enhance inferences drawn from the temporal changes in tafoni weathering features and processes. In addition to the form analysis, micro-scale spatial context is explored through a random stratified sampling of pits on separate platforms. The within- and between-variability comparisons of the rock surface provide finer-scale understanding of the spatial variability of tafoni weathering features.

Keywords: geomorphology, weathering, Japan, laser scanning

Chris McColl, M.Sc., Central Washington University. Email: mccollc@cwu.edu; Anthony Gabriel, PhD/Professor, Central Washington University. Email: gabriela@cwu.edu; *A Fire Hazard Decision Support Tool for Improved Rural Security*

In the Pacific Northwest an increasing number of residential developments are being planned and are occurring within forest and shrub lands. As more development extends deeper within these regions, the associated risk of wildfire to these residences increases. It is advantageous for local land use planning agencies to foresee which regions would be at risk due to wild fire hazards, enabling appropriate mitigation plans to be developed in advance. This research outlines the development of a fire hazard decision support tool that is based upon two modeling components: 1) a fire hazard model; and 2) a land use forecasting model. The fire hazard model has been developed by incorporating influential fire hazard variables to spatially identify wildfire-at-risk regions using GIS technologies. Future residential distribution patterns are forecasted by the land use forecasting model, which is based upon a county government comprehensive land use planning policy of the selected study area. Identified 'wildfire-at-risk' regions are compared to forecasted patterns of future residential growth, delineated by the land use model. Overlapping regions of wildfire hazard and future growth can be identified as locations where mitigation activities should be focused. Results of this application can then be used to aid land use planning activities in the modification of comprehensive land use plans that incorporate future fire hazard risks within their design at the county scale.

William J. McConnell, Michigan State University. Email: mconn64@msu.edu; *Forestation in Post-colonial Madagascar Highlands*

Madagascar's farmers have long been vilified as the main agents in an environmental disaster ensuing from the deforestation of the island. But studies over the past decade - in Madagascar as elsewhere - have undermined this conventional degradation narrative. While it is clear that a great deal of the island's forests have been felled to make way for agriculture, considerable areas are undergoing net increase in tree cover. Some of this forestation is taking place in formal/commercial plantations and is well-documented, but analysis of informal, scattered tree growth is scant. Thus, there are no reliable estimates of long-term rates of forestation. This paper describes preliminary results from research designed to provide such estimates for the past five decades. The paper contributes to the development of forest transition theory, providing empirical evidence for that Madagascar is following the so-called 'forest-scarcity' path. Forestation in Madagascar is important to the livelihood options of the rural population, both directly through the provision of consumable and marketable products, and indirectly through soil and water conservation. There are also

broader environmental implications, such as the sequestration of carbon. The study will help ascertain the degree to which forestation is meeting fuelwood needs on a sustainable basis, and at what point such forestation could make Madagascar's land use carbon neutral. These data will form the basis for spatially explicit simulations capable of reproducing the observed land cover trends in the Madagascan highlands over the past half century, and projecting those trends out through the next several decades.

Keywords: Madagascar, forest transition

Jen McCormack, PhD Student, University of Arizona. Email: jenmack@email.arizona.edu; *Rebels and Scholars: Palestinian Bedouin Women Students in the Naqab/Negev Desert*

As first generation college students at Ben-Gurion University, a group of Palestinian Bedouin women in the Naqab/Negev desert of southern Israel challenge both an antagonistic state and a legacy of patrilineal power by their academic pursuits and political action. In a series of interviews, these young women elucidated the changing identity politics for the Bedouin communities in Israel and growing vocal affiliation with Palestinians in the West Bank and Gaza. Additionally, they articulated the expectations of women in traditional Bedouin communities and how as young women, they are consciously rebelling against those kin-based power structures. In their university studies, these students expressed goals of obtaining degrees that will allow them to aid their impoverished communities. Essentially, by developing skills at the university, they can return to their villages and counteract the socio-economic problems created by state policies against Negev Bedouin communities. And by attending the university, securing degrees and directly engaging the political climate on campus, these women offer a revolutionary form of leadership to the traditionally agnatic based power structures in their communities. One interview participant encapsulated her aim, "I will do something to change. I want the generations that live now to have freedom in their families, in their communities." These young women subvert both tradition and state policies by cultivating a constructive form of rebellion offering a unique model to other young people in socially and politically disadvantaged communities.

Peter J. McCormick, Fort Lewis College. Email: mccormick_p@fortlewis.edu; *Moors, Sephardim, Celts, and Indians: auto-histories and auto-geographies of diaspora and place*

The initial push of humanistic geography in the 1970s was an attempt at re-peopleing a discipline dominated by social science. Since then the radical turn to technology and social theory has, once again, removed human agency and, to some degree, the individual and collective sub-groups from time and place. This paper draws upon early geographic humanism, by placing the 'self' within geographic discourse and within cultural and ecological space and is the result of years of personal genealogical research. The focus is on the convergence of people of Black Irish (Celtic/Iberian), French Huguenot/Iberian (Basque, Moorish and Sephardic Jew), and American Indian (Civilized Tribes) origins, in the Dust Bowl of the southern Plains of the 1930s. The paper discusses the development of cultural and familial homelands, diaspora and culture change, and the impact of this project on individual and family identity. The research process of connecting nearly four dozen family lines has been integrative; that is, it has allowed a corporate recovery of the past by placing families within larger historical and geographical contexts. The paper also illustrates how, over time, families, as cultural groups, transcend ethnic boundaries, social crises, and environmental disasters. Finally, the paper speculates on how such processes can serve as a means for understanding the nature of individual and collective identities and the imperative role geography plays in ethnic and cultural formation.

Keywords: Moors, Sephardic Jews, Celts, American Indians, homelands, landscape, Dust Bowl, auto-geography, humanism

Sabrina McCormick, Michigan State University. Email: mccor124@msu.edu; *Controversies over Large Dams in the Amazon*

In this paper, I explore the local, national and transnational controversies surrounding struggles over large hydroelectric dams in the Brazilian Amazon. As a part of a larger megadevelopment plan, the Brazilian government intends to construct an undetermined number of dams. Major international contention is developing due to the environmental sensitivity of the region and the potentially sweeping impacts on local populations. An additional component of these debates relates to potential funders of these projects. Transnational corporations from several other continents including North America, Asia, Europe and Africa are making investments in hydropower in Brazil. I seek to identify the intersection of these corporate institutions with civil society and the state. Why do companies prefer to invest in Brazil? How does the Brazilian government respond to these corporate interests? What is the role of civil society in policy-making regarding new dam construction? I focus on two recent cases to examine these processes: Belo Monte Dam in the eastern Amazon and Rio Madeira in the

western part of the region. These cases inform how contestation over other large hydroelectric dams in the Amazon will be rejected or resolved.

Keywords: Brazil, water, energy, Amazon, hydroelectric dam

Matt McCourt, University of Maine Farmington. Email: matthew.mccourt@maine.edu; *Affective Encounters in "Bloody Harlan"*

In 1931 a series of violent confrontations between miners and deputies in Harlan, Kentucky, attracted widespread attention in the national media. The ensuing year of organizing, investigating, and reporting brought an outpouring of relief, fundraising, and visits from sympathizers in metropolitan centers of the northeastern US. Among the visitors were groups of notable writers drawn from the leftist intelligentsia. The writers' encounters with Harlan and Harlan's labor conflict produced numerous articles, plays, reports, published memoirs and notes, several poems and fictionalized accounts, countless letters to the editor, leftist and mainstream press coverage, and diary writing. Reading the writers' more authoritative accounts, you might find them highly composed and self-possessed. You might find their interventions high-minded and even heroic. On the other hand, their personal writing is more apt to plumb their petty quarrels and infighting, their convulsions, their wracked nerves, paranoia and gloom. This paper draws from those writings that tap a visceral register, following the writers as they stumble upon situations that stretch the bounds of their considerable literary endowments, at times, rendered wholly unintelligible. In their diaries, notes and memoirs, the writers enact a micropolitics of encounter that might serve as an admonition for subsequent interventions.

Talia M. McCray, Ph.D., University of Rhode Island. Email: tali@m.uri.edu; *Perceptions of Personal Space of Urban Teenagers Living in Providence, R.I.*

Studies agree that gender, household responsibilities, and life-cycle are significant factors that influence travel behavior. Some researchers have even used the ability to physically reach activities as a social indicator for monitoring the quality of life. However, little attention has been given to how transportation and land-use patterns affect the activity choices of urban teenagers. This study takes place at one inner city Providence high school, comprised of 180 students, who are predominantly children of immigrants. The research attempts to glean an understanding of the different perceptions of "personal space", and how various socioeconomic factors affect activity spaces. Perceptions of safe and unsafe places in Providence are compared with crime data from the City of Providence. Preliminary results show differences related to gender, transport mode, family structure, and part-time jobs.

Brent McCusker, PhD, West Virginia University. Email: Brent.McCusker@mail.wvu.edu; Joseph Hodge, PhD, West Virginia University. Email: Joseph.Hodge@mail.wvu.edu; *Historical Land Use Change in Limpopo, South Africa: The Case of Betterment and "Bantu" Town Planning*

South Africa's transition out of apartheid has been complex and the break with past traditions has been incomplete. A primary concern in the apartheid era was physically separating black from white people whilst keeping the black populations close enough to places where their labor was needed so that it could be mobilized when necessary. When considered unnecessary, black laborers could be "endorsed out" or expelled to more distant reserves - the bantustans. Using a political ecology approach, we present evidence on the historical and contemporary constitution of land use change in the northern part of the former Lebowa bantustan. We map changes in the region from 1963 -2001 encompassing the university town of Mankweng, Limpopo and nearby betterment areas. Throughout the paper we attempt to link observed land use changes to national, regional, and local agents of change. We outline several policy challenges resulting from our investigation pertinent to current rural planning and land reform attempts.

Keywords: land use, historical geography, betterment, South Africa

Paul N. McDaniel, University of Tennessee. Email: pmcdani1@utk.edu; *Ethnic Enclave or International Corridor?: Immigrant Businesses in a New South City*

Immigration is changing the U.S. South in unprecedented ways. The South is no longer nearly the exclusive domain of whites and blacks. Hispanics and Asians comprise increasingly influential minorities in towns and cities throughout the region. Immigrants, many of whom are recent arrivals, often choose to start entrepreneurial business ventures rather than go to work for someone else. My research examines immigrant-owned entrepreneurial establishments along two business corridors in metropolitan Birmingham, Alabama, a middle-tier metropolitan area that has experienced minimal in-migration in the last half century - but is now receiving more and more immigrants from many places. In this paper I examine the following issues: (1) factors leading to the development of

Birmingham's international corridor, (2) the reasons immigrant-entrepreneurs came to Birmingham specifically and the results of their presence in the area, (3) determinants of the location of the international corridor, and (4) the perceptions of immigrant entrepreneurs by local government officials. I address these issues using a multi-method approach that includes statistical analysis, archival research, personal observations and semi-structured open-ended interviews.

Keywords: Migration, Entrepreneurship, Ethnic Enclave, International Corridor, Birmingham, Alabama, U.S. South

Melanie Hughes McDermott, Rutgers University. Email: mmcdermott@aesop.rutgers.edu; *Locating Benefits: Decision-making, Resource Access and Equity in U.S. Community-Based Forestry*

The Ford Foundation's Community-based Forestry Demonstration Program, implemented over five years at thirteen pilot sites, represents an important experiment in community natural resource management in the United States. In its call for proposals and subsequent assessments, the Ford program promoted a prominent model, or ideal, of community natural resource management in which a defining feature is the simultaneous, balanced pursuit of ecological, economic and social goals (often symbolized as the "three-legged stool," or "triple bottom line"). In fact, an in-depth ethnographic examination of two of the pilot sites, one in southwestern New Mexico, and one in western Alabama, finds that these initiatives do not match up well to this model. However, a view through an alternative lens tells a different story. Rather than characterizing the outcomes of community natural resource management, this alternative framework examines the causes, or mechanisms, through which it acts, asserting that it will bring about social change (generate benefits), when it shifts: (1) who has a role in making what decisions about forest management, and (2) who gets access to what resources (e.g., forest, capital, knowledge). Both cases met these foundational criteria, yet were pursuing ecology, economy and equity in sequence (and with uneven emphasis), rather than as an integrated whole. We also found that who among community members gained access to resources and decision-making influence (1) reflected the distribution of power, cultural values, and racial/ethnic dynamics in the community, and (2) largely predicted who benefited from community natural resource management.

Ashley McDonald, Mississippi State University. Email: anm68@msstate.edu; Grady Dixon, Dr., Mississippi State University. Email: ; *Variation in Storm Surge Height: Result of Coastal Geography*

Hurricanes strike the United States coast annually, and with each land-falling storm there is potential for significant damage as a result of storm surge. Storm surge causes most coastal devastation and it is generally accepted that hurricane strength, categorized by the Saffir-Simpson scale, and storm surge are directly proportional. Because this scale does not include storm surge and other land-sea interactions, it inadequately reflects effects a hurricane can have on the coast at landfall, which consequently leads to underestimated predictions of potential damage. Since most destruction occurs from storm surge, variables contributing to storm surge become the most important factors when assessing damage potential. For this study, coastal geography and bathymetry are examined as major variables contributing to storm surge heights. The Gulf Coast and Atlantic Coast are divided into 5 basins, based upon geographical similarities and bathymetric structure; resulting storm surge from hurricanes, within the same category and having similar environmental variables, are then compared for each basin. Thus, two hurricanes of equal strength, which make landfall at two separate locations having different coastal geography and/or bathymetry, can have a considerable storm surge difference, although categorically identical. In order to provide timely, accurate forecasts and proper projection of potential damage, this research will improve the understanding of variables contributing to storm surge and the inconsistencies with the Saffir-Simpson scale.

Darrel L. McDonald, Ph.D., Stephen F Austin State University. Email: dmcDonald@sfasu.edu; Daniel Scognamiglio, Ph.D., Stephen F. Austin State University. Email: dscognamiglio@sfasu.edu; *Aspects of Sacred Space Spatiality Arising from Mapping of Selected East Texas Counties Cemeteries*

The earliest cemeteries in East Texas were attributed to Caddoan groups. Few of their mound burials remain on the landscape today. Later, Spaniards established cemeteries but, again, these sacred places were essentially erased by later settlers. The present cultural cemetery landscape dates from the early 19th century when Euro-Americans moved into East Texas. The study examined the spatial and temporal affinities of nearly 800 cemeteries located in Nacogdoches and Angelina Counties. GPS locations, orientation and temporal factors were analyzed to better understand cultural processes at work from the 19th century to present. Temporal analysis indicated a general trend from church affiliated

cemeteries to community related cemeteries to an increase in city-based internments, although in recent years there has been a change toward an increasing number of family cemeteries located on private land. Spatial patterns displayed a wide variety of orientation patterns, with an eastern facing entrance gate most common. Additionally, cemeteries tended to occupy mid to upper slopes, understandably, that insured longevity by reducing the potential for disturbance of the cemetery landscapes. Currently an important spatial interpretation challenge for many of the older cemeteries is the fact that intra-spatial mapping was less organized after establishment, record keeping was minimal which has now given rise to considerable issues of does the cemetery have room for more internments or is the cemetery full.

Keywords: Sacred Space, Spatial Analysis, East Texas Cemeteries

David A. McDonald, Queen's University. Email: dm23@post.queensu.ca; *Electric Capitalism: Recolonizing Africa on the Power Grid*

The electricity sector in South and Southern Africa has been undergoing massive reforms over the past ten years as it moves towards more commercially-oriented and privately-managed networks. These reforms are having enormous implications for the way that electricity is generated, priced and consumed in the region. From the introduction of private producers to cost reflective pricing to a renewed push for nuclear power to the creation of a Southern African Power Pool, changes appear to be geared primarily for the benefit of capital at the expense of affordable and sustainable energy for the poor. So too have large South African electricity actors - such as the massive state-owned Eskom - been expanding elsewhere on the continent, privatizing and commercializing electricity systems throughout Africa. This paper provides an overview of these developments, situated within a critical perspective of neoliberal reforms in Southern Africa more generally.

Mary G. McDonald, University of Hawaii. Email: mcdonald@hawaii.edu; *Historical Land Systems in Japan: Knowing Time Through Space*

This paper traces changes in Japan's historical land systems in relation to knowledge and state projects. Periodizations of the Japanese past conform so closely to transformations in tenure systems that consciousness of history appears predicated on the knowledge of reconfigurations of land rights. That is to say, time is known largely through space. Knowledge of Japan's historical geographies has not been continuously accreted, but has been excavated and inserted into "order" for two millennia. Land systems and knowledge about them have long been state projects. Nineteenth century cadastral reforms marked an ontological and epistemological modernization and commoditization of space. The modern state must repeatedly reposition land in communitarian time and space while deploying land into circuits of accumulation and differentiation.

To provide an understanding of river and floodplain processes for restoration decisions, we used historical aerial photographs and maps, LIDAR data, soil maps, and field stratigraphic investigations to map the floodplain and present and former channel positions for a 150km-long river section. The Sprague has alternating wide and narrow valley segments, with a high-sinuosity (1.5-1.9), low-gradient (

Hungary, culturally, geographically and linguistically has had a complex relationship with notions of "Europe" and "Europeanness" since at least the conversion to Roman Catholicism by St. Istvan in the 10th century. The vicissitudes of Hungary during the 20th century further complicated the picture.

Fifteen years on from the end of communism, the place of Hungary within Europe, as East, Central or just Europe still remains a salient point of conversation within and outside the country. This paper addresses the question of how foreign visitors to the Hungarian capital of Budapest interpret and understand the place of Hungarian culture within a larger “European” cultural context. Visitors were interviewed on the streets of Budapest regarding their pre-conceptions of what they would find in the city, their familiarity with Hungarian culture and their interpretations of a Hungarian cultural identity within the cosmopolitan cityscape of the capital. Other visitors were given disposable cameras and instructed to take pictures of the non-monumental parts of the city which for them seemed particularly or uniquely Hungarian. This paper will discuss the results of this research, interpreting perceptions of Hungarian culture against the larger backdrop of “Europe.”

James Metzger, West Chester University. Email: jimatwcu@gmail.com; Using GIS to Model First Responder Communications System Antenna Placement

Police, Fire, and Emergency Services demand reliability for their radio communications systems while performing their duties. These systems rely heavily upon proper transmitter and receiver antenna placement to insure the highest quality of service. With the natural variations in terrain, antenna height and visibility are key factors in any radio system’s performance. Using digital elevation data and the terrain analysis tools in ArcGIS, the viewshed for a proposed system is shown. With the addition of transmitter power and antenna efficiency, the model can show coverage range. These results can be used to assess the dependability of an existing system, as well as being used as a planning tool for new and expanded systems. A CommunityViz interface is used to make dynamic changes for antenna and transmitter characteristics. The model makes use of map displays, using both aerial photographs and street maps, for presentation to the end user.

Martin Meyer, SPRU - University of Sussex & SooS, K.U. Leuven. Email: m.s.meyer@sussex.ac.uk; The emergence of nanotechnology: Why can there be regional concentration without regional clusters?

Previous research indicated that research and development activity in nanoscience and nanotechnology is concentrated on a comparatively small number of regions. Policies in a range of countries have supported the creation of regional nanotechnology clusters. However, more recent work seems to suggest, at least for a number of cases, that networks of collaboration among nanotechnology firms are technologically driven rather than localised in individual regions. In other words, even though one can trace regional concentration of scientific and technological activity in this emergent area, collaboration at the regional level is not as forthcoming as one may have thought. This study seeks to explore some of the reasons for this situation and draws on a multi-method approach, examining bibliometric, patent and firm-level data. Our observations suggest that nanotechnology is still an area of loosely coupled, inter-related and overlapping rather than broadly converging technologies. One can still track quite distinct technological clusters. While a considerable number of nanotechnology firms cater to a range of markets, only very few firms could be identified that integrate nano-scale technologies. Before the background of these findings, the apparent paradox of strong regional concentration of R&D activity without a corresponding intensity of collaboration within the region seems less surprising.

Sherry A. Meyer, University of Wisconsin - Milwaukee. Email: sameyer@uwm.edu; Placing the Putative within Policy: Environmental Illness and the Spatial Endeavor for Health

An emerging and contested condition, environmental illness (also known as multiple chemical sensitivity), remains putative. This situation presents challenges for anyone who comes face to face with it, whether doctor, lawyer, insurer, government employee, neighbor or the person living with environmental illness. Set against backdrops of site and situation, the present research examines the ways in which persons with environmental illness respond to and manage their illness within the bounds of space and scale, endeavoring to stabilize and restore their health. Analyses of the data may reveal patterns and processes which can inform policy makers.

Klaus J. Meyer-Arendt, University of West Florida. Email: kjma@uwf.edu; Jon Oravetz, University of West Florida. Email: jro8@students.uwf.edu; Chris Houser, University of West Florida. Email: chouser@uwf.edu; Geomorphic Impacts of Hurricane Katrina Upon the Mississippi Barrier Islands

The Mississippi barrier islands (Petit Bois, Horn, Ship, and Cat) are undeveloped and mostly within the Gulf Islands National Seashore. Originating via a combination of shoal emergence and westward longshore drift, today they appear to maintain themselves as independent sediment cells. Mid-latitude and tropical cyclonic storms have flattened dunes and re-shaped island morphology over the years, and this has rendered the islands more vulnerable during subsequent storms. This NPS-funded study documented geomorphic impacts of Hurricane Katrina and their effects upon island recovery and vulnerability to future storms. Subaerial morphologic change was documented by analysis of pre- and post-storm elevation profiles extracted from NOAA LiDAR data. Bathymetric profiles, spaced at 400m intervals and extended out 1 km on both the Gulf and Sound sides, were generated by echo sounder and compared with pre-storm bathymetric data. Subaerial and subaqueous profiles were lined up across the islands, and empirical orthogonal functions (EOF) analysis was used to identify characteristic island profiles. Results from Petit Bois Island indicate significant dune flattening and shoreline erosion. Despite the erosion, the Gulf bathymetry showed little change, but Sound bathymetric profiles revealed both scour and overwash deposition. Where pre-storm dunes were low (western end), storm surge overwash caused extensive scouring as evidenced by bathymetric ‘drop-off’. In areas of higher dunes (center) or forest (east), soundside deposition was more characteristic. For the Mississippi barrier islands, such morphologic change—and associated redistribution of sediment—is considered to be an important control on the rate and variability of dune and island recovery

Nadia Mian, New School University. Email: nadie19@hotmail.com; The Redevelopment of Religious Institutions

This paper will explore the redevelopment activities of religious institutions in both the United States and England. In recent years, throughout the United States and England, decentralization, immigration, and new religious practices have led to the redevelopment of declining urban religious spaces. In order to raise funds, churches are entering into agreements with developers to sell their air rights and create spaces comprising of religious, residential and commercial activities. While each country has adopted a similar attitude towards dealing with the issue of declining churches, the method/process each utilizes differs. The Church of England has set up a system through which the Redundant Churches Commission deems churches “redundant” and deals with them accordingly. In the United States, no such hierarchical organizational religious body exists, and declining churches are dealt with on an individual basis by each parish. In addition, immigration, new methods of practicing religion, and spatial shifts in population have led to more religious diversity and triggered a demand for new religious spaces. The effects of this demand have led to the “shrinkage” of major churches and the commodification of religious spaces, with more and more religious institutions acting as financiers and developers. This paper will reveal how the transformation of the urban landscape has led to the need to examine how religious institutions re-utilize land in urban spaces, look for new sources of income from real estate, while at the same time attempting to minimize community conflict.

Franca Miani, University Of Parma. Email: miani@unipr.it; Urban Challenge in “Global” China

China’s urban growth represents a considerable geographical laboratory with remarkable political and social consequences. During the past decade the most important cities have experienced massive growth in economy, population, transport, consumption and land use. These changes are causing massive strain on metropolitan’s existing cores, and question the manner of expansion. To meet this challenge the essay, starting from a social-economic analysis, deals with a new interpretation of sub-urbanism with particular reference to the metropolitan area of Shanghai.

Email: mhtaio@163.com; *Technological learning through networking in Chinese inland economic and technological development zones: case study of Zhengzhou, Henan Province*

Regional technological learning and global-local production network are the two stirring research themes in contemporary mainstream economic geography. Although a large recent body of work in the theoretical formations of and case studies on 'industrial districts', 'new industrial space', 'agglomeration', 'innovative milieus', 'regional innovation systems', 'learning regions' and 'clusters' has explored the driving forces to promote economic successes of some localities in mature capitalist economies such as 'Third Italy', 'Silicon Valley', 'Baden Württemberg', the natures and patterns of learning and networking and their relationships in other localities especially in less favored regions in developing countries remain relatively under-researched. This paper is based on a questionnaire of nearly 100 companies and some field interviews that capture the cooperation patterns of firms in Zhengzhou economic and technological development zone (ETDZ), a less developed one in 54 national ETDZs in China, to discuss the possibilities and difficulties for companies to make their technological upgrading and innovation by networking. The findings presented in this paper confirm that whereas both local and non-local networking with other companies, universities and public research organizations are vital for companies in Zhengzhou ETDZ to get new ideas and design new products, there exist different patterns and difficulties of networking for different companies with reference to their sizes, property rights and independent R&D capacities. Learning through cooperation with foreign companies is a complex bargaining process and successful technological upgrading and innovation depend on a set of requirements, not just networking.

Xin Miao, Missouri State University. Email: XinMiao@missouristate.edu; Melida Gutierrez, Missouri State University. Email: MGutierrez@MissouriState.edu; Elias Johnson, Missouri State University. Email: ; *Land Use and Land Cover Change Detection in the Rio Conchos Basin in Mexico using Multi-year TM images*

Land management in the arid areas in northern Mexico required extensive land use / land cover spatial information. In order to overcome the limitations in road accessibility and availability of detailed field data, four-year (2000-2003) Landsat Thematic Mapper (TM) images have been collected in the Rio Conchos basin. The Rio Conchos basin is part of the Rio Grande basin shared by Mexico and United States of America. The Rio Conchos is a major river in northern Mexico, flowing through the Chihuahuan Desert. Variations in the amount of water flowing from the Rio Conchos into the Rio Grande have been identified as the most important potential impact to the water supply of the lower Rio Grande basin. Environmental concerns arose because the non-native riparian vegetation salt cedar or tamarisk (*Tamarix ramosissima* Ledeb.) had started to invade along some tributaries of Rio Conchos. Salt cedar is considered a severe threat to the structure and stability of riparian plant communities, and it consumes tremendous amounts of water, drawing down ground water and drying up springs. Furthermore, its leaves are concentrated with salts, which when released on the surface can prevent colonization of many native plant species. The objectives of this study are (1) to investigate land cover / land use spatial information in the Rio Conchos Basin in northern Mexico through multi-year TM images, emphasizing non-native riparian vegetation salt cedar; (2) to conduct a land cover / land use change detection analysis to help improve the land management.

Bernardo A Michael, messiah college. Email: bmichael@messiah.edu; *Cultures of Governance and the Production of Space Along the Anglo-Gorkha Frontier, 1780-1814*

This paper seeks to understand how elite and subaltern actors produced space [territory] along the frontier separating the possessions of the English East India Company and the Himalayan kingdom of Gorkha (present-day Nepal) in the early nineteenth century. Territorial disputes between the two powers ultimately resulted in the Anglo-Gorkha War of 1814-1816. Historical research on the circumstances leading to this war provides valuable insights into the practices of governance that produced the space of the Anglo-Gorkha frontier. I will examine the activities of local elites like one Mirza Abdullah Beg whose shifting political loyalties to kingdoms?large and small?produced a fluctuating geography of state spaces. Moreover, the presence of a malarial forested frontier and a mobile labor force added even greater fluidity to the organization of territory along the Anglo-Gorkha frontier. Consequently many districts lying

along this frontier displayed discontinuous bodies and boundaries that remained inconstant. It might be argued that such spatial slippage exacerbated tensions between the British and the Gorkhalis and ultimately contributed to the outbreak of war in 1816. While this paper is based on research conducted at various archival holdings spread over north India, Nepal, and Great Britain, such a historical exploration places limits on the extent to which we can glean information to reconstruct the links between performative practices and the production of space in the not too recent past. [226 words]

Keywords: English East India Company, Gorkha, Mirza Abdullah Beg, space, territory

Kristen L. Michaud, University of Massachusetts-Amherst. Email: klm2905@yahoo.com; *Sense of Community: A Geographic Perspective of Japanese Exclusion During WWII*

The Japanese American community in pre-war times on the west coast was active and culturally vibrant. Their clustered communities were based on limitations set by American society as Japantowns and similar enclaves developed up and down the west coast. With the signing of Executive Order 9066 and the process of internment, Japanese American communities were forever changed. In light of this change, new communities inside the internment camps soon developed. Those stuck inside the barbed wire communities did what they could to sustain their way of life. This paper describes the change of a sense of community during internment. Focus will be placed on the period before the war, during the war, and after resettlement. The Japanese Americans in this period of US history were extremely resilient and intent on keeping their heritage and spirits alive. The sense of community for this particular group of people may have changed geographically, but their overall culture never wavered.

Email: cgibson@uow.edu.au; Andrew Gorman-Murray, University of Wollongong. Email: andrewgm@uow.edu.au; *Get into the groove: the role of sound in generating a sense of belonging at street parades*

In this paper, we explore the role of music in constituting particular spaces and identities that arise within street parades. We examine the ways music can give us access to our emotional and affective states, and the significance of these states on formations of identity, community, as well as senses of belonging or exclusion. This particular case study raises issues around notions of the constitution of rural places, and the role of music in reaffirming or challenging accepted ideas of who inhabits these places. Two street parades from two different festivals in the same town are compared: one at the Daylesford ChillOut Festival (the largest non-metropolitan gay and lesbian festival in Australia); the other as part of the Daylesford-Hepburn Springs Swiss-Italian Festa. We focus on the bodily and emotional responses to the music and sounds of these street parades, and introduce the concept of rhythmic spaces as a way of understanding how music and sound constitute forms of non-verbal aural communication and subsequently shapes notions of belonging and community. Our article also discusses the importance of non-representational theory and methods in understanding the role of music in place-making.

Akihiko Michimi, University of Connecticut. Email: akihiko.michimi@uconn.edu; *Regional Variations in Dietary Intakes of Black Urbanites: Empirical Findings from Public Health Surveillance Databases*

The health status of blacks has received increasing attention in public health to document health disparities. The scale of analysis, however, is often limited to the national level, due to confidentiality issues affecting dissemination of data. The Third National Health and Nutrition Examination Survey (NHANES III), implemented from 1988 to 1994, provides a nationally representative database on health and dietary intakes of the general population and data are disaggregated to the U.S. Census regions as well as urban/rural areas. Using data from the NHANES III, this paper examines the regional variations in dietary intakes of black urbanites in response to the South's vibrant economy and the recent North-to-South migration trends of African Americans. The African American migrants who move from northern to southern metropolitan areas are generally younger and have a higher socioeconomic status than those who stay in the North. Therefore, it is hypothesized that due to the positive addition of healthy migrants, Southern Black urbanites are likely to show dietary patterns that promote or maintain good health, compared to their counterparts in the North and to rural blacks in the South.

Ryo Michishita, University of Utah. Email: ryo.michishita@geog.utah.edu; Bing Xu, University of Utah. Email: bing.xu@geog.utah.edu; Ikuho Yamada, University of Utah. Email: ikuho.yamada@geog.utah.edu; Time-series analysis of air passenger transportation networks in Japan 1985-2005

Due to the airline deregulation in 1985, a series of new airport developments in the 1990s and 2000s, and the reorganization of airline companies in the 2000s, Japan's air passenger transportation has been dramatically altered in the last two decades in many ways. In this paper, the authors examine how the network and flow structures of domestic air passenger transportation in Japan have geographically changed since 1985 with a focus on the impacts of these changes. For this purpose, passenger flow data in 1985, 1995, and 2005 are extracted from Air transportation statistical survey conducted by the Ministry of Land, Infrastructure and Transport, Japan. First, development of the network structure is evaluated via dominant flow, network density, and centrality (path length) analyses. Second, changes in the passenger flows over the network are examined with respect to their spatial and network autocorrelations. The passenger flow data are first examined as a whole and then divided into three carrier-based categories. The results indicate that a hub-and-spoke system has evolved from 1985 to 2005 in Japan and that excess concentration of flights and passengers on Haneda Airport, which serves for the Tokyo metropolitan area, is still increasing regardless of its shortage of departure and arrival slots.

Keywords: air transport geography, Japan, network analysis, time-series analysis, hub-and-spoke system

Barry Russell Middleton, geographer, United States Geological Survey. Email: bmiddleton@usgs.gov; Ed Pfeifer, United States Geologic Survey. Email: epfeifer@usgs.gov; Satellite-based monitoring of rangeland health on the San Carlos Apache Indian Reservation and comparison sites in southern Arizona and southwestern New Mexico

A significant part of the San Carlos Indian Reservation economy depends on grazing, and careful assessment and management of these semiarid grassland communities is important to the sustained utilization of this dwindling resource. Attention to rangeland health is becoming increasingly critical as desertification processes can be greatly accelerated during times of drought. Many of these desertification effects may prove irreversible, and timely information about trends in grassland health indicators could prove invaluable. Estimates on the health of reservation rangelands are being obtained by the analysis of calibrated multi-temporal satellite datasets (totaling over 100 "single-date" images) to quantify vegetative activity and gather phenological information on annual and perennial plant activity. Grassland areas most affected by desertification processes can be expected to show increased activity (relative to more "pristine" grasslands) during the spring annual, desert shrub, and nonnative grass growth periods and decreased activity during the late summer/early fall perennial native grass green-up. Calibrated vegetation indices derived from multi-temporal Landsat and Moderate Resolution Imaging Spectroradiometer (MODIS) satellite data collected over a 17-year period are being used to map and monitor the relative condition and productivity trends of the San Carlos tribe's primary grazing area on Ash Flat. Processed images highlight 750m-square areas that are becoming divergent from designated, lightly or nongrazed native grassland control sites within selected, well-managed grassland preserves in southern Arizona and southwestern New Mexico. This research attempts to provide reservation land managers with easily interpretable image products reflecting the effectiveness of their rangeland management practices over vast areas.

Beth Rose Middleton, UC Berkeley. Email: bethrose@nature.berkeley.edu; "We Were Here, We Are Here, We Will Always Be Here:" Activism, Identity, and Healing in Mountain Maidu Country

This project focuses on historic and current Mountain Maidu activism to protect, access, and control land and other natural resources. I demonstrate some of this activism spatially using previously unavailable GIS visualizations of Maidu allotment lands. The map represents a limited assertion of spatial representation, as it illustrates the racialized, gendered enclosure movement that accompanied colonialism. The map also raises current questions of access to, ownership, and use of sensitive property information in an arena fraught with conflict over historically unresolved land grants and takings. With the allotment era as one salient example, and drawing on information on activism during the land claims, termination, and self-determination eras in Federal Indian policy, what have been the scope and character of ongoing Maidu activism for natural resources? Why haven't efforts been successful for the community as a whole (recognized and unrecognized tribal members)? Theoretical perspectives from social movements literature, political ecology, and critical race theory inform this exploration of activism and identity, and help to answer whether Maidu activism can be seen as a source of healing from intergenerational trauma due to ongoing colonialism.

Preliminary results highlight the role of governance in creating the community capacity for effective action, and the challenges posed by historic representations of Maidu identity, including internal/external expectations of cultural purity. Finally, as a rural woman of color, I confront my own commitments to ideals of information sharing and justice, as I simultaneously negotiate conflicts over representation, governance, and resources within and outside of the community.

Keywords: Native American, indigeneity, GIS, representation, activism, healing, intergenerational trauma, political ecology, natural resources, race

Erin Middleton, UCSB. Email: erin@geog.ucsb.edu; School Choice and School Location: Why Families Choose

While school choice has often been debated in the education literature, seldom is the relationship between school selection and school location explored. To examine this topic, in-depth interview with parents were conducted in a small urban school district, with a majority enrollment of Hispanic students and a long history of public school choice. Based on these interviews, a tentative model of the school choice process is proposed. First, parents use information networks and school location to construct a list of potential schools. Next, parents gather information about this subset of district schools. Based on this new information, parents ultimately select a school. For one set of parents, it is the proximity of the school to their place of work, their home or their children's caregivers that dictates their final selection. These families generally have no stay-at-home parent, inflexible work schedules, limited housing choices due to living in apartments or subsidized housing, and are more likely to be Hispanic. For other parents, it is a school's prime location on their social network that influences where their children enroll. Due to one parent having a flexible work schedule or staying at home, these families are able to devote more time to transporting their children to school and volunteering at the school. Though parent's definition of "closeness" varies, each parent sent their children to their closest school.

Jennie Middleton. Email: jennie.middleton@kcl.ac.uk; 'Dogs, babies and buses': the social dimensions of pedestrian movement

There are repeated claims within UK urban and pedestrian policy that walking encourages 'social mixing', 'community cohesion' and 'social interaction' (DfT, 2004; TfL, 2004, 2005). However, within these documents such terms are rarely unpacked as to what they actually mean or the specific role walking has in facilitating them. This paper draws on research in London investigating the many different types, forms and characters of walking and in doing so seeks to address questions that include; what are the nature of social interactions on foot? Who are they with, what initiates them and how do they unfold? And in what ways are the social dimensions of walking best understood and conceptualised? It is argued that urban and pedestrian policy oversimplify the relationship between walking and the social exchanges it is said to promote. Drawing upon Sack's (1992) concept of the 'ticket', dogs, babies and material objects are suggested as highly significant as initiators of social interaction on foot. In addition, 'integrative events' (Sacks, 1992) are also argued as key dimensions of exchange between pedestrian strangers. Attention is also drawn to the significance of walking in maintaining existing social relations as opposed to it creating new ones. This significance makes visible social relations beyond the immediate local area that are mainly ignored by urban policy as it engages with notions of 'community'. It is concluded that the social dimensions of urban pedestrian movement can only be fully understood in the context of a complex web of relational social networks.

Keywords: walking, social interaction, tickets, integrative events

Richard Stephen Middleton, Los Alamos National Laboratory. Email: rsm@lanl.gov; Optimization for carbon capture and sequestration

Many strategies exist for minimizing anthropogenic carbon dioxide (CO₂) emissions, such as use of alternative fuels. Because fossil fuels will continue to be a cheap and abundant source of energy (the United States, for example, has hundreds of years of known fossil fuel reserves), it is essential to develop 'clean' methods to, in particular, convert coal to electrical power. Carbon capture and sequestration (CCS) is the process of capturing CO₂ at its source and sequestering it in geologic reservoirs. To date, much effort has been devoted to both the capture and sequestration processes. However, little research has focused on linking the capture and sequestration processes; to maximize the benefit of CCS, CO₂ will be efficiently allocated from sources to sinks. I present an optimization/linear programming (LP) model that minimizes the cost of sequestering CO₂ (pipeline construction and maintenance, CO₂ flow and injection) between sets of CO₂ sources and carbon sinks. Further, I discuss future directions for this research, such as modeling the uncertainty of carbon reservoir capacities and consequent dynamic allocation of CO₂.

Keywords: optimization, CO₂, energy, linear programming

Mara Miele, Dr., Cardiff University. Email: MieleM@cardiff.ac.uk; Adrian Bruce Evans, Dr, Cardiff University. Email: evansa18@cardiff.ac.uk; *Animal welfare and ordinary consumption: towards an alternative ethic of embodied care.*

Many accounts of politico-ethical consumption adopt a traditional approach to ethics, which focuses on the intentional motivations behind consumer choices. However, these accounts do not sit comfortably with broader theorisations of consumption, which view everyday consumption practices as basically 'repetitive, intuitive and inventive' (Hermes 1993) and as practical-moral rather than abstract-intellectualised (Miller et al 1998). In this paper we seek to develop an alternative account of consumer responsibility/care that draws on Varela's (1999) contention that 'a wise (or virtuous) person is one who knows what is good and spontaneously does it.' More specifically, we draw on focus group research conducted in Italy and the UK, to argue that consumers often purchase animal welfare-friendly goods for practical reasons (such as taste, visual presentation and the specific characteristics of the space in which the product is encountered) rather than as a result of a highly reflexive ethical strategy. Crucially, however, we contend that although these practical desires are largely intangible and highly context-dependent, they still embody complex ethical, political and aesthetic dimensions that are worthy of further consideration (see Stati 1999). For example, we critically examine the notion of 'taste' by illustrating how this seemingly mundane and static sensation is influenced by wider performative settings (see Teil and Hennion 2004) and by showing how taste sensations can incorporate ethical values. Furthermore, we illustrate how consumption spaces (e.g. supermarkets, butcher shops and restaurants) materialise different values, which in turn provides consumers with a more experiential means of evaluating different ethical relationships to food.

Keywords: consumption, ethics, embodiment

Robert Mielke, Nicolet Area Technical College. Email: rmielke@nicoletcollege.edu; Paul O. Ehlers, Nicolet College. Email: pehlers@nicoletcollege.edu; *Finding Home: Using GIS to Delineate a Vernacular Region*

Geographers have long used the "regional" concept to organize Earth into manageable units. A "vernacular" region is said to exist in the minds of the people who live there: people know where they live. As with all regions, delimiting the boundaries of Wisconsin's "Northwoods" is problematic. One technique is to assume business names determine the sense of a place and its limits. The business would want to capture the sense of loyalty and belonging of the inhabitants by using regional identity as part of its name and marketing efforts. Business names containing "northwoods" and their zip codes were located using yellowpages.com, manually entered into a Microsoft Access database, and joined with a zip_usa.shp file. Zip codes containing "northwoods" business names were color differentiated and a visual display of the vernacular region of the "Northwoods" was viewed. The students created their boundary delimiting the "Northwoods" and created a map of their region.

Monika Mihar, University of Memphis. Email: mmihar1@memphis.edu; Thad A Waskiewicz, University of Memphis. Email: twsklwcz@memphis.edu; *A Comparison of Arid and Humid Debris Flow Fans with the Aid of High-resolution DEMs*

Regional climatic differences have spurred debates over environmental controls on fan evolution. Early hypotheses proposed formative processes were different for "dry" (arid and semi-arid) and "wet" (humid) environments. Dry fans were characterized as being dominated by debris-flow processes, whereas fluvial processes dominated humid fans. Numerous studies have disputed this earlier notion as well as provided new insights into the role of regional variability in fan dynamics. However, the research conducted to date has been based on qualitative observations, planimetric measures, and stratigraphic relations between fans in different environmental settings. There have been no studies conducted that used quantifiable measures of 3D form (surface complexity) to determine if relationships exist. Combined geomorphometric parameters extracted from high-resolution DEM values are generated for comparison of surface complexity of debris flow fans from Japan and Death Valley. The preliminary results indicate the spatial patterns of surface complexity do not differ despite considerable differences in the environmental setting of the fans. The results indicate the impacts of regional variability are not a driving factor in determining surface complexity.

Rhiannon Mihld, Cal State University Fullerton. Email: rhiannon@fullerton.edu; *Living Beyond Our Means: A study of housing prices versus income levels in Los Angeles*

The issue of rising home costs presents a new field of research which examines many different levels of real estate patterns including reasons for market spikes and the history of home buying in specific urban and suburban geographical regions. When combined with a comparison of home owner income levels, there lies a new dimension of research comparing home owners who can afford the houses they live in, and home owners who simply can't. As the market for houses in the Los Angeles area rises beyond average affordability, the logical assumption would be that people would stop buying houses. This certainly has not been the case. In order to reside in metropolitan Los Angeles, a rapidly growing majority of home buyers push beyond their financial means and often pay much more than they can afford. A healthy amount of income spent on a house payment per month, according to budget guidelines, is one third of the buyers' income. In most cases, we will see home owners over burden themselves to extreme lengths, far above the one third mark, in order to live in the Los Angeles area. Using GIS, I will explain these patterns and map the areas of metropolitan Los Angeles where home owners are more and less financially over extended. Are people more willing to live beyond their means in Santa Clarita or Santa Ana, Manhattan Beach or Laguna Beach, Beverly Hills or Anaheim Hills?

Keywords: housing costs, housing affordability, income levels, Los Angeles, GIS

Paul Milbourne, Cardiff University. Email: milbournep@cardiff.ac.uk; *Socio-natural Belongings and Exclusions: young people's experiences of environmental regeneration in ex-industrial spaces in Britain*

This paper explores the position of children and young people within community forest projects in Britain. These projects have sought to engender both socio-economic regeneration and environmental restoration in areas characterised by high levels of socio-economic disadvantage and considerable environmental degradation linked to the previous operations of extractive capital. The paper draws on findings from recent locality studies in three of these forests - two in England and one in Scotland - which have involved group discussions, depth interviews and ethnographic research with different social groups. In particular, it discusses findings from the work with school children and youth groups in these localities. Attention is given to young people's perceptions of and interactions with their local socio-natural environments, their attitudes towards local mining activities and their feelings towards and involvements with the community forest projects. The research findings not only highlight young people's multiple and conflicting constructions of their local environments - as spaces of inclusion and exclusion, of safety and fear, and of freedom and constraint ? but also the complex connections that exist between social and environmental forms of (in)justice in different localities.

Keywords: environmental regeneration, disadvantage, young people's experiences

Anelia Milbrandt, NREL. Email: anelia_milbrandt@nrel.gov; Margo Melendez, NREL. Email: margo_melendez@nrel.gov; *Hydrogen Infrastructure Demand and Development*

Infrastructure development analysis plays a critical role in understanding the best methods and techniques to use in the nascent hydrogen economy to foster hydrogen use in transportation. Most alternative fuel experts agree that infrastructure issues have been among the top barriers to transitioning to alternative transportation fuels. Matching emerging hydrogen vehicle demand with emerging infrastructure is critical to a successful transition. Because demand varies spatially, using a geographic information system (GIS) method to differentiate demand across the country is advantageous in assisting hydrogen stakeholders in targeting key markets. Key attributes of consumers, fleets, and policies were identified as critical for market acceptance of hydrogen vehicles. Consumer attributes are those that describe the consumer themselves, such as income, education level, and the number of vehicles they own. Fleet attributes are those that describe the location and size of fleets. Policy attributes are those that are the result of external factors that influence the market for hydrogen vehicles, such as government incentives and local air quality. These attributes lay the foundation for analysis of how these efforts combine, resulting in the most preferred or likely locations for hydrogen demand to grow. The attributes were spatially quantified using GIS. They were combined with other attributes to illustrate hydrogen demand across the United States, within regions and metropolitan areas.

The New York metropolitan area, like other urban areas in the US, suffers from severe highway congestion. And, like other metropolitan areas, congestion in the New York region is forecast to only get worse. As one part of dealing with this problem, the region is exploring the expansion of waterborne transportation for both freight and passengers. The New York Metropolitan Transportation Council (NYMTC), the Federally-designated Metropolitan Planning Organization (MPO) for the New York City area, is one of the key players in studying the potential of an increased role for waterborne transport. We have recently contracted with NYMTC to assist them in the assessment and evaluation of both the current and future potential of sites suitable for the development of facilities to support waterborne transportation of people and freight. Specifically, the study focuses on the development of assessment criteria to optimize under-utilized marine transportation resources and services. In the study we review previous research about the waterborne transportation needs of the region; interview local experts who are responsible for the development and maintenance of waterborne transportation infrastructure; develop criteria to assess the viability of existing and potential sites that can be used for the development of facilities and infrastructure to support waterborne transportation; and evaluate and prioritize sites for development. In our interactive short paper presentation we will report on the progress of our work.

Keywords: water transportation; waterborne transportation

B. Lynne Milgram, Ph.D., Ontario College of Art & Design. Email: lmilgram@faculty.ocad.ca; *Negotiating Urban Activism: Street Vending, Space and Class in the Northern Philippines*

Throughout regions of the South, structural adjustment policies and the changing economic base from agriculture to industry have created new work opportunities for some and instances of constraint for others. In the northern Philippines, such social and economic transformations are particularly visible in the growing number of street vendors who, through their trade, have reconfigured the urban streetscapes (sidewalks and roadways) of Baguio City - the region's administrative and only highly industrialized center. In this paper, I focus specifically on women's work as street vendors to argue that female entrepreneurs sustain this new livelihood by engaging in everyday forms of activism that unsettle essentialist categories of work, class and space. That many of their new livelihood projects take place on urban streets or within civic spaces often reserved for "public" rather than "private" use further challenges the very existence of these activities. Indeed, in May 2006, Baguio City Hall issued new by-laws banning all vendors from public venues. Street sellers, many of whom are unskilled and have migrated to the city from rural provinces may appear to be unlikely candidates for labor organizing. I demonstrate, however, that female street vendors have maintained their captured landscape by organizing into associations while forging alternative linkages with government and non-government sectors. In so doing, women's activism thus engages a "distinctly gendered politics of place" (Mills 2005) that has enabled them to mobilize despite the constraints they face.

Email: lonepine@bigsky.net; *Complex Responses of Subalpine Forests to Climate Change*

High elevation biota, including subalpine tree species and associated treeline, are commonly assumed to respond to global warming by migrating upslope. This assumption generates a conservation hypothesis that habitat will be lost as available area diminishes approaching mountain summits, with extirpations and extinctions as likely consequences. In recent years we have been studying recruitment, demography, and mortality of high-elevation forests in the Sierra Nevada, CA and Great Basin ranges, NV in response to paleoclimatic variability (past 3500 years) and to 20th-century warming and decadal variability. Conclusions from these studies suggest that subalpine forest responses to warming climates are more complex than simple movements upslope. Using examples from our studies, we propose the following types of responses to warming temperatures: I. Subalpine Forest Densification (no treeline change) A. General Subalpine Forest Infilling B. Treeline (Ecotonal Zone) Infilling C. Colonization of Formerly Persistent Snowfields D. Colonization of Subalpine Meadows II. Change in Tree Growth & Form (no treeline change) III. Change in Patterns of Forest Mortality (no treeline change) A. Change in Drought and Insect & Disease Effects B. Change in Genetic Diversity & Adaptation C. Change in Fire Relationships IV. Change in Geographic Aspect of Forests (no treeline change) V. Change in Elevation of Forests (with treeline change) A. Differential Shifts in Elevation by Species (individualistic) B. Shifts Down in Elevation C. Synchronous Shifts in Elevation by Multiple Species

Susan W.S. Millar, Syracuse University. Email: swmillar@maxwell.syr.edu; *Climate effects on winter snowpack and stream response in Central New York*

Historic changes in the hydroclimatic regime and its relation to hemispheric-scale atmospheric indices are examined for central New York for the period 1950 to 2006. Mean winter (Nov-Mar) temperature, winter precipitation, winter snow water equivalent (SWE), and snow to precipitation ratio (S/P) were obtained from the National Climate Data Center for Syracuse, Utica and Lowville. Winter (Nov-Mar) discharge, spring (Mar-May) discharge, and the winter/spring center of volume (WSCV) were obtained from USGS gauging stations on Oneida Creek and Independence River. Hydrological and climatological data were compared to indices for the North Atlantic Oscillation (NAO), the Pacific North American (PNA) Oscillation, the Pacific Decadal Oscillation (PDO) and the Southern Oscillation (SOI). Regional climate signals were derived using a Principal Components Analysis. Pearson correlation analyses with the PCs indicated that cold and snowy winters are negatively correlated with a negative NAO and positive SOI, greater stream discharge in spring, and later WSCV dates. Warm and wet winters are negatively associated with the PNA and PDO, experience earlier WSCV dates, and have greater winter discharge. Historic trends were examined using the Mann-Kendall test, and indicate that winter discharge in both streams has increased over the study period, and that SWE in Syracuse has decreased over the same period. It is likely that central New York is moderately influenced by the state of the NAO, and that this has a non-linear effect on hydroclimatology due to its impact on the contribution of lake effect versus mid-latitude cyclone-derived snow to the winter snowpack.

Keywords: lake-effect snow; central New York, hydroclimatology; hemispheric-scale oscillations

Ashley S Miller, . Email: miller60@students.rowan.edu; Joseph T Pantiliano, . Email: pantil93@students.rowan.edu; *Who Sprawls Most, North Jersey or South Jersey?*

Sprawl has become a major issue in New Jersey due to a vast increase in the popularity of the suburban lifestyle. Changes visible in the land use and landscape of the nation's most densely populated state suggest that sprawl has crept its way into all corners of the Garden State. The purpose of this poster presentation is to analyze the patterns of sprawl in both the northern and southern regions of the state of New Jersey. By utilizing the New Jersey Department of Environmental Protection (NJDEP) digital Land Use/Land Cover data set, state-wide patterns of urban and suburban growth were delineated and evaluated. The data sets used were from 3 different dates, 1986, 1995, as well as the newest set for 2002. The study evaluates the urbanization patterns and assesses the differences in these patterns between the northern and southern regions of the state. By looking at the number of acres of land consumed, the population growth, and the categories of

residential type developed, the results demonstrate that there is a significant difference in development patterns between northern and southern New Jersey.

Keywords: sprawl, njdep, new jersey, landuse

Byron A. Miller, University of Calgary. Email: byron.miller@ucalgary.ca; *Neoliberalism, Resistance, and Multi-Scalar Governance: Complexities and Contradictions in Calgary*

Calgary is often considered to be a leader in neoliberal governance among Canadian cities. Many of the policies of the City of Calgary and the Province of Alberta have been oriented toward the imposition of market rationalities. The downloading of responsibilities from the provincial and federal governments, without corresponding capacity to fulfill those responsibilities, has exacerbated social and economic hardship. Yet neoliberal policies are frequently contested, sometimes drawing on market rationalities of self-interest, other times challenging market rationalities at their core. Neoliberal governance and resistance to it is further complicated by the scalar structuring of governance and conflict, influencing the geographic constitution of identities and interests. Drawing on the regulation, governmentality, scale, and network literatures, a theoretical hybrid is proposed to help begin to make sense of this complex and often contradictory political landscape.

Keywords: neoliberalism, resistance, regulation, governmentality, scale, networks

David Neal Miller, The Ohio State University. Email: miller.3@osu.edu; *Falling into Brooklyn: Real and Imagined Jewish Space*

Literature of Brooklyn often enough is framed by passages to or from Brooklyn. This act of framing is largely independent of the actual narrative content of the works. This paper examines the notion of Brooklyn as alternative geographic reality, one requiring acts of passage. Discussion will raise theoretical issues concerning notions of fictiveness, narrative reliability, and imagined space. The paper examines works of diverse generic provenance (film, poetry, narrative prose) within an Ashkenazic Jewish cultural context.

Keywords: Brooklyn, Ashkenazic, Jewish, narrative, poetry, prose, film, passages, imagined space

Harvey J. Miller, University of Utah. Email: harvey.miller@geog.utah.edu; *Time Geographic Fields: A Continuous Theory for Time Geography*

Time geography is a powerful framework but until recently has been conceptual rather than analytical. Over the past decade or so, researchers have improved the rigor of time geography through re-formulations suitable for computational implementation. Towards this end, the author developed a measurement theory for time geography that provides analytical definitions of basic entities such as the space-time path and prism suitable for high-resolution measurement using location-aware technologies as well as simulation using agent technologies. While rigorous and general, the theory retained one of the harshest assumptions in classical time geography, namely, the uniform velocity assumption. This paper extends the time geographic measurement theory to the case where travel velocities vary continuously across space. Using the continuous transportation modeling approach pioneered by researchers such as Beckmann, Puu, Angel, Hyman and Mayhew, I extend analytical definitions of the path and prism to the case where unobserved components are characterized by minimum cost curves through an inverse velocity field rather than straight line segments based on a uniform velocity. This paper also illustrates the approach using a computational implementation based on the Cova-Goodchild object-field data model. The extended theory is more realistic and also links time geography to the continuous space modeling tradition in geography and regional science. In addition to theoretical relevance and elegance, the time geographic field approach provides a synoptic summary and visualization technique that can provide insights to space-time accessibility patterns.

Jason Matthew Miller, MA candidate, University of Connecticut. Email: jason.miller@uconn.edu; Melinda Daniels, PhD, University of Connecticut. Email: ; Tim Byrne, PhD, University of Connecticut. Email: ; *Geomorphic Analysis of the Hsuehshan Range, Taiwan.*

This study will quantify and relate several geomorphic parameters across the Hsuehshan Range in Taiwan. Parameters include hypsometry, stream long profile, stream gradient, stream order, and basin geometry. The primary focus of the study is to determine any tectonic indications in the basin landscapes that point to the presence of a basement indenter acting on the accretionary wedge mechanics of Taiwan. Relative rates of uplift and erosion can be assessed quantitatively through application of the geomorphic parameters to each of the Hsuehshan basins. These parameters are studied on the scale of individual basins, groups of basins, and the entire range to enhance pattern recognition in the data. In addition to this primary objective the study will address issues in the applica-

tion of certain parameters such as the quantitative definition of a mountain front in a dynamic relief landscape. Adjusting these methods becomes important because the topography of the Hsuehshan range does not easily fit simplified models of mountain uplift. A 30-meter digital elevation model is used to analyze the basins for specific geomorphic attributes systematically extracted using a combination of GIS software (ESRI ArcMap and RIVIX LLC RiverTools).

Keywords: geomorphology, GIS, taiwan, Hsuehshan Range, hypsometry

Jennifer E. Miller, PhD Student, University of Texas At Austin. Email: jennifer.miller@mail.utexas.edu; *Scaling Urbanization: Consequences for Wildlife in Changing Watersheds*

Increasing urbanization results in increased impervious surface cover. However, the spatial-temporal pattern of impervious surface cover degrades water quality and alters wildlife habitat in scale-dependent ways. Stream plethodontid salamanders are widespread, abundant, and are effective bioindicators of water quality. This study was designed to investigate the effects of impervious surface cover and forested riparian buffer width on the abundance of larval southern two-lined salamanders (*Eurycea cirrigera*). Fifty-meter reaches of forty-three low-order streams were sampled to represent the range of impervious surface cover and forested riparian buffer width combinations across Wake County, North Carolina, USA. Larval abundance decreased with increasing impervious surface cover at the watershed scale. Further variation in abundance was explained by site-scale measurements, including percent detritus cover, percent pebble substrate, and the interaction between intermittency and substrate interstice sedimentation. Larval abundance was not affected by forested riparian buffer width measured at the site scale, as typically measured for regulation. To minimize the effects of urbanization on stream salamanders, (1) forested riparian buffers should be managed at the watershed scale, requiring complete buffers without drainage bypasses, (2) sediment pollution should be minimized, especially as caused by new construction, and (3) further research should be conducted as to the role of impervious surface cover in reducing stream base flow.

Wendy E. Miller, Ph.D., Washington College. Email: wendy.e.miller@gmail.com; *Using GIS across the Curriculum in Liberal Arts Higher Education*

Geographic Information System (GIS) technology provides students of many disciplines with the ability to understand complex problems. Many educational institutions are expanding the use of GIS outside of the geography department to economics, biology, chemistry, and even foreign languages. One example of a successful interdisciplinary program is in place at Washington College, a small liberal arts school on the Eastern Shore of Maryland. Three GIS courses are offered for students, including a competitive internship program that matches students with faculty who are interested in using GIS in their research. In addition to the GIS-specific courses, students in many courses are introduced to GIS through lectures, assignments, and on-campus activities. Students at all levels are given the opportunity to work on real-world projects that allow them to see their work being used in other courses, in faculty research, published in local brochures, or placed on websites. This use of active and experiential learning, as well as interdisciplinary cooperation provides students with a well rounded education and opportunities to see what life after college will be like.

William R Miller, ESRI. Email: bill_miller@esri.com; *Geo-Design: Designing Entities in Geographic Space Using GIS*

All organizations, large or small, public or private, do three things: they get and manage information (data); they evaluate, assess or otherwise analyze that information for some purpose (analysis); and they ? using the information and the results of their analyses ? create and/or recreate goods and/or services (design). Geographic information systems have played a highly active and beneficial role in the acquisition, management and analysis of spatial information. Their utility with respect the creation of goods and/or services (design) has been negligible. This paper explores the role of GIS as a design tool and demonstrates, through the use of some new geo-design tools, how designers (urban planners, landscape architects, natural resource managers, disaster response planners, etc.) can now do their creative work in geographic space. The paper shows how designers are using the new geo-design tools to rapidly and easily create, visualize, and analyze spatial designs (land use plans, land management plans, disaster response plans, etc.) much as they would if they were drawing those plans (their designs) using pen and paper.

Keywords: Design GIS

Christine Milligan, Dr, Lancaster University. Email: c.milligan@lancaster.ac.uk; Liz Bondi, Prof, . Email: ; Nicholas Fyfe, Prof, . Email: ; Wendy Lerner, Prof, . Email: ; Richard Kyle, . Email: ; *Contradiction or conformity? Voluntary sector activism in the UK - a grassroots perspective*

In this paper we draw on material from the first phase of a cross-national study that seeks to examine the material importance of place for understanding the interrelationship between government, voluntary organisations and activists. Drawing on extensive questionnaire and interview data we seek to explore the extent to which organisations operating within the fields of mental health and community safety view themselves as being activist in intent and how this may have changed over time. Importantly, we examine how these voluntary organisations understand the concept of 'activism'. In a political climate that increasingly leans toward the development of partnership working and governance over government, we ask whether organisations are shifting away from those more demonstrative forms of activism prevalent in the latter half of the 20th century to more subtle and nuanced activist pursuits. In doing so, we also consider whether those new spaces of political governance that have emerged within local authority jurisdictions in recent years are recognised by activist organisations as key sites for the direction of their activity, or whether they continue to pursue more traditional avenues. In examining these issues we explore the extent to which there is apparent conformity in organisational views on activism and the focus of activist activity as well as some of the apparent contradictions. Finally, we consider some of the gaps in responses to ask whether these in themselves may be viewed as the performance of active resistance.

Andrew Millington, Dr, Texas A&M University. Email: millington@geog.tamu.edu; Conservation, Poverty and Geography

At what scales should we look for linkages between conservation and poverty? Drawing on examples from Bolivia, I will attempt show that poverty-conservation linkages exist at many geographical scales. Nonetheless I argue that that poverty-conservation literature is dominated by small-scale studies. and hypothesize the reasons for this. These small scales studies (should) serve development well if we consider bottom-up approaches to be a relevant model for development. But what of poverty-conservation linkages at larger scales: do these have any relevance in development?

Keywords: Conservation, Poverty, Bolivia

Steve D. Millington, Manchester Metropolitan University. Email: s.millington@mmu.ac.uk; Tim Edensor, Manchester Metropolitan University. Email: t.edensor@mmu.ac.uk; Contested landscapes of Christmas: illuminating urban and suburban space

Over the past decade, the controversial practice of adorning the exteriors of British homes with bright illuminations during the Christmas period has increased, causing much comment in the media (for example, see Save Our Christmas Illuminations Daily Mirror 8.12.05, p20). This paper therefore investigates whether and in what ways these decorations constitute a new expressive mode of imprinting identity and status upon (sub)urban landscape, expressing identities associated with class. In this context, we want to explore how these academically overlooked sites of illumination may be variously conceived (or contested) within Greater Manchester as violations of suburban aesthetics, expressions of community, individual assertions of status, places of vernacular creativity, minor tourist attractions or charitable acts.

Keywords: creativity, class, identity, community

Marco Millones, Clark University. Email: marcomillones@clarku.edu; Robert Gil Pontius, Doctor, Clark University. Email: rpontius@clarku.edu; Follies and fixes of commonly used indices of categorical map comparison in land change simulation models.

Two most common applications for map comparison indices are to measure overall change in land cover between maps from different dates, and to assess the accuracy of simulated or modeled maps with respect of a reference or 'truth' map. Although many indices exist, the Kappa Index has become the most popular global statistic to quantify the agreement between categorical maps. Despite its popularity, many scholars have pointed out that Kappa can be misleading in at least two ways: (a) it uses the incorrect expected-correct proportions due to chance, and (b) confounds the two main components of agreement and disagreement in map comparison: quantity (i.e., estimation of the correct amount of pixels of a given category), and location (i.e., allocation of pixels of a given category in the correct location, given a quantity). In response to these concerns, variations on Kappa were created, most notably, a Kappa for location, and two Kappas for quantity. In spite of these efforts, global agreement indices like these still carry some of the flaws of the original Kappa and thus misguide the final users. This paper aims to expose the problems of Kappa and its variants in land change models, and to overcome these limitations by proposing

an improved and more fundamental method. We show how Khisto, Kquantity and Klocation can be misleading. We endorse the more basic and primary methods that we call budget of components of agreement and disagreement and thus, provide a clearer indication of the comparison between maps.

Amy Mills, Ph.D., University of South Carolina. Email: amills@sc.edu; Geographies of Memory: Minority Narratives of Istanbul from Israel

Istanbul, Turkey once had a multiethnic urban culture shared by its historic Greek Orthodox, Armenian, Jewish, and Muslim communities. By the 1970s, most remaining non-Muslim minorities had emigrated. Recently, in Istanbul, a nostalgic cultural memory of tolerant cosmopolitan urbanism has emerged. Minority history in Istanbul is a very difficult topic to research as minorities are hesitant to speak, archives are closed, and the press faces censorship. In July 2006 I conducted ten days of interviews and a survey with former residents of Istanbul who live in Tel Aviv, Israel. The narratives from Tel Aviv communicate a lot of information which was untold in Turkey. They also reveal the interconnectedness between places through which diasporic identity is constituted. What can the geography of memory reveal about the work of nationalism? What do Jewish place narratives about Kuzguncuk, Istanbul, work to do - as they tell of self, of belonging and difference? how do they illuminate the teller's position within the interstices of power relations that constitute the national context in Turkey, and then, in Israel? In this paper, I discuss but one theme in the narratives: the remembering of anti-minority nationalist events in Turkey which reveal how nationalism worked at various scales; in the bodies of people, as neighbors, on the street, with the use of words or moments of assistance, help, and also discrimination and violence.

Keywords: Turkey, memory, place, identity, nationalism

Jacqueline W. Mills, Ph.D., Louisiana State University - Disaster Science and Management Program. Email: jmills5@lsu.edu; LSU Geographers on the Frontlines of Katrina and Rita: Exploring Solutions for Community-Centered Response and Recovery

Much has been written about and spoken about Hurricane Katrina and it is doubtful that these commentaries, reports, articles, books, conferences, meetings, and discussions will end any time soon, nor should they, as the events that comprise this catastrophe deserve our full attention in the hope that we learn and apply a few of her lessons. However, for those geographers who served sleepless days in the Emergency Operations Center (EOC), spent many dark and uncertain hours on Red Cross disaster assessment teams driving through a landscape that had been familiar, brought organization and efficiency to branches of our state and federal government in a time of confusion and devastation, and looked earnestly and found easily ways to put their skills to work to make substantive improvements to the response, Katrina is more than an academic opportunity for analysis, publication, and publicity, though certainly these aspects have their place. For these geographers, Katrina, followed by often-neglected Rita, has provided opportunities to practically demonstrate the relevance of many facets of geography. A unifying theme in these experiences is the power of geography in creating solutions for community-centered disaster management. From this work, a sample of cases will be presented focusing on the three new regions of coastal Louisiana: Katrina-impacted parishes, Rita-impacted parishes, and the "near miss" parishes.

Keywords: Hurricanes Katrina and Rita, geography, disaster, community

Andrew A Millward, Assistant Professor, Ryerson University, Geography. Email: millward@ryerson.ca; Colin Squirrell, Graduate Student, Ryerson University, Geography. Email: colsquirrell@gmail.com; Physical influences of landscape on forest regeneration following ice damage

The 1998 ice storm was broad in spatial coverage and produced a patchwork of tree damage severity across much of the northeastern United States and eastern Canada. Previous research, using image differencing of field-calibrated Landsat TM derived vegetation indices, was conducted within a 2045 square kilometre study location in New York State's Adirondack Park. Results of this work provide location and intensity data for canopy damage from which forest regeneration can be quantified and monitored over time. This study employs multi-temporal Landsat TM and ETM+ imagery (1998, 1999, 2001, 2002, 2005) to identify forest regeneration in locations that experienced moderate to severe damage intensity resulting from the 1998 storm. The principal question driving our investigation is: are landscape physical features correlated with the regenerative success of ice-damaged forest? Coupled principal component and change vector analyses are applied to a time-series of satellite-derived vegetation and moisture indices. Geovisualization is used, in conjunction with line graphs, to illustrate trajectories of forest recovery. Physical landscape features have been shown to be strongly correlated with coverage and intensity of ice damage. We hypothesize that these same features (e.g., elevation, aspect, forest boundaries) play a role in the space-time recovery of damaged trees; evidence of this has

important implications for understanding forest dynamics and organizational processes occurring across a broad spatial extent.

Keywords: ice storm, forest regeneration, ecological disturbance, remote sensing

Nicole Ann Milne, University of Hawaii Manoa. Email: nmilne@hawaii.edu; Consuming Communities, Consuming Nature: Anticipating Native Hawaiian Use of Honu, the Pacific Green Sea Turtle (*Chelonia mydas*)

Native Hawaiian cultural use of honu, the Hawaiian green sea turtle (*Chelonia mydas*), came to a halt in 1978 when U.S. populations of the Eastern Pacific green turtle were listed as Threatened under the Endangered Species Act. The green turtle has traditionally played an important role in Polynesian and Micronesian cultural, religious, and ceremonial practices, however modernization of island cultures in the region, coupled with declines in green turtle populations, have decreased the turtle's cultural importance to island residents. While conservation and management measures designed to protect turtles have benefited local populations of honu in Hawai'i, a political ecology approach examining the interface between science and politics surrounding sea turtles in Hawai'i, illuminates instances of disempowerment in local communities. As populations of honu increase and their delisting becomes imminent, the potential exists for conflicts between proponents for traditional use of honu, the tourism industry, younger generations, and other island residents.

John D. Milton, Department of Geography and Environmental Studies, Carleton University, Ottawa, Canada. Email: johnmilton@rogers.com; Farmer-bred Varieties in India: A Response to Anitha Ramanna and the 'Tragedy of the Anticommons'

In 2001, India passed The Protection of Plant Varieties and Farmers' Rights Act. This Act provides intellectual property rights protection to crop varieties and represented one condition for India's entry into the WTO. However, this Act went further than most plant breeders right legislation by providing protection to varieties created by public sector institutions and farmers. Furthermore, the criteria for recognition under these new categories of crop varieties are not based upon the commonly applied DUS, or Distinct, Unique and Stable, criteria. To Anitha Ramanna (2003, 2006), the creation of these categories of rights, and recognition of a new set of holders of these rights, could lead to the underutilization of resources resulting from the excessively high transaction costs in securing the necessary genetic materials from these various holders of rights. This situation she described as an 'anticommons.' However, through the national competitions held by the National Innovations Foundation in India, a corpus of farmer-breeders have emerged whose varieties are being recognized for the dramatic impact these are having on local agriculture. This paper argues that, not only should the intellectual property rights of these grassroots breeders be recognized and protected, but also that these individuals represent a new dimension in crop breeding activities and possible partners with formal crop breeding institutions and corporations. As such, the dangers of an 'anticommons' could well be offset by the new opportunities for partnerships between grassroots breeders and formal public and private institutions involved in crop breeding.

Jason Minderlein, Rowan University. Email: Minder53@students.rowan.edu; Analyzing Farmland Loss in the Garden State

This poster presentation analyzes the status of farmland and its development in rural southern New Jersey. Utilizing the NJ Digital Land Use/Land Cover data set for the South Jersey Bay Shore region, the study examines farmland for three separate years, 1986, 1995, and 2002. The research evaluates the current status of farmland, farmland preservation, the loss of farmland as a whole, and the loss of prime farmland to residential and commercial development. The analysis characterizes and quantifies agricultural land use patterns over the past 15 years providing a measure of impact of urban and suburban growth on the most significant remaining agricultural area remaining in the Garden State. Lastly this presentation will project the current rate of loss and pattern of farmland loss to provide insight into the future condition of the South Jersey farming community.

Keywords: Land use, farmland, GIS, New Jersey

J. Toby Minear, University of California - Berkeley. Email: tminear@berkeley.edu; Matt Kondolf, PhD, University of California - Berkeley. Email: kondolf@berkeley.edu; Estimating Reservoir Sedimentation Rates: Long-Term Implications for California's Reservoirs and Future Dam Removals

Reservoirs are continually filling with sediment by reservoir sedimentation, resulting in decreased water storage capacity and in some cases complete filling of reservoirs. Surprisingly, there have been decreasing numbers of sedimentation surveys and few large-scale compilations of sedimentation records. In addition, current reservoir sedimentation models are inadequate for efficiently estimating large-spatial scale (1,000 km²) and long-temporal (100+ yrs) scale reservoir sedimentation. Using California as a case study, we developed a new type of reservoir sedimentation model that incorporates the spatial relationship of different reservoirs to one another through time, while accounting for varying trap efficiency. First, we compiled published reservoir sedimentation records and determined the median rates for different geomorphic regions; we then applied the median rates to unmeasured reservoirs. We found that the state-wide water storage capacity (47.2 billion cubic meters) has likely decreased by 4.2% due to sedimentation of 2.0 billion cubic meters of sediment. Annually, approximately 2.4 million cubic meters of bedload material is trapped within the state's reservoirs. Simpler sedimentation models over-predicted sedimentation amounts between 160% and 410%. Compared to other models, our method provides a relatively simple way to improve estimates of large-scale, long-term reservoir sedimentation.

Troxl D.N. Miner, B.S., University of Nebraska at Omaha. Email: tminer@mail.unomaha.edu; Sites of Tragedy within Nebraska's Cultural Landscape: An Analysis of Transition in Segregated Space

Sites of tragedy are recognized by geographers to be significant examples of landscape modification. This research considers historical sites of tragedy within Nebraska's Great Plains landscape, classifying them according to process and modification. The classification scheme is designed to develop a model which may be used in other geographic contexts as well. Historical evidence is documented to provide temporal data reflecting transition, and field research provides the majority of the data. The study area encompasses an intriguing variety of sites, considering places associated with the Starkweather murders, Native American displacement, natural disasters, and pioneer mortality; to name only a few. Methodology relies upon purposeful sampling to ensure maximum variation, and utilizes both qualitative and simple quantitative analysis technique. The study is designed to contribute to a historical base of knowledge, and evaluate the impact of tragedy upon the unique character of the cultural landscape.

Keywords: Social geography, place attachment, Great Plains - Nebraska

Julian V. Minghi, University of South Carolina. Email: minghi@sc.edu; *Borderscapes : A Tentative Classification*

The literature of political geography has been enriched by many classifications of boundaries - some based on form, some on function, and still others on the human geography of the region at the time the boundary was first drawn. More recently, especially over the past two decades, many new ideas have appeared in the literature on the distinctive characteristics of actual border regions, that is of borderlands. This paper steps beyond this large body of research in an attempt to identify distinctive borderscapes - the artifacts and behavior patterns discernable in the landscape near boundaries. Must we classify borderscapes into categories that relate directly to the boundaries and borderlands generating them, or are borderscapes better understood as separate and independent phenomena? With illustrations drawn from fifty years of research, the tentative classification may improve our understanding of the concept of borderscapes.

Keywords: borderscapes, borderlands, boundaries, classification

Leandro Minuchin, UCL. Email: l.minuchin@ucl.ac.uk; *Engineering exception: the limits of a bio-political notion of urban space*

For the Italian philosopher Giorgio Agamben, the political is reduced to the constitution of a sovereign power capable of securing the passage from a 'territorial space' to a 'population space': the transition that takes a natural life into a civic realm. However, Agamben signals that this political process is always unstable and incomplete: the meaning of life never ceases to be challenged and reviewed. As a result, the consistency of modern cities is defined by the proliferation of spaces of exception, where power confronts unprotected and bare-bodies, inscribing excluded social circles within the bounded totality of urban realm. For Agamben, the production of modern space is organized around the exceptions inscribed by a sovereign power that can no longer align forms of life and juridical rules in a determinate space. In this presentation I would like to explore the limits of Agamben's notion of urban space. I will describe how by reducing the moment of crafting the polis to a juridical relation, the essential political passage from zoe to bios treats space as a subordinate and pre-given entity. I will argue that the inscription of a political realm, implies not only a problematization over the value of life, but also about the modes of assembling and producing space itself. Exception needs to be engineered: how and which materials can be joined and gathered is also part of the political. The notions of materiality and assemblage will be used to illustrate this point.

Keywords: Agamben, cities, exception, materiality, assemblages

Eric Minzenberg, PhD, Miami University. Email: minzeneg@muohio.edu; *The Importance of Subsistence Hunting in Amazonian Frontier Communities in the Transition to Market-Based Economies*

Rural householders in the Amazonian frontier are transitioning to increasingly market-based economies with individualized systems of production and consumption. The individualized market system serves to decrease social engagement between households in the community. Social relations enacted in hunting extend, and maintain, a household's contact with neighbors in the community, and it is this social interaction that joins households together. Community social relations expressed in hunting through both social conflict and cohesion bind households and community social structure is reinforced by the non-market exchanges enacted in hunting practice. In this paper I explore the significance of the hunting practice in Brazil's first sustainable development settlement, Projeto de Desenvolvimento Sustentável (PDS - Sustainable Development Project) São Salvador, in maintaining a sense of community in the western frontier of the Amazonian state Acre. Using the framework of political economy with ethnographic data, I argue that hunting in the settlement binds households together through conflict and cohesion within an increasingly individualized market-based agricultural economy. Non-market exchanges entailed within hunting (meat exchange, hunting together) are important mechanisms in the community's social structure. The hunt serves to reinforce familial ties across households wherein both men and women are important actors. Kinship connections act as a regulatory mechanism in the exploitation of game resources in the settlement. Conservation and development planners should seek strategies that build upon community kinship ties in their effort to link social and ecological sustainability.

Keywords: hunting, Amazon, conflict, cohesion, kinship, meat exchange, Acre

Debby F Mir, Prof., Northeastern Illinois University. Email: debbymir@yahoo.com; *Preparing Future Environmental Studies Teachers through the Illinois MSTQE Program*

This study presents experience with the MSTQE program preparing future math and science teachers to present environmental science, in response to the chronic deficit of skilled teachers trained in the pedagogy or content developmentally appropriate for middle schools students. Students were taught content,

research skills, and exposed to a variety of field, multi-media approaches and techniques addressing scientific, policy and social aspects of environmental issues. The program was aligned to the Illinois State Content Standards for Teachers of Science and designed to empower pre-service teachers to take an integrated and meaningful approach to teaching. For example, a role-playing exercise assessed the safety of school children after a chlorine spill using the EPA "ALOHA" computer model. The diversity of the students was reflected in their initial and changing perception towards environmental issues and relevance to future classroom practices. Students came to appreciate the scientific, policy, social and geographical aspects and significance of environmental issues and proposed solutions (e.g. urban sprawl, city parks and gardens, alternative energy, restoration) for an urban or a rural middle school audience, and learned to research and design relevant lesson plans that incorporate local human and institutional resources.

Keywords: Environmental, Middle School, Teacher, computer, Modeling, MSTQE, ALOHA,

Faranak Miraftab, Dr., University of Illinois, Urbana-Champaign. Email: faranak@uiuc.edu; *Modern Gold Mines Right Downtown: Resistance and Real Estate Boom in Cape Town*

This paper examines a neoliberal urban revitalization strategy implemented in Cape Town, South Africa, known as Business or City Improvement Districts (BIDs or CIDs). Analyzing discursive and spatial practices of Cape Town Partnership, the managing body of downtown CIDs, the paper reveals its difficulties in stabilizing the socio-spatial relations of this neoliberal urban strategy. It highlights how CIDs are challenged from both within and without their managing structures by contentious local issues, and in particular by vast social inequalities and citizens' historical struggle for inclusive citizenship and the right to the city. Whether and how CIDs' inherent limitations can be overcome to address socio-spatial inequalities is an open question.

Keywords: Business Improvement Districts, South Africa, urban revitalization, neoliberal spatiality, governance

Atmospheric-topographic correction and radiometric calibration of remote sensing image data are important for change-detection studies, time-series analysis, multi-sensor data integration and intercomparison, and parametric comparisons between image and field data. It is necessary that the data be first converted into physical units (in reflectance or radiance) for a more accurate quantitative and dependable analysis. Techniques for atmospheric correction and surface reflectance estimation are grouped as either absolute (radiative transfer models, image-based DOS models, etc.) or relative (dark-pixel subtraction, log-residuals, IARR, etc.). Accurate physical models to simulate atmosphere and hence its removal exist, but require contemporaneous collection of atmospheric data at the time of scene acquisition. This is mostly difficult and often impossible for historic data. On the other hand, relative atmospheric correction methods, which are image-based, are often too inaccurate to meet specific requirements. Hybrid models using both absolute and relative methods together provide the best results. Advance Spaceborne Thermal Emission and Reflection radiometer (ASTER) records electromagnetic radiation in 14 bands, with 9 bands in solar reflective region (0.56-2.40 μm) and 5 bands in the thermal infrared region (8.13-11.65 μm). An ASTER image of Khetri Copper Belt, Northwest India, was corrected for atmospheric effects using a physical model (MODTRAN-FLAASH) and image-based Dark Object Subtraction (DOS) model (Chavez method) to obtain absolute surface reflectances. Relative reflectance methods, like log-residuals and Internal Average Relative reflectance (IARR) were also tested. A combination of FLAASH and IARR produced a surface reflectance product with the best match with laboratory spectra of known materials in the area.

Keywords: Atmospheric correction, surface reflectance, ASTER, FLAASH, Chavez method, IARR, log-residuals, hybrid correction

Allyson A Mitchell, PhD. candidate, York University. Email: mail@allysonmitchell.com; *Bodycentric Spaces and Fat Body Knowledge: Reading the Work of Cindy Baker*

In the burgeoning body of research around geographies of fat, it has been acknowledged that moving through public spaces in a fat body can be a highly emotional experience (Colls, 2004, 2006). Not all spaces are created equally, however; some seem to engender a broader range and depth of emotion than others. In particular, spaces such as nightclubs, swimming pools, food courts,

change rooms and gyms are cited by many fat women as difficult spaces in which to locate themselves. I suggest that these are 'bodycentric' spaces, and are significant in their salience as sites of knowledge production and embodiment. Emotional responses to these spaces, then, are evocations of 'fat' knowledge gathered, created and, in some instances, resisted over the course of a lifetime. This paper focuses on a handful of those resistant instances presented by Canadian performance artist Cindy Baker. In particular, the strategies Baker invokes in her performance "Fashion Plate" to subvert and resist the gaze(s) directed at fat women's bodies (including those set forth by other fat women) will be considered for their spatial-epistemological significance. In commanding and controlling the scrutiny of the fat woman's body, and simultaneously presenting and troubling her body as a spectacle, I argue that Baker effectively alters the meaning of 'fat' via space and resistance. Baker's performance work, then, will be understood as one incarnation of the transgressive/libratory potential of using an embodied knowledge of fat against itself to revalue/reconfigure the 'bodycentric' space.

Keywords: bodycentric space, fat, resistance, spectacle, transgressive performance

James K. Mitchell, Professor, Rutgers University. Email: jmmitchel@rci.rutgers.edu; *Reinventing disaster recovery for the 21st century*

Serious flaws in American post disaster recovery efforts have been highlighted by troubling new public policies adopted in the wake of 9/11/01 terrorist attacks and by the national experience of hurricane Katrina. A review of the current research literature about disaster recovery provides a point of departure for consideration of potential alternatives both in the United States and elsewhere. Particular attention is devoted to holistic strategies for recovery that are being pioneered in several parts of the world. In the USA, the entire concept of disaster recovery requires reinvention and reinstitutionalization if the country is to successfully engage existing and emerging hazards of the 21st century. Three principles of reform are identified. These include: (1) expansion of the recovery agenda to address issues of ambiguity as well as issues of uncertainty and to incorporate perspectives on the functions of communities at risk as well as their form and material content; (2) development of larger and more permanent constituencies in support of hazards policies; and (3) accommodation and exploitation of surprises that occur during the post-disaster recovery period. Prospects for achieving these reforms are assessed and evaluated.

Keywords: hazard, disaster, policy, models, resilience, decision making, Katrina, 9/11, USA, international

Lynne Mitchell, Oxford Brookes University. Email: lmitchell@brookes.ac.uk; Elizabeth Burton, Oxford Brookes University. Email: ejburton@brookes.ac.uk; *Streets for Life*

The ageing of the population is a global phenomenon yet the design of the built environment continues to focus mainly on the needs of the young and healthy. People do not generally experience a diminishing desire for independence, choice and social contact as they age but unless the needs of older users in the outside environment are taken seriously many will be restricted in their ability to get out and about. This is particularly the case for people with dementia, whose numbers are growing, as they tend to remain in their own homes at least during the mild to moderate stages and face particular environmental barriers due to both their physical and mental deterioration. This paper presents design principles and recommendations for producing outdoor environments that are easy for older people with dementia to understand, to feel safe and comfortable in and to find their way around. These are based on the findings of a three-year research project, funded by the UK Engineering and Physical Sciences Research Council, which sought to identify the outdoor design needs of people with dementia through interviewing people with dementia living at home or in sheltered accommodation and by going on accompanied walks with them around their local neighbourhoods. The research led to our developing the concept of 'Streets for Life', which help people with dementia to maintain a quality level of independence and social contact and to prolong their ability to remain in their own homes.

Keywords: older people, dementia, streets, neighbourhoods, design

Phillipa Mitchell, University of Auckland. Email: p.mitchell@auckland.ac.nz; *A Long Way from Home? The Role of Information and Communication Technologies in South Korean and South African Migrants' Experiences as they Settle in Auckland, New Zealand*

Migrants face many challenges in moving to a new country, particularly one as geographically isolated as New Zealand. This paper investigates the role of information and communication technologies in the experiences two disparate migrant groups, the South Koreans and the South Africans. Interviews were conducted with individuals of different ages and who emigrated at different times, to explore what, if any, difference our increasingly coded world has meant how they settle in New Zealand's largest city, Auckland. As expected there were

distinctive differences in the use of technology by the two groups, however, there were also several common themes. Email, the internet and mobile phones have radically altered their ability to connect. Feelings of alienation and isolation are being mediated both by the ability to find out much more about the destination country and the ease with which they can maintain contact with their country of origin. All of the migrants described a tapering off of their need to communicate with 'home' over time even though it is now considerably easier and cheaper. Most have made the conscious choice to stay in New Zealand and identified that these new technologies empowered them simply by being accessible, even if their use has declined. Those that emigrated pre internet were extremely aware of how their experience would have differed, agreeing that these technologies would have lessened their sense of dislocation. Information and communications technologies are altering the way individuals interact with spaces and this has significant implications for geographical research.

Keywords: technology, information, communication, migrants, isolation, empowerment

Matt Mitchelson, University of Georgia. Email: mmitchel@uga.edu; *Imprisonment as a Spatial Process: Counting and Mobility in Penal Space*

The illusory permanence of the steel bars and fortress-like walls frequently employed by U.S. prisons belies the reality that prisons are actually the loci of considerable, though less-visible, population mobility. This multi-method project redresses the widespread misidentification of the U.S. prison population as a static, readily countable, sub-population of citizens in cells. I argue that cross-sectional population counts, which are often labeled 'the' prison population, are analytically insufficient and must be placed within a broader spatio-temporal context of state-imposed migration: the production of penal space. Hence, this project is designed to interrogate the contradictions between significant and interrelated spatial moments?origins, destinations, and conduits?within the carceral geography of the United States. The paper proceeds in two parts. First, using the Georgia Department of Corrections as a case study, the inherently spatial mechanics of 'inmate classification' are investigated via the formation of state 'power/knowledge' in the Georgia Department of Corrections Inmate Classification Unit. In-depth interviews of Department of Corrections employees, as well as direct observation of the Inmate Classification Unit in Atlanta, Georgia, are used to collect primary data. Second, an analysis of the U.S. Census Bureau methodology for counting prisoners in Census 2000, and analysis of current legislative debates concerning proposed methodological alterations for the 2010 census, is presented. The presentation is complemented by spatial and statistical analyses of Census 2000 data; hence, the census is an object of analytical inquiry on two ontological levels.

Keywords: prison, mobility, power/knowledge, Census geography

Beth Mitchneck, University of Arizona. Email: bethm@u.arizona.edu; Joanna Regulska, Rutgers University. Email: regulska@rci.rutgers.edu; *IDPs and Governance Environment: The case of Georgia*

Since 1990, the number of armed conflicts and the number of refugees have declined worldwide, yet the number of internally displaced persons (IDPs) has remained stable. The large number of IDPs and their physical location increases their vulnerability to decreased human security. Consequently, the development of coping mechanisms and strategies for the accumulation of resources for livelihood, by forced migrants, become dominant activities. We argue that through these actions forced migrants become part of a larger governance environment that surrounds the post-conflict situation and frames the social context of the management environment. We theorize further that the nature of social relations and interactions within the governance environment fundamentally shapes the construction of social networks and in turn individual and household livelihood strategies. Governance suggests that forced migration is neither the sole domain of institutional actors nor of individuals, but rather a political-economic process in which many individuals and institutions participate. The scope of government then extends far beyond the simple enactment of laws and management of the economy to a set of other cultural and economic processes. This paper will examine how IDPs use social networks in the construction of their livelihood strategies and how through their actions they construct a governance environment within which they live and function. In this paper, we will report on the preliminary findings from our fieldwork in Georgia, where a series of civil wars beginning in the early 1990s, created an estimated 260,000 IDPs.

Assessment and modeling of urban sprawl in Kolkata, India

The Kolkata megapolis, beginning with a population of 100,000 in 1735 and moving up to the present 7 million, can boast of unlimited, uncontrolled growth over the past 300 years. This sprawl has stagnated the city's development. There is past empirical evidence to show that all over the world, ever increasing population in the cities and adjoining suburbs has restricted the planned development of a burgeoning city. This is more prominent in the developing countries, where unplanned urban sprawl along with its unprecedented effects changes the overall environment, climatic pattern and ethical character of the city. In this poster presentation, we will assess the extent of urban sprawl over the years in Kolkata and characterize its growth pattern. The first objective is to conduct an analysis using historical maps and satellite images to delineate the extent of the urban sprawl. The second objective is to place Kolkata's urban growth within the context of different factors that have contributed to this population explosion and moulded its growth. The natural and political factors which have profoundly influenced the sprawl in the 20th century will be highlighted. The last objective is to project the impact of future urban sprawl on the city using urban modeling strategies. Our assessment will pay particular attention to how environmental factors such as the urban heat island and pollution will affect weather/climate patterns as Kolkata transforms from 'the City of Joy' into a concrete jungle.

New Policies for Land Consolidation from Market Liberalization in Japanese Agriculture

Agricultural liberalization is restructuring social/spatial relations in agrarian land in Japan. Japan's agricultural land reform after WWII limited farmland ownership to farmers and equalized ownership among small farmers in Japan. This landscape has been under contestation for fifty years. The recently decreasing rice price with the rice market liberalization has affected this situation. Since WWII, the government controlled channels of rice trading from producers to consumers. The government kept the rice price high to appease farmers until the 1960s only to find it too expensive with rice over-production. Government policies started to liberalize the market to let the price of rice decrease. Allowing the import of rice in the 1990s after the GATT agreement pressured the price to decrease much further. The Japanese government has supplemented the income of farmers to decrease the rice supply and at the same time tried to increase the efficiency of agriculture to keep farmers competitive. Along with the modernization of farm practices, the government emphasized land deregulation to facilitate the consolidation of landownership. Currently, the government proposes to designate farmers and farm organizations which have consolidated enough lands individually or by organizing their communities. The government will supplement the income of designated farmers if the decreasing price of rice, soybeans, or wheat results in a loss. This new agricultural policy may change the ownership and management of agricultural lands and labor. Pressures for land consolidation drive a re-assessment of rice farming, farm households, rural communities, and equality of landholding.

Vegetation Succession in Response to Glacial Recession on Mt. Kenya

Dramatic changes are taking place in the glacier-covered high mountains of Africa. The glacial area of 2002 on Kilimanjaro is only half as large as it was in the 1970s. The Tyndall Glacier on Mt. Kenya, which retreated at approximately 3 m/yr from 1958 to 1997, retreated at 9.8 m/yr from 1997 to 2002 and at 14.8 m/yr from 2002 to 2006. The air temperature increased about 2°C from 1963 to 2005 at the 1890m point of Mt. Kenya. Leopard's remains were discovered at Tyndall Glacier in 1997. The radiocarbon dates of ca. 900+-100yrs BP correspond to the shift from a warm period to a cool period and the age of the Tyndall

Moraine. Pioneer species such as *Senecio keniphylum*, *Arabis alpina*, mosses, lichen, and *Agrostis trachyphylla* have advanced over areas formerly covered by the glacier. The rate at which this vegetation migrated up the former bed of the glacier (2.1-4.6 m/yr from 1958 to 1997) is similar to the rate of glacial retreat (2.9 m/yr). In the interval from 1997 to 2002, *Senecio keniphylum* of pioneer species advanced at 8.8 m/yr, while the glacier retreated at 9.8 m/yr. In the interval from 2002 to 2006, *Senecio keniphylum* advanced at 14.0 m/yr, while the glacier retreated at 14.8 m/yr. Rapid glacial retreat has been accompanied by rapid colonization of plants. Pioneer species improve soil conditions and make habitat suitable for other plants.

Kunashiri-to (Ostrov Kunashir) - 60 years since Soviet Occupation

The leaders of the US, UK and USSR agreed in Yalta that on the condition of Soviet entry into the war against Japan, the USSR will get South Sakhalin and the entire Kuriles. Kunashiri-to (Ostrov Kunashir in Russian) has then been under Soviet and subsequently Russian rule since September 1945. Since 1950s, Japan has made futile demand on return of the 'Northern Territory'; and when the Soviet Union under perestroika opened up these islands to foreigners in 1989, Japanese government called upon the Japanese citizen not to visit them on Russian visa. The network of settlements has changed significantly after the Soviet Occupation of Kunashiri. At the end of Japanese rule, there were ca. 88 fishing and agricultural hamlets, which were grouped into two municipalities - Tomari and Ruyabetsu. Tomari was the highest-order central place under Japanese rule, with ferry connection to Nemuro on Hokkaido mainland, and had administrative functions for the entire island and a shrine. After Russians expelled all the Japanese people out of the island, Tomari lost these functions and declined, as other fishing hamlets, most of which were totally deserted. Soviet Union built the new administrative centre after image of a European city on the barren hill overlooking Furukamappu, a small fishing hamlet, and named it Yuzhno-Kurilsk. Tomari, renamed as Golovnino by the Russians, was relegated to a small hamlet supporting border guard and military functions. The former village of Ruyabetsu lost all functioning hamlets, and now constitutes a part of heavily protected nature reserve.

Historical Climate Reconstruction, Paleoclimate, and Society

Historical climatic reconstructions provide detailed information at decadal to subdaily timescales. Although such research is more known from reconstructions conducted on Europe, much unexploited documentary evidence and early instrumental records exist in North American archives. Much of the nineteenth century in particular, possesses high temporal and spatial resolution of data to reconstruct "natural climate variability" which is significant, as this is a time when anthropogenic influences on fire, land use, and fluvial systems became prominent. This paper provides an overview of the current status of historical climatic research and its linkages with other paleoclimatic proxies, referring to selected examples scattered over North America. Specific aspects discussed include precipitation frequency, growing season length, selected time series of temperature, case studies of flooding, and synoptic mapping. Recent research developments also demonstrate documentary climatic reconstructions to help 1) provide further insight on climatic variability on North America extending back several hundred years, 2) integrate these results with other high resolution proxies for selected time slices during extreme events (e.g., ENSO, extreme flooding events, 1849) and for calibration purposes, 3) provide a continental-scale climatological perspective with modeling and statistical aspects when utilizing both marine and terrestrial data sources, and 4) assess details on the linkages between climate change and society (e.g., Civil War drought). Future American historical climatological research should specifically consider the quality and quantity of historical materials useful for climate reconstruction, the locations of specific sites useful for assessing particular modes of climatic variability, and interdisciplinary perspectives on historical climate impact studies.

From Immigration to Integration Policies: The Role of Community Based Organizations in a Multicultural Metropolitan Area

In the absence of a national immigrant integration policy, voluntary associations, philanthropists, religious organizations, and unions have historically provided immigrants with the services and safety nets necessary to participate fully in American society. Recent literature has pointed to Community Based

Organizations (CBOs) as the newest manifestation of non-government integration facilitators. Because social, cultural, economic, and political integration occurs at the local level, in this paper we explore how the place-based emphasis of Community Based Organizations can be aligned with an articulated policy of integration in the U.S. In our research, we explore the relationship between CBOs and immigrants in three ways. First, we compare the distribution of CBOs to that of the foreign born population in Los Angeles County, California in an effort to identify their spatial relationship. Social geography of the county will be closely examined, in order to develop a more accurate spatial model for explaining the distribution of the CBOs in the County. To understand whether particular needs contribute to the burgeoning of specific types of CBOs, our second set of analyses will closely examine the relationship between the location of each organization and the services it offers. Third, we explore the degree to which CBOs in Los Angeles County are operated by immigrants. The paper will conclude with an examination of policy alternatives for inclusion of the CBOs in formally articulated integration policies.

Harold Moellering, Ohio State University. Email: moellering.1@osu.edu; *Developing a North American Profile for the World Spatial Metadata Standard*

In recent years many countries have developed a National Spatial Metadata standard. In 1994 the USA Federal Geographic Data Committee (FGDC) developed the Content Standard for Digital GeoSpatial Metadata (CSDGM). In the following years a world effort by ISO/TC211-Geographic Information developed a world spatial metadata standard. This standard was issued in 2003 and named the ISO 19115 Geographic Information - Metadata. Since that time, most countries have been busy harmonizing their national spatial metadata standard with that of the world standard. This situation has presented the opportunity for the Canada and the USA to develop a North American Profile-Metadata that can serve both countries in common. This paper will review recent work relating to the development of the North American Profile - Metadata.

Alexander Moffett, University of Texas - Austin. Email: amoffett@mail.utexas.edu; Sahotra Sarkar, University of Texas - Austin. Email: sarkar@mail.utexas.edu; *Modeling Disease Vulnerability: A Global Malaria Risk Map*

Of emerging interest globally is the differential susceptibility of human populations to disease and the concomitant ecological and climatic conditions associated with those disease origins and vectors. In this paper an attempt is made to model such susceptibility through the creation of a worldwide malaria risk map. A database of georeferenced records of those species of mosquito capable of transmitting malaria is created using data collected from an extensive literature search. Niche modeling using a maximum entropy method is then used to predict the geographic distribution of these species using environmental data collected from the WorldClim database. Data drawn from the Gridded Population of the World database is used to determine the relationship between these distributions and that of human populations. The different risks posed by each species are modeled via species-specific parameters representing the abilities of the species to function as malarial vectors. An overall measure of risk is determined by combining a measure of the overlap of vector and human distributions with a representation of the ability of the vectors to transmit malaria. The methodology developed here is suitable for customization and

application to the modeling of other vector borne diseases.

Sandhya Mohan, West Virginia University. Email: smohan@mix.wvu.edu; Jonathan R Cumming, West Virginia University. Email: jcumming@wvu.edu; *Investigation of short-term drought effects on urban and non-urban sugar maple trees.*

Urban areas are characterized by anthropogenic stresses such as elevated temperature and higher levels of pollutants such as CO₂ and ozone. These stresses may make urban trees more susceptible to natural stresses such as drought and frost damage. Sugar maple was chosen to study the possible differential effects of drought on trees growing in and outside urban areas, with its recorded sensitivity to environmental stresses as well as ecological importance in the Northeastern US. Dendrochronology was used to analyze sugar maple growth in Morgantown, WV, a small city (population < 50,000) in the mid-Atlantic region. Sixty randomly selected sugar maples were cored from suburban regions, small urban and larger peri-urban woodlots. Average ring width differences and annual basal area increments (BAI) five years before and after three drought events (1966, 1988, 1998) were compared among the three sites. Trees were more stressed after drought at smaller urban woodlots and in suburban trees (13% and 20% less ring width, respectively; $p = 0.0201$) than in larger woodlots. Mean annual BAI was significantly higher in suburban trees ($p = 0.0360$), probably indicative of less competition and additional water availability than trees in the woodlots. We believe that urban trees that are not actively managed, especially those in remnant woodlands in the urban matrix, are more susceptible to decline due to climatic stresses, a factor that gains importance in view of the projected change in global climate. Future management efforts may need to include tree species that are not as sensitive to stress.

Rama Mohapatra, University of Wisconsin Milwaukee. Email: rama@uwm.edu; Richard Shaker, University of Wisconsin Milwaukee. Email: rrshaker@uwm.edu; Changshan Wu, University of Wisconsin Milwaukee. Email: cswu@uwm.edu; *Landscape Ecology and Cellular Automata: Investigating Patch Transition in Exurbia*

Since the end of World War II, there has been significant population growth causing development to radiate outward from the traditional urban core, metabolizing large areas of rural countryside with sprawling suburbs and exurbs. Sixty plus land classes were reclassified into five land patch categories that included: agriculture, developed, excluded, fallow/open/transition, and woodland for historical land use data of Southeastern Wisconsin. Using Markovian spatial simulation techniques and four landscape ecology metrics (e.g., contagion, edge density, fractal dimension, patch density) as influencing factors, patch transition in exurbia was simulated. This modeling approach is potentially a significant model for simulating landscapes beyond the urban fringe. In the selected study area, the model proved to be 72 percent accurate showing a rate of change of land patches as: -9.7%, 6%, 2.4%, 6.6%, -1.3% for agriculture, developed, fallow/open/transition, and woodlands, respectively.

Rhett L. Mohler, Kansas State University. Email: rlmohler@ksu.edu; *Historical Channel Change on Vermillion Creek, Kansas, 1857-2002*

The importance of rivers and streams to both human and natural systems is great. Understanding these relationships is critical not only to comprehending how landforms themselves are created, but also to understanding the complex interaction of human and natural systems. This study examines channel change on Vermillion Creek, Kansas in the context of both human and natural causal agents. Analysis in this study consisted of examining aerial photographs and historical surveys. Vermillion Creek was found to be relatively stable through major land-cover changes during the late 19th century, and relatively unaffected by climate between 1891 and 2002. A channelization event near Vermillion Creek's confluence with the Kansas River, however, likely caused channel migration away from the cutbank, or opposite of the expected direction established from the historical survey. Furthermore, based on absolute migration distance values, Vermillion Creek currently seems to be in its most dynamic state since at least 1857. Because other change agents (climate, land-cover) can essentially be ruled out, channelization is likely responsible for most of the change found in this study.

Imelda K Moise, University of Illinois at Urbana-Champaign. Email: imeldamoise@yahoo.com; *GIS and Spatial Modeling of HIV Prevalence in Zambia*

While there has been a surge in research on statistical and mathematical approaches to HIV/AIDS modeling, there is little research that has used such models in analyzing local and scanty HIV/AIDS epidemiological data from developing countries. This study uses scanty sero-surveillance data obtained from testing pregnant women attending antenatal clinics to characterize the spatial pattern of HIV prevalence in Zambia for 1994, 1998 and 2002. A geographical information system (GIS) based analyses involving spatial interpolation, spatial econometric methods in GeoDA and UNAIDS' Estimation and Projection Package techniques are used to characterize the geographical distribution of HIV prevalence in Zambia and to predict current and future HIV prevalence.

Sami Moiso, Academy of Finland. Email: sami.moiso@utu.fi; *State, territory and the expansion of market-place society in Finland: towards a framework for analysis*

We live in an era of the rapid transformation of the European states. States are taking new forms rather than being disappeared or hollowed out. This phenomenon refers to the question of the interaction between the state and territory. A growing need to conceptualize these changes in statehood from historical perspective exists in various European margins. This paper aims at providing a context sensitive theorization about the gradual transformation of the Keynesian welfare-state spatiality in Finland rather than repeating the existing theories of the spread of the neo-liberal statehood. At all times, certain modes of arguing, seeing and thinking of the state space have governed the regional political practices. These historically contingent modes of reasoning are conditioned not only by domestic politics but also by the changing discursive structures of world affairs and international political economy. We suggest that the idea of the "central governmental problem" of state administration, in this paper called the "state paradigm", is constituted in these discursive structures. For the authentication of these arguments, we have used documents and statistics representing the Finnish state's public investment policy as a historical example of the expansionist Keynesian welfare-state construction - a state form which aimed to build up a specific capitalist mode of accumulation in order to spatially prevent the spread of communist political ideology in Finland.

Diana Mok, The University of Western Ontario, Dept. Of Geography. Email: dmok3@uwo.ca; *The Spatiality and the Cost of Language Identity*

This study examines the role of language as a source of social identity and its spatial implications. It describes how language acts as a source of social identity and motivates individuals to sort themselves by residential location. It further examines the extent to which economic factors such as housing values and institutional factors such as the provision of language schools reinforce social identity and influence residential location. It uses census geographic data of Montreal, Toronto and Vancouver to conduct comparative case studies and to provide empirical evidence.

Keywords: household sorting, language identity, housing value

Laura M. Moley, Ph.D., Kansas State University. Email: lmoley@ksu.edu; *Aridisol in Suburbia: Salinity and Soil Water Management Practices in the Las Vegas Valley*

Suburban development, particularly for amenity and "lifestyle" landscape choices, presents specific management challenges for soil sustainability. These challenges are multiplied in arid environments, and salinity is a primary concern. This paper will examine current water resource and soil management practices in the Las Vegas valley and the lower Colorado River basin, including traditional water budgeting methods and more recently popularized efforts to "flush" saline from aridisols using over-watering techniques under conditions of scarcity. I will explore short and potential long-term effects on soils, with particular focus on local aridisols, under several typical landscaping regimes.

Keywords: soils, water resources, suburban development

Irene Molina, . Email: irene.molina@ibf.uu.se; *Place and nation in racial formation - The Swedish suburb*

The article attempts to identify particular aspects of Swedish racial formation. Starting from the Swedish suburb, contemporaneous discourses and mechanisms of structural racial discrimination it attempts to put spatial racialized politics at the local level within the historical frame of the production of racist knowledge. An ethnographic case study in Gottsunda, a suburb in the middle sized city of Uppsala is the scene for the discussion on the roots of Swedish racism. A presentation the modern and current story of the suburb, in which processes of stigmatization and segregation are being replaced by re-representation and gentrification follows. New housing production for white middle class households

in the outskirts of Gottsunda, has changed local power relations. The formerly stigmatized immigrant population is now being confined to some segments of the area and made invisible. The text goes then back to the twenties, when the Uppsala Institute of Race Biology, with the internationally prominent figure of Herman Lundborg, specialized itself in the production of racist theories through extensive empirical works of cranium and other bodily measuring. The efforts of racial biologists in order to show a sort of regionalized and class divided Swedish racial hierarchy are discussed in relation to current representations of immigrants living in segregated suburbs.

Keywords: racialization, racism, Sweden, Uppsala, Gottsunda, segregation

Sharlene Mollett, Ph.D., Dartmouth College. Email: sharlenemollett@hotmail.com, sharlene.mollett@dartmouth.edu; *A "Racialized Common Sense"? Miskito Natural Resource Conflicts in the Honduran Rio Platano Biosphere Reserve*

The Honduran Rio Platano Biosphere Reserve has become a place of struggle over natural resource access and property rights. The Miskito Indians, the Reserve's most populous indigenous group, currently seek the formalization of their customary territorial rights from the Honduran state. However, Miskito claims have been persistently challenged by outside interests, both indigenous and non-indigenous and the state itself. Through ethnographic participant observation, semi-structured interviews, historical data collection, and with a focus on discourse, this paper examines the ways in which Miskito territorial struggles are racialized. A particular focus concerns the ways that historical, pervasive and contradictory discursive constructions of indigenous and afro-indigenous peoples and their habitats are presently re-constructed and infused in contemporary natural resource struggles. Such processes appear taken-for-granted in the Reserve where ladino, indigenous and afro-indigenous representations come to be normalized and serve as effective tools in the re-ordering of Reserve land. Building upon the insights of political ecology and critical racial studies, this paper encourages increased attention to the entanglement of race and space in the arena of international development and environmental conservation.

Bernard P Momer, University of British Columbia Okanagan. Email: bernard.momer@ubc.ca; Donna Senese, University of British Columbia Okanagan. Email: donna.senese@ubc.ca; *From Production to Consumption: The Cultural Diffusion of Wineries and the Redefinition of Rural Economies in North America.*

The origins of winemaking in North America reflect colonial migration patterns of settlers and clergy members. The early diffusion of wineries across the continent therefore followed traditional relocation models. However, with the evolution of wine making into a full-blown wine industry over the last 25 years, the spatial diffusion process of wineries became intertwined with the redefinition of the rural economy. An analysis of the opening dates and geographical distribution of North American wineries indicates that the recent spatial diffusion of the wine industry responds to socio-cultural changes based on neo-localism and Epicureanism, more so than to the classic spatial diffusion models. The data collected have been triangulated with personal interviews with wine industry stakeholders to reveal the importance of the value added tourism based sector of the industry, where wine consumption now outranks agricultural production in these landscapes. Our findings will contribute to an understanding of the localised processes involved in the adoption of the wine industry as a mean to create and recreate a regional identity based on the consumption of wine landscapes.

Keywords: Wine, diffusion, cultural landscape

Janet H. Momsen, Univ of California. Email: jdmomsen@ucdavis.edu; *Fair Trade versus Unfair Trade: the Windward Island banana industry in the face of WTO restrictions*

During the 1990s Latin American producers challenged the protected market for ACP bananas in Europe resulting in WTO proceedings initiated by the USA and Latin America in 1996. In February 2002 a compromise was reached opening the European market to non-traditional, that is non-Caribbean producers, and the new EU banana regime came into force on 1st January, 2006. The Windward Islands have been dependent on bananas as their main exports for over four decades but as high cost producers they cannot compete with the cheaper Latin American bananas. The trade uncertainties of the 1990s led to lack of investment in the Windward Island industry and four years were spent in educating producers and consumers about the concepts of Fair Trade. The export of Fair Trade bananas to Europe from the Windward Islands began in 2000 with 466 growers in Dominica, St Lucia and St Vincent. In 2005 a strategic decision was made to convert all Windward Islands fruit exports to Fair Trade. By the end of November 2005 2640 banana farmers were registered as Fair Trade producers. This paper examines the role of British NGOs and supermarkets in encouraging

Fair Trade banana production and exports. It also looks at the gender of Fair Trade banana producers and the impact of the social premium, an integral part of Fair Trade, on local island communities.

Keywords: Caribbean, trade, bananas, Windward Islands

Email: ; *Involving Community in Environmental Decision-Making in Developing Countries: the Case of Ramsar Wetland Management in Bangladesh*

Community participation in environmental decision making has been recognized as a prerequisite for sustainable development. This democratic process has its origin in the publication of 'Our Common Future' by the World Commission on Environment and Development in 1987 and the declarations and documents that emerged from the Rio Summit in 1992. Inspired by the world events, the governments in developed countries have provided legislative mandate to community participation and made it a requirement for environmentally and socially significant decisions. While community consultation and participation in development projects funded by donor agencies is often a precondition for developing country governments, it has yet to attain a legal status in most South Asian countries. Based on the results of extensive field survey in the Ramsar wetland sites of northern Bangladesh, this paper will examine how communities can be better involved in the management of wetlands. Recently, we have seen the adoption of Vroom-Yetton normative decision model in developing guidelines for managers that allow them to determine the level of public involvement in natural resource decision making. This paper will explore if a modified version of Vroom-Yetton model can make any meaningful contribution to deciding the extent to which local communities may be incorporated in decisions relating to wetlands management. The paper will further strengthen our understanding of the necessity of involving community in all facets of resource management - from inception of planning to the implementation and monitoring of program.

Keywords: Bangladesh; community participation; the Ramsar Convention on Wetlands; Vroom-Yetton Model.

William Monfredo, Ph.D., University of New Orleans. Email: wmonfred@uno.edu; Katrina—Surveying the Damage in the Lower Ninth Ward

This presentation briefly discusses hurricane history along the Gulf Coast, introduces observations and meteorology associated with Katrina, and compares events of this nation's costliest natural disaster with 1969's Hurricane Camille. Katrina's Sea-surface temperatures, wind shear, rainfall, and storm surge are considered. Results of a damage survey conducted in the Lower Ninth Ward are shown; quality black-and-white photographs reveal an intriguing aspect. Unlike New Orleans' Lakeview district, widespread and intense flash-flooding occurred east of the Industrial Canal—damage similar to an F4/F5 tornado ensued. Using prior strength, duration, & areal extent of storms to aid the prediction of maximum storm surges appears prudent. In the future, studies indicating whether and how increasing levels of atmospheric carbon dioxide might contribute to both SST variations and upper-air patterns favorable for the growth of large and dangerous storms would prove useful in lieu of ongoing global-change debates.

Keywords: flood, hurricane, Katrina, New Orleans, storm surge

This paper draws on interviews with health experts engaged in public policy making and implementation, including legislators, federal government administrators, community health administrators, and health advocates, on both sides of the Mexico-US border. It explores how they conceptualize "women's health," "gender," and "the border" in discussing priorities for health policies and programs. Their framings of the border reveal strong influences of individuals' specific geographic locations and professional roles (their place and positionality). Interpretations of women's health issues frequently conflate biological "sex" distinctions with "gender" as a socio-political concept. We compare discourses across both national and professional boundaries and raise questions about ways in which feminist scholars can work to improve women's health across these borders.

Keywords: women's health, gender, Mexico-US border, policies

Mark Monmonier, Syracuse University. Email: mon2ier@maxwell.syr.edu; *Sea Level Rise and the Fourth Shoreline of Coastal Cartography*

Maps of sea level rise are of potential interest to map historians because they represent the emergence of a fourth distinct type of cartographic shoreline, the oldest of which is the high-water line, captured initially in the offshore sketches of mariners and global explorers and used for centuries to promote wayfinding at sea as well as frame continents on geographical maps. The second shoreline is the low-water line, which marks the horizontal position of the tidal or sounding datum, while the third shoreline portrays the plausible landward reach of storm surge. Like these second and third depictions, which warn respectively of near-shore navigation hazards and coastal flooding, the fourth cartographic coastline relies on measurement and modeling to advertise another environmental hazard, namely, the combined impact of the local subsidence or emergence of Earth's crust and the imminent global rise in sea level associated with climate change and the possible disruption of glaciers in Greenland and Antarctica. Unlike such distant cousins as Alfred Wegener's 1915 graphic hypothesis of continental drift and the didactic depictions of oceanic invasions in nineteenth-century geology textbooks, maps of sea level rise assumed the important role in public discourse of informing skeptical or ideologically biased citizens about an imminent yet uncertain hazard with a slow onset and potentially catastrophic impact. An inexact time frame and complex causes promote diverse renderings of the fourth coastline, which include small-scale forecasts of massive inundations of coastal lowlands and larger-scale depictions comparing the consequences of different strategies for managing coastal wetlands.

The diurnal cycle of stable isotopic values in leaf water has not been studied extensively, and the few reports published in the peer-reviewed literature show large fluctuations, particularly during the summer growing season. We therefore collected lodgepole (*Pinus contorta*) and Jeffrey (*Pinus jeffreyi*) pine samples from Little Valley, Nevada to study leaf water exchanges over a 24-hour period. The focus of this study is to determine the diurnal fluctuation of hydrogen (dD) and oxygen (d18O) water stable isotopes as it relates to evapotranspiration during the growing season and into the dormant season. Additionally, we evaluated diurnal photosynthetic activity using a LICOR instrument. Diurnal sampling from four trees per species took place on: (1) October 15-16, 2005, with a total of 12 samples per tree. (2) June 19-20, 2006, with a total of 16 samples per tree. Two spot check sampling events took place on June 14, 2006 and October 16, 2006. Other sampling included: precipitation, xylem, branch, soil, and stream water. Other observations included: diurnal cycles of canopy relative humidity, air temperature, hourly air temperature, and solar radiation from the Little Valley weather. The diurnal variation for the dormant season in dD and d18O of leaf water reached a minimum (-70 and 0.72, respectively) at midday, reached a maximum (-51 and 9.07, respectively) in the late afternoon/early evening, and decreased in the morning. The diurnal variation for the growing season is currently being analyzed. The diurnal cycle of stable isotopic values is graphically presented and its implications are discussed.

Enrique L. Montano, MS, University of New Mexico. Email: tresmont@unm.edu; Karl Benedict, PhD, University of New Mexico, Earth Data Analysis Center. Email: kbene@edac.unm.edu; Bob Parmenter, PhD, Valles Caldera National Preserve. Email: bparmenter@vallescaldera.gov; *Proactive Grazing Management in the Valles Caldera National Preserve Using Internet Mapping Services and Remotely Sensed Forecast Models*

The Valles Caldera National Preserve (Preserve) is a unique experiment in sustainable management, multiple use, and self-sufficiency. The use of portions of the Preserve as a working ranch is an integral part of the management mandate and continues a long tradition of cattle grazing on the Valles Caldera. The Preserve currently performs active and innovative management of these grazing lands through adaptive stock size and day-to-day monitoring of activity and impacts. The purpose of this presentation is to explore the internet mapping service developed by the Preserve in conjunction with the University of New Mexico's Earth Data Analysis Center to address the needs of active management.

The current service is used to deliver daily Normalized Daily Vegetation Index (NDVI) data from the MODerate Resolution Imaging Spectroradiometer (MODIS). To further address the needs of active management and proactive management, the Preserve is implementing a forecast model of NDVI values as part of the internet mapping service. The forecast model is the result of the combination of high-temporal frequency remote sensing products from MODIS with precipitation products from the NEXt Generation RADar (NEXRAD). The model provides a foundation for future research in biomass estimates from NDVI, refinements to the discrete temporal resolution of the model, and season-wide simulation models. The presentation of these spatial tools allows managers to see what is occurring and forecast potential impacts of management practices.

Roberto Luís Monte-Mór, Ph.D., Associate Professor, UFMG, Universidade Federal de Minas Gerais. Email: montemor@cedeplar.ufmg.br; *Extended Urbanization and Production of Space in Metropolitan Brazil*

In 1950, only 36% of the Brazilian population lived in urban areas. In two decades, industrial development and intense urbanization led to an urban population of 56%, in 1970, mostly concentrated in regional and industrial cities. Since then, metropolitan and urban growth spilled over middle size cities and small towns and the urban population reached 81.2%, in 2000. Metropolitan regions further extended urban-industrial infrastructure and services, along with market areas, much beyond cities and towns to create complex urban-rural patterns throughout the country. Such intense and extended urbanization process took the urban-industrial conditions of production (and reproduction) beyond cities and towns and produced the urban form that characterizes contemporary Brazil. Extended urbanization also carried within it the specificity of the city, and of the polis - citizenship; politics; urban social praxis. This paper looks at Brazil's recent socio-spatial restructuring from such a perspective and focuses on its two outermost manifestations: metropolitan regions and the Amazonian frontier.

Keywords: urbanization, metropolitan, Brazil

Daniel R. Montello, Ph.D., Univ of California Santa Barbara. Email: montello@geog.ucsb.edu; *Climate Change and Cognition: Introduction and Overview*

The causes and consequences of ongoing global warming are to be found in both biophysical and human geography, and responding to global warming will require human action at many levels, from individuals to institutions. In this session, we explore the idea that understanding human responses to climate change requires understanding human cognition about climate and climate change?what people believe about how climate works, and how weather relates to climate; whether people think climate change is occurring, and what they think causes it; what people expect the consequences of climate change will be, including the spatial and temporal characteristics of these consequences; and what, if anything, people think can be done to respond to these changes and attenuate their negative impacts. Furthermore, it is relevant to consider cognition about climate change from the perspectives of various groups of people, including climate scientists, lay people, and policy makers. How do climate scientists understand climate and climate change, and how do they communicate their understanding to lay people and policy makers? How do the values, beliefs, and attitudes of individuals and organizations shape public concern and support for climate-change mediation and policy? In this paper, I introduce and overview potential research topics concerning the cognition of climate and climate change.

Keywords: climate change, cognition, perception, behavioral geography

Alesia Montgomery, Ph.D, Michigan State University, Dept of Sociology. Email: montg143@msu.edu; *The Pursuit of "Natural" Spaces by Black Middle Class Mothers*

The social reproduction of the middle class requires not only vast quantities of parental time but superior qualities of neighborhood space. Drawing upon visual data and in-depth ethnographies in Detroit and South Los Angeles, this paper frames the spatial bind of black middle class mothers: Distant from the amenities enjoyed by white middle class mothers in affluent suburbs, these mothers often reside in low-income, racially stigmatized areas that have been hit hard by urban restructuring. The dearth of resources for acquiring (dominant) cultural capital and the lack of spaces (fresh produce stores, public parks) to safely consume "nature" in these areas make it hard for these mothers to adopt middle class patterns of consumption and cultivate middle class advantages for their children. Ironically, while upwardly mobile African American mothers have acquired middle class tastes, some of them feel that they have less favorable surroundings to satisfy their tastes than they did in their working class childhoods. The efforts of these mothers to distance environmental risks while maintaining kin and community ties increase their time burdens, intensify their

stresses, and draw them into racial, class and gender conflicts. This study contributes to theorization of the co-construction of urban environments and gender practices.

Keywords: black middle class, gender, daily rounds, nature

Mariana Montoya, University of Texas at Austin. Email: mariana.montoya@mail.utexas.edu; Kenneth R. Young, University of Texas at Austin. Email: kryoung@mail.utexas.edu; Kelley A. Crews-Meyer, University of Texas at Austin. Email: kacm@uts.cc.utexas.edu; *Contested landscapes of the Pastaza and Corrientes Rivers of the Peruvian Amazon*

Indigenous groups located in the northern Amazon of Peru find their lands and resource zones embedded within or among landscapes designated by the national government for nature conservation, for possible future timber concessions, and for oil exploration and extraction. This project uses spatial data such as titled community lands, settlements, petroleum concessions, watersheds, and protected areas to evaluate the overlaps among the differing formal and informal land claims affecting the Achuar, Kandozi, and Kichwa, plus their other neighbors including long-term settlers. In most cases, recent land titling projects have begun to clarify some land tenure concerns, but have not resolved other instances of environmental injustice including water contamination from upstream sources. As a result this area has become of concern to social and environmental activists, to decision makers, to nongovernmental organizations, and to the governing bodies of the indigenous groups. Vulnerability of the indigenous people is a result of exposure and susceptibility, type of contaminant, resource scarcity, and their degree of self-governance.

Keywords: Amazon, indigenous groups, contested landscapes, petroleum, concessions

Aaron Moody, Univ of North Carolina. Email: aaronm@email.unc.edu; R Todd Jobe, University of North Carolina. Email: ; Nick Haddad, North Carolina State University. Email: ; Jeff Walters, Virginia Tech. Email: ; *Creature Space - Geographies of Animal Movement*

As the landscapes of everyday or life-cycle activities are transformed through various forces, the movements of individuals are affected positively, negatively, or not at all, depending on their particular movement niche. The movement niche, which varies more between than within species, includes aspects of an individual's behavior (including social behavior), life-history, environmental sensitivities, and trophic vulnerability. The movement niche is enacted in what might be called movement space, or more generally, the landscape. In many cases, for example in urbanized landscapes, humans have transformed movement spaces (along with habitat) without considering which species would benefit and which would not. No theories or general principles exist for describing how biological communities existing in human dominated landscapes have changed (or will) due to the modification of movement spaces. In this paper we present empirical data on landscape characteristics and movement behavior for the red-cockaded woodpecker (RCW) and the St. Francis satyr (butterfly). These data have been collected for 18 radio-tracked juvenile female RCW during their dispersal period, and through in situ observation of St. Francis satyr and experimental release experiments using a surrogate species (Appalachian brown satyr). We analyze our data along with other studies of animal movement and present a framework that attempts to generalize about how wildlife communities are affected by the interplay between landscape structure and animal movement.

Jerker Moodysson, Lund University. Email: jerker.moodysson@keg.lu.se; *Spatially distributed life science systems: epistemic communities as global lifeworlds*

This paper deals with the geography of knowledge collaboration. Particular attention is paid to how the different rationalities of actors in various situations underpin their choice of collaborators. Biotechnology is a good example of a platform that encompasses various types of actors and activities that embraces several sectors, which makes it a good case for an analysis of the rationalities behind local and non-local knowledge collaboration. Such an analysis requires a shift in focus, from the level of systems (e.g. RIS) as unit of observation to an approach also considering the specific characteristics of the actors and their activities. Based on a study of 10 life science research groups and 10 dedicated biotech firms located in the Swedish part of the Medicon Valley bioregion, the following findings deserve to be highlighted: Local knowledge exchange underpinned by 'lifeworld' rationality is a rare phenomenon in biotechnology. To the extent that knowledge spillovers and social interaction stimulating these spillovers exist at all, they are as frequent on a non-local scale as on a local. Most of the knowledge that is to be exchanged is organized, formalized, and structured. Non-local knowledge collaboration is not entirely based on 'system' rationality, but on a mix of lifeworld and system rationalities, characteristic for

so called epistemic communities.

Eli Moore, Syracuse University. Email: ebmoor01@maxwell.syr.edu; Research and mapping in a context of conflict: The parallel relevance of participatory action research principles

In this paper I consider how participatory action research (PAR) principles enabled a still-flawed research process to occur in an area of heightened socio-political conflict in rural Colombia. Key moments in a research process that included video production are contrasted with reflections by local organizers about their participatory mapping processes. The comparison demonstrates how PAR principles apply differently to the cartographic and video research processes. I acknowledge important tensions between viewer/participant subjectivities as they are distinctly mediated by the two research media. I also argue that the different positionalities of outside researcher/video producer, local organizers and participants shaped the way PAR principles applied to building safety, trust and reciprocity.

Keywords: research methodology; participatory mapping; Colombia

Francesca P L Moore, BA MSc MPhil, University of Cambridge. Email: fplm2@cam.ac.uk; Regulating Motherhood: Governmentality and Reproduction in Industrial Britain

Foucault has argued that in the 18th and 19th centuries the female body was designed as a maternal body. He believed this was because the bourgeoisie needed maternity as a social institution. Assumptions of the essential 'maternal' character of women were reflected in the law, such as the Offences Against the Person Act. I intend to explore the regulation of women's reproductive behaviour to expose the social control strategies behind the legal norms. I intend to explore the significance of the unborn child in regulation and evaluate the position of the life of the unborn child in relation to that of the woman that carries it. I will argue that the regulation of reproductive capacity confirmed women's marginalisation in industrial society, reinforcing gender and class discrimination and put them at the bottom of a hierarchy of power.

Keywords: Motherhood, Abortion, Governmentality

Jason W. Moore, University of North Carolina, Chapel Hill. Email: jasonwmoore@earthlink.net; Empire, Enclosure, & the Political Ecology of the Long Wave: The World Ecological Revolutions of the Long 17th Century

Imperialism is back in vogue. And with it has come a newfound interest in Marx's concept of "primitive accumulation." After more than a decade when everything - even within critical historical circles - seemed to turn on the market, the new debates on empire and enclosure make clear that capitalism survives as much by the march as by the market. Unfortunately, these new debates have been constructed on exceedingly limited historical foundations. Much as the globalization literature before it, analysts of imperialism and "accumulation by dispossession" have pronounced its novelty with clocklike regularity. Taking the environmental history of primitive accumulation as its angle of vision, I argue that coercive-intensive accumulation is a cyclical phenomenon of capitalism. From this standpoint, primitive accumulation appears dialectically bound with those capital-intensive accumulation strategies ? pivoting on rising productivity and market forces ? typically regarding as "normal." The argument is advanced by exploring the era of Dutch hegemony during the long 17th century (1570-1790s). Exploring the environmental histories of imperial and domestic "enclosures" (broadly conceived), I advance a historical reconstruction of the era's two great moments of resurgent primitive accumulation ? the first crystallizing during the Braudel's "Age of the Genoese" (1570s-1640s), the second during the subsequent, Dutch-led financial expansion (1730s-1790s). In both instances, capitalist and territorialist agencies, within but not limited to the ascendant hegemonic power (United Provinces, Great Britain), intensified coercive-intensive relative to capital-intensive accumulation strategies. Such a world-historical perspective will allow us to discern what is genuinely novel about the present conjuncture.

Keywords: capitalism, imperialism, political ecology, globalization, environmental history, historical geography

MacKenzie K.L. Moore, M.A., UC Berkeley Department of History. Email: macmenzy@gmail.com; Unfamiliar Terrain: Place, Ideology, and the Conquest of Nature in the Jacksonian West

Jacksonian Americans who traveled on the great plains in the middle decades of the nineteenth century attempted to interpret their environment through many lenses - Romanticism, Primitivism, Environmental Racial thought, and the Great Chain of Being. I argue that travelers encountered a landscape in the Great West that challenged dominant Jacksonian thought, and therefore confounded men and women who relied on popular ideology to interpret their experiences ? and their purpose ? in the West. Once disabused of their trusted interpretive tools travelers embarked on a project of sense-making that was constantly in dialogue with the landscape. Though these experiences might have destabilized travelers' rationale for Western conquest, my evidence demonstrates that this process actually strengthened their determination to conquer the land beyond the frontier. The most important mechanism travelers used was to associate Indians with animals. By intermingling the environmental context of the plains with reorganized older ideas, early Western travelers were able to construct an idea of the Western Indian as equally connected to the environment and the place of the West as were animals. The stigma of animality not only reaffirmed the inferiority of Indians as compared to White men, but also specifically elucidated their destruction as a prerequisite for successful and total conquest. Once the United States set the plains Indians in their sights, they would not stop until every Indian was severed from the environment of which he seemed so much a part.

Susan Moore, Dr., Cardiff University, Wales. Email: MooreS6@cardiff.ac.uk; Rearticulating notions of public/private in the provision of residential built environments

Planning and market interests are largely cast in antagonistic relationships within studies of urban development. The built environment is often seen in functional terms as the end result of the tug-o-war between planners and developers in the normative pursuit of affordable housing, sustainable communities, smart growth and the like. The exaggerated distinction between public interests and private market forces in explanations of urban change and land transformation belies the situated hybridity of all forms of building provision. Such constructions of state/market or public/private say little of the assembly of actors within relational contexts of action, which constitute geographically and socio-politically specific development practices and rationalities. This paper illustrates the blurring of 'private' and 'public' processes, roles, and actors within the complexities of housing provision by drawing upon primary research of master-planned communities in Canada and the UK. Rather than articulating public/private as the primary analytical categories in distinguishing between key actors and events in the development process, the intent of the paper is to shift attention toward how these constructions themselves are perpetuated through relations of context, practices and rationalities; and how the latter might be used to devise a new framework for researching built environments.

Toby Moore, American University. Email: moore@american.edu; Measuring the Impact of Tougher ID Laws on U.S. Voters

Perhaps the most controversial area of election reform is the drive to require voters to show photo identification and prove their citizenship status at the polling place. Georgia, Missouri, Arizona and Indiana are among the states which have passed such laws; slightly different ID measures passed in both the U.S. House and Senate in 2006, although it has not become federal law. Supporters cite the need to prevent voter fraud; opponents say the laws are discriminatory and ineffectual. Despite extended litigation battles and legislative debates, reliable data is scarce. Estimates of the number of voters who lack photo ID and proof of citizenship vary widely, and attempts to match drivers' license databases with voter registration rolls have proved unsatisfactory. Under a grant from the Smith Richardson Foundation, the Center for Democracy and Election Management has initiated an innovative effort to determine how many people lack photo ID and proof of citizenship, who these people are, and what impact such laws have in the polling place on Election Day. The study will use statewide telephone surveys, localized "snowball" surveys and election observing in an effort to determine the impact of requiring photo ID and proof of citizenship. This paper presents tentative findings from the study.

Zachary A Moore, Ph.D. Student, National Geographic Society. Email: za-moore@txstate.edu; Issues Affecting Geographic Education in America's K-12 Public Education System: An Historical Perspective

Over the past one hundred and twenty-five years, geographic educators have published a plethora of articles exposing numerous issues that affect K-12 geography. An analysis of contemporary literature reveals three prominent concerns - pre-service training/teacher education; instructional material/teaching methods; geography's position within K-12 education - that affect geography education in the current education system. Based upon these themes, the author examined literature from the nineteenth century to present in order to document historical trends or commonalities in these contemporary themes. Results indicate scholarly works routinely mimic concerns brought to the forefront by scholars around the turn of the twentieth century.

Sharon Moran, State University of New York - Env. Science and Forestry, Syracuse, NY. Email: smoran@esf.edu; Following the dirty water down the drain: political ecology and the nonhuman

Recent work on the nonhuman provides several different ways for geographers to explore the relations of authority that exist among the composite entities we know as people, places, and things. One of the most provocative aspects of these ideas is that they illustrate how the "ethical-political horizons of the 'self' are now seen to extend across multiple spatio-temporal networks" (Braun 2000) which manifest possibility of change and transformation in various locations. In order to interrogate the utility of the concepts articulated by authors including B. Latour, S. Whatmore, B. Braun, and others, I use a case study approach. The paper examines a wastewater management challenge in a small lakeside community where the lake also serves as a reservoir for a more distant city. I track the recursive process through which the challenge was characterized, actors became involved, and technologies were (re)deployed. This case is examined in connection with three aspects of idea of the nonhuman - its ontological commitments, its theorizing of the micropolitics of capitalism, and its framing of governmentality - and the paper concludes that the conception of the nonhuman both illuminates and frustrates greater understanding.

Keywords: political ecology; wastewater management; technology

Barbara Morehouse, Inst for the Study of Planet Earth. Email: morehoub@u.arizona.edu; Socio-Ecological Resilience, Habitus, and the Practice of Everyday Life

Resilience theory, as developed by Folke, Berkes, Gunderson, Holling, and others, is by its very nature political in that it requires close socio-ecological coupling to achieve desired ends. However, establishing socio-ecological resilience requires not only changes in policy. It also requires recognition by individuals that non-humans are, in important ways articulated by Latour, actors in their own right. Accepting this epistemological approach may be difficult enough for researchers involved in interdisciplinary resilience research. Even more difficult is introducing it into political structures and practices. Bourdieu's concepts of habitus, field, and reflexivity, combined with deCerteau's views on the practice of everyday life, offer an avenue for exploring how to overcome such barriers and how to refine resilience theory's conceptual foundations.

Rachel Morello-Frosch, Brown University. Email: rmf@brown.edu; Manuel Pastor, University of California, Santa Cruz. Email: mpastor@ucsc.edu; James L Sadd, Occidental College. Email: jsadd@oxy.edu; The 'Riskscape' and the Colorline: Examining Geographies of Inequality in Environmental Health

Race, as a social construct and mechanism of classification, has historically defined and continues to shape the distribution of power, privilege, and economic resources in American society. Myriad forms of past and present discrimination in the U.S. are imprinted onto our landscape, as evidenced by the persistent spatial separation of diverse communities along racial/ethnic and class lines. Researchers, policy-makers, and environmental justice advocates argue that communities of color who are segregated in neighborhoods with high levels of poverty and material deprivation are also disproportionately exposed to physical environments that adversely affect their health and well-being. Examining these issues through the lens of racial residential segregation provides insights into the junctures of the political economy of social inequality with discrimination, environmental degradation, and health. More importantly, this line of inquiry highlights whether observed pollution - health outcome relationships are modified by segregation and whether segregation patterns impact diverse communities differently. This paper examines theoretical and methodological questions related to racial residential segregation, economic inequality, and environmental health disparities. We begin with an overview of race-based segregation in the United States and propose a framework for understanding its

implications for environmental health disparities. We then discuss applications of segregation measures for assessing disparities in ambient air pollution burdens across racial groups and go on to discuss the applicability of these methods for other environmental exposures and health outcomes. We conclude with a discussion of the research and policy implications of understanding how geographies of inequality shape environmental health disparities across diverse communities.

Christopher M. Moreno, San Diego State University. Email: cmoreno@mail.sdsu.edu; Stuart C. Aitken, San Diego State University. Email: saitken@mail.sdsu.edu; Deleuzian Geographies of Drug Addiction in Darren Aronofsky's Requiem for a Dream

This paper, explores a variety of Deleuzian geographies of drug addiction in Darren Aronofsky's Requiem for a Dream. Initially, we connect Deleuze and Guattari's notion of a 'drug using assemblage' to 'becoming' to express drug using bodies in terms of their enabling (good) or blocking (bad) attributes as 'bodies in motion' and potential to 'become other.' We then draw on Aronofsky's poly expressive montage depictions of 'drugged bodies' in the film as a way in which to visually and affectively express these ideas. And finally, we further address the film's affective qualities in terms of creating what Deleuze calls 'zones of intensity' or 'media fields' where the filmic and social spaces of drug addiction come together and affect one another. (Keywords: Body, Drug Addiction, Film, Gilles Deleuze).

Diego Moreno. Email: diego.moreno.sierra@gmail.com; Dominique Badariotti, . Email: dominique.badariotti@univ-pau.fr; Arnaud Banos, . Email: arnaud@lorraine.u-strasbg.fr; Introducing morphology and accessibility in urban cellular automata models: a graph-based approach

Cellular Automata (CA) models have proved their usefulness in urban studies, especially those aimed at exploring the influence of spatial structure on the global behavior of the urban system. However, the standard representation of the urban structure in cellular automata models, i.e. by a regular lattice, may be relaxed to fit more complex relationships in the city. Designing irregular lattices, overstepping the classical assumptions about isotropy and stationarity of space, then requires the description of neighborhood structures by other formalization than the simple contiguity of spatial units. Geo-Algebra and graph-based cellular automata models are two key perspectives we decided to adopt and enrich in this work. We recently proposed a graph-CA model based on urban network accessibility, the REMUS model. This model allows the computation of a functional graph representing network-time-distances between buildings (the cells of our automata), according to a given transportation mode. The derived neighborhood graph, constructed by selecting a certain distance threshold, is then used in REMUS to define the neighborhood of each spatial unit (building) in the cellular automata to be constructed. The purpose of this communication is to move a step further. Indeed, we propose to explore the behavior of a very classical model (Schelling's neighborhood segregation, 1971) when applied to more realistic urban patterns. More precisely, the application to a real city (Pau, France) may reveal the sensibility of segregation processes to urban structure, defined both by its morphology and network accessibility.

Keywords: Graph-based cellular automata, urban graph, segregation model

Rafael Moreno, University of Colorado at Denver. Email: rafael.moreno@cudenver.edu; Richard Streeter, Stratus Consulting Inc. Email: richardstreeter@earthlink.net; Hovik Sayadyan, Armenian Agricultural University. Email: hovik_s@yahoo.com; Determining the forest cover extent in Armenia

The forests in Armenia are both scarce and essential for the sustainable development of the country. Since its independence in 1991 (coinciding with the collapse of the USSR), Armenia has experienced multiple social, economic, and environmental hardships. The country has been unable to conduct a forest inventory with national coverage. The most recent reliable information on the condition and extent of the forests dates back to the last Soviet Armenia National Forest Inventory in 1988. The transition to a market economy and the recent war with Azerbaijan have put tremendous pressure on the forests as sources of income and fuelwood. There is an urgent need for more recent estimates of the forests extent and for estimates of recent deforestation rates. This paper presents the results of estimates of the forest cover extent for the periods 1987-1988 and 2000-2001 using LANDSAT TM and +ETM images. Accuracy assessments indicate a high degree of precision in discriminating forest vegetation from other land cover types. Our estimates indicate a forest cover of 246 098 hectares for the year 2000, and 294 135 hectares for 1988.

Keywords: deforestation, forest cover, Armenia, Eurasia

Raquel Moreno-Penaranda, Doctoral Candidate, Energy and Resources group, University of California Berkeley. Email: raquelmp@berkeley.edu; Shared Natures, Uncertain Communities: reconstructing the forest commons in the shifting socio-economic landscape of Spain.

Collectively owned forests are widespread throughout the inner provinces of Spain. Most of those forests have remained productive till today by relying on community-based management systems deeply rooted in customary law - for example, by guaranteeing access to the forest goods and services to local community residents only, excluding outside residents with legal rights. The broader, often abrupt economic and social transformations that Spain has been experiencing over the past century have resulted in the severe depopulation of rural areas. As a consequence, local communities are severely depopulated, and forest property rights are fragmented among an enlarged, geographically dispersed population of community descendants. The new nation wide forest law intends to accommodate the challenges of community forest management under this conjuncture. Among its novel features are the "management boards"? small assemblies constituted by accredited legal owners residing or not in the community. The board is entitled to manage the forest and to allocate its revenue among the owners, which overwrites the customary local residency requirement to do so. The paper focuses on a case study in a local community hosting a pilot project for the implementation of the new forestry law. I argue that beyond the managerial challenges deriving from geographic dispersion, outdated legal rights, and local depopulation, the uncertainties emerging from a shifting broader socio-economic context (raise of rural tourism, new capital-intensive rural residential developments) plays a crucial role in the direction that CNRM might take in the near future.

Fraser Morgan, University of Auckland. Email: f.morgan@auckland.ac.nz; David O'Sullivan, University of Auckland. Email: d.osullivan@auckland.ac.nz; Understanding the human dynamics of neighbourhood re-development with agent-based models

Within New Zealand's local government system, local councils are at conflict with property developers over their preference of greenfield type development. Larger New Zealand cities, such as Auckland, have expanded substantially over the last 30 years resulting in urban sprawl and developmental issues around the city fringes. While councils provide incentives for re-development within existing neighbourhoods, most developers still continue to focus on the ever increasing fringe. Developers who are interested in neighbourhood re-development are subject to pressure about the location of their development from lenders based upon a risk and reward profile, pressure which potential homeowners who wish to purchase in the same area and developers focusing on the city fringes do not encounter. A change in the lenders risk/reward profile, based upon variables such as an increase in owner occupied dwellings, could allow developers into a neighbourhood. Agent-based models provide a framework to investigate the interactions between householders, developers, and lenders and the spatial patterns which result. This talk will present a conceptual framework of an agent-based model to investigate the human dynamics of the varied agents within neighbourhood re-development.

John W Morgan, Dr, Futurelab. Email: John.Morgan@futurelab.org.uk; "Building up a detailed picture of our lives": Theorising Teacher-Child relations in school settings.

Holt and Holloway (2006) suggest that a central achievement of childhood studies has been to 'illuminate and critique dominant conceptualisations of childhood and youth'. Much of this work has gone beyond the ethnographic impulse to 'write other people's lives' and sought to theorize the processes that construct children and young people as 'less than adult' or 'human beings'. In this literature however, it is striking how little of this work focuses explicitly on the experience of young people in schools and classrooms where a particular form of adult-child relationship (teacher-pupil) is enacted. Often it is assumed that school classrooms are experienced as a space where children's agency is muted or at best limited to acts of 'resistance'. This paper will attempt to show that there is much more going on in schools and classrooms. It is derived from an on-going curriculum project - Enquiring Minds? which is seeking to explore ways in which children's experiences and interests might be given centre stage in formal secondary schooling (aged 11-18). This interest in 'student voice' has gained the interest of educational policy-makers in the UK (Fielding 2004). Teachers in the project have explicitly tried to reconfigure the routines of the classroom and develop a 'pedagogy of listening' that seeks to make visible and recognise pupils' own experiences and interests (Dahlberg and Moss 2005). This paper will explore the theoretical and political implications of this work,

particularly in relation to how teachers and children negotiate the co-construction of schooled identities.

John T. Morgan, Emory & Henry College. Email: jtmorgan@ehc.edu; Home-cooking Restaurants and Local Garden Crops

The U. S. South might best be defined by the traditional foods found in the region. Some foods are present throughout much of the region whereas other foods appear only in certain parts of the South. This paper seeks to determine if vegetables served in local restaurants reflect traditional food crops produced in area gardens. For this research, a survey of a study area's garden crops will be compared with vegetable offerings at home-cooking restaurants in the area. If results show a positive correlation, the study will be replicated in another part of the South. Ultimately I hope to be able to generalize about the relationship between local restaurants and regional foods in the South.

Keywords: U. S. South, food, restaurants

Cory Morin, University of Arizona. Email: corywm417@aol.com; Andrew C. Comrie, University of Arizona. Email: comrie@arizona.edu; Dynamic Modeling of Mosquito Populations with Climate Data

Climate is an important control on populations of mosquito disease vectors such as *Aedes Aegypti*. Improved understanding and modeling of climate effects on mosquito populations is needed to help predict disease epidemics. There is a surprisingly limited number of mosquito models with a climate component reported in the literature. The majority of these are empirical and statistical, and in particular, there are no dynamic simulation models. In this study we report on the development of a dynamic mosquito population model driven in part by climatic data. Model inputs include temperature, precipitation and relative humidity that influence mosquito population development through maturity and mortality in relation to temperature, population density, and water availability. These factors are considered through all phases of mosquito life cycle development from mosquito ovulation through each instar level to pupae and finally adult. In addition to climate data, the model also incorporates the land use and land cover of the area. Temporal resolution is daily, and the model can be calibrated for specific mosquito species and locations. We use the model to evaluate the role of climate variability in mosquito populations, using Tucson, Arizona as a case study. Using different versions of the model we examine the relative behavior of the species of mosquito most likely to dominate the mosquito population given a specific area and climate. This relationship is important for determining the nature of risk for an epidemic.

Inka Moring, . Email: inka.moring@helsinki.fi; Spatial Genealogies of Post-Europe: 'Citizenship,' Public Space and Econocracy

The formation of "New Europe", containing post-communist Eastern and Central European countries, provides close to laboratory conditions for the observation of societal change and media. However, the new spatial formation of the unified East/West does not follow a conventional centre-periphery pattern. This paper focuses on the accelerating spatial structuration and detachment of the new political and journalistic elite in the capitals of the new EU-member states. The focal question is how media and the new elites interact, and in which way the new citizenry is produced in Eastern 'econocracies' through domestication of a "European" project. Theoretically the Habermasian revised concept of "public sphere" will be contrasted with the Foucauldian genealogical reading of transforming collective understandings of the "new" Eastern part of Europe. The paper introduces the concept of 'citizenship' which is starting to replace the older linkages between state and citizen with one of place and dweller transforming the understanding of democratic practices. The paper draws also on theories within urban theory, human geography and theories of social remembering. Empirically, the paper builds on interviews carried out with leading politicians and journalists in Estonia, Hungary, Latvia, Lithuania, and Finland. Methodologically, these issues are addressed through thematic interviews, statistics on economic development and comparative media system analysis. Themes that are addressed are: how discourses on power, territory and identity emerge and what the characteristics of argumentation are, relating economic interest (business- and market) to national interest and European common good in the global contexts?

Keywords: media geography, public sphere, borderland, econocracy

Masatoshi Morita, Graduate student, Nagoya University. Email: mm19781002@hotmail.com; Kei-ichi Okunuki, Department of Geography, Nagoya University. Email: nuki@lit.nagoya-u.ac.jp; A study on edge effects in spatial analysis of points on a network

In spatial analysis, to define the edge of a study region often becomes a problem because it influences the results of analysis. In point pattern analysis, for instance, it is possible for a set of points that a tendency of their randomly

distributing is found in some cases of edge definition but it is not in the others. In the literature, the edge effect problems are considered not on a network but on a plane. On a network, a new additional edge effect problem occurs because the edge of a region restricts the paths between some pairs of points. In this study, these edge effect problems are considered on a network not only theoretically but also empirically. First, a framework to consider these edge effect problems is shown. Second, a simple mathematical model is formulated for examining how the results of point pattern analysis such as the K-function method are affected by the defined edges of a region of a network on which a set of points distribute. Third, an empirical study is conducted for a real road network on which urban facilities exist. Through this study, a new method is proposed for obtaining a guaranteed result in any case of edge definition, and its empirical application is also shown. Last, the direction for future work is discussed.

Keywords: spatial analysis, point pattern analysis, edge effects, network, K-function method

Richard L. Morrill, University Of Washington. Email: morrill@u.washington.edu; Lawrence Knopp, University of Minnesota-Duluth. Email: lkknopp@umn.edu; *How stable are Red and Blue America*

How stable are Red and Blue America? The 2006 elections. Richard Morrill and Larry Knopp Since the 2000 elections are yet to occur, this abstract can only suggest (riskily) what we might expect. Our analyses of the 2000 and of the 2004 presidential elections and of 2000 to 2004 change broadly supported a dual socio-economic-cultural and geographic polarization - between a more 'traditional' south and a more modern' north and west, and between a more tolerant and liberal metropolitan and a more conservative non-metropolitan America. Still we found anomalous exceptions to any simple division. We dare to predict that these broad divisions will remain, driven by twin concerns for security and 'traditional' values, but that trends between 2000 and 2004 which suggest some shifts in a progressive direction in some regions and in some kinds of places, even in the south, or in rural areas, will shift the electorate marginally 'leftward', in turn revealing that not everyone is immovably Red or Blue. Whether we are correct or not, our paper will assess whether the 2006 results amplify the somewhat subtle shifts that occurred between 2000 and 2004, or whether a deeper realignment may be in process, or whether 2006 just represents an across-the-board shift toward the Democrats, leaving the broad dimensions of a Red and Blue America unchanged.

Aaron O. Morris, Department of Geography, University of Cincinnati. Email: [morrissa8@uc.edu](mailto:morrisa8@uc.edu); *Where you want to go to get away from it all: Theoretical Models of Cruise Tourist Behavior*

We examine several theoretical models of tourist behavior in order to explain the increasing popularity of the cruise vacation. According to the United Nations World Tourism Organization (UNWTO) tourism has an "average annual growth rate of more than 4%." (Yarnal & Kerstetter 2005:368) Projections indicate that by 2020 there will be over 1.6 billion international tourists. As the numbers of tourists continue increasing, the numerous tourism sub-industries will grow as well. Researchers classify cruise tourism as "one of the fastest-growing segments of the tourist industry" (de Blij & Murphy 1999:320) with studies showing that the average annual growth rate has been "in excess of 8% since 1980." (Yarnal & Kerstetter 2005:368) This increased popularity is physically evidenced by increases in the number of active cruise ships and the number of berths per ship. However, the increase in popularity of the cruise industry has not been adequately explained. Thus far, the main foci of study have been on "economic analyses and environmental impact studies." (Yarnal & Kerstetter 2005:368) Other perspectives, such as anthropological, geographical, psychological, and sociological have yet to be fully explored. This paper uses theoretical models of tourist behavior in order to explain the rapid increase in cruise popularity. In addition, these models will also be applied to cruise passengers in order to explain trends in cruise destinations and shore excursion activities. Based on preliminary analyses, we expect to find a positive correlation with the increasing popularity of adventure and sports tourism.

Jesse Morris, University of Utah. Email: jesse.morris@geog.utah.edu; Andrea Brunelle, University Of Utah. Email: andrea.brunelle@geog.utah.edu; *Sedimentological Signals of Disturbance from the Wasatch Plateau, UT*

In subalpine forests across the intermountain west, widespread bark beetle infestations are as ecologically significant as wildfire. In spruce/fir forests, it has been suggested that that bark beetles are the primary agent of forest maintenance, not fire. During the 1990s in central and southern Utah, outbreak populations of spruce bark beetle (*Dendroctonus rufipennis* Kirby) caused high mortality in thousands of acres of subalpine forests. This research examines

sedimentary records of fire, beetle occurrence and vegetation change in hopes to better understand forest disturbance relationships in Utah. In addition to bark beetles and fire, human impacts on subalpine ecosystems in Utah are important agents of change. Grazing, logging, introduction of exotic species, and fire regime modification have taken place in the study area over the last 150 years. Possible relationships between human impacts and beetle outbreaks are also examined through the use of sedimentological proxy, with specific attention to vegetation change as indicated by pollen.

Keywords: pollen, spruce bark beetle, charcoal, grazing, wildfire

Nina J Morris, Institute of Geography, University of Edinburgh. Email: N.Morris@ed.ac.uk; *'Greetings to you, you who are sunlovers!': naturism and nudity in inter-war outdoor culture*

In recent years, a small number of theorists across the social sciences have begun to focus their attention on the practice of social nudity in Western cultures. Whilst the resulting literature has started to uncover the complex, often fragmentary, geographies and histories of naturist practice, and has contributed to recent debates on nature, the body (including its exposure and adornment), the politics of the gaze, and the sometimes contradictory moral frameworks through which the naked body is conceptualised and understood. I argue that they have largely neglected the sensory and embodied geographies of naturism, and specifically the ways in which naturists have conceptualised, valued and attached meaning to the body in nature. Drawing upon literature published in the 1920s and 1930s, at the dawn of the British naturist movement, this paper will offer a fresh perspective on naturist practice, highlight the international cross-fertilisation of ideas which occurred in this period, and contribute an added empirical dimension to the study of inter-war 'outdoor cultures'.

Keywords: naturism, cultural geography, historical geography, body, nature

Stacy Randolph Morris, University of Utah. Email: stacy.randolph@geog.utah.edu; Andrea Brunelle, University Of Utah. Email: andrea.brunelle@geog.utah.edu; *Using paleoecology to reconstruct site abandonment at Range Creek Canyon, Utah.*

Over the past decade the effect of climate variability on prehistoric human settlement patterns has emerged as an important field of study. Site abandonment and changes in settlement patterns due to drought and subsequent agricultural decline has gained particular credibility in examining native populations in southwestern North America. Paleoecology offers the opportunity to interpret archaeological settlement patterns and site abandonment's by providing information on agriculture practices, climate change and fire regimes from sedimentary proxy. Fossil pollen and charcoal accumulations entrained in wetland sediments are proxies specifically relevant to these types of reconstructions. Paleoarchaeological research being conducted in Range Creek, Utah seeks to examine climate mechanisms that may have directly to or at least contributed to site abandonment around 1250 AD. A sediment core was obtained from a wetland called Cherry Meadows and analyzed for fossil pollen, fossil charcoal, magnetic susceptibility and loss on ignition. Stratigraphic layers surrounding the years of abandonment (1250 AD) were examined at higher resolution and radiocarbon dated, whereas -abandonment (900 AD - 1250 AD) and post-abandonment (after 1250 AD) sections of the core were examined at lower resolution to establish baseline influx data for pollen and charcoal.

Keywords: Paleoecology, Archaeology, Paleoarchaeology

Jennifer Morrissey, Oxford University. Email: jennifer.morrissey@sjc.ox.ac.uk; *Making it count: Ethical and practical implication of carrying out research with young people*

In the past 10 years the academic agenda has shown increasing concern for the lives of young people and how they are experiencing life in the 21st century. This is set in the context of debates about economic restructuring, advances in technology and changing societal and gender relations. This paper discusses my experiences of researching young people making transitions from school to work in a specific local labour market. I will consider how to recruit, interview and represent them in a way that contributes and 'makes it count' towards both political and academic agendas. By analysing the factors which make transitions problematic, such as involvement in criminal activity and socio-economic factors e.g. class and local labour market opportunities I have faced a number of ethical and practical concerns which have been at times intimidating and challenging which I will also discuss.

John Morrissey, National Univeristy of Ireland, Galway. Email: john.morrissey@nuigalway.ie; *US CENTCOM and the Middle East: Grand Strategy and the Exceptional Spaces of the Global War on Terror*

A central player in the advancement and management of the so-called 'global war on terror' is United States Central Command (US CENTCOM), whose

'Area of Responsibility' in terms of US 'total world surveillance' encompasses Afghanistan, Iraq and the greater Middle East region (US DoD, CENTCOM, 2006). In this paper, I want to use Giorgio Agamben's (2003) notion of the 'state of exception' to offer a critique of the projection of American military and geopolitical power in the Middle-East by US CENTCOM. I make particular use of CENTCOM's published strategy paper on the Middle-East 'Shaping the Central Region for the 21st Century' to interrogate the specific ways in which the US military's grand strategy invokes and perpetuates a series of 'states of exception' in both the imagining and functioning of US geo-strategic interests across the region.

Keywords: US CENTCOM; Middle East; Global War on Terror

Veronica Mort, . Email: vmort@ksc.mailcruiser.com; *Quantifying Intangible Benefits in Dam Removal Decisions*

As dams in the United States age and become obsolete, the occurrence of dam removals has increased. Feasibility studies serve to point out the costs and benefits of such proposed dam removals, however most do not consider intangible benefits and costs to the community in a cost/benefit analysis. In order to consider these intangibles in a dam removal process and compare their relative benefits, they must first be monetized. In this research, a willingness to pay survey was used to assign a monetary value to intangible goods associated with the proposed removal of a historic dam on the Ashuelot River in southwestern New Hampshire. The survey was distributed to residents throughout the community, and documented environmental, historic, and existence values associated with the dam. Environmental issues like improving water quality and restoring fish populations were valued higher in willingness to pay results, while the historic and existence values of keeping the dam were significantly lower. This shows that the values currently being omitted from this dam removal decision would increase the cost effectiveness of removing the dam.

Keywords: dam removal, contingent valuation method, New Hampshire, cost/benefit analysis

Catriona Mortimer-Sandilands, York University. Email: essandi@yorku.ca; *Le Petit Dérangement: Expropriation, Ethnicity, and The Politics of Landscape in Cape Breton Highlands National Park*

In 1934, R.W. Cautley advocated to Canadian Parks Commissioner J.B. Harkin that the community of Cap Rouge be displaced for the development of a new national park, Cape Breton Highlands. Expropriation was a common practice in Canadian parks into the 1970s. Here, the presence of this community inside park boundaries did not suit the park's desired presentation of rugged, "uninhabited" cliffs. In addition, however, Cap Rouge was dissolved even though other communities of similar size remained intact; these latter communities were primarily English or Scottish, underscoring what historian Ian McKay has called "Tartanism," meaning the systematic "Scottification" of the Nova Scotia landscape. This paper investigates the founding of Cape Breton Highlands National Park and the aesthetic/ethnic politics that effectively destroyed a subsistence community of large, Acadian families. It also examines the ways the event of the expropriation has been incorporated into the park's current interpretive agenda. A recreation of an Acadian fishing shed now graces the beachfront, and a trail has been developed along the bench where most of the Cap Rouge families had their homes. These interpretive presences reinforce the legitimacy of the expropriation: The Acadians of Cap Rouge appear as an overpopulated, destitute anachronism that "naturally" gave way to the "progress" of resettlement, and to the bourgeois achievement of a national park that can reflect on the difficulties of its own creation as if these origins did not involve violence, racism, and the overt imposition of whiteness onto the social nature of Cape Breton.

Keywords: Cape Breton, nature, whiteness, national parks

Brian J. Morton, Ph.D., Center for Urban and Regional Studies, Univ. of North Carolina. Email: bjmorton@unc.edu; Daniel Rodriguez, Ph.D., Dept. of City and Regional Planning, Univ. of North Carolina. Email: danrod@email.unc.edu; *Improving Regional and Intra-Urban Public Transit for the Poor in Cuenca, Ecuador: Methodology, Data, and Recommendations*

In 2006, we conducted a comprehensive investigation of the mobility of the poor residents of Cuenca and developed recommendations for improving regional and intra-urban public transit services. Our study was commissioned by The World Bank in conjunction with its US\$ 25 million loan to Cuenca to fund the bus transit- and pedestrian-oriented Urban Transportation Project. Cuenca is a textbook example of a central place: the spatial interaction between Cuenca and its environs is intense because the city is the locus of traditional markets, the tourist trade, essential services, and several large manufacturers. The goals of our paper are, first, to describe the policy framework we developed to assess the implications of the UTP and, second, to summarize our recommendations for changes that would enhance Cuenca's public transit. We were particularly concerned with equity: impacts on the poor, women, the elderly, and children.

We will identify the planning database that we sought to obtain and the one we did obtain - create is actually a better word because of the active role we played in expanding the local concept of the planning database by including information on poverty and bus riders' travel experiences. We will summarize our recommendations for better coordinating regional and intra-urban transit services, rationalizing operators' operating and reimbursement schemes, improving bus drivers' courtesy and riders' security, and coordinating transit and land use planning. Our conclusion will be that our policy framework and the structure of our planning database are applicable to other medium-size cities in developing countries.

Keywords: Transportation, developing country, equity, Ecuador, public transit, planning

Jan Mosedale, University of Otago. Email: jmosedale@business.otago.ac.nz; *Commodity Chains and the Mobility Turn in Tourism*

The macro-level has received little attention in research on economic development. However, changes occurring in the organisation of economic activities in the tourism production system (such as the emergence of large integrated tourism corporations via mergers and acquisitions in European markets and an increasing internationalisation of tourist flows) require an analysis that transcends state boundaries yet realises that economic systems are unevenly contained by these boundaries. Castells (2000), for instance, declares that the world is increasingly composed of flows or constitutes of a 'space of flows' as opposed to a 'space of places'. Perhaps more accurate is the perspective that the world is made up of both spaces of places and spaces of flows, thus posing the question on the relationship between these spaces and the implications for actors in the economic system. This paper presents a larger analytical picture of tourism economic development by drawing on corporate geographies of integrated tourism companies and argues for a research agenda that is more adequate to the study of global or cross-border and mobile economic activities. It explores the use of commodity chain research, arguing that it provides a suitable conceptual framework for researching the connections between flows and places and offers a nuanced analysis of the spatial distribution of production. An examination of the vertical assembly of the tourism product beyond national and regional boundaries links the 'coal face' with the wider economic structure of the tourism industry at other geographical scales and situates production in relation to local economic organisation.

Keywords: commodity chain, tourism, economic geography, mobility

William G. Moseley, Macalester College. Email: moseley@macalester.edu; *Fighting the Fire with a Broken Tea Cup: South Africa's Land Redistribution for Agricultural Development Programme*

South Africa revised its land reform policy at the start of the Thabo Mbeki Administration, moving away from a model of land redistribution for poverty alleviation, towards one aimed at promoting a class of black commercial farmers. The major vehicle for this effort is the Land Redistribution for Agricultural Development (LRAD) Programme, which largely replaced the Settlement/Land Acquisition Grant (SLAG). This paper explores the first five years of the LRAD policy (2001-2005) and compares it to the record of the SLAG program by examining 1) design and conception at the national level and 2) practical application within the context of two very different provinces: Limpopo and the Western Cape. Limpopo is one of South Africa's poorest provinces, with a largely black African population that has a history of subsistence food production, and a small, but significant commercial farming sector. The Western Cape is the historical hearth of commercial white farming in the country with a large (mostly coloured) farm worker population and little to no recent history of subsistence food production. The authors report that the LRAD programme is running into similar troubles that afflicted SLAG in both provinces. Failures are linked to a common set of design flaws as well context specific issues in each province. The results are based on interviews with policy makers, commercial farmers and land redistribution beneficiaries.

Keywords: land reform, agriculture, poverty

Susanne C. Moser, National Center for Atmospheric Research. Email: smoser@ucar.edu; *Shaking Hands with the Govenator: A Science-Practice Blockbuster Called California*

In recent years, the state of California has emerged as a leader in climate change policy. One of its unique efforts is a state-funded research program which aims to produce science in support of the state's climate policy and risk management. In June 2005, Governor Schwarzenegger signed an executive order, which - among other things - requested periodic updates on the state of climate change science and climate impacts. In addition, he requested reviews of the state's greenhouse gas mitigation efforts and how well prepared California is to deal with the unavoidable impacts from climate change. As part of the first of these periodic science updates, I contributed a study on the preparedness of

California's coastal managers to the Governor's Climate Scenarios report of 2006. Rather than simply report on the findings of this study, this paper will summarize and reflect on the impacts it has had in various policy contexts. I will conclude with some lessons about what interactions between science and practice are needed but not yet or insufficiently happening.

Keywords: science-policy interface, California, climate change, adaptation

Ngakaemang Ben Mosiane, Mr., Syracuse University. Email: nbmosian@maxwell.syr.edu; Citizens, Chiefs and Subjects: Contradictions of Flexibility and a Challenge to Construct a Viable Urban Culture.

It is well documented that the movement of capital, bodies, goods and information across space continues to make and unmake particular places, and that in the case of the developing world, such processes have often been 'met, engaged and countered by social actors whose own histories and geographies enabled and called forth broad and differentiated material social practices'. But a fascinating encounter with capital by the people of Rustenburg, South Africa remains terra incognita to geographers. My paper examines the more contemporary, competing and often conflicting actions of a local ethnic community and immigrants, as they reposition themselves in an emerging democratic South African urban space. It particularly discusses the ways in which the 'corporate ethnic state' and migrant households negotiate socio-structural transformations, including those of the newly legislated mineral rights and communal land administration. The paper hopes to shed some light on some of the contradictions of flexibility and the challenge for cities - the co-presence of multiple spaces, multiple times and multiple webs of relations - as dynamic spatialities that are potentially transformative.

Keywords: flexibility, culture, urban

Ellen Mosley-Thompson, Ohio State University. Email: thompson.4@osu.edu; Lonnie G. Thompson, The Ohio State University. Email: thompson.3@osu.edu; Abrupt Climate Change (Past and Present): Evidence from the Ice

The Earth's ice fields, from the polar regions to the equator, continue to provide unique multi-proxy climate and environmental histories. Some glaciers and ice caps provide long records at the expense of temporal resolution, while others provide shorter, but highly detailed histories. The latter are invaluable to unraveling the history of abrupt climate changes. A single ice core can provide a rich array of proxy information, reflecting both global to regional scale processes. An abrupt climate change has been defined as occurring when the climate system is forced to cross a threshold that triggers a transition to a different state at a rate that is controlled by the system and is faster than the forcing mechanism. From a societal perspective, an abrupt climate change occurs when it is so rapid and unexpected that human and other natural systems have difficulty adapting to it. Ice core evidence reveals that naturally forced abrupt climate changes have occurred in the past. Multiple lines of glaciological evidence argue that the current global-scale warming and the widespread retreat of glaciers, unprecedented in some regions for the last 5,200 years, constitute an abrupt climate change that will challenge the adaptive capacity of both human and other ecological systems. This paper will review ice core evidence for abrupt climate change with emphasis on three lines of evidence for such changes, past and present, in the tropics.

Keywords: paleoclimatology, global climate change, ice cores

Pamela Moss, University of Victoria. Email: pamelam@uvic.ca; Fatigue as a symptom of contested illness

Contested illness framed as illegitimate by researchers, health practitioners and policy-makers operating within conventional paradigms of knowledge, comprises a host of disabling conditions, as for example, Environmental Illness (EI), Myalgic Encephalomyelitis (ME), and Multiple Chemical Sensitivity Syndrome (MCS). Even when science supports or courts legislate the existence of contested illness in conventional terms, health practitioners, insurance companies, and employers remain skeptical. Each contested illness is defined by a set of symptoms a person experiences and by the detection of skewed or disrupted conditions of bodily systems (circulatory, neurological, etc.). One common symptom in many types of contested illness is fatigue. As an experience, fatigue is multidimensional ranging from daily tiredness, through excessive sleeping, to immobilization when awake. Because of similar manifestations of symptoms with other types of illness accepted by the medical community, as for example, depression, irritable bowel syndrome, and allergies, many people experiencing the symptoms associated with contested illness are diagnosed with and treated for secondary, partial, or unrelated conditions. This inquiry is more than just a definitional foray. Understanding the framing of one symptom, fatigue, in various contexts can show how multiple sets of relations shape the social practices associated with awareness, diagnosis, and treatment. For this presentation, I explore the meaning of fatigue. I draw on three contrasting sets of data - Canadian women's magazines from the 1980s, Irish women's experiences of

fatigue who were diagnosed with ME, and treatment of fatigue among soldiers in a Canadian psychiatric field unit during the D-Day invasion.

Keywords: chronic illness, contested illness, fatigue, gender, soldiers, women

Thomas L. Mote, University of Georgia. Email: tmote@uga.edu; An Integrated Use of Microwave Instruments for Assessing of Snow Cover

Snow cover is an important component of the climate system and is also particularly sensitive to changes in climate. Numerous methods of monitoring continental-scale snow cover have been developed. For example, multiple algorithms of snow depth and snow water equivalent (SWE) have been proposed using past and existing passive microwave satellite instruments (SMMR and SSM/I). These algorithms may also be used to determine snow extent. Efforts are underway to develop depth and SWE algorithms for the latest passive microwave instrument (AMSR). More recently, NOAA has used AMSU sounder data to monitor snow cover. Meanwhile, active microwave instruments, particularly Ku-band (NSCAT) and C-band scatterometers (ERS), have been shown to be useful for monitoring of snow. Yet, few comparisons have been made between the snow extent and depth from the combined use of these instruments and in situ observations. This work evaluates several microwave instruments used to monitor snow depth and extent by comparison to in situ snow depth and SWE observations. Additionally, passive active and microwave-derived snow cover extent is examined by comparison to gridded in situ snow depths and weekly NOAA snow charts, which are primarily based on visible satellite imagery. The potential for active microwave systems and sounders to augment the passive microwave snow products is presented as well as possible applications.

Keywords: snow, remote sensing, cryosphere

Tamar Eve Mott, Ohio State University. Email: mott.21@osu.edu; Coming to America: The Role of Voluntary Resettlement Agencies in the Adjustment of Refugees

This paper builds upon current theories of assimilation, specifically considering two research questions: 1) what are the adjustment patterns of African refugees? And, 2) what role do voluntary resettlement agencies (VOLAGs) play in the adjustment patterns of African refugees? Based on the analysis of in-depth interviews with African refugees from different countries and ethnic groups, in addition to service providers, this research found that many of the refugees who were doing well attributed their success to not only personal factors, but to contextual factors - in particular, VOLAGs played an important role in their adjustment. Refugees are a unique group, as contextual, controllable, forces may play a role in their adjustment. VOLAGs can counteract some of the barriers to adjustment that refugees face. Money and social services allocated to refugees, in addition to the locations where VOLAGs choose to "place" refugees impact in what way, and how fast adjustment occurs.

Keywords: Adjustment, Africa, Immigration, Refugees, Resettlement, VOLAGs

Oli Mould, Creative Industries Observatory. Email: oli.mould@gmail.com; Freelancers and the Firm: A Relational Account

In an increasingly Castellan networked society aided by the march of technology, it is becoming easier for creative individuals unattached to a traditional firm to contribute to the economic landscape. Specifically, the creative industries of cities have seen a proliferation of freelance workers, and can now be seen to have a substantial contribution to the productivity of the various industries. The interaction between freelancers and traditional firms is becoming increasingly important in the construction of economic spaces and the processes involved in these interactions, often informal and intangible. In this paper, using specific examples, I will argue that interaction between freelancers and other freelancers as well as traditional firms are creating relational economic spaces that cannot be theorised using scale or other social constructionist narratives. Instead, it is a landscape of process, of which scale is a by-product. Theorisations of the 'global' and the 'local' create constrictive boundaries which obfuscate these processes, and therefore should be ignored in favour of a more topological spatial formation of space.

Keywords: Freelancers; Relational Geography; Creative Industries; Sydney.

Keith R. Mountain, University of Louisville. Email: krmoun01@louisville.edu; Surface Energy Balances on the Summit of Mt. Kilimanjaro, Africa

The retreat of tropical glaciers has been well documented over the past 20 years. The existing ice on Mt. Kilimanjaro (19,335'; 3° S.) has undergone substantial retreat since the turn of the last century and predictions suggest total disappearance by the year 2015. Surface energy balance measurements were carried out in February of 2000 over the surface of the northern icefield and simultaneously on the non-ice surface approximately 0.5 kilometers from the edge of the glacier. Measurements included wind speed, humidity, and temperature at two levels and solar and net radiation at one level. Calculations identify

evaporation as a major component of the surface energy balance. Complete energy budget analyses between these two fundamental surface types indicate the remaining ice masses on Kilimanjaro can not survive under the current climate conditions

Keywords: Energy balance, climate change, radiation

Giorgos Mountrakis, State Univ. of NY - College of Environmental Science and Forestry. Email: gm@esf.edu; *Moving Towards Collaborative Remote Sensing Analyses: An Impervious Surface Detection Paradigm*

Human-constructed impervious surface area (ISA) is an important indicator expressing human alterations to natural environments and ecosystems. ISA reduces or eliminates the capacity of the underlying soil to absorb water, and has a significant impact on the environment and human health, therefore playing an important role in land use decisions. Having better information on the amount and locations of impervious surface would further enable us to analyze its direct effect on runoff and sediment delivery. With this paper we tackle ISA monitoring through remote sensing analysis. Our Landsat image classification method is composed of multiple context-based processes, each designed to perform a targeted classification (e.g. distinguish dark soil from dark ISA). All processes are tied together through a hierarchical tree structure facilitating high accuracy with an easy to interpret/evaluate/correct system. The overall goal of our detection method is to perform the training at a regional scale but have a solid enough algorithm that could be easily generalized for a national simulation. Initial simulations at the Las Vegas, NV training site exhibit a 90% classification accuracy. An additional benefit of having different processes is creation of spatially-explicit uncertainty metrics associated with the ISA detection, warning potential scientists using our ISA maps of problematic areas. Our approach can be extended to other remote sensing analyses methods, where i) scientists can collaborate by addressing specific sub-problems, and ii) where advanced uncertainty metrics are desirable (e.g. if the detection product will be used for further modeling).

Alison Mountz, Syracuse University. Email: amountz@maxwell.syr.edu; *From protection to securitization: contemporary geographies of asylum, detention, and activism*

This paper examines the ways in which asylum practices have passed over from their initial project of protection to regimes of securitization. In recent years, nation-states have pursued more aggressive and geographically dispersed policies of border enforcement. These include remote detention on islands, the creation of legally ambiguous and stateless zones, and interdiction - the practice of stopping potential refugee claimants from ever reaching sovereign territory. This paper examines these mechanisms of exclusion as well as the related strategies and networks of activists, lawyers, and immigrants who have fought to overcome the isolation of those seeking protection. Most examples are drawn from Australia and prompt critical examination of traditional political geographies of sovereign territory and corresponding spaces of legal possibility.

Keywords: Detention, asylum, refugee, border enforcement, exclusion, Australia, activism

Amer Moustafa, American University of Sharjah. Email: amoustafa@aus.edu; Fatih Rifki, American University of Sharjah. Email: frifki@aus.edu; *Dubai's Waterfront Mega Project Developments: A Boon or a Curse?*

As it aspires to join the club of global cities, Dubai has in the last decade pursued an aggressive strategy to transform itself into an increasingly important node in the global grid of networked cities. To that end, numerous mega projects have been initiated and currently underway in support of the city's banking and finance, tourism, real estate among other service sector industries. This paper will focus on infill waterfront urban development projects that have aimed to transform the city's 45-mile coast an elaborate 750 miles of waterfront of exclusive real estate commodity. Dubai's water front mega projects have been quite a novelty in transforming the local geography and urban landscape. They include the Palms, three man-made islands shaped after a palm tree, and The World, a group of smaller artificial islands that are made to look like the (political) map of the world. These new developments will be used for housing, tourism, and commercial activities. What are we to make of these developments that have already transformed the city's coastal geography, fragile ecology (as well as its cognitive map) once and for all? What is behind their pursuit? What discursive methodologies are most appropriate to understand and evaluate these developments? I will explore these questions in the context of the political economy of this rising city-state and will conclude with some important lessons that could inform geographers, planners, and city managers as they strive to make their cities humane, sustainable and inspiring destination for an increasingly

urbanized population.

Keywords: waterfront developments, Dubai, global city, urban transformation

Irena Mrak, University of Ljubljana, Slovenia. Email: irena.mrak@siol.net; *Baltoro glacier - a victim of high mountain mass-tourism?*

In the past 50 years the Karakorum Mountains have become increasingly popular among a variety of tourist target groups including alpinists, climbers and trekkers. Unique mountain scenery, well-organized tourism facilities, and a sense of adventure attract larger and larger number of visitors each year. In an average tourist season from May till September over 30 000 people cross Baltoro glacier. The fragile high mountain environment is already showing the negative environmental impacts of the rapid mass mountain tourism development. In addition to environmental impacts there is a social impact of tourism as well. Due to the remoteness and special political status of Baltoro glacier, all tourism activities involve the local population as porters, cooks and guides. In order to estimate the impacts of tourism activities in the area of the glacier simple field water quality tests were made. The testing locations were tourist camps along the glacier up to the K2 base camp and also the main glacier stream at the Baltoro mouth. On the basis of different data, the carrying capacity of the glacier has been estimated as well as the level of the environment degradation. In addition the historical and present data on expeditions and trekking groups were crucial in order to create various scenarios and suggestions of future high mountain tourism development in the wider area of Baltoro glacier.

Lan Mu, University of Illinois at Urbana-Champaign. Email: mulan@uiuc.edu; Rongzeng Liu, Institute of Urban Economy, Zhengzhou University. Email: ; *A Spatial Analysis of Intercity Connection Retrieved from Telephone Data*

We use telephone volume data to spatially explore, retrieve and analyze intercity connections and urban dynamics. The dataset includes more than 16 millions of domestic calls made during a month between Zhengzhou, a provincial capital city in central China, and 300-plus area codes in mainland China. We identify two major constraints in the data. First, discrete geographic locations of those phone calls are not available for the purpose of privacy and security, and only area code-aggregated data can be used. Second, only calls made from Zhengzhou to other areas are included, and the opposite telephone traffic is not available. Using destination, count and duration (in a unit of 6 seconds) of calls, we create a radial flow map serving as the reference. We apply methods of spatial clustering and computational geometry to achieve three objectives. 1) Retrieve spatial-temporal patterns and hierarchies between Zhengzhou and other cities in China using telephone calls as an indicator. 2) Deepen the understanding of intercity connections and urban dynamics in the context of geographic location, socio-economic variables, and telecommunication. 3) Integrate the knowledge derived from this work to urban studies to better interpret the urban system in China.

Keywords: GIS, spatial analysis and modeling, intercity connection

Pierpaolo Mudu, Università Di Roma. Email: 113204.3100@compuserve.com; *The Italian COBAS: Putting Autonomous Trade Unions into Practice and Practice into Alternatives and Opposition to Neo-liberalist Policies*

The 1980s in Italy were open by an historical defeat of the working class movement in front of the FIAT gates in Turin. The corrosion and decline of traditional trade unions was happening within a prolonged wave of repression enforced against thousands of people involved, since the end of the 1960s, in the long cycle of struggles against the Italian dominant establishment. The Italian COBAS were born at the end of the 1986 and represent a development of the 1970s struggles carried out by the antagonistic Italian movement. The COBAS developed as an unusual subject putting together trade unions struggles with political ones, workplaces conflicts with those in the territory, fights for the rights of workers with migrants' requests. The COBAS existence induces a real alternative to reformist trade unions by refusing the creation of a caste of

professional trade union representatives and in their practices the COBAS deal with the difficulty to involve workers in fragmented, over-controlled and exploited work-spaces. Their activities happen through a collective action that generate a global discourse of opposition to capitalist exploitation, envisioning also some reflections on the centrality and role of work in everyday life. This original experience encourages further elements of discussion on several topics including, for example, the limits of democracy in workplaces and the possibility to influence and change traditional trade unions from outside instead of from within.

Birgit Muehlenhaus, Macalester College. Email: muehlenhaus@macalester.edu; Post-Reunification Germany: A Cartographic Perspective on Socio-Economic Disparity

An official census of Germany has not been conducted since 1987 in the former Federal Republic of Germany (FRG) and since 1981 in the former German Democratic Republic (GDR). Since that time, significant changes have taken place: the Berlin Wall fell in 1989, Germany reunified in 1990, and the German mark was phased out for the euro in 2001. However, a census of Germany will not take place until the EU-wide census scheduled for 2010/2011. Fortunately, an online regional statistical database, entitled GENESIS, was created in January of 2006 by the Statistische Ämter des Bundes und der Länder (the Federal Statistical Office and the Statistical Offices of the Länder). This database contains a multitude of socio-economic variables concerning the Bundesländer (German federal states), as well as smaller enumeration units such as the Regierungsbezirke (a subdivision of certain Bundesländer). Using GENESIS, this poster visually represents socio-economic change at the state and sub-state level for all of Germany. It shows comparative change since reunification of particular demographics of the two former countries (FRG and GDR) in an effort to highlight areas which may need more assistance and intervention from a public policy perspective. Results will facilitate future analysis and research of the varying levels of success of German reunification.

Keywords: GIS, map, Germany, reunification, cartography, Europe

Ian Muehlenhaus, University of Minnesota. Email: ioas@umn.edu; Beyond Mapping? GIS Diffusion and the Deterritorialization of Geopolitics

GIS technologies are proliferating and diffusing at a pace unseen in the history of mapping, yet there is a dearth of research concerning why and how these technologies are diffusing now. For the first time in the history of capitalism, many states have not only allowed but facilitated the proliferation of mapping technologies, the very same technologies they have traditionally kept under lock and key. Though a plethora of critical GIS literature analyzes the societal benefits and risks of GIS diffusion, I argue it suffers from a major shortcoming - it has failed to contextualize the diffusion of GIS technology within a holistic framework. As mapping has largely been a technology of state power throughout the history of capitalism, my research asks two fundamental, overarching questions: 1) Why now? Why and to what potential gain are certain states (i.e., the US government) promoting the diffusion of GIS technologies? and 2) How is GIS diffusing? Is GIS diffusion linked to, or merely a part of, broader geopolitical processes beyond the scope of current critical GIS research (e.g., neoliberalism)? I will present my preliminary research critically analyzing a recent US government document entitled *Beyond Mapping* using World Systems Theory. I hypothesize that GIS diffusion, and subsequently all the social benefits and side-effects associated with it, are the manifestation of geopolitical deterritorialization occurring during US hegemonic decline.

Keywords: critical GIS, GIS and society, geopolitics, US hegemony, deterritorialization

Rick Mueller, USDA/National Agricultural Statistics Service. Email: Rick_Mueller@nass.usda.gov; Crop Specific Mapping Techniques with Landsat and AWiFS

The USDA/NASS annually produces cropland based classifications over the major growing regions of the US that are derived from medium resolution satellites such as the Landsat TM and ResourceSat-1 AWiFS sensors. Annual area based ground truth collections from the NASS Area Sampling Frame provide information from over 11,000 nationally randomly stratified samples during the June Agriculture Survey. This comprehensive survey is leveraged to provide a framework for building the Cropland Data Layer (CDL) product using ISODATA clustering and maximum likelihood classification techniques. The Landsat TM sensor was considered the de facto standard in NASS for twenty two years in land cover mapping and was continuously used to create regression based county and state level acreage estimates and since 1997, the CDL. However, for crop year 2006, with the unpredictability of the Landsat TM, NASS changed sensors to the Indian Remote Sensing; ResourceSat-1 AWiFS and will produce all CDL products using the AWiFS sensor. NASS began investigations of AWiFS starting in 2004

with a pilot study over Nebraska and followed up with additional studies in 2005 with CDL products in Arkansas, Louisiana, Missouri, Mississippi, Nebraska and North Dakota. Preliminary indications show that while AWiFS does not have the spectral (4 vs. 7 bands) or spatial resolution (56 vs. 30 meters) when compared to TM, it does have 5 day repeatability and its classification and acreage estimates indicate that while not as accurate as TM, AWiFS is statistically significant and accurate enough for consideration for usage in the CDL program.

Keywords: Agriculture, Land Use, Cropland, Landsat, AWiFS

Sven Mueller, M.A., University of Dresden. Email: mueller_sven@gmx.net; School network planning in urban areas

Closing down of school locations due to shrinking population is a problem faced by a growing number of European countries. As an example the reduced number of school locations in the City of Dresden (Saxony) causes a shift in student trip distribution and travel-to-school mode choice. On account of the closure of certain school locations students have to reallocate to the remaining ones and face longer ways to school. Hence, they possible switch - under certain circumstances ? to other modes of transport. Assuming a major shift to public transportation this will cause a higher payment by the authorities of German countries and the local government. Therefore the savings of the authorities due to the closures of school locations could be influenced negatively. For this reason we have analysed the patterns of school choice and the travel-to-school mode choice of 12,666 college students. Based on a random sample of nearly 4,700 students we have specified a multinomial logit model (MNL) for transport mode choice and a conditional logit model (CL) for school choice. These results are an important input for a small-scale, dynamic capacitated school location problem. Due to the fact, that in Germany no school districts exist, this cost-minimizing MIP (np-hard) gives respect to the individual school choice and the time-spatial patterns of population distribution. Therefore it is an enhancement of the present school-location models.

Keywords: location planning, GIS, choice modelling, logit

Shaima Muhammad, Central College. Email: shaima-mhd@hotmail.com; Follow The Women: Cycling for Peace

Follow The Women is a non-profit organization founded by Nobel Peace nominee Detta Regan. In April 2004 and in September 2005, about 300 hundred women from 30 countries cycled more than 300km (186 mile) from Beirut through Syria and Jordan to the West Bank. Their main goals were to raise awareness of the conflict in the region and its impact on women and children, and to network among women for ways to end violence across the globe. Based on contacts with women who participated in the rides as well as the organizer, I will present on the impacts of this project, as well as discussing some of the difficulties that arose. The project helped break the stereotypes about Arab women, and help many gain first-hand experiences about life in the region. On the other hand, women's voices are not heard enough and they wish they had more media involved. Another obstacle is that Palestinian women are not always able to get out of their refuge and cross the Israeli borders. There have been attempts to engage women from Israel in the two previous rides or at least have a "sister ride" in Israel that could join the main ride in a neutral area, but they have been not successful. There is hope this will happen in April 2007 when the next ride will take place.

Thomas Muhr, University of Bristol. Email: Thomas.Muhr@bris.ac.uk; Venezuela's Higher Education For All as a challenge to capitalist economy of knowledge production

In this paper I argue that the praxis of Venezuela's Higher Education For All (HEFA) strategy challenges not only the commodification of knowledge but the dominant economy of knowledge production in general. In municipalising HE, as operationalised via the Universidad Bolivariana de Venezuela (UBV), the historical uneven geography in the production, distribution and 'consumption' of education is being levelled out on the national and increasingly regional (Latin American/Caribbean) scales. Central to the transdisciplinary UBV study programmes are student-community learning projects which, as a form of sustained participatory action research, facilitate democratic knowledge construction by the sub-alterns in concrete contextual geographies and, subsequently, contribute to a plurality of knowledges. HEFA challenges the emerging global education elite spaces (e.g. Singapore's "global schoolhouse") and rejects the production of enterprising subjects fashioned for the global economy. Rather, subjectivities are formed along the moral values of solidarity and cooperation for endogenous sustainable development and a 'socialism for the 21st century'.

Keywords: Venezuela, counter-hegemony, higher education for all, knowledge economy

Falguni Mukherjee, doctoral student, UW-Milwaukee. Email: falguni@uwm.edu; Rina Ghose, Associate Professor, UW-Milwaukee. Email: rghose@uwm.edu; GIS and Spatial Technologies for Urban Governance

GIS and Society literature emphasizes that GIS is uniquely shaped by local cultures, societal mores, institutional norms and political conditions. However, questions regarding interrelations between such conditions and GIS use in the light of urban governance remains unexplored. In this study we aim to critically examine the GIS activities of Dane county, Wisconsin which is one of the fastest growing counties in the state of Wisconsin and has a strong history of GIS. Dane county land information office and its GIS activities are uniquely shaped by federal grants, Wisconsin Land Information program, research projects at UW-Madison and state and county mandates. Agencies and departments construct thematic and territorial networks at various levels for different purposes that include obtaining spatial and non-spatial data to collaborations for multi-partner GIS projects. GIS activities within the context of the county's political, social, historical and institutional processes will be examined to explore GIS construction within the county's external as well as internal environment. Theoretical framework integrated from GIS and Society literature, Urban Planning literature and Political Economy will be used. Perspectives from planning literature provide entry points to this study while GIS and Society provides a valuable approach in examining the GIS practices. Political economy provides unique lens for examining the GIS activities within the socio-political-institutional environment. Political economy emphasizes the social construction of scale and network formations. They encompass complex and messy socio political processes for strategizing struggles over power and resources which holds true regarding the complex process of GIS construction.

Keywords: GIS, GIS & society, networks, politics of scale, urban planning

Sanjukta Mukherjee, Syracuse University. Email: samukher@maxwell.syr.edu; Gendered ideologies and practices of the "neoliberalizing" State: Case of the Indian IT industry

Over the last decade the IT industry has become emblematic of not merely India's growing economic power, but also of its increasing integration with the global economy and successful neoliberal reforms. One of the main symbols of this apparently "Shining India" is embodied in the increasing visibility of middle class professional women in the modern, high tech, secure, and pristine workspaces of urban India. In order to attract and sustain women's employment in this sector the Indian "neoliberalizing" State has proactively made specific policy amendments (particularly around labor laws), and introduced new incentives (around tax relief, home-working, telecommuting, etc) to suit the demands of its most profitable export driven service sector. In this paper I explore the gendered policies, practices and ideologies of the State and their implications on changing gender relations of work, home and community of this emerging class of "knowledge workers" in India. What do the changing relationship between middleclass professional women (and men), the beneficiaries and backbone of the new economy, and the Indian State tell us about the particular form neoliberal developmental strategies take within specific social contexts, and how they continue to adapt, engage and negotiate local patriarchal gender regimes? Conversely, a gendered analysis of the IT industry and the contemporary Indian State will also highlight the manner in which the identities of the middleclass "knowledge workers" have been partially shaped through the new relationships with the State and its neoliberal developmental policies.

Keywords: Gender, Indian State, neoliberalism, "neoliberalizing" State, development, knowledge workers, IT

Anuradha Mukherji, University of California, Berkeley. Email: amukh03@hotmail.com; Rebuilding The Neighborhood: Community Participation In Urban Town Planning In Post-Earthquake Bhuj, India

This paper examines post-disaster urban recovery in the city of Bhuj, India, in order to understand community participation in urban town planning. The 2001 Kutch earthquake, in Gujarat state in western India, flattened 230,000 houses and damaged 1,000,000 homes in Gujarat. Close to the epicenter, in Bhuj, housing and infrastructure in the old town urban core was destroyed and the government proposed town planning to rebuild the city. But due to a centralized town planning system, lack of information and inadequate community consultations, Bhuj residents felt cut out from the planning process, creating confusion and miscommunication during implementation. However, in Soniwad, a neighborhood in Bhuj, residents formed a neighborhood committee and actively participated in town planning by organizing weekly meetings, and inviting town planning consultants and Bhuj Area Development Authority (BHADA) officials to discuss relevant issues, including the best way to organize house plots in Soniwad; to look at housing options with NGO collaboration; and to help planners map existing plot lines. By examining this collaborative effort between the Soniwad neighborhood committee, the planning consultants and BHADA officials, this paper hopes to present Soniwad as a possible model for community

participation in post-disaster urban planning and recovery, that can be extended to other disaster situations and inform future policies.

Matthew C Mulbrandon, Penn State. Email: mcm307@psu.edu; An Agent-Based Method for Modeling Neighborhood Selection During the Housing Search Process

Work on the housing search process was an area of active research peaking in the 1970s and early 1980s. In recent decades there has been relatively little work done on this subject. This research will examine the use of multi-criteria optimization methods to govern behavior of household agents in the selection of neighborhoods. These methods have been used in industry, finance, and policy making for many years on problems that involve the same kinds of trade offs found in housing selection. Past research on the housing search has either not incorporated space or did so using rudimentary euclidean measures. By having agents that can move through space to satisfy goals, the spatial influence of the urban environment can be examined by researchers. This will require new kinds of data that involves spatial detail, more akin to cognitive research, than surveys on this subject used in past work. Understanding neighborhood selection is the first step to gain insight into the housing search process. This will allow the computational burden of computer models to be reduced by limiting the search in a way that reflects real life. Additionally it can improve the modeling of residential location and housing price by predicting the numbers of bidders and their attributes.

Keywords: Agent-Based, Urban Modeling, Optimization, Housing Search

Alice E. Mulder, Weber State University. Email: amulder@weber.edu; Place for Sale? Privatism, Community, and Urban Development in Ogden, Utah

There is a history in the United States of privatism guiding urban policy, such that private sector interests and goals are often privileged over those of the local community with the belief that success of the private sector will lead to benefits for the community. What is good for one should be good for the other. Indeed, in some circumstances the private sector may be viewed as the salvation of a city. A case study of this argument can be found in Ogden, Utah, a city at the foothills of the Wasatch Mountains. Here the city administration is actively promoting a land development and transportation proposal put forth by a private developer which requires the sale of public land. This paper examines this case, identifying the problems it clearly illustrates, and the questions it raises about how a place should be shaped and for whom. In addition, it highlights the importance of open spaces in place making and in making places desirable.

Ondrej Mulicek, Institute of Geography Masaryk University Brno. Email: mulicek@geogr.muni.cz; Ludek Sykora, Charles University in Prague. Email: sykora@natur.cuni.cz; Polycentricity in National Urban System: Concepts, Methods and Empirical Analysis of Czech Republic

In the conceptual part of our paper we discuss the notion of polycentricity referring to recent European discussions stimulated by ESDP and ESPON and developing our own conceptual framework employed in the empirical analysis. First we frame polycentricity within a more general concept of hierarchical organisation of settlement systems. Secondly, we stress the importance of relational aspect of polycentricity focusing on reciprocal relations between localities. In the empirical part, we first define centres within the Czech Republic stressing their function as job centres (they are selected from over 6 thousands municipalities). In the next step, using data about commuting to work we identify strongest reciprocal relations between centres and delimit integrated settlement systems consisting of centres linked with strongest reciprocal relations. Thirdly, we provide assessment of various aspects of polycentricity within national system and metropolitan areas of Prague and Brno. In the final section, we discuss our empirical insights in the context of European debates that present polycentricity as desirable aspect of settlement systems that fosters both external competitiveness of given territorial entity within global economy as well as internally sustainable development.

Keywords: polycentricity, metropolitan, settlement system

Tiffany K. Muller, University Of Minnesota. Email: mull0130@umn.edu; The Whitening Effects of Urban Neoliberalism: Producing Normative Relations through a Leisure Space

This paper is a first cut examination of the relationship between intersectional identity categories -specifically gender, race and sexuality- and the neoliberal and urban entrepreneurial U.S. city. The urban political economy is reliant on and productive of specific normative relations, as Rod Ferguson (2003) and others have shown. In Minneapolis, Minnesota, normative relations like 'traditional' notions of femininity, whiteness, and heterosexuality shore up the local political economy, which is marked by neoliberal and urban entrepreneurial policies. These relations are produced in leisure spaces, including professional

sport venues, like the home court for a women's professional basketball franchise. At first glance, this arena is an unlikely site to find normative mappings; in many ways, female athletes and fans who use (and themselves produce) this space challenge restrictive social norms that underlie the neoliberal city. Yet it is because this arena is a contested space that such norms are reinscribed through spatial and discursive practices. This paper, then, attends to the process by which one of these norms, the construction of whiteness, occurs in and through a leisure space. It further demonstrates how process of normative racialization is integral to the neoliberal and urban entrepreneurial logics of this political economy.

Keywords: whiteness, neoliberalism, leisure

Jeff Mulligan, North Carolina Central University. Email: mjmulligan@verizon.net; "Interpreting the Iraq Conflict Through Jared Diamond's Five Criteria for Societal Collapse: Comparisons to Rwanda and Japan"

Throughout history societies have faced potential catastrophes. Some societies recognized the impending threats early on and took the necessary measures to ensure survival. Others chose to ignore the warning signs and eventually the suffered societal collapse. This poster applies Jared Diamond's framework for understanding societal collapse (Collapse, 2005) to the current events in Iraq. The role of the five criteria used to explain societal collapse (environmental change, hostile neighbors, friendly trade partners, climate change and societal response) is discussed and compared to the genocide in Rwanda in 1994. Each of these societies has groups of people who have become polarized over a period of time. Both have decisively had environmental change impact their society. The important fifth factor, societal response, foretells Iraq's current societal collapse as rampant destruction and chaos are now common daily occurrences. A contrasting example is discussed, the crisis of deforestation faced by Japanese society in the Tokugawa era. In contrast to the previous societies discussed, the Japanese recognized the potential for impending disaster and unified to take remedial action.

Keywords: Iraq "Jared Diamond" Collapse

Beverley Mullings, Queen's University. Email: mullings@post.queensu.ca; *Skilled Migrants to the Global South and the Institutionalization of Neoliberal and Neocolonial Landscapes of Power*

Among international migrants, the highly skilled are held in especially high regard because they are believed to increase the stock of human capital, stimulate innovation and, as UN secretary general Kofi Annan recently observed, play a leading role in the global circulation of wealth (Annan 2006). Studies that examine skilled migration have tended to focus almost exclusively on the social and economic effects of the flow of skilled migrants from poorer countries in the global South to the global North. We know relatively little about the developmental impact of skilled international migration when the flow is in the other direction; from the developed industrialized world to poor countries of the global South. This paper addresses this lacuna by examining the relationship between the flow of skilled first world migrants to the Caribbean and their role to the transnational spread of neoliberal and neocolonial forms of governance in the region.

Keywords: neoliberalism, networks, skilled migration, Caribbean

Dustin Mulvaney, University Of California - Santa Cruz. Email: dustin@ucsc.edu; *Containing Risk: explaining social resistance to transgenic salmon*

This paper will explain how changing discourses about transgenic salmon containment enrolled local activists, regulators, the aquaculture industry, and risky objects, into the collective that governs transgenic salmon. An application for the regulatory approval of AquaBounty's transgenic salmon brood stock known as AquaAdvantage? is pending approval at the Food and Drug Administration (FDA). Yet even with FDA approval, AquaAdvantage may never be grown in the US. States with wild salmon runs have taken regulatory and legislative measures to prohibit the introduction of transgenic salmon through bans and moratoria. Despite the ecological modernization and blue revolution claims about potential benefits of AquaAdvantage, the aquaculture industry has also distanced itself from transgenics. Despite AquaBounty's claims about the fish being more akin to cows than invasive species, Trojan genes and genetic pollution remain powerful tropes for activists in their efforts to slow the deployment of transgenic salmon. This case demonstrates how the changing spatial and discursive dimensions of ecological risk reshaped power asymmetries and destabilized the politics of scale. Discourses about containment shifted from land-based production to using sterile (triploidy) salmon in net pens in coastal waters, enrolling state regulators. Through an analysis of the ecological risks presented by transgenic salmon and the political ecology of farmed salmon, this paper looks to identify the sources of social resistance to transgenic salmon contributing

ongoing discussions in social movement theory, science and technology studies, and political ecology. This research was based on over thirty semi-structured interviews in wild and farmed salmon regions of North America.

Keywords: salmon, biosafety, risk, genetic engineering, politics of scale

Osvaldo A. Muniz, Texas State University, San Marcos. Email: o.muniz@txstate.edu; *Cyberspace flow model of geographic knowledge*

This paper shows the results of an international research derived from a national program in Chile called MECESUP and funded by the World Bank since 2003 to improve higher education. MECESUP Program stands for the enhancement of quality in higher education and one of its projects was classified as AUS0307. It was approved to improve the computer network among 13 universities in Chile in order to develop teaching and research activities by using the World Wide Web. As an indirect outcome of AUS0307, a research about flows pattern of geographic knowledge over a given cyberspace network was developed. This research has been classified as VirtualFlow1. The general objective of VirtualFlow1 was to verify the level of geographic knowledge networking. Two specific objectives were considered. First, measure the level of scientific knowledge flows related to the stages of e-learning processes. Second, characterize the form of succession and possible translation of geographic knowledge. Research data was gathered from six active nodes previously designed within a network that connected North, Central and South America. Each node represented a given active researcher who agreed on participating to discuss some geographic topics over a period of time. Asynchronous system prevailed during the process of measuring flows and characterizing the form of geographic knowledge. The results of this research show an evident demonstration that the overall flow pattern comports a systematic scale degradation of active participation.

Keywords: cyberspace, flow, e-learning, geographic knowledge

I. Solange Munoz, University of Texas - Austin. Email: solangem@mail.utexas.edu; *Peruvian Immigration to Chile: Policy, NGOs and the Chilean State*

Since the 1980s neoliberal reforms have had an important impact on economic, political and social structures and institutions throughout Latin America. In line with these reforms, non-governmental organizations, international institutions and local, grassroots organizations have stepped in -in varying degrees- to fill the gaps often created by neoliberal economic and political processes. Proponents of the neoliberal model have described the increasing role of civil organizations like NGOs as both improving and diversifying forms of participation, allowing for a more panoptic provision of services capable of incorporating those minorities and groups historically excluded by the State. This research explores how national, racial, and ethnic notions and discourses of identity are reflected in the way that Peruvian immigration is addressed by international and local NGOs collaborating with state institutions. Institutional programs and initiatives that address Peruvian immigration to Chile are explored and understood as representative of the way that public discourses discuss and position Peruvian immigrants in relation to the host society. This focus addresses the way that Chilean national identity is currently being constructed and how Peruvian immigration is being positioned within this construction in the current context of neoliberal institutional structures and processes.

Keywords: NGOs, immigration, Chile, Peru, ethnicity

Lorena Munoz, University Of Southern California. Email: lmunoz@usc.edu; "Tamales?Elotes?Champurrado: Transforming Latino Vending 'Street-Scapes' in Los Angeles"

Street vending is an economic practice exercised by millions of people around the world. Although often attributed to third world economies, it is a phenomenon that it is visible in many cities in the United States. This paper examines the landscapes in which Latino street vendors exercise their daily informal economic practices in Los Angeles - a city where many residents (especially Latino residents) favor vendors who recreate the cultural and informal economic spaces of their countries of origin. Immigrant vending practices commonly transform street corners, yards, and parking lots into informal commercial profit-making sites. This reconfiguration of urban space not only shapes immigrants' and immigrant vendors' experience of everyday life, but shapes the urban landscape around them as well. Through the use of various qualitative methods, specifically, field observation, semi-structured interviews, photo-elicitation and photo documentation this paper explores how notions of 'place' shape urban cultural landscapes of Latino street vendors in Los Angeles and how state enforcements, regulations and notions of 'illegalities' imposed on 'brown bodies' in relation to street vendor's daily life, contribute to the production of cultural landscapes. The dialectic process of vendors creating urban cultural landscapes is important for understanding how the state at various scales, intersect in the local, where tensions are created between the local-state and the

vendors through the enforcement of code regulations and the surveillance of bodies. These tensions between vendors and the local-state inform the production of vendor landscapes. This dialectical process shapes the collective or individual agency of the vendors.

Keywords: street vending, cultural geography, landscape

Mandy Munro-Stasiuk, Kent State University. Email: mmunrost@kent.edu; Donna Witter, Kent State University. Email: ; Jospeh Ortiz, Kent State University. Email: ; Scott Sheridan, Kent State University. Email: ; NEOGEO: Providing Effective Teacher Professional Development Opportunities

Kent State's GK-12 Program, NEOGEO (NorthEast Ohio Geoscience Education Outreach), offers a three-workshop professional development series for teachers. Centering on terrestrial, aquatic, and atmospheric interactions and the use of geospatial technology, the workshops are: 1. SATELLITES (Students And Teachers Exploring Local Landscapes to Interpret The Earth from Space), a geospatial technology workshop offered in collaboration with OhioView; 2. Integrated Earth System Science, focusing on geological, chemical, physical and biological processes and how these interact in the Earth system; and 3. A four-day field experience to the Lake Erie Islands and surrounding localities that emphasizes the relationships between the local geology and the physical processes that have shaped northern Ohio. These workshops may be taken in succession or independently. All three have at least two NEOGEO faculty and six NEOGEO Fellows as the teaching team. Each team develops and presents inquiry-based activities designed and aligned with their own research expertise and the Ohio Academic Content Standards. We have found that a large teaching team is crucial to the success of the workshops as this provides a differential knowledge base and high student to instructor ratios. Based on the evaluations of the workshops, this approach significantly increases teacher satisfaction and retention of new material. We will present an overview of the organization, the activities, and the evaluation of the workshop outcomes.

Emily Murai, University of Minnesota - Minneapolis. Email: murai019@umn.edu; Technologies of Place and Place Technologies: the cultural geographies of information technology

Mainstream perspectives on information technology (IT) and culture often view them as entirely disparate or wholly collapsible entities, such that IT is often considered to be socially neutral and 'cultureless,' or that particular cultural values reify and reinforce technological development. Recent racial and ethnic conflicts in Cupertino, California, an upper-class suburb in the heart of the Silicon Valley, demonstrate that the relationship between IT and culture is far more complex. This paper will argue that the racial conflicts are the result of shifting dynamics in the post-industrial, information-based global political economy. In particular these broad economic shifts have produced new forms of racialized subjectivity, such as the elite transnational migrants from Asia, which challenge normative place identities in the Silicon Valley. This paper will elaborate upon these connections in order to advocate a further exploration into the cultural and racial geographies of IT.

Keywords: information technology, Silicon Valley, critical place geography, race

Petronella Muraya, Howard University. Email: petah_muraya@yahoo.com; NGOs and development in Santo Domingo

In the past, most development projects in urban areas were implemented by the private sector, but that is no longer the case as more and more NGOs acquire responsibilities in development that were previously restricted to governments. It is hoped that NGOs will be more successful than the public sector in meeting the needs of the urban poor. The demand for basic services in cities in developing countries is high due to a history of rapid urbanization and the failure of the private sector in delivering these services. The high demand for services has resulted in the rapid increase of NGOs in urban areas leading to competition and crowding as well as inefficiencies and duplication of effort. In Santo Domingo, the Dominican Republic, the collaboration of various NGOs eliminates the competition and enables them to meet the needs of the target group by providing various services. This paper analyzes the interaction between four NGOs in Santo Domingo: Instituto Dominicano de Desarrollo Integral, Inc. (IDDI), Ciudad Alternativa, Enda Caribe and Centro de Estudios Sociales Padre Juan Montalvo, s.j. This study finds that besides delivering services and promoting a sustainable environment, the NGOs also uphold ethical values and social justice by endorsing citizen participation in their development projects.

Keywords: Santo Domingo, Dominican Republic, NGOs, development

Robert A. Murdie, York University. Email: murdie@yorku.ca; Ethnic Transformation and Gentrification in West-Central Toronto

The nature, causes and effects of gentrification have been much debated during the past three decades. However, consideration has rarely been given to the positive and negative effects of gentrification on ethno-racial groups living in neighbourhoods undergoing physical and social upgrading. This paper evaluates the potential impact of gentrification on ethno-racial groups in West-Central Toronto, an area that historically was Toronto's major immigrant receiving district but has recently been impacted by major changes, including a decline in manufacturing jobs and an increase in professional employment. The outcome has been accelerated gentrification and an accompanying change in the area's social geography. In particular, European immigrants have moved from this area to other parts of the city but more recently arrived visible minority immigrants from various countries of origin have moved into the area. The specific objectives of the paper are to (1) document the dynamics of this process, (2) analyse the relationship between ethnic transformation and gentrification, (3) identify the potential winners and losers, and (4) discuss the implications for preserving ethnically mixed affordable neighbourhoods in this part of Toronto. The evidence is drawn primarily from census tract data for 1971 through 2001 and special cross tabulations of 2001 census data. The results point to the complexity of this issue, the importance of context and the fact that not all groups are impacted in the same way.

Keywords: ethnic groups, gentrification, Toronto

Ann Marie Murnaghan, York University. Email: amfm@yorku.ca; Doing feminist urban political ecology: Bringing gender in with methodology

As a nascent field, urban political ecology stretches the boundaries of urban environmental studies to reveal how urban political processes influence the distribution of natural resources, and access to nature. Coincident with uneven spatial distributions are distributions of resources that are unequal, and often inequitable, across social groups. Feminist geographers have been documenting these differences since their earliest studies, while at the same time they have been exploring the social and environmental in new and unanticipated ways. Feminist scholars continue to be at the leading edge of research methodology in geography, and in this paper I examine how their comments on both nature and research bring important contributions to the field of urban political ecology. I argue that it is through 'the doing' of research one can bring gender in, and pay closer attention to other axes of difference which have been as yet underrepresented in the literature. Using research from Toronto, Canada, I explore how a feminist methodology changes how one asks questions about access to nature, the scaling of the research, the context in which the research is situated, and the methods that are employed.

Keywords: feminist geographies, urban political ecology, gender, methodology

Alexander B. Murphy, University of Oregon. Email: abmurphy@uoregon.edu; Victoria Lawson, University of Washington. Email: lawson@u.washington.edu; Making the Case for Geography

The discipline of geography is strengthening its position in institutions of higher education in the United States. Student and faculty numbers are expanding, new programs are emerging, and extra-disciplinary appreciation of the discipline is growing. If geography is to continue to move forward, departmental leaders need to make strong, effective arguments about the discipline's value and its expanding influence. To facilitate that effort, we have developed a segment of the AAG's Healthy Departments Initiative website with "talking points" that geographers can draw on to show why geography is indispensable to colleges and universities. After an introduction arguing that geography is an established, integrative discipline that spans the social and environmental sciences, we set forth a series of discussion points, examples, and links related to several key ideas: that geography is a key component of a liberal arts education, that geographical thinking is essential to the thoughtful development and application of geo-spatial technologies, that geographical work is increasingly influential across the social and environmental sciences, and that training in geography can open up significant employment opportunities for students. The goal of this endeavor is to provide a resource of potential use to those involved in preparing drafts of self-study and annual reports; in discussions with administrators, parents, and students; and in writing advocacy letters to lawmakers and administrative authorities.

Keywords: healthy departments, geography's status, geography's influence

James T. Murphy, Clark University. Email: jammurphy@clarku.edu; Methodological Considerations for a Practice-Centered Economic Geography: Linking Socio-Spatial Processes to Regional and Global Economic Patterns

While recent interest in practice-centered research in economic geography has raised important questions about how agency, power relations, knowledge flows, and inter/intra-firm relations might be better conceptualized in relation to

particular spaces and places in the global economy, the methodological implications of these concepts remain unclear and open to sharp (often scathing) criticisms. A particular concern is that when researchers seek to account for the socio-spatial processes constituting economic relationships this precludes the possibility that they can then reach valid conclusions about the connections between these factors/forces and wider economic and industrial phenomena. Simply stated, there is concern that micro to macro-scale linkages are not rigorously determined or measured and/or that there is an insufficient accounting for the role that structural factors play in shaping regional development trajectories or global economic patterns. This paper assesses the methodological challenges of practice-centered approaches in economic geography and considers how researchers might more effectively assess and analyze the links between spatially embedded social relations and regional or global economic outcomes. The goal is not to definitively state what researchers should or should not be doing in the field but to suggest ways in which research questions, data gathering procedures, and analysis methods might be framed or conducted such that the dynamics of economic practice (e.g., the agencies, networking strategies, and power asymmetries) can be measured and used to demonstrate how, why, and where larger-order configurations of economic and industrial relations emerge in the global economy.

Email: ayoachim@tulane.edu; Paul Harvey, Research Fellow, Overseas Development Institute. Email: p.harvey@odi.org.uk; Crops, Cellphones and T-Cells: Technology Change for Livelihood Security in Sub-Saharan Africa

HIV/AIDS, the leading cause of death in Sub-Saharan Africa, intersects with chronic poverty and livelihood insecurity to undermine the prospects for long term sustainable human development. Rural, urban and peri-urban communities are responding with innovations and adaptations in technologies ranging from 'software' (support groups) to 'hardware' (mobile phones). This paper highlights findings from a two-year research project (funded by the MacArthur Foundation) which asked, Given the reality of HIV and AIDS: What development policies and programs are needed to encourage appropriate technology change for livelihood security and long-term, sustainable human development? How are African communities affected by HIV and AIDS responding through the adoption, adaptation, innovation of technologies to enhance their livelihood security? How does the development policy framework facilitate or hinder technology innovation? In-depth case studies of hybrid, community-based technology changes (through qualitative fieldwork in Kenya and Malawi) reveal specific barriers, and complement a comprehensive document review of changes (and lack of innovation) throughout sub-Saharan Africa in sectors ranging from farming systems, to household reproduction, to communication. Findings provide insight into the nature of "appropriate technology" to enhance livelihoods and are discussed in relation to development actions, which -if they are to succeed in promoting human development?need to be more flexible, long-term and responsive to the devastating interaction of AIDS and poverty in rural Africa.

Keywords: Africa, AIDS, Agriculture, Technology Change, Development, Livelihoods

Richard Lee Murphy, University of South Carolina. Email: murphyr4@mailbox.sc.edu; Kirstin Dow, Ph.D., University of South Carolina. Email: kdow@sc.edu; Jinyoung Rhee, University of South Carolina. Email: rheej@mailbox.sc.edu; Greg Carbone, Ph.D., University of South Carolina. Email: greg.carbone@sc.edu; User Awareness of Uncertainty in an Online Mapping Tool: The Dynamic Drought Index for Basins in North and South Carolina

The role of advanced GIS tools continues to increase in importance within decision-making processes. It is important to gauge the effectiveness of tools by evaluating user understanding of a tool's functionality. While online mapping tools allow greater access to spatial data for decision-makers, few studies have addressed the uncertainties created in the interpolation process of such tools. The Dynamic Drought Index for Basins in North and South Carolina (DDI) is an advanced tool that allows users to analyze multiple drought measures in different temporal and spatial scales. The DDI uses the Inverse Distance Weighted (IDW) method to interpolate climate data derived from National Weather Service (NWS) stations to a 4 km x 4 km grid. The interpolated data can then be displayed in choropleth map form at several user defined scales. Surveys were conducted with targeted users of the DDI: water resource managers throughout South Carolina. Users' understanding of uncertainty inherent in the data interpolation process was measured through objective questions relating to four

scales of interpolation available within the DDI tool. In comparison, users' ability to evaluate uncertainty from graphical methods was measured using objective questions relating to a probability graph and a box and whisker plot. Awareness of users' recognition of uncertainty can contribute to better designed communication strategies and more effective tools for decision-makers.

Keywords: uncertainty, GIS, cartography, interpolation, probability, cumulative probability graph, risk communication

Adam Murrah, Mississippi State University. Email: awm6@msstate.edu; The Use of Geospatial Technologies and Ground-Based Field Studies to Quantify the Affect of Hurricane Katrina on the Vegetation of the Weeks Bay Reserve

Hurricane Katrina (August 29th, 2005) had a tremendous impact on the Alabama, Mississippi, and Louisiana Coasts and it is one of the worst natural disasters in US history. The storm-surge along the Mississippi coasts was unprecedented reaching heights of up to 30 m. Although not as severe in Alabama, the storm surge still inundated many coastal environments including the Weeks Bay Reserve, a nationally protected estuary. After the storm surge subsided in Weeks Bay, there was no precipitation for a 15 day period. The main focus of this current research project is to investigate what affect the saltwater inundation followed by absence of rain had on the estuary vegetation of Weeks Bay. We used Landsat TM satellite imagery to compare changes in estuary vegetation before (March 24, 2005) and after (September 16, 2005) Hurricane Katrina. Normalized Difference Vegetation Index (NDVI) values and Tasseled Cap Transformation "Greenness" values were derived from Landsat imagery and were used to estimate differences in vegetation health. The changes in vegetation were compared to water quality data, such as salinity, within Weeks Bay. Preliminary results indicate that the vegetation showed significant decreases in both NDVI and "greenness" following the saltwater inundation and absence of rain. Currently the vegetation index values from the September 2005 image are being compared with vegetation index values derived from summer 2006 images. The results of this project will provide insight into the sensitivity of estuary vegetation to large storm surge events and their associated recovery rates.

Brian J. Murton, University of Hawaii. Email: bmurton@hawaii.edu; Maori 'Mirror Landscapes' and Oral Mapping

When Maori first encountered Europeans they were able to draw maps with charcoal on the deck of a ship, in dust with a stick, or in the sand on a beach. A little later a number of Maori drew maps on paper. Scholars have argued that these early maps drawn on paper are not wholly or partly derivative of the European tradition of mapmaking, but are the first permanent record of a Maori oral mapping tradition. This paper examines the knowledge base underlying the Maori mapping tradition. It will argue as that place based knowledge in which genealogy is of great significance, Maori knowledge is 'mirror knowledge' reflected in 'mirror landscapes', marked by place names. The role of names, both of places and of ancestors (human and divine) for ordering knowledge and providing the base for oral maps (and the early ones on paper), is illustrated through the use of examples drawn from two place in Aotearoa/New Zealand. The paper concludes with a discussion of the importance of spoken narratives for understanding Maori landscapes and oral maps.

George J. Musa, MA, Graduate Center & Hunter College, CUNY; Columbia University-MSPH/NYSPI. Email: musag@childpsych.columbia.edu; Effects of Neighborhoods and Transportation Systems on Post-Traumatic Stress Disorder on Ground Zero Area NYC Public School Children after 9/11

An epidemiological study was conducted six months after 9/11 under the auspices of the NYC Board of Education, to evaluate the impact of the World Trade Center attacks on children's mental health. A large representative sample of public school students in grades 4-12 (N=8,236) were screened for eight psychiatric disorders including Post-Traumatic Stress Disorder (PTSD), as well as various types of exposures to the 9/11 events, health problems, family circumstances, etc. Analyses of these data has shown that being a student at a Ground Zero Area (GZA) school was not a significant risk factor for developing PTSD (Hoven, et al, 2005). These findings are counterintuitive. Neighborhood variables (e.g., median household income, crime, land form, land use, quality-of-life, line-of-sight to the WTC Towers, etc.), Euclidian distance from the students' home zip codes to their GZA schools, transportation distance and travel time will be analyzed to observe their potential influence on developing possible PTSD.

Keywords: WTC, 9/11, Neighborhood, PTSD, GIS

Luca Muscarà, Università degli Studi del Molise. Email: muscara@unimol.it; *The Cold War Transition from Political to Urban Geography : Megalopolis as a Global Projection of the Body Politic*

Gottmann's Megalopolis anticipated a transition from political to urban geography while the post WWII eclipse of political geography subtracted the global scale as area of disciplinary application, and the post-war effort made it increasingly involved with regional and urban scales. The intertwining of scales implied by its "hinge" function was not a mere description of the urbanized Northeastern US seaboard rise to the scale of the new global order. It embodied the idea that this urbanized region could have filled the scale gap by projecting globally the megalopolitan body politic. Possible implications after 9/11.

Keywords: megalopolis, body politic, global scale, cold war, political geography, urban geography

Daanish Mustafa, King's College, London. Email: daanish.mustafa@kcl.ac.uk; *Hazardscapes of Globalization in the Asian Earthquake and the 'War on Terror'*

A neo-realist conceptualization of social power is used to apprehend the geographies of vulnerability at the local scale and geopolitics of assistance from global to local scales in the 2005 Asian Earthquake in the Pakistani administered Kashmir. The pattern of vulnerability to the earthquake was complex in that the middle class suffered higher proportionate fatalities, while the poorest suffered more in the longer run. In the aftermath of the quake an unprecedented level of aid flowed in from the Pakistani society & diaspora, to international NGOs to Western governments. Without cynically underestimating the genuine humanitarian concern with providing assistance to bereaved humanity one can still trace the undercurrent of the war on terror and its linkages to the 'hearts and minds' battle during the western relief effort. The globalization discourse and its concomitant geographies of power/knowledge and compensatory power spawned the geography of vulnerability to the physical event of the October 8th, 2005 earthquake. In the relief effort though it was the naked power of the state and the social and geographical positionality of the disaster victims within the geopolitical calculus of the global hegemony that at least partially contributed to the flurry of response to the disaster. Along the way, the role of the international media in globalizing the local life spaces of the disaster victims also played a pivotal role in mobilizing the level of effort that transpired. The international and national relief effort, however, is still being filtered through the traditional patronizing state apparatus and social class relations.

Kebiche Mustapha, Université du Québec à Montréal, Département de Géographie. Email: kebiche.mustapha@uqam.ca; *The challenge of emergency management in risks and*

The city of New Orleans is one of the most attractive cities in the world in term of cultural tourism. The Festival of jazz, the Heritage Festival and the French Quarter are attracting millions of visitors every year. However, a single event has recently shown how vulnerable is the city. A category 4 hurricane Katrina hit Louisiana on August 29th 2005 causing a surge and severely damaging the levee that was protecting the city from Pontchartrain Lake. The storm itself lasted not more than a day but the floods have lasted several days making hurricane Katrina the most destructive and costliest "natural" disaster in the US history. The flooding has triggered riots for many days among the most vulnerable people of New Orleans. On December 2005, four months later, the city was dealing with benzene pollution. What we have learned from Katrina is that risks and "natural" disasters are very complex systems. A system has many components interacting in different ways in space and time. Ignoring the dynamic of the system can lead to a disaster. In this presentation, we show this complexity through the events that affected New Orleans and the challenge for risks and disasters management. * Adjunct Professor at Université du Québec à Montréal, département de Géographie, Canada.

M Marian Mustoe, Eastern Oregon University. Email: mmustoe@eou.edu; *Point Of Purchase Perceptions: Selling Products With Place*

Point of Sales or Point of Purchase (POS or POP) advertising has a long history of linking products with the advertising images on signs, wrappers and product labels. For many products using this form of advertising, a sense or notion of place plays an important role in identifying the product to the consumer. Although textual references can build powerful identities with products and places, i.e. Pendleton Shirts ...a shirt manufactured in Pendleton, Oregon... images are also used by advertisers to make direct and sometimes subliminal references to a product's place/landscape connections. Sometimes these may have little to do with the product's origin. This presentation will explore how the imagery of place is used to sell a product at the point of purchase level. Examples

of labels will be shown. Taking the landscape categories from D.W. Meinig's, Beholding the Eye a simple analysis model will be presented that students can use in evaluating POP images in the context of places and landscapes. David Lowenthal suggests that "beyond that of any other discipline... the subject matter of geography approximates the world of general discourse; the palpable present, the everyday life of man on earth, is seldom far from our professional concerns." Thus, even a lowly candy bar wrapper may have something of geography etched upon it! Consider the "Idaho Spud", the "Mountain Bar" or the "Old Faithful"...confections, all covered up at the point of sale in wrappers steeped in images of place!

Erin Mutch, Mountain House Community Services District. Email: emutch@sjgov.org; *New Town, New Data and the GIS Solution*

The Mountain House Community (MHCS) has been described by the Associated Press as the "First New Town of the New Millennium". Many innovative measures were taken to ensure successful project execution, including the development of a GIS. The demands for useful information from the GIS have grown with the immediate need for accurate asset inventory and GASB 34 reporting. An integral part of daily operations at the MHCS is the ability to ask the question of "where?" Paper topics will include moving GIS services "in-house", inter-agency coordination, GASB 34 requirements and design of community-wide GIS. Various reports are needed such as length of sidewalks, acreage of roadway, number and condition of street lights and other reports regarding all of the facilities the MHCS is responsible for maintaining. Many calculations are currently made by MHCS engineers, many by reviewing paper maps. The challenges of CAD to GIS integration will also be discussed in addition to the update of data standards for submission of improvements to accommodate data conversion into the GIS. Our goal is to create an enterprise Server GIS which will support our departments and ultimately the community residents. The Mountain House departments include community development, public works, accounting and operations & maintenance. The full effects of building the first new town of the new millennium have yet to be realized. With the planned infrastructure and features Mountain House will offer, it is sure to be studied by planners of future communities and prospective residents alike.

Suresh Muthukrishnan, Assistant Professor, Earth and Environmental Sciences, Furman University, Greenville, SC 29613. Email: suresh.muthukrishnan@furman.edu; *Earth from Space: Integrating Spatial Science and Technology into Introductory Geosciences Curriculum*

As part of an initiative to enhance science literacy of non-science majors at undergraduate colleges, a new and exciting introductory course that tightly integrates geosciences and spatial technology was developed and introduced in fall 2006 at Furman University. An introductory science course would traditionally attract students who are either inclined to be science majors or need to satisfy a general educational requirement in the sciences area towards their graduation. A common perception among non-science students is that science is hard and requires quantitative/mathematical skills and so they fear taking science courses. However, many of our students have a natural affinity towards computers and technology in general, and learn technology faster than class room materials. This new course capitalizes on the students' zeal for computers and technology, and introduces earth system science concepts using geospatial tools and technologies such as GIS, remote sensing, GPS and PDA (pocket PC) while at the same time providing a stronger foundation for them to understand the interactions between geosphere, hydrosphere, and atmosphere using scientific literature along with engaging activities using GIS and spatial data. Main objectives of this course are: to integrate spatial thinking and spatial technologies into teaching basic concepts in geosciences; to increase active participation by students in learning the topics covered; and to raise the overall science literacy and global awareness to make them better informed citizens. A PDA based classroom interaction and feedback system was used to assess student understanding of core concepts along with google earth and ArcMap programs.

Keywords: introductory geosciences, GIS/GPS, Remote Sensing, Clickers, PDA

Christine M Mutiti, Miami University. Email: mango1@muohio.edu; *Exploring the Tsavo Savannah: Bushland versus Grassland in Southeastern Kenya*

Regional-scale patterns of vegetation often correlate with regional gradients in precipitation and temperature. In the African savannahs, physiognomic types at the broad scale can be delineated into woodlands, bushlands, grasslands, parklands, and scrubs. The Tsavo ecosystem in southeastern Kenya is broadly described as an Acacia-Commiphora bushland. The creation of Tsavo East and West National Parks resulted in the Taita wildlife corridor forming as a peninsula of privately and commercially owned lands between the bushland of the national

parcs. Many studies have indicated an increase in open grasslands in the protected areas, and debated on whether this is a natural cycle between woody and herbaceous vegetation or whether it is caused mainly by large elephant populations. The aim of this study is to contrast vegetation patterns between the protected area (national park) and a non-protected area (wildlife corridor). It is hypothesized that differences in vegetation composition between the wildlife corridor and the national park correspond to a management boundary. This study uses satellite images to determine the distribution and amount of tree-dominated bushland versus non-bushland vegetation. The study also evaluates the relationship between the distribution of these physiognomic types (bushland and grasslands) and physical environmental factors such as rainfall, geology, topography, and surface hydrology, as well as human historical factors in the form of management regimes. Preliminary findings show that while climate results in gradual changes in vegetation along a rainfall gradient, changes in vegetation patterns resulting from differences due to management are rather abrupt.

Keywords: Remote sensing, savannah, bushland, vegetation patterns

Samuel Mutiti, Miami University. Email: mutitis@muohio.edu; Jonathan Levy, Miami University. Email: ; Kathryn C Kilroy, Miami University. Email: ; Britton Windeler, Miami University. Email: ; Matthew Birck, Miami University. Email: ; *Developing A Model Developing a Model for Predicting the Amount Riverbed Scour During Storm Events*

This study investigates the temporal variability of riverbed sediment scour and determines its relationship to river stage. In this study, the amount of scour taking place on a reach along the Great Miami River, in southwest Ohio, is monitored and quantified. The working hypothesis for this study is that the amount of scour taking place increases with an increase in river stage. For the purpose of this study scour is defined as the change in sediment thickness. Scour is continuously monitored using scour chains and load cell sensors. Scour chains are buried in the riverbed and analyzed after high river stage events. This enables the monitoring of sediment scour during these storm events. The load cell sensors are buried in the riverbed to continuously monitor the height of overlying sediments. In this study, river stage is also continuously monitored using pressure transducers. Data used in this study were collected over a period of one year. The amount of sediment scour is related to the river stage height and a regression model that can be used to predict the amount of scour given a rise in river stage is created. This is especially important at sites of induced infiltration where there is potential for increased groundwater contamination when the riverbed is scoured away. Having the ability to predict how much scour would take place during storm events would help water supply utilities to continue supplying clean drinking water. Results indicate that significant scour takes place only during big storm events.

Aaron T. Myers, Oak Ridge National Laboratory. Email: myersat@ornl.gov; Daniel J. Getman, Oak Ridge National Laboratory. Email: getmandj@ornl.gov; An Assessment of GIS Server Software

Geographic Information Systems (GISs) have become important tools in research and industry. More recently, however, a need to distribute and analyze geographic data in a web-based framework has begun to influence the approach taken for application development. This web-based development is being carried-out, in large part, with a limited assessment of available software, and incomplete guidelines for the selection of the appropriate framework to develop the desired product. The goal of this research was to evaluate web-GIS software in terms of ease of installation, capabilities, cost, and overall functionality. Software chosen for this research includes University of Minnesota's MapServer, MapGuide Open Source, ArcIMS, ArcGIS Server, and Oracle MapViewer. After a thorough literature review, each server application was installed in a similar environment, and configured for use with a common database. Vector and raster data of varying scale, file size, and spatial extent were included for display and analysis. Sample applications aided in the evaluation of each server type in terms of map display, geo-coding, layer query, and spatial analysis. After the evaluation, a summary of server performance along with guidelines to aid researchers in determining which software product is more appropriate to fill their needs is presented.

Email: rnyyas@gmail.com; Evaluating channel disturbance and response during invasive plant eradication along the San Marcos River, Texas

River management requires understanding the time-scales for river channels to adjust to disturbances. The San Marcos River (640 km²) emits from a large spring (4.5 m³/s) at the eastern edge of the Edwards Plateau in Central Texas, and has been significantly impacted by *Cryptocoryne beckettii*, an exotic water

trumpeter from Sri Lanka. State and federal river management agencies removed the *Cryptocoryne beckettii* via extensive channel dredging. This paper provides an overview of the extent of geomorphic adjustment over a one year period, spanning the predisturbance, disturbance, and the initial stages of the post-disturbance regime. A variety of approaches were utilized to characterize the geomorphic response of the San Marcos River to channel dredging, including repeat channel surveys, acoustic Doppler bathymetry surveys, channel bed erosion pins, bank erosion pins, turbidity measurements, and estimates of bed load transport. Based on repeat channel cross-sectional surveys, 155 m³ of material was dredged from the river channel bed. There was an average increase of 1.9 m² in channel cross-sectional channel area, but was as high as 6 m² where *Cryptocoryne beckettii* was densest. The maximum depth of dredging exceeded 0.75 m in some reaches, creating dredge holes and channel knickpoints. After several months dredge holes showed minor (7.6 cm) upstream expansion, and associated downstream infilling (6.1 cm). Data from bank erosion pins reveals very low rates of bank erosion. The San Marcos River does not show significant signs of adjustment, which may be due to inherent channel stability, as well as persistent low flow conditions.

Garth Andrew Myers, University of Kansas. Email: gmyers@ku.edu; The Land is (Not) Ours: Land Reform and Urban Expansion in Zanzibar

The scope and pace of urbanization in Zanzibar's West District is unprecedented, since its population has quadrupled, from 1988 to now. The pace of the urbanization of land is especially notable. This extraordinary expansion has taken place during a transition in Zanzibar's political system and economic development framework. Like the rest of Tanzania, Zanzibar has seen tremendous change since 1985. These two decades or so of transformation and restructuring have brought a reform agenda to issues of land and urbanization as well, with new development projects, new governmental and non-governmental institutions, new legislation, and new processes and processes all designed around reshaping the way land is developed, controlled, managed, or claimed in and around the city of Zanzibar. The latest example of this reform agenda in land is the Finland-funded program for Sustainable Management of Lands and Environment (SMOLE). SMOLE is inseparable from the broader development rubric that dominates Tanzania, aligned with rhetorical movements for sustainable development and good governance within a neoliberal model. In exploring the limited outcomes of this project, in this piece, I want to focus on the first of what will be six themes of my research, based around the preliminary phase of a two-year research project that includes interviews with donors, officials, land agents, and residents, as well as archival analysis. This theme is the as yet unexamined - and seemingly counter-intuitive - continuities of SMOLE with the profound failings of colonial-era peri-urban land and environmental management.

Vanessa Myers, Kent State University. Email: vmyers2@kent.edu; Wayne Kline, Kent State University. Email: wtkline@kent.edu; GK-12: Bringing Weather Into the Classroom

In the Ohio school curriculum, "weather" is referred to throughout the Earth and Space Science Standards, Benchmarks, and Indicators. It is often hard for K-12 students to understand the complexities involved with weather and therefore meet Ohio's standards. To help improve understanding of weather in Stark County, Ohio, Kent State University was awarded a GK-12 grant from the National Science Foundation. This program allows graduate students with a meteorology and climatology background to work with K-12 students and teachers. They have worked both in and outside of the classroom developing inquiry-based activities to better explain weather concepts. While in the classroom, the graduate students have been able to act as "experts" in their field answering crucial questions, providing examples of what scientists do, and creating further student interest in weather. Through their research, the graduate students have been able to bring current data into the classroom, giving the K-12 students an insight into how to use and interpret current data.

Soe WIN Myint, Arizona State University. Email: soe.myint@asu.edu; Gregory S Okin, University of California, Los Angeles. Email: okin@ucla.edu; Quantifying impervious surfaces in the Phoenix metropolitan area using multiple endmember spectral mixture analysis

Urban impervious surface areas (e.g., cement parking lots, asphalt roads, shingle rooftops) can only be recorded as either present or absent in each pixel when using traditional per-pixel classifiers. Sub-pixel analysis approaches that can provide the relative fraction of surface covers within a pixel may be a potential solution to effectively identifying urban impervious areas. Spectral mixture analysis approach is probably the most commonly used approach that models image spectra as spatial average of spectral signatures from two or more surface

features. However, spectral mixture analysis does not account for the absence of one of the surface features or spectral variation within pure materials since it utilizes an invariable set of surface features. Multiple endmember spectral mixture analysis (MESMA) approach addresses these issues by allowing endmembers to vary on a per pixel basis. We employed the MESMA technique to model Landsat TM reflectance in the Phoenix metropolitan area. Field spectra of vegetation, soil, and impervious surface areas collected with the use of a fine resolution Quickbird image and pixel purity index tool in ENVI software were modeled as reference endmembers in addition to photometric shade that was incorporated in every model. This study employs twenty-eight endmembers and five hundred and forty four-endmember models to identify impervious surface areas in the city of Phoenix. Results from this study suggested that the MESMA approach is reliable and the algorithm picked the signatures effectively.

Keywords: urban, impervious, multiple endmembers

Miyo Nagakura, Graduate School of Asian and African Area Studies, Kyoto University, Japan. Email: nagakura@jambo.africa.kyoto-u.ac.jp; Agro-pastoral land use in relation to natural environments in a mountain area of Lesotho

Lesotho is a mountainous country located in the middle of Drakensberg mountains in southern Africa. The people practice both crop cultivation and pastoralism. The aim of this paper is to clarify the relationship between the agro-pastoral land use and natural environments. Natural environments were focused in detail by looking at the diversity of environment within the village, in order to clarify the relationship between land use and natural environments precisely. I conducted a six months research in a village of eastern Lesotho, from September 2005 to March 2006. Temperature, soil, vegetation, and landform surveys were carried out in several points of different altitudes within the village. As a result, landscape characteristics of the site included a terrace formation at about 2500m of altitude, and a unique settlement pattern. The settlements were located horizontally at 2600m altitude, separating a steep slope mountain and a gentle slope terrace. Moreover, three land use patterns such as cultivated field, pasture and settlements were identified, each with specific environmental characteristics. For example, in the cultivated fields, average temperatures differed according to altitudes of the fields, and soil depths were the deepest among the three land uses. In the pasture, maximum and minimum temperatures were at extreme, and soil depths were the least among the three land uses. And lastly, in the settlements, houses were located above the cold air lake which formed during the nights, and diurnal range of temperature was the smallest, which indicate the comfort of the settlement location.

Kenkichi Nagao, Osaka City University. Email: nagao@econ.osaka-cu.ac.jp; Michael Plattner, Trier University. Email: ; User-producer relation and knowledge production in Japan

The aim of this paper is to present the empirical results regarding knowledge production based on the user-producer interaction of machine. We explore production process of machine, the rising amount of product related services such as the maintenance of machines and planning, the changing forces in producer driven value chains, and the spatial patterns of enterprise locations. Flexible automation of manufacturing leads to a value added shift from the processing of material goods to the creation of product related services. Due to the resultant altered network relations, producers accumulate power over the users to establish technological alleged collaborations in manufacturing regions. Remaining research questions relate to previous empirical examinations conducted in the field of economic geography: In which markets does new knowledge arise, where is it offered and where is its demand? Previous studies on business services took only little notice of the tertiarization within the manufacturing sphere. The empirical researches include a multiple case study of the machine producers and their users in Japan.

Keywords: machine production, factory automation, Japan

Nicholas Nagle, University of Colorado. Email: nicholas.nagle@colorado.edu; The Spectral Analysis of Areal Data

Waldo Tobler has separately suggested that areal aggregation may be viewed as a spatial filtering applied to a latent, continuous process, and that spectral analysis may be "frame-independent," i.e. that the spectrum of a process does not depend on one's scale of analysis. Application this method to data demonstrates that while theoretically correct, this latter statement of frame-independence needs modification for practical analysis. The frame-independence property holds practically for low frequency components, but not for high frequency components. The loss of high-frequency components make it impossible to generate realistic maps and simulations of continuous phenomena from areal data without extra information (such as on the smoothness of the continuous process). The frame independence property does hold, however, for low frequency components. Importantly for applied spatial analysis, this suggests

that areal data alone is sufficient for constructing confidence intervals for spatially continuous phenomena. Results from simulation evidence and an application to the analysis of census data are presented.

Yaser M. Najjar, Department of Geography, Framingham State College, Framingham, MA 01701. Email: ynajjar@frc.mass.edu; Hashem Almadani, Department of Civil and Architectural Engineering, University of Bahrain. Email: halmadani@uob.edu; Mohammad Saad, Department of Civil and Architectural Engineering, University of Bahrain. Email: msaad@uob.edu; Traffic Impact Analysis of Selected Roundabouts in Bahrain

Rotaries or Roundabouts are popular and dominant features of the road network system in Bahrain. The landscape design of these roundabouts enhanced the physical beauty of the road network. However, roundabouts are considered hazardous intersections due to accident counts, traffic congestion, and noise and air pollution, especially during peak travel periods. Transportation engineers classified the level of traffic flow at roundabouts as level D during normal Traffic hours and level F during peak hours. Therefore, it is timely important to analyze traffic flow and circulation within the most congested roundabouts. Thus, data for the fifteen major roundabouts were collected and analyzed during spring of 2006. The variables used as the base for selection included A. M. & P.M. traffic flow and number of collisions. Also, personal interviews of officials, experts and citizens were conducted. Questions focused on their views and preferences towards roundabouts as a traffic control alternative. Six roundabouts were selected for this study that characterized by high volume of traffic and collisions, irregular traffic flow patterns and in-adequate pavement marking and signage. This study evaluated the six roundabouts based on the analysis and explanation of the mobility and access traffic patterns. Findings indicated that performance of a roundabout depends on its geometry, traffic characteristics, spatial orientation, topography, signage, pavement markings, predominant user characteristics, user driving education, and traffic regulation enforcement. The analyzed roundabouts have unbalanced traffic flows. Some entries have heavier flows than others which cause continuous circulating traffic, therefore excessive delay and queuing were observed.

Keywords: : roundabouts, traffic flow, traffic delay, traffic queuing, spatial orientation

Nicholas Nalepa, University of Michigan - Dearborn. Email: nnalepa@umd.umich.edu; Jacob Napieralski, PhD, University of Michigan - Dearborn. Email: jnapiera@umd.umich.edu; Using GIS to Ascertain Efficient Spatial and Vertical Resolution for Determining Drumlin Morphometry: A Case Study of the Palmyra Drumlin Field

Streamlined glacial landforms, such as drumlins, provide unique insight into glacial history; however, attempts to delineate drumlins are frequently subjective and time consuming. The purpose of this research is to use geographic information systems (GIS) to design an objective, reproducible method to measure the physical characteristics of drumlins then apply this method to a case study in Central New York. The base of the drumlin (i.e. lowest enclosed contour line) was used to extract, delineate, and characterize a drumlin. This was accomplished by generating a variety of resolutions and contour intervals from a Digital Elevation Model (DEM) and then using basic GIS tools to calculate the spatial characteristics of each drumlin. The optimum resolution and contour interval is assessed by comparing volume estimates against spatial resolution, identifying which resolution/contour interval facilitates fast, efficient, and cost effective analysis. Drumlin morphometry (i.e. volume, area, height) calculations are expected to change due to the influence of spatial (and vertical) resolutions. This methodology is then applied to the drumlin field around Palmyra, New York to better describe the general patterns and characteristics of the drumlins. Results from this study can help standardize drumlin delineation, and provide a GIS technique that can potentially be used to analyze the morphology of other glacial features (i.e. cirque, flutes, moraines).

Keywords: gis, morphometry, spatial analysis, drumlin, resolution

David P. Nally, University of Cambridge. Email: dpn24@cam.ac.uk; "A different race of men": famine and the racialisation of poverty in 19th century Ireland

Although recent writings have shown an interest in the regimes of governance that underpin or produce famine, there has been little attempt to connect these state-led actions to the theory and practice of colonialism, especially its investments in the 'liberal' goals of development, reform and social improvement. In this paper I explore the origins, growth and consolidation of these liberal ideals in relation to the problem of Irish poverty, focusing especially on the half-century prior to the Great Irish Famine (1845-52). The paper draws attention to the ways in which economic theories of Irish underdevelopment worked to revitalise longstanding fears of racial difference. While this analysis is

intended as a critique of the racist assumptions often embedded in 'instrumental knowledges' (and one which takes seriously Amartya Sen's point that "the sense of difference between ruler and ruled? between 'us' and 'them'? is a crucial feature of famines"), I also aim to explore the connections between governing norms, 'aid', and liberal state intervention. These reflections are based on readings of official government commissions, political pamphlets and contemporary travel writings.

Keywords: famine, colonialism, governmentality, racism, development theory

Sylvia Nam, University of California, Berkeley. Email: sylvianam@berkeley.edu; *The Political Economy of Development and Apparel Production in Cambodia*

Garment production has figured centrally in Cambodia's contemporary economic development while the 2005 liberalization of the global garment trade has resurrected debates on its significance in developing economies. As Cambodia's recent integration into the global capitalist economy has largely been secured through garment manufacturing, its global integration has also occurred through post-conflict inflows of aid money and expertise. Liberalization thus makes visible the deliberate convergence between poverty alleviation and free trade-based growth in the larger project of development. In the realm of development, gendered work is often discussed as women's exploitation under capitalism or as empowerment through wage labor. While the feminization of garment work has been identified as both the preponderance of women in the sector and the devaluation of the work itself, women workers have been identified as key agents in poverty reduction through their entrepreneurialism. This paper seeks to address how garment production occupies a key position in the debates of work and poverty policy by examining representations of women's participation in garment production. Such participation relies on taken-for-granted assumptions about the nature of poverty and unequal power relations in the political economy. Accordingly, this paper will consider neoliberal commodity capitalism alongside liberal development practices as a framework to understand gender and development politics in the country.

Keywords: economic development, garment production, feminist geography, Cambodia - Phnom Penh

Steven Namikas, Louisiana State University. Email: snamik1@lsu.edu; *Mapping the Spatial and Temporal Variability of Surface Moisture Content on a Fine-Grained Beach*

It is generally recognized that moisture-induced cohesion can significantly influence rates of aeolian transport on sandy beaches. Although the basic mechanics of this process are well understood, almost nothing is known regarding the spatial distributions of surface moisture content in beach sediments, or regarding how those distributions change over time. In this study, surface moisture contents were monitored using a modified theta probe on a twenty meter wide, cross-shore sampling grid. The grid was sampled every 3-4 hours for a two week period, providing one of the most extensive surface moisture content data sets ever collected. Additionally, a variety of environmental parameters (temperature, humidity, evaporation rates, water table elevation, etc.) were simultaneously monitored to document the processes thought to control surface moisture content, and establish linkages between these processes and observed changes in surface moisture content.

Keywords: aeolian transport, sediment transport, surface moisture content, beach

Cindy A. Nance, Ph.D., Mt San Jacinto College. Email: cnance@msjc.edu; *Razing the Dead*

Evolving attitudes toward a place for the dead are revealing of a new world view. Apparent in evolving settlement patterns, as a land use scheme to things, are changing spatial and temporal associations with a place for the dead. From Louisiana to Los Angeles, changes in attitude toward a place for the dead are evident in traditional cemetery abandonment and Memorial Park preference. Prevalent in professional journal articles are discussions of "sites" as "situated" in both space and time. I propose a third dimension for untangling complex relationships of land use change - "situation." A multi-dimensional trialectic based on site-situated-situation, rather than two-dimensional dichotomies, are presented as a new theoretical approach for the analysis of land use change. Through a trialectic approach, natural and cultural factors that adversely impact cemeteries are examined to explain changing attitudes toward a place for the dead. In this way, human interaction and decision making processes are integrated as agents of land use change over space and time. At many scales, contemporary photographs and historic to current map research present horizontal and vertical perspectives that facilitate a cultural-historic reconstruction of evolving settlement patterns. I will demonstrate through photo collages and GIS applications empirical and statistical methods for spatial and temporal analysis of cemeteries in situ, as sites that are situated and evolving with changes in

situation. A trialectic approach "puts flesh on the bones" of the past.

Keywords: Cultural-historic, GIS, trialectic, cemeteries, settlement pattern

Ishikawa Nao, Nagoya University. Email: nawobe@yahoo.co.jp; *Factors in the Continuation of Bullfighting in Tokunoshima Island, Japan*

A high school student says, "There are a lot of attractive woman and nice fellow at the bull ring. And if he treats bulls nicely, he will be popular in high school." A number of traditional events have recently been on the verge of extinction in Japan mainly because of the lack of successors. The tradition of bullfighting in the Tokunoshima Island has fortunately continued up to now. This study investigates how bullfighting is continued and its significance in the Tokunoshima Island by concentrating on the connection between the social relations created between the bulls and local society. Bullfighting is occurred in 6 districts in Japan. In Uwajima district and Oki Islands, People try to preserve the event by making it sightseeing resources and getting support from the government. But In Tokunoshima Island, bullfighting takes root in society and many young people are willing to raise bulls. I figure out why people have bullfighting actively only in Tokunoshima Island. I set up theses three point of view. 1: How they run the event from an economical viewpoint? 2: How the custom has been taken over from generation to generation? 3: What's significance of bullfighting in Tokunoshima Island? I focus on the various inhabitants who run the bullfighting, particularly the following four types of people: ushinushi (bull's owner and trainer), seko (bull's motivator), the ushinushi's neighbors, and the ushinushi's family. Currently, bullfighting takes place in Tokunoshima town, Isen Town and Amagi town. People have about 500 bulls there.

Keywords: Traditional event, actors, bullfighting, social relations

Jacob Napieralski, University of Michigan- Dearborn. Email: jnapiera@umd.umich.edu; *Incorporating social perspectives in environmental science through inquiry-based undergraduate education*

Environmental science education is an important component of the school curriculum given the current state of environmental conditions, and because of the need for environmentally literate citizens who are empowered to take environmental action. Unfortunately, environmental educators typically focus on natural phenomena rather than urban/built environments or the social-cultural components of environmental problems. This preoccupation with the "naturalness" of the environment could undermine efforts to equip individuals and communities with knowledge and skills to improve environmental quality for all. The purpose of this work is to describe how an inquiry-based, undergraduate environmental science course provided students with opportunities to explore and appreciate the social aspects of environmental issues using scientific investigations. An environmental science course was designed to introduce students to key environmental concepts in local and global contexts, relying on short lectures, activities, and a project. Two activities are used to illustrate how student responses were used to evaluate their perceptions of the social implications of pertinent, environmental issues. First, students determined the amount of water they consumed within a 24 hour period (local/personal context). Second, students learned about climate change and the issues related to the Kyoto Protocol (global context). The responses of one student are used to illustrate the presence of self-awareness and their particular role in the environment. The findings demonstrate that allowing students to investigate human impacts on the environment in the context of real-world situations made them aware of the social, political and cultural implications surrounding environmental decision-making and motivated students toward environmental action.

Darrell E. Napton, USGS Visiting Scientist and South Dakota State University. Email: Darrell.Napton@sdstate.edu; *Recent Land Changes in California's Chaparral and Oak Woodlands Ecoregion*

California's chaparral and oak woodlands are among the most picturesque landscapes in the nation. This ecoregion also includes most of the populations of San Francisco, Los Angeles, and San Diego. The population increased by 15 million after 1970, yet most of the ecoregion is rural and thinly populated. The most dramatic land change was caused by fire, which was involved with four of the five most common land transformations. Fire contributed to the complexity of land change, but burned areas generally quickly returned to the natural covers that originally burned. The most significant transformation was the conversion of agricultural land to urban development. Much of this conversion, however, was offset by the conversion of other land to agriculture. The California coastal valleys of this ecoregion have been prized for their ability to grow fruits and vegetables throughout the year. Recently, their mild climate and flat land has attracted developers. Farmers have adapted to higher land prices by growing more high-value, specialty crops. Additionally, many vintners have converted wooded and grassy hills to grapes. The result is that nearly two-thirds of the conversion of agricultural land to developed uses was offset by farmers converting forest and grass/shrub lands to crops. While the conversion of farmland to developed uses

raises long-term questions about the sustainability of exceptionally valuable farmland, the conversion of forest and oak savannas to vineyards raises immediate environmental issues.

Keywords: : land use dynamics, ecoregion, California, fire, vineyards

Kim Naqvi, PhD, Kent State University. Email: kb.naqvi@gmail.com; Assessing the Relationships between Eastern European Industrialisation on North American Post-War Economic Development

Perceptions of North American economic development are contrasted with actual patterns as shown in international historical data in order to place that development in the context of international change. In particular, North America's sequential development of industrial transformation, rising domestic consumption, and industrial trade is placed in the context of the post-war industrialisation and re-industrialisation of Europe, and the rising political and economic challenge of Eastern Europe and including states in the former USSR. Historical time-series data show that the rise of post World War II industry in the Eastern Bloc and western states of the USSR formed a distinct cluster of newly industrial countries in the 1960s. However, both the historic impact and its lasting effect of this cluster on North American and overall world economic change tends to now be under-examined and under-theorised since the collapse of the Soviet economic system. This paper argues that the loss of this history with the loss of political entities associated with that history can lead to distorted and simplistic interpretations of economic and social development

Keywords: Industrialisation, Eastern Europe, North America, Economic Development

Venkat naga Narasimham, Madras Inst of Devt. Studies. Email: venkatt2k@gmail.com; Redefining urban space: The role of Neighbourhood Associations in creating a neoliberal vision of the city

Indian cities are being transformed by through grandiose schemes of urban renewal driven by national and global agendas. The burgeoning economy is changing the urban landscape as well as the urban mindset. The increased economic activity in cities has intensified pressure on the land and added to the already large population of slum dwellers, squatters and other migrants. In the meanwhile infusion of global culture has led to the emergence of the new middle class who claim their rights as citizen-consumer. The existence of the illegal and semi-legal population, sharing the resource and space with the 'proper citizen' is being contested. This study, that covers resident welfare associations and other neighbourhood based associations in the city of Chennai and its suburban peripheries, inquires whether these associations, while claiming the status of civil society in the emerging order, intend to redefine urban space from the perspective of the 'citizen'. Using a combination of survey and ethnography, it seeks to sketch the self-images that these associations promote, as well as the visions they construct of cities as an exclusive space for citizens to live, work, relax, revel and participate in civil society. The study also delves into the citizenship claims made by the associations and how they negotiate the political and social space in order to promote these claims and their interests. The study elaborates on the methods that residents' welfare association use in contesting and counter acting the claims of the 'population' represented through political society.

Keywords: urban renewal, neighbourhood associations

Joseph Narus, Portland State University. Email: joenarus@yahoo.com; Polygeneration from Coal in China: The Role of Geography in China's Clean Coal Future

My research focuses on the characteristics of an optimal location for polygeneration from coal in China. Polygeneration is a gasification-based system capable of creating electricity, heat, liquid fuels, and hydrogen, while capturing carbon dioxide and reducing emissions of particulate matter, sulfur dioxide, and nitrous oxides. The integrated concept supports China's sustainable development goals and the government's Three E's strategy of economic development, energy security and environmental protection. Determining the optimal location for a polygeneration plant involves several important geographical factors. These include the composition and distribution of coal resources, competing pressures on water resources, distance from population and industrial centers, and regional development trends. I will evaluate how these factors may influence the development of polygeneration from coal in China.

Keywords: China, energy, coal, development, economic geography

Alan Nash, Concordia University, Montreal, Concordia University. Email: nash@alcor.concordia.ca; "From Spaghetti to Sushi": ethnic restaurants in Montreal, 1951-2001

This paper explores some geographic issues raised by the development of ethnic restaurants in Montreal, 1951-2001, in the context of a growing body of theory concerning the phenomenon. It disputes the argument advanced by Wilbur Zelinsky that "there is usually at best only a weak relationship between the geographic pattern of a given cuisine and that of the related immigrant

stock" in a metropolitan area (Geoforum 1985). The paper thereby also takes issue with an alternative explanation presented in a 2004 study by Rhona Richman Kenneally in which she identifies the city's world's fair (Expo '67) as the beginning of an accelerating fashion for ethnic cuisines in the city. On the basis of evidence derived from an analysis of Montreal's Yellow Pages from 1951 to 2001, this paper argues that immigration remains the single best explanation for the major trends in both number and type of ethnic restaurants. The paper concludes that theorists have so far largely ignored the wider social and economic roles played ethnic restaurants, and that we need to consider their importance in family employment strategies and the like if we are fully to understand the phenomenon.

Keywords: ethnic restaurants, Montreal

Catherine Jean Nash, Brock University. Email: Catherine.Nash@Brocku.ca; Transforming the 'gaybourhood': Trans politics, FtMs and the transformation of space

Gay and lesbian urban neighbourhoods provide important political, social and economic support for gay and lesbian activism and various forms of social interaction. Dissident sexualities and gendered practices, tentatively captured under the term 'queer', have also found some elemental acceptance in these urban spaces. Nevertheless, unstable and fluid queer expressions increasingly test homonormative identity politics and trouble the historically essentialized quality of gay and lesbian urban areas. This paper examines the experiences of FtMs or trans-men in Toronto's well-established and long-standing gay and lesbian district. FtMs, in their multiple masculine practices, bring new social and political effects to lesbian, queer and gay male spaces in distinctly disconcerting ways. In particular, the research argues that FtM embodied presences and practices radically undermines and disassembles the stable fixity of Toronto's 'gaybourhood' and intentionally seeks to confront not only homonormative but queer renderings of sexualized and gendered behaviours and practices. Not only are the homonormative underpinnings of gay and lesbian identity and space increasingly troubled by the presence of queer and trans bodies, but new, distinct and alternative queer and trans spaces are emerging to challenge the gay village's hegemonic positioning as the location of sexual liberation and critique.

David J. Nash, School of the Environment, University of Brighton, UK. Email: d.j.nash@bton.ac.uk; Stefan W. Grab, School of Geography, Archaeology and Environmental Studies, University of the Witwatersrand, South Africa. Email: grabs@geoarc.wits.ac.za; "A Sky of Brass and Burning Winds": Documentary Evidence of Climate Variability in the Kingdom of Lesotho, Southern Africa, 1825-1900

This paper presents the first 19th century climate history for Lesotho derived from documentary evidence. The primary data sources were unpublished English-, French- and Sesotho-language materials archived in Lesotho, South Africa and the UK. These included letters, journals and reports written by missionaries and colonial authorities, which were supplemented by published newspapers, diaries, travelogues and other historical sources. Each of the sources was read in chronological order, with any climate information recorded verbatim. This included details of catastrophic events such as droughts, floods or snowstorms, general observations of weather, and indirect evidence of climatic variability such as harvest failure and river levels. Annual records for specific locations were then classified into five categories (Very Wet, Relatively Wet, 'Normal', Relatively Dry, and Very Dry) based upon the predominant climate during each 'rain-year' (July to June). The latter portion of this chronology was then compared for accuracy against precipitation records from 1887 onwards. The results yield a semi-continuous record of climate information from the early 1830s (following the arrival of the first French missionaries) to 1900. Prior to this, observations are more sporadic. Data are mostly restricted to lowland areas, but reveal several drought episodes (the most severe of which occurred in 1850-52 and 1862-63) and major wet periods or floods (e.g. 1890-91). Phenomena such as heavy snowfalls, severe frosts and tornadoes are also reported. The climate chronology is compared with similar records for South Africa and Botswana, and forcing mechanisms such as teleconnections associated with the El Niño Southern Oscillation considered.

Keywords: historical geography; nineteenth century; Lesotho; climate variability; El Niño-Southern Oscillation

Katherine Nashleanas, Ph.D., University of Nebraska-Lincoln. Email: knashleanas2@unl.edu; Metageographic Communities: A Model of Non-linear and Multi-scaled Communications Systems

The changing nature of digital face-to-face communication specifically, and the diffusion of flexible personal media more generally, has lead to a paradoxical expansion of the immediacy of the intimate and local over greater distances. Social systems traditionally create communities that extend across relational space and build multi-scalar systems of connectivity through a variety of

communications technologies. Systems of communications can facilitate these spatially complex communities of individuals, enclaves, and cores composed of multiple locations that connect over time and space. These systems are more deeply structural than are the networks and nodes of connectivity built from them. Because such systems are dispersed over distance and do not conform to traditional patterns of spatial clustering, we need new tools and models with which to bring them into focus and make them visible. I have developed a theoretical construct I call a Metageographic Community (MGC) that captures these phenomena and have created a working model by which we can map and analyze their spatial dynamics. Metageographic communities are composed of four interconnected but non-linear levels. They use the intensities and frequencies of interaction at multiple scales through flexible personal and mediated ties that lead to new ways of manipulating space using distance as a tool to facilitate community identification and efficacy. Multiple belonging is a result, transnationalism is a result, regional integration and globalization are results, - terrorist cells are a result — of communications technologies and their networks of practice embedded in systems of deeper social, political, economic, and technological structure.

Keywords: Communications systems, spatial model, transnationalism, multi-scaled systems, metageographic community, community model.

Anthony T. Nasuta, Kent State University. Email: anasuta@kent.edu; *In Spite of Themselves*

On state and private campuses across America, the classroom environment shifts away from passive, institutional instruction as technology augments and even displaces the authority of a single lecturer. Students believe they are entitled to a dynamic educational experience not bound by textbook and teacher. However, smaller budgets and mandates to serve non-traditional students preserve traditional, passive instruction in many secondary programs (branch campuses, vocational and for-profit schools), to the detriment of students and faculty. Reviewing seven years of teaching at two state universities, several branch campuses, and a for-profit vocational school offering an associates degree, I describe several unsettling contrasts between students at mainstream campuses and those in secondary programs catering to non-traditional students. Those in secondary programs generally are of a lower socioeconomic rank, can be defined as socially and educationally disadvantaged, and lack confidence in their abilities, even their right to an education. To engage them in the classroom, Geography is stripped to its essentials and reassembled in structured, approachable units heavily informed by local, real-world examples stressing gainful applications of Geography to everyday situations. A substantial part of the curriculum includes basic study skills, organizational exercises, and confidence-building assignments to prevent students from dropping out of the learning process. The instructor is still the center of the learning experience in most non-traditional Geography classrooms, I share a narrative of efforts to empower these students through the use of technology and “edutainment”, and transform their expectations of classroom learning from the passive to the active pursuit of knowledge.

Email: Richard.Shearmur@ucs.inrs.ca; *The evolution of jobs' and workers' spatial distribution in the business service industries, in Montreal, between 1996 and 2001*

While we may know about location of jobs and workers of the knowledge economy on a national scale, much less attention has been devoted to their geography on a metropolitan scale. With a case study of the metropolitan area of Montreal, between 1996 and 2001, we analyze the spatial distribution - and its evolution? of the business service industries' workers at homeplace and workplace. We focus on this industrial sector partly because of its connexion to the knowledge economy, partly because it was subject to a strong growth in that period (49 970 news jobs, an increase of 41%). The impact of this growth on employment centers and labour pools can lead to a consolidation of the existing ones, to the development of new ones or to the occurrence of both phenomena. From this new structure emerges a new jobs-housing balance which we analyse. To analyze and compare spatial distribution of business service industries' workers at home and work places, we calculate several segregation indices grouped into five classic dimensions (evenness, exposure, concentration, spatial clustering, centralization). This segregation analysis allows us to characterise both home and work places as segregated. Then, we identify locally, using GIS, business service industries' employment centers with a trial-and-error method. We also explore the possibility of identifying labour pools within the business service industries. By observing the consolidation and development of employment centers and labour pools, our analyses contribute to the understand-

ing of the evolution of the jobs-housing balance within a particular industrial sector.

Lisa Naughton, PhD, University of Wisconsin. Email: naughton@geography.wisc.edu; Dawn Day Biehler, University of Wisconsin. Email: dbiehler@students.wisc.edu; *Wildlife Conservation and Moral Authority Over Nature: When Wolves and Dogs Misbehave*

We review the history of public interpretations of ‘criminal acts’ by canids, from housepets to wolves. We examine legal discourse from the U.K and U.S. dating back to 1700 concerning canid conflicts stemming from bites, attacks and depredations. By studying how blame is assigned for these events, we trace shifts and persistent themes about human responsibility for animal ‘misbehavior’. We posit that people’s reactions to attacks on livestock and pets by wolves are refracted through their intense feelings about dogs as well as by conventional norms assigning responsibility for dogs to their owners. Specifically, we identify three factors shaping liability for dogs and wolves: 1) ‘guilty’ knowledge regarding an animal’s propensity to do harm, 2) technological capacity to control animal behavior, and 3) property claims (to both land and animals). Our findings illuminate the moral dilemmas regarding wildlife management in humanized landscapes. The Endangered Species Act has been necessary for wolf recovery but its emphasis on federal responsibility has heightened public expectations that government agencies assume liability for wolves and control their movements, just as individual citizens are legally accountable for the behavior of their dogs. At its core, we offer an example of the troubling efforts to compartmentalize control of wild nature. Because the costs of conserving large carnivores are localized and benefits diffuse, moral rights of individuals at risk of loss are primary in most control and compensation schemes. Treating wolves like “federal dogs” may be politically necessary, but it impedes the long-term integration of people and nature.

Lisa Naughton, Department of Geography, University of Wisconsin. Email: naughton@geography.wisc.edu; *Deforestation in western Uganda: Biodiversity and Human Welfare Concerns*

Field data linked to satellite imagery analysis illuminates the causes and consequences of deforestation in western Uganda during 1995-2005. Specifically, this study investigates how urban demand for biomass energy, uncertain access rules to land and forests, and the rapid expansion of tea cultivation drive rapid forest loss. Longitudinal survey data from 220 households living within 5 km of Kibale Forest National Park illuminates the connections between deforestation and poverty. While the majority of households have improved their incomes over the past 10 years, the lower quintile has slid into deeper poverty. These very poor households are most reliant on communal forest patches and consequently they are most at risk when forest patches are converted to agriculture or eucalyptus plantations. Comparing human welfare indicators for households neighboring Kibale Park versus those more distant reveals that the park is not a ‘poverty trap’. Rather it may be buffering the very poor among neighboring communities from the subsistence crises experienced by their counterparts in the broader landscape.

Anoop Nayak, . Email: anoop.nayak@ncl.ac.uk; *Bodies out of Place: Race, Migration and Asylum in the Global City*

This paper examines the complex articulation of race and migration in the light of urban unrest in Britain in 2001 and the aftermath of the London bombings in 2005. It considers the contradictory ways in which the nation-state is being re-imagined in New Labour policy and contrasts this with the lived testimonies of young ethnic minority subjects, asylum-seekers and refugees. A key fault-line identified in political rhetoric is the tension between citizenship and difference. In so doing the paper argues that the utopian ideal of cosmopolitan citizenship remains far removed from the prosaic struggles of young ethnic minorities residing in working-class neighbourhoods whose lives are mapped through stark monochrome geographies of race. The paper concludes that asylum-seekers and minorities are better conceived of as ‘bodies out of place’ - dark matter that is challenging claims to whiteness, Britishness and the nation state.

Keywords: asylum, Britishness, ethnicity, globalization, migration, youth

Shawn Shahriar Nayeri, Indiana University-Purdue University Indianapolis (IUPUI), Geography Department. Email: snayeri@iupui.edu; *The Caspian Sea Prospects: Security, Energy, and Water Politics*

The fate of countries in the Caspian Sea region is linked to the region's energy development and their strategic location for exporting oil and natural gas to Europe and other destinations. The multiple pipeline policy has presented the Caucasus region a great opportunity to progress with transformation towards economic stability and democratic processes, while attracting international investments. Security issues and protection of the region's water and natural resources have become urgent matters. The Baku-Tbilisi-Ceyhan pipeline was completed in July of 2006 by a consortium of oil companies led by British Petroleum, despite strong objections by World Wildlife Fund and Amnesty International. Rise of pollution in water resources and threats of oil spills are the environmental concerns, especially in the conflict zones and ecologically sensitive areas. Pipeline projects for the Caspian Sea and Central Asia regions have received strong support of the western nations as they provide greater measure of sovereignty, while encouraging democratic trends, improvement of relations with Islamic countries, and diversification of global energy source outside the Persian Gulf. This research investigates the causes that could potentially weaken the ability of the regional states to establish security. While exploring the relationship between environmental issues and socio-economic stability, those causes are identified and evaluated based on conflicting values of the regional and the powerful industrialized countries. Understanding the larger policy objectives for the region's security issues based on multiple perspectives, in the light of its immense energy reserves and water resources, are found paramount when dealing with Caspian Sea region.

Keywords: Caspian Sea, Central Asia, Pipeline Policy, Energy security, Environment, Political, economic geography, Environmental geography, Baku-Tbilisi-Ceyhan, exporting oil, exporting natural gas, Persian Gulf, British Petroleum, World Wildlife Fund, Amnesty International, water resources, caucasus region,

Laura T. Neal, University of North Carolina Wilmington. Email: ltn9781@uncw.edu; Michael M. Benedetti, University Of North Carolina Wilmington. Email: benedettim@uncw.edu; *Streamflow response to tropical and extra-tropical storm systems on the Carolina coastal plain.*

Frequency analysis of streamflow assumes that flood magnitude can be treated as a random variable drawn from a population with a known probability distribution (log normal, Gumbel, log Pearson, etc). This assumption may be false in watersheds where floods are generated by distinct hydrologic processes, for example in cool temperate watersheds where separate flood populations are caused by rainfall and snowmelt. The present study demonstrates significant differences between floods generated by tropical and extra-tropical storm systems for 4 medium-sized rivers (1,700-3,200 sq. km.) in North and South Carolina. Late summer and early autumn floods on these rivers are generated by tropical depressions, tropical storms, and hurricanes. Winter and spring floods are generated by frontal precipitation associated with passing wave cyclones. Winter floods are about twice as common as summer floods in the annual flood series of these rivers, but in most cases the largest floods on record were generated by tropical systems. Summer floods are generated by precipitation of greater intensity and duration, but are preceded by warm weather and lower baseflow conditions. Winter floods are associated with greater duration, longer basin lag, and greater water yield, reflecting the moderate intensity and large spatial coverage of frontal storm systems. The frequency distributions for summer floods show significantly lower mean and modal peak discharge, with much greater variance, skewness, and kurtosis than the winter flood distributions. Therefore, although summer floods are less frequent than winter floods, they strongly influence the parameters used in flood frequency prediction methods.

Keywords: floods, hydroclimatology, South Carolina, North Carolina

Abigail H Neely, University of Wisconsin - Madison. Email: aneely@wisc.edu; *A Place-Based Approach for Understanding Infectious Disease and Environmental Change*

Throughout Sub-Saharan Africa HIV/AIDS is affecting both individuals and landscapes through complex feedback loops. While many experts have recognized the enormous toll that HIV/AIDS is taking on both human life and society in general, few scholars are addressing the environmental effects of the virus. This paper proposes the use of a "place-based" approach for understanding how infectious diseases interact with the biophysical environment through their human hosts. A place-based approach provides a framework for including a number of both human and environmental factors like labor migration, gender relations, uneven access to biomedicine, disease history, and the environmental histories of climate, flora, fauna, agriculture, and conservation. Furthermore, focusing on a single place offers a useful framework for explaining how microbial, individual, household, local, national, and global forces become inscribed in landscapes through sick bodies and in bodies through changing landscapes. This

paper will use the example of a single place - the Ingwavuma District of KwaZulu-Natal, South Africa ? to show how a place-based approach can shed new light on the historical and present relationship between ecology and disease.

Keywords: HIV/AIDS, environmental change, disease, place

Neeti Neeti, Clark University, MA. Email: neeti77@gmail.com; *Uncertainty in prediction of land change under different scenarios*

This paper demonstrates a technique to compare different scenarios produced by models of future land-use change in a manner that considers the certainty of the model. Scientists usually want to use models to examine various possible scenarios where each scenario reflects a different process of change over time. This paper compares two such scenarios for the Plum Island Ecosystems in northeastern Massachusetts, which is a Long Term Ecological Research site of the United States' National Science Foundation. One is a "business-as-usual" scenario based on the continuation of past trends of net forest loss. The alternate scenario has been generated to portray net forest gain. The paper uses the model Geomod to extrapolate forest change from 1999 to 2097. The certainty of Geomod is estimated based on measurement of a validation run from 1985 to 1999. I have used different model parameters to project the forest change in the alternative scenario. The method assumes that the certainty of both scenarios decays asymptotically to randomness over time. The rate of exponential decay for both the "business-as-usual" and the alternative scenarios is consistent with the measurement from the validation run. The study provides an estimate how far into future can the model be relied upon to distinguish between scenarios. This paper proposes that long-term prediction uncertainty in the model would render the two scenarios indistinguishable in the far future, although there are meaningful differences between scenarios in the short time frame.

Robert J. Neff, Ph.D, UMBC (University of Maryland, Baltimore County). Email: neff@umbc.edu; *Vulnerability to climate variation and change in Baltimore, MD: Research approach, preliminary findings, and future directions*

Vulnerability to climate variation and change varies across time and space. This simple fact has profound implications for studies that attempt to monitor vulnerabilities long-term in a way that is comparable to other study areas. Not only must research approaches be broad enough to encompass a collection of biophysically and socio-economically diverse places - they also must be specific enough to ensure that important components of local context and place-specific conditions and processes that contribute to or mitigate vulnerabilities are included in the analyses. Further, vulnerability frameworks must recognize that study areas can change quickly, and the vulnerability frameworks applied today need to enable research that will be comparable to future research within the same study area under potentially drastically different biophysical and social regimes. This paper describes an evolving research framework for understanding vulnerability that has been tested in previous research and is being applied to the Baltimore Metropolitan Area as part of research being conducted by the Baltimore Ecosystem Study (BES) Long-Term Ecological Research (LTER) site. Particular attention will be paid to applying mixed methods to investigating vulnerability holistic, and in a way that is comparable over space and time. Preliminary findings focused on the vulnerability to drought and flooding will be presented, and directions for future research will be discussed. In addition, results from past research in other study sites will be compared to preliminary findings from Baltimore to demonstrate the comparability of results across multiple and diverse study areas.

Keywords: Baltimore, Vulnerability, Drought, Floods

Rohit Negi, The Ohio State University. Email: rohitnnn@yahoo.com; *(Re) Negotiating the Postcolonial State in Zambia: chiefs, subjects and the politics of land*

Most research on the contemporary Sub-Saharan state does not consider its bifurcated nature. This is despite the fact that as far as land ownership and governance are concerned, most countries exhibit a legal and administrative dualism. On the one hand, albeit limited in reach, land is governed through private property rights. On the other, the bulk of the land is under the custodianship of so-called 'traditional rulers' or the chieftaincy. The two models of land ownership and governance enjoy a complex history of interrelation and conflict. However, particularly acute antagonisms have emerged recently due to the neoliberalizing strategies of the Zambian state. This project is an attempt to make sense of this dilemma through an ethnographic engagement on three fronts: the local state; the chieftaincy; and the peasantry. I explore this question: What, precisely, are the dynamics of the emerging relationship between the chiefs and the neoliberal state on the one hand, and the chiefs and their 'subjects' on the other?

Email: jtownshe@mail.umd.edu; *Quantifying Carbon Consequences of Human and Natural Disturbances to Ecosystems in North America*

Accumulating levels of carbon dioxide in our atmosphere are projected to have detrimental climate change consequences. Humans have altered the global carbon cycle through fossil fuel burning, and modification to land cover. Our study decomposed differences of human and natural impacts to carbon sinks in North American vegetation to characterize mechanisms that regulate net storage and/or releases on short temporal and small spatial scales over the past 30+ years. We used remote sensing data and carbon simulation modeling, to seek and understand mechanisms that drove and/or perturbed carbon sequestration within the terrestrial biosphere from 1982-2005. To focus our investigation we used NDVI anomalies from AVHRR to: 1) Define large regions of natural and human disturbances that have affected the carbon balance; 2) Determine the causes of these natural and anthropogenic disturbances and map their associated land cover characteristics with Landsat data; 3) Quantify carbon consequences associated with these disturbances with specific land cover results using biogeochemistry simulation modeling. We found natural climate variability of warming temperatures in the Arctic and drought recovery in the Midwest which both had increasing net primary productivity (NPP). Land cover disturbances included natural vegetation recovery from fire in the boreal zone of the Canadian Prairie Provinces. Human alterations included salvage logging from an extensive outbreak of insects in Southern Quebec and agriculture expansion and intensification in the Midwest of the Continental US. All regions investigated had increased NPP, with unique net ecosystem production (NEP) dynamics. Carbon pools duration and size were directly related ecosystem disturbance.

Benjamin D. Neimark, Rutgers, State University of New Jersey. Email: bneimark@eden.rutgers.edu; *The biological prospecting filière: Political ecology of access and extraction in Madagascar*

Research on cultural knowledge concerning the use of flora and fauna for medicinal and functional purposes has long been the realm of the social scientist. More recently, scientists, including systematic and economic botanists, phytotaxonomists and chemists have begun collecting, storing and appropriating biological resources and ethnobotanical knowledge under the domain of scientific inquiry and the preservation of "common heritage." The knowledge, found within botanical surveys, market studies and interviews with "medicine men," helps to provide leads to those in the Life Science Industries (i.e., pharmaceutical, cosmetics and biotechnology) for the advent of novel pharmaceuticals, nutraceuticals, cosmeceuticals and improved industrial products found within the bio-resource. This use of this ethnobotanical information and the collection of the associated resource for commercialization is a practice known as biological prospecting (bioprospecting for short). However, since its inception, bioprospecting has been wrought with claims of "biological piracy," and raises a number of ethical issues concerning the practice. I build on a 14-month case study of the global filière or commodity chain of genetic and biological resources extracted for new pharmaceuticals and industrial products. This study traces the circulation of these resources from the island nation of Madagascar to large-scale pharmaceutical and chemical companies and research laboratories in the US and Europe. I highlight how current conservation and development policy in Madagascar allows research scientists and plant exporting companies to overcome the social, spatial and regulatory obstacles in the bioprospecting filière, and thus acquire, control and maintain the lion's share of benefits derived from the project.

Alyssa A Nelson, University of California, Davis. Email: aanelson@ucdavis.edu; Ricardo Hernández, Community Member. Email: ; *Community Mural, Geographic Storytelling*

This case study demonstrates how a community mural can draw on and contribute to geographic knowledge, in both community and academic settings. The mural's participatory creative process emphasized the transformative power of community murals to effect positive change by bringing people together and eliciting their personal stories. Nelson and youth, including Hernández, researched the community, wrote grants, and planned and executed the mural with the help of artist Alicia Siu. Participatory research included a survey, interviews, conversations, texts, photography, drawing, and writing. Even while we painted, community members' stories continued to influence the design. As a representation of community narratives, the mural also becomes a narrative in itself. Thus, both the process and product reflect (and create) place-based identities. The 80 by 8-foot community mural is painted on a market beside the highway through Knights Landing, a small, rural California town (USA). Funded in part by the California Council for the Humanities' "Story Fund," the mural integrates past and present with visions of the future through imagery: local people, plants, animals, landmarks, and landscape such as the river and agricultural fields reflect the stories we heard. Youth are depicted playing, making music and art, learning, graduating, and helping each other to "Rise Up!"; this exhortation is written graffiti-style as well as illustrated by water-blue River People bursting through scenes of a conflicted past. A suggested title, "Listen: We and the River Have Stories to Tell," highlights the importance of local knowledges and creative expression in participatory geographic inquiry.

David M. Nelson, Arizona State University. Email: David.Nelson2@asu.edu; *Automated Classification of Urban Environments from Satellite Images*

The goal of this research is to devise an automated, or partially-supervised, classification method that processes satellite images for a large number of urban environments (UE) and several different imaging dates per UE. Because UE are growing more rapidly than ever, it is important to monitor their rates of growth and the resultant changes in land use/land cover. I suggest the use of multi-scaled images and incorporation of site-specific features in the classification would enhance accuracy and expedite this process. First, low resolution (100m - 500m) images are used to isolate UE (e.g., Level 1 classification using Maximum Likelihood). The resulting non-urban classes are then used to mask higher resolution images, limiting further processing to only UE. Next, classification within the UE identifies areas experiencing change/growth. User determination of the following four environmental conditions for each UE enables a more accurate, second-stage, automated 2nd-3rd level classification. 1) City pattern establishes the texture model used for a grid, radial/concentric, or unstructured UE. 2) Climate (e.g., arid, semi-arid, temperate, wet) of the UE determines the use/interpretation of a Normalized Difference Vegetation Index (NDVI). 3) Terrain assessment of natural barriers (e.g., valley, plains, coastal, wetlands, mountainous) is used to delineate potential, or indicate absent, growth boundaries. 4) Configuration of the commercial/residential areas in UE modifies the use of texture and NDVI models. In some UE, residential areas are separate from commercial/industrial centers, whereas in others residences and industry are fully integrated and are better classified as high or low density areas.

Frederick E. Nelson, University of Delaware. Email: fnelson@udel.edu; Michael T. Walegur, University of Delaware. Email: walegur@udel.edu; Kim J. Park Nelson, University of Minnesota. Email: gregg0051@umn.edu; *Periglacial Appalachia: Paleoclimatic and Geocryological Implications of Blockfield Elevation Gradients, Eastern U.S.A.*

Locational data were obtained for 96 periglacial blockfields in the Appalachian Mountains of eastern USA using "TerraServer," a Virtual Globes (VGs) resource for viewing air-photo and satellite imagery. The elevation of Appalachian blockfields south of the Last Glacial Maximum border parallels regional gradients of contemporary mean July, summer, and annual temperature. July temperature reductions inferred from paleoecological studies indicate that the median elevation of blockfields throughout the Appalachians lay at or above timberline during the Last Glacial Maximum (LGM). Paleotemperatures calculated using known Appalachian lapse rates and published LGM temperature departures indicate that most blockfields in the study area were formed in association with permafrost. Allochthonous blockfields appear to be constituent elements of periglacial "form communities" developed under severely cold conditions, and are useful indicators of Pleistocene permafrost conditions. Internet-based VGs can be used to create generalized reconnaissance-level data bases of large-scale periglacial landforms and hillslope features over large areas.

Complementary use of Virtual Globes technology and spatial-analytic techniques holds considerable potential for addressing the broad-scale problems with which traditional climatic geomorphology is concerned.

Keywords: Appalachian Mountains, blockfield, periglacial, permafrost, Quaternary, Virtual Globes

Ingrid L. Nelson, University of Oregon. Email: inelson1@uoregon.edu; Participatory GIS: possibilities and limitations in Mozambique

Participatory GIS approaches are still largely built upon notions of public process and participation prevalent in the global North. What are the potentials and limitations of participatory GIS methods “traveling” into non-western and “underdeveloped” contexts? The 1997 Land Law in Mozambique initiated a process of participatory community land registration. Land registration and participatory GIS remain inextricably linked because community land rights, once delimited, are seen by development organizations as enabling further community-led projects requiring participatory GIS (such as community-based natural resource management). Based on research conducted in 2006 that explored institutions using GIS in Mozambique, I found a deep chasm between top down technocratic GIS institutions and communities engaged in usufruct land rights mapping. Given the progressive and participatory nature of the 1997 Land Law, and the concurrent expansion of GIS technologies in Mozambique, this paper explores how critical GIS and innovative participatory GIS methodologies might successfully bridge this gap.

Keywords: critical GIS, land rights, Mozambique, participatory GIS

Peter B. Nelson, Middlebury College. Email: pbnelson@middlebury.edu; Baby boomer migration and rural community change: reflections from the field

Aging baby boomers have attracted considerable attention from the news media, academics, and policy makers alike. Their retirement-related migration is of particular interest to geographers, as the nearly 80 million baby boomers will make an estimated 250 million moves over the next 20 years. Research conducted at the macro scale has identified the types of communities likely to become destinations for these mobile boomers, and this paper extends the existing body of work on baby boomer migration by exploring micro-scale impacts on receiving communities. A series of four in-depth community case studies conducted between 2005 and 2006 suggests baby boomer migration will significantly transform the economic, social, and cultural landscapes within destination communities. More significantly, the field work analysis suggests 1) the temporal process of migration may be protracted over many years; 2) the spatial scale of migrant impacts is highly localized; and, 3) retirement and its relation to migration decision making is not a discreet event. Therefore, insights from this field work identify several ways in which our age-specific understandings of migration contribute to on-going theorizations of migration as a spatial and temporal process.

Keywords: rural migration, community change, baby boom

Sara Nelson, Macalester College. Email: saranelson1@gmail.com; Farming on the Fringes: Changes in Agriculture, Livelihoods and Land Use in the Peri-Urban Zone of Dar es Salaam, Tanzania

Agriculture is a central part of Tanzania's economy. Both within Dar es Salaam, its primate city, and in the city's peri-urban zone, agriculture is an important part of the livelihood strategy for people of all social classes. However, because the peri-urban zone is one of transition from urban to rural, it tends to undergo more pronounced changes in land use over time than do the city and rural area it borders. This paper examines the ways in which larger political and economic forces within and outside of Tanzania have influenced change in agricultural land use within the peri-urban zone of Dar es Salaam since Tanzania's transition from socialism to a market economy. Based on fieldwork conducted in three villages within the peri-urban zone of Dar es Salaam and a review of existing literature on the topic, this paper argues that not only has the nature and function of agriculture changed markedly with economic reform in Tanzania, but that these changes vary spatially and with social class. The development of a large informal land market and widespread land speculation within the peri-urban zone have altered who practices agriculture and for what purpose.

Keywords: agriculture, peri-urban, Tanzania

Stephanie Nelson, University of North Carolina, Chapel Hill. Email: nelsonsc@email.unc.edu; Reconstructing Disaster Areas through Development Aid: The case of Phang Nga, Thailand

The Indian Ocean tsunami of December 2004 reconstructed not only the physical landscape of coastal Thailand but opened the door to an overhaul of the social and economic landscape as well. Referred to as the “second tsunami”, development aid rushed in accompanied by different approaches to disaster recovery. The Phang Nga province, a relatively new tourist destination, was the hardest hit area in Thailand in reference to loss of life and property damage. The landscape is now littered with development projects in varying stages of

completion. Analysis of published surveys of 98 aid agencies out of the 172 in the province suggest that aid agencies are overwhelmingly providing aid that leads to new livelihoods in the tourist sector. Initial conclusions point to the transformation of place through disaster recovery as a vehicle to implement new development agendas.

Email: colinr23@gmail.com; Laura Feyrer, University of Victoria. Email: ljfeyrer@uvic.ca; The space-time string: a spatial-temporal exploration of the foraging range of gray whales

In this paper we develop and demonstrate a flexible approach to spatial-temporal analysis. The space-time string (STS) method is founded on the conceptual notion that the state of a spatial pattern may be persistent or variable through time, and that the nature of variability is, at least in part, a result of the underlying process. For fixed locations, the state of a spatial pattern is quantified using a one dimensional binary string. At each position in the string, a 1 indicates the presence of a signal (or significant) spatial pattern and 0 indicates a non-signal spatial pattern in a given time period. String properties, such as the number of changes in spatial pattern state, can be summarized to quantify the temporal characteristics of the spatial pattern of a phenomenon. We apply the STS method to nine consecutive years of gray whale (*Eschrichtius robustus*) foraging data to explore temporal variability in the annual spatial distribution of whale foraging effort. We cast the whales' inter-annual spatial behaviour and the prey response into one of two possible theoretical camps, either in an equilibrium arrangement, or a severe disturbance event with several possible conclusions.

Velvet Nelson, Sam Houston State University. Email: vnelson@shsu.edu; The Visual Landscape in British West Indies Travel Narratives, 1815-1914

The role of vision in travel and tourism holds an interesting, and sometimes controversial position. Travelers and tourists are necessarily outsiders in relation to the landscape. They do not have the many associations and meanings that the landscape holds for those who interact with it in their daily life. Outsiders have a different relationship with landscape. They are likely to have an idea of the landscape in their minds, based on preconceptions from representations and ideals, but their first impressions are almost entirely based on vision. This paper is based on a case study of 19th and early 20th century travel to the Caribbean. Travelers at this time approached the islands from the sea. From the ship, they formed an impression of the harbor as well as the island's character and landscape. Travelers who explored the islands then had an opportunity to revise these initial impressions as necessary and refine them, giving them ever greater detail. Given the popularity of travel writing at the time, many travelers provided in-depth descriptions of these landscapes and their landscape experiences that essentially painted a verbal picture of the landscape in their narrative. Using a method of coding, I determined that travelers' descriptions of the landscape in the British West Indies were made up of four broad, interrelated components: features of the landscape, qualification of the landscape features, comparisons to other landscapes or landscape ideals, and reactions to the landscape.

Keywords: Caribbean, landscape, tourism, travel writing, historical geography

Jeremy Nemeth, Rutgers University. Email: jnemeth@eden.rutgers.edu; An Empirical Assessment of Urban Design Quality and Public Space Security

As urban planners have been reduced to using exactions and providing incentives to developers in order to achieve public goals, cities have witnessed a proliferation in privately owned parks and plazas. While creating publicly accessible space where there was none before, these spaces are often criticized for restricting social interaction, constraining individual liberties, and excluding certain undesirable populations. Yet few studies have empirically tested such assertions over a wide range of cases or documented the variation within this universe of privately owned spaces. One reason for this dearth of pragmatic research is the absence of an adequate tool with which to conduct such an analysis. I address this oversight by operationalizing a comprehensive, conceptually-grounded tool to allow researchers, city officials and citizens to empirically quantify the degree to which behavioral control is exerted over publicly accessible spaces. This “Control Index” is comprised of twenty indicators gauging everything from a space's legal or access restrictions to the intensity of surveillance and policing measures. I then apply the pilot-tested index to all 163 privately owned parks and plazas in midtown Manhattan, evaluating each with scores based on the presence and intensity of various security measures. The paper has two major findings. First, levels of restrictiveness are significantly correlated with a space's age, location, quality, and several other physical characteristics and design features. Second, and perhaps more importantly, the

index is a simple yet valuable tool for assessing control levels in both publicly and privately-owned spaces, and can be utilized in future studies.

Sanjay K Nepal, Texas A&M University. Email: sknepal@tamu.edu; Tourism-induced rural energy consumption in Nepal's Annapurna Region

Analysis of energy dependency on fossil fuels in rural destinations is an important aspect of the discourse on sustainable tourism and global climate change. This paper analyzes energy consumption patterns in tourist lodges in Nepal's Annapurna region. Data on energy sources and energy-saving technologies were collected from tourist lodges located along three major trekking routes. Results indicate that primary energy sources include wood and kerosene, but the use of renewable energy and locally developed energy-saving technologies is increasing. Energy consumption patterns are influenced by altitude, accommodation capacity, energy cost, diversity of energy sources, access to energy-saving technologies, and institutional rules and regulations.

Keywords: rural energy, fossil fuels, renewable energy sources, Annapurna Conservation Area, Nepal.

Jacob Michael Ness, Geography, GISc Student, South Dakota State University. Email: jmness@jacks.sdstate.edu; David E. Clay, PHD, South Dakota State University, Plant Science Dept.. Email: david.clay@sdstate.edu; Cheryl Reese, MS, South Dakota State University, Plant Science Dept.. Email: cheryl.reese@sdstate.edu; Wheat Quality as Influenced by Cultural and Climatic Interactions

Quality is very important in the production of wheat. Differences in the characteristics of wheat flour determines its use, be it pasta, bread, and so forth. These differences also reflect a difference in price per bushel. Cultural practices and climate can have a large effect on the quality of wheat. These factors effect many different aspects of the wheat industry from the plants in the field to their final products in the market. In this study different varieties of winter and spring wheat, geographical location, and historical wheat data are taken into consideration. Data collection is primarily done through soil and grain samples, and weather stations. Geostatistical analysis is the primary tool used for data analysis and display. This project is supported from the South Dakota Wheat Commission.

Amy L Neuenschwander, University of Texas at Austin. Email: amy@csr.utexas.edu; Kelley A Crews-Meyer, Dr., University of Texas at Austin. Email: kaem@uts.cc.utexas.edu; Assessing Temporal Dynamics Using Landsat TM/ETM+: Disturbance and Resilience in the Okavango Delta, Botswana

The objective of this research is to quantify the impact of flooding, fire, and their interaction on vegetation response through time in the Okavango Delta, Botswana. The Okavango Delta, an internationally recognized wetland, is undergoing natural and anthropogenic change at a variety of spatio-temporal scales. Using EVI as a surrogate for vegetation response, this research will investigate whether ecosystem signals derived from remotely sensed imagery can be decomposed deterministically and if the deviations from the decomposed signal are correlated with observed flooding and fire regimes. A time-series of 85 TM/ETM+ scenes ranging from April 1989 through October 2002 was used to extract the flooding and fire regimes in the Delta. Additionally, Enhanced Vegetation Index (EVI) values (with and without atmospheric correction) were calculated for each input image and sorted using an ISODATA classifier. Landscape trajectories comprised of mean EVI values were created for each temporally separate cluster on the landscape and are decomposed into permanent and transitory signals. Trends, annual and seasonal cycles, and long term oscillations were identified using wavelet analysis and then deterministically extracted using harmonic regression to characterize the permanent signal for each landscape cluster. In addition to seasonal and annual fluctuations, the vegetation response was also found to exhibit a long-term decadal trend. The combination of two harmonic fits largely defined by climatic periodicities (semi-annual, annual, and decadal) accounted for 71% - 88% of the variance in the trajectories, however the residual signals likely contain frequencies that are a combination of climate and anthropogenic effects.

Keywords: multi-temporal, Landsat, ecosystem resilience, disturbance, Okavango

Shana K Neumann, University of Wisconsin-Eau Claire. Email: neumansk@uwec.edu; Harry M Jol, University of Wisconsin-Eau Claire. Email: jolhm@uwec.edu; Three Dimensional Visualization and Analysis of an Eolian Dune

Three-dimensional (3D) ground penetrating radar (GPR) imaging can be utilized to understand the internal stratigraphy of eolian sand dunes. The 3D software allows for slices to be made in a data cube that can aid in showing

continuity of reflection patterns, as well as visualizing the internal stratigraphy from any perspective. Because the internal layering of an eolian sand dune is often exposed through coring or digging of trenches, GPR data collection can be beneficial since it allows the data to be collected in a non-invasive, non-destructive manner. A 3D grid was collected from a quartz arenite dune complex within the Early Jurassic Navajo Sandstone located in the Checkerboard Mesa area of Zion National Park, Utah. Using a pulseEKKO 1000 GPR system with an antenna frequency of 225 MHz, a 4 x 10m grid was collected. Data was plotted and processed using pulseEKKO software. A 3D cube was created using T3D which allowed for the depositional framework of stratigraphic units of interest to be visualized and interpreted. The findings showed a continuous, horizontal reflection at 90 ns (5m) and 200 ns (10.5m). The data also showed that the upper set of dipping reflections was inclined at an angle of 13-15° and the underlying dipping reflections were at an angle of 18-20°. Interpretations of the 3D cube suggest the inclined reflections are dune foresets and the horizontal reflections are erosional truncations formed by dune migration. Based on the 3D interpretations one can provide information on dune size, shape, and migratory patterns.

Keywords: geomorphology, ground penetrating radar

Bruce Newbold, McMaster University. Email: newbold@mcmaster.ca; Andrei Rogers, University of Colorado, Boulder. Email: Andrei.Rogers@colorado.edu; Wanran Ma, University of Colorado - Boulder. Email: Wanran.Ma@colorado.edu; James Raymer, University of Southampton. Email: raymer@socsci.soton.ac.uk; Indirect Estimates of Age-Specific Interregional Migration Flows in Canada

Building upon earlier work (Rogers et al. 2003; Rogers and Jordan 2004), we use data from the 1996 and 2001 Canadian censuses to estimate interregional migration flows based on infant migration propensities and observed regularities in the age-to-infant migration ratios. Infant migration refers to those who are 0-4 years old at the time of the census and living outside their region of birth. Given observed regularities in the age profiles of migration, levels of migration in this youngest age group must be related to migration levels in other age groups. Application suggests it is a robust method for estimation of migration flows.

David Newburn, Texas A&M. Email: danewburn@ag.tamu.edu; Adina Merenlender, University of California, Berkeley. Email: adina@nature.berkeley.edu; Spatially explicit models demonstrate the importance of preventing rural residential development and inform land conservation planning

Protecting biodiversity on private land in the United States requires immediate action to prevent low-density residential development on rural land. As regulatory options to prevent subdivision have become politically unpalatable, incentive-based land conservation tools such as conservation easements and transfer of development rights are being used to restrict development below zoned densities in unincorporated areas. We demonstrate how a combination of ecological and economic models provide the type of spatially explicit planning needed to maximize the conservation benefits of incentive-based programs while minimizing costs. Modeled scenarios reveal how and where land should be protected and where development should be encouraged. We also quantify the limited effect that urban growth boundaries, a popular planning tool to restrict urban sprawl, have on preventing rural residential development. The main reason is that urban growth boundaries are designed to limit the extension of sewer and water infrastructure, which are not required for low-density rural residential development. This work was done for Sonoma County, California where an intermix of vineyards and low-density residential development surround nine incorporated cities. This research emphasizes that coupling conservation planning with land use planning is essential for private land conservation in the United States.

Josh Newell, University of Washington. Email: newell@u.washington.edu; Furniture, Self-Certification, and the Consumer Imaginary: Sourcing IKEA's Wood Supply in Siberia

In contrast to other global retailers such as Wal-Mart, academic and popular literature frequently cites as IKEA as a model corporate actor, with high standards of social and environmental responsibility. On paper, the company requires that all suppliers adhere to a four-step staircase model to steadily improve performance. Yet ? based on multi-sited fieldwork in Russia and China, including interviews with IKEA's Chinese suppliers ? a far different picture of this corporate giant emerges. Despite setting up a wood procurement office in Russia and making yearly audits of its suppliers, IKEA, like other global retailers, remains primarily concerned with the bottom-line. It pushes quality costs onto suppliers by demanding legally-sourced wood, yet refuses to pay a premium for FSC chain-of-custody certified Russian timber. IKEA requires Chinese suppliers

provide a Russian logging ticket to provide evidence of wood origin, yet Russian logs are unlabeled and hopelessly mixed with other logs supplies at numerous nodes along the timber chain. Interviews also revealed that Russian timber harvesters and exporters collude with corrupt government officials to fabricate documents certifying legality. As a result, IKEA standards have had very little direct influence in terms of improving Russian timber harvest practices. This raises broader questions about the ability of 'buyer-driven' commodity networks to reshape environmental governance, particularly in highly corrupt countries such as Russia. The research also reconfirms growing skepticism with corporate self-certification, which, left unchecked appears largely an exercise in green image-making ? corporate branding increasingly essential due to the rapidly emerging 'ethical' consumption movement.

Keywords: Commodity chains, ethical consumption, political ecology, Russia, China, Ikea

Candace M. Newman, PhD Candidate, University of Waterloo. Email: cmnewman@fes.uwaterloo.ca; *Integrating Remote Sensing and Contextual Information to Address Coastal Management Concerns: A Case Study of Bunaken National Park, Indonesia*

Coastal management faces major challenges in utilizing remotely-sensed information to address environmental issues that operate at multiple spatial and temporal scales. One of the more common and reoccurring challenges is how to merge digital, image-based data with local, contextual information. For example, how can local concerns for a specific coral reef region be encapsulated within a rigidly defined habitat classification scheme. This research presents a potential solution to this problem through the use of an integration technique. This technique incorporates qualitative measurements about stakeholders' knowledge, uses, and traditional beliefs of the marine environment into a satellite image habitat classification scheme. Using informal interviews and general observations with stakeholders and managers of Bunaken National Park, Indonesia, information was extracted, prioritized and, where possible, associated with biological habitats. Next, IKONOS satellite imagery was acquired, in-situ data were gathered, and the imagery was processed to remove effects that may reduce classification accuracy. Following multiple discussions with stakeholders and managers, several habitat-relevant classification images were produced. Results from this study suggest that this integration technique (1) extends the usability of remotely-sensed information beyond traditional, baseline habitat maps, (2) enhances the flexibility of remotely-sensed information by addressing spatially-based questions from different stakeholders, and (3) provides an opportunity to target specific coastal concerns of local communities. Conclusions identify that remote sensing is a useful tool for coastal management, though it requires the inclusion of contextual information to appropriately and effectively address coastal management issues.

Keywords: coastal management, remote sensing, integration

Mirela I. Newman, Dr., Westfield State College. Email: mnewman@wsc.ma.edu; *Identifying Green Urbanism Elements Using the Urban Morphological Analysis in Almere New City, the Netherlands*

This paper identifies and examines green urbanism elements implemented in Almere, the newest Dutch city, planned and built from scratch from the 1970s on, by employing a detailed urban morphological analysis based on extensive fieldwork and library documentation. Located at the northern edge of the Dutch metropolis, Almere New City is the urban product of Dutch planning and spatial policies that promoted urban development in new towns as an alternative to urban sprawl. While the urban plan for Almere has not been perfect, this city represents the quintessential expression of Dutch planning efforts to shape a new, greener urban form and lifestyle. This study was guided by two sets of research questions: 1) Can Almere be viewed as the spatial product of a Dutch green urbanism paradigm? To what extent was it possible for Almere's planners to implement a "green urbanism" approach in the face of regional growth and development pressures? 2) What green urbanism elements does Almere New City display? Which are the main identifiable physical and spatial features that incorporate the idea of a green city? Using the spatial and morphological data collected in Almere, the author identifies the city's green urbanism elements and examines them against Timothy Beatley's suggested essential components of green urbanism.

Keywords: green urbanism, urban morphological analysis, Almere New City, the Netherlands

Jason C Newton, University of Louisville. Email: jcnwt01@louisville.edu; *Development and Displacement in Tehri, India*

"This is the end of a civilization," stated Sunderlal Bahuguna in July of 2004 about the 187 year old town of Old Tehri, a community of 12,500 people situated in the Southern Himalaya Mountains of Northern India. Since Bahuguna's statement in 2004, the town of Old Tehri has been inundated by a lake created by the construction of the Tehri Hydroelectric Dam, one of the

Indian government's newest modernization and development projects in the South Asian country. This dam has resulted in a paradox for the country as it attempts to bring modernization and development to the far reaches of the territory, while it also creates displacement conflicts which can change a few people's lives for the potential benefit of millions of others. A new city designed for the displaced residents, New Tehri, is located on the side of a mountain, which has disrupted the people's connectedness to the sacred rivers. It is important to learn from the trials and tribulations of how governments respond to problems concerning displaced people as a result from development projects. By conducting fieldwork onsite in Tehri, I hope to apply a mixed set of qualitative methods including leading focus/discussion groups, conducting personal interviews, and collecting a short survey/questionnaire. The main goal of this project, my senior thesis, is to understand how the newly installed inhabitants of New Tehri have adjusted culturally, socially, and economically to their new "hometown" and how have they recreated their sense of place with new homes and businesses.

Keywords: Displacement, Resettlement, India, Tehri Dam

Raye Ng, University of Liverpool. Email: raye@liv.ac.uk; *Constructing corporate culture in Singapore*

Corporate culture is often described as 'how things are being done around here' (Scheoberger 1997, Deal and Kennedy 1982). In this paper, drawing on fieldwork in Singapore, I argue that corporate culture is influenced by societal culture and an array of management practices. In a society where the management styles of Chinese businesses are increasingly Westernising, this does not necessarily translate into a Western practice of corporate culture in the working environment due to the cultural embeddedness of the actors and agents. I illustrate how hierarchy and kinship are embedded in a 'Westernised' and yet Asian economy; the notion of guanxi (personal connections) and bamboo networks is relevant for understanding contemporary production and consumption networks in Singapore. By using Singapore as a site for exploring and analysing the (re)production of a particular form of economic practices and business systems, I demonstrate how corporate culture is shaped by the socio-economic landscape.

Kikombo Ilunga Ngoy, Dr., Kean University. Email: kngoy@kean.edu; *Evaluating the impact of war and turmoil on the forest cover around Lubumbashi in the Democratic Republic of Congo using Remote Sensing data*

Two major wars have affected the Democratic Republic of Congo in the last 10 years. Within the country, many people were forced to move from the frontlines and to find refuge in war-free zones. As a result, many cities including Lubumbashi received a massive influx of people from the hinterland. The drastic demographic increase had a major impact on the natural environment around the city as the demand for fuel wood and charcoal increases. We compared satellite data sets of 1989, and 2001 to evaluate the rate of deforestation. We found that the annual deforestation rate has drastically increased between 1989 and 2001 compare to previous findings.

Keywords: Democratic Republic of Congo, Lubumbashi, Remote Sensing, deforestation rate.

Thao Nguyen, Department of Geography, University of Southern California. Email: thao.t.nguyen@usc.edu; Travis Longcore, Department of Geography, University of Southern California. Email: longcore@usc.edu; John P. Wilson, Department of Geography, University of Southern California. Email: jpwillson@usc.edu; *Green does not mean ecologically vibrant in a Mediterranean climate*

The Normalized Different Vegetation Index (NDVI) has been used as an indicator for ecosystem health across large areas because it reflects the extent and condition of vegetation. In most urban contexts, higher NDVI values are taken to indicate "green" areas of cities, which are generally interpreted as desirable. We investigated the use of NDVI to classify vegetation and land use in a Mediterranean climate. For planning region that encompasses the Los Angeles basin we calculated NDVI from six separate images taken during winter and summer. We took a sample of these values spatially stratified by land use and vegetation type and then used the mean and standard deviation of the NDVI for each category to cluster them with Ward's method of agglomerative clustering. These clusters showed that a set of seasonally varied NDVI values are sufficient to identify some sets of native vegetation types (e.g., oak woodlands) and some urban land uses (e.g., commercial), but clustered some native vegetation with urban land uses (e.g., desert scrub with trailer parks). It furthermore showed that clusters characterized by the highest NDVI values were exotic vegetation supported by imported water, such as golf courses. We conclude that although high NDVI values do not indicate native vegetation in a Mediterranean climate, they can be used to assist in classifying land cover and can be used to identify some native vegetation types.

Keywords: Urban Green Space, NDVI

Chin-Cheng Ni, . Email: ccni@mail.nhcue.edu.tw; *A Defense Against Tourism: The formation of a cooperative system in Smangus, Taiwan*

This paper evaluates the impact of tourism on Smangus and analyzes the formation and practices of a cooperative system adopted by the village. Smangus is an indigenous mountain village located in northern Taiwan. There are about 130 residents. When a road into the village was constructed in 1995, thousands of tourists were attracted to the village's sacred trees and aboriginal culture. The physical environment, as well as the social life and economic base of the village were impacted. To address the problem caused by tourist activity, a Tnunan system (a special kind of cooperative system) composed of tourists, the mass media, and non-governmental organizations was adopted in 2004. But maintenance of the Tnunan system and inequality in the workplace have surfaced as new problems. The wisdom of adopting the Tnunan system is now being questioned.

Michael A Nicholas, University of California, Davis. Email: mianicholas@ucdavis.edu; Joan Ogden, PhD, University of California, Davis. Email: jmogden@ucdavis.edu; *Projecting Hydrogen Refueling Patterns: Learning From the Gasoline Retail Experience*

If hydrogen were to replace gasoline as the fuel of choice in the future, many infrastructure challenges would ensue. Sizing hydrogen stations accurately is one of the very important aspects of planning for a successful hydrogen refueling network. Over-sizing a station results in wasted capital, under-sizing a station results in unsatisfied customers. Determining the important metrics to get the correct sizing is important in minimizing these risks. To analyze this issue, we started with the hypothesis that hydrogen demand distribution may be similar to gasoline demand distribution in some respects. Evidence suggests that many people refuel near either work or home. The extent to which this is true is investigated. The number of gasoline stations is great enough so that consumers can refuel where they would like. By understanding their behavior, we can better understand what demand should be expected at a hydrogen station. In this analysis we assume that fuel demand distribution correlates to either population factors and/or traffic factors. Preliminary results show that on a large scale, population is a better predictor of fuel demand. However, as the analysis area is divided into smaller and smaller zones, traffic becomes a better predictor. Some interesting patterns also emerge. Customers seem less likely to refuel in the central business district than traffic patterns may indicate. This may be an important factor in sizing a station. Also, customers appear more likely to refuel between home and the freeway as opposed to any other part of his/her journey.

Keywords: Hydrogen Refueling Patterns Gasoline

Erinn Patricck Nicley, University of Illinois. Email: enicley2@uiuc.edu; *Somos Galegos!: Regionalism, Political Economy and Place Context in Galicia, Spain*

Studying the resurgence of ethnic regionalism in west-central Europe requires engagement with the theoretical literature on regional political economy and place context in political geography. The emergence of regional political economy in the past 25 years highlights the diminishing role of the nation-state as the sole source of social legitimacy. The Galicia region of northwest Spain provides a case study for the intersection of regionalism, political economy, and a place context perspective. The rise and fall in popular support for the Bloque Nacionalista Galego (BNG), a social-democratic regionalist coalition, reflects the geography of political and economic transformations within Galician society from the late 1970s to the present. BNG electoral geography is grounded in the place-specific social relations associated with structural economic reform, regionalist identities and European Union integration. The study emphasizes the importance of a place context perspective beyond universalist accounts of regionalist political behavior.

Heather N Nicol, Ph. D, University of West georgia. Email: hnicol@westga.edu; *Geopolitics and North American Borders in Global Context: Identifying the "Borders that Count" in Post 9/11 America*

Over the course of the 20th and 21st century, the borders of North America have shifted and evolved in terms of their strategic importance. In some cases borders were negotiated where none had existed before, but more importantly borders were negotiated and constructed through very political and public discourses which ranked their perceived importance in geopolitical terms. A rough count of political borders and borderlands in North America today suggests that there are now approximately a dozen international boundaries (land and maritime). Yet in 2006, U.S. geopolitical discourse only counts to three. This paper focuses upon the ranking or prioritization of international borders within the U.S., and compares these intersubjective boundaries with those of the twenty-first century political map. It argues that the geopolitical relative importance or

lack of importance of each of these borders reveals an underlying "New World Order" geopolitics which, while specific to the U.S., has had a significant impact upon North American bordering practices in general. These geopolitics may well derive from Homeland Security and formal U.S. government policies, but they are also incorporated into the popular press and public opinion, as well as acted upon by neighboring countries, within and outside of North America. This paper thus suggests that there is a broader North American and global context to U.S. "Post 9/11" borders that needs to be understood if we are to appreciate the nature of its contemporary borderlands and the nature of a new 21st century transnationalism.

Keywords: borders, North America, geopolitics

Kathleen Nicoll, Ph.D, University of Utah. Email: kathleen.nicoll@geog.utah.edu; *Recording a symphony in sand: assessing the fidelity of oceanic archives for terrestrial Quaternary climate change in the NE Sahara*

Offshore records suggest that the ~15 ka cal BP onset and the ~5.5 ka cal BP termination of the "African Humid Period" was a rapid response to gradual insolation forcing. Although there is general agreement that an enhanced Afro-Asian monsoon profoundly affected the water balance of the continental landmass, it is evident that the delivery and tempo varied by location. This paper examines the synchronicity between the oceanic and terrestrial realms as interpreted from various proxy records, with emphasis on the palaeoenvironmental and geoarchaeological archives from the northeastern Sahara. A synthesis of available floral, faunal, and cultural records for the onset of wet conditions in Egypt and Sudan includes 500+ published radiocarbon dates from cultural contexts and various fluvio-lacustrine and Aeolian stratigraphies. At its wettest "monsoonal maximum" ~10 - 6 ka cal BP, the interior of North Africa was a marginal drought-prone environment, barely sustaining human activities and a meager steppe-shrub desert flora/fauna with some Sudano-Sahelian elements. Recurrent dry phases are associated with abandonment, deflation, and sedimentation of Aeolian sand. The complexities in this highly continental terrestrial record reflect ascendant global, oceanic, and atmospheric changes, as well as other local feedback mechanisms that cannot be gleaned from the ocean archives. Abrupt hydroclimatic changes influenced resource availability across NE Sahara, and fostered technological innovation and adaptation, as well as the development of complex culture in Desert Peoples - one that displays linkages with the emerging Pharonic civilization in the Nile Valley ~ 5 ka cal BP.

Marriage fields - the geographical area where people meet to partner ? are traditionally very small. People tend to recruit a partner from the same town or region, but it can be expected that with Globalisation and the increasing levels of mobility marriage fields will expand in size, not only within a country, but also on a global scale. Since people increasingly travel abroad for business or pleasure and also increasingly become part of virtual networks via the Internet, these developments are likely to increase the 'risk' that people recruit their partner from abroad. Using unique longitudinal population data for Sweden, this paper aims to give a descriptive overview of the globalisation of Swedish marriage fields between 1990 and 2004. We explore changes in the volume and country of origin of partnering related migration to Sweden and study the demographic characteristics of the native Swede and the partner from abroad (in age and educational level and the age and educational distance between the partners) in relation to the country of origin. We will also test the hypothesis that there is a relationship between the volume of migration and the level of development of a country.

Christopher Niedt, UC Berkeley. Email: niedt@berkeley.edu; *Kelo and the Castle: Multiscalar Property Rights Activism, Economic Development, and Regional Governance in the United States*

The U.S. Supreme Court's 2005 Kelo decision was not only a rare instance of local eminent domain issues capturing national headlines, but was also a moment of unprecedented political coalition between a range of property rights advocates. Urban and suburban groups became key supporters of a cause more often associated with a network of rural and libertarian organizations, as both fought to limit the state's power to take land for economic development. This paper considers the recent evolution, scale repertoires, and impact of the U.S. property rights movement, with particular attention to its effects on urban and regional governance. We investigate the relationship between contemporary property rights activism, urban growth coalitions, and redistributive metropolitan politics. We ultimately consider whether property rights activism constitutes an

emerging (if implicit) form of regional governance that might displace or transform dominant urban regimes in the United States.

Michael Niedzielski, Ohio State University. Email: niedzielski.4@osu.edu; Przemyslaw Sleszynski, Institute of Geography and Spatial Organization, Polish Academy of Sciences. Email: psleszyn@twarda.pan.pl; Ready, set, go: the coming urban sprawl explosion in Warsaw, Poland

This paper investigates claims that suburbanization is a major force changing the spatial fabric of post-socialist cities. The focus herein is to analyze Warsaw's spatial organization over the years of its transformation. An overview of the city's economic structure is followed by the presentation of regional commuting patterns. Intra-city and inward work trips are the dominant commuting patterns, thus it follows that commuting trends are similar to those in the U.S. during the 1960s and that Warsaw's urban structure is mostly monocentric. It is also apparent that the journey-to-work pattern has not changed significantly from that in the socialist era. The lack of investment in the regional transportation infrastructure has stifled the development of suburban pull factors and, as a consequence, this flaw has limited the extent of urban sprawl. The growth of the transportation network - a historically important factor in the dispersion of Western cities - has been absent in the region. However, on the verge of a sprawl explosion, Warsaw's urban form may experience dramatic change when road network improvement plans have been completed.

Andrea Nightingale, University of Edinburgh. Email: anightin@geo.ed.ac.uk; Passionate about the Sea: exploring the role of emotion and subjectivity in fisheries management

Nephrops (prawn) fishing in Scotland is a key industry sustaining remote, rural villages and continues to support a number of small, independent vessels. While competition between boats is fierce, there is also a great deal of cooperation and in places, skippers have come together and formed a variety of formal and informal agreements about how to spread fishing effort. These agreements sit uneasily with the European Union's Common Fisheries Policy which gives all collective choice rights to the EU. This paper examines processes of collective action by bringing together work on subjectivities and common property. It therefore seeks an alternative to rational choice theories and rather investigates how people's emotional attachments and subjectivities are important to collective practices. Many fishers express a 'love of the sea' and similar passions to their environment. This research is interested in trying to understand how these passions are important to their willingness to cooperate. Preliminary results from work done on the Nephrops fishery in Scotland is used to help illustrate the theoretical argument.

Keywords: subjectivity, emotional geographies, fisheries, common property, Scotland

Jan Nijman, University of Miami. Email: nijman@miami.edu; Alpen Sheth, U of Miami. Email: alpen.sheth@gmail.com; Neglected Spatiality: Mumbai's Slums as Sites of Production

The existing literature views slums overwhelmingly as residential spaces. In this paper, we focus on a neglected spatiality of slums: the slum as a site of economic production. The productive function of certain slums is important in regards to local livelihoods but also in terms of its contribution to the urban economy and its role in wider production and exchange regimes. We present a general argument about slums as sites of production followed by an empirical study of Mumbai. The empirical study consists of two parts. First, we examine prevailing discourses on Mumbai's slums among policy makers, news media, academicians, and NGOs. We are particularly interested in the extent and manner in which economic production inside the slums figures in these discourses. Second, we provide an exploratory case study of one Mumbai slum that functions as a site of production. Through fieldwork observation and interviews we examine the nature of production, the reasons for its location, the relation to labor, linkages to the wider economy, and the role of production in the very existence of the slum. We relate our findings to broader debates about economic globalization, neoliberalism, industrial location, and flexible production.

Keywords: slums, production, urban economy, Mumbai

Theodore Nik, University Of Illinois at CHIC. Email: theodore@uic.edu; Jamie Peck, University of Wisconsin-Madison. Email: ; Marc Doussard, University of Illinois at Chicago. Email: ; After deindustrialization: Chicago's search for a new mode of growth

This paper considers processes of economic restructuring that have unfolded in Chicago over the past two decades. Following the tumultuous 1980s, the 1990s economic boom featured record productivity increases, the longest period of sustained job growth since World War II, and the strengthening of ties between U.S. cities and the global economy. This led many observers to declare that seemingly intractable economic development problems, like racial inequality and entrenched inner-city poverty, had been substantially alleviated. However, by the mid 2000s, many of the gains made during the previous decade had been erased. In the paper we stress the continuities - including capital flight, uneven development, and socio-spatial polarization - between Chicago's Fordist past and its embrace of a post-industrial economy. We argue that Chicago's transformation from declining Rust Belt city to global business center should be understood in relation to broader macroeconomic swings and their impact on regional industrial structure. Tracing four distinct periods of change - deindustrialization, service-industry growth, the 1990s boom, and the 2001 recession and jobless recovery - we find that Chicago's growth, while impressive in the aggregate, has been uneven, fragile, and built on a foundation of insecure employment for an ever-growing segment of the workforce.

Keywords: economic restructuring, uneven development, Chicago

Daniel Niles, Clark University. Email: dniles@clarku.edu; The Concept of Demand and the Imaginary Territories of Future Agriculture

The concept of "demand" has been taken as a key factor in the process of agricultural change. Global demand for food, which is expected to double by mid-century, accordingly serves as a baseline in large-scale assessments of future food security. Increases in demand can also be used to set productivity minimums for any kind of "sustainable agriculture". The question of how much food humankind does or will need should follow from an understanding of how much food is now produced and consumed, but these elemental figures are surprisingly difficult to establish. Though demand is often described as an immutable physiological and unimpeachable economic force, future estimations of demand rest on incomplete and often dubious figures of present agricultural production and wildly varying assessments of food availability, consumption, and waste. In this paper I report how many large-scale assessments of future food security and agricultural sustainability derive future "demand" from the most statistically visible patterns of contemporary agricultural production. As a consequence, the forecast "doubling of demand" is tautologous. It presumes the intensification of industrial-scale agricultural production and diminishes the real and imaginary territories in which non-conventional food futures lie.

Email: oleary@mail.sdsu.edu; Using Population Viability Models for measuring Landscape Connectivity

Habitat connectivity for animals has been studied in a number of ways. Structural habitat connectivity is measured by identifying where habitat patches are situated with respect to each other. Functional studies of landscape connectivity look at how a landscape facilitates movement and functioning of an organism. This paper takes an approach of using individual-based modeling for measuring population viability metrics as a surrogate measure to identify connectivity. Individual-based modeling has found less application in geographical analyses, though many spatially-explicit approaches to problem-solving exist. Habitat connectivity for animal movements can be measured by metrics such as fluxes through habitats, net gains and losses, or through measures such as viability that show direct impacts on populations of regions. We selected a region with diverse landcover classes and multiple land uses in the Willamette River watershed of Central Oregon for analysis. Three wildlife species were selected for comparative analysis of connected habitats. We then used a spatially-explicit population model to measure connectivity over the landscape through the flux of individuals between habitat units. Connectivity was altered by introducing barriers to movement and altering their properties, and the significance of these barriers was measured by examining their impacts on simulated population trends. Results illustrate the significance that movement barrier properties can have on population dynamics, and demonstrate how such impacts can change based on species' life-history traits. These insights should lead to innovations in developing new functional measures of connectivity.

Keywords: population viability, PATCH, habitat connectivity

Josef Nipper, . Email: j.nipper@uni-koeln.de; *The role of heritage in urban development in East Germany since reunification*

The reunification of Germany has caused transformation processes in almost all fields of the former East Germany society. Changes have almost always been some form of adoption of West German concepts and structures. On the urban level, the idea of retaining an urban heritage has played quite a leading role in developing the East German cities since reunification. After having briefly characterized the situation of East German cities at the time of reunification, the paper will discuss first the concept of urban heritage and its development (over the last 15 years) in East Germany and secondly, it will be shown and demonstrated how the so-called "socialist heritage" concept has been applied in practice as seen through empirical examples. The final section will discuss the role of urban heritage in relation to one of the present and future most influential prevailing development phenomena in East Germany; the shrinking of cities.

Keywords: urban heritage, urban development, East Germany

Richard Nisa, Rutgers University. Email: rnisa@eden.rutgers.edu; *Rogue Elephants: The Legal Organization of Violent Bodies in International Conflict*

Borders are phantoms. They are fleeting, mobile, and discursive? conjured and negotiated through time and social relations. The frontier between legal and illegal violence in international warfare is one of the most ghostly limits, formed deep in the discourses of modern geopolitical power. Yet borders are also material? the laws that purport to organize warring populations are corporeal and affective? their transgression leaves marks on the body and the earth, exposing very real biological matter to varying conditions of freedom or imprisonment, of life or death. In this paper, I will concentrate on the dynamic landscape that occurs at the frontiers of legal order, spatial production, and state control of non-state violence. First, I will explore the legal discourse that both distinguishes and connects two classifications of violent bodies active in the so-called war on terror: Private Military Contractors (PMCs) and unlawful or enemy combatants. Both of these groups, by nature of their political and biological lives share a precarious position relative to the production of legality and legitimacy in international and U.S. state law. Next I will trace this unstable legal geography into the contemporary war prison? where the embodied manifestations of discursive organization collide with one another? un-law against un-law? and individual bodies become diagrams for the interchange of geopolitical power. The primary objective of this study is to explore the production of state space and the possibility for justice at this aporetic frontier, where ghostly discourse and biological matter converge and lay claim to the legal organization of political violence.

Yuichiro Nishimura, Disaster Prevention Research Center, Aichi Institute of Technology. Email: nishimura@aitech.ac.jp; Kohei Okamoto, Nagoya University. Email: h44540a@nucc.cc.nagoya-u.ac.jp; *The Changes of daily activity and subsistence complex: Time-geographic analysis using GPS and GIS in Dongkhuwaai village, Laos*

The poster investigates how the daily lives of suburban village people in Laos are related to natural environment and how their subsistence complex is changing under marketization and urbanization. We focus on three points; the penetration of wage labor, the continuance of the activities related to natural environment (hunting, fishing, gathering, etc.), and the gender differentiation in the daily activities. Data is collected from the interview and the time allocation survey using GPS and GIS. We conducted the survey in Dongkhuwaai village: about 30km from Vientiane Capital. The field survey was done on Aug. 2006 and Feb. 2007. The wristband GPS units recorded the time-spatial allocation of all members of the 40 households (total 154 person). After the finishing of 24 hours GPS recording, the data was stored and visualized by GIS. We also had interview with the household members for clear the detail of the activities because GPS records show only the time and place (latitude and longitude) of the activities. The data shows the activities such like hunting or gathering take the considerable part of the time-spatial allocation. Because the selling price of natural products is relatively high, the importance of these activities seems to rise in the daily life. On the other hand, penetration of capitalist economy increases various types of wage labor near Vientiane. It will promote time-spatial segmentation (workplace/home, working hours/non-working hours, nature/non-nature) and the radical changes of the villager's daily time-space have occurred.

Keywords: Laos, daily time-space, subsistence complex, time-geography, GPS, GIS

Wairimu Njambi, Florida Atlantic University. Email: wnjambi@fau.edu; William O'Brien, Florida Atlantic University. Email: wobrien@fau.edu; *Safari Tourism, Technology, and Local Resistance: The Socio-ecological Significance of CB Radios and Mini-vans in an East African Park*

From television documentaries and other media, the word "safari" conjures images of both serenity and possible danger in "wildest Africa." For some, it also presents a promise of exclusive tourist experience, albeit one tinged with a residue of colonial history. Less immediately apparent is that the safari experience is also mediated by technology such as photographic equipment and plane travel, but also by road vehicles and communications devices. Emphasizing the nexus of race and class, we focus on tensions in the safari experience brought about particularly by minivans and CB radios. These technologies work to facilitate access to an imagined wild landscape, but they also destabilize the idealized safari through their inscriptions on the savanna, while at the same time providing a means of everyday resistance for tour guides. Illustrating our points using video from Kenya's Masai Mara, we suggest that such technologies help rewrite safari experience as ambivalent in that it cannot live up to the expected stories on a landscape modified in the globalized pursuit of tourism revenue. Spurred by the mediascapes that conjure the alluring "safari," these technological mediators of the African savanna paradoxically undermine the imagined world to which they provide access.

Jeremia N Njeru, University of Wisconsin-Milwaukee. Email: Jnjeru@uwm.edu; *Urban and Peri-urban Deforestation, Neoliberal-inspired Economic Transformations and Political Liberalization: A Case of Nairobi City, Kenya*

Urban and Peri-urban deforestation is not new in Africa. A host of studies have noted that many large urban areas are characterized by rings of deforestation, mainly attributed to high demand for bio-fuel in form of firewood and charcoal. Other studies suggest that forests decline around cities due to demand for resources as urban incomes rise. These studies do not substantially address how the recent political, social and economic changes may have changed these dynamics of urban and peri-urban deforestation. Yet, in recent years, studies on urban environmental change suggest that there are intricate interconnections between urban environmental change and the ongoing political and neoliberal-inspired economic transformations in Sub-Saharan Africa. This paper will highlight these interconnections by investigating deforestation of Karura and Ololua Forests, both public forest reserves in Nairobi, which underwent accelerated loss of trees and land in the 1990s. The paper draws on fieldwork conducted in Nairobi in 2005 and 2006, which included in-depth interviews with environmental NGOs, government officials and Nairobi residents and textual analysis of planning and environmental documents. The paper argues that the implementation of neoliberal inspired policies and/or pressures from the World Bank and IMF and/or foreign donors to the Kenyan government to implement them, and the resultant economic conditions, combined with the processes of democratization, particularly struggles related to, and introduction of, competitive elections in Kenya to largely produce Nairobi's deforestation.

Keywords: Urban, deforestation, Neoliberal, political liberalization, Nairobi

Carline Noailles, Chargee De Programme UN - Habitat. Email: cnihsi@yahoo.com; *Migration toward the regional capitals of Haiti*

This study tests the general assumptions of growth pole and dependency theories in explaining the growth of regional urban centers in Third World countries. I use Haiti as a case study. I compare the numbers of migrants predicted by the potential model to the actual numbers provided by the census data to assess the accuracy of the model. I test the influence of sizes and distance on the number of migrants and analyze economic activities in identified poles. The units of analysis are the eight regional capitals in relation with the other urban centers of their regions. The study shows that growth pole theory poorly predicts the number of migrants in the regional capitals. The distance from the primate city plays little role in the capacity of a regional capital to attract migrants. The size of the city of destination plays an overall strong role while the role of the size of the city of origin varies. The distance between the origins and the destination plays a role that varies from a region to another. The variations observed are explained by geographic factors such as natural obstacles and the track of the roads. They are also explained by economic factors. Indeed, other cities located in geographic sub-regions with important economic activities, with port facilities and the ones located at the frontier with the Dominican Republic compete with the regional administrative capital to attract migrants. The study confirms the assumptions of dependency theorists.

Keywords: Urban Primacy, regional migration, regional poles

Catherine L. Nolin, Assistant Professor, Univ of Northern British Columbia. Email: nolin@unbc.ca; "We have to protect the investors": 'Development,' indigenous social exclusion, and modern Canadian imperialism in Guatemala

Neoliberal development schemes of mining, oil extraction, and hydroelectric projects, are embraced by post-conflict Guatemala as the way forward on the path to democratization. At the same time, the Canadian government's pro-business, pro-mining stance, through its Embassy's activities, is shaping the very nature of the so-called "development model" for this Central American country. Neoliberal development models are often associated with human rights abuses and an unwillingness to incorporate local knowledge or allow for locally-driven, smaller-scale development. Large-scale resource development on Maya traditional territories, lands to which they have no rights, affects every aspect of the local indigenous peoples' livelihoods, health, and cultural identities. In this paper, based on fieldwork in the summer months of 2004 and 2006, we focus on the resulting clash of competing visions of 'development,' between large scale resource exploitation and indigenous Maya communities' resistance to what they identify as their impoverishment through social and spatial exclusions, health deterioration, and economic marginalization. Through a rights-based approach to our analysis of 'development' we highlight the silenced voices of Maya community members in opposition to unsound development practices and President Óscar Berger's need to "protect the investors" rather than the lives of his country's own citizens.

Keywords: development, Guatemala, Canada, indigenous, social exclusion, rights

Marie Nordfeldt, Ersta Sköndal University College. Email: marie.nordfeldt@esh.se; Lars-Erik Olsson, . Email: lars-erik.olsson@esh.se; Marcus Knutagård, . Email: ; Homelessness in the Swedish universalistic welfare system - the case of four municipalities

This paper focuses local welfare regimes in relation to the problem of homelessness in Sweden. The welfare system in Sweden is decentralised with a high degree of self-government and the responsibility for issues of housing and homelessness lies with the local authorities. The aim of the paper is to discuss with a comparative approach the local strategies to prevent and solve homelessness. From a theoretical point of view the local mixture of traditional solutions such as emergency shelters run by charity organisations and the implementation of new types of models such as "housing first" will be discussed. The paper is based on case studies conducted in four Swedish municipalities. Stockholm, Malmö, Krikanstad and Eskilstuna. The former two represents large cities in Sweden and the latter two, middle-sized towns. The study is based on qualitative research methods; interviews and documents' analyses. The actors interviewed are local politicians, employees in the social authorities, voluntary organisations representatives, representatives of the housing market, correctional care and the psychiatric care. Research questions to be illuminated are: Why do old solutions to homelessness, such as emergency shelters, become revived at the local level? What is the present role of Christian charity organisations? How does new models become implemented, and what are the obstacles to innovations?

Keywords: homelessness, local regimes, Sweden.

Anna Nordfelt, Texas A&M University. Email: anordfelt@tamu.edu; Steven Quiring, Texas A&M University. Email: squiring@geog.tamu.edu; A study of the intensity and duration of the North American Monsoon as a function of winter and spring snowcover

The North American Monsoon (NAM) brings heavy precipitation during the summer months to portions of the southwestern United States and northwest Mexico, where the NAM is the primary source of water. Studying the NAM is important because if a relationship between winter snow cover and summer precipitation can be developed, then it may be possible to better predict the onset, intensity, and duration of the NAM. Based on the results of the analysis of 283 grid cells at 1/8° resolution in Arizona and New Mexico (1967-2001), an average onset (July 4th), ending date (September 18th), and season length (77 days) were defined. Winter snow cover is positively correlated with date of onset, and negatively correlated with the length of season and the number of precipitation days. Monsoon rainfall is strongly correlated with the date of monsoon onset and termination. The amount of precipitation that falls during the season is directly related to date of onset, season length, and number of precipitation days occurring during the monsoon season. It tends to be greater during years that have an early onset, longer than normal season with an above average number of precipitation days. Investigations of the predictability of monsoonal precipitation may provide a basis for forecasting water deficits in urban areas.

Keywords: North American Monsoon, snowcover, precipitation, Southwestern United States

Emma S. Norman, University of British Columbia. Email: enorman@interchange.ubc.ca; Karen Bakker, Ph.D., University of British Columbia. Email: bakker@geog.ubc.ca; Transgressing Scales: Water Governance across the Canada-US Borderland

Many recent water management initiatives in Canada and the United States entail the involvement of local actors — usually sub-provincial and often community-based — in water management. This trend parallels the devolution of environmental governance to the sub-national level, which is well documented within geography. In this paper, we review recent debates on rescaling and borderlands, which offer useful concepts with which to expand conventional analyses of transboundary water governance. We query several assumptions underpinning this literature: specifically, the assumption that rescaling implies greater empowerment for local actors, and that the rescaling implies that nation-states are less important in water management. Thus, we bring recent insights from the study of borderlands to bear upon debates over environmental governance. In particular, we emphasize the simultaneous fixity and porosity of borders, and document how local actors simultaneously undermine, yet are constrained by the container of the nation-state. Moreover, we approach the freshwater bodies as part of wider 'hydrosocial' cycles embedded in both ecosystems and social systems. We draw on a case study of several transboundary groundwater and freshwater systems in western Canada and the United States, focusing on two regions: the relatively water-abundant Pacific Coastal, and the relatively water scarce Western Montane.

Keywords: Borders, Scale, Water Governance

Moss E. Norman, B.Kin., M.A., Ph.D (candidate), University of Toronto. Email: moss.norman@utoronto.ca; Digesting Spaces, Shaping Identities: The Spatial Construction of Boys' and Their Bodies.

Feminist theorists have long been writing about the fat female body as a "feminist issue" (Orbach, 1998), suggesting that fatness is a culturally disparaged, perhaps even "uninhabitable" (Butler, 1993), identity in contemporary western societies. Comparatively, however, there has been little written on the intersections of fatness, men, and masculinity (Gilman, 2004). This paper is taken from research for my doctoral dissertation exploring how young men (13-15 yrs.) from a Toronto, Canada area private school and community centre deploy the identity category "fatness" in the process of constructing a stable masculinity based on a healthy sense of self. Part of the methodology involved giving the participants disposable cameras to take pictures of their everyday life worlds, an adaptation of the Photovoice technique. This served to reveal the central role space and place play in the constructions of body size, in particular fatness. Discourses of health, especially those related to eating, exercise, and body size, shaped how the young men experienced the everyday spaces they inhabited. What became evident is that fatness is a fluid identity that is consumed differently from mother's 'soul food' to McDonald's 'fast food', from the privacy of the bedroom to the publicity of the gymnasium, and from the local vegetable to the national grocery chain. These spaces, along with others, were complex sites with a multiplicity of intersections, giving rise to a range of interlocking identities including fatness, race, ethnicity, social class, sexuality, and age.

Keywords: body size, identity, masculinity, photovoice

Leslie A. North, University of South Florida. Email: north2@mail.usf.edu; Philip E. van Beynen, Ph.D., University of South Florida. Email: vanbeyne@cas.usf.edu; Applying the Karst Disturbance Index in West-Central, Florida

A hierarchical and standardized environmental disturbance index, specifically designed for karst landscapes, was created by van Beynen and Townsend (2005). To assess the applicability of the index and provide recommendations for its refinement, the index was applied to four counties in West-Central, Florida. The karst disturbance index consists of 30 indicators contained within the five broad categories: geomorphology, hydrology, atmosphere, biota, and cultural. Data was readily available for most environmental indicators used to construct the index. Overall, levels of disturbance vary between the counties due to the level of urbanization, with the highly populated Hillsborough-Pinellas having higher degrees of disturbance than less developed Pasco-Hernando counties. While this result may seem obvious, the measure of disturbance using many indicators provides benchmarks of levels of disturbance that can be reassessed with time and highlights those aspects of the environment most in need of attention. However, several minor issues arose during the testing: the need for broader indicator descriptions that encompass a variety of scenarios, a new water quality indicator, obsolete data on sinkholes, and a lack of data for biota indicators. The lack of data for certain indicators suggests where future research efforts can be directed; for our region those include species richness and diversity changes in caves and urban groundwater quality.

Keywords: Florida, karst, index-environmental, urbanization, human impact

Jack Norton, University of Washington. Email: jsn7@u.washington.edu; *Rethinking First World political ecology: (post)colonialism and the case of Mohawk militancy*

This paper looks at the rise of Mohawk militancy through the lens of political ecology and post-colonial studies, highlighting the contested nature of the state and the environment in one region of North America. I contend that political ecology is a particularly useful approach for analyzing the rise of the warrior movement, insofar as it addresses disputes over the meanings of land, as well as national self-determination and questions of sovereignty. I engage with political ecology literatures through an analysis of the (post)colonial dynamics surrounding these two events, situated as they are in struggles over control of the use and meanings of certain landscapes. At the same time, I hope to problematize certain conceptions about what constitutes an 'environmental' or nationalist movement while tracing linkages between discourses of poverty and indigeneity as they are employed in such landed struggles.

Keywords: Political Ecology, Post Colonialism, North America

Since 1990, through four distinct phases, the authors have surveyed the values and worldviews of undergraduates around the world (although primarily in the USA). The objective of this project has been to explore the extent, character and implications of a "postmodern turn," i.e., a worldview-shift away from the assumptions of both traditional and modern Weltanschauungen. Our principal findings are here reported, including those of a just-completed fifth phase which focused thematically on issues of religious diversity and pluralism. The single most striking discovery has been that, with the sole exception of the Palestinian students of the College of Science and Technology, Gaza, the worldviews of contemporary undergraduates throughout the world tend to be varying admixtures of traditional, modern and postmodern values.

Keywords: Cultural shift; postmodernity; geosophy; worldviews; undergraduates.

Theo E. Notteboom, ITMMA - University of Antwerp. Email: theo.notteboom@ua.ac.be; Jean-Paul Rodrigue, Hofstra University, NY. Email: Jean-Paul.Rodrigue@hofstra.edu; *The next fifty years of containerization: container vessels, liner shipping and seaport terminals*

In 2006, container shipping celebrated its 50th anniversary. The container evolved from a pioneering stage in the late 1950s and early 1960s to become a dominant transport technology in today's worldwide logistics networks. The basic principle of containerization remained the same notwithstanding scale increases in vessels and terminals and a clear productivity increase in container handling. However, history proves all innovations sooner or later reach the end of their respective life cycles and are replaced by more advanced and more efficient solutions for a given problem. This paper explores potential development trajectories in container technology starting from an identification of future demand patterns and logistics requirements. It discusses three key elements related to future container vessel design and operations: (1) new maritime transport systems and liner network configurations, (2) vessel speed and (3) the vessel handling at seaport terminals. The paper discusses both incremental improvements in existing technologies (e.g. improvements in gantry crane design) as well as more fundamental innovations that could alter the way we move unitised boxes over the world seas. This contribution is the first in a set of two papers on the theme 'The next fifty years of containerization'. The second paper addresses the challenges for containerization with respect to the land interface and intermodal transportation.

Jakub Novak, Universita Karlova. Email: kubanov@natur.cuni.cz; Jana Temelova, Universita Karlova. Email: janatem@natur.cuni.cz; Martin Ourednicek, Universita Karlova. Email: slamak@natur.cuni.cz; *Changing Social Environment in Transforming Inner City of Prague after 1990*

During the communist era the inner city of Prague stood outside the interest of centrally planned investment flows. The economic, physical and social environment in traditional industrial districts of the 19th century was deteriorating. Poor quality of housing stock, high proportion of low educated and elderly population and concentration of Roma people in some areas characterized the residential environment of inner city during socialism. The change of political system in the Czech Republic after 1989 reestablished the market economy and open the way for foreign investors and foreigners generally. Economic growth and commercial overload in the center of Prague increased the attractiveness of

inner city for investment, particularly for office development. Some traditionally industrial districts in inner city have recently experienced dramatic change in physical environment and functional use. New socio-economic activities, incoming inhabitants, visitors as well as outgoing population necessarily change the social environment of inner city neighborhoods. New residents with higher socioeconomic status and new live styles replace the original working class population. Consequently the transforming localities are becoming divided into several different social worlds. The main aim of our paper is to investigate the changes in social environment in the dynamically transforming inner city neighborhoods of Prague. How the social environment of traditional industrial neighborhoods in inner city has been changed? And, which processes contribute to the change of local social environments? To answer these questions we offer two case studies of traditional industrial neighborhoods in the inner city of Prague

Keywords: social environment, inner city, transformation

The built environment of a city is extremely durable and long lasting; however, a single stray spark can radically alter the urban landscape. A Historical-Geographic Information System (HGIS) was implemented in this study to explore the affects of fires on certain urban dynamics in London, Ontario from 1915 to 1927. Two broad sets of questions pertaining to fires and their affects on the city were studied. We first observed the general spatial-temporal patterns of fires. Was there a concentration of fires in the densely-developed core? Were fires more likely to occur in the winter months? Were wooden buildings more likely to burn than brick? We also took into account the rebuilding process after a fire. How long did it take to rebuild after a fire? Was the new building structure more substantial than the old one? How often did the fire spark a change in ownership and/or land use? The HGIS allowed us to more easily recognize and explore the complex spatial-temporal patterns of destruction and reconstruction in the city.

Adam P Novick, University of Oregon. Email: anovick@uoregon.edu; *Aldo Leopold, ethicist or political ecologist? A review of Leopold's work finds a lifetime of critical interdisciplinary inquiry beside his moral claims*

Conservationists typically cite Aldo Leopold to justify ethical positions or policy prescriptions to protect the environment. However, the practical value of such moral claims seems constrained by political and economic forces, and attributed policy prescriptions often conflict. Is Leopold losing relevance to society? Reviewing Leopold's work, I find that throughout his life, Leopold offered a second prescription for conservation policy, in cautioning that land and its relationship to people are both complex; that conservation policies can backfire and succumb to orthodoxy and overly narrow goals; that conservation policies must be based on open-minded, interdisciplinary study of land and its relationship to people; and that policies should be evaluated by their effect on the landscape. I also find that Leopold saw such inquiry as seeking to ensure the sustainability of people and the environment. I suggest that in advocating such inquiry, Leopold in part championed key elements of contemporary political ecology, understood as the normative, empirical, research-based study of environmental issues as mediated by relations of power, usually including attention to economic, cultural, and/or biophysical dynamics; local study; scale; and alternative framing of problems and solutions. I also suggest that by demonstrating the practical value of such inquiry, Leopold remains highly relevant to addressing contemporary environmental problems.

David J. Novlan, National Weather Service. Email: dave.novlan@noaa.gov; Thomas E. Gill, Ph.D., University of Texas - El Paso. Email: tegill@utep.edu; *Historic Monsoon Flooding in El Paso, Texas in 2006- Impacts and Implications*

After a decade of drought, the wettest summer monsoon in 127 years of weather records at El Paso, Texas occurred in 2006. Three of the seventeen largest rain events on record occurred within a five week period, and the Rio Grande exceeded its banks multiple times- its first floods since 1958. Damaging flooding impacted El Paso County from July 27 through August 4, and intermittently thereafter through the monsoon season until mid-September. Flash flooding and river flooding caused major structural failures, rendered neighborhoods uninhabitable, as resulted in ~\$100 million in damage. An anomalous upper level cyclone persisted over the region from July 27 through August 4, resulting in ~73% of El Paso's annual average precipitation falling within nine days. Near-theoretical-maximum precipitable water, minimal upper-level flow, and orographic enhancement provided by the Franklin Mountains combined on August 1, resulting in slow-moving thunderstorms causing catastrophic flash floods. Annual recurrence intervals (ARI) for cumulative rainfall amounts based

on pre-existing calculations and airport meteorological data increased with time: approximately decadal on a one-day basis, fifty to one hundred years on a two-to thirty-day basis, and many hundreds of years on a forty-five to sixty day basis. This event inspires reconsideration of flood ARI calculations for urban areas of complex terrain in the Southwest, and raises questions about relying on single airport weather station observations (as opposed to a meteorological mesonet) in such regions. A possible connection of the extreme rainfall events with a developing positive ENSO event is also addressed.

Andrea Nuernberger, UCSB. Email: anuernbe@umail.ucsb.edu; *Assessing wheelchair users' acquisition of accessibility information for travel planning*

For many wheelchair users, mainstream travel information is insufficient for trip planning. The study explored the question "How do wheelchair users utilize accessibility information during trip planning, and which information formats are most valuable?" Participants were asked to travel three unfamiliar routes, but prior to traveling, were able to evaluate route accessibility based on accessibility maps, photographs of potential barriers, and phone conversations with an access consultant. Variables measured during evaluation included change of level of confidence to travel a route safely, perceived helpfulness of information source, time spent evaluating routes and sources, and type and number of information sources acquired. Pre-task interviews showed that in daily life participants primarily acquired accessibility information through verbal means and focused on buildings and accommodations. During experimental route evaluation, however, participants generally preferred maps and images because these provided independence and did not require overt and pro-active information acquisition. Participants with cerebral palsy greatly preferred images, which argues for user-centered design. Although telephone was required least frequently, all three information sources were perceived as equally helpful, and participants' confidence in safely traveling a route increased significantly after evaluating any of the sources. The conversations with the access consultant showed that many participants were inexperienced in acquiring access-specific route attributes and rarely used objective measures to communicate accessibility. The study showed that accessibility information provided prior to traveling unfamiliar routes improves wheelchair users' confidence in traveling safely, and strongly suggests that lack of high-quality information sources negatively affects information expectations and information acquisition skills.

Keywords: accessibility, wheelchair use, route planning, trip planning, information acquisition, cerebral palsy

Safy Nurhusein, University of Oregon. Email: snurhuss@uoregon.edu; *Building State Capitalism in Stateless Space: Somalia's Telecommunications Frontier*

Southern Somalia is a great place to start a business, but it also isn't. During the past fifteen years, the country has seen political fragmentation and multiple attempts to build a central authority. At the same time, diverse economies have arisen in different spaces and at varying scales. Mobile phone and internet companies offer services that rate among the best and cheapest in Africa to customers enduring some of the continent's worst living conditions. Additionally, as Somalia is officially uncontrolled space, insurance and property protection are unenforceable and the educational system virtually non-existent. This paper asks how an impoverished, uncontrolled country becomes a regional leader in telecommunications services. It builds on previous work on the nature of the state and institution-building, as well as theories of social capital, and informalization. Interviews and surveys reveal a number of pre-existing and new institutions that have been adapted to rebuild the economy and the state, often without distinction.

Keywords: Somalia, telecommunications, informal sector, governance

Peter Nwilo, Department of Surveying and Geoinformatics, University of Lagos-Lagos, Nigeria. Email: ; *Flooding in the Niger Delta: The Impacts and Risk Assessment*

Flooding in the Niger Delta is attributed to heavy rainfall, tidal inundation, global sea level rise, subsidence phenomenon, deforestation, storm surges and construction of canals. Maximum floods from flood/tide gauge measurements for Yenegoa and Ogboinbiri Rivers are 6.2m and 4.15m respectively. There are two

peaks of flood from rain fall; one between September and October (White flood) and the other between December and March (Black flood). The Black flood is as a result of the delay of the flood water at the inland delta around Timbuctu. Close to the coastline, the influence of rain water diminishes and tides and storm surges become more prominent causes of flooding. Tidal value ranges from 3.5m, 2.75m, 2.10m and 1.5m at Calabar, Bonny, Forcados and Lagos East mole, respectively. With height values varying between 0.8m to 4m at the barrier islands of the Niger Delta, most areas are flooded during heavy rains, at high tides and during extremes of sea levels. The impacts of flooding in the Niger Delta can be both positive and negative. The major positive impacts are sustenance of the coastal wetlands and enriching of the flood plains for agricultural purposes. The negative impacts include destruction of fishing settlements, coastal erosion, destruction of agricultural lands and destruction of coastal infrastructure. In this paper, we shall use data from tide/flood gauges and satellite imageries to assess the areas at risk from flooding in the Niger Delta and also discuss the socio-economic impacts of flood in the Niger Delta region.

Gyan Nyaupane, Arizona State University. Email: gyan.nyaupane@asu.edu; *Tourism User Fees: A Tool for Protected Area Management*

Lack of funding for managing protected areas (PAs) has been a major challenge for managers, conservationists, and governments across the globe. Tourism User Fees (TUF) in the form of entrance fees, concession fees, licenses and permits, and tourism-based taxes can potentially generate significant amount of revenues. With the growing demand of nature-based tourism, protected area managers are experiencing even more challenges to meet the demand while protecting natural resources. PAs have been facing overcrowding, congestion, poor quality of facilities, and lack of local support and funding for conservation. Although resource protection and tourism development are often considered two conflicting goals, TUF can be a tool for protected area management. This paper argues that through TUF protected areas become economically self-sustained and gain more local support, creates better relationship between tourists (users) and protected area managers, and tourists become more responsible towards the resources. In addition, TUF can help managers to deal with congestion and overuse of resources. The paper also discusses some of the issues related to TUF including inequity, lack of funding for less popular PAs, and over development.

Keywords: user fee, protected areas, nature-based tourism, ecotourism, sustainable tourism

Michelle Nyberg, Northern Illinois University. Email: mnyberg@niu.edu; *Physiological Response of Sugar Maple to Forest Light Levels*

Researchers have growing concerns regarding how plant communities will react to global climate change, especially in long-lived forest species. Abiotic stressors brought on by climate change can include persistent drought, shifts in precipitation and an overall increase in solar radiation. Stratospheric ozone depletion, caused by amplified greenhouse gases, increases the amount of solar radiation entering the biosphere resulting in physiological stress. Excessive light can cause an imbalance between energy absorbed through chlorophyll pigments resulting in a photochemical release of light seen as chlorophyll fluorescence. Chlorophyll fluorescence can yield information regarding the health of the photosystems, which are responsible for harvesting light energy furthermore converting CO₂ into biomass. Sugar maple (*Acer saccharum* Marsh) is an ideal species to study due to the extensive range of habitat, specific temperature requirements and its shade tolerance. This study aims to determine the amount of light stress sugar maple can endure along the latitudinal gradient in their distribution while inferring individual responses' to increased solar radiation that may be a product of global climate change. Chlorophyll fluorescence was measured at the northern limit of its range in Lake Superior Provincial Park, Ontario, Canada and within the central range in northern Illinois at Blackberry Maples. To understand future implications of global climate change, chlorophyll fluorescence was monitored in the vulnerable life stages of seedlings and saplings using a modulated fluorometer. Measurements were recorded to track the level of stress throughout the growing season during the summers of 2005 and 2006.

Breandan O HUallacháin, Arizona State University. Email: ohuallachain@asu.edu; Timothy F. Leslie, Arizona State University. Email: timothy.leslie@asu.edu; *Do University Patents Weaken Knowledge Spillovers*

Patenting by universities is altering flows of scientific information and invention rates. Results of a traditional knowledge production function approach show that industrial research is a straightforward determinant of commercial patenting across U.S. states, but the effects of university research are more

complex. A spatial econometric model shows that spillovers of university research advance commercial patenting once the effects of university patenting are controlled. This paper also questions the underlying rationale for the knowledge production function approach. Industrial and university research are not simple substitutes. A second model relates underlying regional characteristics to invention rates. Results show that higher levels of high-technology manufacturing and services, greater urbanization, and more invention specialization positively relate to invention rates. Patent procurement by universities and location in the South and the Midwest negatively influence commercial patenting.

Keywords: Knowledge Spillovers, University Patenting, Spatial Regression

William E. O'Brien, Florida Atlantic University. Email: wobrien@fau.edu; State Parks and Jim Crow in the American South

Little scholarly attention has been focused on the history of African American exclusion from Southern state parks under Jim Crow. This paper sheds light on this hidden history, emphasizing white resistance to park system integration during the 1950s and 1960s. State parks generally have received little academic consideration and the few historical works on the development of state park systems largely omit discussion of the foundational fact of their segregation in the South. While park systems in the region developed in earnest starting in the mid-1930s, only a handful of parks in only a few states in the South were available to African Americans until the 1950s. By this time legal challenges to the "separate but equal" doctrine elicited fear among whites about integration, prompting park systems to expand offerings to African Americans in hopes of forestalling that outcome. By the late 1950s most, but not all, Southern states had created areas in several parks, and in some cases even an entire park, for African American recreational use. The strategy, however, began to unravel almost as soon as it began as Federal court judgments in the 1950s and 1960s, following the lead of the *Brown v. Board of Education* decision, declared park segregation illegal, prompting the integration of all park systems by the mid-1960s.

Christina W. O'Bryan, University of Oregon. Email: cwobryan@uoregon.edu; North American Interior Landscapes: Evocations of There

Immigrant landscapes are created not just on maps but on the interior geographies of walls, ceilings and floors of immigrant businesses. In ethnic restaurants, markets, and other businesses, representations are created to assert or confirm identity to those within and outside of the community of refugees and immigrants holding a particular ethnicity. This is particularly important in multicultural settings where many ethnic groups vie for recognition and for perceived legitimacy. Such interior landscapes may reflect exterior landscapes, iconic images, social ideals, gender and a wide array of other cultural features designed to distinguish clearly one ethnicity from another. In particular, they sometimes articulate ideas about the gaps between ideals and realities as well as between the remembered past and a present that must be left behind. In this study, which is part of my dissertation research in Vancouver, B.C., I examine the ways in which representations of ethnicity and history in such interior landscapes are deployed in service of ethnic identities. Participant observation, structured and unstructured interviews and focus groups form the central core of my methodology, along with archival research.

Stephen M. O'Connell, Oklahoma State University. Email: geographilia@hotmail.com; Roads to the Wilderness: Highways and the Structure of National Parks

Transportation and National Parks have been intertwined ever since railroad companies supported the establishment of the first parks. As the automobile became the dominant form of transportation in an increasingly mobile country, the structure of parks changed as well. Not only did parks feel the pressures of an expanding infrastructure, they were faced with a change in the dynamics of park visitation and use. As the highways brought more travelers to the far corners of the nation, individual parks were forced to deal with a rise in use while the park system as a whole had to deal with a new landscape of protection and heightened expectations of access. This paper will highlight important trends in the growth of both the national highway and national park systems. Emphasis will be on the relationship between regional highway access and park system expansions with important consideration of changing recreational uses.

Keywords: national parks, transportation, recreation

Daniel P O'Connor, University of Richmond. Email: dan.oconnor@richmond.edu; Capitalist Production of 'White' Space in Neoliberal Nicaragua

The history of Nicaragua is the history of contested and reordered space. Resultant from this spatial discord was the continual production and simultaneous interrogation of "white" space within the borders of Nicaragua. Since the implementation of the domestic neoliberal regime during the early 1990s, global capitalism and its agents have been at the center of a matrix of pressures that work to transform spaces of the "other" within Nicaragua into "white" spaces: areas in which "whiteness" is normatively centered and white privilege is operative. This process of metamorphosis works primarily through both governance and the twin forces of economic and cultural imperialism. Capitalism created and maintained "white" space within Nicaragua quite overtly in the past. However, the discourses of modernization brought on with the Liberal party's return to power partially obfuscate this process and camouflage its racial element. This paper explores several case studies of capitalist production of "white" space within Nicaragua in the period following the fall of the FSLN. Furthermore, this paper situates this process of spatial production within Nicaragua's historical and cultural contexts.

Keywords: Nicaragua, race, space, capitalism, whiteness

Paul O'Hare, Department of Town and Regional Planning, University of Sheffield, United Kingdom. Email: p.o.hare@shef.ac.uk; Grassroots participation in community regeneration and 'community-led' partnerships

The British Labour Government created an Office for the Third Sector, partly in recognition of the increasingly important role voluntary groups now play in delivering public services. The days of civic sector organisations lobbying the public sector and political representatives are increasingly, for many groups, giving way to organisations that assume responsibility for service delivery themselves. This challenges what has traditionally been viewed as state-civic boundaries, with substantial impacts upon both those in positions of power, as well as the civic sector itself. This paper reflects upon ethnographic research on two neighbourhood based community forums in England that attempt to influence decision-making processes and service delivery. Analysis of qualitative data has generated a useful insight into how such groups attempt to gain influence and the reasons why they do so. I examine critical moments in their development and discuss key variables that have a determining influence upon their activity. I investigate the creation of the groups, how they are facilitated and by whom, and how they relate their activities to the state and other community organisations. I illustrate that such groups, despite being distinct from the public sector, are often reliant upon Government or municipal authorities for sustenance. This situation often leads to their activities being restricted, although there are slivers of resistance on the part of communities. The research offers a fresh perspective upon literature in this field, illustrating through grassroots examples how the civic-state dichotomy is much more nuanced and complicated than is often believed to be the case.

Linda S. O'Hirok, California State University, Los Angeles. Email: lohrok@adelphia.net; Matt Horns, California State University, Los Angeles. Email: ; Geomorphic Assessment and Stream Restoration of Dry Canyon Creek, Calabasas, California

Dry Canyon Creek is a headwater tributary of the Los Angeles River that drains the north slope of the Santa Monica Mountains. The Mountains Restoration Trust, a Santa Monica Mountains nonprofit trust to provide open space, resource protection and recreation, is planning to restore wetlands and natural processes to Dry Canyon Creek, enhance existing habitat and provide educational opportunities to the public. Dry Canyon Creek has been dramatically affected by human influences. Originally homesteaded in 1890, Dry Canyon Creek's landforms, channel systems, hydrology, riparian plant communities and environmental resources have been altered by agriculture, residential and commercial development, and roads. Aerial photographs reveal that well defined meanders were obliterated when Dry Canyon Creek was rerouted for the construction of Mulholland Highway. To enlarge useable residential property, fill was added and retaining walls constructed along the banks to prevent erosion. Significant amounts of remnant concrete and asphalt discarded into the fill, channel banks and bed have been remobilized and incorporated into the steps, pools and bars. Total length of stream for restoration is 1 km which includes the floodplain and channel network from a large culvert to a bridge downstream that have altered the channel slope. Both structures will be replaced by bridges that do not impact the channel. Geomorphic assessment included longitudinal and cross sectional profiles, sediment analysis and aerial photography to evaluate channel morphology. Macroinvertebrate community compositions were collected from

step environments. Wetland delineation and assessment were determined by David Magney and Associates.

Keywords: fluvial geomorphology, stream restoration, step-pools, Santa Monica Mountains

Morton E. O'Kelly, Ohio State University. Email: okelly.1@osu.edu; *The Impact of the Illinois and Michigan Canal*

The scope of the analysis is the particular geographical transportation system focused on St. Louis and Chicago in the mid-nineteenth century. At that time the rapid development of improved modes of transport transformed the ability of productive growing areas to reach the market with their agricultural surplus. Using geographical information systems (GIS) to develop the necessary network data, this paper examines the redirection of Illinois' agricultural production towards the Great Lakes transportation system then emerging at Chicago. The reactions are presented as a set of equilibrium adjustments. Rather than attempt to work backwards from a world with rail to a more primitive system of wagon and water transport, as Fogel does in a famous counterfactual analysis, this paper works forward from a pre-existing system and shows that the impacts of the changes produced further reinforcing dynamics. The article aims to incorporate spatial analytic models into historical studies with the aid of GIS.

Keywords: Transportation, historical GIS

Kelley J. O'Neal, University of Maryland. Email: kelleyo@umd.edu; John Rogan, Clark University. Email: JRogan@clarku.edu; David Roy, South Dakota State University. Email: David.Roy@sdsu.edu; *Assessment of the Impacts of Climate, Land Use, and Fire Management on Vegetation Composition in Semi-arid Grasslands*

Semi-arid grasslands in the southwestern U.S. are undergoing transformation due to increasing human modification of the landscape and climate change. Over the past century, there has been a substantial decline in grassland extent due to increasing shrub encroachment. This shift in vegetation composition has been facilitated by three drivers of change in the region: climate, land use, and fire management. Conservation and mitigation efforts require information on the effects of each driver, the inter-relationships between the drivers, and the coupled effects of the drivers in combination in order to understand how they continue to impact the landscape. Historical and current spatially gridded climate data, land use records, fire management information, and vegetation composition derived from Landsat and MODIS data were analyzed to understand trends in vegetation composition shifts. Results indicate grazing as the most influential factor in increasing shrub cover, and areas experiencing over-grazing coupled with fire exclusion exhibit the most change in vegetation composition.

Keywords: remote sensing, land use, land cover, fire, climate, semi-arid, rangeland, grazing, grass, shrub

Kathleen O'Reilly, Texas A&M University. Email: koreilly@geog.tamu.edu; *Women's Movements Public and Private: Combining Sanitation and Women's Empowerment in Water Supply*

Women and water resources have been linked together in mainstream development for decades. Many water supply projects include sanitation as one aspect of their intervention and specifically target women as agents for change in household and personal hygiene practices. In contrast to research that accepts taken-for-granted linkages between women, water and sanitation, this paper investigates the impact of latrines on women's mobility and empowerment. I explore the implications of latrine building for gendered, social change. Through a series of images, I show the connections between water, latrines and village women made by Indian staff of a Rajasthani drinking water supply project. I also discuss the opportunities and contradictions that emerged over the course of the project due to latrines. The siting of latrines, their usage, and their acquisition played simultaneous roles reinforcing and subverting social norms about women's access to public and private spaces and their movements within these spaces. The findings of this research apply to a broad context of sanitation projects insofar as they suggest that latrine building and usage promotion are both technical and complexly gendered political interventions.

Adam O'Shay, PhD, Risk Management Solutions. Email: adam.oshay@rms.com; Steve Jewson, PhD, Risk Management Solutions. Email: Steve.Jewson@rms.com; Manuel Lonfat, PhD, Risk Management Solutions. Email: Manuel.Lonfat@rms.com; *Statistical Development of a 5-Year Perspective on Hurricane Activity in the Atlantic Basin*

This work illustrates several perspectives on modeling Atlantic Basin Hurricane activity during the five year period: 2007-2011. A collection of models using historical data from the National Hurricane Center's HURDAT catalogue in addition to the Hadley Center Sea Surface Temperature data (HadISST), have been developed that rely upon the relationships of past hurricane seasons and the association of Sea Surface Temperature and hurricane activity. Those methods

were applied to the basin activity, US landfalling hurricanes and to regional activities in the Western Atlantic. This study summarizes the main components of those methods and results derived for the number of storms in the basin and at US landfall and will be discussed in the context of applicability to the insurance and reinsurance industry.

Keywords: hurricane,atlantic,landfall

Margaret O'Shea, BSc., MA., University of British Columbia. Email: meg.oshea@gmail.com; *The Emergence of Embodied Sustainability*

Sustainability exists as both a conceptual and a practical entity. The conceptual terms and conditions of the political, economic, social, and ecological needs for a sustainable future constitute substantive sustainability. Procedural sustainability is the local instantiation of those terms and conditions in the form of human behaviour. Substantive sustainability is a conceptual paradigm and thus cognitively biased while procedural sustainability is inherently behavioural. Actions and behaviours emerge as members of the public selectively take up some arguments of substantive sustainability to embody values and preferences within the environmental context. This critical concept of emergence must be allowed for in communications about sustainability and in the expectations of public response. Creating a space in which behaviours and actions may emerge at the local level empowers lay people and communities as architects of and participants in creating a sustainable future. Valuing the emergent property of embodied sustainability (pro-environmental behaviours and actions) also functions to close the gap between substantive sustainability as a concept and procedural sustainability on the ground. The call for pro-environmental behaviour change can be made in the terms of individual and collective capacities for action, allowing for the emergence of pro-environmental behaviour change as a response to a diminished gap between substantive and procedural sustainability.

Keywords: sustainability, embodiment, behaviour change, communication

David B O'Sullivan, University of Auckland. Email: d.osullivan@auckland.ac.nz; Chris McDowall, University of Auckland. Email: c.mcdowall@auckland.ac.nz; *School Choice and Neighborhood Change in New Zealand, 1998-2005*

New Zealand was among the first countries to introduce 'parental choice' in education, whereby parents may decide which state school their children attend. Parental choice is now an established feature of the social and educational landscape, and is also a common feature of school reform programmes worldwide. Parental choice conflicts with the widely held ideal of neighbourhood schools, and since 2001 the New Zealand system has attempted to resolve this tension by guaranteeing that children can attend school locally by requiring popular schools to designate and maintain a geographical zone. Linking geographical zones to a choice system makes household decisions about education and school decisions in zone design especially critical to processes of neighbourhood formation and change, and may impact on the socioeconomic and ethnic composition of neighbourhoods. We will present preliminary results on changes in the ethnic composition of schools in New Zealand from 1998 to the present, focusing particularly on Auckland, a diverse, cosmopolitan city, which has seen large inflows of Asian immigrants in recent years, many at least in part for educational reasons. Regional variations in the patterns of change with respect to the socioeconomic status of schools and school type will also be examined.

Keywords: school choice, neighborhoods, segregation

Tim Oakes, University of Colorado. Email: toakes@colorado.edu; *Welcome to Paradise! Domestic Tourism and the Myth of the Frontier in China*

Based on long-term fieldwork in southwestern China, this paper argues that with the campaign to Open Up the West, China has initiated a new era of national myth-making. It focuses on the construction of mythic frontier landscapes, through commercial tourism development, as the concrete expression of a "modern" and "civilized" national identity. China's western frontier landscapes and cultures have become resources for commercial tourism development. Developing these resources, however, depends on a process of utopian myth-making, and in this China is embarking on a project strikingly similar to the United States 19th century model of frontier development and nation building. The paper thus suggests numerous points of comparison between China and the United States and ultimately argues for an understanding of the frontier myth as a product of a global imperialist discourse.

Keywords: China, Tourism, Frontier

Ann M Oberhauser, West Virginia University. Email: ann.oberhauser@mail.wvu.edu; *Negotiating Scale and Gender in the Context of Neoliberal Restructuring*

This paper addresses the socio-economic dimensions of neoliberal reforms in the Global South. In recent years, development studies have included critical analyses of the discourse and practice of neoliberalism that focus on the scale of the nation-state and global institutions. Relatively little attention, however, has

been paid to household livelihoods and specifically the effects of neoliberal restructuring on gender dynamics in employment and related economic activities. This research focuses on the multiple and intersecting scales that shape alternative livelihood strategies in Accra, Ghana. In this context, state support for social services has been dramatically reduced while market-driven economic reforms have been implemented as part of neoliberal structural adjustment programs and more recent IMF programs linked to debt relief. This discussion examines community-based and household strategies in the context of neoliberal economic and political restructuring that involve diversification of livelihoods, informalization of labor, and increasing vulnerability of workers in the labor market. The analysis is based on research conducted on livelihood strategies in Ghana's capital city of Accra where everyday economic practices are strongly affected by neoliberal strategies. This study has implications for gender analyses of neoliberalism and livelihood strategies, especially at the local and household scales.

Keywords: neoliberalism, gender and development, Ghana

Alex Oberle, University of Northern Iowa. Email: Alex.Oberle@uni.edu; *Immigration rhetoric versus economic redevelopment: The role of Latino businesses in revitalizing declining Iowa towns*

The recent mid-term political cycle brought the drumbeat of anti-immigration rhetoric to the forefront of both state and national campaigns across Iowa. Like similar discourse elsewhere in the country, media attention only focused on negative themes. Yet Iowa, unlike most states, is experiencing only very modest population growth that is largely confined to major metropolitan areas, while many rural or micropolitan areas have been devastated by substantial population losses in recent years. These population declines are particularly evident in many CBDs where vacant storefronts and high turnover are now the norm. This paper examines how Hispanic businesses in some communities have served as a catalyst for redevelopment. In particular, this research explores this dichotomy between the popularized criminalization of immigrants versus the reality of Latino immigrant entrepreneurship as a successful form of economic revival.

Keywords: Hispanic, redevelopment, rural decline, Iowa

Godson C. Obia, Eastern Illinois University. Email: gcofia@eiu.edu; *Cultural Adaptations to Population Growth and Declining Environmental Resources in Rural Areas of Sub-Saharan Africa*

It is a widely held view that population growth in developing countries is the culprit in environmental degradation. Policies emanating from this view presume that population decline will ultimately result in reducing population pressure on the environment. Decades of such policies have achieved limited effectiveness in rural areas of Sub-Saharan Africa. Part of the reason for this failure is that the public policy debate on population and environmental degradation has paid little attention to the impact of local adaptive mechanisms in combating population pressure and environment degradation. This paper examines the successes and limitations of cultural and ecological adaptations to population pressure and environmental degradation in selected areas of Sub-Saharan Africa. The paper finds that cultural adjustments to land use and land tenure, the availability and use of technology, and the diversification of the rural economy play a significant role in ameliorating environmental degradation. The results also indicate that successful cultural and ecological adaptations promote integrative rural development and act as catalysts to rural poverty alleviation. The paper identifies the successes and limitations of cultural and ecological adaptations and underlines their implications for rural policy on population and the environment.

Keywords: population growth, environmental degradation, cultural adaptation, Africa-Sub-Saharan

John Onu Odihi, PhD, Universiti Brunei Darussalam, Bandar Seri Begawan, Brunei Darussalam. Email: odihi@fass.ubd.edu.bn; *Water Pricing Sensitivity in Brunei Darussalam*

The aim of this paper is to highlight the problems of raising water rates in Brunei Darussalam, a country with a long tradition of high water subsidies and high per capita water consumption, and to suggest ways of overcoming the problem. There are good reasons to tackle the high rate of water consumption although the country is well endowed in water resources which are renewable. These include the high cost of providing water and the inevitable growth in demand in future as a result of the country's high population growth rate and the planned diversification of the economy from its present monocultural base of oil and gas exploitation to industry, tourism and agriculture. There is also an important ecological reason. Brunei has only 8.5 km³/yr annual renewable water resources. A survey of households to determine sensitivity to raised water rates showed that people are generally unhappy about and will be unwilling to pay for any increase in rates because they see water mainly as a social good that government should provide free for them. The strong feelings which people have against raising of water rates requires government to work hard to educate people

on the need to use water more efficiently and to accept higher rates that mirror the true cost to government of supplying water to consumers. The existing mass media and religious institutions in the country can be used to facilitate such education.

Keywords: Brunei Darussalam, water, pricing, sensitivity

Ceri Oeppen, BSc, MSc, University of Sussex. Email: c.j.oeppen@sussex.ac.uk; *Return, Remittances, and Social Change: Afghans in California*

In recent years there has been a growing academic and political interest in the role that refugee diasporas can play in the future of their 'sending' countries, as well as how diaspora groups can support fellow refugees in 'receiving' countries. It is now widely recognised that refugee migration is very rarely a one stage, permanent move; this is particularly true for those with the resources to occupy transnational spaces by accessing education or business opportunities in multiple places, including making temporary return visits to the 'sending' country. The research outlined in this paper discusses how Afghan professionals have used the transnational networks initiated and maintained by migration and return visits, to try and improve the social situations of Afghans in Afghanistan and within the diaspora. The paper is based on semi-structured interviews and participant observation with Afghan professionals in the East Bay area of California.

Keywords: Afghans, California, refugees, diaspora, transnationalism, return migration

Benjamin Ofori-Amoah, Western Michigan University. Email: ben.ofori@wmich.edu; *Trade Area Characteristics and Survival of Downtown Malls: A Suggested Explanation from Wisconsin*

The survival of downtown malls is one of most difficult problems facing small cities in the United States. Over the past decade, small cities have been struggling to retain their downtown malls with mixed results, just as their large city counterparts had done several decades before them. In Wisconsin, where most small city downtowns have lost the battle of retaining retail to outskirts locations, Downtown Wausau appears to be holding its own. It is still booming in the face of outskirt location of retail activities. Using traditional methods of trade area analysis, the paper investigates the reasons behind the successful performance of Downtown Wausau compared to the failure of other small city downtowns in the state as retail centers. The paper concludes that the relative location of the city of Wausau, which in turn has led to the lack of strong competition, is the single most important trade area characteristic accounting for much of Downtown Wausau's success as a retail center.

Keywords: downtowns, trade area analysis, relative location

Yelena Ogneva-Himmelberger, Clark University. Email: yogneva@clarku.edu; *Urban sprawl in Moscow, Russia: linking pattern to process*

This paper analyzes spatial patterns of urban expansion in Moscow, Russia over a 10-year period right after the collapse of the Soviet Union. Spatial patterns of land cover change are examined using a novel technique, distinguishing between a systematic and a random change in the landscape. Once systematic patterns of change are determined, they can be linked to the underlying processes. Land cover maps were created from Landsat TM and ETM+ imagery for 1991 and 2001. Spatial metrics (texture measures) were combined with multispectral bands to classify the images using Fisher classifier, which is based on the discriminant analysis. Four broad categories of land cover were identified: built-up areas, forest, agriculture/open land, and water. Subsequent crosstabulation analysis determined spatial location and the extent of all land-cover transitions, including total loss and total gain per category. Quantitative information in the crosstabulation matrix was further analyzed according to its various components in order to calculate the amount of change expected due to a random process. Observed and expected gains and losses were compared to single out the systematic changes in the landscape. Our analysis showed that urban expansion at the expense of the agriculture/open land was the main systematic land cover change in Moscow between 1991 and 2001.

Monica V Ogra, Gettysburg College. Email: mogra@gettysburg.edu; *Gender, Vulnerability, and Human-Wildlife Conflict at Rajaji National Park*

This paper examines the gendered aspects of human-wildlife conflict (HWC) in a rural village adjacent to a national park in Uttaranchal, India. Based on an analysis of direct and indirect effects of HWC on people in one park community, this case study suggest that (a) local residents interact with wildlife in specific and gender-differentiated ways, (b) impacts of HWC are compounding in nature, and (c) negative consequences of HWC may be distributed unevenly between female and male household members. The findings highlight the relative invisibility of women's vulnerability to HWC, in particular, and point to

potential ways to reduce people-park conflict.

Chandrani Ohdedar, Penn State University. Email: chandrani@psu.edu; Tacit knowledge and quality of work: A case study of call centers in Kolkata, India.

A decade after lower labor costs prompted outsourcing of services from the developed world, much attention is being paid to the quality of services being provided by firms in developing countries. Offshore destination countries like India now face the challenge of providing high quality service at a low cost. Existing literature has shown a strong connection between tacit knowledge and higher quality of work in manufacturing industries. This relation has not yet been studied in greater detail in the voice-interactive services sector. The aim of this study is to explore this connection in the context of voice-interactive services through a case study of call centers in Kolkata (India). An ethnographic study of call center agents was done to understand how tacit knowledge is created in call centers and the skills developed by the agents by applying tacit knowledge to their work. Skill development is critical for improving the quality of work and moving up the value chain of services. The study concludes that tacit knowledge is vital for skill development and consequently better quality of work in voice-interactive services. However, certain characteristics of the labor processes within a call center, like long work shifts, limited growth opportunities, emotional stress at work often act as impediments to the effective translation of tacit knowledge into higher quality of services, thereby preventing agents to move up the value chain of services.

Koji Ohnishi, University of Toyama. Email: ohnishik@hmt.u-toyama.ac.jp; Children's social environmental learning through crime prevention maps in Japan

These days, there are a lot of crimes that children become victims in Japan. For creating and finding safe place for children, many schools' PTA and local governments make crime prevention maps for children. In these maps, many criminal and traffic dangerous points are indicated. This study evaluates these maps effectiveness for keeping children's safety, and is clarify children's environmental learning through these maps. Are these maps effective for crime prevention? Many crime prevention maps were made by adult in the local community. For children, it is just ready made maps. Children read just the signs of dangerous points from maps and they cannot find the reason why the points are dangerous. Children should understand why these points are dangerous and they must learn to find the dangerous points and places. Ready made crime prevention maps are not effective for children to learn crime prevention concept. Some crime prevention maps are made with children's participation. These are effective for crime prevention learning and social environmental learning. For map making, children have to walk their town with adult and learn the dangerous points and places, and they have chances to learn why these points and places are dangerous. For example, they learn dark and few people walking roads are dangerous for abduction and assault from adult. Map making process is important. For making effective crime prevention maps for children, children's participation style map making is important. The participation fosters children's understanding why these points and places are the dangerous.

Kayo Okabe, Hosei University. Email: kayo@folio-net.com; Atsuyuki Okabe, University of Tokyo. Email: ; Siripun Morathop, Dept. of Livestock Office, Thailand. Email: ; Wittaya Chintanawat, Chiang Rai Provincial Livestock Office. Email: ; Analysis of villagers' behavior of keeping chicken in North Thailand

The objective of this study is to analyze villagers' behavior of keeping chicken in relation to tribes, land use and topography of the villages in Chiang Rai Province, North Thailand. For this study, the questionnaire survey was conducted in January 2006 as part of the Japan-Thailand joint study of the Human-chicken Multi-relationships (HCMR) research project. This project has been studying domestication processes of chicken through the interdisciplinary viewpoint of geography, biology, anthropology, economics, and linguistics. The questionnaire consisted of questions about seven aspects: 1) characteristics of villages, 2) raising chicken, 3) chicken feed, 4) fighting cock and fancy chicken, 5) jungle fowl, 6) cost of raising chicken, 7) marketing chicken. The total number of questions amounted to sixty eight. The interviewers asked two persons in each village, i.e., a village head and a villager who keeps chicken (except for a few villages). The number of interviewed persons was 1236 across 669 villages. Focusing on aspects 1, 2, 4 and 5, this paper statistically examined the behavior of villagers with respect to: i) purposes keeping chicken, ii) methods of chicken raising, iii) methods of breeding, species selection, iv) choice of chicken type, v) experience of raising jungle fowl (original species of domesticated chicken), vi)

cross breeding between domesticated chicken and jungle fowl, vii) possibility of domesticated chicken turning to wild chicken, viii) fighting cock, color and shape preference. All these factors were examined in relation to tribes, land use and topography.

Keywords: chicken, tribes, topography

Kohei Okamoto, Nagoya University. Email: h44540a@nucc.cc.nagoya-u.ac.jp; The change of the function of visual information in geographical studies

Geographical studies commonly employ visual information such as maps and figures. The relationship between geography and visual information differs by research framework and it changes over time. This study examined the quantity of visual information employed by the papers in major geographical journals in Japan, U.S. and U.K. since 1950. The journals examined were *Geographical Review of Japan*, *Annals of the Association of American Geographers*, and *Transactions, Institute of British Geographers*. The result for AAAG was as follows. 1) Through 50 years in the late 20's century, the total number of visual information employed was 50 pieces per 100 pages in average, which was equivalent to the area of 25 pages (maps; 7pages, tables; 5pages, photograph, paintings, and pictorial diagram; 6pages, other figures; 7pages). That is, a quarter of the total pages were occupied with the visual information. 2) Historical analysis showed that the number of visual information was small in 1950's, and it rapidly increased in the 60's, and then reached the maximum in the late 20's century. It decreased subsequently through 70's to 90's. The results indicated that the visual information increased after the quantitative revolution of geography when the empirical studies flourished, and the role of the visual information became less significant in the recent studies.

Keywords: visual information, geographical journals

Yuko Okubo, University of California, Berkeley. Email: yokubo@berkeley.edu; Politics of Multicultural Education and Production of Ethnic "Others" in Globalizing Japan

This paper, based on an 18-month ethnographic research, explores Chinese and Vietnamese "newcomers'" (new immigrants') experiences of multicultural education in a multiethnic neighborhood in Osaka, Japan. In particular, I investigate the tensions that exist between Japanese teachers' interpretations of and responses to the discourse of the national government and the discourse of the local minority education. Under the multicultural education program, the marking of "newcomers" as ethnic "others" occurs despite teachers' efforts to empower these immigrants in school where citizens of modern-nations are produced. The teachers in my field site require all children whose parents are "newcomers" to be enrolled in Japanese language class regardless of the students' length of stay in Japan or their Japanese language ability. The national government, on the other hand, simply acknowledges Japanese language instruction for foreign students who are in need of the language instruction. Moreover, clubs that celebrate students' international backgrounds are often offered together with Japanese language classes, linking such marking of nationality to the lack of Japanese status in Japan. Since the local minority education encourages "newcomers" to be proud of their background as ethnic minorities, even second-generation Vietnamese, who are already fluent in Japanese, are further rendered members of ethnic minorities through such educational activities. Since the cultural assimilation of previous minorities (Burakumin [former outcaste people], resident Koreans) and the recent local internationalization movement (kokusaika) contribute to the increasing marginalization of the "newcomers," I argue that this phenomenon captures a unique moment in globalizing Japan, one that requires further examination.

Email: ; Justin Harrison, University of Canterbury, Department of Geography. Email: ; *Surface Microclimate Observations of an Iranian Desert*

Desert environments cover approximately twenty percent of Earth's surface and provide an important thermally extreme boundary to the atmosphere through exchanges of radiant and turbulent heat fluxes. They also provide an important contribution to tropospheric aerosols which strongly impacts atmospheric radiation budgets. Despite the considerable surface area and diversity of climates and ecosystems, desert microclimates have received relatively little detailed observational attention, particularly many Middle Eastern and Central Asian deserts. This study presents surface energy, radiation and water flux observations from a desert in Yazd Province, in the west of one of the biggest playas in Iran (Lout) which is covered by salt layers, located near the geographic center of Iran, collected in the summer and autumn of 2006. Observations include eddy covariance measurements of turbulent heat fluxes at 3 and 12 m above undulating sand dunes and sparse vegetation as well as the surface radiation budget, ground heat fluxes and profiles of temperature, humidity and wind speed. In addition, attention is brought to a severe environmental problem in Sistan Province, near the Iranian border with Afghanistan where strong northerly summer winds blow across a recently dried lake bed resulting in extreme sand and dust storms and inundation of the city of Zabol and surrounding agricultural areas.

Lisa N. Oliver, Simon Fraser University. Email: loliver@sfu.ca; If you build it? will they walk? Using GIS to examine the influence of land use on walking behaviours in Greater Vancouver, Canada

Examining environmental influences on walking is important from a population health perspective as it is the most common physical activity among adults. Local land use may influence walking patterns by structuring opportunities to engage in particular types of walking. Undertaking such research requires GIS methods to measure salient characteristics of individuals' local environments. This research uses GIS to evaluate the influence of land use on patterns of walking in Greater Vancouver. A survey of 2000 adults in suburban neighbourhoods in Greater Vancouver was conducted in February 2006. A 5-point Likert scale was used to assess three categories of walking in the neighbourhood: walking for leisure, walking to work/school, and walking for errands (e.g. grocery store, bank). GIS is used to construct one-kilometer circular and network buffers around each respondents postal code centroid. Land use characteristics are calculated for circular and network buffers including the proportion of land area that is residential, commercial, industrial and parkland. This research demonstrates that GIS methods are valuable for population health research to examine the influence of land use characteristics on patterns of walking.

Norman Oliver, M.D., M.A., University of Virginia. Email: noliver@virginia.edu; Kevin A. Matthews, M.S., University of Virginia. Email: kev.matthews@gmail.com; Mir Siadat, M.D., M.S., University of Virginia. Email: mirsiadat@virginia.edu; Fern R. Hauck, M.D., M.S., University of Virginia. Email: frh8e@virginia.edu; Linda W. Pickle, Ph.D., National Cancer Institute. Email: picklel@mail.nih.gov; Geocoding and selection bias in public health research using geographic information systems

Context: Researchers increasingly are using geographic information systems (GIS) to assess population health. However, GIS analyses can be biased owing to inaccuracies in geocoding. Objective: To describe selection bias in GIS analyses with unrepresentative data owing to missing geocodes. Design: A spatial analysis of prostate cancer incidence among whites and African Americans in Virginia, 1990-1999. Outcome measures: Statistical tests for clustering were performed and such clusters mapped. The patterns of missing census tract identifiers for the cases were examined by general linear regression models that included age, education, and income characteristics in the area. These analyses were stratified by the rural status of the community. Results: All cases in the VCR are located in

counties, and 26,338 (74%) of these cases were successfully geocoded to census tracts. The overwhelming majority of unmatched cases were in rural locations. Statistical testing for global clustering was highly significant for the entire study period. Statistically significant local clusters at the county level were identified in both time periods, using either 100% of the cases or the reduced data set of just those cases geocoded to census tracts (74%). In the cluster map for each time period, however, cluster patterns appeared markedly different, depending upon whether one used the cases located in the county or those geocoded to the census tract. Discussion: We found statistically significant pattern differences resulting from spatially non-random differences in geocoding completeness across Virginia. Appropriate interpretation of maps, therefore, requires an understanding of this phenomenon, which we call "cartographic confounding."

Keywords: geocoding, selection bias, spatial epidemiology, public health, cancer surveillance

Eric D. Olmanson, University of Wisconsin. Email: eolmanso@wisc.edu; A Short History of Imaginative Geographies of Lake Superior

This paper will examine the role of the imagination in the interpretation of the Lake Superior environment, focusing on the southern shore, with examples from the seventeenth and nineteenth centuries. It will examine the writings of Jesuit Fr. Claude-Jean Allouez, who left one of the earliest written accounts of the region, depicting the Lake Superior region as a demonic haunt; Henry Rowe Schoolcraft and Thomas McKenney, who each accompanied Lewis Cass, the territorial governor of Michigan Territory, on important expeditions to Lake Superior, and whose perceptions of landscapes and people were influenced by romantic poets, painters, and novelists; Charles Whittlesey and David Dale Owen, whose rigorous geological reports employed romantic aesthetic conventions and references to the sublime; mid-nineteenth century boosters, who imagined interminable resources and geographical forces all but determining the rise of a future metropolis on the west end of Lake Superior; and bird's-eye view artists, who depicted pastoral scenes in northwoods settings.

Keywords: imaginative geographies, ruins, Lake Superior, environmental perception

Elizabeth A. Olson, University of Edinburgh. Email: e.olson@lancs.ac.uk; Discerning the edges of faith: exploring the intersections between religious values and secular norms in development

In cities and elsewhere, recent geographic research on faith actors demonstrates a departure from conceptions of religious actions and organizations as conscripted, distinct places, and toward an analysis which focuses on the negotiation and contestation of ideological and normative boundaries between 'the secular' and 'the sacred'. In this paper, I explore the challenges faced by faith-based development organizations in negotiating meaning and practice in the modernist project of development. My examination draws upon ongoing participatory and action research with a network of Christian evangelical development organizations, and more specifically, on the ethnographic encounter of working with this group to elaborate a means for measuring spiritual impact. Rather than suggesting how spiritual impact can be measured, in this paper I disentangle the processes and conversations involved in defining terms and clarifying what a positive 'spiritual impact' might look like. I suggest that concepts such as justice are arrived at through complex negotiations between doctrine, identity and politics, including the practical problem of remaining responsive simultaneously to the expectations of religious membership and to those of secular states. I further examine the tensions between the secular solution of social justice as achievable through interfaith cooperation, and a view of justice and dignity as ultimately achievable only through spiritual transformation. Though the paper is particularly rooted in development discourse, it parallels ongoing conversations in other geographical settings about the boundaries between secular and sacred normativities and the consequences for how social agendas are established and pursued.

Jeff Olson, Geography Department, The Ohio State University. Email: olson.154@osu.edu; Geographic Changes in US Banking

The banking industry in the United States has undergone some major structural changes in the past 20 years. Banks, by and large, were restricted in their market areas by state boundaries by the Glass-Steagall Act of 1933. The Riegle-Neal Interstate Banking and Branching Efficiency Act of 1994, however, opened the door to interstate banking and has led to fewer banks, larger banks, and a change in financial centers and flows. This presentation looks to quantify the changes in geographical aspects of the banking sector and identify the implications of these changes to the economy.

Keywords: Banking, Economic Geography, Financial Geography

Judy M. Olson, Professor, Michigan State University. Email: olsonj@msu.edu; *Human Subjects Research and the IRB*

Academic research with human subjects inevitably involves IRB (Institutional Review Board) approval. Cartography, GIS, and visualization researchers, as well as those in many other areas of geography, commonly conduct human-subject studies that are innocuous (a usability focus group, for example) or they may conduct studies that put subjects at risk (a vehicle navigation protocol, for example). In either case, people may flock to participate or recruiting them might require considerable effort. Whatever the nature of the study, and regardless of how anxious people are to participate, the IRB has to give its approval for the study to proceed. Why do these Boards exist? Does IRB approval really matter? What do they look for? How does one get through the process without compromising what needs to be done? Do they really do audits? Relating the IRB process to human research in geography, and especially to research in cartography, GIS, and visualization, I will suggest some specific guidelines including: do not ignore it, use the process to prepare for and to check your readiness to conduct the research, know the required elements of Consent Forms and include them, and do not make unrealistic promises because you think it might help "get it through." Basic understanding of the principles of human subject protection help in interacting with IRBs.

Keywords: IRB, Institutional Review Board, human subjects research, cartography, GIS, visualization, usability

Tyra Olstad, University of Wyoming. Email: tolstad@uwyo.edu; *Defining the Red Desert: How Sense of Place Influences Conservation Values*

When federal officials began revising management plans to allow for oil and gas development on public lands in south-central Wyoming, citizens began vociferously campaigning to conserve the open, arid region known as the Red Desert. The professional positions expressed by both groups, however, do not fully reflect the rich relationships individuals have formed with the landscape; local residents' personal experiences and values have shaped their perceptions of the desert's geographic features and aesthetic qualities. This study uses qualitative methods to examine how such senses of place can ground conservation values in a region that is in the process of transformation.

Steven Oluic, PhD, US Military Academy. Email: bs6943@usma.edu; *The Hidden Front in the War on Terror: Radical Islam and Bosnia & Herzegovina*

The purpose of this research is to explore the presence and role of militant radical Islam in Bosnia and Herzegovina. Using open source intelligence and information garnered from visits with Bosnian and Serbian Embassy officials in Washington DC, the US Department of State, J5 - Department of Defense, and Defense Intelligence Agency representatives, this research indicates that a legitimate radical Islamic threat exists in Bosnia. The presence of former foreign Muslim fighters (mujahadeen), radical Islam linked NGOs and charities, the overseas training of Bosniak clerics in conservative Islamic states, Islamic banking operations, strengthening ties with known state sponsors of terrorism, and unwillingness of Bosniak political and religious leaders to even acknowledge and engage the issue of radical and militant Islam in Bosnia highlights a region ripe for possible exploitation as a sanctuary for radical Islamic operations. Moreover, the recent arrests of suicide bombers, terrorist cell members and discovery of links between Bosnia-based radicals and global terrorist network affiliates signifies that Bosnia is already an established base for radical and militant operations. This research illuminates a front in the Global War on Terror that receives scant attention or concern from US intelligence and military agencies.

Keywords: Bosnia, Radical Islam, Terrorism, mujahadeen

Eric Olund, University of Sheffield. Email: e.olund@sheffield.ac.uk; *White Slaves and Sovereign Subjects*

The white-slavery scare in the early 20th-century US unambiguously racialized and gendered prostitutes as white and female; indeed, Progressive social reformers appeared to regard the notion of a black prostitute as an oxymoron. I will explore the ways this racialized distinction was produced through different regulatory strategies in US cities at a time that the state was called upon more and more to regulate the minutiae of society.

Keywords: Progressive era, prostitution, race

Bruce O'Neill, 1st Year Phd Student, Stanford University. Email: boneil02@stanford.edu; *The exotics of space: Starbucks Retail & the production of urban 'dream worlds'*

This paper analyzes the exotic contours of themed space - the construction of urban dream worlds that seduce consumers and that consumers allow themselves to be seduced by. How are some kinds of consumption practices made to be attractive? I address this question through a spatial analysis of a Starbucks Corporation retail store, the international coffee company that has made billions of dollars convincing its customers that they are buying more than coffee. They are buying an experience. Starbucks, I argue, themes its space to this end - Starbucks exotically charges its space by promising an urban experience even in places that are solidly suburban. Drawing on the work of Henri Lefebvre, Roland Barthes and Mark Gottdiener, I argue that through the theming of suburban space, Starbucks produces a synthetic urban cafe experience that is clean, safe and sexy. Connecting my spatial analysis with the existing literature on shopping malls, I examine how Starbucks communicates its urban fantasy through things like hung art, music, lighting and windows. Lastly, I examine the significance of locating a Starbucks in rural Illinois. Referencing film and literary theory, my end point is that by visiting Starbucks, suburbanites who otherwise would not connect with the city are given an opportunity to people watch, to observe bustling spaces and to allow their imagination to wander - in short, to engage in a contrived form of flaneurie.

Keywords: Starbucks, themed space, commodity fetishism, city-&-the-suburb, flaneur

Aihwa Ong, University of California, Berkeley. Email: geoywc@nus.edu.sg; aihwaong@berkeley.edu; *Neoliberal Exceptions, Asian Assemblages*

Is neoliberalism an economic tsunami sweeping across the global landscape, saturating each nation in turn? Yet the very conditions associated with the neoliberal - extreme dynamism, responsiveness to contingencies, and strategic entanglements with politics - confound the multiscale approach of critical geography. This talk suggest a transversal approach that stresses situations of emergence over the stabilization a new global order. Neoliberalism is conceptualized as a migratory logic of governing that is taken up in environments as varied as the Asian tiger or post-socialist authoritarian without entirely replacing the political ideology. Using an analytics of assemblage, I identify a range of tropical milieus. In Asian contexts, neoliberal strategies are translated into policies for promoting self-governing subjects and knowledge societies. I will distinguish the differential conditions of possibility crystallized in Malaysia, Singapore, and China. When neoliberal strategies are introduced as an exception to business as usual, unexpected political and cultural outcomes ensue.

Keywords: Neoliberalism, critical geography, Asia, Singapore Journal of Tropical Geography Lecture

Serene S Ong, MS, University of Redlands. Email: Serene_Ong@Redlands.edu; *Local scale soil erosion modeling using the ArcGIS ArcHydro data model and the Revised Universal Soil Loss Equation (RUSLE): a case study for the North Coast of Honduras.*

The objective of this study is to present a hydrologic and soil loss model at the local scale, using a several watersheds in Northern Honduras as a case study. The Lean and Cangrejil watersheds on the North Coast of Honduras face serious problem with accelerated soil erosion due to increased subsistence farming on the steep slopes of the upper watersheds. In the lower portions of the watersheds, soil erosion has affected water quality within the rivers and deposited sediment into estuaries such as the Boca Cerrado on the lower San Juan River. This has caused the estuary to become shallow over the last few years, changing the coastal habitat for critical wildlife, e.g. the protected Antillean Manatee in the Cuero y Salado/RAMSAR wetland reserve. An assessment of soil loss is essential for formulating effective soil conservation and management plans of these watersheds for sustainable development and protected-area management. We used the ArcHydro data model as a basis for defining the hydrologic network, and the Revised Universal Soil Loss Equation to calculate sediment loss within the study area. The model will serve as a planning tool, allowing watershed and park managers to assess and model various land use practice scenarios and timings to minimize overall soil loss. This was a preliminary study, using the best available collected data for model inputs. The paper also makes recommendations for improved data quality collection and verification with ground checking and field studies.

Sharon Ordeman, San Jose State University. Email: erordem@pacbell.net; Charles E. Chapin, . Email: charliechapin@gmail.com; Site Selection, Disaster Recovery and GIS for Habitat for Humanity-Guatemala

Habitat for Humanity Guatemala needs a GIS application to model appropriate building site selection by assessing natural disaster risks and developing a much needed disaster response and recovery plan. While the organization has already built 20,000 houses, their goal of building 1.5 million homes is challenged by the volatile natural landscape. The devastation wrought by Hurricane Stan in October 2005 embodies the omnipresent risk of natural destruction in Guatemala while exposing a void in disaster management. Though Stan had been downgraded to a tropical storm by the time it reached Guatemala, the sheer volume of rain that it carried destroyed entire villages, roads and communication lines, impeding the distribution of food, water, shelter and medical attention. Linguistic barriers, cultural differences, distrust of government officials and rural isolation also hampered assistance efforts. The need for visual spatial information was clear. Designing a GIS to meet this need required onsite data analysis, GPS training and fieldwork and prototype map production. Work in the United States includes ongoing user interaction, data analysis, database design, map analysis and geo-referencing, and map production with the goal of producing a web-based GIS application that facilitates disaster recovery and saves lives.

Daniel E. Orenstein, Ph.D., Brown University. Email: Daniel_Orenstein@brown.edu; Leiwen Jiang, Ph.D., Brown University. Email: Leiwen_Jiang@brown.edu; Steven P. Hamburg, Ph.D., Brown University. Email: Steven_Hamburg@brown.edu; Demographic Versus Environmental Planning in Israel and China

Empires and nations have always had demographic policies that encourage resettlement of populations from the country's geographic core region to their peripheries. Historically, the justifications for such policies have included to strengthen borders, avoid population concentration in the geographic core, and to redistribute economic development. Often, the underlying goal of these policies is to address fears of secessionism and irredentism of local ethnic groups. While such policies have been central to empires and nations throughout history, in the late 20th century and early 21st century, their environmental implications are becoming increasingly appreciated. The types of development encouraged by such policies conflict with the goals of sustainable land use policies. Environmental planning is a relatively young phenomenon, although it has become a new central paradigm in many nations. We claim that the demographic paradigm in planning continues to pose a subtle, yet powerful, challenge to the successful implementation of environmental planning policies. We address this significant impediment to environmental sustainability management in two countries where both planning paradigms are currently influential. In both nations, ethno-demographic conditions in peripheral regions are perceived to pose challenges to central government sovereignty and settlement policies encourage migration of the nation's ethnic majority to peripheral regions. Both countries are in the midst of a paradigm shift in land use planning, towards an environmentally informed policy of protecting natural resources and avoiding landscape degradation. The more recent comprehensive environmental protection regulations in these nations require a rethinking of policies influencing population migration into peripheral regions.

David J. Organ, Ph.D., Clark Atlanta University. Email: djorgan@bellsouth.net; The Historical Geography of African American Frontier Settlement and Community Preservation: Allensworth, California, 1908-2008

African American historical townships and settlements represent important sites of memory for the remembrance, celebration, preservation and redevelopment of Black community life, history and culture. They constitute sites of resistance and struggle for those who founded and built them, and they remain so for those academics, planners and activists seeking to study and historically preserve these sites for the purposes of African American community redevelopment. This paper summarizes key conceptual frameworks and research findings from a larger study on the historical geography of African American frontier settlement and community preservation in Allensworth, California, 1908-2008. This study examines the historical rise and demise of one of the final chapters in all-black town development on the Pacific Coast frontier, which ultimately distinguished itself as an incipient chapter in the modern African American historical preservation movement. The political evolution and cultural landscape transformation of the historical all-black Allensworth Township into the heritage preservation community of Allensworth California State Historic Park constitutes the primary focus of this paper

Ferjan Ormeling, Utrecht University. Email: f.ormeling@geo.uu.nl; Menno-Jan Kraak, International Institute for Geoinformation Science and Earth Observation. Email: kraak@itc.nl; The national atlas in the Google era

The present activities of the National Atlas Foundation in the Netherlands are targeted towards automatic visualisation of spatial data available through the Geospatial Data Infrastructure (GDI) in a systematic and cartographically accountable way, thus also providing an alternative access to this GDI. By applying fixed templates, data from different sources can be made comparable. This development has been reported to the AAG in 2004 (Philadelphia) Apart from that the 'New national atlas' has to be made accessible for a larger audience. At present the envisaged functionality is still targeted at professional users. The new initiative described here links the national atlas to Google Earth and similar developments that put geospatial information in the public eye and define the new standards for easy access and broadly accessible functionality. The new objective is to link the map material of the National Atlas to a Google Earth environment. This is both a technical challenge and a challenge regarding its content. The technical challenge consists of converting the visualisation methods used for the national atlas (according to Open Geospatial Consortium standards) to a Google environment (using keyhole markup language). Apart from that it will be a challenge to see how the cartographic design (the 'atlas template') fits and functions within a Google environment still mainly consisting of satellite and aerial imagery. Another target is the inclusion of the temporal comparisons by incorporating and digitizing maps from previous national atlas editions.

Keywords: national atlas, GIS

Arnisson Andre Caparas Ortega, Indiana University. Email: acortega@indiana.edu; Trends and Patterns of Population Distribution and Urban Growth in the Manila Mega-Urban Region, Philippines

The Philippines' most recent Census reveals Metro Manila's waning power as a migrant-receiving region posting a negative net migration rate. However, there is a need to explicate this finding by considering population deconcentration and the spatial expansion of Manila beyond the administrative metropolitan region. This study considers an extended metropolitan region, the Manila Mega Urban Region (MUR), by the inclusion of the peri-urban interface which is comprised of towns of adjacent provinces. Demographic and spatial dimensions of the MUR are analyzed in terms of population growth, redistribution and outward expansion. Traditional methods for testing for population deconcentration and counterurbanization (Hoover's Index and Correlation between population growth rates and population density) are used to analyze trends of population distribution since 1908. Results indicate that the MUR is experiencing a deconcentration of population through time with the Metropolitan core experiencing population decline while towns in the peri-urban interface posting dramatic population growth. Thus, phases of population movements can be observed through time in the MUR: (1) population deconcentration from the core to surrounding zones within Metropolitan Manila, and (2) population deconcentration beyond the metropolitan region into the peri-urban interface. This population growth propelled by migration of Metropolitan Manila inhabitants into towns in adjacent provinces has led to the expansion of urban functions into surrounding communities and pose urban planning and administrative issues.

Keywords: Population deconcentration, Manila, Philippines

Migdalia Tamara Ortiz, Graduate Student, University of Denver. Email: mortiz4@du.edu; *The Distribution of Wireless Fidelity Networks in Denver: a relation to the Socioeconomic Landscape*

The current economy is driven by the thirst for innovation and the production of new kinds of information and communication technologies. However, many do not have equal access to technology and information, limiting their educational and employment opportunities. Places that lack the economic capability to develop the proper infrastructure to implement the evolving technology are left behind, thus creating what some have called a "digital divide" between haves and have-nots. In the United States many residents are living in neighborhoods that lack or have poor access to computers and the Internet, while the surrounding vicinities enjoy the services. The objective of the following study is to determine if a correlation exists between the geographic distribution of wireless fidelity (Wi-Fi) networks and the socioeconomic landscape of Denver, Colorado. The location of wireless networks was collected using GPS technology and beaconing, a method that allows wireless devices to perceive the service set identifiers (SSID) of the network access points. A logistic regression model was used to determine the relationship between the dependent variable (the location of the wireless networks) and the independent variables (household income, educational attainment and age structure). Geographic Information Systems (GIS) were used for geostatistical and geospatial analysis. The existence of a correlation between the variables makes it possible to identify, by income level, the variation in wireless network access. The analysis provides insight into the domestic digital divide in the Denver area.

Keywords: GIS, GPS, Wireless-Networks, Urban Geography

Kenneth H Orvis, University of Tennessee. Email: orvis@utk.edu; Sally P. Horn, University of Tennessee. Email: shorn@utk.edu; *Caveat Investigator: Improving Stratigraphic Control of Sediment Core Profiles*

The trend in paleoenvironmental research is toward ever-higher-resolution analyses, with a matching trend toward tighter chronological control. In part this is driven by the growth in development of annual and sub-annual archives such as tree rings, corals, and ice cores that can reveal short-term and even inter-annual climate variability: we naturally want our other proxies to reveal as much as possible. In part, too, it is driven by advances in AMS dating, and the consequent improvement in chronological control that has become possible and even expected. Over years of hand-coring lakes, bogs, and other soft-sediment sites, we have become familiar with a wide variety of physical and mechanical events that can result in retrieval of sediments that are out of position and even out of sequence. Many of these are obvious and adjustments can be easily made during the inspection and logging of cores. Others are not always obvious and in some cases may be nearly impossible to discern. This paper will explore these, to help foster awareness and dialogue, and to serve as a stimulus to good coring practices, correct interpretation of stratigraphy, and advances in the design of coring devices.

Keywords: paleoclimatology, techniques, sedimentology, stratigraphy, coring

Reecia Orzeck, Syracuse University. Email: rorzeck@maxwell.syr.edu; *Dialectics and Law*

This paper considers both the strengths and weaknesses of a dialectical approach to understanding of the institution of law, particularly international law. In so doing, it examines post-structuralist critiques of dialectics as well as the challenges to orthodox dialectics that have emerged from more sympathetic schools such as analytical Marxism and Critical Realism.

Keywords: law, dialectics, analytical marxism, critical realism

Sylvester Osagie, The Pennsylvania State University. Email: sool1@psu.edu; *Social and Cultural Dimensions of Oil exploration in Nigeria*

Until recently, oil exploration in the Niger Delta region of Nigeria was one devoid of all social and cultural sensibilities. Although the discovery of oil created visions of greatness, and was expected to be a source of relief from poverty, instead, the indigenes of this region that are mostly farmers and fishermen, were expected to internalize the costs of oil exploration and extraction. But these externalities (oil spills, gas flares, and ecological degradation) cannot be borne by these indigenes whose livelihoods can no longer be sustained by their environment as a result of ecological degradation. The fact that the sustainable livelihoods of the indigenes of the Niger delta People have been breached by these externalities reveals that one cannot study environmental degradation in isolation. Such study must include all the actors involved, and examine the social space in which these events are occurring. This paper analyzes the social and cultural dimensions of environmental degradation, and argues that the current relationship among the principal certainties, namely, the oil producing companies, the people of Niger Delta, and the state, is being tacitly, rather than explicitly, negotiated, leaving no room for enduring commitments. The strategy of oil exploration in Nigeria divagates from the acumen of most business ethicists. Oil companies subscribing solely to the profit motive, leave indigenes in

oil producing areas in the throes of major ecological devastation. While oil production radically alters the indigenous cultures in this region, there are no concomitant beneficial effects to mollify the impact of oil exploration.

Keywords: Environmental Degradation, Business Ethics

William Y. Osei, Associate Professor, Algoma University College. Email: osei@auc.on.ca; *Water for Sustainable Development in West Africa*

Unlike such critical development resources as energy that are internationally recognized tradable commodities, direct trade in global freshwater resources is not yet fully established. To this extent, global market forces can do little to help balance water needs between surplus and deficient regions. As the possibility of water markets appears distant for many reasons, countries and areas must use various approaches to enhance the security of their water supplies. The West African sub-region of Sub-Saharan Africa is emerging as a critical water hot-spot. The sub-region as a unit has the highest population of all of Africa's regions, and the rate of population growth is equally among the highest. Agriculture, industrialization, energy, rapidly growing urban areas, and the needs of the environment seem to be drawing on existing water resources to their limit. To add to these are the potential effects of global climate change. This presentation provides a detailed analysis of the supply and demand potentials of water in West Africa. The goal is to identify critical water issues, nature of issues, current water management regimes at the local, country, and regional levels, and to identify opportunities for sustainable water security policy and planning needs. For reasons of ecological, geographical orientation of countries, budgetary, technical, and managerial thresholds, regional cooperation and cross-border initiatives are likely to work for security in water in the region.

Keywords: water resources, sustainable development, West Africa

Kenji K. Oshiro, Wright State University. Email: kenji.oshiro@wright.edu; *Food Safety as a Factor in International Agricultural Commodities Trade*

Incidents of the spread of diseases through food consumption have increased awareness of potential dangers in the food supply of a country. Increases in risks result from growth in trade as well as processes of food preparation. Food safety involves potential dangers from the food supply perceived by the consuming public and is an important consideration in policy formulation. The concern for food safety influences decisions on certain components of international agricultural trade by a country. This paper attempts to demonstrate the idea by examining the trade ban and regulations to ensure safety of beef by Japan. The initial case of Bovine Spongiform Encephalopathy (BSE) in Japan was found in September, 2001. A few months earlier in response to an inquiry, Japanese officials received a warning of possible diffusion of BSE through the importation of meat-and-bone meal supplement. After the first case, officials were criticized for their slow reaction to the warning. A total of 26 BSE-infected animals have been discovered by May, 2006. An import ban on American beef was imposed with the discovery of the first case of an animal infected with BSE in 2003. The ban was lifted in 2005 and re-imposed in January, 2006 when an inspection revealed banned parts in a shipment of carcasses from the United States. It was again lifted during the same year. The rapid reaction to the discovery of BSE in the United States was a response to criticisms of earlier bureaucratic inaction and widespread public perception of possible infection.

Jeffrey P. Osleeb, University of Connecticut. Email: Jeffrey.Osleeb@uconn.edu; Yehuda L. Klein, Graduate Center - City University of New York. Email: YKlein@gc.cuny.edu; *An Economic Analysis of Florida Beach Tourism*

The coastal zone of the United States is a major source of economic growth and as a result has seen significant increases in population over the past fifty years. Most aspects of the coastal economy - tourism, residential and commercial development - are heavily dependent upon the environmental preservation and recreational quality of beaches. In earlier work, we documented through empirical evidence the economic and demographic importance of the coastal zone, and the crucial role that tourism plays in its economy. The link between beach enhancement activities on the one hand and tourism and the coastal economy on the other is less-well substantiated. This study links an exploratory spatial data analysis of the tourism sector with case studies of the economic impacts of beach management projects on the coastal economy. We show that, in several important Florida tourism-dependent counties, beach enhancement projects generate economic benefits in the form of greater than expected increased earnings in the tourism sector. A regression model is developed to determine the relationship between beach renourishment projects and their expected impact as a tourist attraction. Results indicate that beach renourishment is an important attractor for tourist dollars in Florida.

Keywords: Tourism, beach renourishment.

Ulrich Oslender, UCLA. Email: Ulrich.Oslender@ges.gla.ac.uk; *Geographies of terror and spaces of confinement: re-conceptualizing forced displacement (with an anti-geopolitical eye on Colombia's Pacific coast region)*

I propose the conceptual framework of 'geographies of terror' as a critique of dominant geopolitical discourses on the 'war on terror', and as a methodological tool to study the impact of terror and its spatial manifestations on local populations on the ground. Applying this framework to Colombia's Pacific coast region, I engage critically with the discourses on forced displacement that have become institutionalized in Colombia to refer to the systematic terror campaign unleashed by armed groups on rural black populations in this region. In particular I will show how an underlying global capitalist logic of displacement can account for the de-territorialization campaigns launched against local populations. One aspect of this de-territorialization is the production of spaces of confinement, in which local populations' mobilities are controlled and restricted by diverse armed actors. This double-process of dis/emplacment allows capital to further penetrate this region. This violent process is argued to be characteristic of a global capitalist modernity.

Keywords: terror, forced displacement, resistance, Afro-Colombia, black communities

Hari Osofsky, University of Oregon School of Law. Email: hosofsky@uoregon.edu; *Local Approaches to Transnational Corporate Responsibility: Mapping the Role of Subnational Climate Change Litigation*

This paper explores the implications of subnational climate change litigation over coal-based energy. It begins by introducing the phenomenon of subnational climate change litigation, and locating it in broader context of subnational efforts to address climate change, transnational climate change litigation, and transnational adjudication in subnational tribunals. Using a law and geography lens, it then engages how this litigation connects to place. As demonstrated by cases in Minnesota (U.S.) and Victoria (Aus.), this type of litigation and the broader policy context in which it occurs reflect the multiscale geography of the underlying problem, human-induced global climate change. The piece next discusses the implications of this geography for current understandings of subnational tribunals by examining these fora as spaces for transnational issues and as spaces for dialogue. It concludes with a reflection of the value of law and geography analysis in these cross-cutting contexts.

John Östh, . Email: john.osth@kultgeog.uu.se; *New measure for labor market assessment: going beyond the spatial mismatch hypothesis*

For almost four decades the spatial mismatch hypothesis has been used to analyze labor market outcomes particularly for marginalized minorities. The hypothesis is commonly used to illustrate the spatial relationship between job growth in the suburbs and jobless population in distressed neighborhoods. Despite methodological advances, the validity of empirical analyses using the spatial mismatch hypothesis is often contested. This is factual partly because there is no natural way of describing accessibility to jobs, partly because the commonly used measures of accessibility, such as commuting distance, are often plagued by endogenous factors. In this presentation a new measure of job accessibility is introduced, which is constructed to answer to the need for an improved measure of job accessibility. The measure, ELMO (Estimated Labor Market Outcome), is constructed to mimic competition for workers/jobs on the labor market, at the same time as problems associated with the use of endogenous factors significantly are reduced. The presentation demonstrates the usefulness of this method and applies it to a uniquely detailed database for every individual in the Swedish labor force.

Keywords: Labor market, spatial mismatch, GIS, time-geography

Aleck S Ostry, MA, MSc, PhD, University of British Columbia. Email: ostry@interchange.ubc.ca; *Abnormally High Weights in Canada: The Long View*

In Canada, and most other developed nations, there is mounting concern about an "epidemic of obesity". This concern is largely based on the observation of rapid increases in overweight and obesity, especially among children, and also mainly since the early 1980s. In this paper we argue for an historical analysis of the evolution of abnormally high weights using Canadian data. The current, a-historical, discussions about obesity fail to take into account that in most developed nations, as early as the 1950s, the proportion of the population that was overweight and obese was already very high. Documentation and recognition of the long term existence of high population weights is important adding to an analysis of the spatial variation in population weights. As well, long term data on changing population weights when linked to national food disappearance data provides insights into the links between changing dietary patterns at the population level and changing weights. Finally, an historical analysis demonstrates that most leading nutritionists, at least in Canada, had identified obesity as

"epidemic" in the population as early as 1970. This paper explores why, although identified over 35 years ago as a major health problem, it is only now that obesity has the attention of health policy makers.

Natalie Oswin, National University of Singapore. Email: geoon@nus.edu.sg; *Postcolonizing sodomy in global city Singapore*

After decades of overtly disallowing expressions of homosexual identity in urban space, the Singapore government has allowed gay and lesbian commercial establishments to surface over the last several years as part of an effort to foster a 'creative economy' and thus retain its competitive edge as a 'global city'. At the same time, attempts to lobby for gay-friendly policy and legislative change have been firmly dismissed. These events have resulted in the emergence of an unprecedented public discourse around homosexuality in the city-state. Two prominent threads of this debate are that it is a 'gay issue' (in other words, heterosexual dominance is pitted against homosexual oppression) and a matter of East versus West. In particular, a dominant argument that homosexuality is a western issue has been countered by an insistence that homophobia in the form of a left-over colonial sodomy law (Section 377A of the Penal Code) is the real import. This paper considers the historical application of Section 377A. It interrogates the ways in which this regulatory mechanism has been used to police the boundaries of a particularly raced and gendered heterosexual norm; a norm that has played a prominent role in the city-state's efforts to negotiate a place for itself as Southeast Asia's 'global city'. This paper thus explores a wider range of social and geopolitical forces supporting Singapore's heteronormativity than current emphases on homophobia and localism permit.

Keywords: sexuality, regulation, Singapore

Doyle Ott, PhD, Sonoma State University. Email: doyleoo@yahoo.com; *Where the Extraordinary is Ordinary: A Phenomenology of Youth Circus Training*

This paper digests the findings of a phenomenological study of youth circus training. Using qualitative methods, the study identified meanings participants in a youth circus program made from their training. They identified youth circus as a site of constructive risk taking, aesthetic and athletic development, intense interpersonal relationship, and a place where the ordinary can become extraordinary and the extraordinary can be accepted as ordinary. The study finds context within the history of American circus, the development of youth circus from its early beginnings in the 20th century, and the construction of "childhood" in contemporary american society. Multiple intelligences theory is used as an ideological framework for the findings.

Keywords: circus, youth, education

Thomas Ott, University of Mannheim. Email: thott@rumms.uni-mannheim.de; *The City in Disguise: Vancouver as a Stand-in for Seattle in Hollywood Movies*

Pressed by declining profits and ballooning expenses at home, Hollywood has shifted production abroad, particularly the production of low-budget movies made for television. Most are made in Canada, where a weak currency, financial incentives and proximity to the United States make production relatively inexpensive and convenient. Especially Vancouver, British Columbia, has developed into a major location for movie production; the city has become known in the industry as "Hollywood North". Major studios and independent producers alike are attracted to Vancouver by the abundance of spectacular locations, the highly experienced production teams, the pool of talented local actors and the state-of-the-art post production facilities. However, despite its role as a set for major Hollywood movies, the city is hardly ever identified as itself. It rather acts as a stand-in for American cities, especially Seattle. This process of reducing Vancouver into a mere backdrop by neglecting space and place as a source of stories and characters is fostered by American production companies and the British Columbia Film Commission alike. The scenery of the built urban fabric obstructs, however, the view on inherited, more fundamental differences in social and cultural structures and processes between Canadian and American cities.

Samuel M. Otterstrom, Brigham Young University. Email: samuel_otterstrom@byu.edu; *Genealogical geography and the construction of shared personal identities, population migration histories, and settlement historical geographies using a northern California case study*

Each year thousands of people attempt to unveil their family trees through research into their historical family linkages. These efforts often yield surprising discoveries to these enthusiasts that expand the temporal and spatial extent of their personal connections with past places. As they reach back in time, a doubling of ancestors through each successive generation means an increasing potential of finding more and more commonalities with the heritage of their

contemporary associates in the form of shared progenitors or identical ancestral origins. Even if a common genealogical link is not revealed, it becomes apparent to the amateur family historian that historical human events are not actually individual experiences that are isolated in a past time and place. This is especially true if the past persists in the memory of a person's descendants through the written and oral preservation of their life's happenings. These ties to the past will become attached to the personal consciousness of the children and grandchildren of the deceased as they are kept in the family. Additionally, genealogical records illustrate the profound importance of family relationships in fashioning historical migration trajectories, settlement patterns, and regional history. My case study follows the diffusion and spread of members of some early northern California families over multiple generations. By using a genealogical geography approach, the research reveals the intertwined relationships that exist among the topics of historical population/settlement geography, local history, and shared personal heritage.

Keywords: genealogy, migration, settlement geography, California

Judith Otto, University of Minnesota - Minneapolis. Email: otto0114@umn.edu; 'Workers' paradise' or entrepreneur's dream? Communist heritage tourism in Nowa Huta, Poland

The centrally-planned 'new town' of Nowa Huta, Soviet-financed and built for Poland's largest steelworks and its workers in the 1950s, was a tourist attraction from the beginning, drawing architects and planners to see how the tenets of socialist planning could be given architectural form. After the fall of communism, however, as Nowa Huta suffered massive unemployment, lack of investment, and a tarnished image due to its associations with the repudiated communist regime, tourists flocked instead to the Renaissance urban spaces of Poland's 'Golden Age' in Krakow. In this paper, I explore how local entrepreneurs have begun to rebuild Nowa Huta's reputation by organizing tours for Western visitors eager to see beyond the mass-market tourism of Krakow's Old Town and other nearby sites. Using promotional materials and transcripts from these tours, I analyze how new narratives about the communist past are being built and shaped against the backdrop of the Soviet baroque landscape, and moreover, how the meaning of those architectural forms is shifting to promote a very different history of Nowa Huta than its founders envisioned. These narratives - fighting for economic survival, fighting for political and religious freedom, and fighting the geographical and social isolation of Nowa Huta itself - illustrate a paradox of post-socialist economic transitions: that the burgeoning tourism sector is driven in part by a focus on a period of history that Poles would very much like to leave behind.

Quin M. Ourada, Oregon State University. Email: ouradaq@onid.oregonstate.edu; Anne W. Nolin, Oregon State University. Email: nolina@geo.oregonstate.edu; Characterizing Spatial Variability of Northern Hemisphere Glaciers: Principle Components Analysis using 45 years of Climatic Data

Glacier mass balance is an instantaneous metric of glacier response to climate change. Understanding glacier response to climate change at regional or larger scales must include glaciers not directly measured. Mass balance data collected from a small number of reference glaciers must be scaled and applied as proxy data to the larger set of unmeasured glaciers. Glaciers respond to changes in both temperature and precipitation, but sensitivity to either parameter is dependent upon combined climatic setting. Present methods for classifying glaciers to geographic regions are disparate and may lead to incorrect assumptions regarding response to climatic setting. Regionalization of glaciers based on variability of both temperature and precipitation allows for scaling that encompasses the two primary driving forces controlling glacier response to climate change. Using monthly temperature and precipitation re-analysis data from the European Center for Medium Range Weather Forecasting (ECMWF) ERA-40 dataset, variability in a 45 year record of temperature and precipitation is spatially characterized. Principle components analysis is used to identify regions of spatial variability in both temperature and precipitation from 1957-2002. Glaciers are then grouped according to this variability. Balance datasets from reference glaciers within each region are tested for similarity of response to determine the suitability of the method for glacier classification.

Joel Outtes, UFRGS-Universidade Federal do Rio Grande do Sul. Email: joel.outtes@ufrgs.br; Ana Cristina Castagna, UFRGS. Email: ; Amanda Fialho Moraes, UFRGS. Email: ; The IFHP- International Federation for Housing and Planning (1913-2007)

The research investigates the history of the IFHP-International Federation for Housing and Planning, its characteristics, network of participants, changes in its policies as well as the role of countries, institutions, groups and individuals in its decisions, policies and intellectual output. The IFHP was created as the

International Garden-Cities Association in 1913 and still exists. The work investigates the role of this institution in the international flow of planning thought and practice, in urban management as well as its role in the constitution of a transnational community of planners. One of the questions to be discussed is how far certain national, regional and particular experiences in housing, planning and management were adopted in certain periods by the institution. In another direction, the resonance or influence of certain ideas and policies of the IFHP in specific, national or regional experiences in housing, planning and related areas will also be explored.

Keywords: International Federation for Housing and Planning, planning, garden-cities, housing

Thomas Overly, Graduate Research Assistant, Center for Remote Sensing of Ice Sheets, University of Kansas. Email: toverly@crsis.ku.edu; Spatial variability of snow accumulation near Summit, Greenland

Due to the technical and physical difficulties involved, it is not known yet whether the Greenland ice sheet is shrinking or growing. Current estimates of snow accumulation on Greenland have large errors (20-25%) because they are derived from a relatively sparse network of point measurements (Ohmura and Reeh, 1991; Bales et al., 2001). Traditional point measurement techniques (snow pits, manual probes, shallow firn cores) are limited in space and often do not represent the region surrounding them due to spatial variability caused by surface slope and deposition and erosion by wind (Maurer, 2006). To determine whether the Greenland ice sheet mass is increasing or decreasing and how this will affect the global sea level, The Center for Remote Sensing of Ice Sheets (CRSIS) at the University of Kansas has developed several ice penetrating radar systems. Ground-based ultra-wideband radar (500-2000 MHz) operated near Summit, Greenland (72.5789 N, 38.4597W) in July, 2005 is used to map near-surface internal layers to a depth of about 150 m with 10 cm range resolution. Radar paths connecting GRIP and GISP2 ice cores enable accurate dating of accumulation radar layers. The accumulation layers are then compared with measurements taken from the ice core site, and statistical and spatial analysis is then conducted to determine the distance from the ice core at which the two sets of measurements become uncorrelated. This analysis provides an improved understanding of spatial variability and accumulation rates in the Summit region.

Bronwyn Sigrid Owen, Truckee Meadows Community College. Email: bowen@tmcc.edu; Jake E Haugland, . Email: isbree@gmail.com; Successionary lag effects resulting from fine-scale frost disturbance in a recently deglaciated landscape.

The role of fine-scale frost disturbance on patterns of vegetation succession was examined on recently deglaciated terrain in the Jotunheimen region of Norway. Our goal was to compare successional trends on microsites of varying frost disturbance intensity with relatively 'stable' ground. A chronosequence along the foreland of the glacier Styggehdalsbreen supplied terrain with documented ages since deglaciation (0-150 years before present), where frost disturbance generally decreases with increasing terrain age. Vegetation was sampled along the chronosequence in three differently-aged units, and at three different disturbance intensities within each unit. Results show that fine-scale frost disturbance in patterned ground features produce a lag effect by delaying vegetation succession when compared to surrounding 'stable' terrain. In addition, individual species found early on 'stable' ground are found only older disturbed sites. These fine-scale disturbances are therefore important to overall landscape heterogeneity, although unlikely to be detected in landscape-level studies.

Marc R. Owen, M.S., Ozarks Environmental and Water Resources Institute (OEWRI), Missouri State University. Email: mowen@missouristate.edu; Robert T. Pavlowsky, Ph.D., OEWRI, Missouri State University. Email: ; Mark A. Gossard, Graduate Student, Missouri State University. Email: ; Timothy W. Smith, P.E., Greene County Resource Management Department. Email: ; Channel Restoration in Urbanizing Streams of the Ozark Plateaus, Greene County, Missouri

Channel instability due to urbanization has impacted streams around the Springfield, Missouri metropolitan area resulting in flooding, bed scour, bank instability and increased sediment yields. Ozarks streams have gravel or bedrock beds and banks are composed of chert gravel and fine grain material that is fairly resistant to erosion. Due to karst, many streams have losing sections and/or have spring discharges that along with changes caused by urbanization complicate the understanding of low flow hydrology critical to evaluating channel forming flows. Regionally, no channel restoration guidelines are available and Ozark stream channel response to urban hydrology is poorly understood. The study reach is part of the Ward Branch of the James River located on the south side of Springfield, which has encountered rapid urban growth over the past two decades.

The reach is located in an area where Greene County Missouri purchased and removed homes affected by flooding from recent developments. The objective of this project is to use bioengineering techniques and natural channel design concepts to stabilize this section of stream and provide guidelines to developers, contractors and design professionals on the process necessary to implement these techniques in the field. This paper will describe the role of geographers in the multidisciplinary team's approach used to implement the project's objectives focusing mainly on fluvial geomorphology. Geographers collected field data, assisted in the location and design of stream remediation practices, and are responsible for pre and post restoration monitoring of the reach.

Christina D. Owens, University of California, Davis. Email: cdowens@ucdavis.edu; *The Universal Consumer?: Selling Human Rights Rhetoric in Japan*

Although Japan is a signatory to the United Nation's Convention for the Elimination of all Forms of Racial Discrimination (CERD), there are no national or regional laws that specifically address the legal ramifications of discriminatory acts. When naturalized Japanese citizen Debito Arudou (then American Dave Aldwinckle) was refused entry into a series of hot spring resorts in 1999, the local government met his protests with a neoliberal hands-off policy. Arudou's (in)ability to fully participate in the consumer market has become an impetus for his continued activism, as he is in the process of taking this case to the UN. This paper uses the Arudou case to expand on recent scholarship that looks at the infiltration of neoliberalist thought into transnational social movements. In reacting to the government's market-driven policies, Arudou often redeployes a neoliberalist rhetoric within a human rights framework. As both of these discursive regimes are associated with Euro-American hegemony, Arudou's status as a white, male, former American citizen takes on particular significance. Even though Arudou connects his cause back to a larger subordinate group that he terms "Japan's people of color and difference," his focus on consumer citizenship and juridical solutions belies the limitations of such a grouping. I will explore the contours of these limitations through analysis of Arudou's 2004 book, *Japanese Only*, which documents and condenses his vast internet archive of activist work on this issue.

Kwadwo Owusu, University of Florida. Email: Kowusu@ufl.edu; *Trends In Spatio-Temporal Variability Of Rainfall In Ghana, (1951-2000)*

This paper investigates trends in annual rainfall totals within the four agro-ecological zones of Ghana during the fifty-year period of 1951-2000. A general downward trend has been reported throughout West Africa, with a marked contrast between conditions in the first two decades and the last two decades the period studied. Potential causal factors being variations in Atlantic Sea surface temperatures, the Inter Tropical Convergence Zone (ITZC) and loss of vegetation among others. A similar distinct break in precipitation regime is found in the mid-1970s in many locations globally. The observed pattern of rainfall totals follows the general downward trend with slight sub-regional variations. Evidence for such a break is sought by applying the hypergeometric distribution to the number of above/below average annual rainfalls in each 20-year period. The humid southwest and dry sub-humid north show a significant reduction (greater propensity for below average rainfall totals than expected by chance) in the last two decades, while a similar, but not significant, drying is present in the moist sub-humid region. Our finding provides a further confirmation that the country like the greater region is experiencing a reduction in annual rainfall with increased inter- and intra-annual variability in the last 20-year period of study.

Keywords: Rainfall variability, Ghana, Agriculture,

Tonny J. Oyana, Southern Illinois University. Email: tjoyana@siu.edu; *Learning Experiences from Teaching Advanced Geographic Information Systems (GIS) Concepts using a Case Study Approach*

This study presents a creative way of teaching Advanced Geographical Information Systems (GIS) based on observations collected over a three-year study period. The use of a case-based approach for teaching advanced GIS studies is proposed. Case studies for teaching are selected based on their relevance to GIS. The case study approach was inspired by past work and the need to develop a fully fledged GIS system for managing U.S. Homeland Security (HLS). The study population consists of three groups who have taken Advanced GIS course spanning a study period from 2004 to 2006. The sample size comprises forty subjects (n = 40) from three academic years with a response rate of 65 percent. The use of case-based modern-style pedagogical method promotes students' desire to learn and discover new concepts, and most importantly gets students actively involved in contributing towards real world GIS solutions. This novel approach encourages, engages, and provokes students to think critically as they explore and discuss the science and technologies behind GIS. The teaching approach also creates an interactive dialogue between the instructor and the students and

stimulates the learning process. Case studies developed from such a study make classroom experiences more lively, attractive, relevant, and interesting.

Rupal Oza, Hunter College, CUNY. Email: rupal.oza@hunter.cuny.edu; *Nuclear Tests and National Virility: Gender and Sexual Politics of Militarization in India*

On May 11, 1998 India detonated three nuclear devices followed by two more on May 13. This crossing of the nuclear Rubicon was received among wide sections of the Indian public with enthusiasm and celebration. India's nuclear status was particularly significant among the Hindu Right who have historically been invested in militarized strength as part of their ideologically and political project. The nuclear tests came to be understood and debated through a deeply gendered and (hetero)sexualized discourse. For instance, Bal Thackeray, the chief of Shiv Sena, claimed in response to the tests that "we have to prove that we are not eunuchs." In this paper I examine the discourse of masculine strength and virility associated with India's nuclear tests. I suggest that the nuclear tests were indicative of what I call "fetishized sovereignty." They represent the displacement of control of unstable political-economic conditions in the country onto demonstrations of militarized strength. My focus is on the conjuncture between the ascendance of the Hindu Right and the growth of middle class nationalism in the context of neoliberal reform within which the tests take on added import. Following Michael Taussig's usage of "totem" to understand state fetishism, I explore the bomb as a "totem fetish" imbued with the power to restore India's emasculated masculinity.

Keywords: Militarization, India, masculinity

Biricik Gozde Ozacar, University of Arizona. Email: bsumeli@email.arizona.edu; Stephen R Yool, Assoc.Prof, University of Arizona. Email: yools@email.arizona.edu; Cigde Goksel, Assist.Prof, Istanbul Technical University. Email: goksel@itu.edu.tr; Michael E Bonine, Prof, University of Arizona. Email: bonine@email.arizona.edu; *Effects on Change Detection of Merged Spatial and Spectral Data over Istanbul, Turkey*

Change detection aims to monitor and determine the type, location and amount of the land conversion and also enables modeling of urban growth impacts on the environment to guide the future urban and resource management and planning studies. In this project, we evaluate the value of fused spectral and spatial features for urban change detection in Istanbul, Turkey. Istanbul is the biggest city in Turkey, and is facing environmental problems and significant land transformations concurrent with rapid urbanization and uncontrolled population growth (500,000/year). The change vector analysis (CVA), which uses spectral bands from multi-temporal satellite data to measure the direction (the angle of the change vector) and the magnitude (the length of the change vector) of change, is applied to multi-temporal Landsat TM and ETM+ satellite time series image data set (1984, 1987, 1997, 2001) to detect and characterize the landuse/cover changes in Istanbul. We aim to test whether structural cues, characterized by image texture, add skill to the change vector analysis protocol compared to spectral data alone. Considering the large study area (more than 5000 km²) and the medium resolution (28.5 meters) data set images are divided into several subimages prior to unsupervised classification process. In order to be more confident on mapping the changes we also define a threshold using Kappa statistics.

Keywords: RS, change detection, change vector analysis, urban, spatial structure, Istanbul, Landsat

Esra Ozdenerol, University of Memphis. Email: eozenrl@memphis.edu; Sylwia Bialas, Graduate Student. Email: Sywiab78@yahoo.com; Bryan Lee Williams, University of Tennessee. Email: bwilli36@utmem.edu; *Spatial Analysis of Sudden Infant Death Syndrome in Memphis, Tennessee*

Birth outcomes in Shelby County, Tennessee are simply atrocious. Infant mortality rate in parts of Memphis exceed 16 per 1,000 live births as opposed to about 10 per 1,000 live births in the state and about 7 per 1,000 live births nationally. In 2002, 14% of children in Memphis were born prematurely as opposed to 12% nationally. Our research investigates spatial clustering of SIDS (Sudden Infant Death Syndrome) in Shelby County. Looking for an answer to the question: "Are SIDS cases clustered relative to non-SIDS infant deaths?" we used Cuzick and Edwards method to screen for clusters of SIDS cases between 1999 and 2003. This method uses the control location to reflect the geographic variation in the population density as a whole. The data showed significant spatial clustering of SIDS cases relative to the spatial distribution of the controls.

Keywords: Spatial, GIS, medical geography, SIDS

Alpaslan Ozerdem, PhD, The University of York, UK. Email: ao102@york.ac.uk; *Transformation of State-Civil Society Relationships in Post-Disaster Recovery*

Recent studies of disaster management have noted the powerful effects of the catastrophic earthquakes on civil society's relationship with the state and the aim of this paper is to provide a review of how state-civil society relationships have been changed in the aftermath of the catastrophic earthquakes that affected Kobe in 1995, the Marmara region in 1999 and the Gujarat in 2001. Through a comparative analysis, the paper will attempt to answer whether or not the occurrence of large-scale disasters strengthens the organisational power and autonomy of the state, how such events mesh with the policies and structures of the international development industry and why civil groups across the world have been unable to reduce their vulnerability to natural hazards. These issues are, in fact, particularly pertinent given the optimism which marks much of the literature relating to the third sector. The paper questions to what extent can acutely destructive earthquakes be seen as a catalyst for the development of the third sector and a civil basis for greater governmental efficiency and accountability? Does the empowerment of civil organisations imply a diminution in state responsibility and action? Have processes of civil empowerment endured or have state agents been able to appropriate their spheres of activity and influence? In summary, can earthquakes and the threat of earthquakes be regarded as an important marker in the 'modern' transition from a politically passive population to an active, rights-based citizenry?

Keywords: state, civil society, earthquake, kobe, marmara, gujarat

Anssi Paasi, University of Oulu. Email: anssi.paasi@oulu.fi; *Nationalism as symbolic exchange: education, religion and military practices in the reproduction of the Finnish nation*

Different forms of nationalism are context-dependent processes that transform perpetually. Nationalism is a specific territorial form of ideology that is often hidden to such expressions as national identity, patriotism, duty or love for one's homeland. One explanation for this is that whereas nationalism often carries negative and aggressive connotations in public discourse, national identity and patriotism are often more positively laden expressions. Established states normally control the key institutions where both the production and reproduction of nationalism take place. It is at times difficult to distinguish these two sides of the same coin since the production and reproduction often take place in the same process that is the perpetual nation building process and the symbolic exchange between societal power and individuals. This paper will scrutinize the reproduction of nationalist practices that are based on symbolic and physical violence in the Finnish context. Key institutions to be analysed will be education and military which are both currently challenged in the context of the EU. This paper also scrutinizes how religion has been exploited in the operation of these institutions.

Keywords: nationalism, , symbolic exchange, military, education

Pablo Pacheco, Center for International Forestry Research (CIFOR). Email: p.pacheco@cgiar.org; *Agrarian reform for forest people in the northern Bolivian Amazon*

The implications of land reform are still not well known in the tropics given that it does not have linear implications in income generation and deforestation, which are related not only to the type of property rights granted to people but to a broader set of economic and institutional factors. This paper explores this issue in the northern Bolivian Amazon in which rainforest is the main vegetation cover, and agro-extractive communities and barracas are the predominant tenure systems. In this region, land rights allocation has not followed the same criteria employed in Acre where access rights to forest people were granted through the formal recognition of extractive reserves. In northern Bolivia, land rights are granted by implementing an agrarian reform which consists in the distribution of lands in household plots but preserving community land ownership. This paper argues that agrarian reform has contradictory impacts in shaping the interactions between people and resources. On one side, it may promote forest conservation and enhance people's livelihoods by securing access to Brazil nuts, while on the other side it stimulates higher pressure on forest timber resources. The factor explaining the final outcome is mostly related to the preexisting community institutions rather than to economic and geographical factors.

Keywords: Extractive economies, agrarian reform, Brazil nuts, Bolivian Amazon

Ben Page, University College London. Email: b.page@geog.ucl.ac.uk; Claire Mercer, University of Leicester. Email: ccm2@leicester.ac.uk; Martin Evans, University of Leicester. Email: mne5@leicester.ac.uk; *Moving Homes: migrants' associations and the places they make*

What do geographers bring to studies of migrant labour that political scientists, sociologists, anthropologists, historians and demographers do not?

This paper argues that what geographers bring is a sense of the inherent instability of the 'geography' of mobility. The geographical sensibility entails a scepticism about ever mapping movement in any simple or final sense. Whereas other disciplines treat the narrative of a migrant's movement from A to C via B as an unproblematic given (indeed as the essence of migration) such an assumption is never possible in a discipline in which space is not a tabula rasa or, at least, where such geometry is only ever the starting point of the subsequent analysis of the spaces and places of migrations. Ironically there is a sense in which the geographical claim for significance within migration studies is that geography (in the crude sense that it is used in other disciplines) doesn't matter; it can't be trusted or taken-for-granted. What does matter are the ways in which social relationships (within migrant groups, between migrant groups, between migrants and those who do not migrate, between migrants and hosts) produce new forms and representations of space. This conclusion is one outcome of a research project that has looked at the associational life of African migrants in the UK, Cameroon and Tanzania. The paper illustrates it using a discussion of the structures and functions of African hometown associations. It uses their changing constructions of home as an example of a potentially 'progressive notion of place.'

Keywords: Migration, place, space, associational life, Britain, Cameroon, Tanzania

Trevor Paglen, U.C. Berkeley. Email: tpaglen@berkeley.edu; *Black Sites, the CIA, and the Geography of Rendition*

There is a contradiction at the heart of the CIA's extraordinary rendition program having to do with the fact that the program is primarily conducted by civilian (rather than military) means. By operating under a civilian guise, the CIA is able to do things that would be extremely difficult for a military agency to undertake. Civilian aircraft can, for example, take advantage of civil aviation conventions to fly wherever they like. They can also hide in plain sight at commercial airports and among civilian populations. However, the extraordinary flexibility offered by a civilian guise comes at a cost. To a certain extent, the CIA has to file the same sorts of publicly-accessible paperwork that a civilian company has to file. And anything involving aviation leaves a very long paper trail indeed. In this presentation, we will explore two different paper trails that a fleet of CIA-controlled aircraft have left in their wake. First, we will use flight-logs on file with the Federal Aviation Administration and Eurocontrol to discern the locations of some of the deepest and most hidden recesses of the CIA's war on terror, including secret prisons like the Salt Pit and the Prison of Darkness on the plains of Afghanistan. Second, we will follow the planes' registration and maintenance records in order to uncover an equally obscure geography subtly concealed in the fabric of everyday American life.

Kathryn Pain, Dr, Research Fellow, The Young Foundation, London. Email: kathryn.pain@youngfoundation.org.uk; *The Urban Network Transformation: Planning city-regions in the new globalisation wave*

A new wave of globalisation will hit the urbanised western world by 2030. Accelerated liberalisation and integration are leading to major global structural changes with critical implications for urban policy and planning. Major investments in research and development in Pacific Asia have paved the way for a shift from manufacturing and low-revenue services to high value functions already transforming the infrastructure of mega-city regions like Shanghai. Shifting world political and trading alliances and demographic change, appear to threaten the established global power geometry of the 'new' service economy and the future growth of Western cities and regions. As Europe prepares to meet these global challenges, its 2005 re-launched Lisbon Strategy is struggling to achieve unified Member State support for a growth agenda that attempts to integrate social and environmental priorities. Meanwhile, spatial strategy, first devised in 1999, tries to rationalise objectives for increased competitiveness and sustainable development by promoting balanced, or polycentric, regional development across the European territory. But recent research points to contradictions between these policy agendas. Trans-urban business networks are transforming spatial relations in North West Europe. Emergent global 'mega-city regions', networked through their multi-scale advanced service economy functions, pose a major challenge for sustainable management and governance. This paper examines the urgent policy imperatives and the implications for other world regions. The conclusions question the relevance of polycentricity in spatial planning and flag the need for inter-city governance to meet the challenge of new-wave globalisation.

Keywords: globalisation, new wave, power geometry, competitiveness, trans-urban networks, sustainable development, global mega-city regions, polycentric

Rachel Pain, University Of Durham. Email: rachel.pain@durham.ac.uk; Ruth Panelli, University College London. Email: ruth.panelli@geography.otago.ac.nz; Sara Kindon, Victoria University of Wellington. Discourses of fear are central to the operation of the 'war on terror'. Fear is part of a widely accepted framework of understanding of how terrorist attacks affect the west, and it is drawn upon to justify the political actions of western governments. The emotions which politicians and the media at least claim to reflect in wider western societies are highly racialised: they are white fears of brown others which have continuity with a longer history of emotional-political relations with the Middle East. However, some minority ethnic groups in western societies, many of whom had raised vulnerability to crime, harassment and violence before 9/11, find the 'war on terror' has altered their experiences of everyday emotional life rather more. We report on research with young men and women from a range of ethnic, cultural and religious backgrounds living in Aotearoa New Zealand and the UK. Our research is exploring young people's hopes and fears in a changing geopolitical climate. In the paper we explore how significant 'Muslim' has become at each study site in relation to fear at different scales; within concerns about global security, unease about 'others' in local neighbourhoods, fears about personal safety from racist bullying and harassment, and young people's responses and strategies for dealing with fear/hope. We aim to show that fear is far more complex, and socially and spatially variable, than commonplace understandings of fear and the war on terror have so far suggested.

Keywords: war on terror, fear, Muslim, young people

Marco Painho, Professor, ISEGI - Universidade Nova De Lisboa. Email: painho@isegi.unl.pt; Building dynamic, ontology-based, alternative paths for Geographic Information Science Curricula

New information and communication technologies may bring significant advantages to learning experiences by broadening the possibilities of promoting autonomous and self-oriented learning. Conceived as an instrument for the support of teaching and learning activities, a Curricula Development Model was developed to promote a knowledge organization structured on networks of concepts and in the construction of conceptual maps, using a Geographic Information Systems and Science ontology. The possibility of establishing multidimensional networks of terms was explored through a relational database. The database design provides an answer to the necessity of linking a vast amount of information related with the set of learning units, considered the main component of the Curriculum Development Model. This approach increases a non compartmentalized and hierarchical idea of knowledge, through the construction of semantic networks that tend to bring closer the association process and the mechanisms of knowledge exploration, to the ways human memory and thought structuring and organization occur. The Curricula Development Model is available in an interactive Web application which includes, access, among others, to: domain terminological dictionaries; generic tools for curriculum development and implementation; structured information and its representation under conceptual maps; creation and visualization of adaptive study programs according to GIS professional profiles, credit requirements and students expectations; sample instructional materials for selected learning units; comparison between alternative curricula. Additionally, it is expected that the ontological approach will contribute to create a GIS-learning Community by giving way to shared information, contents and knowledge.

Keywords: adaptive curricula; geographic information ontology; visualization tool

Tania Pal, Louisiana State University. Email: tpall@lsu.edu; Michael Leitner, Louisiana State University. Email: mleitne@lsu.edu; Accuracy Assessment of Individually Calibrated Journey To Crime (JTC) Functions

The "journey to crime" (JTC) or the study of the travel behavior between an offender's residence to and from the crime scene has long been a subject of study within criminology for many years. Geographic Profiling (GP), which is based on such travel behavior, is a spatial analysis and decision support tool that is used by law enforcement agencies to make estimates or predictions about a serial offender's residence (i.e., home base or 'haven') using various distance decay functions. In this context, distance decay refers to the decrease of the number of crimes committed by an offender as the distance from his/her residence increases. Despite all the publicity and support that GP has received in the last few years, almost no empirical research exists as to the accuracy of GP software programs, including JTC, Rigel, DRAGNET, in predicting the location of the serial offender's residence. This research uses 247 serial crimes with 6 different crime types from Baltimore County, Maryland, between 1994 and 1997 with the objective to (1) analyze the accuracy of individually (i.e., by crime type) calibrated journey to crime (JTC) GP models; (2) determine whether the JTC strategies are substantially more accurate than purely visual (such as human

predictions) and simple spatial (such as median center) profiling strategies; Keywords: Journey to Crime, geographic profiling

Michael A. Palecki, Midwestern Regional Climate Center. Email: palecki@uiuc.edu; Kenneth E. Kunkel, Illinois State Water Survey. Email: ; James R. Angel, Illinois State Water Survey. Email: ; *Extreme Climate Events in the 19th Century*

160 U.S. Forts daily climate data time series were keypunched by the NOAA Climate Database Modernization Program by September 2006. Many of these stations cover 10-40 years during the period 1850-1895, with most time series originating prior to the onset of previously digitized cooperative observer station records. Temperature and precipitation extreme outliers within these raw station data were subject to rigorous quality control. More than 27,000 temperature and 11,000 precipitation extreme values were examined manually by comparison with optical images of the original manuscript forms, and about 30% of these values were changed because they were either keyed incorrectly or were keyed correctly but were implausible (a small subset). Homogenization procedures were utilized to adjust the 19th Century data so they would be comparable to modern records. Time series of indices representing the frequency of heat waves, cold waves, and heavy precipitation events display interesting behaviors in the 19th Century. The final national and regional results of this ongoing project will be discussed.

Keywords: climate extremes, climate change

Joseph Palis, University of North Carolina at Chapel Hill. Email: palis@email.unc.edu; *Projecting the Absence/Presence of Filipinos in Early Biograph Films*

My paper aims to ask what space characterizes the various constructs of orientalism and othering in the early films of Thomas Edison. Using Lefebvre's concept that social space "subsumes things produced, and encompasses their interrelationships in their coexistence and simultaneity" in these early shorts, I will look at three actualities found at the Library of Congress-American Memory page to show how space is manifested and negotiated onscreen. I will examine Edison's "Filipinos Retreat From Trenches", "Capture of Trenches at Candaba" and "U.S. Troops and Red Cross in the Trenches Before Caloocan" which were all released in 1899. These short films were shot during the tumultuous years of the Spanish-American War. In the Biograph shorts, the privileged positions of both Spanish and American forces as regards the annexation of a foreign land in world history books is indicative of the tendency to de-emphasize the contribution of the native population in the war. Manthia Diawara has said that "space is related to power and powerlessness, insofar as those who occupy the center of the screen are usually more powerful than those in the background or completely absent from the screen." The spatial hierarchies and spatially situated images in Edison's short films do not intend to suggest the "badness" and "goodness" of the American powers that produced such images, nor is this a celebration of the minority cultures. Rather the spatial orderings in these early films show the historically configured powers of relation and its attendant oppressive relation to its external "others".

Karina Pallagst, University of California Berkeley, Center for Global Metropolitan Studies. Email: pallagst@berkeley.edu; *Shrinking cities in the US in the rustbelt and beyond*

A shrinking city is characterized by economic decline and - as an effect - urban areas in transformation. Moreover, the loss of a certain type of employment opportunity is setting off partial out-migration. In the US shrinkage can either be part of post-industrial transformations related with a long-term industrial transformation process due to the decline of the manufacturing industry, or be triggered by economic changes in the so called "post industrial transformations of a second generation" concerning the high tech industry. Main hypotheses of the paper are: ? The phenomenon of shrinking cities is not only related to the well-known post-industrial "Rust-Belt" examples, but other areas are affected as well. There is not one type of a shrinking city in the US. ? Transformation processes occur within the sphere of land use; shrinking and growing are processes that can be observed in a parallel mode. The paper focuses on land use development in cities or city regions that can be characterized as "shrinking" in terms of certain types of economies and the related population during a certain period of time. The paper will contribute to the discussion by kicking off the shrinking cities debate in the US embedded in an international comparative context. Three cases of shrinking cities in the US will be introduced: Pittsburgh, Youngstown, and San Jose, each of them representing a different path of shrinkage, showing certain patterns of shrinkage, and of the related strategies.

Keywords: Shrinking cities, patterns of urban and regional development, interdependence of urban growth and shrinkage processes, global planning discourse, comparative planning

Montserrat Pallares-Barbera, Doctor, Universitat Autònoma de Barcelona. Geography Department.. Email: montserrat.pallares@uab.es; Antonia Casellas, Visiting Assistant Professor, University of Utah. College of Architecture and Planning. Email: casellas@arch.utah.edu; Marginal revolution in inner urban areas. Relational economic geography in Barcelona's development

Territorial innovation system seems to be in current economic geography literature intrinsically linked with the concept of relational economic geography. Inner urban redevelopment, new economy firm's location and its impact to already settled groups in inner areas are, most of the time, linked to government policy to upgrade urban decay. This paper deals with Barcelona's 22@ development project. Local government's policies have facilitated the upgrading of this neighborhood as the dominant front within city's global position network. Enforcing new economy firm location for city's new development in Barcelona is a clear policy driven act to upgrade space in order to become competitive in a changing production system world. Nowadays, production is linked with high service activities and rising value added new economic activity firms. Dynamics of urban renewal intrinsically incorporate challenges in both, economic and urban systems. They are in dynamic and continuous relationship; and its outcomes for space can be diverse. Either can result on a booming technological revolution, just a facade including only few low value added service activities; or just a way of developing the city under very higher economic expectations, but not deep grounds. Based on facts and numbers, this paper about Barcelona is devoted to discuss current urban development patterns under these elements and controversial outcomes in the 22@ district.

Keywords: Relational economic geography, new economy, inner urban development.

Ayşe Pamuk, Prof., San Francisco State University. Email: pamuk@sfsu.edu; Locating immigrant clusters in U.S. and European global cities with census data: A discussion of methodological issues

Studies of immigrant concentrations in the United States and in Europe use different methods and definitions in locating immigrant clusters using census data. This paper reports results of an analysis of immigrant clustering patterns in three major immigrant gateway cities in Europe (Paris, Amsterdam, and Stockholm) and in the United States (San Francisco, New York, and Los Angeles) using Geographic Information Systems (GIS) and provides results produced by using different methods in identifying immigrant concentrations. It highlights issues related to comparability of spatial data for immigrants across European nations, and discusses commonalities and differences in clustering patterns in the U.S. and Europe. It contributes to the literature concerned with methodological issues related to locating immigrants in global cities.

Email: kwest@jhsph.edu; Spatial distribution of high risk pregnancy and health care access in Bangladesh

Maternal mortality in Bangladesh is among the highest globally, with estimates ranging from 320 to 850 per 100,000 live births over the past decade. Approximately 75% of deaths are attributed to postpartum hemorrhage, eclampsia, postpartum sepsis, and obstructed/prolonged labor (WHO). Efforts to provide obstetric care have achieved moderate success in reducing maternal deaths as many barriers to adequate and timely care remain, especially in rural areas. In addition to the barrier of extreme poverty, unequal distributions of risk associated with pregnancy and unequal access to health care influence the propensity to seek adequate, qualified care during or after pregnancy. We propose to characterize and quantify the spatial distribution of obstetric complications (e.g., preeclampsia/eclampsia, sepsis, anemia, and delivery complications) and associated access to health care using data from a -year longitudinal study in northern Bangladesh. Data include pregnancy-related morbidity and mortality for approximately 67,000 women as well as GPS data for households, health care providers, and transportation networks. Clustering statistics will be used to identify global and local clustering of high-risk pregnancy. Access to treatment will be examined according to level of health care quality (e.g., hospitals, private physicians, paramedics, village doctors, medicine shops, and traditional healers). Spatial regression will be used to measure the association between high-risk pregnancy and access to different levels of treatment. Results will help us to further understand a woman's propensity to seek treatment as well as to identify

and characterize specific areas of our study region that have an elevated risk for obstetric complications.

Keywords: Health inequality, pregnancy, GIS, high risk cluster

William KY Pan, PhD, John's Hopkins University School of Public Health. Email: wpan@jhsph.edu; David L. Carr, PhD, UC Santa Barbara. Email: carr@geog.ucsb.edu; The ecological fallacy and land use research - Can multilevel models account for scale?

Several studies have recognized the importance of taking scale into account when analyzing and interpreting land use models. Verberg et al (2004) discussed a number of concepts important to land use modeling, including level of analysis and integration, cross-scale dynamics, and spatial neighborhoods; Walsh et al (1999) demonstrated that relationships between biophysical and social variables change as a function of scale; and several studies have examined the impact of the modifiable areal unit problem or MAUP. One option that has been proposed to address these issues is the implementation of multilevel statistical models. Multilevel models are flexible regression models that efficiently estimate parameters defined for different scales. They are commonly used in the fields of demography, sociology, education, and public health. This paper will discuss the shortfalls of multilevel models in handling scale-dependency, most importantly, the remaining problem associated with linkage between people and land (i.e., the people to pixels linkage problem). We present model results from longitudinal panel surveys conducted in the Ecuadorian Amazon and compare two different types of linkages between people and land: (1) farm owners and their land owned; and (2) land plots and the people who occupy the land. The first linkage follows farm owners over time, while the second follows plots. Both linkages are considered nested within local communities. Preliminary results are consistent with published literature, i.e., multilevel models provide better estimates of factors influencing land use change, but interpretation of results are still dependent upon the way people and land are integrated.

Laura Pangallozzi, Rutgers. Email: laura@pangallozzi.org; Black Attitudes toward Integration Management in a U.S. Suburb

Integration management practices (IM) have provoked controversy as U.S. suburbs apply them to counter rising black settlement. IM practices include attracting whites through 'affirmative' marketing and 'benign' racial steering; seemingly race-neutral intervention in home sales such as anti-solicitation ordinances and restrictions on for-sale signs; monitoring of black concentrations through various forms of racial record keeping; and surveillance of changing neighborhoods via strict enforcement of codes on property upkeep and illegal rentals. Suburbs such as Shaker Heights, OH; Oak Park, IL; and Maplewood-South Orange, NJ have all sponsored IM groups. But the policies the groups advocate are more widespread than the organizations themselves. Indeed, IM verges on becoming standard procedure in majority white inner suburbs of cities with large black populations. An important gap in the recent literature on IM has been analysis of the attitudes of African-Americans toward the practice. This paper presents the findings of a focus group, led by a black moderator, of African-American residents of Maplewood-South Orange. The analysis teases out attitudes toward IM along the dimensions of tenure and status. Integration management, the focus group shows, has sharply different meanings for white and black residents of inner suburbs even as there are important continuities.

Maria Papadakis, James Madison University. Email: papadamc@jmu.edu; Benjamin Merriman, James Madison University. Email: merrimbg@jmu.edu; Spatial, Economic, and Technological Determinants of Innovation Diffusion in the Residential Building Industry

The diffusion of innovations is affected by a wide variety of economic, technological, social, and organizational factors, yet may nonetheless follow distinctive spatial patterns. In this paper, we analyze the relative impacts of contextual and spatial determinants of innovation for nine innovations in the residential building industry. Data are from a 2003 national stratified random sample of US residential home builders on their adoption and use of building and construction technologies. Findings are explored with respect to type and size of builder, technological features of the innovation, market structure of the innovation, builder predisposition to innovate, location (along multiple dimensions) of builder, proximity networks, and spatial patterns of diffusion (e.g., contagion, hierarchical, mixed). Implications for theory, business decision-making, and public policy are addressed.

Keywords: diffusion, residential building industry, construction

Diane Papineau, Montana State University. Email: diane.papineau@myportal.montana.edu; *Transforming Place at Canyon: Politics and Settlement Creation in Yellowstone National Park*

Between 1940 and 1970 Canyon's cultural landscape changed dramatically. Empowered by the developing preservation ethic in the United States, the government relocated Canyon Junction and its entire visitor development away from the Grand Canyon of the Yellowstone. Replacing the 70-year-old, "organically-grown," rustic settlement was a modern, preconceived village resembling 1950s suburbia. As a result, different generations of Yellowstone visitors have experienced two contested versions of Canyon as a park place. The old Canyon settlement was established and grew organically. It was tied to a geographic point and its pattern evolved through time?common for most human settlements outside of national parks. Unfortunately, its location was illegal. The settlement was too close to the canyon rim, violating the park's Organic Act. When Canyon was established in the 1880s, national parks represented a new responsibility for the federal government?a new type of land use. Entrepreneurial interests and visitor expectations challenged the government's ability to regulate visitor place creation. Through time, federal government control strengthened. The Canyon cultural landscape?its formation, evaluation, and transformation?illustrates the evolving political strength and maturation of federal government stewardship in national parks.

Trushna Parekh, University of Texas, Austin. Email: tparekh@mail.utexas.edu; *Racialized Landscapes of Gentrification : The Politics of Cultural Memory in New Orleans' Treme neighborhood.*

Drawing on pre-Katrina ethnographic research in the Treme neighborhood in New Orleans, this presentation examines the constitution and contestation of local collective memories that are inscribed on and interpreted through the landscape. The dynamics of gentrification provide an arena in which collective identity is both articulated and constituted by such means as : 1) informal conversations about neighborhood change, 2) community meetings, and 3) the construction and interpretation of culturally marked material objects such as monuments and plaques in the landscape. As a result, the ways in which landscape is racialized, historicized and mobilized differentially legitimates the residents of the neighborhood. By examining these politics of gentrification, this paper hopes to yield insights into the entanglements of racialization, place and cultural memory in this neighborhood.

Bae-Gyoon Park, Seoul National University. Email: geopbg@snu.ac.kr; Young Jin Choi, Seoul National University. Email: knewlife@snu.ac.kr; *Pursuing either Nationalism or Economic Democratization: Mixed Responses of the Korean Social Movements to Globalization*

This paper addresses the ways in which the Korean social movements have responded to globalization and neoliberalization. Unlike what has been widely expected, the responses from the Korean social movements to globalization have been much more mixed and complex than something simply dominated by nationalist resistance against global neoliberalism. To simplify, the Korean social movements have responded to globalization in two contrasting ways. On the one hand, there have been various forms of activism resisting globalization and liberalization, which have been organized by forces aiming at securing Korean national identities and interests from outside forces. On the other hand, there have been efforts to make the Korean economy more open to global competition in order to achieve what is called "economic democratization" by forcing chaebols, the large Korean conglomerates, to reform their "undemocratic" and "inefficient" governance structures under global competitive pressures. This paper aims to explain this mixed picture of the Korean social movements in the era of globalization by examining how the two contrasting responses have been differentially associated with, and influenced by, two important ideological tendencies that serve as the basis for their mobilization of support: 1) nationalism and 2) a strong orientation toward democratization. The main argument suggested in this paper is that different groups in the Korean social movements have been oriented towards one or the other of these two ideological traditions, so that the Korean social movements have been unable to contribute to the construction of successful transnational resistance practices against neoliberal globalization.

Kyonghwan Park, Chonnam Nat'l University, South Korea. Email: kpark3@gmail.com; *Reterritorializing transnational bodies: neoliberal multiculturalism policy in South Korea*

South Korea, having immersed in strong nationalism, witnesses an increasing influence of the term 'multiculturalism' in public domain. Among many dimensions of multiculturalism, the term, often disguised with the notion

of 'international culture' in South Korea, is especially widely employed in discussing geographic changes spawned by transnational immigrants. While multiculturalism could be a descriptive term that especially captures racial, ethnic diversification in society, it is also ideological in the sense that the hosting society has often elaborately implemented the politics of inclusion and exclusion. In many cases in South Korea, such politics is aimed at appropriating multicultural resources for its own developmental ends. This paper explores multiple forms and politics of multiculturalism, and answers which versions of multiculturalism could provide a vantage point for critical geography. At an empirical level, this paper focuses on how local/central government employs the notion of multiculturalism and implements multicultural policies from the perspective of neoliberal, developmental, and corporate ideology. I argue that instrumental nationality imbibed in such notion of multiculturalism is not much conducive to grass-root multicultural communication beyond racial, ethnic lines. Critiquing multiculturalism policies in terms of neoliberal 'reterritorialization', I finally provide a suggestion on how to envision smooth spaces across racial and ethnic lines in an era of transnationalism.

Keywords: multiculturalism, transnationalism, neoliberalism, immigration, South Korea

Sam Ock Park, Seoul National Univ. Email: parkso@snu.ac.kr; *From Production Agglomerations to Innovation Clusters: Industrial Restructuring in Korea in the Knowledge-based Information Society*

This paper examines diverse types of innovation cluster evolving in Korea to find a typical Korean model of innovation cluster in recent years. The role of diverse actors in the innovation clusters and the processes of innovation are analyzed by the types of innovation clusters at different spatial scales. Developing regional innovation systems has been the major policy instrument in Korea since the beginning of the new century. Large industrial districts, which share more than half of the national industrial production with agglomeration of many manufacturing plants, are now undergoing restructuring in order to regenerate competitiveness through developing innovation clusters. Local and national governments have adopted the cluster concept at various spatial scales in order to enhance innovation potentials and to promote regional and national competitiveness. Distinctive characteristics of the regional innovation clusters at various spatial scales have been evolving in these nationwide restructuring processes.

Keywords: innovation cluster, Korea, regional innovation systems, industrial restructuring

Siyoun Park, Western Illinois University. Email: s-park@wiu.edu; Jongnam Choi, Western Illinois University. Email: j-choi1@wiu.edu; *Military Base Closure and the Decline of Korean Americans in Rural America*

The study presents the effect of the location of military bases on the distribution of Korean populations in rural America. Conventionally most immigrant groups tend to concentrate in the metropolitan areas. Korean Americans are, however, often found in small towns as well. This unusual Korean distribution is associated with Korean brides who married American military servicemen. There are two types of Korean brides who settled in rural America: ones who have settled in their husbands rural hometowns, and the others who live in the current military base towns throughout the country. These Korean brides were married to American GIs while their husbands were on duty in Korea. Often they have mixed blood children represented in 2000 Census' new category of more than one race. During the last two decades, there have been major military base closures which have had a pronounced effect on the distribution of Korean population in rural America. The counties with declining Korean American populations in the 2000 Census were clearly represented by Military base closures. The same counties also have A higher proportion of Koreans who marked more than one category of race. The data of the present study is from the U.S. Population Census 1980, 1990 and 2000, and the Department of Defense Base locations and their closures.

Sunyurp Park, University of Hawaii-Hilo (Geography). Email: sunypark@hawaii.edu; Stephen L. Egbert, University of Kansas. Email: segbert@ku.edu; *A satellite data-based analysis of landscape structure changes caused by the Conservation Reserve Program (CRP)*

One of the major results of the U.S. Conservation Reserve Program (CRP) has been the addition of millions of hectares of potential wildlife habitat, primarily as grassland. Changes in landscape structure caused by the program were examined using satellite imagery-derived land cover maps for the pre- and post-CRP enrollment periods. We calculated a variety of spatial metrics to analyze changes in landscape structure attributable to CRP in the southwest Kansas using the FRAGSTATS spatial pattern analysis program. The introduction of CRP has substantially modified the spatial structure of the landscape and showed the reversal of an overall trend of grassland fragmentation. It generated important

positive implications for wildlife habitat changing the count, size, shape, interior areas, and connectivity of grassland patches. The primary objective of CRP is the reduction of soil erosion in areas where cropland occurs on highly erodible and environmentally sensitive land. However, the study result showed that deficits of soil moisture, not necessarily soil erosion potential, might have been an important factor in CRP enrollments. To evaluate the spatial variation of CRP land distribution within the study area, two subset areas (irrigated and non-irrigated areas) were selected and their spatial metrics were compared. Changes in landscape configuration caused by CRP enrollments turned out to be significantly different between the non-irrigated and irrigation-dominant areas. The major landscape transformation for the non-irrigated area was a noticeable aggregation of CRP lands with grassland (133% increase), whereas grassland area increase was only 36% for the irrigated area.

Keywords: Conservation Reserve Program, landscape structure, FRAGSTATS, fragmentation

Albert J. Parker, University of Georgia. Email: ajparker@uga.edu; *What ever happened to Platt National Park?*

Nestled in the Arbuckle Mountains of south-central Oklahoma, the wooded valleys of spring-fed Rock and Travertine Creeks were once preserved as Platt National Park; at 912 acres, America's smallest national park. The administrative history of Platt National Park parallels the history of the National Park Service (NPS) and its shifting mission over the course of the last century. Unlike the wild parklands of the American West, Sulphur Springs Reservation was preserved by un-coerced agreement between Chickasaw Indians and the federal government in 1902. In 1906, ten years prior to creation of the NPS and its regulatory power, the site was designated a national park and ironically renamed in honor of Orville Platt of Connecticut, recently deceased chair of the Senate Interior Committee and supporter of Bureau of Indian Affairs dispossession policies. Over its 70-year history, Platt National Park was consistently underfunded, considered unworthy of national park status by park purists. Most park infrastructure was built by Civilian Conservation Corps workers in the 1930s. By the 1970s, the NPS reluctantly embraced the role of recreation provider for an increasingly urban population. In 1976, Platt was joined with the nearby Lake of the Arbuckle recreation complex to create the Chickasaw National Recreation Area. Ostensibly done for administrative parsimony and to celebrate regional Indian cultural heritage, this action quietly eliminated this unwanted national park. Today, with increasing awareness of the role of people in nature and skepticism of the wilderness ethos, one wonders if Platt National Park would have met the same fate.

Caleb Parker, East Carolina University. Email: wcp0622@ecu.edu; *Sanctuaries of Silence: How North Carolina's United Methodist Pastors Respond to Homosexuality*

The controversy over homosexuality has proven itself to be a point of tension at the state and national levels of The United Methodist Church for decades, but little is known about the dynamics of this controversy at the local, church level. Therefore, viewing church space as both sacred and socially-contested, this research identifies and analyzes the controversy within North Carolina's UM congregations from the perspective of local pastors. Using a web-based survey sent to all of North Carolina's 1,500 UM pastors along with 10 in-depth interviews, I investigate how they understand homosexuality, express such ideologies to their congregations, and hence contribute to the construction of "sanctuaries of silence." Ultimately, the research analyzes the power (or powerlessness) of pastors to shape this sacred space, and the implications it might have on their congregation members.

Email: nbg2@york.ac.uk; Michael Hardey, University of York. Email: michael.hardey@hymys.ac.uk; Nicholas Ellison, University of Leeds. Email: N.Ellison@leeds.ac.uk; *Class places and place classes: the spatialisation of class and the automatic production of space*

Beginning with the work of Scott Lash on the contemporary rezoning of neighbourhoods, this paper empirically examines four very different streets in different parts of England each of which is taken to epitomise one of the socio-spatial zones identified by Lash: live/tame; live/wild; dead/tame; and dead/wild. Within each street we examine the various systems of geodemographic classification to which it is subject by the state and commercial organisations and also the manner in which it is characterised by various internet-based neighbourhood information systems (IBNIS). We then use these four classificatory assemblages of our case study streets (places/classes?) as an entrée to a discussion about the 'spatialization of class thesis' (class places?) recently developed by Mike Savage and others and link to this to debates about the automatic production of space ('automated spatiality') found in the recent writings of Nigel Thrift and colleagues. Our concern in the paper is to offer an empirical exploration of the relationship between the vernacular social geographies of lay people and the formal classificatory systems of state and commerce that are becoming ubiquitous.

Virginia L. Parks, Ph.D., University of Chicago. Email: vparks@uchicago.edu; *Local and Not-So-Local Restructuring Effects on the Wages of Immigrants and African-Americans*

This research considers the local effects of economic and demographic restructuring on immigrant and native-born Black employment during the 1990s in the U.S. Building on local labor market theory, this research attempts to explicate the contribution that local context makes in explaining immigrant and African-American labor market outcomes through interurban comparative analysis. Theoretically and empirically, this research seeks to adjudicate between the role of social resources in facilitating economic success among immigrants as postulated by the ethnic economy literature in sociology and the role of local labor market structure?industrial, demographic, and institutional?in facilitating employment outcomes as described by geographers. In an examination of wages across multiple U.S. cities, I distinguish between effects of group clustering, industry characteristics, and local labor market structure on native- and foreign-born wages. African-Americans are evaluated specifically for their hypothesized position of competition with immigrants in the labor market and their theorized weaker social capital. Through leveraging multiple comparative lenses, this analysis begins to identify the local effects of economic and demographic restructuring on wage inequality as well as effects generated more broadly across places and scales.

Keywords: immigration, black employment, restructuring, wages

Benoit Parmentier, Clark University. Email: bparmentier@clarku.edu; *Improvement in the use of the Relative Operating Characteristic (ROC) statistic*

This paper proposes three improvements in the use of the ROC statistic for applications to GIS: 1. an estimate of the uncertainty of the Area Under the Curve (AUC) using the upper and lower bounds 2. a visualization of the ROC statistic in the form of a map 3. a new baseline of comparison application in land change modeling: the ROC for persistence. The ROC statistic is used to assess the association between a map that shows a rank variable and a map that shows a Boolean variable. Scientists use the ROC for many applications: in psychology, in Remote Sensing applications to assess soft classifications, in ecology to assess the predictions of species presence across space and in land use and land cover change (LUCC) to assess predictions in changes across time. For example, in LUCC modeling, the researcher typically creates a map of ranked suitability that is used to specify the location of land change. The ROC statistic is then used to compare the suitability map to the Boolean map of land change. Applications have focused solely on the use of the Area Under the Curve (AUC) as a measure of the association between the maps. An AUC close to 1 is interpreted as very high association. An AUC of less than 0.5 is then interpreted as low association because a randomly generated Rank map produces an AUC of 0.5 by design at the ROC curve.

Hazel Parry, Central Science Laboratory. Email: h.parry@csl.gov.uk; Andrew Evans, University of Leeds. Email: geoaje@leeds.ac.uk; *Coping with millions of agents: techniques to re-implement a multi-agent model in order to increase the number of agents it can simulate.*

Multi-agent Simulation (MAS) has powerful potential for furthering understanding of the local processes that influence regional population dynamics spatially and temporally, enabling better understanding of how individual local-level interactions result in larger scale population distributions. However, several novel model development issues now face researchers: in particular how to simulate large numbers of individuals or agents with high levels of complexity given finite computing resources. Using the example of an agent-based simulation model of aphid population dynamics in agricultural landscapes, a number of strategies for coping with a large number of individuals are presented. In particular, two strategies are assessed: the use of 'super-individuals' and parallel computing. A comparison is made of the results and computational effectiveness of running the same model under these two methodological treatments, and the benefits and problems of an agent-based approach for the simulation of large numbers of organisms are discussed.

Keywords: Multi-agent simulation, Parallel computing, model development

Anthony Parsons, . Email: a.j.parsons@sheffield.ac.uk; *Hillslope Processes and Sediment Delivery*

The rate at which hillslope processes deliver sediment to a point on the landscape is termed sediment delivery. It has generally been found that the value of sediment delivery declines as area increases (the sediment delivery ratio). However, in the long term all sediment delivery ratios must equal one, for otherwise basins would fill indefinitely. In short-term studies ratios typically less than one have usually been interpreted as evidence for anthropogenic accelerated erosion. But this interpretation, and the evidence on which it is based, bears further investigation. The fundamental assumption underlying sediment delivery is that measurement of sediment flux ($M T^{-1}$) can be related to a contributing area so that the conversion of the measurement to units $M L^{-2} T^{-1}$ is valid. This is true only if L is less than sediment-travel distance in time T . In almost all cases, either where sediment yield is measured at catchment outlets or where it is measured on hillslope runoff plots, this condition is not met. To understand the significance of various slope processes for sediment delivery, we need to focus not only on the amount of sediment that is entrained by slope processes, but also its travel distance. Using data from the research literature, it is possible to quantify travel distances for fluid-gravity processes, but for sediment-gravity processes mapping in individual catchments is typically necessary. Allied to travel distance in determining sediment delivery is the frequency with which particles move. These two concepts can be combined within the notion of virtual velocity.

Keywords: sediment delivery ratio; travel distance; virtual velocity

Geoarchaeological excavations are expensive and time-consuming endeavors. With geophysical tools, such as ground penetrating radar (GPR), archaeological digs can be made more effective and efficient by aiding in identifying locations that show unique subsurface anomalies which appear to be anthropogenic in nature. During the summer of 2006, GPR data were collected at Tel Yavne and Apollonia, Israel. Yavne, located about 20 kilometers south of Tel Aviv, has a history that goes back thousands of years. After the destruction of the temple in Jerusalem in 70 CE, Yavne served as a center of Jewish learning and has subsequently been the site of a Byzantine city, a Crusader castle and Arab villages. Apollonia, named for the Greek god Apollo, existed as a Mediterranean coastal village as early as the 6th Century BCE and was the site of a Crusader fortress. GPR grids were collected adjacent to present excavations at Tel Yavne (7.5m x 13m) and Apollonia (20m x 30m) using 225 MHz antennae. The radar signals penetrated to approximate depths of 1.0m at Tel Yavne and 1.2m at Apollonia and revealed interesting anomalies (archaeological features?) in the GPR images. Preliminary analysis of the GPR data has led to the interpretation of potential walls, collapsed walls, and/or pits in the subsurface. The analysis and interpretation of the collected geophysical data will be used by site archeologists to guide future excavations.

Keywords: ground penetrating radar, Israel, geoarchaeology

Matt S Paskus, Western Washington University. Email: matt@paskus.net; viaTime.org - *Simulating the world of travel for children using Google Earth.*

viaTime was developed in order to teach students not only about distance, time, and geographical locations, but how Geographic Information Systems (GIS) can be tailored to meet a child's creativity and imagination. Google Earth (GE) provides a conduit for collaborative, imagination, research, and creativity. The open platform that GE provides, allows developers to reach geography students by offering new and exciting ways of presenting data. Geographic data can be tailored in various formats geared towards any specific industry. The application viaTime offers a unique perspective into the transportation industry by allowing students to create their own airline by opening doors into the world of geography and transportation. viaTime creates an imaginary world that overlays the real world and transforms time zones, speed, distance, latitudes and longitudes into a world of learning. viaTime offers an easy to use interface that offers anyone within our global community to create an imaginary airline that may reflect not only their ability to learn but how they share their creativity and culture. viaTime merges various disciplines of GIS by blending network analysis, geoprocessing, spatial analysis, and geo-referencing into an educational tool that is both online and easy to use. The world of air travel has created visions of discovery, adventure, while promoting advancements in technology and engineering. viaTime allows students to create their own world and essentially share their world with others while gaining an interest in both technology and geography.

Cynthia Paslawski, University of Michigan - Dearborn. Email: cindypasl@yahoo.com; Matthew Beer, University of Michigan - Dearborn. Email: mbeer@umd.umich.edu; Jacob Napieralski, University of Michigan - Dearborn. Email: jnapiera@umd.umich.edu; *Combining GIS and Field-Based Techniques to Link Soil Properties to Land Use Changes and Variations in Vegetation in the Natural Area of the University of Michigan- Dearborn*

The natural area on the University of Michigan Dearborn campus is a 90 acre parcel that is comprised of forest, grassland, floodplain, streams, and lakes. Unfortunately, detailed information and mapping of soil makeup of this area is either lacking or has been lost over the years. The purpose of this study is to incorporate soil surveying and geographic information systems (GIS) techniques to create detailed and accurate maps of the university natural area with the objectives of linking soil characteristics to changes in land use, vegetation, and topography. The soil survey involves sampling of the A-Horizon, down to the boundary between the B-Horizon. The depth of the A-Horizon is measured and the sample tested in lab for texture using the hydrometer analysis. Sampling of the natural area is based on changes in vegetation and topography, as well as a representative sample of the area. Interpolation techniques are used to create surfaces and 3-dimensional models to test if there are any correlations between soil characteristics and topography, presence of surface water, or vegetation changes. Accurate soil maps are useful for assessing natural changes, determining suitability of land for development and potentially producing new knowledge about soil properties within urban and suburban areas.

Merle Marshall Patchett, University of Glasgow. Email: merle.patchett@ges.gla.ac.uk; *Matter of life and death: the embodied practice of taxidermy*

Close attention to past practice and craft skills can offer empirical and conceptual resources for exploring the geographies of animal (after) lives. Taxidermy practice is a case in point, opening up new spaces of enquiry into the material cultures of life and death that constituted animal collection, preservation and display in the 19th and early 20th centuries. Taxidermy skills were crucial to the colonial trafficking that made dead animals mobile, and ensured the long-term preservation of specimens in entirely alien environments. This paper sifts through technical manuals, the biographies of past taxidermists and collections, and draws on time spent observing and documenting taxidermists at work, to differently figure the working of bodies, and bodies at work. Taxidermy practice is routed through the spaces of the field, workshop and museum. By blending historical research with ethnographic enquiry the paper uncovers the multi-sensory relations existing between people, animals and objects. Through such practical lessons for knowing it is possible to reconsider the way we choose to understand the representation and display of animals, and also the methods through which we generate this historically-informed understanding.

Keywords: practice, embodiment, historical geography, taxidermy

Marine conservation is increasingly gaining importance as nearly two-thirds of the world's people live within 150km of a coastline and are dependent on marine resources. The Marine Management Area Science Program (MMAS) advances the science and application of marine management areas in the service of marine conservation. Model-based decision tools created by MMAS are a great utility to managers and decision makers in MMA environments. We are developing a decision support system framework called MIDAS - Marine Integrated Decision Analysis System, which can integrate spatial and nonspatial data for examining interacting effects of governance, economics, and their supporting ecosystem in the watershed and continental shelf of 10 sites worldwide. A component of MIDAS is Integrative Modeling System developed in Java which allows the user to examine specific interactions amongst the three variables. Java is increasingly gaining momentum as a key language for modeling due to its advantages such as advanced graphical user interface, real-time environment, platform independence and an advanced object-oriented paradigm. Two specific JAVA simulations are presented in this paper to examine the condition of the coral reefs; first, the linkage between watershed, soils and runoff along the coasts and second, urbanization and coastal economic activity including commercial fishing. We will examine the condition of the reef and discuss the relevance of this work in terms of our ongoing global efforts related to MMA models. In addition, the utility of JAVA as a simulation tool is also discussed.

Reena Patel, University of Texas at Austin. Email: reenap_70@hotmail.com; *Working the Night Shift: Gender and the Global Economy*

The hyper-growth of the transnational call center industry in India represents the emergence of a "second shift," namely a night shift labor force in the global economy. Specific to the urban nightscape, women's mobility and access to public space intersects with the spatial and temporal construction of gender. The nightscape is primarily an exclusive, male domain. For example, the Indian 1948 Factories Act states: no women shall be required or allowed to work in any factory except between the hours of 6 A.M. and 7 P.M. Only as of March, 2005 was this act amended. In light of such dynamics, qualitative research methods such as participant observation and in-depth interviews were used to investigate how the global demand for 24-hour workers is re-configuring women's physical, temporal, social, and economic mobility because of the night shift requirement of call center employment. Another key concern is how households respond to changes in women's mobility. Dissertation fieldwork was conducted in 2006 in both Mumbai and Bangalore. Initial findings suggest that the presence of women in the urban nightscape is met with covert resistance. Although there are no visible barriers such as "men only" signs written into public space, women's bodies continue to be marked as a site of transgression.

Zarina Patel, University of the Witwatersrand. Email: patelz@geoarc.wits.ac.za; *Tools and trade-offs in environmental decision making*

Despite constitutional commitments to environmental justice in South Africa, evidence indicates that the poor and the natural environment continue to be marginalised in decision making. In understanding how injustices are perpetuated and maintained, this paper examines the role of environmental assessment procedures in shaping outcomes at the local level. The conceptual framework guiding the evaluation of the tools being used in decision making is shaped by the relationship between power, knowledge and rationality, and the effects these have on the engagement of the public in interventions fostering environmental justice. In the re-vamping of environmental assessment regulations in South Africa, much attention has been paid to streamlining the process of assessment. However, this paper argues that environmentally just decisions cannot be made in a context where debates are centered on process. Instead, debates need to be re-directed to qualities of outcomes, foregrounding the need for an approach grounded in questions of value. Recognising that the poor and the natural environment tend to systematically lose out in a context where environment is pitted against development, environmental assessment must be able to take into account the distributional consequences of decisions. Furthermore, the paper makes a case for the need to challenge the broader political context within which environmental assessments are conducted, as environmental assessments cannot replace broader strategic and policy debates. In the absence of this broader institutional challenge, political power will continue to work through decision making tools to perpetuate and maintain systems of injustice.

Mark W.D. Paterson, University of the West of England. Email: Mark.Paterson@uwe.ac.uk; *Passion and Sensation in an Age of Reason*

Much maligned through the years, René Descartes is the author of significant work on the integration of the passions and reason. 'The Passions of the Soul' (1649) and, later, the posthumous 'Treatise on Man' (1664) inspired La Mettrie's equally provocative but more religiously scandalous work Machine Man. While much has been written on the appealing engineering and thought experiments known as automata, the philosophical work instigated was profound, casting the terms of subsequent discussions in the Enlightenment concerning the relationship between reason, sensation and emotion. Re-engaging with these philosophical implications, it is helpful to return back to Aristotle's protobiology, where in De Anima and in De Sensu et Sensibilibus he explores exactly this physiological territory. But in some key areas of Aristotle's texts we can discern the roots of later thinking of 'affects', whereby *paschein* is the affecting or altering of the faculties of the body through sensation. Thus, thinking through passion and sensation in this way, plus the repatriation of Descartes' ideas concerning the interaction of the mind and the body, leads to revealing insights within present debates within geographical debates concerning 'affects' and 'emotions'.

Keywords: Passion, sensation, affect, emotion, Enlightenment

Lynn Patterson, Kennesaw State University. Email: lpatters@kennesaw.edu; *Sustainable local economic development: a rising tide?*

The purpose of this research is to explore whether and how local economic development agencies in the United States are incorporating sustainability into their policies and programs. Local economic development agencies have traditionally concentrated on economic performance, such as job creation and revenue generation. While economic performance remains the priority for most agencies, there is increasing evidence these organizations are expanding their economic scope to include environmental responsibility and social equity. The research utilizes primary data from a recently conducted national survey of local economic development agencies and secondary data to examine the agencies' attitudes, activities and policies. Descriptive statistics and regression analysis indicate a growing interest in sustainability. This interest may be indicative of a new phase in local economic development policy and practice.

For this project students and faculty members from Central Michigan University (CMU) traveled to Toluca, MX for a week to work with students from Tecnológico de Monterrey, Toluca (Tec) to complete field mapping in Parque, Alameda (a 253 acre, Municipal Park located on the edge of the City of Toluca). The purpose for the mapping project was twofold: first, to provide the students at CMU and Tec an opportunity to interact and work together on a significant mapping and GIS project and second, to provide the Urban Design Program at Tec and the City of Toluca a functional GIS that could be used for analysis and the development of new designs leading to the betterment of the park. A major part of the project involved the creation of discrete layers of GIS data (e.g. roads, stream, lakes, buildings, boundaries, etc.). Land cover and land use layers were created by the CMU students from remotely sensed imagery prior to traveling to Toluca. Ground truth and elevation data was then collected in the field using GPS and Total Distance Stations. The project provided all of the students with the opportunity to plan and execute a complicated GIS project while also interacting with colleague from a different culture.

Wendy W Patzewitsch, Texas A&M University. Email: patzewitsch@tamu.edu; The Perception of Water Through an Assessment of Water Bonds

Using archival sources I show that during the late nineteenth century major fires destroyed significant amounts of the central business district of each of Texas' ten largest cities, leading to demand for the establishment of local waterworks. Fifty years of municipal bond records from the archives of the Office of the Comptroller were analyzed. Fifteen hundred water bonds were identified and input into a database. Time-slice maps were constructed to demonstrate the spread of waterworks funded by municipal bonds. Results indicate significant variations placed upon the value of waterworks in early twentieth century Texas towns.

Kamal Paudel, Department of Earth Sciences, Montana State University, Bozeman, MT. Email: kamalpl2003@yahoo.com; David W. Willey, Department of Ecology, Montana State University, Bozeman, MT. Email: willey@montana.edu; Red panda (*Ailurus fulgens*) habitat use patterns in eastern Nepal using a Geographic Information System: A case study from Singhalila Redpanda Reserve

The Himalayan mountain range represents a transition zone between the Palearctic and Oriental biogeography regions. Mammal diversity in the Himalayan region has been observed to be diverse, characterized by species like the endangered red panda. Habitat loss of the red pandas has placed them in the list of the endangered species (Redpanda Project, 2006). Recent research suggests that red panda fecundity is low and mortality rate for juveniles is high. We used a Geographic Information Systems (GIS, ArcView, ESRI, Inc.) to investigate red panda habitat-use preference in the Singhalila Redpanda Reserve (SRR), Ilam, Nepal. Our investigation was conducted in collaboration with the Redpanda Project (San Francisco, CA). Results of our preliminary analyses indicate the red panda habitat use and movement patterns show concentrated use in areas of abundant bamboo production. Use of bamboo stands may occur rather close to zones of human disturbance, including roads, housing areas, and croplands. These findings provide evidence for non-random use of habitats in our study, and highlight the use of bamboo stands.

Keywords: Red panda (*Ailurus fulgens*), Singhalila Redpanda Reserve (SRR), Ilam, Red Panda Project, habitat loss, resource availability, Geographic Information Systems (GIS), spatial distribution and Goth (barn)

Alan Paul, UCLA. Email: alanpaul@gmail.com; From Homo Economicus to Homo Culturalis: Value Theory in Economic Geography

The original "New Economic Geography" (circa 1980s) replaced spatial science by moving the focus of economic analysis from individual actors to production systems. Although this paradigm shift was driven by a critique of

neoclassical utility theory, it offered no alternative theory of value, and economic geographers have gone about our business for almost 30 years with almost no discussion of value whatsoever. As the "New Economic Geography" is being replaced by "new economic geographies," our attention is returning to individual actors. Unfortunately, without clear notion of how economic value is defined and manipulated, we can say little about actors as creators and constituents of social order, or even about the nature of that social order. Here, I focus on individual actors as constructors of value and on the representational processes that transform their individual actions into normative economic strategies. Building on work by institutional economists (especially Marc Tool), I outline a cultural theory of economic value based on the tension between ceremonial and instrumental value. Sociologists and anthropologists are familiar with this approach, but geographers have overlooked it, so I attempt to delineate some geographical implications. I go on to illustrate the process of value formation with a case study of a newly emerging industry - biotechnology in the 1970s. Finally, I highlight some of the methodological problems inherent in trying to expose a concept like "value," which is interpenetrated with ideology and mythology.

Keywords: economic value theory

Bimal Kanti Paul, Kansas State University. Email: bkp@ksu.edu; Military vs. Mollah: Competition for Winning Hearts of Kashmiri Earthquake Victims

On October 8, 2005, a 7.6 magnitude earthquake struck Pakistan-administered Kashmir and neighboring areas of Pakistan, Afghanistan, and India. An estimated 87,350 people lost their lives in Pakistan alone. Following this disaster, both the Pakistani army and Islamist groups offered relief assistance to earthquake victims. Using information collected from secondary sources, this paper compares the disaster response to the Kashmir Earthquake undertaken by the army and the Islamist groups. A careful review of relevant materials suggests that the disaster response of both groups was effective. However, the quake-affected people of Pakistan-administered Kashmir were aided more by the disaster relief efforts of the Islamists than by the efforts of the Pakistani army.

Keywords: Kashmir, Pakistani army, Islamist groups, disaster response

Derek J Paulsen, Ph.D, Eastern Kentucky University. Email: derek.paulsen@eku.edu; Is Geographic Profiling alone enough? New Methods in serial crime investigation

Over the last several years there has been increasing interest in the use of expert systems in crime series investigations, with particular focus on geographic profiling systems. However, existing geographic profiling systems have come under scrutiny because of both their limitations and research into their accuracy. Specifically, traditional geographic profiling systems are incapable of profiling commuter offenders, a significant portion of all offenders, and their overall accuracy has been found to be no more accurate than simple centographic methods. Because of this, research is beginning to look to alternative ways to analyze crime series that go beyond traditional geographic profiling systems. In particular, this research reports on a new method of analyzing crime series that assist in determining commuters from marauders and then provides the optimal tool for analyzing the crime series. In addition to research results, discussion will include training and future issues in crime series analysis.

Deborah D. Paulson, University of Wyoming. Email: debp@uwyo.edu; William L. Baker, University of Wyoming. Email: bakerwl@uwyo.edu; Envisioning a Society in Connection with a Non-diminished Natural World in Southwestern Colorado

The western United States landscape has been strongly transformed by waves of human activities, especially over the 150 years since Euro-American expansion into the region. Yet, natural ecosystems remain more intact in the interior West than in many other regions. While natural areas of the region are strongly valued by residents and visitors alike, nature continues to be not only transformed, but diminished by new waves of human uses—including rural residential sprawl and gas and mineral exploration. We explore past and on-going transformations, as well as attempts to restore the natural world in our recent book, *The Nature of Southwestern Colorado: Recognizing Human Legacies and Restoring Natural Places* (University Press of Colorado). In this paper we draw from the concluding chapter, where we consider how two philosophies—Aldo Leopold's land ethic and Gary Nabhan's cultures of habitat—might be applied to guide human choices in this region. Both philosophies envision a human society in connection with a non-diminished natural world.

Keywords: landscape transformation, human-environment relations, Western U.S.

Nels Paulson, Ph.D. candidate in Sociology, Arizona State University. Email: nels@asu.edu; *Conceptualizing the Place of World Society, the State, and Environmental Law*

To more fully understand the role of the nation-state regarding ecological change and environmental governance this paper looks theoretically at actual shifts in government structure that cannot be explained by traditional neo-realist approaches that emphasize security and economic interests (Baldwin 1993). Particularly, this paper evaluates state level environmental law as influenced by processes that can be explained better through a world polity perspective (Meyer et al. 1997). With world polity theory as a basis, this paper looks at international non-governmental organizations (INGOs) as a point of entry for understanding particular shifts from security or economic interests of the state to more science-based rationality in construction or reconstitution of laws and priorities regarding the environment in the United States and abroad. Environmental laws are increasingly written using language and influence of various INGOs. This pattern is explored specifically through INGOs that promote similar conceptions of science-based, formally rational structures. This paper argues that while local ecologies are affected by traditional state level interests, a shift toward world polity influence is increasingly changing locally significant environmental laws. Through a world polity perspective, using environmentally-minded and science-based INGOs as an empirical frame, we can see the changing place of the nation-state in constructing local ecologies via law.

Tamlin M Pavelsky, University of California - Los Angeles. Email: pavelsky@ucla.edu; Laurence C Smith, University of California - Los Angeles. Email: lsmith@geog.ucla.edu; *Intercomparison of Four Global Precipitation Datasets and Their Correlation With Increased Eurasian River Discharge to the Arctic Ocean*

Recent increases in Eurasian river discharge to the Arctic Ocean have attracted considerable scientific attention but remain poorly understood. Previous studies have examined fire frequency, permafrost thaw, and dam construction as potential mechanisms. Here, we focus on precipitation as a driver, using 198 dam-free Eurasian river basins ranging from 151 to 897,000 km². Using R-ArcticNet monthly discharge data and four observational and reanalysis precipitation products from the University of Delaware (UDEL), University of Washington (UW), NCEP/NCAR (NCEP), and ECMWF (ERA-40), we (1) assess which precipitation datasets best capture spatially realistic patterns as inferred from agreement with river discharge (198 basins; 1958-1989); and (2) determine to what extent observed discharge trends follow Udel precipitation changes (66 basins; 1936-1999). Results from (1) show for the 74 (of 198) basins displaying statistically significant discharge trends (24 positive, 50 negative; -74% - +89%, mean=-1%), interpolated precipitation products significantly outperform reanalysis datasets, perhaps owing to the fine-scale resolutions examined here. Agreement between discharge and precipitation is 42-86% and 42-97% for UDEL and UW, respectively, but approaches zero for NCEP and ERA-40. Results from (2) suggest that precipitation increases play a significant role in observed long-term discharge increases. For the 40 (of 66) basins displaying statistically significant trends in discharge (32 positive, 8 negative; -23% - +50%, mean=+11%), 29 display corresponding trends in precipitation with 35-62% agreement between discharge and precipitation trend. Comparison of discharge trends with basin permafrost properties indicates a possible, but not strong role for permafrost thaw in the observed increases.

For many outsiders, it is a big puzzle how visions of transborder regions can be constructed amidst fence building, unresolved immigration issues and increasing border security along the U.S.-Mexico border. And yet, driven largely by economic forces, state and local governments continuously search for ways to increase their region's competitiveness by more efficient use of complementary resources on both sides of the border. An assessment of regional economic indicators has suggested that, since the implementation of NAFTA, geographical location in combination with region-specific infrastructure (socio-economic and physical) has resulted in increased spatial differentiation within the U.S.-Mexico border region. This has increased pressure on border states' governments to seek new partnerships and develop innovative approaches to cross-border collaboration. In this paper we first review arguments in support of crossborder collaboration. Preliminary findings suggest that major goals of the government-supported crossborder collaboration have not changed; they are still framed within competitiveness and prosperity. It is the political and economic landscapes in the border region that have changed dramatically since the beginning of the 21st century. We examine several cross-border collaborative initiatives in the U.S.-

Mexico border in order to determine what are the underlying factors and strategies that are being used to make collaborative intentions in these new conditions a reality.

Zoran Pavlovic, Oklahoma State University. Email: djuvedj@yahoo.com; Aswin Subanthore, Oklahoma State University. Email: Aswin.Subanthore@okstate.edu; *Wine in the Hindu Cultural System*

Although wine has been widely present in South Asia since ancient times, its role in Hindu lifestyle fell under the category of a major religious taboo. In India, the origin of wine consumption followed paths of cultural exchange with Greeks and later with Romans. Wine also diffused from China during the Mughal reign when it was used as a representative medium to denote status and class at social events. In southern India, wine production was indigenous prior to contact with Aryans and continued despite Hindu religious laws denoting alcohol ban on so-called moral grounds. Sanskrit scriptures and Hindu beliefs indicated that drinking was a pathway to distraction from reaching God-realization. With the European colonial influence, however, a major shift occurred in Hindu ideology among the upper caste members who perceived wine as an important indicator of status and class within the Hindu hierarchy. British colonization not only improved wine trade but several non-Hindu groups emerged to facilitate this process. Popular culture generated major changes in recent times, both in the area of viticulture, per se, and as a contemporary cultural and social phenomenon. Increased impact from South Asian Diaspora and globalization on India's society has necessitated wine consumption among all sections of Hindu population as a facet of interaction with the Western world.

Marianna Pavlovskaya, Hunter College. Email: mpavlov@hunter.cuny.edu; *Post-socialist migrants in the US: Enacting the transition to capitalism in space*

The transition to capitalism in the former socialist countries can be thought of as a transition in time. There, a market-based economy is to be built in the space formerly occupied by the state socialist socio-economic system. Its widely adopted neo-liberal version privileges corporate interests at the expense of social welfare. Simultaneously, the neo-liberal subjects that are to inhabit the post-socialist world are being actively constructed, also with many contradictions. They are to be made out of their supposed antipodes, the citizens of a society that functioned for ¼ of the 20th century in the symbolic order opposed to capitalism and individualism. Along with this, another - and unrecognized as such - transition to capitalism has been unfolding. Hundreds of thousands of the former soviet citizens left their homelands since the 1990s to settle in the advanced economies of the West. Ethnically and culturally diverse, many these migrants are secular, participate in transnational networks and do not flee totalitarian state. Compared to multitude of other world migrants, however, they stand out because of they all share the complex identity of post-socialist subjects. And similar to those who live in the post-socialist world, they also must negotiate the neo-liberal logics of the society to which they have come although not through a transition in time but in space by engaging in an international migration. This paper raises some theoretical issues important for understanding the impact of the former soviet migrants who are carriers of post-socialism within the borders of the West.

Robert T. Pavlowsky, Missouri State University. Email: bobpavlowsky@missouristate.edu; *Geomorphic resistance and the lack of channel change in a disturbed Ozark river*

Channel form is controlled by the balance between force and resistance in the fluvial system. Nevertheless, most geomorphic studies focus on understanding the influence of hydraulic forces on the channel bed and banks and spend little effort on evaluating the resistance factors involved. This study examines the channel forms and fluvial processes within the South Dry Sac River located on the northern edge of Springfield, Missouri. The objective is to better understand the geomorphic resistance factors linked to apparent channel stability and little channel change over the past century along a 1 mile long channel segment despite chronic disturbance. Indeed, the river has been subjected to a long history of local- and watershed-scale disturbance including land clearing and settlement in the 1840s, mill and reservoir dam construction in the late 1800s, and urbanization since 1980. A preliminary evaluation shows that narrow valleys and shallow bedrock limit channel adjustments in most places. Further, riparian vegetation and the composite banks reduce the rates of channel enlargement and bank failure. The adjustment periods for both geomorphic lag and recovery seem to be relatively long in this system. The main driver for instability appears to be excess gravel sedimentation in mega-bars and plane-bed channels that forces bank erosion where they clog the channel. The source of the gravel probably started

during historical settlement but recent urbanization has also increased gravel loads from headwater tributaries due to bed scour and bank erosion.

Coastal marshes have come under increased scrutiny in recent decades as their ecological productivity and ecosystem contributions become apparent. With research over sea level rise and the increased frequency of extreme weather events, concern over their long-term viability has increased. This study uses high resolution multi-spectral airborne imagery and field data to produce wetland cover maps for Plum Island Estuary, an NSF Long Term Ecological Research (LTER) site in northeastern Massachusetts. The research conducted with the Massachusetts Office of Coastal Zone Management examines the efficacy of high resolution imagery to map wetland landscapes and associated plant species distributions. Results of these efforts can help wetland managers systematically monitor these ecosystems and develop appropriate and targeted conservation strategies.

Eric Pawson, university of canterbury. Email: eric.pawson@canterbury.ac.nz; Student responses to PBL in geography

Problem-based learning (PBL) is an accepted pedagogical method, with most of the literature originating from disciplines where the purpose of holistic styles of learning can be clearly demonstrated, such as medicine and engineering. In geography, it is not clear how widely PBL is actually used, or what the barriers to its adoption might be. This paper discusses the initial results of a six-member team, from five countries, established under the auspices of the International Network for Learning and Teaching (INLT). It seeks to identify the contexts within which PBL is being used in geography, whether at the project, paper or curriculum level. It discusses the experiences of students in PBL courses to examine whether the claims made for PBL, in particular that it is student-centred and leads to more integrated comprehension, are borne out in practice.

Tony Payan, The University of Texas at El Paso. Email: lapayan@utep.edu; The Four Great Eras and the Three Wars of the U.S.-Mexico Border

Over the last century and a half, the United States-Mexico border has undergone three fundamental historical shifts. It has transitioned from a frontier to a customs border to a law enforcement border and now to a matter of national security. Each of these great eras was ushered in by fundamental changes in the United States and in Mexico and by international concerns, principally those of Washington DC. Each new ideological shift has come accompanied by increased bureaucracies, expenditures, laws and regulations, etc., all of which underlie the fundamental failure of both the United States and Mexico to provide order and stability on the borderlands. As a result, the historical pattern is one of closing the border, a pattern that has come accompanied only by increased policy failures. This presentation addresses the material and symbolic changes along the border and the potential future of the borderlands.

Anthrax, a zoonotic disease caused by *Bacillus anthracis*, continues to be a serious problem in livestock and wildlife worldwide. In many agricultural regions of Kazakhstan, human infection rates remain high as a result of infected-livestock slaughter practices and limited veterinary intervention. Kazakhstan has a long history of anthrax outbreaks, as recorded through the anti-plague network

established under the previous government. This allows a unique opportunity to evaluate the spatio-temporal patterns of outbreaks nationwide. Today, Kazakhstan continues anthrax surveillance, vaccination, and control effort nationwide. This includes the development of a spatial database and GIS-based analyses to expand existing knowledge on the distribution of anthrax. This paper introduces a multi-decadal review of the distribution of anthrax outbreaks in Kazakhstan and reviews methodologies for defining risk at various spatial scales. Additionally, identifying areas of high incidence can provide a first-step towards improving disease control. This is an important process for maximizing public health resources and targeting areas with the greatest need. This paper also presents results of spatial cluster analyses designed to distinguish areas of high disease prevalence from what appears to be a uniform distribution of cases. While only aggregated vaccination data are available, these hotspots are evaluated relative to current vaccination efforts. As spatially-explicit data become available on vaccination, these analyses will aid in determining more appropriate distribution locations for vaccines and improve the flow of public health resources across the country. These analyses represent a larger in-country effort to expand spatial data infrastructure and improve disease reporting and control.

Micha Pazner, Ph.D., The University of Western Ontario. Email: pazner@uwo.ca; Jadah Folliott, M.A., The University of Western Ontario. Email: jfolliott@uwo.ca; RS-GIS Wildfire Scar Pattern Analysis

Wildfire activity has been increasing since the 1980s and several researchers acknowledge that longer fire seasons coincide with warming temperatures and earlier springs. Based on a global warming trend, the impacts of climate change may include more frequent and severe fires, shorter growth periods between fires, younger stands, and a decrease in the carbon storage of forest areas. Increased wildfire activity will have feedback effects on climate. Wildfire scar pattern analysis may be used to help identify future trends in climatic and environmental change. Our research focuses on the question of how wildfire scar patterns can be better analyzed over very large land areas and over a 20-25 year period. For this research we will use Remote Sensing (RS) digital image processing and interpretation, and Geographic Information System (GIS) modeling and visualization to detect, analyze, and interpret spatial characteristics and patterns of wildfire scars at multiple scales. Existing methods will be used, and, importantly, new methods will be developed. The study area will include parts of Canada's boreal forest ecozones. Old and fresh burns will be visited for ground referencing and field model calibration and validation. The purpose of the paper is to present a conceptual framework for RS-GIS Wildfire Scar Pattern Analysis. This framework integrates the use of a fast-track interpretation mode and an in-depth analysis mode. The results are expected to show that RS-GIS wildfire scar pattern analysis is a useful method for deriving indicators of global warming.

Keywords: wildfires, Boreal Forest, remote sensing, GIS, global warming, climate change

Linda Peake, York University. Email: lpeake@yorku.ca; Post-colonial, feminist and quantitative? Measuring the extent of domestic violence in Georgetown, Guyana

The vast majority of feminist research in Geography eschews quantitative methods despite the understanding that all data are forms of representation. As a consequence feminist geographers have been prevented from pursuing certain research questions and epistemological paths of investigation. In this paper I investigate the consequences of this state of affairs and discuss the possibilities of a critical approach to quantitative techniques of analysis that incorporates feminist and post-colonial practices. I discuss the results of a survey study of 360 women conducted in 1998 with the Guyanese women's organisation, Red Thread, on the extent of domestic violence in the capital city of Georgetown. The study approximated a random design and took the form of a multi-level cluster survey. I conclude by assessing the importance of opening up feminist enquiry in Geography to the possibilities unleashed by the uncoupling of quantitative techniques from masculinist versions of positivism and of the particular importance of quantitative techniques in the transference of skills in north-south alliances.

Jamie Pearce, University of Canterbury. Email: jamie.pearce@canterbury.ac.nz; Tony Blakely, PhD, University of Otago. Email: tony.blakely@otago.ac.nz; Karen Witten, PhD, Massey University. Email: k.witten@massey.ac.nz; Obesogenic environments in New Zealand: A national study of the association between neighbourhood deprivation and geographical access to fast food retailing

The increasing prevalence of obesity that has been noted in a number of countries has generated considerable concern about the health burden of the disease. Further, it has been noted that there is a strong and growing social gradient in obesity. New Zealand is no exception to these trends as the preva-

lence of obesity has doubled over the past 25 years. Rates of obesity are twice as high in the most deprived quintile of neighbourhoods compared to the least deprived quintile. The explanations for the social gradient in obesity are likely to be multifaceted and to include characteristics relating to individuals (composition) and those associated with the environment in which people live (context). It has been suggested that contextual drivers may be more prevalent in deprived neighbourhoods resulting in neighbourhoods that support unhealthy eating, so called 'obesogenic environments'. This study examines whether access to fast food outlets in New Zealand varied by neighbourhood deprivation. Data were collected on the location of fast food outlets, supermarkets and convenience stores. GIS was used to calculate travel distances from each neighbourhood to the closest food outlet. There is a strong association between neighbourhood deprivation and access to fast food outlets, which may contribute to the understanding of environmental causes of obesity. However, outlets potentially selling healthy food are patterned by deprivation in a similar way. The results highlight the importance of considering all aspects of the 'foodscape' of a neighbourhood before developing environmental strategies to reduce the incidence of nutrition-related mortality and morbidity.

Arctic communities have undergone rapid changes in the past half century. In recent years, communities have been exposed to additional stresses associated with climate change. These changes have transformed harvesting practices, community social networks, cultural and spiritual traditions, and have been linked to loss of identity and its associated social problems. In research conducted with the community of Ulukhaktok, Northwest Territories, Canada, community members identified specific concerns over the vulnerability of community youth. Adult community members and educators point to the potential loss of traditional land-based skills coupled with lack of workplace-relevant skills among the growing population of young Inuvialuit. For example, the role played by technology, globalization, and loss of language in conditioning how Inuvialuit youth experience and respond to climate change remains largely unexplored. In response to this community-identified research need, research is being undertaken in Ulukhaktok together with youth, elders and educators to identify how social change and climate change interact to affect the well-being of community youth, and to identify means for strengthening adaptive capacity. In previous research, youth expressed concerns including: lack of competency standards in education; limited employment; inadequate housing; drug and alcohol abuse; loss of language; and loss of traditional land-based skills. This research builds on these concerns and involves community youth in applied-participatory research through a host of methodological tools including: focus groups, participatory mapping, analysis of secondary sources, and the use of the Internet and video technologies. This paper describes the context for this new research and reports on preliminary findings.

Tyler Rebecca Pearce, University of British Columbia. Email: tyler29@interchange.ubc.ca; *Conversations on The Edge: Spatializing "Unease" and the Racialized Politics of "Revitalization"*

In 2005, a Winnipeg real estate developer and a host of government funders announced the creation of The Edge Artist Village, a revitalization project that included both street-level commercial space and live/work lofts for working artists. Touted in the media as bringing about a much-needed change to the Main Street Strip that would turn this disinvested commercial strip and Winnipeg's "skid row" into a cultural hub for artists, the pronouncements about The Edge discursively ignored the revitalization work organized by Aboriginal organizations who have turned the northern-most section of the street into a hub for Aboriginal social and cultural services and political organizations. Indeed, Aboriginal community and cultural workers often note that they must continually challenge the racialized and racist characterizations of the street that pervade public discourse, including their tacit erasure in race-less, class-based histories of "skid row." Seeking to historically spatialize these dynamics, I turn to three conversations that led to the development of the research project with the store-front in-movers to The Edge - a feminist, and largely white arts organization who have been actively seeking to "decolonize" their organization and programs. Drawing on the intimate geographies of the pre-search, I discuss the ethical and political

lacunas, failings and flailings of the organization's two moves ? the first to "The Strip", the second to "decolonize." Exploring the content, context and ambivalence of each move, I suggest, can offer a productive reframing of gentrification and arts-based revitalization that conceptualizes "race" as more than an additive category.

Keywords: Racialized Space, Artists, Gentrification

Hamil Pearsall, Clark University. Email: cpearsall@clarku.edu; *Risk perception and brownfield redevelopment: Exploring community perceptions of contaminated properties*

Brownfields pose considerable challenges for many former industrial cities in New England. Contaminated properties compromise public health, create blight, and drive local businesses into surrounding areas. In the face of urban decline, brownfield redevelopment offers a promising economic and environmental alternative. Federal and state brownfields policies help developers and lending institutions overcome the financial and legal obstacles associated with contaminated properties by modifying cleanup standards, promoting new remediation techniques, and offering financial incentives and liability relief. This government assistance does not mitigate on-site contamination, but it encourages developers to take the risk of redeveloping brownfields. Little research has investigated public response to this strategy. This paper discusses how public fear of residual contamination after redevelopment could jeopardize economic and community revitalization. Relevant communities include neighborhoods in proximity to brownfields with residents who would potentially use redeveloped sites. To look at community perceptions of brownfield redevelopment, this paper suggests applying a modified version of Slovic's psychometric survey, which would produce quantitative measures of perceived risk for brownfield redevelopment. Exploring risk perceptions associated with contamination will allow policymakers to better understand how public response might affect brownfield redevelopment.

Keywords: Risk perception, brownfields, community revitalization

Kristina Pearson, . Email: Kristina@villageearth.org; *Protecting Indigenous Land in the Peruvian Amazon*

The Peruvian Amazon is being deforested at a rate of over 42 acres each day as estimated by the Food and Agriculture Organization of the United Nations. The indigenous peoples inhabiting the forests have sustainably-managed these lands for many generations. However, the Peruvian government opened up the farthest reaches of the Amazon basin in 2003 for oil exploration and other extractive enterprises (such as logging and mining). Although the Peruvian government has given many indigenous communities the titles to their lands, the indigenous peoples are not aware of the location of their boundaries and, therefore, cannot report infringements on their land as told to me by the representatives from local indigenous organizations. As well as lacking the technology to monitor and demarcate their lands, the region is so remote that communication with the outside world is difficult. By facilitating the organization of these communities around land issues, they can then mobilize to protect their territories. My research uses Geographic Information System (GIS) and Geographic Positioning System (GPS) technology, in collaboration with Shipibo and Ashaninka communities in the central Peruvian Amazon, to monitor land use and demarcate indigenous territorial boundaries. Around forty indigenous communities in the district of Iparia, Ucayali, Peru are attempting to organize to better protect their land and natural resources from the illegal extraction of these resources.

Michael Pease, Southern Illinois University. Email: peasemike@yahoo.com; *Encouraging Water Reallocation Using Incentive Structures*

As strain on freshwater supplies intensifies in the western United States, states must attempt to bring their water usage closer to their stated goal of maximum utilization. The uncertainty of climate change and the growing need to protect already strained ecosystems could compound this problem. Tough decisions must be made about how to encourage or require more efficient use of water. One option proposed is to facilitate water market operations; in most regions this has failed. Using empirical evidence from Oregon and California, this paper will evaluate whether the use of regulation, or conservation statutes could have the effect of encouraging water trades, increasing the amount of water available to uses with critical needs.

Keywords: water, water markets, prior appropriations, resource management

Patrick P Pease, University of Northern Iowa. Email: patrick.pease@uni.edu; Paul Gares, East Carolina University. Email: garesp@uni.edu; *Air flow transformations associated with the onshore movement of wind: a field experiment at Jockey's Ridge State Park, North Carolina, USA*

The influence of water waves on the vertical profiles of wind has been well documented. However, the transformation of airflow conditions during the transition from water to land is less understood. This study presents preliminary data from field experiments designed to examine the wind profile and shear stress associated with air flow moving from over water with small waves onto a relatively flat, sandy shore. The experiment was conducted at Jockey's Ridge State Park, North Carolina. Three masts with 5 anemometers each were used in the study. Mast 1 was located in 0.5 m of water, approximately 50 m from the shore. Mast 2 was located about 2 meters from the strandline, oriented normal to the beach relative to the offshore mast. Mast 3 was located 12 m further inland from mast 2, again, aligned shore-normal relative to the other masts. Each mast was also fitted with temperature and humidity sensors. Two pressure transducers, one located at mast 1 and the second located about 20 m from shore, were used to characterize the wave conditions during experimental runs. Additionally, 16 sand traps were placed in a transect between masts 2 and 3 to characterize variations in transport. Significant differences in the wind profiles at the three masts were seen during the transformation from water to beach. The roughness characteristics measured at mast one also showed significant variation with different wave regimes. The wind characteristics and transport potential are discussed for several wind regimes.

Keywords: Air flow; land-sea interactions, sediment transport; coastal dunes

Carl Pechman, Ph.D., Power Economics Inc.. Email: cpechman@powereconomics.com; *Territoriality of Electricity*

Electric de-regulation, the move to competition, is one of the most significant economic experiments ever pursued. Largely motivated by the desire to improve efficiency, many of the effects of de-regulation were not foreseen. One such effect is the increase in competition between regions. Using New York as a case study, this paper demonstrates how de-regulation has increased territoriality in electric markets and policy. Electricity is intrinsically territorialized. Corporate boundaries of electric utilities have historically been defined by geography. Vertically integrated utilities served all customers within a fixed service territory. Power plants to serve customers' requirements were located within a utility's service territory (or in the service territory of one of the partners in the construction of a power plant). De-regulation has not changed the relationship between space and power, due to the constraints in the physical infrastructure of electric generation. A second aspect of the territoriality of electricity is the changing nature of pricing under competition. Electricity pricing under regulation involved averaging of rates across the geographic area of the utility. Under deregulation, geographic differences in the cost of providing power are explicitly revealed. This is a particularly pronounced problem in urban areas, with old high cost generation and transmission constrains limiting the import of renewable and low cost generation. Cost differences revealed by deregulation increase political pressure for geographically based rates. These rates in turn increase the incentive for low cost areas to protest the construction of transmission lines that would move energy between low and high cost areas.

Jamie Peck, University of Wisconsin-Madison. Email: japeck@wisc.edu; *Remaking laissez-faire*

While the term has been in circulation for several decades, neoliberalism has received unprecedented attention from critical human geographers in the past few years. Like numerous other big-picture buzzwords before it (postfordism, globalization ?) its fate may already be sealed: following a critical backlash, the field seems destined to move "beyond" neoliberalism. Somewhat against the tide, perhaps, the paper will make an argument for the continuing utility of a refined concept of neoliberalism. But if the concept is to retain explanatory salience, it cannot be used as a half-empty signifier for the contemporary political-economic zeitgeist; it should not be used, in a "for-want-of-a-better-word" fashion, as a loose indicator for the ideological atmosphere. Rather, if it is to be useful, the concept must have (real institutional) content and (historical-geographical) specificity. By way of a critical commentary on uses and abuses of neoliberalism, the paper will suggest some analytical steps in this direction. Amongst other things, this entails looking at neoliberalism from the inside out, as well as the outside in, and conceiving of methodological strategies that both explicate and place stress on the concept.

Snow drives the majority of ecological and physical processes in the high mountain environments of western North America. Mountain snow also impacts distant lowland regions through runoff and streamflow. Despite the importance of snow, long-term records of spatial and temporal variability in snowpack are sorely lacking. For this project, information preserved in 200+ tree-ring records was used in combination with geospatial analysis techniques and instrumental climatology to produce gridded maps (cell sizes 10-150 km²) of Snow Water Equivalent (SWE) that span three or more centuries. Our initial work targets key high-mountain headwaters for the Upper Colorado, Upper Yellowstone/Missouri, and Columbia/Saskatchewan Rivers. Preliminary results show marked interannual to multidecadal variability in total April 1st SWE. Comparisons with existing proxy records of Pacific Basin climate show coupled ENSO and PDO influences on the total amount of mountain snowpack in these regions. However, the strength of the Pacific Basin teleconnection varies within each basin. In the southeastern portion of the Yellowstone/Missouri study area, for example, only the highest elevations show a consistent response to Pacific Basin forcing, while snowpack in lower elevations may show no response, or a weak response of opposite sign. Moreover, the strength and sign of these relationships varies over time. These and other results exemplify why long-term records are essential baseline information for evaluating recent and future changes in mountain snowpack. The overarching goal of this project is to lay the foundation for snowpack reconstructions that encompass high mountain areas in all of western North America.

This study introduces two new socio-climatic monitoring tools for Afghanistan. These tools combine normalized difference vegetation indices (NDVI), water availability information based on snow water equivalence estimates, livelihood information, and population data, providing the results at a district level. The evaluation of food security in Afghanistan requires the analysis of both environmental and socio-economic variables. The early identification of high risk areas enables decision makers to take appropriate actions. Since large and widely dispersed populations depend on pastoralism and agriculture, climate monitoring and forecasting are important inputs to food security analysis. The FEWS NET program has developed a series of agroclimatic tools to help monitor socio-climatic shocks. Several information sources identify hydrologic shocks. Satellite rainfall estimates (RFE) fill in gaps in station observations, and serve as input to drought index maps and crop water balance models. Gridded rainfall time-series give historical context, and provide a basis for quantitative interpretation of seasonal precipitation forecasts. Snow-water equivalent estimates help determine the availability of water for irrigated crops. Several socio-economic data sources provide a critical context for understanding the relative importance and food security consequences of environmental variations. Socio-economic district-level information describes livelihoods, coping strategies and population. We demonstrate the applications of these information products during the 2004 season, when a sudden increase in temperature changed the course of the growing season.

James S. Peet, Ph.D., Pacific Geographic LLC. Email: jpeet@myuw.net; *Geography of Modern Sea Piracy*

This paper presents the current geographic distribution and methods of modern sea piracy, an activity that takes the lives of hundreds and costs hundreds of millions of dollars annually. The difference between how piracy is defined by the United Nations Conference on the Law of the Sea, 1988, and the description developed by the International Piracy Centre, a branch of the International Chamber of Commerce, is discussed, along with an analysis of the geographic difference in activities considered maritime piracy. The analysis was derived from reports made to the International Piracy Centre. Trends over the years have indicated that most acts of piracy are reported in developing countries. Piracy methods involve activities ranging from simple boarding and theft of unsecured

property, to robbery from crewmembers and passengers, up to the theft and re-flagging of entire vessels into “phantom ships,” with passengers and crew either murdered or abandoned at sea.

Smitha Peethambaram, Clark University. Email: f2000342@gmail.com; 3D Cross tabulation matrix for soft classified three map comparisons to validate spatially explicit land change models

This paper proposes a novel statistical method that generates a three-dimensional matrix that serves as the basis for summary statistics in terms of the percent of the landscape that is: 1) correct due to observed change predicted as change, 2) erroneous due to observed change predicted as the wrong gaining category, 3) erroneous due to observed change predicted as persistence, and 4) erroneous due to observed persistence predicted as change. The technique considers simultaneously three maps: 1) a reference map of time 1, 2) a reference map of time 2, and 3) a prediction map of time. The methodology compares these three mixed pixel maps and computes a 3 - dimensional cross tabulation matrix to calculate the error in prediction of the model at varying resolutions. This is particularly useful to assess spatially-explicit models of change among multiple categories of land. This paper is a breakthrough because the method allows each pixel in the map to have mixed membership to more than one category; therefore we can compute the statistics at multiple scales. The method is general so it is useful for any situation where a scientist needs to compare three maps simultaneously, such as comparing three different maps of various species.

Keywords: mixed pixels, crosstabulation matrix, resolution

Megan Peguero, United States Military Academy. Email: megan.peguero@us.army.mil; Land Use Visions and Population Realities - A Case Study of Alexandria, Virginia

Comprehensive plans focus on the planning goals and objectives of a state, city, or town to formulate a vision for the future. Zoning laws are a tool governments use to create that vision for the future. A government's vision will be more successful if the government's plans and zoning ordinances are integrated and complement one another. Alexandria, Virginia is a prime example where zoning laws were driven by the vision of the comprehensive plan. The zoning laws and subsequent land use decisions, intentional or not, played a direct role in determining the socio-economic makeup of the population within Old Town North, a neighborhood within Alexandria. Old Town North is less racially diverse than the City of Alexandria; while minorities make up 40% of the city's population, in Old Town North they only represent 25%. In addition, Old Town North residents have a much higher collegiate graduation rate than the surrounding city and there is a disproportionately low representation of children. The study also looks at incompatible land uses within the area and how that contributes to the population distribution. The paper then presents ideas on how to reconstruct the incompatible land uses to increase viability of the area and to increase diversity within the socio-economic makeup of the population.

Keywords: Virginia - Alexandria, zoning, land use, socio-economic

Mark Pelling, King's College London. Email: mark.pelling@kcl.ac.uk; Kathy Dill, University of Texas at Austin. Email: kathyswebmail@yahoo.com; Human Security and Disaster Risk Reduction

This paper interprets disasters as shocks to systems of political and social control, albeit associated with a natural hazard event. This understanding allows a study of the role of large natural disaster events in shaping ongoing political relationships and discourses. We are interested in the extent to which disaster events can be linked to human security through political conflict (discursive or material). Evidence is presented from a review of secondary data on 14 large natural disasters from an 1899 Hurricane in Puerto Rico to Hurricane Katrina the United States. A range of political consequences are identified. Most importantly it is pre-disaster political relations that influence the extent to which the potential for political change is realized as liberatory (opening space for nascent political forms to emerge catalysing more inclusive governance), or contained by the political elite further strengthening the status quo.

Claude Peloquin, Natural Resources Institute, University of Manitoba. Email: umpeloqc@cc.umanitoba.ca; Fikret Berkes, Natural Resources Institute, University of Manitoba. Email: berkes@cc.umanitoba.ca; Variability, change, and continuity: insights from Cree cultural ecology

This study explores the interplay between variability, change, and continuity in a subsistence hunt in northern Canada, focusing on the Canada goose (*Branta canadensis*) hunt of the Cree people of Wemindji in James Bay, Quebec. The work contributes to the understanding of social-ecological processes in sub-arctic environments that are undergoing biophysical as well as social-cultural

change at multiple scales. We interviewed Cree hunters, and accompanied them to their hunting territories, learning about Cree ecological knowledge and environmental management practices. These inquiries focused on how Cree hunters read and adapt to the environmental variability characteristic of sub-arctic ecosystems. Small-scale ecological variability and unpredictability, such as weather, goose population dynamics and migration patterns, are mediated by local management strategies in which goose-hunting areas may shift in space and time. These strategies traditionally involve rotation of hunting sites, minimizing of some disturbance, and minor physical modifications (bush clearing etc.) to the landscape. Whereas these strategies are still practiced, fine-tuning local arrangements to local environmental conditions, they are (to some extent) overwhelmed by changes occurring at larger scales. Some of these external drivers are related to climate change and anthropogenic disturbances, others are related to social-cultural changes that influence resource-use patterns. We analyze some key ecological variables of this system and discuss how they interact, providing a preliminary model of how change occurs in a dynamic but resilient setting. The study explores linkages between drivers at different levels, linkages in social and ecological processes, and the nature of continuity in a changing world.

Nancy Lee Peluso, professor, University of California. Email: npeluso@nature.berkeley.edu; Peter Vandergeest, York University. Email: pvander@yorku.ca; “The Forests are Surrounding the Cities!” Emergencies, Insurgencies and Forestry in Southeast Asia

From the 1950s through the 1970s, Malaysia, Indonesia, and Thailand experienced “Emergencies” and insurgencies during which political violence was staged in or from many of these countries' forests. We argue that these political movements are best framed not as of “non-state” or “recalcitrant” national subjects, but as alternative civilizing and state-making projects that launched or carried out their own territorializing and governing projects from forests. Both the insurgencies and counter-insurgency strategies produced new perceptions of ethnic identification with national states and of the need for central governments to manage the forest. Hundreds of thousands of people were moved, transforming settlement patterns at the landscape level. Suspect ethnic groups were often moved out of “jungles,” or their rights to land were ignored. People of ethnicities more closely allied with the national state were settled alongside newly zoned “forests” to practice agriculture. Counter-insurgency practices also channeled huge resources into intensified surveillance of forests and development projects in those regions where officials believed the residents' poverty made them susceptible to alternative political ideologies and civilizing projects. Military surveillance technologies and information were subsequently used by forest departments to strengthen their territorial control of political forests. The outcomes varied across sites according to the ethnic character of the different insurgencies and ideologies of the states; the relative influence of forestry departments in relation to agriculture and the civil service, the ways military power was used during and after conflicts, and broader state capacity to monitor and control peoples' activities in diverse ecologies.

Mark Pendras, PhD, University of Washington Tacoma. Email: jmpendras@gmail.com; Urban politics and the production of capital mobility in the United States

This paper identifies and investigates important political qualities of capital's capacity for mobility and considers the relationship between the historical political production of capital mobility and contemporary conflicts over urban politics and development. Emphasis is placed on the political character of capital mobility in reaction to how the mobility of capital has been naturalized in urban politics research and practice. Due to an overemphasis on technical and economic factors, researchers typically assume capital's capacity for mobility (or hyper-mobility), situate that mobility as the starting point for urban research, and then use it to explain the persistence of other development patterns, e.g., urban disinvestment, interurban competition, uneven development, etc. After a brief discussion of the challenges to effective and equitable urban development raised by the naturalization of capital mobility, I begin the task of denaturalizing capital mobility by developing a history of the political production of capital mobility in the US. Here I focus on key federal and state legislative and judicial decisions that redefined the public corporation - the institutionalized form of the more abstract concept of “capital” - in ways that also redefined the relationship between corporations and the place(s) in which they locate and operate. Critical examination of these political moments reveals how “placelessness” for corporations is a historical political achievement, one that both has important consequences for urban politics and development and is also ultimately open to contestation and redefinition through struggle.

Eli I. Peneva, Department of Geography University of South Carolina. Email: peneva@mailbox.sc.edu; *Loss of Mangroves, Gain in Aquaculture: Spatially and temporally detailed means of tracking changes in land use and valuation in coastal Thailand*

The exploitation of mangrove forests in Thailand for aquaculture, particularly shrimp farming, over the past three decades has been extensively documented. The economic impact of this exploitation has been evaluated using economic and non-economic valuation methods and shows strong evidence that the total value of mangrove forests exceeds that of shrimp farms, even in the short-term. This study will use remote sensing-based land use/land cover classifications for five-year intervals from ~1985-2005 to determine the pattern of land use change for two provinces (Chanthaburi and Phangnga) in Thailand. The classifications will provide a means to track the subsequent land use patterns of mangrove forests that were converted to shrimp farming. An economic and non-economic valuation will be applied to the various land use types and assigned on a pixel-by-pixel basis to the classifications for each five-year interval. This will permit a spatially detailed means of tracking the economic fortune of converted mangrove forests. Field work will be conducted in several coastal communities within the two provinces to determine the indirect and, especially, the non-economic valuation of mangroves and shrimp farming. This study will help establish a methodology that will aid coastal communities in Southeast Asia in determining sustainable land use conversion approaches.

Keywords: mangrove, shrimp farm, land use/land cover classification, Remote Sensing, coastal communities

Robert Penfold, PhD, Winnipeg Regional Health Authority. Email: rpenfold@wrha.mb.ca; *Injured on the job: the workplace injuries of children in Ohio*

Little is known about the frequency, location and severity of injuries sustained by children at work. The PURPOSE of this research was to determine the most common injuries acquired by children at work and describe differences in injuries by age, sex, and location. METHODS We obtained 8 years (1997-2004) of complete hospital claims from the Ohio Hospital Association for which the Ohio Bureau of Worker's Compensation (BWC) was the primary payer. There were 2614 inpatient visits paid by BWC during this period. We selected 1132 records for which the primary, secondary, or tertiary diagnosis code was between 800 and 995 (injuries) and the patient was a child (

Geri Pepe, West Chester University. Email: gpepe@esri.com; *Traditional Survey Mapping Versus LIDAR Mapping: Delaware Seashore State Park and Surrounding Beach Communities*

Traditional surveying of beaches using classical leveling, transects and profiles, aerial photography and Global Positioning Systems (GPS) is time-consuming and labor intensive. In recent years, Light Detection and Ranging (LIDAR) has been widely employed in coastal mapping. Analysis of LIDAR data with Geographic Information System (GIS) software assists with a number of different coastal applications from measuring coastline erosion and changes to beach topography, to monitoring beach nourishment and evolution. The objective of this research is to analyze the accuracy and effectiveness of traditional survey mapping versus LIDAR mapping in Delaware Seashore State Park and surrounding beach town communities. The state park is bounded on the east by the Atlantic Ocean and on the west by Rehoboth Bay and Indian River Bay, a total of 2825 acres. The two beach town communities of Rehoboth Beach and Dewey Beach are located in the North corner of the park. The hypothesis is that LIDAR is more effective and accurate than traditional survey mapping for analyzing topography of the beach.

Keywords: LIDAR, beach geomorphology, beach volume change, survey, Delaware Seashore State Park, Rehoboth Beach

Randy A. Peppler, University of Oklahoma. Email: rpeppler@ou.edu; *Knowing weather and climate: how people understand, forecast and cope with meteorological events*

From the literatures on ethnoscience, traditional environmental knowledge, and environmental perception, I will review how people who rely on weather and climate for their livelihood traditionally recognize and forecast meteorological events and cope with extremes. This review is part of a planned historical examination to uncover native ways of knowing weather and climate within Oklahoma Indian Nations, framed by the claim that a person's perception of nature and its extremes is in part culturally or locally formed. Work in ethnoclimatology has sought to uncover local ways of forecasting weather and climate events and evaluate their scientific validity. One example I will review is from Orlove, Chiang and Kane (2002), who uncovered a scientific basis for the successful forecasts of coming rains by potato farmers in the Andes of Peru and Bolivia. The degree of obscuration of the stars in the Pleiades, as observed by the farmers, foretell either a normal rainy season (bright and numerous) or a delayed,

erratic one (dim and sparse), leading to different planting date strategies. The authors related the degree of obscuration to the lack or presence of El Niño-produced subvisual cirrus clouds. They suggest that people are not "fatalistically resigned" to accept climate variability as a reality but instead seek information useful for dealing with it. Such inquiries into indigenous knowledge uncover information that might serve as a model for studying present-day situational awareness during extreme events.

Keywords: ethnoclimatology, indigenous forecasting, weather

Lee Pera, graduate student, University of Oregon. Email: jpera@uoregon.edu; *"Tamagringo": Amenity migration and community change in Tamarindo, Costa Rica*

This paper explores struggles over development, identity and place on the Pacific Coast of Costa Rica where thousands of U.S. citizens have purchased real estate and settled over the past two decades. Significant scholarly attention has been given to immigration from Latin America to the United States, and, more recently, to amenity migration within the U.S. Yet growing numbers of North Americans are moving outside of the U.S. and seeking out less expensive, beautiful places to live permanently or to invest in second homes. Often called amenity migrants, they are a minor percentage of the total international migration stream; however, their impacts on both the landscapes and the communities of the places they settle are great and range from shifting class and race hierarchies to changing land titling systems. In the late 1980s Costa Rica began to court potential amenity migrants with tax and residency incentives, becoming a popular destination for North American amenity migrants. This paper analyzes results of twenty interviews conducted in Tamarindo, Costa Rica and textual analysis of publications written by and for the English-speaking expatriate community. I employ a citizenship framework to explore impacts of this relatively new population of North American migrants in one of the many relocation "hotspots" in the hemisphere. Finally, given the ability of U.S. amenity migrants in Costa Rica to exercise citizenship through their economic and political clout, I suggest that current amenity migration can provide a more nuanced examination of neocolonial relationships between the United States and Central America.

Keywords: amenity migration, citizenship, Latin America, transnationalism

Jose Peralta, Department of Sociology. University of Illinois at Urbana-Champaign. Email: peraltao@uiuc.edu; *GMO contamination of native corn in Oaxaca and resistance to NAFTA*

This paper discusses the struggles emerging in Mexico after the discovery of GMO contamination of native corn in 2000 in Oaxaca, a region considered to be a historic epicenter of corn diversity in the world. Based in data collected during the summer 2006 in Oaxaca -the Mixteca Alta and Sierra Juarez-, I explore the ways in which different segments of the population resist and make sense of GMO contamination as they confront the economic and social impact of NAFTA. In particular, I discuss the implications of situating GMO contamination in narratives of national and local histories, not only memories of a pre-Hispanic technological development of corn but also farmers' experiences with the green revolution. I question how these narratives as well as farmers' strategies for evaluating imported agricultural technologies and changes in the markets enable them to decide on ways to negotiate and resist the process of neoliberalization affecting their everyday lives and economies.

Keywords: GMO, NAFTA, corn

Gary M. Pereira, PhD, San Jose State University. Email: gpereir1@email.sjsu.edu; *Diversity in the Modeling of Individualized Autonomous Agents*

The use of agent-based or individual-based models for the investigation of geographical and ecological phenomena is well-established. However, the principle of parsimony is adhered to a bit excessively, particularly with regard to the representation of individualized behavior. It is demonstrated that even the simplest representations of individualized diversity in dynamic models can provide insights into geographical properties that would remain hidden if such models treat autonomous or separable entities solely as members of behaviorally homogeneous classes. The focus here is on the generative capabilities of agent-based models, their ability to investigate the emergence of spatiotemporal patterns and behaviors from multiple, distributed interactions of well-defined agents, when such patterns and behaviors are not implicit in their isolated characterizations or local interactions. Findings support the hypothesis that diversities of behavior yield stable patterns of organization, provide coherence, enhance efficiency, and improve resilience in a variety of geographical domains, through the creation and satisfaction of functional niches. The need to properly model, and possibly encourage, functional and behavioral diversity in planning for resources, hazards, transportation, agriculture, and other domains is discussed. A sampling of models is used to illustrate this point. A vehicular traffic flow model that provides a range of acceleration rates among individual vehicles is

shown to yield greater flow rates at higher densities than equivalent models of vehicles with identical behaviors. A set of resource allocation models investigates the emergence of patterned coherence, with improved systemic yield and resilience, in the dynamics of behaviorally diverse mobile consumer agents.

Keywords: Agent-based models, diversity, pattern formation, resilience

Harold Alan Perkins, Ph.D, Ohio University. Email: perkinsh@ohio.edu; *Laboring through Neoliberalization: The Cultural Materialism of Urban Environmental Transformations*

Human labor transforms nature into urban forms, resulting in symbolic and material cultural engagement with the environment. From this, aspects of urban environments considered 'natural' such as the urban forest, can actually be considered cultural artifacts produced by human labor for the survival and prosperity of people. However, what appears to be an engagement with nature for the prosperity of everyone is actually a process appropriated by late capitalism, geared toward the expansion of profit. Instead of equitably distributed green urban environments, the unevenness inherent to the cultural materialism of a neoliberalized capitalist political economy within the United States has produced inequitable urban environmental geographies in cities like Milwaukee. Generally, neoliberal capitalist processes are a reversion to market led urban service provisions. This research investigates how these neoliberal forms of governance have affected efforts to (re)forest and revitalize urban green infrastructures, and what effect they may have upon the ability urban poor communities to consume them. A qualitative methodology is employed to conduct a scalar investigation into the effects of these processes. Thirty-six stakeholders involved in urban forestry and revitalization of park spaces were interviewed to determine the extent to which neoliberalizing processes are impacting provision for, and access to, green infrastructures. While the situation is contextual, devolution of responsibility for the production and maintenance of infrastructures from the state to the local and bodily scale is occurring.

Matthieu Permentier, Utrecht University. Email: m.permentier@geo.uu.nl; Gideon Bolt, Utrecht University. Email: g.bolt@geo.uu.nl; Maarten van Ham, University of St. Andrews. Email: maarten.vanham@st-andrews.ac.uk; *Neighbourhood reputations: differences and similarities between internal and external reputations*

Reputations of urban neighbourhoods are thought to have several consequences for residents' lives. These consequences can be economical, social or psychological: jobs are not offered to people residing in neighbourhoods with a bad reputation, engaging in social relationships can be troublesome and people possibly internalize the neighbourhood's stigma. Neighbourhood reputations are a social construct and both residents of a neighbourhood and outsiders can think differently about the reputation of a neighbourhood. Little is known about the similarities and differences between these internal and external types of neighbourhood reputations, and the relationship between these types of reputation and neighbourhood characteristics. This paper will address two points. First, we investigate to what extent neighbourhood reputations differ between groups (residents and non-residents) and within groups. Second, we investigate to what extent these neighbourhood reputations are associated with neighbourhood characteristics. We use data from a survey which we carried out in the spring of 2006 in Utrecht, the fourth largest city in the Netherlands. We collected information on 1400 residents in 24 different neighbourhoods and also questioned 38 real estate agents. Analysis of the data shows that neighbourhood reputations are higher rated by residents and realtors than other city residents. Within the group of other city residents we find differences in rating based on socio-economic status, ethnicity and education. In relation to the second point we conclude that neighbourhood reputations are most significantly correlated with socio-economic and ethnic characteristics, while physical and functional neighbourhood characteristics are of less importance.

Keywords: Neighbourhood reputations, residents, neighbourhood characteristics

Eric P Perramond, Colorado College. Email: eric.perramond@coloradocollege.edu; *The Devil's Wire and Neo-liberal Enclosure: Material and Conceptual Privatization in Sonora, Mexico.*

In the latter half of the 20th century, private ranchers in the Rio Sonora region of Sonora, Mexico began to seal off open range using barbed wire. The "Devil's wire" as some local communal farmers and ranchers called it, disrupted access to regional grazing pastures and facilitated the de facto control over previously open range cattle grazing. Since the reforms to Article 23 of the Mexican Constitution, in 1992-93, a new and "virtual" form of enclosure is now occurring; one based less on physical space and material disruption of livelihoods. Instead, the new "neo-liberal enclosure" is closing former commons by offering "opportunities" to communal farmers and ranchers, namely, renting and selling their previously communal lands. If human agents were directly responsible for

the material enclosure of rangelands, it is the Mexican federal government and federal agencies now leading the push to virtually enclose the ejido, Mexico's post-revolutionary land reform invention. This paper discusses the details of this latest wave of enclosure, documented through ethnography and analysis of household economics and decision-making, and illustrates how conceptual "enclosure" may help explain the closing of livelihood options and the short-circuiting of locally important institutions such as the ejido in Mexico.

Keywords: ejido, neo-liberalism, Mexico

Thomas A. Perreault, Syracuse University. Email: taperrea@maxwell.syr.edu; *A volatile mix: Natural gas, national imaginaries, and social movement politics in Bolivia*

Contestation over the governance of Bolivia's natural gas reserves - the second largest in South America - is at the heart of the country's ongoing social conflict. This includes recent moves by the government to 'nationalize' Bolivia's natural gas, the efforts of the recently formed Constitutional Assembly to rewrite the constitution (and thereby 're-found' the nation), and the centrifugal forces of regional autonomy movements. Since the 2003 'gas war,' which led to the ouster of President Gonzalo Sánchez de Lozada, natural gas has taken center stage in Bolivian politics, as both the foundation of economic development, and a signifier of national meaning. This paper examines the political ecology of natural gas in Bolivia. It considers the ways that gas has figured into conflicting regional imaginaries of the nation, and the ways that the geography and materiality of natural gas help shape these conflictive politics. Natural gas is an expansive and highly volatile substance, which is brought into circuits of production and social reproduction only through complex engineering systems oriented toward its extraction, refinement, conveyance and combustion. In contrast to its political centrality, it is extracted from fields located at the periphery of Bolivia's national space. The paper examines the ways in which the geography and materiality of Bolivian gas have contributed to the social and political forms in which it is imagined, governed, and contested.

Keywords: Bolivia, natural gas, political ecology, resource conflict

Marc J. Perry, U.S. Bureau Of the Census. Email: mperry@census.gov; *Population Trends in Coastal America: 1950 to 2005*

The number of Americans residing in a coastal county recently passed 150 million, making the coastal population larger than that of the entire U.S. population in 1950. More than one-half of the U.S. population is coastal, even though the 673 coastal counties, as defined by the National Oceanic and Atmospheric Administration, constitute only about one quarter of the country's landmass. In this poster we use decennial census data and recent population estimates to examine population growth patterns for coastal areas in recent decades. We examine trends in population growth and population density for coastal and non-coastal areas. For the period 2000 to 2005 we examine the individual demographic components of population change to determine the relative contributions of natural increase, domestic migration, and immigration to the growth of the coastal population. In recent decades, many coastal areas likely have had sizable increases in their seasonal populations, a trend not immediately apparent in population data from decennial census or postcensal population estimates, both of which reflect an area's permanent population. The poster examines the growth of the seasonal housing stock in coastal areas and includes more detailed case studies of several areas reflecting this trend. Finally, the poster concludes with a discussion of the percentage of the U.S. population that lives within 50 miles of the coastline. A wide range of estimates of this percentage has appeared in the media, and this poster includes the first Census Bureau calculation.

The long-term consequences of forest thinning treatments on water yield, especially in seasonally drought-stressed climates, are essential for planning contemporary forest management in southern Oregon. After a 25-year snooze when streamflow and vegetation measurements lapsed, new records from the Coyote Creek watersheds in the South Umpqua Experimental Forest are providing insights into long-term vegetation and streamflow responses to forest treatments conducted in 1970. Historical vegetation and streamflow records were collected from 1963 to 1981 on four small watersheds, where clearcut and overstory thinning treatments occurred in 1970. In 2000, the U.S. Forest Service in cooperation with Oregon State University resumed streamflow monitoring,

and regenerating vegetation was surveyed in the summer of 2006. Multi-decade changes in forest composition and structure were related to landform effects (soil, slope, aspect, topographic position) and disturbance legacies (clearcut, overstory thin, and small patch clearcut harvest treatments, roads, proximity to harvest patch edges). Streamflow responses were related to the range of harvest treatments to determine the relationship between fractional canopy removal, subsequent vegetation regrowth, and water yield. Results from the clearcut basin showed an emerging water deficit in spring, summer and fall, under young plantation forests, but less pronounced long-term responses to thinning and partial harvest treatments. Interactions among forest harvest treatments, vegetation regeneration and water yield were more complex than could be described using simple relationships of leaf area removed vs. water yield changes. These results show awakening moribund experimental watersheds can yield important ecological and hydrologic findings relevant to contemporary forest management issues.

Rudy Persaud, Federal Highway Administration. Email: Rudy.Persaud@fhwa.dot.gov; NDGPS

This paper describes the development the Nationwide Differential Global Positioning System (NDGPS), which augments the Global Positioning System (GPS) and provides 1 to 3 meter positioning accuracy in real time and 2 to 5 centimeter accuracy using post processing. NDGPS currently provides single-station coverage service over 97% of the continental U.S., Alaska, Hawaii, and Puerto Rico, and dual coverage over approximately 67% of the same area. Improved accuracy is secondary in the Wide Area Augmentation System (WAAS), and John Deere's Star Fire transmits their corrections from geostationary satellites. The ability to use the WAAS or John Deere's at or near the surface of the Earth is sometimes limited based upon terrain or local obstructions. In general, a ground-based augmentation system is required for surface transportation activities such as intelligent transportation system, positive train control, and 911 responses. Such a system is the NDGPS. The goal of the NDGPS dual terrestrial coverage of the continental U.S. and Alaska to support a wide range of current and future positioning and navigation requirements for federal, state and local government agencies. Some of the current and future needs of the private sectors may also be satisfied, but this is not the primary purpose of the system. Dual coverage will improve system availability from 99.7% to 99.9% to meet the accuracy, integrity, and availability requirements of many safety-of-life applications. The implementation of NDGPS in U.S. and Alaska to accomplish a common goal of providing a seamless navigation and positioning system with unprecedented accuracy, integrity, and availability.

Keywords: GPS, NDGPS, WAAS, augmentation, accuracy, integrity

Lisa M Pesnichak, San Francisco State University. Email: lpesnich@hotmail.com; Analysis of an Archaeological Site Cluster in the San Francisco Bay Area

Prehistorically, the San Francisco Bay Area was densely occupied, leaving behind hundreds of archaeological sites -many which have been documented and studied by archaeologists over the past century. The methods used to record archaeological sites have not been consistent, resulting in irregularities within the archaeological record. The San Francisco Bay Area Shellmound Project - headed by Kent Lightfoot (UC Berkeley) and Edward Luby (San Francisco State University) - aims to consolidate this documentation. As a result, a database (in Microsoft Access) of the prehistoric sites in the San Francisco Bay Area has been established using verbatim data from the original site records. In addition to being valuable to archaeologists for basic research, the database also allows for analysis using Geographical Information Systems (GIS) programs, such as ArcGIS. This presentation will use ArcGIS to evaluate one specific site cluster within the San Francisco Bay Area -using the Shellmound Project database. The main research question will focus on the spatial relationships between and patterns amongst different site-types.

Michael W. Pesses, Graduate Student - California State University, Northridge. Email: gorillamap@gmail.com; Authentic Spaces of Bicycle Tourism

In the past thirty years, bicycle touring has become a legitimate form of tourism. This paper serves as an attempt to examine bicycle touring as an "authentic" form of tourism as well as to examine how the trip affects the bicycle tourist's sense of identity. Through a qualitative analysis of the journals of bicycle tourists, this paper will look into how authentic space and authentic experiences affect the individual's concept of identity and self. The authenticity of the toured space is in constant tension with existential authenticity; one cannot exist without the other in bicycle touring. To find meaning in one's travels, and consequently in one's life, both forms of authenticity are constantly

being challenged by the experience and the landscape.

Keywords: Tourism-bicycle, authenticity, landscape, produced spaces

Sandra Petermann, University of Mainz. Email: s.petermann@uni-mainz.de; Rituals make places. Commemoration of landing of Allied troops in Normandy

1945. Large parts of Europe were razed to the ground in the wake of World War II. Many citizens of the European countries affected by the war entertained the hope that they would soon be free of the effects of turmoil and destruction and could leave behind the war-related traumata. The dissertation illustrates by reference to the commemoration of D-Day in June 1944 what attempts were made to shape a peaceful future in Europe during the postwar period and why war commemoration rituals captivate thousands and thousands of people even to this day. Based on action-theoretical concepts, the dissertation demonstrates how rituals create various place constructions. To this end, more than 100 qualitative interviews were conducted with designers of former war zones, ritual participants and battlefield tourists and analyzed together with extensive archive material. The interviews have been evaluated by way of a qualitative content analysis. It can be demonstrated that further place dimensions, which may be conceptualized as political, sacred and historical places, are evolving in ritual war memories besides commemorative places. These place dimensions are based on the spheres of ideology, beliefs and knowledge and besides being a ritual can lend a sense of security to people who were rattled by the warlike mass murder and order the experienced chaos. They help people to come to terms with their traumatic past: People can channel their shaken trust to these dimensions, which in turn continue to aid them in structuring their constantly more complex world in which to live.

Deike Peters, Center for Metropolitan Studies, TU Berlin, Germany. Email: deike.peters@tu-berlin.de; A New Era of Downtown Revitalization by "Grand Urban Schemes"? Los Angeles' "Grand Avenue" and New York's "Atlantic Railyards" Projects

Taking the rise of very large-scale urban revitalization schemes in the central areas of major metropolises around the world as a general starting point, this paper asks whether we might be seeing a return to a more visionary, comprehensive approach to urban planning and plan-making precisely during a new era of multi-level metropolitan governance characterized by public officials' diminished powers to implement large-scale visions, and how this seemingly paradoxical situation might be explained. Via a comparative analysis of two case studies from two key U.S. American world-class cities - Los Angeles and New York, the paper seeks to elaborate and ultimately confirm the proposition that there is indeed a current new generation of billion-dollar 'grand urban schemes' emerging that is different from the typical mega-projects of the 1980s and early to mid-1990s in that a) they are directly linked to a renewed wave of physical, economic and social restructuring in the central areas of world-class cities and b) they constitute a deliberate attempt by visionary urban leaders to capitalize on the renewed attractiveness of central urban locations for work, life and leisure in order to promote wide-ranging restructuring schemes for central urban areas. An additional point of investigation in this context is the role of star architects in downtown redevelopment (both the downtown L.A. and Downtown Brooklyn cases are Frank Gehry projects).

Keywords: Urban redevelopment/revitalization, Los Angeles, New York, mega-projects

Evelyn J. Peters, University of Saskatchewan. Email: evp818@duke.usask.ca; "[T]hey promise natives education and housing in treaties." First Nations hidden homeless men's and women's housing strategies and the geography of rights to housing

This paper addresses the housing histories over 18 months of hidden homeless adult First Nations men and women in a Saskatchewan city. "First Nations" is a term often used to refer to one group of indigenous people in Canada. Hidden homelessness was defined as staying with friends or family in order to avoid absolute homelessness. The paper attempts to avoid essentializing First Nations people and cultures by situating their experiences within the continuing effects of colonialism and the resulting geography of rights First Nations people have to housing. The paper frames the analysis in the literature on urban poverty, and especially work on the "underclass". This literature fixes poor people in space and associates them with "underclass" neighborhoods. It also constructs the poor as homogeneous populations living within bounded space. These frameworks may be particularly problematic for understanding First Nations people homelessness because many still have connections to rural reserves. Differences between First Nations men and women obviate the heterogeneity of this population.

Jacob J. Peters, University of Southern California. Email: jjpeters@usc.edu; *Thinking Code: Software as a Cultural Product, Free/Open-Source Software, and Ideology.*

This paper analyzes aspects of Free/Open-Source Software (FOSS) in order to ask how code might be taken seriously as a cultural product. Taking code out of the realm of the universal (where code's assumptions, precepts and functioning are the same everywhere) while also thinking about the rhetorical work that code does when thought of as universal, particularly in relation to racialization and ideologies of difference, is the crux of this paper. Code can be understood as a system of representation - having a flux of structures, protocols, histories and geographies? all which matter not only when thinking about how code is produced but also when thinking about how code, software and computing technologies are understood and made to mean. Code can also be seen as a system of production? to create code requires the intricate organization of human labor and many cases (relatively) unfixed capital. Legitimizing and maintaining the current normative mode of code production (proprietary software development) requires a great deal of energies, time and structuring from its active consumers as well as from the law and the state. How might FOSS's alternative systems of software production engender new sorts of social relations that expose and help think about how code as a cultural product relates to logics of racialization and difference? That is, what work does code do in excess of its computational functions? How might ideologies of difference be tied up in how code is produced, used, understood, theorized and imagined?

Keywords: free/open source software, code, ideology, difference, racialization

Katharine E Peters, State University of New York at Geneseo. Email: kep12@geneseo.edu; *Traditional Farming Villages to Overcrowded Urban Clusters: An Ethnographic Study of China's Future Development and Increasing Social Devastation*

The People's Republic of China has become one of the world's fastest growing, industrializing, and globalizing economies. While the nation's overall wealth is expanding, the rural sector, comprising nearly two-thirds of the population, is experiencing economic decline resulting in rural-urban disparities. As a result, a growing percentage of rural residents are migrating to cities in search of higher wages. This paper examines the current social, housing, and economic trends in China to predict social changes in future generations. Analysis is based on recent field work, primarily interviews and observations, in both rural and urban sectors. Rural villages on Hainan Island and the cities of Beijing, Xian, and Shanghai are analyzed and compared to contemporary research. Qualitative data from this study demonstrates that structural barriers in China cause rural residents to face difficult decisions regarding whether to remain in poor villages or risk moving to cities. Contrary to some current research, movement to urban areas often does not lead to higher quality of life in China. This research argues that the rapid movement from rural to urban is devastating the lives of all of China's residents. In order to ensure the future protection and welfare of its residents, the Chinese government must refocus its attention inward, on the urban conditions and lives of the rural residents, instead of outward, on its position in the rising global economy.

Kevin Peters, Rutgers University. Email: kipeters@eden.rutgers.edu; *The Contemporary Landscape in Art*

This paper addresses ideas of how landscape is conceived, perceived, depicted, and understood in the contemporary visual arts. It focuses on how artists choose to depict a contemporary geographic reality that has been variously described as "postmodern," "fragmented," "confused," "heterotropic" or "Thirdspace." As case studies, I take four artists whose work embodies these concepts: Benjamin Edwards, Robyn O'Neil, Mark Lombardi, and Julie Mehretu. Each challenges the idea of what a landscape is and forces a broadening of how the genre is understood. I conclude that these artists are essentially working as cutting edge geographers in their engagement with landscape. They demonstrate that landscape can no longer aspire visually to traditional notions of truth and reality, but must embrace unprecedented levels of complexity.

Paul A Peters, University Of Texas. Email: papeters@prc.utexas.edu; *Spatial Segregation in Complex Urban Systems: Addressing the micro-macro link*

Changes in policies and planning brought about by globalization and neo-liberal agendas strongly influence the patterns and processes of urban change in Latin America's largest cities. Globalization and the neo-liberal policies that often accompany it, are frequently seen as unavoidable and powerful processes, promoting a homogenization imposed from above, contrasted with a fragmenting localization from below. Tracing the patterns of urban development within this context is complex and involves incorporating the interactions between civil

society, markets, and the state, operating at both micro and macro levels. Of key importance is the manner and degree to which the interaction or isolation between different agents shapes development patterns. This research examines how residential segregation in Latin American cities in general, and Santiago, Chile in particular, is influenced by shifts in policy and planning and how advanced research methods can expose the linkages between social segregation, planning policy, and urban development. The primary goal of the research is to examine the nature of class-based segregation in Metropolitan Santiago and the role that public planning agencies and public housing provision plays in (re)producing or reducing the separation of different social classes. Using a mixed-methods approach, the research relates the policy and planning of housing programs, analytic evaluation of segregation patterns, and the simulation of segregation processes over time. The central methodological contribution of the research is the employment of a simulation approach, whereby formal methods that reinforce or reduce segregation are examined within a multi-level cellular automata model.

James F. Petersen, Texas State University - San Marcos. Email: jp01@txstate.edu; Richard A. Earl, Texas State University. Email: re02@txstate.edu; *An analysis of stream terraces and pediment surfaces in Big Bend National Park, Texas*

The landscape of Big Bend National Park is best known for the Chisos Mountains, and three major canyons on the Rio Grande. Widespread areas of the park, however, are dominated by a fairly continuous gravel-surfaced pediment that grades from the foothills of the Chisos Mountains toward the Rio Grande. This pediment, interpreted to be of middle Pleistocene age by the USGS, is beveled across badland-forming K-T sediments, as well as some dikes as wide as 8 meters. Grading downstream toward the river, the pediment surface is increasingly dissected by tributaries to Terlingua Creek on the west, Tornillo Creek on the east, and direct Rio Grande tributaries to the south. Fluvial dissection is characterized by a complex of terrace levels that step below the pediment surface down to the modern drainage channels. Many terrace remnants, however, appear to be surfaces abandoned by stream piracy or the result of baselevel control by resistant dikes that cut across the drainage channels. Field study of the pediment surface and terraces in the west side of the park are interpreted based upon topographic position, gradient, underlying geologic structures and relative dating techniques.

Keywords: Big Bend National Park, Rio Grande, pediment formation, fluvial terraces

Tagge Petersen, Centre for Regional and Tourism Research. Email: tagge@crt.dk; Tagge Petersen, TP, . Email: tagge@crt.dk; *Destinations and places seen as part of an innovation system*

The economic impacts of tourism are normally measured as the tourists' expenditures at the destination they are visiting, either for their vacation or for business. These impacts also include the broader contribution of tourism through its multiplier. In Scandinavia in general and as a part of a 6th EU frame-project called "Eurodite" several projects at the moment look at and analyse tourism and destination development from a learning and innovation perspective. In innovation theories, the user/producer interaction is one of several driving forces behind the innovation of new products or the appearance of new productions processes. Looking at tourism from this perspective — which recognizes that tourism is more than about the money used at the destination but also accounts for a demanding market in terms of customers using various production facilities — widens our perspective of this sector as a driving force of regional economic growth. This paper will consist of a short presentation of the theoretical framework. A discussion of why a theoretical framework on innovation is relevant from a destination's perspective is illustrated with examples from the Islands of Bornholm and Lesbos, as well as examples from literature and research. The presentation will conclude, that especially in peripheral regions, tourism can be seen as a primary driving force in the development of new companies and economical activities that are not necessarily included in the tourism sector. Finally, a discussion will demonstrate how this positive effect of tourism can be promoted by local business programs and initiatives.

Rosanna Petralia, San Diego State University. Email: petralia@rohan.sdsu.edu; *"See no evil, hear no evil, speak no evil": the obliteration and the silent commemoration of Mafia landscapes in Sicily*

The Sicilian Mafia is an entity with which Sicilian political leaders and citizens almost invariably deny being associated. This is the great lie upon which all Mafia enterprise is based. Nonetheless, the signs of its myriad crimes, and the institutionalized political corruption it has engendered, indelibly mark the Sicilian landscape, and are omnipresent. Some of these signs are emblematic of the widespread collusion between political leaders and organized crime that has characterized the history of Sicily since the end of WWII. Others come in the form of ad hoc memorials: stories of doomed heroism on the part of the long list of assassinated judges and journalists who have tried to root out the parasitism of Mafia influence. The shame felt by the Sicilian social elite for the messages conveyed by mafia landscapes threatens their future existence and undermines the possibility of transforming them into sites from where a renewed civic involvement could stem. The present paper, based mostly on landscape observations, attempts to tell the story of some selected mafia landscapes in Sicily, analyzes their current symbolism, and muses on their fate.

Keywords: landscape, memory, Sicily

Andrey N Petrov, University of Toronto. Email: andreyn.petrov@utoronto.ca; *Residual regions: regional dichotomies and spatial logics of marginalization in the Russian and Canadian northern frontier*

Frontier regions in Canada and Russia have been developing under very different economic and political regulation regimes. Nonetheless, an attentive observer would notice that the Canadian and Russian North share similar economic problems and face similar development challenges. These similarities stem from a fundamental process of economic marginalization of resource peripheries manifested in both capitalist and (post-)socialist economies. In the recent decades, changes in the world economic order have deeply affected northern peripheries and contributed to multidimensioning of spatial logics of marginalization. This paper explores the present status of marginality in the resource frontier of Russia and Canada along the multiple vectors of marginalization. Quantitative analysis unveils similar and distinct processes and spatial patterns in the two regions. It is argued that the contemporary relationships between northern regions and national economic centers are best described as multiple core-periphery dichotomies. Emerging 'post-modern' peripheries are fractured and deeply marginal. These empirical findings are conceptualized from the positions of the regulationist approach to regional development in attempt to connect the logics of marginalization with spatial modes of regulation in their particular forms in the two countries. One conclusion, among others, is that the residual position of northern regions in economic, social and political spatial domains, as well as in the development discourses and practices, contributed to the continuous marginalization of the Russian and Canadian frontier. To accomplish regional breakthrough, frontier regions from being residual have to become central in development policy and public discourse.

Keywords: regional development, periphery, economic policy, regulation

Christopher J Pettit, Dr, Department of Primary Industries, Victoria. Email: christopher.pettit@dpi.vic.gov.au; Ian D Bishop, Professor, University of Melbourne. Email: i.bishop@unimelb.edu.au; *Using computer based tools to assist with planning at the urban rural interface in Victoria*

There are a myriad of computer based tools that have been developed to assist municipalities in planning for a sustainable future. These tools are generically referred to as planning support systems (PSS). Many applications and developments of PSS technology to assist decision-making has been driven by technology push rather than demands worked through with the end-users (planners). This paper discusses recent experiences in Victoria (Australia) in working with both State Government and local municipalities in understanding user requirements. We then examine the deployment of a suitable PSS technology for addressing issues associated with competing land uses within the urban rural interface surrounding the City of Melbourne. Within the next 30 years it is expected that Melbourne will need to accommodate about 1 million new residents. The projected population increase will place significant stress on the

natural resources and agricultural land comprising the surrounding rural hinterland. Within this paper particular focus is given to the engagement exercise with the Shire of Mitchell, which is situated to the North of Melbourne, along the Hume Growth Corridor. We discuss the application of the What if? collaborative geographical information system (GIS) based PSS in developing a number of land suitability scenarios to understand the implications of potential land use change within the Shire. The paper concludes by discussing the key learnings in working with the planners and applying the PSS tool to inform land use change dynamics.

Participatory video is a research, communications and social action tool with the ultimate goal of transformation and empowerment (White, 2003). Through participatory video, members of a community learn to use video technology to explore social issues that impact their lives. This technique can serve a range of community and individual needs: identifying community environmental and social issues, planning for change, building self-esteem and community pride, increasing media literacy, exploring solutions to social challenges, communicating with government officials, and resolving intercommunity conflict. In 2004, the authors conducted a participatory video workshop through the community development project "A Child's Garden of Peace" in the Centro Sul neighborhood of Santo Ângelo, a small city in Rio Grande do Sul, Brazil. Eight teenagers participated in the month-long course. The multi-faceted goals included encouraging reflection and introspection amongst the teenagers and producing documents to share the lives of these young people with the larger world. The project focused equally on process and product. In the conceptualization process, it became clear that the teens were unaccustomed to viewing their lives as narratives. They had never seen a documentary film and were given few creative or introspective activities at school. Initially, they insisted that there was nothing interesting about their lives but slowly began to identify strengths and challenges present within their personal, community, and societal spheres. One of the goals of this project became helping the teens shape positive personal narratives which could also serve as narrative models for others in the community.

Jamie A Pfadt, . Email: jxp1775@sruc.edu; Travis Anderson, . Email: ; Shawn Widing, . Email: ; Jack Livingston, . Email: ; Patrick Burkhardt, . Email: ; *Species Area Relationships in Terrestrial Habitat Fragments*

Species area relationships were examined using Carabidae Sp. among the pediment remnants (sod tables) of the White River Badlands. Sod tables are resistant remnants of alluvial and colluvial fans that provide habitat between areas of sparse cover. This study continues to examine the relationship between patch size, isolation, and species number among naturally occurring habitat fragments that began in the previous year. Using updated control points of vegetation and isolation characteristics, an insight will be provided of habitat characteristics. Samples were collected from sixty sod tables over three field seasons using pit traps for fossorial organisms. Sod tables were mapped in the field using GPS. Control points were used to locate land cover areas on DOQ, land cover types will provide information concerning habitat characteristics within the study area. Area isolations and matrix effect were determined from aerial photography for each sod table. Distance relationships were established using a statistical analysis in GIS. Distance and species relationships were analyzed with regard to the matrix and neighboring tables.

This study takes a detailed multi-decade look at glacial retreat and loss of permanent snowfields and the resulting land-cover and land-use changes in the Brooks Range and Wrangell Mountains of Alaska and selected mountain ranges in far-eastern Russia and Central Asia. A variety of remotely sensed satellite data, ground-based observations, and historical databases serves as the primary sources of information to derive glacier extent. Data in the Global Land Ice Measure-

ments from Space (GLIMS) database are used to identify past changes in glacial margins and extent of permanent snowfields. Ancillary data, such as historical aerial photography, topographic maps, and historical reports are used for additional interpretation. A literature search was used to identify historical maps of the study areas before 1900; these maps are used to help identify glacial margins and snowfield extent prior to availability of remotely sensed data and are integrated into the baseline dataset. Moderate Resolution Imaging Spectroradiometer (MODIS) data are used in the study to analyze phenological change at a high temporal resolution. Current and historical animal location data (radio-collar and visual observations) are coupled with information derived from various satellite data and other datasets to construct models of habitat preference and change by applying various classification and statistical methods. We investigate the possible development of models to predict future phenological and habitat change. We hypothesize that climatic changes are altering the traditional favored habitat for high-mountain large mammals, particularly wild sheep and goats.

Deborah A. Phillips, University Of Leeds. Email: d.a.phillips@leeds.ac.uk; *Negotiating Spaces of Difference and Belonging: British Asian Narratives of the City*

Ethnic segregation, particularly as it relates to people of South Asian origin, is at the centre of public debates about 'race' and 'difference', integration, citizenship and belonging in multicultural Britain. Persistent ethnic segregation may, however, be read in different ways. This paper takes a critical look at discourses of segregation and challenges interpretations based on cultural 'otherness' and normative assumptions about patterns of social and spatial integration and the 'whiteness' of the city. Drawing on research in Leeds and Bradford in the UK, the paper presents insights into how British Asians perceive, and make sense of, the urban spaces in which they are living and through which they are being enjoined to disperse. Their narratives of the city reveal multiple readings of ethnic segregation, the multi-ethnic inner-city and the suburbs. The paper explores how experiences and perceptions of urban space (real and imagined) play a role in understandings of both 'self' and 'others', sense of belonging and rights to space and other resources. It argues that this has implications for British Asians' sense of identity, feelings of belonging, inclusion and exclusion, whether this is at the scale of the family, the 'community' or the city.

Keywords: multiculturalism, ethnic, integration, Britain

Emily C Phillips, United States Geological Survey. Email: ecphillips@gmail.com; *Evaluation of Challenges to Sustainable GIS Technology in Post Hurricane Mitch Central America*

A geographic information system (GIS) is a crucial component of mitigation, recovery, and reconstruction operations, often transferred to areas of need after natural disasters and other complex emergencies. In such situations there can be significant challenges associated with implementation of the technology that can affect the long term sustainability of the GIS. While an initial needs assessment cannot fully address all of the eventualities which may be encountered during GIS implementation, post-transfer long term follow-up provides additional information that can help identify obstacles specific to a locality or region. Using a questionnaire, this study conducted such a long term review of a GIS transfer to 75 Central American municipalities affected by Hurricane Mitch in 1998. The results indicate that within the municipalities the program was successfully used for mitigation purposes in only a few jurisdictions. Two main dynamics, identified as obstacles for the region which may have played a role in the selective sustainability, are: the potential for staff loss due to political turnover and weak linkages between local municipalities and higher governmental levels. After a final summary of obstacles to the sustainability of GIS for hazard mitigation is completed, a secondary study can be conducted to determine successful strategies for more efficient, cost effective, and sustainable technology transfers in the future.

Keywords: GIS, Central America, hazards, mitigation, reconstruction, sustainability

Martin Phillips, University Of Leicester. Email: mpp2@le.ac.uk; *The Production and Consumption of Gentrified Nature: Images From An English Village*

This paper draws on research undertaken on the gentrification of rural nature as part of the UK's Rural Economy and Land Use (RELU) research programme. The paper notes how environmental change has widely been associated with agricultural developments before highlighting studies that have suggested that residential space can be a driver of ecological change in the countryside. Attention is drawn to the way that gentrification, widely seen as an important dynamic in the reconstruction of rural built environments, may also impact on nature and how nature is itself drawn into the processes of

gentrification. The paper highlights Ingold's (1995, 2000) notions 'building' and 'dwelling' perspectives, suggesting that research on rural gentrification has largely drawn upon the former but that investigation of the production and consumption of gentrified nature might usefully draw upon the latter perspectives, which connects to post-constructionist and performative approaches to nature. The paper draws upon detailed investigations of an English village undergoing gentrification utilising a complex series of ecological and social survey methods to explore how human and natural actants dwell and live together, and apart, in spaces of gentrification.

Keywords: Gentrification, Rurality, Nature, Dwelling

Richard S Phillips, Dr, Liverpool University. Email: Richard.Phillips@liv.ac.uk; *Contested common ground: anti-imperialism in contemporary anti-war movements*

Movements can be energized and extended when disparate activists cross boundaries, translating the differences and distances between them into common ground, through which to advance common projects. Contemporary anti-war activists have set aside some of their differences and found common purpose by re-imagining and re-articulating themselves and their relationships. Not only opposed to war, these activists have agreed to varying extents upon opposition to: racism, breaches of civil liberties and - the subject of this paper - imperialism. Anti-imperialism is a powerful, contested area of common ground for a wide range of activists. The unity and difference of anti-imperialisms can be traced to disparate experiences and forms of imperialism, different ways of thinking and speaking about imperialism, and different rhetorical and real spaces of imperialism.

Keywords: Imperialism, anti-imperialism, anti-war, resistance.

Tasha Phillips, University of Minnesota. Email: phil0344@umn.edu; *Community-Based Mapping for Sustainable Disaster*

Natural disasters occur at the most unexpected times. It is at these times that we find out how prepared or unprepared we are to deal with natural disasters. Hurricane Katrina exposed its citizens', its government's, and its city's lack of preparation for a storm such as Katrina. It is important that we begin to change our actions and become more personally involved in getting ready for natural disasters. This project aims to enhance community and high school students' awareness about disasters through service learning. Students in Imagine College at Pearl-Cohn High School in Nashville, Tennessee, will be involved in working with the community members, community organizations, and their classmates in developing a plan for disaster preparedness. This plan will be implemented through using ArcGIS software to map places of shelter or safety for members to go in times of emergencies. These maps will include things such as locations of food shelters, tornado shelters, and areas of land more vulnerable to damage from a disaster. Students will create these maps themselves with help from Dr. David A. Padgett, Associate Professor of Geography, at Tennessee State University and the Neighborhoods Resource Center. The maps will be used during a series of community seminars for all community members, merchants, parents, children, and organizations to increase their knowledge of how to become prepared for a disaster. In addition, the State Farm Good Neighbor Grant will be sought to help aid in the development of a sustainable GIS lab for Pearl-Cohn High School students.

Alan G. Phipps, University of Windsor. Email: phipps@uwindsor.ca; *The Usefulness of an Internet Mapping and Surveying Project in Windsor, Ontario, Canada: A Cultural-Historical Activity Theory Perspective.*

This study is an evaluation of residents' responses about whether browsing an internet mapping and surveying project contributed to, and corroborated with, their knowledge of events in their neighbourhoods. These residents browsed The Glengarry and Wellington-Crawford Geographical Monitoring Project (GWCGMP) via the internet at <http://www.gwc.uwindsor.ca>, during 2003 to 2005. They answered the project's entry questions before selecting from 26 sequences of computer-animated maps and graphs of the locations and timings of crime and disorder events, and house sales and prices, in their neighbourhoods. Before exiting the project, they answered questions linked to their particular entry answers, and browsed maps and graphs. As one indicator of the project's inferred usefulness, almost all of 29 respondents answering a linked series of questions, had found and focussed on their home's location if it was on a map. As another indicator, usually less than one-half of approximately 30 respondents thought that their area had the same amount of either disorder offences, offences against people, or property violations, as on the respective maps. In conclusion, from the perspective of cultural-historical activity theory, the GWCGMP is an example of a technological tool that residents may use for more timely information about the events around them.

Michel Phipps, University of Ottawa. Email: mpphipps@uottawa.ca; *Entropy Reduction, Data Mining and Knowledge Discovery*

This presentation proceeds from a basic tenet: data mining bears strong analogy with information entropy reduction. A cascade of entropy falls between specific entropy levels adequately sketches this reduction process and these levels necessarily entail a decrease of uncertainty about the state of an observed system. This approach is implemented using an algorithm dedicated to the analysis of environmental systems (ecological landscape). It reduces the spatial entropy of a target attribute using information provided by an optimized combination of other attributes. It operates in a stepwise, divisive way, selecting divisive attributes according to their relative information. Although not new, this approach regains relevance in the wake of data mining advent. Its most salient features include its inductive nature, its strong spatial significance, its use of information metrics to specify various parts of the system. Among these, some deserve mention: the rule-based knowledge structure as the procedure's end product; the map of entropy left unreduced after the algorithm has exhausted all available information; the Omega function relating the amount of information extracted to the computational complexity necessary to discover this novel knowledge and finally, the correspondence analysis allowing a meaningful interpretation of the unveiled structure. Discussed applications represent various conditions (area and data set size, scale). Contrasted to a similar algorithm (C4.5), this entropy reduction algorithm exhibits comparable performance. Moreover, its proper features spelled out above make it an efficient tool fulfilling most objectives deemed essential to data mining and knowledge discovery, particularly useful in a research exploratory phase

Michael Phoenix, Ph.D., ESRI. Email: mphenix@esri.com; *Global perspective on GIS education*

The author will provide a comprehensive view of where we stand in GIS education around the world. The spread of GIS Education around the world has been amazingly successful. Thousands of people in almost 200 countries have contributed to a tremendous increase in the teaching and awareness of GIS. Perhaps 200,000 students a year are learning something about GIS in a classroom. Distance education in GIS is reaching thousands more every year. New degree programs are being developed at all levels and GIS is being taught in secondary schools in many countries.

Frederick S. Pianalto, University of Arizona. Email: pianalto@email.arizona.edu; Stephen R. Yool, Ph.D., University of Arizona, Department of Geography and Regional Development. Email: yools@email.arizona.edu; *A Combined GIS and Remote Sensing Habitat Model of Valley Fever Pathogens in Southern Arizona.*

Coccidioidomycosis (Valley Fever) has increased significantly in Arizona within the last decade. Valley Fever is produced in Arizona by spores from the soil-dwelling fungus *Coccidioides posadasii*. Outbreaks appear driven by environmental and climatic changes. Dispersion-related conditions are important predictors of incidence. This study explores the hypothesis linking human disturbance of soil to dust generation and fungal growth and spore dispersion. We use air quality dust permit and building permit databases to create a GIS soil disturbance map for Pima County, Arizona. The disturbance layer is used also to identify areas of land change predisposing spore dispersion and to guide development of change detection techniques. We apply change detection techniques to Landsat Thematic Mapper satellite images over the period of 2000 to 2005 in eastern Pima County to identify locations and extent of human disturbance such as grading, subdivision construction, road construction and trenching. Standardized principal-component analysis of two-date images and single date unstandardized first and second principal components are classified and compared in change tables to identify areas of soil disturbance likely to disperse fungal spores. Results serve as inputs to a disturbance-climatic decision support model for Valley Fever mitigation in southern and central Arizona.

Keywords: Valley Fever, coccidioidomycosis, Geographic Information System, remote sensing, principal component analysis, Landsat Thematic Mapper, change detection.

Stephane Olivier Picault, Institut National De La Recherche Scientifique (INRS). Email: stephane_picault@hotmail.com; *Is there a spatial structuring effect of large shopping malls? The case of Montreal's CMA.*

This research aims at demonstrating the importance of large malls in the capitalistic urban system. Urban spaces are incontestably a representation of society and of the economic system which articulates it. There is production of space (Lefebvre, 1971) with the creation of spaces of capital (Harvey, 2001) predominantly in cities. Because we are immersed in those spaces we have often forgotten to look at them for what they are: spaces made by capital with the sole goal to generate more of it, through consumption. If true, we would then be in a

consumer society (Baudrillard, 1970; Jayne, 2005). Consequently it is reasonable to think that urban spaces and their population are criss-crossed by commercial zones underpinning mass-consumption. These commercial centers by their attraction effect are playing a role in the structuring of space. The study of large malls, can help us better understand their importance in the capitalist system. Using the case of Montreal, Quebec, Canada, we will observe large malls' location and evolution using maps and aerial photographs spanning over several decades. We will be trying to identify to what extent residential development occurs in the vicinity of large malls after they have been built: to the extent that this occurs, it will suggest that urban space is being structured by these malls, rather than malls merely opening in vicinity to existing residential areas. We will also demonstrate that malls are controlled by powerful corporations managing them like networks, in which finance is predominant (Wrigley and Lowe, 1996, 2002).

Keywords: retail geography; consumer society; production of space; spaces of capital; urban form; shopping centers; malls; aerial photographs; Canada; Montreal.

James B. Pick, University of Redlands. Email: james_pick@redlands.edu; *A Framework for Enterprise Geospatial Software Systems: Empirical Findings on Current Applications and Uses*

Enterprise systems are being integrated with GIS and spatial technologies. The paper provides a framework for understanding geospatial enterprise architecture and the interoperability between these systems. The underlying foundation includes data-bases, data warehouses, servers, and mobile devices. The inter-relationship of leading enterprise software applications among each other and with the underlying foundation is examined. They include enterprise GIS, enterprise resource planning (ERP), customer relationship management (CRM), business intelligence (BI), and supply chain management. For each type of major enterprise system, the role of GIS and spatial technologies is analyzed, as well as its integration with other enterprise components. These include, for example, for ERP plug-in connectors between ERP and GIS software; for supply chain management, relationships between supply chain and spatial aspects of RFID technology; and for business intelligence, close connections with data warehouses as well as with GIS. The extent of actual integration of GIS with enterprise systems in businesses is analyzed through research findings from interview surveys of lead corporate GIS managers in seven medium- and large-sized companies and from intensive case study analysis of GIS and CRM at Chico's, an apparel firm; and GIS, ERP, and mobile applications at NESA, a Danish electrical utility. The paper provides a set of general conclusions on the current extent of adoption and types of integration of geospatial enterprise systems.

Jenny Pickerill, Leicester University. Email: j.pickerill@le.ac.uk; *Walking side by side? Muslim anti-war activism in Britain*

The prominence and voice of Muslims within peace and anti-war campaigns has increased dramatically in recent years. This involvement of a challenges the political left to accommodate and understand Muslim concerns. Parallels could be made with the anti-war movement in the US and its treatment of Black and Latino communities. The contemporary anti-war movement is thus a broad and contested alliance of a myriad of groups. Tariq Ramadan (2005) identifies Muslim involvement in the British anti-war movement as part of the 'silent revolution' "working in the name of common values" as "evidence of ... a new movement that is coming out of our presence". However, there is suspicion that Muslims are being tokenised and appropriated by secular anti-war groups so such groups can appear inclusive and draw on broader support. Many challenges remain for Muslim and non-Muslim activists to acknowledge these debates and their implications: "We are forcing open a space not only within the Marxist left but also in contrast to the right-wing Islamists as well. We have multiple identities and need multiple spaces. Those who want to engage with us have to recognise our rights to these identities and spaces" (Rehman, 2004). Using empirical work (as part of an ESRC-funded project with Frank Webster and Kevin Gillan, City University), this paper examines the complexity of Muslim anti-war activism in Britain and raises questions as to how coalitions work, how commonality is shared and tested and the spaces of communication between differing factions.

Roger M. Picton, Ph. D. Candidate, University of Toronto. Email: rmpicton@gmail.com; *"Hewers of Wood and Drawers of Nature:" Canada's National Capital Commission and the Political Economy of National Nature*

Recently, the National Capital Commission (NCC) has led a private-public development on LeBreton Flats in the heart of the Canada's federal capital under the veil of the neo-liberalism's "golden path" of entrepreneurialism. Overlooking the tragic expropriation of working-class neighborhood on the shores of the Ottawa River, this redevelopment mimics the global language of urban-chic green development(s). This paper investigates the dream-image of natural regeneration

and the political rationale and practices which drive the state-intervention in the development and redevelopment of LeBreton Flats. This paper contends that urban political economy and neo-liberalism does not adequately explain the actions of the NCC and its institutional momentum. It will argue that the constellation of power on the Flats resulted in a particular politics of scale that is unique to the Canadian context. By exposing the historical and geographically embedded working relationship with nature forgotten and replaced by a sanitized national-identity, the case study elucidates the importance of considering the issue of practical and symbolic sovereignty as part of the neo-liberal production of nature.

Sonja K. Pieck, University of Chicago. Email: spieck@uchicago.edu; Sandra Moog, University of California, Berkeley. Email: samoog@essex.ac.uk; Competing Entanglements: Thoughts on the Geography of Global Civil Society

Observing developments throughout the 1990s, much of the early literature on the rise of transnational politics and global civil society struck a rather optimistic tone. The participation of NGOs and their grassroots partners was seen by many as a potentially powerful catalyst for social and political change. Midway through the first decade of the twenty-first century, however, observers even within the global civil society literature have grown less sanguine. Global civil society does not, ultimately, represent an independent "third sector" buffered from nation-states and global capital; rather, it is constituted precisely through its articulation with geopolitical and market forces, and is therefore inevitably shot through with many of the same inequalities which plague these other spheres of social life. Clearly this is true, but how can we conceptualize this? We suggest that the concepts of "entanglements" and "institutional knottings" - based on geographical debates on the politics of scale and place? can offer a better understanding of the concrete ways in which particular kinds of attachments to political and market forces enable or disable democratic processes. In other words, if global civil society is not wholly independent from market and political forces, then what kinds of strings are attached? And when and how do these "competing entanglements" matter? This paper explores the potential for transnational advocacy organizations to provide voice for disempowered groups through an assessment of one recent experiment in transnational network-building: the Amazon Alliance, a coalition between US environmental and human rights NGOs and Amazonian indigenous federations.

Keywords: NGOs, networks, global civil society, politics of scale

Brent J. Piepergerdes, University of Kansas. Email: bpieps@gmail.com; "The Real Italy?": Interrogating the Cultural Hegemony of the Italian Economic Miracle in Pasolini's *Comizi d'amore*

As Italy's preeminent theoretical-political filmmaker of the 1960s and early 1970s, Pier Paolo Pasolini signified, via his controversial deconstruction of Catholicism and his valorization of the subproletariat, the vital role that cinema plays in challenging dominant structures of national socio-cultural identity. More than any of his internationally renowned films, Pasolini's often overlooked 1964 documentary *Comizi d'amore* (Love Meetings) is the clearest embodiment of a true 'film inquest' in which an objective attitude toward the phenomenal world (as characterized by neorealism) is replaced by a more critical analysis of 'reality'. On the surface, the film is a shockingly frank survey of the sexual attitudes and mores of Italians across multiple regions, highlighting the disparate responses between inhabitants of the industrialized cities of the North and the rural, familial South to the 'sexual problem'. Underlying Pasolini's inquiry however, is a reliance on Antonio Gramsci's concepts of language, hegemony, and the "Southern Question" in relation to the widespread cultural and economic transformations instigated by Italy's postwar "economic miracle". In his critique of the uneven development between North and South, city and country, Pasolini challenges the notion of postwar modernization as harbinger of a new Italian nationalism. Through a visual mapping of the pervasive retention of regional- and local-level identity, Pasolini disputes the homogenizing influence of the emerging consumer culture.

Andrew Pierce, Penn State University. Email: adp179@psu.edu; Alan H. Taylor, Dr., Penn State University. Email: aht1@psu.edu; Spatial Patterns of Regeneration and Interspecific Competition in Mixed Aspen-White fir Forests in the Southern Cascades, USA

Aspen (*Populus tremuloides*) provides habitat and forage for wildlife, timber resources, and scenic value in the western United States. However, nearly a century of fire suppression and livestock grazing has significantly reduced Aspen regeneration and promoted regeneration of White fir (*Abies concolor*), increased competition between aspen and conifers, and lead to replacement of aspen by conifers. Using principles of symmetric and asymmetric competition, this study

assesses the effects of spatial proximity and density on aspen and conifer growth rates and species' regenerative patterns in five pairs of 625m² plots in mixed and pure stands in the southern Cascades. Quantitative data on size, age, height, spacing, growth, and light levels are collected in each plot. The null hypotheses tested include i) within stand spatial patterns aspen and conifers are random; ii) aspen and conifer growth rates are similar in pure and mixed stands; and iii) aspen regenerates in both pure and mixed stands, regardless of light levels. The spatial analysis of stems and growth rates indicate that number and size of nearest neighbors influences change in biomass over the preceding decade. Furthermore, aspen can regenerate in both pure and mixed stands, but ramets in conifer dominated stands die quickly possibly due to low light levels and wildlife browsing.

Keywords: Aspen (*Populus tremuloides*), conifer invasion, competition, tree regeneration, spatial analysis, Cascades - southern

Peter M. Piet, City of Elmhurst. Email: peterpiet@meginet.net; Richard P. Greene, Northern Illinois University. Email: rgreene@niu.edu; Juice Bars, Immigrants and Sunshine: The Varying Influences on Population Growth and the Expanding Metropolitan Fringe, 1980-2005

Having recently crossed the 300 million threshold, the United States continues to increase rapidly in population, but in an uneven fashion, with much of the increase occurring in metropolitan and adjacent exurban counties. Expanding earlier work investigating population change at the metropolitan level, demographic, social, economic and climatic variables are used to investigate the factors determining county-level growth rates. The varying influence of these factors over the period from 1980 to the present will be examined.

Lisa Pietro, University of Delaware. Email: ; Michael A. O'Neal, University of Delaware. Email: michael@udel.edu; Jack Puleo, University of Delaware. Email: ; David R. Legates, University of Delaware. Email: ; Large Scale, High-Fidelity Surface Models of Rehoboth Beach, DE

Since November of 2005, monthly topographic surveys were completed using a terrestrial-based LIDAR (Light Detection and Ranging) system along a 1-km stretch of Rehoboth Beach, Delaware. The survey data are used to construct sub-meter scale (horizontal) digital terrain models (DTM). However, each monthly dataset of 5 to 9 million survey points must first be filtered to remove unwanted natural and man-made features that obstruct the beach surface (i.e. drift wood, grasses, trash cans, fences, debris, and people). Therefore, a filtering technique was developed that examines data in a 1 m² "moving window" and removes unwanted points based on differences in elevation, group membership in a cluster analysis, and outliers beyond one standard deviation of the mean elevation. The difference between the average elevations of data from the filtered 1m² area and those of the bare-earth control set is 5 millimeters on average, underscoring the effectiveness of the technique. The filtered data are critical to the development of accurate DTMs that are used to: 1) assess the response of the beach geomorphology to storm events, local climate variability, and seasonal climate patterns, 2) determine monthly volumetric variability of sediment within the measurement area, 3) assess the performance of the soft-sediment stabilization project in the study area, and 4) integrate with the University of Delaware SANDcam video system for video-measured beach widths and associated volumes.

Keywords: LIDAR, Delaware, Digital Terrain Model

Roos Pijpers, Radboud University Nijmegen, the Netherlands. Email: r.pijpers@fm.ru.nl; The migrant flexworker: circular labour migration and the anchoring role of International Employment Agencies

In the literature on social migrant networks and transnational migration flows, the constitutive role of employers and their recruiting actors remains somewhat underexposed. This is despite a known and persistent economic demand for migrant labour which is cheap, readily available and easily dismissed. Aiming to contribute to a further understanding of how the recruitment of migrant labour, instigated by employers, works, this paper focuses on the example of International Employment Agencies. It is argued that these agencies currently are the anchors of the circular labour migration between Poland and the Netherlands. In the Netherlands, private labour market intermediation is a fully legal and common phenomenon, allowing the agencies to transfer part of the Polish employment from the underground to a more legal and visible presence. When regarded through a post-Fordist regulatory lens, these migrant workers could be named migrant flexworkers. Apart from analysing the origins and current functioning of the International Employment Agencies, the paper discusses their development prospects as well as some more normative aspects of migrant flexwork.

Keywords: Migrant flexwork, International Employment Agencies, Poland, the Netherlands

Andy Pike, Dr, Newcastle University. Email: andy.pike@ncl.ac.uk; John Tomaney, Professor, Newcastle University. Email: john.tomaney@ncl.ac.uk; Andrés Rodríguez-Pose, Professor, London School of Economics. Email: A.Rodriguez-Pose@lse.ac.uk; What kind of local and regional development and for whom?

This paper asks the question what kind of local and regional development and for whom? First, issues of definition are examined to understand what is meant by local and regional development, to establish its historical context and to emphasise the importance of space, territory, place and scale. Second, the nature, character and forms of local and regional development are explored to reveal its different varieties and principles and values in different places and time periods. Third, the objects, subjects and social welfare dimensions are addressed to explain the often socially uneven and geographically differentiated distribution of who and where benefits and losses from particular forms of local and regional development. Last, a holistic, progressive and sustainable version is outlined and reflections offered upon the limits and political renewal of local and regional development. Our argument is, first, that we need to consider the basic principles to get a better analytical purchase on the question of 'what kind of local and regional development and for whom?', and, second, locally and regionally determined models of development should not be developed independently of more foundational and universal principles and values such as democracy, equity, internationalism, justice, and solidarity. The specific local and regional forms and articulations of such principles and values are normative questions and subject to social determination and political choices in particular national and international contexts.

Keywords: Local Regional Development

Richard J. Pike, Research Geologist, United States Geological Survey. Email: rpik@usgs.gov; Debris Flows in Guatemala from Hurricane Mitch Localized by Wind-driven Rain?

Shallow rainfall-triggered landslides are a major natural hazard in Central America. My analysis of previously published observations from the catastrophic 1998 Hurricane Mitch suggests that hillside aspect and storm-wind direction are slope-instability criteria that could narrow the uncertainty in predicting locations of future landslides. Two contrasting distributions of slope aspect from a digital elevation model are plotted in 10-degree bins: initiation sites for a sample of 2,951 debris flows in the Sierra de los Minas of southeast Guatemala (on 15- to 55-degree slopes above 1200 meters), and about 1,000,000 10-meter grid cells for topography in the same area. Topographic aspect is fairly evenly distributed by compass direction, whereas 61% of the debris flows are concentrated on east-to-south-facing slopes (70 to 200 degrees). A constant wind from the southeast, a direction characteristic of hurricanes of Category 3 strength, may explain this dramatic difference. The most substantial evidence for a persistent, strong southeast wind during Hurricane Mitch is from the azimuth-frequency distribution for 200 uprooted mangrove trees on Isla Guanaja, Honduras, where 76% of the trees fell between orientations of 105 and 135 degrees. The two similarly skewed distributions are consistent with a slanting wind-driven rain that delivers more moisture to windward slopes than to level terrain or leeward slopes. I propose that southeast-facing hillsides in Guatemala were exposed to heavy rain driven by strong winds from the southeast whereas leeward slopes were partially sheltered from the inclined rain, resulting in preferential initiation of debris flows on southeast slopes.

Keywords: landslides Hurricane Mitch wind-driven rainfall Central America

Steve Pile, The Open University. Email: s.j.pile@open.ac.uk; A Dream of a Method? Psychoanalysis, space and the interpretation of dreams

In the main, psychoanalytic approaches to geographical questions have relied for their techniques on two fundamental tactics. On the one hand, they have used psychotherapeutic techniques to bolster, broadly, an ethnographic approach. On the other hand, they have used psychoanalytic theory to bolster psychodynamic interpretations of specific situations. In both cases, there is the use of what we might call strong method and strong theory. Naturally, there's nothing wrong with being strong - with being rigorous. Strong does not, for example, mean insensitive or indeed brutish. Even so, I'd like to offer a weak psychoanalytic approach. Weak, not because it is not rigorous, but because it is always unfolding; not because it is open to new meanings and interpretations, but because it demands them. This "weak" psychoanalytic method is based in Freud's description of dream interpretation. Dream interpretation, of course, has been widely used in the social sciences and humanities. In this paper, however, I use it as a model of city life ? and not just as an interpretative technique ? because this means city life is always somewhere other than you thought it was. Don't worry: I'll use examples.

Keywords: psychoanalysis, city life, dreams, networks of meaning, methodology

Igor V. Pilipenko, Lomonosov Moscow State University. Email: igor_pilipenko@yahoo.com; The territorial-industrial complex approach: a revival in the Russian market economy?

The theory of territorial-industrial complex (TIC) realized the idea of industrial production optimization in the planning economy within a certain territory according to its resource endowments. It was employed most actively in the 1950-1980s fulfilling the Soviet paradigm "The shift of productive forces to the East", when a range of large industrial areas were constructed from almost nothing in developing Eastern and Southern regions of USSR (Western and Eastern Siberia, Far East, Central Asia). But after the collapse of USSR and the transition of Russia to the market economy the TIC approach was left behind as almost all the enterprises that formed TICs were privatized, and it was not already possible to realize large-scale interregional project from a united decision-making center. Since the beginning of XXI century the cluster concept has become popular among regional authorities, but it is often confused with the TIC approach that lead to regional policy failures. In this paper we compared and made a clear distinction between these two concepts using a number of characteristics: definition, genesis, spatial organization, mathematical apparatus, specialization, the role of human and information factors. Development of various forms of production organization in Russian regions also evidences differences between the TIC theory and the cluster concept. Using a case study of Lower Angara region it is shown that TIC approach can be also applied in the market economy in a form of public-private partnership. Moreover these two approaches can supplement each other in regions with considerable disparities in economic development.

Udesh Pillay, Dr, Human Sciences Research Council. Email: upillay@hsr.ac.za; Are Globally Competitive 'City Regions' Developing in South Africa?: Formulaic Aspirations or New Imaginations

This paper chronicles the process of global city region formation across the world. The paper sheds light on the emergence of this phenomenon in the developing world, and assesses the extent to which the process of 'city region' formation/development has been occurring in South Africa's major metropolitan areas. The paper begins with a review of the literature on emerging global city regions, before contextualising this phenomenon in the developing world and among African cities. The discussion then turns to the contemporary status of South African cities, following which detailed (primarily economic) profiles of South Africa's 'big four' urban agglomerations are offered, and their prospective growth and development trajectories assessed. The paper then reflects on the applicability of the city region literature has in a South African cities context. It is argued that while South Africa's larger urban agglomerations do constitute dense sub-national and spatial formations, they do not necessarily qualify as global city regions. Against a critical review of the international literature it is suggested that the city that may be South Africa's best 'global' prospect, and is most likely to approximate city region status, is Johannesburg and, in particular, a spatially-quadrangular tract of land referred to as the 'urban'core of the province of Gauteng. The paper concludes with observations on the critical need among urban scholars and practitioners in the developing world to begin a process where new and alternative ways of imagining cities, and ones less rooted in a strict adherence to 'global city' formulations, can be negotiated.

Keywords: City Regions, developing world, South African Cities

Ngai Pindell, University of Nevada - Las Vegas Boyd School of Law. Email: ngai.pindell@unlv.edu; The right to the city in Las Vegas

My paper chronicles the impact of the Southern Nevada Public Lands Management Act (SNPLMA) on the availability of shelter to the homeless and the lowest income residents of Las Vegas. SNPLMA is a federal law that regulates public land sales in Southern Nevada. Approximately 13,000 acres of land have been transferred from public to private ownership at auction since the law's inception in 1998, generating over \$2.7 billion for Nevada. This economic windfall to Nevada has not produced corresponding increases in affordable housing for median income residents or for residents further down the economic ladder. At the same time SNPLMA made thousands of new acres available for residential development, Las Vegas and the rest of the nation experienced tremendous housing price increases. These increases put even more pressure on the already scarce supply of affordable housing. This paper surveys housing trends in Las Vegas between 1998 and the present, particularly trends in the availability of housing and shelter for Las Vegas' lowest income residents. Inspired by the global right to the city movement, my paper will suggest that SNPLMA legislation should be amended to include specific requirements mandating the inclusion of affordable housing. Without the inclusion of specific requirements, which could be considered limited rights to housing, these residents are excluded from the huge economic gains the region has made within the last eight years and precluded from sharing in future gains. This paper also considers

the social and political benefits and costs to including these rights.

Keywords: Las Vegas, affordable housing, right to the city

David Pinder, Queen Mary, University of London. Email: d.pinder@qmul.ac.uk; Cities on the Move: Walking, Plugging In, Floating, Dissolving

What is to be made of demands for cities to become mobile? To leave behind static forms and embrace movement, even to grow legs, to develop floating structures and to take flight? Many visions of the modern city emphasise mobility, dynamism and speed. They often seek to remake urban space to enable rapid transit through the provision of necessary infrastructure. This chapter, however, is concerned more with calls for cities to become mobile themselves, to embody a restlessness and energy supposedly in keeping with modern times. It concentrates on imagined cities and architectural projects from the European avant-garde from the 1960s that outlined mobile and nomadic alternatives to the stasis not only of traditional monumental design but also to modern movement orthodoxies. It explores the attraction of these forms of mobility for elements of the avant-garde, as well as their political and social implications, setting them in the context of a key tension in much urban literature between settlement and movement. In so doing it addresses concerns about the qualities of movement and their spatial politics, concerns that remain in need of interrogation in cities today.

Keywords: cities, architecture, mobility, avant-garde

Adam M Pine, Ph.D. Candidate, Rutgers University. Email: apine@eden.rutgers.edu; Performing Citizenship in the Neoliberal Metropolis

One of the key issues within neoliberal urbanism is how new immigrant communities interact with civil society. As the state devolves and hollows-out, the institutions that make up the shadow-state are playing an increasingly important role providing for citizens. Therefore, entry into these institutions is vitally important for immigrant communities. Yet their admission is not always guaranteed; instead civil society is an institution with boundaries policed by unwritten codes of behavior that reflect the cultural, ethnic, and class affiliations of its members. In this paper I examine how Dominican grocery store owners in Philadelphia are negotiating their entry into the communities surrounding their stores. I use Judith Butler's theory of 'performativity' to suggest that the grocers' position as transnational entrepreneurs makes them feel as perpetual outsiders, yet they perform the acts of engaged citizenship in a conscious attempt to present themselves as community insiders. The grocers understand this performance as a defensive strategy: only if they are seen as conforming to community mores will they be physically safe in their stores. The grocers' experiences 'performing' citizenship demonstrate the difficulty for immigrant groups of the ascendancy of civil society as a supposedly neutral space that can effectively mediate between the state and the individual. I argue that the grocers are disempowered members of their community, and their 'performances' of citizenship hinder the enactment of transnational citizenship and demonstrate the role that civil society plays in policing nonconforming activity.

Alasdair Pinkerton, Royal Holloway & Bedford New. Email: a.d.pinkerton@mac.com; Broadcasting geopolitics: the BBC World Service as 'Britain's Voice around the World'.

Since the launch of the BBC's Empire Service in 1932, radio has been utilised as a powerful form of direct 'public diplomacy' by the United Kingdom government when communicating with international audiences. This was confirmed in 1997 when the UK's Foreign Secretary, Robin Cook, described the World Service [renamed after 1965] as 'Britain's Voice around the World'. Cook's remark, however, disguised a longstanding uneasiness between the BBC and UK/international governments regarding the relative independence or complicity of the BBC's international services from/in British foreign policy. This paper examines these uneasy relationships by drawing on audience/listenership evidence, and archival sources, relating to the BBC's reporting of post-colonial India and, in the year of its 25th anniversary, the Falklands conflict in 1982. In so doing the paper explores the significance of 'radio' as both an information/news medium and mode of geopolitical expression, particularly in environments where television had comparatively little penetration.

John M. Pipan, Cornell University. Email: ; Michelle Goman, Ph.D., Cornell University. Email: mg254@cornell.edu; Mid to Late Holocene Paleohydrology and inferred Paleo-Precipitation for upstate New York

Temperate peat land deposits provide a long-term, continuous archive of paleoclimate conditions for much of the Holocene. Here we present a high-resolution reconstruction of paleohydrology focusing on mid-late Holocene timescales from a site in upstate New York, where paleoreconstructions have tended to focus on the deglacial history of the region. A 7m long sediment core

was collected from Purvis Road Bog. The site, about 1 acre in size, is blanketed by a variety of Sphagnum mosses, discrete highbush blueberry (*Vaccinium corymbosum*) clumps exist and the protected carnivorous pitcherplant (*Sarracenia purpurea*) is relatively common. White pines (*Pinus strobus*) appear to be encroaching on the bog surface, suggesting a possible drying phase in the past. Multiproxy data (LOI, density measurements, pollen, macrofossils, testate amoebae, and A.M.S. dates) were collected from the core. Basal sediments indicate that the site, which was originally a kettle pond, began to infill about 13,000 calibrated years ago. Sphagnum peat and true ombrotrophic (rain fed) conditions appear to be in place by about 4500 cal yrs B.P. Preliminary analysis of high-resolution density data suggests possible changes in climate conditions lasting on the order of centuries. Further, the testate amoebae indicate that a period of much wetter conditions occurred between about 1500-2500 cal yr B.P.

Keywords: Holocene, paleohydrology, peat, testate amoebae, New York

Michael Pirani, PhD, North Carolina Central University. Email: mpirani@nccu.edu; Student Perspectives on Iraq: Applying a Theoretical Framework

Applying a well developed theoretical framework can assist students in understanding and conceptualizing complex situations. In our upper-level political geography class, students used the theoretical perspective developed by Jared Diamond in his book *Collapse* (Penguin Books, 2005) to contextualize the internal and external conflicts that are ongoing in Iraq. This theoretical framework seeks to understand and explain how some societies fail under the weight of environmental, social, economic or political problems, while others come to terms with and overcome the same sets of difficulties. The students were instructed to choose the society discussed in the text that they believed most closely parallels the situation in Iraq and compare their similarities and differences. They also chose a contrasting example. Nine students believed that Iraq resembled states that had collapsed under the burden of several of the above criteria, while one argued that Iraq was trending toward a positive outcome. The comparative examples and the factors that the students argued were common and contrasting between the different states will be illustrated. The application of a carefully designed, well constructed framework proved very useful in helping students to organize a variety of complex and sometimes conflicting information, consider the factors behind the current situation in Iraq, and speculate as to possible positive and negative outcomes to Iraq's problems. The conceptual framework used by Diamond, with carefully explained criteria and a focus on comparative examples, was ideal for use in this context and generated thoughtful and rigorous discussion and research among the entire class.

E. Mark Pires, Long Island University. Email: mark.pires@liu.edu; A Historical Political Ecology of Land Use in the Southeastern Peanut Basin of Senegal

In this paper I present a generalized history of twentieth-century human occupation and agricultural expansion in the southeastern Peanut Basin in Senegal, West Africa. I describe social and cultural characteristics of the region's population relevant to an analysis of environmental challenges that have affected this region over time. I also address the significance of state intervention, during both colonial and post-colonial times, in agricultural resettlement schemes that were intended to control access to land-based resources in this less densely populated part of the country. This examination of historical land use dynamics in the southeastern Peanut Basin informs current conditions and future concerns regarding natural resource management in the region.

Email: doug_king@carleton.ca; Robert Bemrose, Carleton University. Email: ; Using forest health scores and dendroecological methods to examine the impact of the 1998 ice storm on the health of sugar maple (*Acer saccharum*) dominated forests in Gatineau Park, Quebec

In the mixed forests of eastern North America disturbance results from a number of factors and occurs across a variety of spatial and temporal scales. Important natural disturbance factors include pathogen outbreaks, defoliating insects, and ice storms. While ice storms are one of the most frequent forms of disturbance, the ice storm of January 5-9, 1998 was unique in both scale and intensity. Up to 110 mm of freezing rain fell in eastern Canada and the northeastern United States during the five-day event. The area of ice accumulation was approximately 10 million hectares, although forest damage was highly variable and patchy. Following the 1998 ice storm, a research study was established in Gatineau Park, Quebec with the goal of monitoring structure, composition and health changes in response to ice storm damage over the long term (10-20 years). Since 1998 we have conducted a temporal analysis of forest

cover and ground vegetation change to examine the relations between stand dynamics and damage incurred during the 1998 ice storm. In 2005 we also conducted a dendroecological investigation of sugar maple growth with the aim of quantifying growth trends prior to and following the ice storm. Combined, our monitoring study and the dendroecological investigations provide new insights into the physiological response of sugar maple forests to disturbances events such as ice storms.

Keywords: ice storm, forest dynamics, eastern North America

Lisa Marie Piscopo, Ph.D., University of Denver. Email: lmurphy@du.edu; *Explaining The Variability in Colorado Student Assessment Program (CSAP) Scores in Denver*

The Colorado Student Assessment Program, or CSAP, is the Colorado standardized testing program that measures student progress in reading, writing, and mathematics for all public schools in the state of Colorado. The scores vary across the state between districts, neighborhoods, and schools. Is there any pattern to this variation in scores? Is there one primary factor that explains this variation? At which scale are factors most significant? This project uses GIS to map the CSAP results and to correlate CSAP scores with neighborhood demographic variables such as income, race, educational attainment, as well as school related variables such as teacher salary and percent free lunch. The hypothesis that school scores are influenced by the characteristics defining the neighborhoods in which the students live challenges the theory that educational success is independent of these social factors. The most explanatory variable used in the analyses was percent free lunch. The higher the percentage of students that qualify for free lunch in a school, the lower the average CSAP scores for that grade at all scales of analyses. The school scale provided the strongest correlations between the CSAP scores and percent free lunch.

Brush, Professor, Department of Human and Community Development, University of California at Davis. Email: sbbrush@ucdavis.edu; *Effect of Mexican Farmers' Integration to Non-Agricultural Market Labor on Maize Diversity: Preliminary Findings*

The aim of the paper is to discuss some aspects involved in the relationship between the farmers participation in off-farm works and the maize diversity at both household and village level. A study case was conducted in five villages located in the Puebla Valley, Mexico, where maize production is combined with other agricultural and non-agricultural activities as well. Among these villages there are notorious differences in the participation of households in off-farm works, ranging from households basically devoted to agricultural activities to other households with strong connections with the labor market at different levels. In this area most of the maize populations managed by farmers belong to the Conico race. However, farmers differentiate two groups of maize varieties that are adequate for either valley or foothill conditions. The maize fields are located in two contrasting conditions. Two villages are in the valley (2100 to 2300 meters above sea level), another two are located in the foothills of the Popocatepetl and Iztaccihuatl volcanoes (2400 to 3000 meters), and the farmers from the fifth village have maize fields in both physiographic conditions. Under this context, the relationship between farmers' integration to an off-farm labor market and maize diversity is neither direct or simple. This relationship is mediated by complex interactions that affect farmers' outcomes in terms of maize diversity. Some of these interactions are discussed in this paper, having the allocation of labor by households a prominent role in order to fulfill the requirements of the different activities they are engaged.

Steven C. Pitts, UC_Berkeley Center for Labor Research and Education. Email: spitts1@berkeley.edu; *Bad Jobs for Black Workers: A Study of Job Quality and Black Workers in Four Cities*

Traditional discourses on the job crisis in the Black community focus on the high levels of unemployment in central cities among the Black labor force. This discourse is a narrow one because it ignores the high level of low-wage employment among Black workers. The narrow focus supports a limited approach to addressing job problems facing Black workers. The UC-Berkeley Center for Labor Research and Education is completing a multi-city study of low-wage and Black workers documenting the prevalence of low-wage worker between 1970 and 2000. Since the existence of low-wage work reflects the spatial confluence of several factors — among them race, ethnicity, gender, and industrial structure — a key question asks how the nature of low-wage work among Black workers varies by region. This study will begin to shed light on this question.

Keywords: Low-wage work; Black Workers

Email: hanlon@unbc.ca; *Expanding the mine, killing a lake: a case study of competing environmental values, perceptions of risk and First Nations' health*

In recent years, uncertainty concerning the long term future of British Columbia's forest industry has led to renewed interest in the mining sector as a means of generating economic growth. While unresolved treaty negotiations and ongoing land claims with First Nations remain significant issues in the evaluation of potential resource development projects, a second set of concerns has also emerged. These concerns centre around the legal obligations of the provincial government to establish meaningful processes of consultation with First Nations regarding the impacts of mining activities on their environment, health and traditional ways of life. Political ecology holds much promise as a critical framework for exploring the uneven power relations and discursive strategies that underlie these consultative processes between state, industry and Aboriginal groups. Using the proposed Kemess North mine project in northern BC as a case study, I employ qualitative research methods to explore the competing claims and discourses of environmental risk and welfare development. The linkages between the Takla Lake First Nation and the Tsay Keh Dene's perceptions of risk, environmental values and health are explored in the context of this political process of environmental review, and it is suggested that health and well-being are undermined when First Nations perspectives are not effectively acknowledged and incorporated into the assessment.

Keywords: perceptions of risk, environment, health, First Nations, political ecology

Lorne Platt, . Email: laplatt@uwm.edu; *Pastoral and Political Nature: Milwaukee's urban parks as tamed wilderness*

This paper investigates national discourses of nature and their influence on the evolution of urban parks in Milwaukee, Wisconsin. In the last decade of the nineteenth century, local park advocates and civic leaders sought the guidance of Frederick Law Olmsted to help design parks in the rapidly industrializing and growing urban landscape of Milwaukee. Olmsted's rationale for park placement and design incorporated an inherent duality in emphasizing both culturally elite landscapes and the impact such spaces could have on the toiling masses. This paper subsequently investigates the early years of the twentieth century as both a part of this vision, but simultaneously as a time when the bourgeois ideology of Olmsted was being contested and challenged by urban growth and social change. At a time when immigrants and workers were flocking to the city for jobs, Charles B. Whitnall sought to promote parks as part of a wider Socialist agenda for Milwaukee. It is the Olmstedian ideology of the picturesque, and Whitnall's emphasis on social and environmental improvement through parks that conflate in the varied cultural representations of Milwaukee's parks.

Rutherford V. Platt, Ph.D., Gettysburg College. Email: rplatt@gettysburg.edu; *Modeling Structure Location for Wildfire Hazard Assessment*

Evaluating wildfire hazard in areas close to structures can help inform evacuation plans and wildfire mitigation strategies. Unfortunately, the location of structures is not generally known within socioeconomic units such as tracks or parcels. If wildfire behavior is homogeneous within the socioeconomic unit, then the exact location of structures within parcels is not needed. If however, wildfire behavior is heterogeneous, knowing the exact location of structures will improve estimates of proximate wildfire hazard. This study has two primary research questions: (1) To what degree does wildfire behavior (i.e. fireline intensity and preponderance of crown fire) vary between and within parcels? (2) If within-parcel variability turns out to be large, can a decision tree model improve our estimate of structure location based on relative location within-parcel, topography, amenities and accessibility? It was found that a large amount of variation occurs within-parcel for all but the smallest parcels, thus an average measure of wildfire behavior within a parcel is not necessarily representative of the location of the structure. Within small (i.e. < 4 acres) parcels, structures tend to be located away the edge of the parcel. Within large parcels (i.e. >= 4 acres), structures tend to be located in areas of low slope, away the edge of the parcel, in open stands, and in valleys. The decision tree model incorporating these factors improved prediction of structure location over a null model. Thus the model is useful for refining the location of structures to improve estimates of potential wildfire behavior close to structures.

Lee Ebinger Plowman, USDA/National Agricultural Statistics Service. Email: Lee_plowman@nass.usda.gov; *Statistical and Geospatial Data from the National Agricultural Statistics Service*

The National Agricultural Statistics Service (NASS), an agency in the United States Department of Agriculture, conducts national agricultural surveys and censuses and prepares reports covering various aspects of the nation's agriculture such as crop and livestock production, prices, expenses, chemical use, land use, farm equipment, and farm and operator characteristics. As part of NASS' mission to provide timely, accurate, and useful agricultural statistics, NASS offers national, state, and county level statistical and geospatial data in digital format. The data are available online in the form of static maps, graphs, and published statistical reports; interactive applications which display dynamic maps and tables for querying and examining agricultural census data; and downloadable data files for use in spreadsheets or geographic information systems (GIS). The data files include statistical survey and census data, and geospatial data of state and county level agricultural census boundary files, state level land use strata showing percentage of land cultivated, and satellite imagery of categorized cropland for specific states. This paper introduces the GIS community to NASS, familiarizes users with the NASS web site (www.nass.usda.gov), and explores the different types of digital agricultural data available to the public. It primarily focuses on statistical and geospatial data files for GIS applications so that geographers interested in analyzing economic, environmental and/or demographic aspects of agriculture can take advantage of the wealth of data provided by NASS.

Ian Benjamin Plummer, Florida State University. Email: ibp03@garnet.acns.fsu.edu; *Making Dangerous Places: The Use and Abuse of Political Risk Assessment Services*

This paper critically examines Political Risk Assessment Services (PRASes), business-consulting firms that provide corporations with rankings wherein places are evaluated based on their potential danger to the client's investments and/or employees. This study builds upon the insight that idealized Western versions of reality often coincide with (or manufacture) "othered/dangerous" non-Western versions of place and that such representations often are constitutive of, as well as reflective of the actual experiences of place. To achieve these constructions of place, PRASes rely not only on ideas about a distinct thing called "place" (which they essentialize into a rank-order number or textual description) but also on assumptions about distinct phenomena of "politics" and "risk." Through assertions of certainty, these firms construct ideals of their own authority to navigate clients through the world of dangerous places that the PRASes themselves discursively construct. Thus, this paper reveals the complex intersections of power, knowledge, authority, and the will (and ability) to discursively construct place that underlay a little studied aspect of multinational commerce.

Bryan Poirier, Ph.D. Candidate, Department of Geography, University of Guelph. Email: bpoirier@uoguelph.ca; *Risk, Relevance, and the Role of the Teacher: Lessons from Theory and Practice on Fostering Learning in the Undergraduate Classroom*

For many students, a teacher's pedagogical approach can be a key determinant of their willingness and ability to learn. The literature on experiential learning identifies a number of variables that can affect a student's level of engagement, including: 1) the extent to which elements of risk are incorporated into curriculum in a pedagogically constructive manner; 2) student perception of the relevance of the intended curriculum; and, 3) the roles and responsibilities assumed by the teacher. Insights on these three variables will be drawn from the literature on experiential learning and compared with findings from an empirical study of the pedagogical beliefs of selected expert teachers. These insights will be supplemented with lessons learned from practical experience in the researcher's efforts to foster student interest and learning in the undergraduate geography classroom.

Anne Pollard, National Geographic Society. Email: apollard@ngs.org; *My Wonderful World: A Campaign for Geography led by National Geographic*

In May 2006, National Geographic and leaders from the business, nonprofit and education communities unveiled a public-engagement campaign designed to give U.S. students tools to become more informed global citizens. The goal of the five-year, multimedia campaign — My Wonderful World — is to improve the geographic literacy of young people ages 8-17 by motivating parents and educators to expand geographic offerings in school, at home, and in communities. A 2006 National Geographic-Roper geographic literacy study provided alarming evidence that Americans ages 18 to 24 — those who most recently

leaving the education system — still display a disturbing lack of basic geographic knowledge about the world. The My Wonderful World coalition is utilizing public-service advertising, promotional events, grassroots activities, and Web media to educate and motivate the public about the importance of geographic literacy. Some of the 20-plus coalition members include AAG, National Council for Geographic Education, ESRI, and World Affairs Councils of America.

Jane S. Pollard, Newcastle University. Email: J.S.Pollard@ncl.ac.uk; Cheryl McEwan, Durham University. Email: Cheryl.McEwan@Durham.ac.uk; Nick D Henry, Newcastle University. Email: Nick.Henry@ncl.ac.uk; *The non-'Global City' of Birmingham, UK: a gateway through time*

Recent years have witnessed numerous critiques of the concept of global cities from a variety of different perspectives. Alternative views point towards the benefits in attending to the diversity of urban experiences, propose alternative urban theories based on difference, 'ordinariness' and connectedness of cities, and broaden the scope of analysis beyond the economic. Drawing on such approaches, this paper explores the status of Birmingham (UK) as a long-established 'urban immigrant gateway city'. We begin by examining briefly the nature of gateway cities in the UK. We then consider Birmingham as a gateway city, using census and other data to demonstrate that it is an established gateway. Exploring Birmingham as a gateway city through time, we argue, following Ley (2004) and Smith (2001) that current patterns have their roots in specific urban and migratory histories that are, in turn, related to much older patterns of globalization. We thus highlight the importance of understanding gateway cities as constituted through (relations structured in) time and space. This provides a basis for understanding Birmingham as a contemporary gateway city, the socio-cultural impact of immigrants and their role in shaping the contemporary urban economy. Finally, we reflect on what this means for the gateway city concept, particularly in the UK context.

Relying upon longitudinal socio-economic survey of colonists, a community survey, a remote sensing image time-series and GIS coverages of resource endowments and geographic accessibility, land use/land cover (LULC) dynamics are examined in the Northern Ecuadorian Amazon, a region undergoing pronounced social and ecological changes that have implications for forest fragmentation, biodiversity, vulnerability of protected areas, food security, and the nature of interactions among diverse stakeholders. Framed within the context of a coupled human-natural system, the questions that motivate the research include: What are the reciprocal pattern-process relations between population change and landscape dynamics? What are the scale dependent and non-linear relationships among people, place, and the environment that influence LULC change patterns? Based on theoretical and analytical frameworks in the social, natural, and spatial sciences, different scenarios of actors and their interactions with changing environments are analyzed using a host of analytical techniques. Cellular Automata (CA) and Generalized Linear Mixed Models (GLMM) are used to generate spatial and statistical models used to examine the causes and consequences of LULC dynamics. Working in iterative time steps, the CA model determines the state of LULC based upon initial conditions, neighborhood associations, and growth or transition rules. The GLMM are used to examine the composition and spatial configuration of LULC types on household farms to assess the drivers of change and the degree of forest fragmentation.

Colin Polsky, Clark University. Email: cpolsky@clarku.edu; *Vulnerability Research at the Science-Policy Interface*

"Global Change Vulnerability" has emerged in recent years as an important topic in both the global change and natural hazards research literatures. The two communities view this topic slightly differently, but they share the same motivation and general goal: to understand, in order to reduce, human and material damages resulting from natural hazards. It is increasingly recognized that a precondition for achieving this goal is a concerted, sustained and productive interaction with stakeholders, i.e., where researchers work closely with not only the people whose vulnerability is to be reduced but also the people who exercise policy influence over the process. This idea is not new in social science (even though it remains somewhat controversial), but the idea has not been applied much in the "vulnerability" research domain. This paper first details this problem, second presents some recent vulnerability research where the stake-

holder interaction model is being followed, and third discusses methodological challenges associated with following the stakeholder-interaction model.

Alina Polyakova, University of California, Berkeley. Email: apolyakova@berkeley.edu; *Ethnic Entrepreneurship and the Socialist State: Russian Entrepreneurs in the United States*

Sociological research on ethnic entrepreneurship has focused almost exclusively on the study of non-white ethnic minorities with high rates of self-employment. As a result, theoretical approaches seeking to understand immigrant economic incorporation cannot explain why Russian immigrants tend to exhibit high rates of self-employment in comparison to other immigrant groups. Moreover, current immigration studies rarely encompass immigrants' sending countries in explaining entrepreneurship. I propose that to understand the full extent of entrepreneurial behavior among Russians in the United States, we cannot privilege the receiving country context over that of the sending country. This paper explores the relationship between Russian immigrants' tendency to become entrepreneurs in the United States and the socialist state structure of the Former Soviet Union (FSU). Analyzing interviews conducted with Russian entrepreneurs in Atlanta, GA, and in Moscow, Russia, I examine how the skills and knowledge acquired by individuals under state socialism influence entrepreneurial behavior. I argue that everyday practice in FSU, which involved innovative circumvention of economic shortages and bureaucratic obstacles, endowed individuals with the ability to perceive opportunity openings within constraining social structures. The resulting set of skills, or cultural "tool-kit," positively affects Russians' tendency to engage in entrepreneurship as immigrants in the United States and in the transition economy of post-Soviet Russia.

Keywords: Russia, entrepreneurship, socialism, immigration

Lars Pomara, University of Texas - Austin. Email: larspomara@mail.utexas.edu; *Environmental and Human Influences on Regional and Landscape Distributions of Bird Communities in the Peruvian Amazon*

This research assesses the biodiversity status of particular places as outcomes of multiple natural and cultural processes operating at multiple spatial scales. Causes of biogeographic diversity may include spatial and temporal variability in climate, soils, topography, interspecific interactions, and dispersal abilities. Additional complexity may be contributed by human influences including hunting, agriculture, and forestry. Surveys across variable forest landscapes in the western Amazon basin are used to test the relative influences of such factors on the geographical distribution of bird species assemblages, or species turnover. Measurable proxies used to test hypothesized causes of diversity include plant species composition, forest structural characteristics, elevation, location relative to major dispersal barriers (rivers) and biogeographic zones (ecoregions), distances among sites, and accessibility relative to local human settlements and regional markets. Associations are tested at both landscape and regional scales. Avian surveys were conducted at 12 sites in northeastern Peru during 2005 and 2006 in primary non-flooded forest. Results may indicate a complex situation in which different groups of bird species respond to different factors at different spatial scales. Plant species composition (driven by soil type), position in relation to the Amazon River, and human disturbance all appear useful in explaining differences in bird species composition. Because proxies for each of these factors are extractable from satellite imagery, it may be possible to partially predict community distinctiveness across wide areas at high spatial resolution for the purposes of conservation and development planning, subject to validation with new survey data.

Robert Gilmore Pontius, PhD, Clark University. Email: rpontius@clarku.edu; Mang Lung Cheuk, University of Oklahoma. Email: mlcheuk@ou.edu; *A generalized cross-tabulation matrix to compare soft-classified maps at multiple resolutions*

This paper addresses two grand challenges in the development of methods for Geographic Information Science. First, this paper presents techniques to compute a cross-tabulation matrix for soft-classified pixels. Second, it shows how to compute the cross-tabulation matrix at multiple scales. The traditional approach to construct the cross-tabulation matrix uses a Boolean operator to analyze pixels that are hard-classified. For soft-classified pixels, the contemporary approach uses a Multiplication operator; the fuzzy approach uses a Minimum operator; whereas this paper proposes a multiple-resolution approach that uses a Composite operator. There are difficulties with the traditional, contemporary, and fuzzy methods of computing the cross-tabulation matrix. The proposed multiple-resolution method resolves those difficulties. Furthermore, the proposed method facilitates multiple-resolution analysis, so it can examine how results change as a function of scale. The paper derives the equations to compute cross-tabulation matrices at multiple resolutions and connects those equations to ontological foundations of GIS.

Barbara Poore, United States Geological Survey. Email: bspoore@usgs.gov; *Scientific information, technology, and emergent behavior during the hurricane seasons of 2004 and 2005*

In the very active hurricane seasons of 2004 and 2005, earth scientists at the US Geological Survey were called upon to provide technical and geographic information, traditionally produced to support the production of peer-reviewed assessments of coastal change, to a wide range of new and unexpected customers. These research projects combine cutting edge remote sensing technologies such as experimental Lidar systems, digital media such as film, and GIS. The overwhelming increase in the magnitude and frequency of storms in 2004 and 2005 combined with new communications affordances of the Internet to focus attention on scientific knowledge and made it easier for the media and the public to access this information directly in near real-time. At the same time these technologies allowed the scientists to communicate with peers and with federal, state, and local emergency managers in new ways. This talk presents work-in-progress on an ethnography of scientific information use in recent hurricane seasons. The hypothesis of this research is that new technologies grouped under the rubric of Web 2.0 (Google Earth mashups, wikis, blogs) support emergent behavior during disasters and that distributed GIS is being used in a variety of new ways to support emergency response and recovery. How scientists deal with these non-traditional roles and the blurring of boundaries between scientific knowledge and local knowledge will be interrogated.

Fire is a dynamic component of pine barrens ecosystems. While impacts of forest fire on erosion, sedimentation, and hydrology within geomorphic and soil systems are well studied, pedogenic factors are relatively unstudied. The sandy

parent material, acidic organic input, and complex hydrology all play an important role in the unique New Jersey Pine Barrens soils, yet there is little understanding of the impacts of regular and occasionally intense fires. Our initial studies look at physical, mineralogical, and chemical attributes in order to ascertain both short term and medium term (ca. 10s of years) signatures of fire-influenced pedogenesis. Our study site, in the vicinity of the Air National Guard Warren Grove Range and Preserve, is in the Pygmy Pine Plains of southern New Jersey, a unique ecosystem with dominating fire influence as well as a long history of forest management. In surface horizons, clay mineralogy, bulk chemistry, cation exchange capacity, and texture all appear to exhibit an immediate impact and shock to the soil system, followed by years of gradual stabilization until the next fire event. Ongoing studies will establish how fire-impacted surface attributes incorporate into lower horizons by illuviation. Pedogenic processes beyond ca. 100 years are difficult to ascertain, though the repeated fire frequency on top of rare catastrophic high-intensity burns may well have long term effect. Just as fire influences the ecosystem's temporal and spatial complexity, it stands to reason that the soil itself is at dynamic equilibrium with "pyrogenetic" factors.

Jeff Popke, East Carolina University. Email: popkee@ecu.edu; Rebecca Torres, East Carolina University. Email: torresr@ecu.edu; *The Antinomies of Neoliberal Transnationalism: Latino Migration and the Case for a Rural Cosmopolitanism*

Recent commentary has suggested that a deepening transnationalism can be potentially liberating or emancipatory. From one perspective, the transnational migrant is seen as challenging the hegemony of fixed borders and fostering a form of nomadic subjectivity that constitutes the multitude. From a different perspective, it has been suggested that transnational spaces are conducive to a cosmopolitan imaginary with the potential to foster greater responsibility toward different and distant Others. Both perspectives, however, are challenged by the realities of migration to rural areas. Using the example of the US South, this paper will examine the contours of neoliberal transnationalism in rural areas. We will argue that the rural South is witnessing a transnationalization of its population and economy but without a concomitant transnationalization of consciousness and responsibility. To redress this requires an ethic of rural cosmopolitanism, within which we can reclaim the economy as a site of responsibility and, on this basis, reposition the migrant as the subject of an ethics of hospitality.

Email: kmoser@uwo.ca; *High-Resolution Quantitative Reconstructions of Holocene Climate Change in the Central Canadian Arctic: Implications for Human Occupation*

The biological, physical and geochemical properties of sediment cores recovered from the central Canadian Arctic are used to resolve decadal to centennial-scale temperature variability and identify the impact of climate change on vegetation and people during the Holocene. More specifically, I am attempting to identify the impact climate change had on the Paleo-Eskimo community present on Victoria Island, Nunavut, Canada, approximately 4000 years Before Present. Based on the abundance of dwelling features found on well-dated former marine shorelines, it appears that Paleo-Eskimo populations in southwest Victoria Island experienced pronounced population rise between 4500 and 4000 yr BP, peaked between 4000 and 3800 yr BP and underwent a rapid and sustained decline in population within a few decades of 3800 yr BP. This decline was coincident with a widespread decline in late pre-Dorset occupation intensity throughout the Canadian Arctic. In this presentation I will discuss the role of climate change in the 'boom-bust' cycles in the Paleo-Eskimo population documented in the archaeological record of southwestern Victoria Island over the last ~5000 BP. A midge-based transfer function for summer surface water temperature (SSWT) has provided a robust model for estimating past fluctuations in SSWT. The current model is based on 51 lakes and has $R^2_{jack} = 0.690$ and a RMSEP = 0.62°C. I will present the results from the down-core reconstructions and discuss how post-glacial environmental change may have influenced human occupation history on Victoria Island.

Alison Porter, Swansea University. Email: a.m.porter@swansea.ac.uk; Angela Evans, Swansea University. Email: A.Evans@swansea.ac.uk; *Spaces of engagement in action research*

This paper presents learning from a government-funded Sustainable Health Action Research Programme (SHARP) in Wales, UK, which worked with deprived communities to find new approaches to addressing the determinants of

health inequalities. It examines the spaces of engagement - houses, community centres and so on - where the programme staff drawn from those communities encountered other community members, and considers the symbolic, emotional and functional value of those spaces. The action research process which took place there brought together a range of orthodox and unorthodox research methods with action largely based on building social networks and finding new ways to promote healthy behaviours, in a complex and sometimes messy mix. The spaces of engagement - bounded, secure, under control, and the scene of manageable encounters - are nested within neighbourhoods where having a sense of place can mean identifying with a label of poor health status and deprivation, but which can also represent loyalty and belonging. The paper considers the means by which the programme moved from being a set of assumptions and expectations about a place to being a series of encounters acted out in the spaces of engagement. It discusses how this process was shaped both by community members' own ambiguous relationship with the place where they lived, and by their relationship with the action researchers who came from the same communities.

James Jonathan Porter, King's College London. Email: james.porter@kcl.ac.uk; *The co-production of fluvial modelling and flood risk policies?*

In 2006, the UK's Met. Office held a flood simulation exercise, to bring together the treads of science and policy. In a single moment, a dazzling array of visual props played out, blurring what constituted science, truth, and reality, as floodwaters engulfed London. Modelling, in this instance, promised to answer the government's prayers, the ability to produce clear and unambiguous answers to an open and indeterminate future. With this technology the state could engage in 'politics of uncertainty' and prevent the horrors of tomorrow from unfolding today. Over the last decade the UK has experienced number of major flooding events. The rising toll from these floods, and growing concerns over climate change, has prompted a major shift in UK flood policy, now emphasising 'softer' measures to reduce and manage floods. Technologies like the Environment Agency's Flood Map are promoted as ways to curtail climate change, by disciplining people's imaginations of 'risk', through the creation of responsible subjects. Here, modelling has become indicative of a changing governance of science, one that invokes a particular kind of science (commercial) and a particular kind of politics (neo-liberalism), in an attempt to shape a new 'public' that is not only enlightened but self-reliant. By exploring scientific practices and objects, this paper looks at the way science and politics are co-produced to reveal how knowledge-making is incorporated into practices of state-making, and equally how practices of governance influence the making and use of knowledge, bound up in the politicised world of science-policy.

Jess C. Porter, M.S., Oklahoma State University. Email: jess.c.porter@okstate.edu; *Redefining the Dust Bowl: Popular Notions of an Event, Era, and Region*

The Dust Bowl is simultaneously recognized as event, era, and region in academic and public spheres. Divergent perceptions of the three Dust Bowl concepts can be noted in any sample of Dust bowl literature as academicians have defined and refined these concepts over the past 70 years. Published Dust Bowl survivor accounts also suggest differing understandings of the Dust Bowl phenomenon in the general public. These accounts, however, provide only anecdotal evidence regarding the general public's perceptions and knowledge of an unparalleled episode of American geography and history. Furthermore, these accounts focus on the perspective of the Dust Bowl survivor, neglecting the perspectives and knowledge of later generations. Therefore, a systematic appraisal of public perceptions and knowledge through time provides a new and unique contribution to the body of Dust Bowl literature. This poster presents preliminary results of a questionnaire designed to examine Dust Bowl knowledge and perceptions. The questionnaire was administered to individuals from four age cohorts in 93 Dust Bowl counties. The results detail striking differences in knowledge of the Dust Bowl as event and era and perception of the Dust Bowl as region. These differences are readily apparent along both locational and generational lines.

Keywords: Dust Bowl, environmental perception, region

Michael Porter, CUNY Graduate Center. Email: mporter@gc.cuny.edu; *A sustainability fix in the entrepreneurial city: Florida's brownfields and the historical specificity of environmental justice*

Over the past 15 years underused, abandoned, and contaminated properties known as brownfields have become the target of state-level redevelopment policies. Located in primarily low-income, minority, and urban neighborhoods, brownfields redevelopment has served as a cornerstone of the federal environ-

mental justice policy. This presentation investigates one state policy, the Florida Brownfield Redevelopment Act (FBRA), and argues that instead of reducing environmental inequities, FBRA transforms and displaces them. In order to understand this transition, however, it is necessary to situate FBRA in the context of the entrepreneurial city and urban governance in late capitalism. Faced with inter-urban competition and in hopes of attracting real-estate capital, cities are forced to roll-back existing environmental regulations. At the same time, a city's growth is contingent on the image of a clean and safe environment. Government in the entrepreneurial city is thus faced with the contradictory needs for economic growth and sustainable development. Environmental policies crafted to assuage this tension never fully resolve the dilemma but serve as only partial and temporary solutions. Brownfields policies, like FBRA, are one such "sustainability fix" (While et al 2004). Contrary to claims that brownfields policies reduce environmental risks in poor and minority neighborhoods, FBRA enables developers to contain, rather than remediate, existing contamination. As such, environmental inequities are not reduced, but re-produced in new forms. By examining the ways that environmental injustices emerge within the entrepreneurial city, this presentation extends claims of contextual specificity by arguing that environmental injustices not only vary between places but change in time.

Trevor J. Porter, Carleton University. Email: tjporter@connect.carleton.ca; Michael F.J. Pisaric, Carleton University. Email: mpisaric@ccs.carleton.ca; Steve V. Kokelj, DIAND. Email: kokeljsv@inac-ainc.gc.ca; A dendroclimatic investigation using ring-width, carbon-13, and oxygen-18 of white spruce trees (*Picea glauca*) in the Mackenzie Delta, NWT, Canada

The Mackenzie Delta in northwestern Canada is an ecologically significant and climatically sensitive region. Because of the hydrologic regime of the delta, forest fires are a rare occurrence and, thus, the opportunity exists to develop long proxy records of climate from trees in this region. White spruce trees growing in the delta are typically long-lived because of the lack of disturbance. The Carleton University Paleoecology Laboratory has developed a number of well replicated ring-width chronologies spanning the past 500 years from this region. One of these site chronologies (Timber) covers the period 1529 to 2003 and was developed using sixty increment tree cores from thirty trees. A subset of cores (six cores) from Timber was analyzed for annual-resolution carbon-13 and oxygen-18 isotope ratios for the period 1850-2003. Statistical relations between the three proxies and climate were examined over the period 1957-2003, for which detailed meteorological data from the Inuvik climate station are available. Carbon-13 was found to be highly correlated with maximum growing season (June/July/August) temperatures, while oxygen-18 is highly correlated with minimum December-July temperatures. Relative humidity during the growing season was also significantly correlated with both isotopes. These results reflect the dependence of carbon-13 on environmental conditions which affect stomatal conductance of trees during the growing season, and the dependence of oxygen-18 on environmental conditions which affect the isotopic composition of source and plant water throughout the year. In these trees, standard ring-width was not found to be as sensitive an indicator of climate compared to the isotopes.

Keywords: Mackenzie Delta, stable isotopes, tree rings, dendroclimatology

Christopher W. Post, University of Georgia. Email: cpost@uga.edu; Contestation, Race, and the Memorialization of John Brown in Kansas

The memory of Kansas abolitionist John Brown has been highly contested since his death in 1859. Many citizens have praised his abolitionism and freeing of slaves while others have ridiculed him for his violent tactics. Still Brown's behavior in Kansas has permanently linked him to the state. This past is reified through the cultural landscapes of the John Brown State Park in Osawatimie, a statue of him in the African American neighborhood of Quindaro in Kansas City, and his depiction in John Steuart Curry's mural in the Statehouse in Topeka. This paper discusses these landscapes, their contestation, and how race has played a role in their development and identity with John Brown and his tenure in Kansas during the state's territorial period. Tourism revenue and invention of tradition together with the aforementioned concepts of race and identity have influenced the memorialization of Brown in Kansas

Keywords: Cultural landscape, memorialization, identity, Kansas

Tracey J. Potts, University of Nottingham. Email: tracey.potts@nottingham.ac.uk; Floral Tributes: Emotional Geographies of Traumatic Loss

Material practices around bereavement are changing. The laying of wreaths and flowers can be seen increasingly to spill beyond the cemetery and into public space. Occasioned usually by "bad" deaths' floral tributes form an ever more established element in the popular repertoire of emotional expressiveness around traumatic loss. Such spillage is itself the site of emotional expressivity as those

who object to the 'cluttering up' of the landscape refer vociferously to outbreaks of 'sentimental hysteria'. Floral tributes, for some, constitute signs of a generalised sentimentalisation of culture. Epitomised by the public response to the death of Princess Diana, so-called 'outpourings' of grief expressed with flowers and teddies become readable as aesthetic evidence of a chronic cultural malaise, marking a rising tide of bad taste. This paper views floral tributes otherwise: as nodal points in emotional geographies of traumatic loss and as forms of vernacular creativity. Roadside shrines constitute emotionally charged landmarks that breach the mundane landscapes of the everyday. Further, for the passer-by, the chance encounter with the scene of a stranger's death offers a potential experience that punctures the complacent fictions of metropolitan living. Rather than effect rational and emotional distance, pausing to register the pain and losses of others proffers the promise of an end to a certain form of loneliness. Following Norbert Elias' definition of the lonely the symbolic violence (Bourdieu) that structures 'moral' objections to floral tributes is reconfigured as an ethical issue pertaining to the ability to feel and to connect as human beings.

Keywords: emotional geography, vernacular creativity, death, loneliness

Michael Poulsen, Associate Professor, Macquarie University. Email: mike.poulsen@mq.edu.au; Ethnic Segregation and Social Mobility: Determinants of Segregation Outcomes

What we need in segregation studies is not the endless development of yet more segregation indices, but the utilisation of established measures that challenge the policy perspective that the geography of segregation is simply a contextual matter. One approach that is well suited to producing extensive measures that are comparative is the PJF (Poulsen, Johnston, and Forrest) typology. Not only does it make more use of the information contained in the census data than the traditional segregation indices, it provides both aspatial and spatial measures of segregation, including the mapping of segregated areas. By linking this methodology to the study of social mobility we can address the issue of whether the geography of segregation is important in a policy context.

Keywords: Ethnic Segregation Social Mobility

Joseph B. Powell, U.C. Santa Barbara. Email: jpowell@lsu.edu; Wine Regions and Edible Landscapes: An Example from the Vinho Verde Region of Northwest Portugal

In this paper I use the concepts of hybridity and socionatural landscape production to explore the notion of the wine region as a socionatural process understood through the theoretical construct of the "edible landscape." The edible landscape refers to both a physical setting and the social relations between humans and non-humans that are co-produced in dialectical relationship with this setting and which render it consumable and reproducible through food. A focus on the edible landscape of northwest Portugal, home of the "vinho verde" region, reveals wine regions as unfolding within the broader socionatural networks of food production and consumption in which wine-related activities are embedded. In this case, the key processes include cultivation, harvesting and consumption of maize (*Zea mays* L.), a companion crop to wine grapes in northwest Portugal. In the context of the edible landscape framework, wine regions can be understood as a specialized subset of routines, practices, knowledges and social relationships within wider geographies, or landscapes, of food production and consumption. This perspective allows the analysis and interpretation of wine regions to account for "non-wine" actors and processes that nevertheless play a functional role in producing wine regions. The paper illustrates and elaborates on these points with visual data from ethnographic fieldwork in the Sousa Valley of northwest Portugal.

Keywords: edible landscapes, socionature, vinho verde, northwest Portugal

Gareth Douglas Powells, Durham University. Email: g.d.powells@yahoo.co.uk; Domestic Energy Efficiency in the UK: Ontological Politics in the New Carbon Economy

It is estimated that four million British households will be in fuel poor in winter 2006/2007 (NEA 2006), and that around 29,000 over 65s died as a result of living in cold damp homes in winter 2005/2006 (Help The Aged, 2006). At the same time, domestic energy use is responsible for 27% of UK carbon dioxide emissions (Friends of the Earth, 2005). This paper uses contemporary thinking in actor-network theory (ANT) and non-representational theory to consider domestic energy efficiency in a landscape in which governmental interventions attempt to reduce carbon emissions as well as save lives. Policy responses to energy efficiency in the UK are largely framed by cognitive as well as non-cognitive experiences of 'the market' and go on to perform the market in interventions such as the Energy Efficiency Commitment. Energy ethics are questioned by moving away from caricatures of environment, social equity and commercial interest being in antagonistic opposition to consider how they are mutually enmeshed in actor-networks. These hybrid actor-networks gather space, resources, knowledges and affects, opening up new worlds of opportunity for

researchers, politicians and people. Among the results are a series of ethical questions around the new carbon economy. These dilemmas are considered with reference to 'ontological politics' (Mol, 1999; Law, 2004) which asks social scientists to consider their creative role in generating worlds such as the new carbon economy.

Keywords: energy efficiency, domestic CO₂, ontological politics, Actor-Network Theory, fuel poverty.

John M Power, NOAA/CSC. Email: john.power@noaa.gov; Providing Inundation-Related Support to Coastal Communities

Working to enhance the resilience of coastal communities to storm surge inundation and flooding, the NOAA Coastal Services Center is building decision-support tools focused on visualizing and mapping coastal inundation. In addition, the Center is developing a Coastal Inundation primer to serve as a source for inundation-related resources. The coastal surge model is being built using the Advanced Circulation Model (ADCIRC), a finite element model for solving time dependent, free surface circulation and transport problems in two dimensions. An unstructured grid was created to include higher resolution in shallow coastal areas near channels, inlets, and beachfronts as well as to indicate the natural and built environments as obstructions to flow. The model will be calibrated to reproduce the water levels recorded during Hurricane Ivan. This Gulf of Mexico project covers the areas impacted by Hurricane Ivan (2004) and includes communities in the Pensacola Bay, Florida, to the Mobile Bay, Alabama. The model results will be validated with high water marks collected after Ivan and inundation maps developed by FEMA (FEMA Flood Recovery Maps, 2004). Model output will be displayed as 2D or 3D depth of water over land surface visualizations, in a GIS and as high-end animations. The primer will provide a one-stop source for such things as tools developed by the Center to assist coastal communities, information relating to tsunamis, high waves, flooding and storm surge, such as tutorials and resource guides, and links to hurricane evacuation studies and hurricane evacuation zone maps.

Keywords: gis, storm surge, coastal inundation, models

Steven D. Prager, University of Wyoming. Email: sdprager@uwyo.edu; Representation and Analysis of Complex Networks for Understanding Geographic Phenomena

Many significant advances in understanding complex geographic phenomena can be attributed to advances in representation. At the same time, however, issues of representation are almost inevitably bound to the geography of location. An alternative perspective, the explicit characterization of the geography of interactions and relationships, is required to make the leap from analysis centered about where things exist to analysis addressing the consequences in changes in that existence. The limited dimensionality of Euclidean space and the relatively strict set of entity-relationship rules imposed by even the most sophisticated spatiotemporal data models still embody explicit assumptions regarding the geography of location and its role in defining the spatiotemporal process. Moving beyond limitations in current GIS requires a perspective that moves away from a focus on structures and refocuses on explicit consideration of relationships, process and concepts. This paper illustrates how complex network theory and related representations can be used to significantly enhance our understanding of relationships and interactions occurring across geographic space. A case study of the United States domestic airline transportation network will be used to illustrate the concept of functional geographies, how these geographies exist and change within the context overlying networks, and how complex network theory can contribute to a greater understanding of geography in general. Using the aforementioned example, this paper will address the integration of complex network analysis with GIS, issues relating to geographic visualization, and existing libraries for construction, visualization and analysis of complex networks.

Keywords: complex networks, geocomputation, GIS, interaction, spatiotemporal

Kathryn Pratt, University of Minnesota. Email: prat0033@umn.edu; Reaching Through the Fog: Ambiguities and Tensions in the Development of Community-based Forest Conservation in Chile

In recent years the temperate rainforests of southern Chile have been declared a critically endangered ecosystem by international environmental organizations. This "threatened" status has spawned a plethora of new forest conservation and management programs. These range from grassroots efforts to sustainably harvest forest resources to large-scale forest reserves funded by northern NGO's. A common thread in most programs is a profound commitment to community development and involvement. Though enthusiasm for "community-based" approaches remains high, they occupy an uncertain place in national environmental policies, local and international resource economies, and NGO politics. Specifically, community forest conservation efforts have been challenged by an inadequate policy framework, the regional dominance of industrial

forestry, new and diverse forms of collaborative conservation, and conflicting conceptualizations of human-forest relationships. Drawing on case studies, this paper explores the tensions and ambiguities that have characterized the growth of community-based forest conservation in Chile. I argue that new ways of describing and implementing meaningful collaboration are necessarily for successful local involvement in conservation.

Rhea Presiado, PhD, University of Wisconsin - Platteville. Email: presiador@uwplatt.edu; Wayne Weber, PhD, University of Wisconsin-Platteville. Email: weberwa@uwplatt.edu; Morphologic and Genetic? Body size variation along a latitudinal gradient for the smooth brittle star.

Brittle stars (ophiuroids) have a cosmopolitan distribution, however few studies have investigated their genetic variation along large latitudinal gradients. This study investigates the link between genetics and latitudinal variation in body size of the brittle star *Ophioplocus esmarki* (Lyman 1875) from California and Baja California. Body size data were collected from 532 individuals of *O. esmarki* at 24 research sites from 36°N at Santa Cruz, California south to 27° N in Bahía Asunción, Mexico. The genomic content (DNA from 86 individuals) of *Ophioplocus esmarki* was analyzed and compared. We believe that the genetic variances within these sequences and our DNA analysis will allow us to explain some of the differences in body size between *O. esmarki* populations in geographically distant locations.

Keywords: marine biogeography, genetic variation, DNA, Pacific coast

Valerie Preston, York University. Email: vpreston@yorku.ca; Ann Marie Murnaghan, York University. Email: amfm@yorku.ca; Audrey Kobayashi, Queens University. Email: kobayasi@post.queensu.ca; Immigrants in the Suburbs: The Impacts of Transnational Social Fields

Recognition of immigrants' efforts to maintain simultaneously social ties and social identities at their places of origin and destination is challenging current explanations of the spatial patterns of immigrant settlement. Unprecedented numbers of international migrants are settling directly in the suburbs of North American cities. The residential decisions that underpin the current suburbanization of immigrants are not well understood. Recent immigrants have been characterized as suburbanites seeking the advantages of new and spacious housing in suburban environments. Others have emphasized that recent immigrants' transnational connections facilitate new residential and commercial concentrations of immigrants in suburban locations. We explore the nature and causes of suburbanization by case studies of recent Hong Kong immigrants in Toronto, Canada. More affluent and better educated than earlier migrants, Hong Kong immigrants are pioneering transnationals who have concentrated in unprecedented numbers in the Toronto suburbs. Focus groups and in-depth interviews with immigrant women highlight the impact of transnationalism on residential decisions and the appeals of suburban housing.

Keywords: transnational migration, immigrant settlement, suburbs

Robert Preston-Whyte, Professor. Email: preston@ukzn.ac.za; Catherine Oelofse, lecturer. Email: oelofsec1@ukzn.ac.za; Coastal resort development in South Africa

The recent history of coastal resort development has been one of intense property speculation and investment in new, reviving and previously 'undiscovered' areas, as well as progress in conservation environments geared towards community involvement. The increasing demand for holidays in coastal towns and cities, the ongoing construction of holiday homes in coastal resorts, new 'economy' developments in previously undeveloped areas and the accelerated provision of state-managed and community-driven ecotourism experiences in wildlife conservation areas, are explained by 'drivers' that initiate the creation of the bustling waterfronts, the search for new lifestyles, the rejuvenation of stagnating resort towns, the conservation of pristine wilderness shorelines, the shaping of community-based tourism ventures in tribal areas and the search for undiscovered locations. The discussion of these drivers is structured in relation to (a) increased domestic and international demand for the consumption of coastal resources, (b) improved linkages to the global economy, (c) increased levels of expendable income, (d) shifts in quality of life expectations, (e) government insistence on policies of economic redistribution constructed around the notion of 'responsible tourism' and (f) the quest for authenticity. Coastal tourism resorts are then shown to have a variety of faces that reflect global trends, meet different needs, respond in new ways to political visions, adjust to the racial transformation of society and accommodate increasing levels of expendable income.

Keywords: coastal resorts, drivers, communities, rejuvenation, authenticity

Donovan Preza, University Of Hawaii. Email: preza@hawaii.edu; Donovan C Preza, University of Hawaii?i at Manoa - Geography. Email: preza@hawaii.edu; *Hawai'i's Great Mahele - Between a Rock and a Hard Place*

The Mahele of 1848 represents a transition from the "traditional" feudal-like governance to a freehold system of land tenure. This occurred 28 years after the arrival of missionaries but also only 5 years after Hawai'i was an explicitly recognized independent nation-state. The Mahele was effectively carried out using non-written knowledge systems. Many complications occurred following this division which led to the use of "western" style paper maps and surveying techniques. A majority of academic scholarship on the Mahele perceives the Mahele negatively, more specifically as a means of dispossessing the Hawaiian people. This presentation will contextualize the Mahele to determine if dispossession did in fact occur as a result of the Mahele. If Hawaiians were not materially/physically dispossessed of lands as a result of the Mahele, then the interaction between the "West" and the "Other" may not have been as one sided as previously argued. This could have significant implications for other issues such as human agency, methodology, notions of dispossession, and logical fallacies of causation in the context of Hawaiian Political Geography. The Mahele represents a complex place of interactions between "traditional" Hawaiian knowledge systems and other "Western" forms. It is viewed as a progression from the "traditional" to "western" articulations of land tenure. This is an attempt to articulate a perspective of that interaction.

Keywords: Hawaii, map, land, land tenure

Katie Price, University of Georgia. Email: kprice@uga.edu; *Effects of forest conversion on baseflows in the southern Blue Ridge: A cross-landscape comparison of synoptic measurements*

Basin forest cover is understood to influence stream baseflow in a variety of ways, most significantly via increased soil infiltration and increased evapotranspiration (ET). Extensive forestry experimentation has consistently demonstrated a negative relationship between forest cover and baseflow, attributed to ET losses associated with greater forest cover. However, it is unclear whether this relationship can be extrapolated to larger spatial and temporal scales. Spatially, larger basins may contain greater subsurface storage capacity, potentially overriding the effects of ET losses on baseflow and contributing to a positive relationship between forest cover and baseflow. Temporally, non-forest land uses may be associated with pronounced soil modification, reducing infiltration and baseflow discharge, again resulting in a positive relationship between forest cover and baseflow. This study addresses the relationship between forest cover and baseflow in mesoscale sub-basins of the upper Little Tennessee River basin in Rabun County, Georgia and Macon County, North Carolina. Ten pairs of basins ranging from three to 33 km² were created by aligning key physical traits (e.g. basin size, aspect, and total relief), while allowing forest cover to differ within the pairs. Three series of synoptic measurements were conducted in July and August, 2005. In most pairs, greater baseflow per unit area was associated with higher forest cover, and an overall positive relationship was demonstrated between forest cover and baseflow among all twenty sub-basins.

Email: johnson@ksu.edu; *Estimating Cover of Red Cedar and Modeling its Invasion Patterns in a Central Great Plains Tallgrass Ecosystem*

Conifer red cedar (*Juniperus Virginiana*) is a native and widely distributed tree species in the eastern Great Plains. Of all the woody species invading into the tallgrass prairie, red cedar may pose a greater threat than other invading species since it thrives on both lowland and upland area, and its evergreen growth-form allows it to more effectively compete for soil moisture and nutrients. Over the past several decades, invasion of red cedar into the tallgrass prairie has been widely documented and has raised concerns of land managers because the growth of the woody species can adversely affect grazing productivity. Furthermore, its invasion into the grasslands can alter biogeochemical and biophysical processes, trace gas fluxes, biodiversity, and consequently change vegetation climate interactions. The goal of this study was to develop remote sensing methods for mapping changing tree distribution patterns and estimating percent cover. Methods used for estimating cover, and animations of tree distributions over a 15 year period will be discussed and demonstrated. A linear spectral mixing model approach was used to map tree cover. Our model was validated using e-Cognition classification of multispectral high spatial resolution

airborne imagery. This approach was found promising for mapping the cover of this species over large geographic regions. A leaf-off imaging period was best for discriminating red cedar from other land cover types. Our findings support the thesis that red cedar geographic distribution is expanding and the density of the trees is increasing at an alarming rate.

Keywords: red cedar, remote sensing, spectral mixing model, invasive plants

Marie D. Price, George Washington University. Email: mprice@gwu.edu; *Immigrant Gateways and Guest Workers: The Case of Dubai, UAE*

This paper documents the remarkable growth of Dubai as an immigrant destination and gateway in the Persian Gulf. In terms of large cities, over 80 percent of Dubai's population is foreign-born, making it the highest percent foreign-born city in the world. The metropolitan area now has over 1 million foreign-born migrants. Workers are predominantly from South Asia, but as the Dubai economy grows and diversifies so does its immigrant population. This is a highly regulated system, with most workers arriving on three year contracts that can easily be extended indefinitely as long as a worker has employment. Yet immigrants are also seen as 'guests' with no access to permanence or citizenship. The permanence of temporariness is a fact of life for the majority of residents in Dubai. This raises important questions about the relationship between globalization, immigration, urbanization and citizenship. After reviewing the features of the migration system in Dubai, the paper will focus on three key aspects of that system: 1) the maintenance of temporariness, 2) spatial and social segregation of native and foreign-born, and 3) the balance between openness and control.

Keywords: Immigration, Gateways, Middle East

Patricia L. Price, Florida International Univ.. Email: pricep@fiu.edu; *Identity in Balance: The Shifting Grounds of Self and Community in Three Latino Enclave Neighborhoods*

The relationship between place and identity is explored in three Latino enclave neighborhoods: East Little Havana, Miami; Garfield, Phoenix; and Pilsen, Chicago. An interdisciplinary research team conducted extensive and intensive survey, interview, and focus group research with neighborhood residents from 2004 - 2006. Preliminary data analysis reveals similarities and differences amongst Latino/a residents within and across place. The scope and depth of the data gathered allow strong claims to be made regarding the relational and contingent nature of Latino identities within the category 'Latino', a term typically treated as monolithic. The data also allow strong claims to be made about similarities, and differences, across place. Because all three of the study neighborhoods are currently undergoing rapid socio-spatial transformation, the findings of this study have implications for many other U.S. cities also undergoing rapid change due to gentrification, urban revitalization, and international migration. These neighborhoods also provide timely sites of inquiry into issues surrounding the so-called Latinization of U.S. cities. Thus this study touches on key contemporary issues at the national scale: 'race', immigration, and belonging.

Keywords: Latino, urban geography, neighborhood change, 'race', immigration

Narcisa Gabriela Pricope, University of Florida. Email: npricope@ufl.edu; *Assessing Spatial Patterns of Sediment Transport in the Pitman Creek Basin, KY*

Off-site soil erosion has tremendous impacts on the present state of most river systems throughout the United States, contributing sediments to channels mainly as non-point pollution resulting from land-use and agricultural practices. A model that would be able to assess soil erosion needs to start by identifying the sediment sources and delivery paths to channels and link these sediment supply processes to in-channel sediment transport and storage. This study focuses on the Pitman Creek Basin and is concerned with analyzing hillslope erosion rates using The Unit Stream Power Erosion and Deposition Model and thereby estimating patterns of sediment supply to rivers in order to predict which portions of channel networks are more likely to store large amounts of fine sediments. Results indicate that much of the eroded sediments are redistributed within the hillslope system, but also that a large proportion is delivered to the channel. These predictions have been tested by sampling the fine sediment content of the streambed at key locations along the channel network and comparing the observed patterns to those predicted by the soil erosion model. By linking topographic and soil characteristics with land cover data, it has been concluded that high intensity erosion tends to occur at contact between different vegetation covers, on croplands and 15-25% slopes poorly protected by vegetation. Erosion "hot spots" have been identified in the Pitman Creek HUC 05110001-90-130 and 05110001-90-050, both part of the Big Pitman Creek sub-basin, as well as in Mill and Falling Timber Creek basins but with lower intensity.

Keywords: erosion and deposition rates, sediment delivery, streambed sediment content

Martin Pries, . Email: pries@uni-lueneburg.de; Martin Pries, PD Dr.. Email: pries@uni-lueneburg.de; *Against decline: The growing City of Hamburg.*

In order to compete with other leading world regions, the city of Hamburg continues to grow and to develop. City planners implemented three main concepts for urban renewal and rebuilding: The HafenCity, the cities leap across the Elbe and the sustainable redevelopment of urban quarters. Hamburg tries to stop the decline of the city and change the demographic decrease of population into a growth strategy. The HafenCity is one of the most ambitious urban development programmes in Europe. The city of Hamburg will be extended towards the River Elbe by approximately 40 percent. A new mixture of working, living and edutainment components will change the devastated port area into a vibrant neighborhood. The leap across the Elbe develops the city to the south. Over centuries Hamburg has been growing northwards of the River Elbe. The entire region south of the Northern branch of the Elbe was characterized by declining harbor facilities and now offers space for new cityprojects for the growing population. Small projects of a sustainable development in the city itself bring new quality of living into the urban core. Both concepts aim at a high quality of living, working and recreation in the city core in order to attract new residents as well as international companies and tourists.

Russell Prince, University of Bristol. Email: russell.prince@bristol.ac.uk; *Policy transfer and techno-politics in creative industries policy*

The creative industries are a set of industrial and cultural sectors that have only recently been described, circumscribed and measured as part of today's economy and yet they are now a ubiquitous feature of economic development and regeneration strategies at various administrative scales all over the world. Their initial articulation in the British Government's 1998 Creative Industries Mapping Document has become the standard imitated by these other creative industry development projects. This work of assessing their impact on revenue, employment and investment has become the path to placing them near the centre of local and national economic strategy. This paper explores the processes by which this type of creative industries policy has moved from one place to another in two interlinked ways. For one, it will consider the forms that the policy takes when it travels. This includes textual forms, such as the mapping document, and embodied forms, such as in the expertise of particular academics and policy entrepreneurs. But it will also consider the role of techno-politics in making the idea travel - what is it about the knowledge wrapped up in creative industries policy that was appealing to those particular political actors that brought it in? In other words, it will consider how and where knowledge and politics intersect over the creative industries. The goal is to reveal some of the machinations behind policy transfer in advanced liberal societies.

Keywords: creative industries, policy transfer, techno-politics, knowledge

Katherine F Pritchard, Virginia Tech. Email: kpritch@vt.edu; Lisa M Kennedy, Virginia Tech. Email: likennel@vt.edu; John D Boyer, Virginia Tech. Email: joboyer@vt.edu; *A New Map to Promote Tourism in Virginia's Wine Region*

The Virginia wine industry wants to increase tourism to the area and continue to promote the over 100 wineries in the state. Maps are often used to promote tourism in wine regions, and show the location of wineries, the surrounding areas, and directions to the wineries. We are interested in determining the effectiveness of the map in terms of its goal of promoting tourism in the state's wine region, and we question the usefulness of the current Virginia wine industry's map for a tourist. The original map has several cartographic elements that do not follow cartographic principles, and it appears to be overwhelming and difficult for the reader to focus in on the important information. We propose to develop a new map that improves map readability and usefulness. Here we present the results of a preliminary survey of tourists of the Virginia wine region to discover the specific elements of the current map that tourists find confusing and awkward, and which elements they find useful. We will use the results to produce a tourist map that will excite the user and bring increased tourism to the wine industry of Virginia by using symbols, color, text, and photos, along with improving the legibility of the map. The improvements of the new map will be compared to the problematic elements in the current map.

Keywords: wine, cartography, tourism

Jain Priyanka, PhD, University of Kentucky. Email: pjain2@uky.edu; *Embodied State in Central Vista: Public Space, Discipline and Corruption*

The literature on public space has constructed its ideal model as a political, democratic landscape, a sphere of critical discourse accessible to all, an arena in which power dynamics are minimal. I develop an integrative framework by connecting three major connotations of public space to study Central Vista, a monumental public space in New Delhi. These connotations are: public space as

physical property of the state; public space as a semiotic democratic landscape; public space as a sphere of rational critical discourse where the citizens of the country experience national solidarity. The ethnographic field work helps me trace three kinds of encounters with the state in Central Vista: state as abstract monolithic entity, state as embodied and state as a regulating body. In this work I highlight different ways in which the state governs at micro level and challenges publicness of public space. This particular case study goes beyond reflecting the problematic of presence in public space that has been constructed in segregational and exclusionary terms. I attempt to show that the misrecognition of socially embedded subjects as the absolute embodied state thereby creating spaces of economy of corruption.

Kim L Procter, University of Leeds. Email: kimprocter@yahoo.co.uk; *How where we live influences obesity: a geo-demographic classification of obesogenic environments using spatial microsimulation modelling*

Obesity has a complex, multi-factorial aetiology; therefore, to stem the epidemic, we need to consider which combinations of risk factors are most obesogenic. This paper explains how SimObesity, a dynamic spatial microsimulation model, was built and how it facilitates the identification of obesogenic environments. SimObesity combines the outputs of the UK 2001 census with the Health Survey for England 2003 data using deterministic algorithms. The resulting synthetic micro-population has lists of attributes from both information sources. These household attribute lists can be expanded to incorporate other variables of interest, e.g. television viewing time, using probabilistic algorithms. Validation methods are discussed. Finally various characteristics about each neighbourhood, e.g. green space access, are added to the lists. The resulting dataset enables identification of clusters of attributes that are particularly obesogenic. Increased understanding of obesogenic patterns facilitates effective policy formation to reduce obesity prevalence. These suggested policies can then be theoretically evaluated using a dynamic version of SimObesity. The upgrade uses estimates of the 2011 and 2021 census in place of the 2001 census outputs and changes any attributes affected by the policy (e.g. more green space in some neighbourhoods). The resulting synthetic population reflects the prevalence of obesity as impacted by both the future population structure as well as by the policy changes. This paper demonstrates a methodology to predict micro-level obesity prevalence and highlight the most obesogenic neighbourhoods, thereby improving policy formation. SimObesity also has implications for policy evaluation, assessing the likely future impact of policy change at the local level.

Jodicus Prosser, Texas A&M University. Email: wayneprosser@yahoo.com; *Bigger Eyes in a Wider Universe: The American Understanding of Earth in Outer Space, 1893-1941.*

Astronomers, who have access to large telescopes, strongly influence the way others imagine the structure of the universe and the location of Earth in the cosmos. Their theories, drawings, photos, and interpretations are privileged and have become the dominant force in shaping the accepted view of the universe. This paper traces the history of American astrography (attempts to draw and explain the structure of outer space) between 1893 and 1941. Cartographic representations of outer space, popular science and astronomy journal articles, annually published atlases, newspapers, and astronomy textbooks are analyzed to reveal the American understanding of outer space. During the study period, the accepted position of Earth's physical location in the cosmos changed from near the center of a modest stellar system to the edge of a large and remote galaxy in an endless sea of similar galaxies. Three alterations within the cultural landscape of the United States provided the catalysts for this change. First, the acquisition of funds by astronomers from wealthy individuals allowed the development of larger, more sophisticated telescopes. Second, the movement of the base of astronomical research from America's core region to California allowed for new concepts and invoked new imaginings. Third, the introduction of overarching scientific theories, such as Einstein's "relativity", fostered conformity within the community of astronomers. These socio-cultural changes led to a widely accepted and radically new understanding of the universe.

Jesse S. Proudfoot, Simon Fraser University. Email: jproudfoot@gmail.com; *Interviewing Enjoyment: The Limits of Discourse in Psychoanalytic Methods*

This paper addresses the issue of how psychoanalytic methods and concepts can be used for conducting and analyzing unstructured interviews with research subjects. Drawing on my work as a research assistant over the summer of 2006, I discuss the process of conducting over 50 interviews with soccer fans attending

televised broadcasts of World Cup soccer matches in café spaces in Vancouver, British Columbia. Using questions designed to examine people's feelings about nationalism, ethnic identity, and consumption habits related to the World Cup, the research aimed at understanding how the Lacanian conception of enjoyment can be used to work through these concepts. Reflecting on the interview process, this paper discusses the inherent difficulties in capturing enjoyment through interviews and argues that enjoyment is best understood as intrinsically extra-discursive in that the loop of enjoyment breaks down when articulated and represented through speech. I argue that psychoanalytic approaches and methods which attempt to grasp enjoyment must therefore be attentive not just to how subjects represent their enjoyment through discourse but also to the spaces of tears, ecstatic chanting, and celebration which characterize the performance and enactment of enjoyment itself.

Erik Prout, Texas A&M University. Email: prout@geog.tamu.edu;
Republicanism, Rurality, and Texanité: county courthouse squares of Texas

Rural courthouses and their surrounding squares or plazas are often the commercial and social centers for their counties, but the actual sites contain numerous historical monuments and markers that can be interpreted for their political meanings. The State of Texas has recently appropriated significant funds for the preservation of county courthouses. Primarily, the funds are dedicated to the buildings as historical landmarks. Nevertheless, this in turn is fueling a reassessment and engagement with the past through landscape changes. New monuments and landscaping schemes are appearing in the square or plaza, which alter the immediate spaces around the courthouse. Three elements stand out: the identification of Republican partisanship, of rural folksiness, and of Texas chauvinism. I document and interpret these changes in the context of iconography and visual inventories for these landscapes. Preservation of county courthouses in Texas is providing an opportunity for communities to represent themselves in terms of actual landscape artifacts as well as engage in symbiotic representation.

Keywords: iconography, courthouses, rural Texas

Scott Prudham, Associate Professor, University of Toronto. Email: scott.prudham@utoronto.ca; *Hybrid Neoliberalism or Small Scale Socialism: What is Community Forestry Exactly?*

In 1998, the provincial government of BC introduced a pilot program to experiment with community forestry tenures. These are small area and volume-based tenures awarded to community groups, some of them First Nations, based on submitted proposals. Initially, seven proposals were approved and awarded 5 year licenses. The program has since been renewed, and the length of tenures has been extended. However, even a cursory review of these proposals indicates considerable diversity regarding the approach to community forestry undertaken by community groups and approved by the Ministry. This only confirms what many have been saying about community forestry, and community natural resource management for some time; CBNRM programs are politically ambiguous, and "community" is a vague word. Much depends on the specific relationships between local, regional, and national level states and civic groups, but also how the word "community" is actually interpreted and put into practice in the realms of forest management practices, forest governance, and forest commodity production. In this paper, I examine proposals obtained via Freedom of Information requests to evaluate the diversity of ways that community groups are operationalizing community forestry in BC. I use this to comment on how we can appraise this and other programs like it.

Michael Pryke, Open University, Senior Lecturer. Email: m.d.pryke@open.ac.uk; *'Total market vision': the application of visualisation software to financial markets*

The world of modern finance is awash with data. These data range from official figures published by the likes of the Federal Reserve and the IMF, real-time market data from market exchanges such as Chicago Board of Trade, to news and market reports supplied by 'secondary economy' suppliers such as Reuters and Bloomberg. The data relate to market fundamentals and variables that constantly worry 'the markets'. In effect the data flows reduce a host of spatialities and temporalities to supposedly easily digestible numbers that stream into financial organizations and which may then be acted upon by calculative agencies. Yet while the growing availability of market data has benefits it creates another problem: how to make sense of such continuous flows - how to see the 'market' and the future. The solution lies, supposedly, in the design and application of visualisation software. Based on recent interviews with those involved in developing and using the latest visualisation software, this paper adopts a cultural economy of finance perspective to examine the implications of this cutting edge innovation and suggests how visualisation techniques empower modern finance with fresh eyes designed to interpret and manipulate data and

thus to enable participants 'to see more and understand faster'. The visualisation of financial data not only raises issues about the visual in cultural economic debates about the preparation and workings of financial markets, it is, as the examples in this paper argue, central to understanding how finance gains its latest power to spatialise.

Because of natural and anthropogenic processes, Earth's surface features frequently change their state at a range of spatial and temporal scales. Therefore, timely and accurate change detection of Earth's surface features provides us with the foundation of understanding relationships and interactions between human and natural phenomena to better manage and use resources. For monitoring and controlling the extent and intensity of an invasive species, in this paper, a direct multi-date image classification method was applied in invasive species (saltcedar) change detection in the study area of Lovelock, Nevada, with multitemporal Compact Airborne Spectrographic Imager (CASI) hyperspectral data sets. Two types of hyperspectral CASI input data and two classifiers have been examined and compared for mapping and monitoring the saltcedar change in the study area. The two types of input data are all two-date original CASI bands and 12 principal component images (PCs) derived from the two-date CASI images. The two classifiers are an artificial neural network (ANN) and linear discriminant analysis (LDA). The experimental results indicate that (1) the direct multitemporal image classification method applied in land cover change detection is feasible either with original CASI bands or PCs, but a better accuracy was obtained from the CASI PCA transformed data; (2) with the same inputs of 12 PCs, the ANN outperforms the LDA due to the ANN's non-linear property and ability of handling data without a prerequisite of a certain distribution of the analysis data.

Jasbir Puar, Rutgers University. Email: jpuar@yahoo.com; *Biopolitical Intimacy*

The 2003 Lawrence and Garner v. Texas ruling that decriminalized sodomy in the U.S. has been hailed by many queer theorists as a victory and an incitement to other kinds of policing and regulation of sexual subjects by other commentators. However the impact of Lawrence-Garner will be rendered most forcefully not only in terms of the sexual subjects it liberates, but also in terms of the spatial politics of race and racialization it imposes or reinforces (through explicit and implicit mobilization of homophobic-racist stereotypes). Thus this 'new regime of heightened regulation of homosexuality' (Nan Hunter) must be understood in conjunction with, not separate from, profiling, surveillance, and information technologies currently in use. Considering the contemporaneous consolidation of a new racial population, implicating Arabs, Muslims, and South Asians and those 'mistaken' for them (perhaps most aptly termed 'terrorist-look-alikes'), the impact of Lawrence must be examined in the context of this intensely-charged racial atmosphere which persists in redefining again and again the contours of racial markings not only in relation to a dominant white American formation, but also amongst people of color themselves. If we examine the re-spatialization due to government practices of indefinite detention, there is both a perverse homosexual othering at work in the construction of the terrorist detainee, as well as a vast widening of the gulf that

fissures heterosexuality and heteronormativity.

Keywords: sexuality, detention, sodomy

jpuhalla@missouristate.edu; Notes from the field: Combining Research and Service Learning in Tanzania

The purpose of the field course was for the students to experience first hand sustainable development and conservation issues in Northern Tanzania. The field study was an extension of a semester long course on Sustainable Development and Conservation in East Africa. Students spent two weeks in Tanzania learning about conservation and wildlife issues, and education, health, and livelihoods of the Maasai in Northern Tanzania. To make the trip more interactive with the local community, students participated in an organized one-day service learning project at an elementary school, conducted personal interviews of the staff working at an eco-tourist/community based retreat, and made visits to a local school and hospital. Students were required to complete research on a previously chosen topic and to submit a reflection journal of their experience at the end of the trip. The outcome of student learning as shown in their research projects and journals will be presented. Comments from student journals reveal that the service learning component and interaction with the local communities clearly made an impact on the students' perception of sustainable development and wildlife conservation issues.

Nancy Hoalst Pullen, Kennesaw State University. Email:

npullen@kennesaw.edu; Robert F Stallard, PhD, USGS. Email: rstallard@colorado.edu; Correlating tropical soils to soil hydrology: A fine-scale approach

Many tropical soil hydrology studies use augured holes in identifying saturated hydraulic conductivity (Ksat) rates of soils, but few if any studies have examined the soils removed from these augured holes, or any potential relationships between the soils and Ksat. In determining the fine-scale patterns and correlations between soil properties and Ksat rates, three permanent Center for Tropical Forest Science (CTFS) Forest Dynamics Plots (FDPs) were used for this study. Within each plot, 20-40 soil samples were collected, with four samples per Ksat augured hole (0-40cm depth, 10cm increments). These soil samples were later analyzed for physical (grain size, color, etc.) and chemical (pH, K, P, etc.) properties. Correlations between soil properties and Ksat varied widely among sampling sites and forest plots. In the Ecuadorian plot, limited vertical movement of water was directly linked to an impermeable clay soil layer at approximately 15cm depth. In the Malaysian plot, soil properties were highly variable and occasionally contradictory when compared to the Ksat measurements. In the Panamanian plot, topographic position influenced both Ksat and soil properties, with steep gradients promoting physical rather than chemical weathering, and flat regions showing increased Ksat rates with depth. As suggested with concurrent studies in Panama and Ecuador, these fine-scale patterns and correlations between soils and soil hydrology are in part the antecedent conditions influencing numerous non-random spatial distributions patterns of tropical plant species.

Lydia M. Pulsipher, University of Tennessee. Email: lpulsiph@utk.edu; Firewood, Flexibility and the Oil Crisis in a Slovene Village, Summer, 2006.

Slovene villages are no longer populated by farmers; they are full of bureaucrats and professional folk who arise early and roar off in fine cars for the 45 minute drive to the capital city. There they put in 8 hours or more and then drive home, where in summer they enjoy a bit of gardening, often some conversation, a drink or two, and maybe a light impromptu meal on a neighbor's patio. Typically they do not spend their summer evenings and weekends slicing up 30-foot tree trunks with chain saws, splitting logs, stacking the wood and trundling a cord or three into the basement. But in the summer of 2006, this is exactly how the people on Prešernova ulica, male and female, young and old, fit and decrepit, spent every spare moment for about three weeks. The catalyst was extra high heating oil prices. Were these people engaged in what theorists might term a classic case of household flexibility — a rapid, agile, defensive response to changing external circumstances? Or, in this affluent post-Communist society, was the fuel emergency perhaps a surreptitiously welcomed event that allowed parents to show children and each other how to survive in hard times, maybe even how to be flexible, as was essential in the old days? And what are the physical and social contexts that enabled ubiquitous access to so much wood? This paper will examine this set of circumstances through the lens of flexibility theory.

Edward Pultar, University of Utah. Email: Edward@EdwardPultar.com; EDGIS: A Dynamic GIS Based on Space Time Points

This paper presents a new method for implementing a dynamic GIS built on a fundamental concept known as a Space Time Point (STP) or Geo-atom. STPs are defined by their location, attributes, and time. A geo-atom can be formalized as the tuple: where x is a vector that defines a point in space-time (e.g. a four-dimensional point with values), Z is an attribute or property, and $z(x)$ is the specific attribute value at that point in space-time for the attribute Z . Objectives of this research include: 1. Develop a dynamic GIS based on organizing STPs into objects with ascribed identity. 2. Design a novel and intuitive dynamic GIS interface that is easy to use. 3. Develop new data structures and algorithms to support rapid query and retrieval of STP-based dynamic geographic representations. This framework is implemented as a Java program called Extended Dynamic GIS (EDGIS). Sample dynamic GIS scenarios have been created and tested using this system. The user is able to perform spatiotemporal queries on real-world data given a location in (x, y) coordinates, attribute, or time. If a query matches data in the current scenario then appropriate results are returned. EDGIS provides a way to handle dynamic GIS scenarios such as those containing moving objects with dynamic shape and internal variation through use of dynamic attributes. EDGIS does not solve every dynamic GIS representation problem (e.g. vector), but it provides an implemented software solution for representing, querying, and visualizing dynamic geographic phenomena.

Different models of hierarchy of sizes and urban growth distribution in systems of cities have multiplied recently. A high quality of data sets is required for testing these models. We propose here a method for reconstructing consistent and comparable harmonised data bases on the long term evolution of urban systems. The political or administrative definitions of a city are not sufficient to follow the spatial expansion of urban entities. For delimitating them over historical times, we use successively the concepts of urban agglomeration then daily urban system, adjusting the criteria according to changes in transportation speed and suburbanisation. Applications are made on France, Europe and United States from 1800 to 2000 (population data at all census dates). Several models of city size distribution and urban growth are experimented on these data. Besides the well-known significant differences in the historical morphogenesis of the settlement systems, we find meaningful contrasts in the hierarchical and spatial patterns. Despite these different morphogenetic configurations, the systems exhibit very similar patterns in the distribution of urban growth, which can be adjusted by a three parameters adaptation of Gibrat's model. According to the results, we explore if a convergence in the evolution of the European and American urban systems towards less or more urban concentration can be expected.

Bharat Khushal Punjabi, University of Western Ontario. Email: bpunjabi@uwo.ca; Agrarian change in the urban periphery: The politics of the commons and the dilemmas of class mobilization in the Mumbai countryside.

The growing critical literature in human geography on Indian cities tends to underemphasize the nexus of the politics and political economy of the urban and the agrarian questions. In the Mumbai context, such interconnections manifest in the growing mobilization of small and marginal farmers around livelihood issues in the northern and southern hinterlands of the Mumbai metropolitan region. As farmers in Raigad and Thane districts face intense difficulties with rampant land acquisition for industrialization, and irrigation water shortage - two lower caste communities, the Kunbis and the Agris, which are present in significant numbers in the region have now come together and are attempting to forge a common political platform on agrarian issues. These two caste groups which are now in alliance with the Communist Party of India (Marxist) - which in turn is a political force in the tribal areas have demanded access to irrigation water from reservoirs in both districts, redistribution of agricultural land, and access to industrial employment. These developments indicate some tentative moves towards "class unity" in the region against the nexus of state, agrarian capital, urban property developers and a predatory form of industrial capital. Largely based on field work in the summer of 2006 on the politics of water in Thane district, my presentation will also offer a critical evaluation of the farmers' movements and political economy literature of India.

Mark H. Purcell, University of Washington. Email: mpurcell@u.washington.edu; *Neoliberal Governance and Democratic Resistance: Seattle's Duwamish River Cleanup*

This paper is set in the context of the ongoing neoliberalization of urban governance. However, the goal of the paper is not to analyze that process, but to explore ways we might resist it. I suggest that democratic social movements are one promising way to build such resistance. The paper offers a case study of one such movement in Seattle, one that is working to democratize the Superfund cleanup of the city's main river. An alliance of disparate interests called the Duwamish River Cleanup Coalition (DRCC) is struggling to articulate and realize a vision for the river basin that sees it not as property to be owned and exchanged, but as a complex environment that is inhabited by both humans and non-humans. Rather than neoliberal governance that tends toward a closed process dominated by elites and experts, the DRCC is inventing creative new ways to meaningfully involve a range of community groups in Superfund decision-making. The upshot of the case is that actually existing neoliberal governance in cities is complex and contextual. While neoliberal practices very clearly pose daunting impediments to democratic participation, they also always leave open (and sometimes create) opportunities for democratic resistance. Such resistance is best undertaken by broad and coalitional social movements that can articulate a clear alternative to neoliberal values, both in terms of how we make political decisions and how we value urban space.

Tracy Purdum, California State University Northridge. Email: tracy74656@hotmail.com; *Classification of hyperspectral imagery for geologic mapping*

Cutting-edge technology and satellite remote sensing allow for a new approach to geologic mapping. Advanced classification algorithms enable the distinction of lithologic units within hyperspectral imagery. This study examines the performance of support vector machine (SVM) algorithms for classifying geologic formations based on spectral data in order to delineate various lithologic units within the Panamint Range, California. SVMs performed class assignment for all pixels throughout an image based on user-provided training examples. Imagery was subsequently produced in which the extent and pattern of the lithologic units bore a strong visual resemblance to the existing geologic map of the region. Statistical analyses support SVM capabilities, which allows the conclusion that SVMs are strong candidates for future geologic classification studies on Earth and Mars.

Keywords: remote sensing, mapping, classification

Scott Pusich, University of Kansas. Email: spusich@hotmail.com; *The Territorial Base: A Geography of Ground-Up State-Building*

The current fashion among geographers is to see territory as an intellectual trap as it applies to analysis of states. Critical geopolitical analysis in particular focuses on "unpacking embedded discourses of power" while postulating a cosmopolitan, anti-territorial (flat earth?) utopia in which borders have vanished or become irrelevant. The aim of this paper is to "trouble" these notions and to construct a more realistic (those for whom this is troubling would say essentialist) model of geographic analysis of the phenomenon of territory, especially as it applies to the process of state-building. Territory remains the sine qua non of internationally recognized statehood. It is also an essential part of the political and cultural identities which provide the impetus for forming a state from the ground up, and which also provide borders, if not frontiers. The paper will demonstrate the counterintuitive notion that, indeed, more borders are better than fewer borders. Truly effective state-building is done by those who see themselves as citizens of the state in question or emergence. Such state-building is often achieved using the "ground-up" fragmented territorial pieces of a failing or failed state. The case of the former Yugoslavia will be used in combination with concepts from the work of Leopold Kohr, James Scott, and Jeremy Rifkin to show how a political world with two thousand states is both more logical and more moral than the political world of two hundred states we inhabit now.

Keywords: political geography, territory, Yugoslavia

Heather R Putnam, University of Kansas. Email: hputnam@ku.edu; *Meaning and Progress in the Fair Trade Network*

The messages presented to consumers in places of consumption about fair trade coffee force us to consider what falls within the realm of fair and what does not, as large corporations enter into fair trade. Different actors in the fair trade network assume varying interpretations of fairness. This creates confusion among consumers who must make choices about their purchases and within the fair trade network, in effect creating a movement without clear moral basis, opening it to possibilities of perpetuating postcolonial understandings, social relations, and trade geographies through a simplistic understanding of "helping" others in the global south, which is the dominant message found in places of consumption. I explore how the fair trade network that exists was not inevitable,

and has developed because of the convergence of geohistorical processes at different moments, and has resulted in certain dominant actors being mediators of meaning. I then analyze what the impacts are when the dominant meaning of a consuming place is imposed on producers, and whether unmediated exchange between consumers and producers in a fair trade agrotourism program in Nicaragua allows actors to identify common morality and goals. Using an analysis of marketing propaganda, participant-observation experience, and surveys and interviews of actors within the Fair Trade coffee network, I find that when direct contact occurs between consumers and producers in Matagalpa, consumers preserve their understanding of fair trade, cooperative members experience changed perspectives and practices, and savvy cooperative leaders exploit that dominant meaning in positive ways to further their cooperative's development.

James Pytko, . Email: pytko1ja@cmich.edu; *Geographic Information System Habitat Modeling for the Northern Orchid *Calopogon tuberosus**

In Michigan, all fifty one native orchid species receive special protection by the Department of Natural Resources, unfortunately these populations are ephemeral by nature and difficult to locate when they are not in bloom making conservation planning necessary, but difficult. The grass pink orchid, *Calopogon tuberosus*, is relatively common and is typical of the northern bog and northern cedar swamp habitats. A successful geographic model of this species in northern Michigan will lead to models of rarer species that are in need of stewardship. Using the raster data model and a weight scoring system derived from previous research, data layers of land cover, slope, aspect, soil content and inclusion on the State Wetland Index were combined to yield a statistical probability grid for locating the target species. After calculation, the data was converted to vector, classified and spatially joined to the township/ranges of the study area using the averaging option, producing a probability score for each township/range. This model output was then correlated to historical data collected from herbarium records. The success or failure to correlate to the historic data was then used to determine the level of success and modify the mathematical operation and composite layers in order to produce better accuracy for use in further conservation planning of these uniquely northern habitats.

Keywords: data model, orchid, conservation

Feng Qi, UT-San Antonio. Email: feng.qi@utsa.edu; A-Xing Zhu, UW-Madison. Email: azhu@wisc.edu; *Geographic Knowledge Discovery Based on Prototype Theory*

Much effort has been taken in knowledge discovery for geographic classification and category extraction. Previous studies have been limited to extracting categories with definite boundaries and uniform memberships within class boundaries. This paper presents a framework for representing and extracting knowledge for categorizing geographic entities with fuzzy boundaries. The framework is based on prototype theory and consists of three components: (1) a knowledge representation scheme that capture the prototype effects of geographic categories, (2) a knowledge discovery procedure that enables the extraction of knowledge in such representation, and (3) an inference scheme that uses the extracted knowledge to classify geographic entities while maintaining the prototypical properties of the resulting categories. Three data mining approaches are implemented to populate the framework. A case study on knowledge discovery for fuzzy soil mapping shows that knowledge for classifying geographic entities with fuzzy boundaries is embedded in geographic data sources such as area-class maps and can be extracted under the framework. Such knowledge, represented in a way that is cognitively sound, captures not only the typical characteristics of the classes, but also within-class variations and transitions between classes.

Poyang Lake, located in Jiangxi province and connected to the Yangtze River, is the largest fresh water lake in China and has important impact on the mid-lower Yangtze River watershed. During the last 50 years, the ecological environment of Poyang Lake has been degenerated which caused natural disasters, frequent flooding, soil erosion, drought, and schistosomiasis. To better understand the environmental and ecologic changes of wetlands in the Poyang Lake region, we apply RS/GIS techniques and mathematical modeling in a study of the flooding, soil erosion and land use and land cover changes (especially the vegetation cover) with a discovery-driven approach aimed at understanding the interrelationships between flooding, land-cover and land-use change (LCLUC), ecology and human environment. The context of the project is the broader fields

of land-change science and sustainability science that seek to evaluate the complex interactions between environmental variability and human activity at multiple space and time scales.

Keywords: LCLUC, Wetland, Poyang Lake

Xiaojun Qin, Louisiana State University. Email: xqin2@lsu.edu; *Creating an Information Management System for Emergency Situation*

There are several industries located in the city area, and because of the high possibility of terrorism attack and other emergency situations. Evacuate the residents living surrounding the troubled industry in a short time period is necessary. The precondition to fulfill this task is to get the accurate information for the whole affected area. This project tries to create an information management system for the emergency situation. The provided information includes the affected residents, the major evacuation road available, the shelters available, the nearest fire stations. With these information, the governors can make the decision of how many police officers should be sent there and can allocate the residents to the nearest shelters available.

Keywords: GIS, information database, decision making

Fang Qiu, Dr., University of Texas - Dallas. Email: ffqiu@utdallas.edu; Shaofei Chen, University of Texas at Dallas. Email: shaofei.chen@utdallas.edu; *Multidimensional Spatial Interpolation: A Comparative study*

Spatial interpolation is the process of estimating the value of an attribute for a continuous surface at unsampled sites from a set of observed values within the same area. A number of spatial interpolation methods widely available in most GIS software, such as splines, Kriging, inverse distance weighted (IDW) and trend analysis only take the two-dimensional (i.e. longitude and latitude or easting and northing) horizontal locations of the sample points into consideration. However, climatic attributes, such as temperature and precipitation, for example, are often a function of the three or more dimensional effects (e.g. longitude, latitude, elevation). In this paper, we employed four different novel quantitative techniques, namely multidimensional IDW, artificial neural network, co-kriging, and geographical weighted regression (GWR), to incorporate three or more variables into the spatial interpolation process. These multidimensional interpolation techniques were used to estimate the Annual Temperature in the Northeast United States. Their interpolation accuracy is evaluated based on root mean square error obtained by both validation and cross validation methods. Estimation error variance and fractal dimension were also employed to assess the estimation uncertainty and stability. The results of the four new techniques are compared with each other and with those of two-dimensional interpolation approaches. It was shown that the incorporation of the dimensions beyond longitude and latitude improved the accuracy of traditional two-dimensional techniques. However, the improvements of the four new techniques are varied, suggesting that each method has its own advantages and there is no technique that is always better than others.

Keywords: Spatial Interpolation, Co-Kriging, GWR, Neural Network

Hong-Lie Qiu, California State University, Los Angeles. Email: hqiu@calstatela.edu; Baoguo Li, Prof., China Agricultural University. Email: libg@cau.edu.cn; Lichun Ma, China Agricultural University. The ear-shaped surface feature in the eastern end of Tarim Basin was revealed by satellite remote sensing in early 1960s. This mysterious phenomenon has attracted many attentions from scientists and the general public. The concentric rings that make up the "Great Ear" are believed to be the former shorelines of Lop Nur, the terminal lake of a huge inland basin, and they represent a period of increasing dryness in the region. However, information on these former shorelines and their ages are sparse and incomplete, making it difficult to reconstruct the history of the Lop Nur Lake. This paper re-examines the features related to former shorelines based on all available satellite images, ground investigation data, and digital elevation models. The existence of baymouth sand bars, shoreline cliffs, river inlets, and extensive salt crust suggests that Lop Nur was once occupied by a huge lake (approximately 10,000 square kilometers). Digital terrain models derived from Shuttle Radar Topography Mission (SRTM) data were used to estimate the extend and volume of this large ancient water body. Although the exact timing and duration of this high water period are yet to be determined, it is clear that the Tarim Basin region experienced a period of wetter climate in the past.

Keywords: Lop Nur, Tarim Basin, Climatic Change, Inland Basin

Xiaomin Qiu, . Email: xq1001@txstate.edu; *Potential Habitat for the Endangered Houston Toad*

The Houston Toad is a small endangered amphibian in Texas. Habitat loss and alterations are the main reasons for the endangerment of this species. A spatial analysis was performed to identify potential areas composed of oak or pine savannah and clearings of less dense shorter grasses within one mile of shallow, slow moving water, and loose sandy soils.

Keywords: Houston Toad, spatial analysis

Youliang Qiu, University of Florida. Email: qiuy1@hotmail.com; *Integrating AJAX to Distributed GIS Visualization*

Geospatial data is naturally provided by different providers with different formats. To integrate and share of heterogeneity spatial data, some specifications such as Open Geospatial Consortium (OGC) standard and methods such as web service, have been introduced to solve the geo-spatial interoperability and common data format problems. However Geographical Information System (GIS) still has problems related to performance and interoperability, especially for web-based data mapping and visualization. As the Web platform continues to mature, AJAX (Asynchronous JavaScript and Xml) is an important web development model for web-based application that makes Geographic Information Systems (GIS) visualization applications to new levels of power and usability. In this paper, AJAX approach is integrated to a web-based vector GIS mapping service to visualize Thailand economic, social and environmental data in a generic and performance efficient framework. This architecture offers advanced reasoning on metadata, keeps the services and data up-to-date with dynamic information update service. The efficient user interface hides complexity of data from users with seamless integration of visualization and data with good performance and efficiency.

Keywords: WebGIS, AJAX, Visualization

Addie Louise Qualey, University of Maine Farmington. Email: addie.qualey@maine.edu; *A Spatial Study On The Distribution Of Registered Sex Offenders In The State Of Maine, Rural Versus Urban.*

National and state private organizations have plotted the domicile of sex offender registrants on maps for several states. Those maps have then been distributed either on the internet or in hard copy. Private organizations have mapped the registered sex offenders in the state of Maine, but none of those efforts or maps take into consideration the demographics of the region. This research examines the rate of registered sex offenders as a proportion of the population in the state of Maine, by town and township. It also inspects whether there is a higher rate of offenders in rural versus urban Maine, using a spatial distribution model. This model examines possible correlations between the location of offenders with respect to age and gender, displayed through maps created using GIS software.

Keywords: spatial distribution, sex offenders, Maine

Email: jxq1@cdc.gov; *Environmental Public Health Surveillance for Exposure to Respiratory Health Hazards: A Joint NASA/CDC Project to Use Remote Sensing Data for Estimating Airborne Particulate Matter Over the Atlanta, Georgia Metropolitan Area*

As part of the National Environmental Public Health Tracking Network (EPHTN) the National Center for Environmental Health (NCEH) at the Centers for Disease Control and Prevention (CDC) is leading a project called Health and Environment Linked for Information Exchange (HELIX-Atlanta). The goal of developing the National Environmental Public Health Tracking Network is to improve the health of communities. Currently, few systems exist at the state or national level to concurrently track many of the exposures and health effects that might be associated with environmental hazards. An additional challenge is estimating exposure to environmental hazards such as particulate matter whose aerodynamic diameter is less than or equal to 2.5 micrometers (PM_{2.5}). HELIX-Atlanta's goal is to examine the feasibility of building an integrated electronic health and environmental data network in five counties of Metropolitan Atlanta, GA. NASA Marshall Space Flight Center (NASA/MSFC) is collaborating with

CDC to combine NASA earth science satellite observations related to air quality and environmental monitoring data to model surface estimates of PM_{2.5} concentrations that can be linked with clinic visits for asthma. While use of the Air Quality System (AQS) PM_{2.5} data alone could meet HELIX-Atlanta specifications, there are only five AQS sites in the Atlanta area, thus the spatial coverage is not ideal. We are using NASA Moderate Resolution Imaging Spectroradiometer (MODIS) satellite Aerosol Optical Depth (AOD) data for estimating daily ground level PM_{2.5} at 10 km resolution over the metropolitan Atlanta area supplementing the AQS ground observations and filling their spatial and temporal gaps.

Email: cw2036@columbia.edu; Does Park Access and Park Quality Predict Adult Obesity in New York City?

Despite growing evidence that the built environment may influence body size, we know little about the role that park access and park quality plays on physical activity in large, densely settled cities, where parks are the primary means for public access to the outdoors. We examine the relationship between park access, park quality, and bodyweight for a sample of more than 13,000 healthy adult residents of New York City. A Geographical Information System model was built connecting subjects and individual covariates to data on neighborhood characteristics including built environment and sociodemographic measures. Park accessibility was defined by GIS-derived network distances to park access points. Park quality measures were based on data from the New York City Department of Parks and Recreation's Parks Inspection Program. This program rates parks for sixteen measures, grouped into three domains: cleanliness (litter, graffiti, broken glass, weeds), structural features (sidewalk quality, paved surface, benches, fencing, play equipment, safety surface in play areas) and landscape features (lawns, trees, horticultural areas, athletic field, water bodies, trails). The analysis uses multilevel modeling to test our hypotheses that aesthetically-pleasing characteristics and access to recreational facilities are associated with higher levels of physical activity and lower body size. Drawing on an extensive dataset with a high degree of spatial precision as well as unusually detailed and objective measures of park quality, the research informs the empirical literature relating the built environment and obesity as well as policy measures to improve park access.

Keywords: GIS, Urban Geography, Obesity, Park Access, Park Quality, New York City

Sarah-Louise S Quinnell, King's College London. Email: sarah-louise.quinnell@kcl.ac.uk; Politically & socially modified: A critique of the construction of the GM debate in Sub-Saharan Africa

Persistent poor agricultural production and rising food insecurity in Sub-Saharan Africa have brought into sharp focus the role of modern agricultural biotechnology in human development. Growing food insecurity in a number of countries including Ethiopia, Kenya, Malawi, Mozambique, Zambia and Zimbabwe have stimulated political, press and public attention on genetic engineering and its associated risks and benefits from around the world - particularly in relation to the 2002/3 food crisis in Southern Africa. Considerable space in the debate is often taken up by groups of non-governmental organisations (NGOs) opposed to GMOs and purporting to speak for the African rural poor and (conversely) groups of scientists who espouse the benefits of the new technology for the poor. It is unlikely that the two groups - anti and pro GMOs have the attention of millions of farmers in Africa. Research has illustrated that the general public and farmers in particular are not informed about the nature of this new technology, its benefits or risks, and rarely do they participate in deciding on what crops or problems biotechnology should be focused upon. Taking the 2002/3-food crisis in Southern Africa as a starting point this paper examines the framing and construction of the agricultural biotechnology debate in Sub-Saharan Africa. Drawing from both international and internal press coverage of the issue alongside interviews with relevant stakeholders this paper looks at the political, social and media framing of the GM debate in Sub-Saharan Africa and its impact upon the development of new technology and appropriate regulation.

Margarita Quinones, . Email: margaquinon@yahoo.com; Mapping the Sourcepoints of Homelessness in Los Angeles County

The latest estimative for the number of homeless in Los Angeles County has dramatically reached high quantities. The most recent report from Los Angeles Homeless Service Authority (LAHSA, 2006) estimated the number of homeless to be 82,291 at a given point in time during 2005. This high number has taken the attention of majors and policy makers leading to new strategies and policies to help this sector of society. These policies include the creation of new shelters and housing alternatives. According to the LAHSA report 78% of the homeless people in Los Angeles County had been living in the area at the time they became homeless. To this end, this research addresses the areas in Los Angeles County that generate homeless and recommends the best zones to locate new homeless services based on sourcepoints and current availability. The methodology for this paper consists first in establishing and comparing the homeless services and others public services spatial distribution and second identifying and mapping the sourcepoints of homelessness. These areas will be determined through a survey conducted in the two biggest concentrations of homeless in the county. Preliminary findings from this research established that the homeless services follow a strong cluster distribution being Skid Row Los Angeles and the city of Santa Monica the biggest concentration areas.

Nicholas Quinton, University of Alabama. Email: kaquinton@yahoo.com; Gerald Webster, PhD, University of Alabama. Email: gwebster@bama.ua.edu; Differential Tax Levies and Retail Outlet Locations

A geographically elongated state, Tennessee can count eight other states as neighbors. Tennessee's tax structure relies almost solely on a general sales tax, creating significant contrasts in aggregate sales tax levies on goods purchased in retail outlets in close proximity to the border. Do businesses consider the sales tax implications associated with state borders in location decisions? Do consumers take variations in sales tax levies into consideration when deciding where to shop? Tennessee is a somewhat unique subject area for a study of the affect sales tax has as it relates to retail outlet locations. This paper examines the influences associated with the differential sales tax levies along this border as they relate to the location of retail sales outlets. Using the concepts of threshold and range, this paper examines the geographic distribution of furniture outlets, gas stations, food and beverage stores, building supply locations and general merchandise stores along both sides of the border. Preliminary analysis indicates differential sales tax rates do affect the decisions made in location of retail outlets.

Keywords: Tax, Retail Location, threshold analysis

Steven Quiring, Texas A&M University. Email: squiring@geog.tamu.edu; John Nielsen-Gammon, Texas A&M University. Email: n-g@tamu.edu; Monitoring Drought Conditions at the Local Level in the State of Texas

Drought (moisture) indices can be useful tools for providing information to decision-makers in business, government and to the public stakeholders. A large number of drought indices exist, each having a variety of data input requirements and each providing a somewhat different measure of drought. Some of the more commonly used schemes include the Palmer Drought Severity Index (PDSI) and Moisture Anomaly Index (Z-index), Standardized Precipitation Index (SPI), Rainfall Anomaly Index (RAI), Standardized Anomaly Index, Effective Drought Index (EDI), Surface Water Supply Index (SWSI), Percent Normal, Deciles, and the Normalized Difference Vegetation Index-based Vegetation Condition Index. The main objective of this research was to examine all the existing drought monitoring tools to determine which are the most appropriate for monitoring moisture conditions at the local level in the state of Texas. Results indicate that the most appropriate drought index depends on the intended application, specifically: the time-scale of interest, type of drought being monitored (e.g., meteorological, hydrological, or water supply), location, and spatial scale of the application. An objective methodology for developing meaningful drought thresholds was also developed.

Keywords: drought index, Texas, hydroclimate

Ellen Raabe, United States Geological Survey. Email: eraabe@usgs.gov; Lisa Robbins, U.S. Geological Survey. Email: ; Myra Schwarz, ETI Professionals. Email: ; Florida Shelf Habitat (FLaSH) Map Project Presents the World beneath the Waves

Spectacular views of earth from space have become commonplace on the Internet with new application tools, such as Google Earth. The Florida Shelf Habitat Mapping Project (FLaSH) website takes the concept of a bird's-eye view of the earth to the world beneath the waves. The FLaSH web pages invite exploration of the underwater world via Google Earth, bathymetric maps, underwater video, fly-through adventures, and resource tools. The viewer can visit the complex physical and biological world of the Florida Shelf and learn about the submerged terrain. Data for the Florida Shelf originates from many

sources, dates, and formats. A multi-agency effort is underway to coordinate and prioritize the compilation of suitable data sets for an integrated information system of Florida's coastal and ocean resources. Water quality, fishery sustainability, sea level and climate change impacts, and economic issues drive the need for enhanced public awareness of the environment that surrounds, supports, and shapes our coastal communities. The FLASH website places existing data in a user-friendly environment and within the larger context of the Florida Shelf. Accessible data, presented in a geographic context, offers citizens, managers, and scientists an opportunity to visualize coastal resources and to consider options in resource management.

Keywords: Florida Shelf, map, marine habitat, bathymetry, Google Earth, resource management

Mike Raco, King's College London. Email: mike.raco@kcl.ac.uk; *The Politics and Practices of Waterfront Development in a Global City: The Case of Paddington Basin*

This paper draws on a two-year, in-depth study of the politics and practices of urban regeneration in Paddington Basin, West London. Since the late 1980s the Basin has played an important symbolic role as a development that could not only help to regenerate some of the most deprived parts of the city but also play an important strategic role in helping London to attract high level national and international capital investors. The chapter argues that the area's connections to Heathrow Airport, its proximity to the West End of London, and its recent designation as one of the London Development Agency's strategically significant Opportunity Areas have helped to boost its promotional appeal, often at the expense, or at least the marginalisation of, existing local groups. As developers and development bodies have looked to take advantage of its commercial potential community involvement has become primarily defined in instrumental terms. As such, the development illustrates and exemplifies some of the challenges and potential opportunities inherent in waterfront development projects in cities such as London and the tensions associated with the prioritisation of development objectives; the identification and mobilisation of rapidly changing communities; the complexity of partnership-building processes; and competing and contrasting conceptualisations of place and local-global inter-relationships.

Keywords: waterfront regeneration, community, London

Adina E. Racoviteanu, Institute Of Arctic and Alpine Research, University of Colorado- Boulder. Email: markw@colorado.edu; *Glacier and climate changes in Cordillera Blanca, Peru derived from SPOT5 satellite imagery: a contribution to the GLIMS Geospatial Glacier Database*

Changes in glacial area and extent over time are often conducted by comparing historical aerial photography with recent remote sensing imagery. However, several problems are encountered: old inventories from aerial photography often lack metadata and quality control; processing methods used to derive glacier outlines from satellite images are not standardized, leading to inconsistencies in the various datasets; previous glacier datasets are not in public domain. This makes the comparison of glacier areas at different times a difficult process, posing a need for standardized processing methods. Here we present a case study for Cordillera Blanca in Peru (8°30 S, 77°W). Climate control on glacier mass balance in this region is largely unknown. An extensive glacier inventory for this region was conducted using 1962 and 1970 aerial photography. The goal of this paper is to examine connections between short-term climate variability and glacier changes in Cordillera Blanca derived from remote sensing analysis. For the present study, we produced a new set of glacier outlines using 2003 SPOT5 satellite imagery. The dataset was stored in the GLIMS Glacier Database, maintained at the National Snow and Ice Data Center (NSIDC), Boulder. We compared glaciers from 2003 with the ones from 1962-1970 at the basin level to derive detailed glacier statistics and changes in glacier elevation and area. The classification of SPOT5 satellite images yielded 532 glaciers with a total area of 557.82 km². This represents a loss of 16 % when compared to the 1962/1970 inventory.

Sarah A Radcliffe, Cambridge University. Email: sar23@cam.ac.uk; *Marginal citizenship and group rights: the spatialised biographies of Ecuador's indigenous women leaders*

Indigenous women make rare and exceptional leaders by overcoming the disadvantages of domestic gender bias, poor educational provision in predominantly Indian areas, and nationalist discriminatory racial formations. Rather than elite 'lifepaths' (Anderson 1991; Daniels and Nash 2004), the paper examines subaltern ethnic women's engagement with a nationalist project. This paper

traces the spatial biographies of diverse ethnic women leaders in order to extend postcolonial theory's understandings of space and nation. As female indigenous leaders travel around Ecuador to take up education or work and to pursue political careers, they encounter diverse spaces within which their position as indigenous and female has variable meanings and consequences. Contributing to a personal process of politicization, these trajectories engage women in the contestation of ethnic agendas, feminist institutions, and household relations, while simultaneously contributing to the re-formation of multicultural nationhood and women's citizenship rights. In struggles over mobility and leadership, indigenous women enact and produce an embodied and spatialised performance of citizenship that speaks to the ambiguous and contradictory belongings offered by multiculturalism and gender rights. The paper draws on interviews with indigenous women from different ethnic groups and diverse political experiences, to explore how Ecuadorian nationhood is being reproduced through time and over space, in a highly differentiated territory and in the wake of the contradictory legacy of constitutional reform that established ethnic rights and gender rights separately.

Keywords: Ecuador, indigenous women, mobility, citizenship, multiculturalism

Nancy Rader, California Wind Energy Association. Email: ; *The Promise of California Wind in Addressing Climate Change*

The potential exists for wind energy to serve 20% of California's electricity needs by 2020 (up from 1.5% today). This presentation will discuss the wind resource potential, economics, grid integration and environmental impacts of wind energy, and the policy actions that are required for wind to achieve the 20% California target.

Steve Radil, University of Colorado at Colorado Springs. Email: sradil@uccs.edu; *Remaking the Enemy: Elastic Definitions of Terrorism and the Rhetoric of 'Ecoterrorism' in the US.*

In the post-9/11 'war on terror', the language and rhetoric of 'terrorism' have been expanded to include environmental groups engaged in sabotage?often called 'ecotage'?against property and objects thought to be representative of or complicit in environmental damage. In fact, groups engaging in this type of activity, such as the Earth Liberation Front (ELF), have been identified as the leading domestic terrorist threat in the US by the FBI despite the fact that no person has ever been killed or suffered physical injury by this type of politically-motivated resistance. A careful examination of the definition of terrorism reveals a significant difference between genuine terrorism, where actors purposely ignore moral limits against inflicting physical harm, and environmentally-motivated sabotage, where deliberate care is taken to avoid inflicting physical harm. Although any intentional destruction of property is certainly illegal, conflating environmentally-inspired sabotage with the peculiar moral evil of terrorism erodes differences between terrorism and all other kinds of politically-inspired resistance. The transformation of 'ecotage' into 'ecoterror' allows the rhetoric of terrorism to strip away potential public support for environmental issues and to diminish the possibility for environmentally-inspired social change.

Keywords: terrorism, ecoterrorism, ecotage, environment, political resistance

John Radke, GISC, University of California - Berkeley. Email: ratt@gisc.berkeley.edu; *Establishing Better Approximations of Boundary for Geographic Information Retrieval in Online Documents*

A web search to geographically retrieve information almost always involves the use of named places that may or may not have a well-defined boundary or for which boundary data is not available. Yet, in most instances, a boundary is what we seek. For example, Environmental Impact Reports are based on a geographic region and although they often contain maps bounding that region, for the most part, when they exist in digital form, the place names embedded in their text are the only searchable geographic reference. Since it is not practical to visually browse text or maps in each online document to determine if it contains relevant data that would satisfy one's search, we propose an automated data-mining tool that provides an effective means to bound and retrieve relevant data. The simplest, most conservative and most widely used structure to map the spatial extent of a set of place names is the minimum bounding box. Although an efficient retrieval metric, it is likely rare that the bounding box accurately delineates the spatial extent of place names in a document. Although the convex hull offers some improvement, delineating concavity in polygonal representations promises higher precision in spatial matching. We introduce and automate a spatial decomposition algorithm, a variant of an alpha shape, which automatically delineates concave geometric approximations and better bounds, spatial extent and shape in online documents with geographic references.

Keywords: Geographic data retrieval; spatial search; boundary; neighborhood; minimum bounding box; convex hull; spatial decomposition; alpha shape

Pauliina Raento, University of Helsinki. Email: pauliina.raento@helsinki.fi; *Materializing Europe*

The enlarging European Union faces the challenge of fostering a common sense of European identity among the increasingly diverse population living in its territory. In this task of promoting “European values” and an “imagined community” of Europe, the EU employs the methods of “banal nationalism,” as described by Michael Billig in his influential, similarly titled book. The emphasis in the “flagging” of a supranational “nation” is strongly on popular material culture and visualization. My presentation exemplifies how the European Union’s ideals of “Europe” are materialized as identity-promoting consumables in quotidian landscapes within the EU and especially in its capital city Brussels. Observations and artifacts collected from the field show how a political identity project meets consumerism, as citizenship education encourages voluntary consumption of identity-politically themed merchandise, entertainment, and free promotional material. Not only is the European Union built from the top down with official symbols (currency, flags, license plates, cartography), but also from the bottom up, as ordinary people willingly pay for the flagging of “Europe” (souvenirs, collectables, comic books, a theme park). In the spirit of individualistic post-modern consumer societies, straightforward propaganda takes the form of participatory persuasion and seeks to disguise an evident strategy and socio-economic class hierarchies.

Keywords: EU, banal nationalism, identity politics, material culture, visual culture

Parvati Raghuram, The Open University. Email: p.raghuram@open.ac.uk; *Beyond the ‘Brain Drain’ impasse: spatial ontologies and temporal configurations*

The migration of health professionals has been accompanied by politically and morally charged discussions on the effect of such migration on the health of those left behind. The critique of ‘brain drain’ migration has sparked a flurry of initiatives to limit the amount and the impact of such mobilities. In the UK, the National Health Service, which has long been dependent on overseas migrants, has responded to critics accusing them of ‘poaching’ health professionals with a range of measures to limit health worker mobility. These measures counterpose the right to mobility of health workers with the right to health of those they leave behind, posing academics working on brain drain with a quandary: how do we think of brain drain migration ethically? This paper aims to address this question by exploring the spatial and temporal ontologies that are being mobilised in current thinking around the brain drain, and how this shapes the arguments and policy initiatives, occluding other ways of thinking about health worker mobility. The paper argues that an institution that is emblematic of national identity is also necessarily and from the start embedded in international relationships shaped over longer periods of time. It then provides some steps towards unsettling these ontologies that privilege current national formations in order to think ethically about brain drain.

Keywords: brain drain, scale, spatiality, temporality, nation

Shakhlo Rahkimova, PhD, Center for Quarantine and Prophylaxis of Most Hazardous Infections, Uzbekistan. Blackburn, PhD, Louisiana State University. Email: jblack6@lsu.edu; *Distribution, Ecology and Spatial Analyses of Plague, *Yersinia pestis*, in Central Uzbekistan*

Plague, a vector-borne, bacterial disease of antiquity caused by *Yersinia pestis*, remains a public health threat throughout the Former Soviet Union nation of Uzbekistan. While vaccination and surveillance efforts are in place for combating the disease in-country, limited data are available on the spatial ecology and geographic distribution of the disease in Uzbekistan. The development of a new spatial data infrastructure provides an opportunity to study relationships between vector micro-habitats, wild reservoirs and hosts and their environments, and the potential for human risk. This paper will introduce the spatial distribution of the disease based on a 30-year archive of zoological collection data and provide spatial clustering analyses and predictive modeling approaches to evaluate the relationships between ecological parameters and the geography of the disease in-country. These analyses include efforts to model the disease agent and both local vector and host species. Similar analyses from other geographic regions have provided insight into the ecology of the disease. The results of this current study will be compared with these efforts other countries, including the United States, to examine relative similarities and differences in this disease and its evolution throughout its contemporary range.

Keywords: plague, GIS, disease analysis, central asia

Muhammad Tauhidur Rahman, University of Oklahoma. Email: mtr@ou.edu; *Integration of REA and Geo-Spatial Techniques in Post-Crisis Management*

Natural and human-induced hazards often have catastrophic effects on the environment and urban structures. Understanding these effects is not only important to predicting, preventing and mitigating the impact of disasters, but they are also crucial in rescue and relief operations and ultimately in saving lives. Although the environmental effects of disasters are typically of a rapid nature, investigations of these effects usually take place months after the disaster occurrence leaving many of causal factors of such effects and their overall impacts less understood. It is therefore very critical that assessment of the environment and urban structures takes place within hours and days after the disaster strikes. The assessment process needs to be detailed but simple to use so that it can be utilized by rescue and relief operations personnel with minimal training. Over the past few years, Rapid Environmental Impact Assessment (REA) methodologies have been proposed to fulfil both requirements. However, combining REA methods with geospatial techniques such as Geographic Information Systems (GIS) and Remote Sensing (RS) may be more beneficial not only in collecting, integrating, managing, and analyzing spatial data pertaining to the damaged areas, but also in supporting the rapid updates of changing datasets which can then be visible in detailed organized maps. The purpose of this paper is to explain how REA can be combined with RS and GIS to not only help in rescue and relief operations but also save life during disasters.

Keywords: Hazards, REA, GIS and RS Integration

Meredith Raimondo, Oberlin College. Email: meredith.raimondo@oberlin.edu; *The Queer Intimacy of Global Vision: Documentary Practice and the AIDS Pandemic*

Geographers made an important contribution to the interdisciplinary consideration of the HIV/AIDS pandemic by demonstrating the necessity of spatial analysis of its uneven distribution. This paper explores one outcome of this successful intervention; namely, documentary films that take the “global pandemic” as their subject. I explore the ways in which visual practices drawn from ethnographic film undermine the multicultural humanist goals of these representations through a practice of spatial Othering that relies on the intersection of sexuality, race, and poverty to protect the imagined viewer from implication in the social processes that make HIV infection a political rather than natural event. Given the centrality of the mass media to the production of spatial normativities, a queer feminist anti-racist practice must engage with such practices of popularization and consider the kinds of political subjectivities produced in critically lauded attempts to illuminate the global pandemic. I analyze Rory Kennedy’s *Pandemic* (2002) and Robert Bilheimer’s *A Closer Walk* (2002) as narratives articulating a scalar optic in order to connect but also place the geographically distant bodies of “viewers” and “subjects” through tropes such as sexual danger, suffering, and empathy. I ask how positioning viewers as global citizens who “see” the entire world works along side the production of stories about local experiences of AIDS in specific sites not to illuminate the importance of cultural context or the structural conditions shaping different experiences of HIV infection, but to produce a neo-colonial narrative which universalizes a discourse of normative sexuality while obscuring structural inequalities.

Keywords: Queer Studies, AIDS, media

David R. Rain, The George Washington University. Email: david.rain@gwu.edu; *Liber Geographicus Pro Bono Publico*

Peter Gould’s legacy of liber geographicus pro bono publico, or the public-spirited general audience geography book, continues to be a relevant one today for geographers interested in spreading their message farther than academic or scholastic circles. Attempts to achieve this quixotic mission to date, by authors such as Ed Soja, George Demko, Jared Diamond, and Mike Davis, have highlighted the difficulty of breaking through disciplinary stereotypes perpetuated by media and academics in more prominent fields. Geographers’ messianic impulse to open eyes to the way the world really works is in the presenter’s view a noble one, although the publishing terrain can be rather rocky. This paper will review potential for a project of how to ‘sell’ geography as a new, exciting, and immediate subject to a public that can only think of bees and capitals. After reviewing some efforts to capture and put forth various views of geography in mainstream society, it will present some key rhetorical concepts that are working metaphors for the geographic enterprise: operating instructions; the planetary nervous system; phronesis, or the idea of ‘mastery in place,’ which has led Bent Flyvbjerg into a wholesale critique of the social sciences; and the notion of geography as the ‘survival science.’ In a world of instant news, hype and spin, geography as the enduring study of the earth and its inhabitants still has relevance, but only if the story is told right.

Clionadh Raleigh, University of Colorado, Boulder and PRIO. Email: raleigh@colorado.edu; Henrik Urdal, PhD, International Peace Research Institute (PRIO). Email: henriku@prio.no; *Population Pressure, Resource Scarcity and Armed Conflict: A Disaggregated Study*

Climate change is expected to bring about major change in freshwater availability, the productive capacity of soils, and in patterns of human settlement. However, considerable uncertainties exist with regard to the extent and geographical distribution of these changes. Predicting scenarios for how climate related environmental change may influence human societies and political systems necessarily involves an even higher degree of uncertainty. The direst predictions about the impacts of global warming warn about greatly increased risks of violent conflict over increasingly scarce resources such as freshwater and arable land. We argue that our best guess about the future has to be based on our knowledge about the relationship between demography, environment and violent conflict in the past. Previous rigorous studies in the field have mostly focused on national level aggregates. This article represents a new approach to assess the impact of environment on internal armed conflict by using geo-referenced (GIS) data and small geographical, rather than political, units of analysis. It addresses some of the most important factors assumed to be strongly influenced by global warming: land degradation, freshwater availability, and population density and change. While population growth and density are associated with increased risks, the effects of land degradation and water scarcity are weak, negligible or insignificant. The results indicate that the effects of political and economic factors far outweigh the relationship between local level demographic/environmental factors and conflict.

Kevin N. Raleigh, University of South Carolina. Email: raleigh@mailbox.sc.edu; *Is it Happy Hour Yet? Analyzing Alcohol Law Changes in Boyle County, Kentucky*

The recent change in county alcohol laws in Boyle County, Kentucky from traditional dry status to the present complexity of limited, winery and golf illustrates the interdependence between the cultural and the economic, and exemplifies Andrew Sayer's observation that viewing these geographic spheres as separate and mutually exclusive is limiting. Understanding that the cultural is inflected into the economic, and vice versa, permits a greater examination of processes that affect legalities across space. These complexities are illuminated in the study area of Boyle County, Kentucky, located at the edge of Kentucky's Bluegrass region, where the question of alcohol legality or illegality in itself may be surprising. Methodological considerations that have included historical and recent legal research, voting results on referenda, county revenue data, license issuances and interviews with invested parties either for or against alcohol law changes have all been combined to illustrate that cultural and economic forces across space are not disjoint. As is demonstrated through Boyle County, the traditional viewpoint of Kentucky's alcohol laws as a battleground between exclusive categorical notions of cultural / moral / religious forces versus economic ones is eroding in favor of an increasingly complex set of regulations that belies such simplistic dichotomization and instead exposes an array of movements that are invoked in processes of legal change.

David Ralph, . Email: davidralph81@gmail.com; David Ralph, University of Edinburgh, Scotland. Email: davidralph81@gmail.com; *Re-imagining of the Nation: Irish return migration from the USA, 1996-2006*

Rather than simply translating the unfettered 'space of flows' of postmodern cultural studies into the language of transnationalism, this project will examine a recrudescence of supposedly obsolete elements in transnational migration by focusing on a re-conceptualized 'transnationalism from below'. The purported obsolescence of nation-state, ethno-national identities and an apparent paradigm shift to 'post-nationalism' will be critically examined through a re-conceptualization of 'transnationalism from below' that seeks to address the following questions: 1) What role do transnational social fields play in the construction of 'home' as an arena ripe for political change and socio-economic transformation, and/or as a space of nostalgic continuity and tradition? 2) How and to what extent are these competing and/or complementary constructions mobilized by political entrepreneurs operating in transnational social fields? The empirical focus of this research will be the return flow of Irish migrants who emigrated in the 1980s to USA and returned between the years 1996-2006, with particular focus on the 30-45 years cohort. This empirical focus generates the following research questions: 1) Do the returnee cohort champion political change and socio-economic transformation in increasingly polarized 'Celtic Tiger' Ireland, or are they agents for conservation of the reigning consensus? 2) As members of transnational social fields, will returnees mobilize new political identities and counter-hegemonic discourses - such as those of Glór an Deorai (Irish Emigrants Voice), a lobbying group of Irish expatriates in the USA campaigning for voting rights for non-resident Irish citizens - or will loyalty to

dominant dynamics of the country of origin remain?

Adam Ramadan, DPhil (PhD) student, University of Oxford. Email: adam.ramadan@ouce.ox.ac.uk; *The guests' guests: the hospitality of Palestinian refugees towards displaced Lebanese civilians in summer 2006*

In July 2006, the geopolitics of the Arab-Israeli conflict were re-manifested in planes, bombs and missiles. A cross-border raid by the Lebanese militant group Hezbollah, that resulted in the capture of two Israeli soldiers, led to massive retaliation by Israel, including prolonged aerial bombardment and a limited invasion by Israeli ground troops. Several thousand displaced Lebanese civilians sought refuge in Palestinian refugee camps in southern Lebanon, thereby becoming the guests of the guests of Lebanon. This paper will explore this reversal of guest/host roles as a moment where Palestinian refugees could show hospitality to citizens of Lebanon, a state that has offered them a very limited and conditional form of hospitality for the last six decades. Jacques Derrida argued that our relations with the 'Other' should be based on a hospitality we strive to make unconditional, so that we are open to the arrival of the visitor, the uninvited guest, at any time, without imposing conditions. What sort of hospitality did Palestinian refugees offer to displaced Lebanese civilians last summer? As displaced Lebanese civilians arrived at Palestinian refugee camps, what motivated Palestinian refugee responses to them, and on what conditions were they admitted into the Palestinian camps? The war saw the alignment of interests of the displaced and impoverished Lebanese Shi'a with those of the Palestinian refugees, who share their story of dispossession and marginalisation at the hands of Israel and the Lebanese elite. This paper will also reflect on how this episode may have affected evolving Palestinian-Lebanese relations.

Keywords: Palestinian refugees, refugees, Palestine, Israel, Lebanon, hospitality

Laxmi Ramasubramanian, Associate Professor, Hunter College. Email: laxmi@hunter.cuny.edu; *Whither Social Justice? Reflections from a Participatory Action Research Project with Youth in New York*

This paper reflects on a participatory action research with young people attending a public school in East Harlem, New York. Although young people were not involved in designing the initial curriculum outline, the instructors followed the tenets of good and ethical participatory planning practice and invited and created opportunities for students to take an active role in designing the curriculum content and shaping the final project outcomes. The goal of the experience was to engage students to think about relationships between people and place, exploring issues and themes central to current planning practice including the need for affordable housing, economic development, and environmentally sustainable land use development. The students discovered new ways of "seeing" their own neighborhood and the city they live in. They acquired a spatial and temporal understanding of how cities work. They learned practical methods and techniques that can help to solve urban problems. Although the instructors sought to imbue the values of "planning for the public interest", in the curriculum, we had only limited success in this regard. It is these challenges that the paper will seek to elaborate upon.

Maria-Teresa Ramirez-Herrera, Ph.D., University of California Berkeley. Email: mtramirez@berkeley.edu; Janet M. Sowers, WLA. Email: ; Christopher M. Richard, Oakland Museum of California. Email: ; *The Creek And Watershed Map Of San Francisco*

The Creek and Watershed Map of San Francisco, at 1:25,800 scale, offers an exceptional look at both the historical stream and watershed system and the modern sewage and runoff system. Maps from the 1800s and the San Francisco Estuary Institute's EcoAtlas were our primary sources for the exact locations of the streams, marshes, sloughs, lakes and shorelines which once defined the historical system. We compiled modern features from municipal public-works

maps, aerial photographs and field observations. Distinguishing the historical watershed system from the modern sewage and runoff system has been our goal, showing both the continuities and the changes. We believe that it is important to educate the public to some of the hazards produced by urbanization of the landscape. To add depth to our presentation, we have marked 21 'points of interest' on the map and keyed them to short narrative descriptions: for example, creeks preserved and marshes restored by community efforts, natural lakes that are now amenities in city parks, and a former bay filled with 1906 earthquake debris caused the collapse of buildings during the 1989 Loma Prieta earthquake. As San Francisco uniquely collects municipal sewage and storm runoff together in underground drains routed to wastewater treatment plants, we have charted this singular system in detail, on the map, and its function and operation are explained in narrative detail. Our intent in producing this map has been to inform public decision-making processes and to encourage in the general public wise stewardship of the San Francisco landscape.

Aida Ramos Viera, The University of Kansas. Email: arv@ku.com; *PROCEDE and Indigenous Common use areas in La Huasteca Potosina, Mexico.*

This paper details results from the participatory research mapping (PRM) component of the First Bowman Expedition, México Indígena, from nine indigenous Teenek and Nahua community lands of the Huasteca study area of eastern San Luis Potosí state, Mexico. We are analyzing the changes in common use areas in five communities certificated by PROCEDE, the program that provides certification of agricultural lands for privatization of what is now legally social property in agrarian communities (legally as ejidos and agricultural communities). We are using official information of the National Agrarian Registry (RAN) and other cadastral records together with PRM to document 1) land use and 2) parcels tenancy changes 10 years after the PROCEDE land certification process. Putting these results together with orthophotos and GIS analysis allows us to visualize changes on the land tenancy and land use, as well as the impact on the common use areas and their forests in certificated indigenous communities.

CindyAnn Marsha Rampersad, Ph.D Student, Penn State University. Email: cmr246@psu.edu; *Diversity in Question: Self-Segregation Among International Graduate Students in the United States*

A half-century after the Brown vs. Board of Education decision, segregation remains a prominent issue within the American education system. While segregation was imposed by law prior to the Brown decision in 1954, today self-segregation poses a challenge to the effectiveness of university diversification policies. Most studies of self-segregation have focused primarily on the African American experience within higher education institutions without taking into account the experiences of international college students. The majority of studies on international students' experiences on U.S. college and university campuses have centered primarily on international undergraduates as opposed to international graduate students. This study, in contrast, examines how and why international graduate students self-segregate while attending a large public university in the United States. Using a mid-Atlantic university as a case study, I explore this issue employing two main strategies. First, I investigate the sociological rationale behind self-segregation among international graduate students, and second, I conduct an in-depth analysis of the extent to which university policies for diversity reinforce self-segregation. Following a qualitative methodological approach, I employ two methods: open-ended interviews and focus groups. In doing so, the present study draws upon, yet challenges, existing theories of cultural and social capital by analyzing the precise linkages between processes of social interaction and the formation of cultural identity. The results of this study shall inform the making of public policy recommendations for higher education institutions regarding the creation and implementation of more effective diversity strategies that encourage "meaningful" social interaction among all students.

Keywords: self-segregation, international, diversity, cultural capital, social capital, cultural identity, social interaction, public policy

Nissa Ramsay, University of Sheffield. Email: N.ramsay@sheffield.ac.uk; *'fragmentary connections: the aura of a souvenir'*

This paper uses tourist souvenirs as a trajectory through recent debates surrounding the 'rematerialisation' of geography. Theoretically, it explores how the notion of an object's 'aura' might offer a way of imagining the materiality of matter. This is conceptualised as an objects' emergent affective capacities, entangled with an objects' form (colours, shapes, textures), other objects, subjects, the moment and its past (life, history). An 'aura' might therefore be recognised as an object materialises into 'presence', attracting our attention as it alters the rhythm of ongoing activity. It is therefore also fragmented and disruptive, drawing attention away from other objects and subjects, soon fading away into the background. An object's aura therefore acknowledges the consistencies of objects as well as their potential to always be thought of otherwise. As a concept this enables us to explore how materiality work through, but are not delimited by physicality or subjectivity. Yet the challenge is how and if such a theoretical imagination might become empirically recognisable. This paper therefore focuses upon ethnographic research carried out in Swaziland (Southern Africa) and the UK. This explores the daily sensual and practical interactions with souvenirs and paraphernalia acquired by tourists. It also pays attention to how, when and if objects become animated at particular moments and by emergent meanings. By exploring the ruptures between such theoretical and empirical imaginations this paper concludes with the possibilities and questions posed by paying attention to materiality.

Keywords: objects, materiality, aura, affect, souvenir

Robert Ramsay, University of Toronto. Email: ramsayr@geog.utoronto.ca; *The Role of the 'Philadelphia Model' in Municipal Wireless Projects in North America*

Following Philadelphia's announcement in December 2004 that it would construct and administer a public city-wide wireless zone, the 'Philadelphia model' quickly became the dominant paradigm for municipal wireless projects, sparking countless discussions at trade conferences, a book, and the dissemination of its methods across the continent. This paper examines the reasons for Philadelphia's prominence in the muniwireless discourse, and the role the city's plan has played in advancing municipal wireless in general and in shaping other projects. I suggest there has been a continuing fetishization of wireless technology that serves to obfuscate the contestations between public and private broadband provision. Through interviews with key players in the muniwireless movement and a discourse analysis of industry literature and media coverage from 2003 to 2006, I argue that the Philadelphia case offers a glimpse of a new approach to urban governance, and illuminates historical yet highly contingent and emergent techno-social urban geographies.

Keywords: broadband, municipal wireless, technology, Philadelphia, discourse, urban geography

Kevin Ramsey, University Of Washington. Email: kramsey@u.washington.edu; *A Call for Agonism: GIS and the Politics of Collaboration*

This paper examines the increasing use of geographic information systems (GIS) to support the project of "collaborative" planning. Specifically, I explore the ways in which the use of GIS in collaborative planning programs work to counteract and/or reproduce patterns of marginalization always present in local political struggles. I explore this question through an analysis of a case study in rural Idaho in which the water management agency responded to a local conflict over water shortages by facilitating the development of a GIS surface water model to be used in collaborative planning between agency staff and water users. I find that the GIS constructed was a reflection of a particular configuration of power relations that resulted from agency employees' situated position as arbiters of knowledge in water resource disputes. I argue that a significant reason for the failure of this and other PGIS endeavors to destabilize existing inequalities in collaborations is a contradiction at the heart of collaborative planning theory: the idea that participants are able to temporarily set aside power relations in their efforts to collectively construct shared understandings on which to base decisions. In my presentation I will give particular attention to the challenges of conducting this kind of critical qualitative GIS research. These include: negotiating my multiple roles as technical collaborator with the agency, advocate for water users, and researcher; and, identifying the ways in which power relations are reflected in the GIS and collaborative process despite agency staff members' stated efforts towards neutrality and objectivity.

Keywords: GIS, collaborative planning, critical GIS, PPGIS, collaboration, agonism, political theory, planning

Matthew E. Ramspott, Ph.D., Frostburg State University. Email: meramspott@frostburg.edu; Kevin P. Price, Ph.D., Dept. of Geography, University of Kansas. Email: price@ku.edu; *Effects of Grassland Management Practices on the Estimation of Photosynthetic Capacity from the Normalized Difference Vegetation Index*

Land use practices in managed grasslands are known to impact soil and vegetation characteristics of these systems. Primary productivity and seasonal variations in photosynthetic capacity are important ecological measures that can be estimated using remotely sensed vegetation indices (VI). The relationship between photosynthetic capacity and VI is more complex in managed grasslands than in croplands and other vegetation types because of 1) seasonal changes that affect the spectral/optical properties of the grassland canopy, and 2) effects of grassland management practices on the composition of the plant community. The authors examined the seasonal and inter-annual stability of the relationship between VI and photosynthetic capacity in managed grasslands of Northeast Kansas, identifying management activities that resulted in deviations of the VI response from the normally expected linear relationship. Findings suggested that conservation management, in which the grass was not harvested by haying or grazing, resulted in a large proportion of senescent material in the canopy and unexpected decreases in VI response. Additionally, heavy grazing resulted in low levels of photosynthetic capacity coupled with increased abundance of planophile forb species, a combination that led to unexpected increases in VI response. After removing sites strongly affected by these two factors from the analysis, the relationship between VI and photosynthetic capacity was found to be stable within and between growing seasons. Analysis of seasonally time-integrated VI revealed that this measure (a surrogate for net primary productivity) was related moderately strongly to live standing crop biomass at the time of peak greenness in these grasslands.

Maano Ramutsindela, University of Cape Town. Email: maano.ramutsindela@uct.ac.za; *The reproduction of the apartheid spatial legacy in South Africa*

This paper focuses on the spatial impact of land reform and the redrawing of internal boundaries on South Africa's former bantustans. It argues that, in contrast to the democratic government's intention to use land reform and boundary demarcation to effectively change the spatial legacy of apartheid, these processes tend to cement the geography of the former bantustans. Though earlier research correctly projected that post-apartheid policies could result in the enlargement of the areas of the former bantustans, the ways in which this could happen were still unclear. This paper draws on experiences of land reform and boundary demarcation to demonstrate how and why the areas of the former bantustans have been enlarged over the 12 years of democracy in South Africa.

Keywords: bantustans, boundaries, land, South Africa

Sanjay Rana, University College London. Email: s.rana@ucl.ac.uk; *Application of Morphological Representation to Enhance the Visualization of Dynamic Weather Maps*

Animated visualizations of dynamic weather parameters e.g., temperature, pressure etc., is a common exercise to understand the structure and evolution of large scale weather phenomenon. Traditionally, such dynamic visualizations involve animation, perspective and immersive volumetric displays, and an overlay of relevant movement related symbolizations (e.g. contours, arrows, flow lines, weather fronts). The most critical information about a surface is contained within the morphological structure of these datasets. The paper proposes that the animation type visualization of the dynamic weather parameters can be enhanced significantly by explicitly representing the so-called fundamental local structural or morphological features, namely minima, maxima, ridges, ravines, and saddle. The motivation behind the research presented here is based on empirical studies related to 2D dynamic maps of geographic surfaces (terrain and socio-economic surfaces), which proposed that an overlay of morphological features during animation leads to the suppression of information overload and a more focused insight into the changes in the structure of the geographic surfaces. In terms of cartographic principles, the morphological representation performs the role of abstraction by selecting, simplifying, and exaggerating the underlying geographic information. The paper demonstrates enhancements achieved in the visualization of the time series of 2D meteorological maps, with an overlay of morphological features. It is suggested that the proposed morphological representation could be used as a simpler technique to understand and monitor the dynamic behavior of the weather for the purposes of forecasting models, which is otherwise carried out with sophisticated numerical modeling.

Keywords: Dynamic Maps, Weather, Animation

Samuel Randalls, University of Oxford. Email: samrandalls@tesco.net; *The Grass is Greener on the Other: Environmentalism, colonialism and the carbon economy*

Critical climate change literatures often draw out two forms of colonial critique which raise questions about ethics and justice in relation to contemporary policymaking around environmental issues. The first is the 'ecocolonialist' critique whereby the environmental externalities of the North become the environmental dangers of the South. Climate change furthers the divide between rich and poor by its inequitable impacts. The second colonialism is arguably encouraged by the policies emanating from international communities whereby the costs of moving away from carbon are disproportionately distributed with the North perceived as using market mechanisms to avoid taking its due share of the burden. This is particularly the case where countries in the South are rapidly developing through carbon based economies (the question of how to deal with them?). Various mechanisms including the emissions trading scheme, clean development mechanism and/or carbon offsets, for various writers, may reinforce power relations and colonial tendencies. These overlapping modes of colonial critique form the backdrop for this paper and set the scene for a broader discussion of colonialism and environmentalism within the climate change field. The paper will focus on a hoarier problem too, one that is frequently sidelined for fear of political disablement. This is namely that the North and Science are the ones redefining the whole world (again). What justifies political decisions and who is empowered to make these decisions become important questions?

Keywords: environmentalism, colonialism, climate change

Brett A. Randle, University of Missouri, Columbia. Email: bar54e@missouri.edu; Michael A Urban, Dr., University of Missouri, Columbia. Email: urbanm@missouri.edu; *Associating Smallmouth Bass young of the year with physical habitat-conditions in three Missouri streams*

Fisheries managers in the State of Missouri have expressed concern that populations of sportfish, specifically Smallmouth Bass (*Micropterus dolomieu*), are declining due to stream degradation stemming from changing land-use patterns and associated shifts in hydrology and entrained sediment. Specifically, young of the year survival is crucial to ensure future viability of local populations. This study examines the role that soil, surficial geology, and watershed scale changes in land use/land cover have on physical habitat conditions known to be important to Smallmouth Bass young of the year. Nine kilometers of stream channel in three streams located in central and northern Missouri were surveyed for such variables as substrate, embeddedness, channel width, thalweg depth, woody debris, canopy cover, and pool/glide/riffle/run complexes. This paper represents one aspect of a larger project intended to associate the presence of healthy smallmouth bass populations with environmental conditions and morphological structure affecting habitat at both landscape and reach scales. A broader understanding of the linkages between smallmouth bass habitat and the physical configuration of area streams will contribute to more effective decision-making and prioritization for stream enhancement or restoration activities within Missouri.

Rainer Randolph, Universidade Federal do Rio de Janeiro. Email: rainerrandolph@yahoo.com; *Gated communities in metropolitan and peri-metropolitan areas: a comparison of the social segregation of space among condominiums inside and outside of the metropolitan area of Rio de Janeiro*

Nowadays, the phenomenon of closed urbanization is present in a lot of cities in the whole world. As describes well the term in Castilian of "urbanización cerrada", those condominiums are not just fortified areas with a set of residential buildings but they count, largely, with an entire infrastructure and internal services of safety and surveillance. These forms of "urbanization" are not only contributing for the metropolitanization of the contemporary societies; they transcend the administrative limits of cities and expand the urban fabric, in a differentiated way, to areas called peri-metropolitan. That whole successive expansion is characterized by the generation of new centers and peripheries and different forms of occupation of space by different social segments. The main task of our work is to discuss if the new forms of socio-spatial segregation in peri-metropolitan areas represent a mere extrapolation of those forms already present in the heart of the metropolis. Our research in the Barra de Tijuca neighborhood of Rio de Janeiro point out gated communities as dominant form of occupation. The characteristics of those communities will be compared with the recent occupation of peri-metropolitan areas in Petrópolis. It's our aim to identify similarities and differences between these processes.

Keywords: Gated community, Rio de Janeiro, Peri-metropolitan Area

Haripriya Rangan, Monash University. Email: haripriya.rangan@arts.monash.edu.au; *Lumpen business and nous: An antipodean critique of uneven capitalist development*

This paper examines how the 'lumpen' masses have been conceptualised in Marxian and postcolonial theory. It critically explores contemporary theorising of global capitalism and its production of geographically uneven development. It offers an antipodean perspective on the marketplaces, geographical transactions, practical intelligence, and pathways of accumulation that form the business of everyday life for the indeterminate masses that are routinely represented as victims of global capitalism. The paper will argue that, contrary to the extravagant and tragic claims made by metropolitan radicals, contemporary capitalist processes do not produce geographically uneven development, but rather rely on geographically differentiated modes of lumpen business and nous to evolve along different pathways and configurations of capitalism and political power.

Keywords: marketplace economies, antipodean critique, capitalist development

Katharine N. Rankin, University of Toronto. Email: k.rankin@utoronto.ca; *The Gender Politics of Development: Neoliberal Alliances, State Projects, Cultural Articulations*

How do neoliberal development technologies articulate distinct national cultural-political and institutional milieu? How has gender been implicated in distinctly national neoliberalization processes, both as a political rationale of governance and as ideologies and practices contouring everyday life in rural communities? These are the key questions that animate this paper examining microfinance as a market-led, women-focused development strategy in Nepal and Vietnam. The objective is to understand how this iconic instrument of 'roll-out' neoliberalization articulates Nepalese and Vietnamese milieu at three spatial scales: national macro-regulatory frameworks for rural finance, organizations implementing development projects, and the beneficiary groups 'on the ground' through which organizations distribute their services. The comparative approach is intended to emphasize the temporal and geographical contingency of such articulations. The multi-scalar approach is intended to highlight how transnational neoliberal projects form the necessary, often uneasy, alliances with distinctive state governing projects, and in so doing also generate spaces for critique and alternative imaginaries as their contradictions become increasingly apparent.

Keywords: Development, governmentality, neoliberalization, microfinance, articulation

Kieran Rankin, University College Dublin. Email: kieran.rankin@ucd.ie; *Rationales and Legacies of M.W. Heslinga's 'The Irish Border As A Cultural Divide'*

Historians and political scientists have chiefly furnished the literature devoted to the partition of Ireland but the pioneering and most enduring contribution to the geographical canon on the subject has been M.W. Heslinga's 1962 work, 'The Irish Border as a Cultural Divide'. As a constant source of controversy, analysis of the Irish Border is unsurprisingly beset by political suspicions. This may account for why the unfulfilled necessity for a full geographical treatment was eventually discharged by a Dutch, and not an Irish or British, geographer. The book heralded a fresh approach in utilising a comprehensive range of sources and placing emphasis on Ireland's links with Britain, and thus conceiving the Irish Border as marking an integral element in an archipelago-wide divide. Despite the book's substantial historical coverage, the sheer volume of the pre-Act of Union sections detract from a curiously inadequate description and analysis of how and why the Border came to be delimited and confirmed in position during the politically turbulent 1911-1926 period. While the book remains an important landmark, it has elicited little by way of a comprehensive critical response. This is quite remarkable considering the book's failure to elaborate upon concepts underpinning any partition's most inescapable and pervasive manifestation - the boundary line itself - as well as the book's classification in certain quarters as a pro-unionist treatise. This paper examines the aims, methodology, and key conclusions of the book as well as to survey its contemporaneous reception in the academic community and subsequent legacy.

Keywords: Ireland, partition, boundaries, Heslinga

Norma M. Rantisi, Concordia University. Email: nrantisi@alcor.concordia.ca; **Deborah A Leslie, University Of Toronto. Email:** deborah.leslie@utoronto.ca; *Viral spaces of creative production in the design sector of Montreal*

In recent studies on the economic significance of creativity, much attention has been accorded to the important role that quality of life attributes of neighbourhoods play in attracting talent to cities, with the assumption that quality of life is most valuable when defined in terms of consumption. In this paper, we reconsider the role that quality of life has on the productive dimension of creativity. More specifically, we examine how low-cost rents and loft-style

dwelling in Montreal's off-beat neighbourhoods alter the risks of producing original styles by affording independent designers the social and material resources to experiment and explore novel concepts. The study draws on interviews with designers in the fields of fashion, graphic and industrial design, and examines their social and spatial production requirements. It suggests that a consideration of the productive dimension of quality of life draws attention to the need for more substantial investments in the development of social and cultural resources which not only benefit designers in an economic sense, but can also shape the social character and physical space of the neighbourhoods in which they are embedded.

Keywords: creative economy, design, urban economic development

Vyjayanthi Rao, The New School. Email: raov@newschool.edu; *Slum as Theory: Density and Development in Global Urbanism*

Urban density is often taken to be self-evident and treated as an indicator or attribute of urban space upon which urban planning and individual planning decisions are made. This paper makes the case for thinking about density as a relational and social quality produced by identifiable associations, practices and systems of human interactions, specifically with infrastructural technologies. Based on ethnographic research in Mumbai, the paper will consider several different 'sites' at which density operationalizes an incessant sense of temporariness and anticipation within the frame of social relations. As geographies of density, these geographies of density yield surprising circumventions of functionality and planning but they also make possible transformation within existing frames of relations. Much of the recent urbanist literature focuses mainly on the slum not only as an empirical but also an analytic geography. Based on the ethnographic work on Mumbai, the paper makes the case for shifting the frame from the slum as the chief site for theorizations of the multitude to including and juxtaposing the slum with other geographies of density. Doing so might yield new insights into the relationship between built form and urban design as well as yield accounts of the city that are not trapped either by normative and prescriptive models of the city or by the need to turn to a redemptive reading of chaos and misery.

Keywords: slum, mumbai, density, globalization

Marilyn N Raphael, Professor, University of California. Email: raphael@geog.ucla.edu; *The Changing Variability in the Southern Hemisphere Annular Mode Associated with Extreme Antarctic Sea Ice Distribution*

The response of the leading mode of atmospheric variability in the extratropical Southern Hemisphere, the Southern Annular Mode (SAM), to extremes of Antarctic sea ice concentration is investigated using a fully-coupled climate model - the NCAR Community Climate System Model-version 3 forced by satellite observed sea ice concentration. Average, maximum, and minimum sea ice concentration climatologies were extracted from satellite-observed sea ice concentrations and used to force the model for three 150-year simulations. Using principal components analysis the SAM was calculated from the 500hPa geopotential height field for each scenario and the results for the southern summer are compared. The model produces reasonable simulations of the SAM. Spectral analysis of the timeseries of the SAM for the different sea ice concentration scenarios indicates that under average sea ice distribution the dominant period is eight years while under the minimum and maximum distributions it is four years and ten years respectively. Physical reasons explaining these changes in variability are discussed.

Keywords: Antarctic sea ice, Southern Hemisphere Annular Mode, Climate Modelling

Melanie Ann Rapino, University of Connecticut. Email: melanie.rapino@uconn.edu; *Gender Roles and Spatial Entrapment*

Many factors contribute to women's secondary labor market status including their overlapping roles within the household and society. The spatial entrapment hypothesis emphasizes that women's job search range is restricted due to multiple factors (i.e. gender roles, lack of transportation accessibility, care of the elderly, etc.). The home responsibilities associated with married women's traditional gender role may limit their ability (i.e. time and money) to travel longer distances to work and thus restrict the jobs from which they have to choose. The restricted job search range may explain why women are disproportionately represented in low-wage occupations. This research utilizes commuting times to test how gender roles influence the job search range of women and their secondary status within waged labor. Using data from the 1990 and 2000 Public Use Microdata Sample of the U. S. Census, this research compares commuting times for heterosexual partners and same-sex partners. Same-sex partners (i.e. lesbian women and gay men) are used as a control group within this research because traditional gender roles are not associated with their commuting behaviors or occupation which previous research has lacked. The hypothesis for this research is that gender roles do play a significant role in explaining women's lower status in the labor market. Provided the results show that lesbian women

have statistically similar commuting times as married men, and that married women have significantly shorter commuting times than both groups, then the hypothesis is supported and gender roles are a significant factor of spatial entrapment for women.

Keywords: spatial entrapment, gender, commuting

Tarek Rashed, University of Oklahoma. Email: rashed@ou.edu; *The Model of Models: An Integrative Conceptual Model for the Spectral Analysis of Urban Imagery*

Remote sensing of the built environments is an important source of information for the intelligence and civilian communities with respect to mapping and monitoring urban environments. Since the 1970s, several models have been proposed to guide the spectral-based classification and analysis of urban remote sensing data including: Anderson's hierarchical classification schema (1976), the Remote Sensing model of Strahler et al (1986), the VIS model of Ridd (1995), and HLV model of Small (2001). These models have however been proposed in isolation and are usually viewed as competing alternatives. This paper argues that they are rather complementary and can be integrated together to guide the spectral analysis of urban imagers. The paper first discusses the context in which the above models were proposed, how they differ, and the implications of this difference on the spectral analysis of urban imagery. An integrated model is then proposed, in which the above models are viewed in a continuum. The application of the proposed model is presented through a case study that utilized multiple urban RS images of various spectral and spatial resolutions for the analysis of urban attributes in Greater Cairo, Egypt. The results of the case study are found to provide more insights into the spectral nature of urban attributes when considered through the conceptual constructs of the proposed model. Reflections made as to how the proposed model can help further our understanding of the potentials and limitations of the various spectral based methods proposed for the analysis of urban remotely sensed data.

Harun Rashid, Professor and Chair, Geography and Earth Science, University of Wisconsin-La Crosse. Email: rasid.haru@uwlax.edu; *Structural and Non-Structural Flood Alleviation in La Crosse, WI: Newspaper Discourse vs. Floodplain Residents' Preferences*

This study compares The La Crosse Tribune discourse on structural and non-structural flood alleviation measures in La Crosse, WI with survey data on urban floodplain residents' preferences for these measures. Based on content analysis of at least 1000 archived reports on the Mississippi floods in La Crosse between 1931 and 2005, the study found that although three-quarters of its flood reports were on routine events, nearly one-half of the Tribune column space for flood news was on flood alleviation, emphasizing significantly more on non-structural than on structural measures. In contrast, the survey respondents from the 100-year flood zone (N = 90) preferred upgrading flood control levees (mean Likert scale score: 4.06), compared to flood-proofing personal property (mean score: 1.94), partial flood-proofing (2.85/2.15) or relocation (2.26). The respondents disapproved several provisions of the NFIP, two-thirds stating that they had to purchase flood insurance as a requirement for their home mortgage, another one-half complaining that the premium was too high, at least one-third asserting that flood insurance was unnecessary for their property because it had never flooded, and only two respondents had purchased this insurance voluntarily. These responses seemed to imply that the floodplain residents of La Crosse had major reservations about the NFIP principles of flood risk mapping and zoning, despite numerous contextual articles in the Tribune on the NFIP. A more deliberate effort by the NFIP to explain these principles through media discourse and public meetings may be helpful in convincing the residents about the usefulness of this program.

Robert Raskin, Jet Propulsion Lab. Email: raskin@seastar.jpl.nasa.gov; *Geoscientific Knowledge Management Using the SWEET Ontologies*

Transformation of data into knowledge is a cliché often invoked to describe the work of a geoscientist. While cyberinfrastructure for "data" is well known, the analogous tools for "knowledge" are less familiar and less available. A geoscientific knowledge cyberinfrastructure clarifies semantics, disambiguates terminology, and provides a reservoir for organizing and classifying scientific concepts. An ontology is central to knowledge representation, as it provides shared understanding of terms, phrases, and concepts, in both machine and human readable forms. The ontologies of the Semantic Web for Earth and Environmental Terminology (SWEET) provide this geocyberinfrastructure. We demonstrate how datasets, features, and resources can be associated with SWEET ontology elements, and retrieved using intelligent access methods that take advantage of geospatial common sense. Applications include: i) geospatial semantic enhancements to search engines, SOAP Web Services, and workflow; ii)

descriptions of spatial data mining targets; iii) and capture of "corporate memory" of geospatial-related organizations and features.

Keywords: cyberinfrastructure, ontologies

In this paper we report on the development of an agent based model (ABM), informed by interviews and a survey of logistics firms in the United States. The model is designed to illuminate the underlying causes and responses that may constitute dramatic organizational changes that have been observed in the logistics industry in the past decade. Two types of agents have been incorporated in the ABM; logistics providers and logistics users. Logistic providers are distinguished by the type and qualities of their attributes that include: location, size, type of services offered (for example: land, air and sea transport, warehousing, and freight consolidation) geographic reach (service territories), and level of information and communication technology (ICT) functionality, among others. Logistics user agents create part of the market environment in which the logistics provider agents function through the issuing of requests for service(s), through the manner in which bids are evaluated (for example cost and trust) and through the selection of agents chosen to provide the service(s). In reaction to their success in this bid/response environment, provider agents can invest in labor and information technology to improve their attributes and enhance their chances of winning bids. Model scenarios are developed by changing investment patterns and by altering the degree to which cost and trust play a role in the selection of winning bids; scenario results are analyzed and evaluated with respect to their implications for the changes that are occurring in the contemporary logistics industry.

Ilkka Ratinen, . Email: iratine@edu.jyu.fi; Ilkka Ratinen, University of Jyväskylä. Email: iratine@edu.jyu.fi; *Development of a SFA modeling by fuzzy logic.*

Eutrophication, which is largely generated by increased nutrient inputs from many sources, has been regarded as one of the major threats to the coastal marine ecosystem in the Archipelago Sea in the Southwest Finland. To increase the knowledge of nutrient inputs and outputs in the open marine system and their influences in the specific sea area, GIS modeling methods and fuzzy logic are needed to understand the complex marine system. This study gives a holistic picture of the nutrients flows in the municipality of Kustavi, Southwest Finland. Nutrient flows from fish farming, agriculture, forestry, cottages, scattered settlement, wastewater treatment, fish processing plants, natural leaching airborne deposition and background loading has been calculated by SFA (Substance Flow Analysis). The background loading has also been modelled by GIS and fuzzy logic to map the spatial variation of nutrients in open seawater system. The study reveals that nutrification is a complex phenomenon and nutrients can drift widely in the open seawater. However, when the distribution of a nutrient is known accurately it is then possible to delineate by GIS a set of artificial borders for the open system. Because phenomena in the seawater are vague but mathematical models may interpret them as inexactness it is needed fuzzy logic approach in the determination of borders in seawater. Doing systems analysis by fuzzy logic and semi-quantitative, the inputs of system can adjust in the specific area by neuro-fuzzy method.

Keywords: fuzzy logic, Substance Flow Analysis, GIS, seawater

Jamie Ratliff, San Jose State University. Email: jlratt97@yahoo.com; *Building a GIS for Habitat for Humanity - Guatemala: A Work in Progress*

The use of geographic information systems for cataloging and observing cultural and natural events is something that is not equally accessible. With the goal of creating a workable geographic information system for Habitat for Humanity in Guatemala to use for plotting houses they have built, the processes needed to accomplish this are many. From the collection of data by Habitat for Humanity in Guatemala to the sending of that data to California for entry into the geographic information system to the location of any extra information needed to enhance the use of the geographic information system, the work needed is extensive. The future completion of the geographic information system, including georeferenced topographic maps and a relational database for easy entry of new data, may span far beyond the current plans for the system, including practical uses by other organizations for disaster planning and other analyses.

Keywords: Guatemala, Habitat for Humanity, GIS

Jaime E Ratner, Binghamton University. Email: jratner1@binghamton.edu; *Evaluating Place Vulnerability: An All-Hazards Assessment Methodology Applied to FEMA Region IX*

The study of hazard vulnerability involves assessing the potential loss of property or life within a given spatial domain. Information from such assessments can help policymakers develop effective hazard mitigation strategies. With limited resources, a comprehensive and reliable assessment tool must exist. Such a tool has the capacity to quantify place vulnerability, based upon the interaction of the physical factors and social context that define a geographic domain, rather than misconceptions based on size, economic standing, or political influence. This research addresses the need for such a fair assessment tool. Readily available socio-economic and geophysical data, compiled by various government agencies, will be aggregated in an appropriate and meaningful methodology utilizing a GIS and geostatistical techniques. This methodology will allow for significant comparisons between geographic entities with the flexibility to provide reliable output at all spatial scales. Focusing on the states defining FEMA Region IX (Arizona, California, Hawaii, and Nevada) place vulnerability assessments will be performed at two distinct spatial scales: (1) an aggregated county-level scale and (2) a disaggregated census-tract scale. These assessments will elucidate spatial variations in vulnerability across distinct geographic domains as a function of socially vulnerable populations and physically vulnerable places embedded within the fabric of geographic space. An evaluation of disaster declaration data will follow the place vulnerability analysis. Geostatistical techniques will reveal spatial patterns between the number of disaster declarations per county across FEMA Region IX from 1981 to 2006 and the associated place vulnerability established during the assessment process.

Keith A. Ratner, Salem State College. Email: keith.ratner@salemstate.edu; *Tracking Land Use Change From New Rapid Transit Development in the Denver Region*

In November, 2004, the residents of the Denver, Colorado metropolitan area passed the FasTracks initiative, a \$4.9 billion expansion of the regions rapid transit system. This expansion will add 137 miles of rapid transit service to Denver's existing 25 miles. It will extend service in three existing corridors, and build new service into six additional corridors. As plans are being developed, there is a significant interest in the impact of the new service on land use, land prices, and land development throughout the Denver region. This paper will present the initial stages of a project that is going to track the land use impact of the new service. The paper will begin with a review of the literature on measuring the regional impact of new transit development. This review will include the identification and ease of obtaining potential measures, the frequency at which different measures should be calculated, and the different regional scales at which measures are found. The paper will conclude with a presentation of how the tracking process in Denver is proceeding at this time.

Email: ffglf@uaf.edu; William Schneider, University of Alaska Fairbanks. Email: ffws@uaf.edu; *Reindeer Herding, Weather, and Environmental Change on the Seward Peninsula, Alaska*

Central to the climate change discussion is the role of daily and seasonal weather within land and natural resource based livelihoods. Reindeer herders on the Seward Peninsula, Alaska rely on specific weather conditions, particularly since the Western Arctic Caribou Herd began wintering in the region in the late 1980s. Over 17,000 reindeer (affecting 13 of 15 herds) have been lost due to mixing and outmigration with the caribou. Interdisciplinary research involving a case study with one herder, weather monitoring, and interviews with other herders yielded insights about the role of weather and climate change within the social-ecological system of herding. Inclement weather limits herd access and can seriously disrupt the balancing act between increasing herd monitoring under caribou presence and finding the economic means to do so with smaller herds, diminished antler markets, and rising fuel costs. Access-limiting weather conditions are usually less measured or measurable by climate change science (e.g., reduced visibility versus low temperatures), or they involve combinations of weather and environmental factors that are also difficult to quantify (e.g., fall freeze-up or spring break-up). Delayed freeze-up (as in 1996, 2002, and 2004), frequent storms (as in fall 2004) and early break-up (as in April 2004) decrease herder mobility and have been implicated in instances of herd loss to caribou or predators. If such events occur more frequently, as is expected by numerous local knowledge holders and climate change models, herders will have to expand their caribou mitigation strategies to include adaptations for shorter and warmer winters.

Keywords: Alaska, reindeer, herding, adaptation, weather, climate change

Martin M Raubal, University of California at Santa Barbara. Email: raubal@uni-muenster.de; *Representing Geographic Concepts In Time*

People make use of concepts in all aspects of their lives. Concepts are mental entities, which structure our experiences and support reasoning in the world. Often, concepts are regarded as static although there is ample evidence that they can and do change over time with respect to structure, content, and relation to real-world objects and processes. Recent research considers concepts as dynamical systems, emphasizing this potential for changes. In order to analyse the alteration of concepts in time, a formal representation of this process is necessary. This paper proposes a formal model for representing dynamic concepts, which utilizes two theories from geography and cognitive science, i.e., time geography and conceptual spaces. Such representation allows for investigating the development of a conceptual structure along space-time paths and serves as a foundation for querying the structure of concepts at a specific point in time or for a time interval. Geographic concepts serve as examples to demonstrate the formal framework.

Julia Rauchfuss, University of Minnesota. Email: rauch024@umn.edu; Susy S. Ziegler, University of Minnesota. Email: ziegler@umn.edu; *Regeneration Patterns at the Lost 40 in the Chippewa National Forest, Minnesota*

Regeneration patterns and disturbance history were determined in an old-growth red and white pine (*Pinus resinosa* and *Pinus strobus*) forest (the Lost 40) in the Chippewa National Forest in Minnesota. The Lost 40 was not logged in the late 1800s due to a surveying error. It is one of the few old growth stands left in Minnesota. We collected data from three plots within the protected forest. We tallied and measured every tree larger than 2 cm diameter at breast height (DBH), noted the crown class, and extracted two increment cores at a height of 100 cm from each tree that was larger than 10 cm DBH. The oldest pine reached coring height in 1769; however, most pines were rotten inside and pith dates could not be obtained in most cases. Basal area data show that the pines are still the dominant trees in the plots. However, white and red pines are only canopy trees and no saplings grow in the understory. Species in the understory include birch (*Betula* spp.), maple (*Acer* spp.), and balsam fir (*Abies balsamea*). Fire scars and charcoal were absent in the plots. Because white and red pines often establish after fire, this could mean that fire has been absent long enough for evidence of fire to disappear. The exclusion of fire and lack of widespread disturbance by wind or logging would also explain the absence of regeneration of white and red pine.

Keywords: white pine, red pine, old growth, regeneration, disturbance history, dendrochronology

Christian G Raumann, United States Geological Survey. Email: craumann@usgs.gov; *Historical land use/cover for watershed model parameterization at Lake Tahoe, California and Nevada*

Changes in land use/cover over the past 150 years of human activity in the Lake Tahoe basin, especially since the onset of urbanization in the 1950s, have contributed to degradation of water quality and lake clarity due to increased sediment and nutrient availability and inputs. In response, a Total Maximum Daily Load (TMDL) analysis of the basin is currently underway to aid in minimizing, stopping, or reversing the trend of decreasing water quality and clarity. Our goal was to produce accurate measurements of historical land-use/cover conditions for selected years (1940, 1969, 1987) that could be used to parameterize a watershed model to determine baseline conditions for water quality and landscape. We refined multitemporal manually interpreted land-use/cover data by incorporating roads and erosion potential data and then aggregated the data to classes coinciding with relative nutrient- and sediment-loading ratios. Contemporary model applications relied on parcel-based land-use data that differed from the manual interpretation-based data used for historical applications. We found that the disparities in year 2002 totals between the two data layers resulted from parcel overestimation of the actual footprint of development, misregistration of roads and ski runs, and variations in the thematic and spatial scales of source data. The potential effect of these disparities on model results likely depends on the resulting variations in modeled nutrient and sediment loads, as well as model sensitivity. Our results highlight the importance of application-appropriate land-use/cover representation and the benefits of considering and emphasizing multiple uses of the data when planning new data-production efforts.

Keywords: Land use, land cover, water quality, modeling, mapping, GIS, Lake Tahoe

Mika Raunio, Sente/University of Tampere. Email: mika.m.raunio@uta.fi; Markku Sotara, Sente/University of Tampere. Email: markku.sotara@uta.fi; Kristina Vaarst Andersen, Imagine/Copenhagen Business School. Email: ; *Attractive city-regions: Varieties of quality of place*

In a recent debate about the creative class and creative cities such concepts as attractiveness and quality of place have emerged as central. It has been claimed that certain qualities of place - throbbing night life, authenticity, high-quality services, diversity, etc. - are important attractors for creative class. In this paper, the fuzzy concepts of attractiveness and quality of place are critically assessed, redefined and placed into the context of a diverse set of city-regions. In addition, the role of quality of place in relation to job opportunities and social relations, more traditional factors for inter-regional migration, is scrutinized. The key questions in this paper are: (a) what does quality of place mean in different city-regions, and (b) what are its actual meanings as an attractive factor for different groups of people. A simplified taxonomy between different types of city-regions is presented and tested with quantitative and qualitative data from eight European countries. This paper draws on the "Technology, Talent, and Tolerance in European Cities" project carried out by eight European research teams. It aims to provide the vivid debate on creative class and creative city with both conceptual and empirical insights.

Keywords: creative city, quality of place, attractiveness

Evelyn D. Ravuri, Saginaw Valley State University. Email: eravuri@svsu.edu; *Hispanic Population Growth and Urban Succession in Detroit, 1990-2000*

Although Detroit, Michigan has had a Hispanic enclave since the 1930s, rapid growth in Hispanic population in the city during the 1990s led to a major transformation of the enclave from predominantly non-Hispanic white to Hispanic, as well as an expansion of the Hispanic Enclave. This paper examines the process of urban succession in Detroit from 1990 to 2000 by creating a typology of succession to examine changes in Hispanic settlement patterns in 63 census tracts in Southwestern Detroit and the adjoining suburb of Dearborn. The five typologies created were Black Stable, Established Hispanic- White Succession, Emerging Hispanic-White Succession, Arab, and White Stable. Maps of owner-occupied housing and median housing values by tract were used to compare with that of the five typologies. In general, housing values and percentage owner-occupied housing increased with distance from Black Stable Tracts. The exodus of non-Hispanic whites from the Established Hispanic and Emerging Hispanic tracts undoubtedly left a surplus of quality housing for bargain prices and probably dissuaded Hispanics from settling in black tracts. Interestingly, more Hispanic growth occurred in the White Stable tracts of Dearborn, tracts with highest median housing values and owner occupied-housing, than in the Arab tracts contiguous to the Hispanic Enclave suggesting that cultural rather than economic constraints were more important in Hispanic settlement patterns. Given the spatial arrangement of the tract typologies in Southwestern Detroit, it would appear that the Hispanic population provides a buffer between non-Hispanic whites and non-Hispanic blacks.

Keywords: Hispanics, Urban Succession, Detroit

Rajiv Rawat, PhD Candidate, York University. Email: rajiv@yorku.ca; *Mountain Shepherds Inaugural Women's Trek: Evaluation of a community initiated and operated tourism project in the Uttarakhand Himalayas*

In the fall of 2006, a unique ecotourism event was staged to mark the launch of the Mountain Shepherds Initiative of the Nanda Devi Campaign, an environmental justice movement fighting for cultural survival and sustainable livelihoods in the Uttarakhand Himalayas. The new commercially oriented yet community owned and operated ecotourism venture attempted to employ the Inaugural Women's Trek as a way to gain exposure to international clientele, as well as to learn from more experienced trekkers ways to improve and give shape to their nascent operation. This presentation will thus trace the experiences of both the young guides and women trekkers as they attempted to navigate the nuances of their mission, as well evaluate the overall effort in terms of feedback received from various parties, including organizers, trainers, and community members who shared in hosting the trek participants.

Lesli M. Rawlings, University of Nebraska. Email: l.r@juno.com; *The Impact of Public Schools on Home Values in Lincoln, Nebraska*

Few studies have quantitatively examined the impact of assigned public schools at the elementary, middle, and high school level on home sale prices. Interviews with school district officials indicated that residential developers readily negotiate land transactions for new elementary school sites as opposed to high schools. Supposedly, homeowners have a "Not In My Backyard" (NIMBY) attitude toward high schools because of traffic congestion and noise generated by student drivers. The objective of this research determines how public school

character (e.g. school level) impact 2005 home sale prices in Lincoln, Nebraska.

Keywords: home value, schools, NIMBY

Emma Rawlins, University of Leeds. Email: geolr@leeds.ac.uk; *Citizenship, Health Education and the UK Obesity 'Crisis'*

This paper considers how conceptions of citizenship in Britain are linked to the notion of being a healthy citizen. In light of the current childhood obesity 'crisis' the delivery of health education messages is seen to be extremely important. In particular the implicit theme of these messages is that being a 'Good' citizen means making the 'right' choices when it comes to lifestyle decisions such as eating and physical activity practices. This study focuses on how these messages are delivered in school and crucially how these messages are interpreted and followed (or not) by students. The research involved work in a Secondary School in a Northern City in the UK, in addition to in depth research carried out with eight families. The findings suggest that the influences on children's lifestyle choices vary across the key spaces of childhood; the home, the school and the peer/community spaces (Holloway and Valentine, 2000). The paper concludes by highlighting the weaknesses of current health education messages that are aimed at the individual. These messages do not consider the interspatial nature of eating and physical activity practices and will not be as effective as those aimed at the family, school and wider community.

Keywords: Citizenship, Health Education, UK, Obesity, Intergenerational

John W. Raymond, Salem State College. Email: john.w.raymond@verizon.net; *Using LIDAR to measure roof areas in hurricane prone regions*

A major concern of the Federal Emergency Management Agency is to minimize the damage of surviving structures and dwellings after a hurricane event. FEMA has instituted a program for post hurricane relief called "Operation Blue Roof". It consists of the placement of plastic blue tarps over the damaged roofs of buildings. This is to minimize further water damage. A major problem is determining the area of the roof's to be covered prior to or just after a hurricane event. Having forehand knowledge of the square footage to be covered will be of great logistical importance. This project will examine the feasibility of using LIADR images or LIDAR in conjunction with other remote sensing data to measure the square foot area of individual structures in a given area. The area of study will be along the south coast of Louisiana.

Keywords: Remote sensing, natural hazards, LIDAR

John W. Raymond, Salem State College. Email: jwraymond60@hotmail.com; *Developing a fall foliage observation route through New England during peak season*

During the fall season many tourists travel to and throughout New England to observe the fall foliage. Normally peak season for fall foliage is between the beginning to the middle of October, when the nights get cold enough and daylight is shortened so that the chlorophyll in the leaves begins to break down letting the other pigments begin to show. This project will attempt to determine the route for fall foliage viewing based on satellite imagery. The data for this project will be Landsat 7 ETM+ satellite imagery from the Global Land Cover Facility website. Not only will I be looking at different land cover types (deciduous and coniferous trees), but elevation data will also help determine the "best viewing areas" in New England by taking elevation, slope and aspect into account.

Keywords: Remote Sensing, New England, tourism

Jane M. Read, Syracuse University. Email: jaread@maxwell.syr.edu; *Teaching Introductory GIS through Public Scholarship*

Action learning through public scholarship provides an opportunity for incorporating real-world (relevant) problems into college courses, which has been shown to increase student learning. Teaching Introductory Geographic Information Systems (GIS) entails linking concepts and principles of GIS with the technical skills required to run GIS software and implement projects, which can be challenging in standard lecture and laboratory-format courses. This paper reports on an upper-level Introductory GIS course for undergraduates that incorporated action learning and public scholarship through a community-driven mapping and analysis project examining food security issues in the City of Syracuse, NY. Throughout the project, students used and developed their GIS skills to compile and analyze datasets, and present results of their analyses to members of the public. They also practiced consultation skills through working with representatives of community organizations, and learned about elements of research design and project implementation. Analysis of student journal reports and student course evaluations indicate that incorporating a community-based project into the course was effective in aiding student-perceived learning of GIS, while also giving them insight into an important social issue within their community. Drawbacks in this exercise included uncertainties in outcomes and the amount of teacher preparation time required to set up and guide the work. Additional benefits, however, included improved and ongoing community-university

linkages, provision of useful data for the community organizations to use, and increased awareness of GIS and geography both on campus at student and administrative levels, as well as in the community.

Email: bward@cas.usf.edu; Michele L Casper, Centers for Disease Control and Prevention. Email: myc5@cdc.gov; *Premature, Out-of-Hospital Cardiac Death: Geographic Perspectives at the National and Metropolitan Statistical Area Scales.*

Premature cardiac death can be defined as a death from "diseases of the heart", under 65 years of age. Approximately 70% of premature cardiac deaths occur in "Out-of-Hospital" locations, such as the residence of the decedent, the community-at-large, in-transit (dead-on-arrival) or in emergency rooms. This paper is concerned with investigating the spatial variation in the relative proportions of premature cardiac deaths which occur In-Hospital and Out-of-Hospital at two different spatial scales. At the national scale, the percentages of premature cardiac deaths occurring Out-of-Hospital by county are compared to county level measures of emergency room accessibility. The measure of accessibility is sophisticated, and is based on aggregating accessibility measures at the census tract level, taking into account relative age distributions and road network distances. At the Metropolitan Statistical Area scale, and based upon the Tampa MSA, a dataset of approximately 50000 cardiac deaths over a 5 year time period (1998-2002) is geo-coded to residential address. The spatial variability in the 'place-of-death' for these decedents is investigated using innovative spatial point pattern methods that take into account both individual-level and community level explanatory variables. The paper makes extensive use of GIS methods and is instructive as to the roles played by different levels of explanatory variables at different spatial scales.

Stacy Rebich Hespanha, UC Santa Barbara. Email: stacy@geog.ucsb.edu; *Interactions between Emotion and Cognition in Public Response to Information about Global Climate Change*

While recent studies show that a majority of Americans and Europeans believe that climate change is happening and that human activities are at least partially responsible, individuals, private institutions, and governments have been slow to adopt behaviors that could mitigate or help prepare for the predicted changes. Scientists, environmental organizations, and concerned citizens and policy makers have waged public information campaigns in an effort to remedy the public's erroneous ideas or lack of knowledge about the nature, mechanisms, and predicted consequences of climate change. However, some behavioral researchers posit that a more complete and accurate public understanding of the climate system may not be enough to motivate the behavioral changes necessary. I will summarize findings from the fields of psychology, cognitive science, risk analysis, and communication suggesting that behavior in response to predicted risk, danger, or loss emerges from the interaction between affective and cognitive processes. In addition, I will examine some models of the influence of emotion on cognitive processes and discuss how these ideas could be used to empirically investigate the emotional impacts of the rhetorical and visual images that are being used to communicate with the public about climate change.

Keywords: cognition, emotion, affect, climate change, public understanding, imagery

Carlos Reboratti, . Email: creborat@arnet.com.ar; " *The Actors of Trans-National Environmental Conflicts: The case of paper manufacturing on the Uruguay-Argentina border*

Environmental conflicts around the installation of paper pulp manufacturing are not new around the world. But since 2004 a new conflict is developing in South America which adds two new dimensions: an international perspective and a strong spontaneous local environmental movement. In this paper we analyze

the origins and development of a still not solved conflict, which act as a mirror for the political, social and environmental situation of both Argentina and Uruguay. This last country had developed, since the '80s an active forestation policy, which end in the project for building two large paper pulp mills over the international Uruguay River. But in Gualaquachu, on the Argentinean margin, a spontaneous popular movement opposed to this project began to grow, based in the potential contamination effects on the river and its impact of the tourist activity. The industries promised to generate a large labor demand and use the best available technology to avoid contamination, and their plans were accepted by Uruguay, but not by Gualaquachu. The environmental movement produced several large manifestations and cut the roads between both countries in many occasions. The Argentine government, lacking an official environmental policy, took the position of the Gualaquachu environmentalists, and the subject was taken to The Hague International court. Social environmental movements, the tension between production and contamination and the existence a political boundary showed as an explosive combination, very difficult to control and with an unpredictable end.

Maharaj Vijay Reddy, University of Kent, UK. Email: m.v.reddy@kent.ac.uk; *Reviving Tourism in the Andaman and Nicobar Islands of India: a Challenge for the Crisis and Disaster Management Planners*

The 2004 Asian tsunami caused serious impacts on the ecosystem, and tourism industry of the Andaman and Nicobar Islands (ANI). The legacy left by the tsunami has meant that hotels and other tourism firms have only received around 5% of their usual business in 2005. Whilst there has been a slow increase in tourist arrivals in 2006, a study funded by UNESCO in 2005 identified that there was an urgent need to engage the local community and tourism stakeholders in post-tsunami crisis management discussions to promote and foster the reinforcement and reconstruction of the tourism industry. Nevertheless, the recent tourism development measures undertaken by the ANI administration have received strong criticism from the environmentalists and NGOs who have indicated that these plans are neither sustainable for the community well-being nor the resource base. Planners and policy makers face a distinct challenge in this part of the world especially considering the Indian government restrictions imposed on developing research with international collaboration. The aim of this paper is to discuss the medium-term challenges facing the reconstruction and reassessment of the ANI tourism industry through a semi-structured interview process. This paper also aims to address the strategic and holistic approaches of tourism disaster management adopted in other destinations. Such models are important for long-term recovery of the tourism industry from disasters and chaos, and could well provide a potential model to aid tourism revival in the ANI.

Sumanth G. Reddy, Kansas State University. Email: sreddy@ksu.edu; *Image, Advertising and Medical Tourism in India*

Just like the IT boom of the mid-1990s, India has been experiencing a medical tourism boom since the early 2000s. Medical tourism is defined as the travel of patients from one country to another to get some form of medical or wellness care/treatment. In most instances patients from Western countries go to developing countries for medical treatment because of the relatively cheap prices. This research examines the extent to which hospitals are using the internet and the different methods that are being implemented to catch the attention of medical tourists. To attract medical tourists, hospitals in India are using print and broadcast media. However, due to the relative ease and universal accessibility of the internet, the web has become the primary source of advertising. With the medical tourism industry in India expected to generate over \$2 billion by the year 2012, it will be crucial and essential that advertising, especially thru the internet will be the key to increased success of the industry.

Danny Redo, PhD student, Texas A&M University. Email: dredo81@yahoo.com; *Resource Usage and Park Performance in the Bolivian Chaco and Chiquitano Forests*

In 1995, Kaa-Iya del Gran Chaco National Park (KINP) was established in the vast Chaco of Bolivia as the largest park in the country and home to the largest remaining intact dry forest in South America. It also holds the highest diversity of large mammals on the continent and claims to be the only co-managed park in the Americas. But in the same light, human development threatens this novel approach to protected area implementation as colonists drive the agricultural frontier ever closer, commercial hunters search for pelts and skins, the Bolivia government undertakes highway construction, and trans-national hydrocarbon industries seek natural gas deposits in and around the park's core. Reconnaissance work in the summer of 2006 and visual examination of

satellite imagery shows this trend, but the degree of forest loss and livelihood effects to the park and people are undocumented. The performance of KINP in conserving, but economically developing one of the keystones of the Chaco forest for economic prosperity, has yet to be assessed. In addition, a variety of ethnic groups living on the park's periphery use the land and the park quite differently and little of this is known. Thus, many questions remain unanswered. Has KINP been successful? What effect is the park having on the livelihoods of local peoples and vice versa? How are local people using natural resources? Is there conflict over resources? This paper seeks to answer some of these questions from a human-environment perspective using sensed analyses and formal and informal interviews.

Bradley Reed, United States Geological Survey. Email: reed@usgs.gov; Jo-Ann Isbrecht, United States Geological Survey. Email: jisbrecht@usgs.gov; Remote Sensing of Desert Annuals Phenology

The phenology of desert vegetation is difficult to characterize with conventional remote-sensing approaches, as there are often two temporal vegetation signals during a calendar year: one from perennial plants (for example, creosote bush and sparse perennial grasses) and a second from the flush of annual plant growth that responds opportunistically to available moisture. In addition to the mixed vegetation signal, difficulties are compounded by sparse vegetation cover and variation in the soil background, which often dominates the vegetation signal. Conventional phenological characterization techniques that are dependent on a well-defined cyclic vegetation index signal do not apply well in desert environments. A new approach is required that identifies the flush of annuals and meaningfully characterizes it by providing appropriate descriptions (that is, the timing, duration, and magnitude of plant growth and the length of time since the last occurrence). An approach to identify the occurrence of annual vegetation has been developed using the red and near-infrared (NIR) wavelengths, coupled with vegetation index data - all derived from MODIS 250-m resolution satellite data over the southwestern United States. The growth of annuals is defined as occurring when the red reflectance is less than the median reflectance and NIR reflectance and vegetation index values are higher than their medians. There is strong agreement between results derived with this method and those obtained from higher resolution satellite imagery. The research has potential applications for identifying fine fire fuels, areas of potential dust stabilization and subsequent dust source, and carbon flux over dryland environments.

Denise J. Reed, University Of New Orleans. Email: djreed@uno.edu; Tidal Marsh Sustainability in the Mississippi and Sacramento - San Joaquin Deltas: the role of storms and floods

Tidal marsh substrates, even those considered peat, provide a record of depositional processes revealing the role of episodic events in sedimentation. In the Mississippi Delta Plain, sediment deposition measurements during tropical storm and hurricane events in the last 15 years have allowed the specific identification of storm sediment inputs. Some workers have estimated that hurricanes Katrina and Rita contributed approximately 130 million tones of sediment to Louisiana coastal marshes. These sediments are crucial to the long-term sustainability of marshes threatened by high rates of relative sea-level rise and massive hydrologic alteration. Sediment mobilization by storms is a process which has influenced these marshes for millennia, possibly with some cyclic variation, and which is expected to continue. In contrast, flood events on rivers providing sediment to the tidal marshes of the Sacramento - San Joaquin have been massively altered in the 20th century. Cores from substrates in these fresh marshes also show periodic inputs of mineral sediment, albeit at a frequency diminished by upstream dams, which provide substantial contributions to vertical building. While the genesis of the marshes and the role of sediment input vary between the two systems, the Mississippi Delta marshes were built during regression while the Sacramento-San Joaquin Delta is transgressive, the role of storm and flood sediment inputs in their future is similar. The flood events in both systems which bring about such huge damage to property, may be critical for the sustainability of tidal marshes in both California and Louisiana.

Keywords: tidal marsh, sediment, storm, flood

Maureen G. Reed, Dr., University of Saskatchewan. Email: m.reed@usask.ca; Uneven Environmental Management: A Canadian Comparative Political Ecology

Contemporary researchers of environmental management argue for community-based approaches that respect local circumstances, skills, and concerns. However, relying on local capacity opens up the possibility of establishing highly uneven management practices. The purpose of this paper is to explore the roots and effects of uneven environmental management. I develop a conceptual framework that identifies key elements of regional environmental

management regimes and then use it to compare experiences in two Canadian biospheres designated in 2000: Clayoquot Sound, BC and Redberry Lake, SK. Analysis reveals that differences in property instruments and civic sectors affect the institutional capacity of each locality, opening the door for private forms of environmental governance in Redberry Lake. To explain how property instruments and civic actors operate, I illustrate how processes associated with property exchange, re-territorialization, valuation, and planning work together to produce a relatively robust and public regime at Clayoquot Sound and a more private form of stewardship at Redberry Lake. In consequence, uneven environmental management practices may take root and reinforce social inequalities across the two regions.

Sarah E Reed, University of California, Berkeley. Email: sreed@nature.berkeley.edu; Spatial Patterns of Carnivore Species Co-occurrence in Grand Canyon National Park

Successful conservation and management of ecosystems require an understanding of spatial relationships among species, and identifying factors driving community assembly patterns is a fundamental question in biogeography. Laboratory and field experiments have demonstrated the local importance of predation and competition, but predictive distribution models rarely incorporate data on co-occurring species. In this study, I paired non-invasive surveys with null model analyses of community structure to assess the importance of species co-occurrence in determining mammalian carnivore distributions. I conducted my research in Grand Canyon National Park, in ponderosa pine and pinyon-juniper forest ecosystems that support at least ten species of native carnivores. Between 2003 and 2005, I surveyed 78 randomly-selected sites using a suite of passive wildlife monitoring techniques to maximize the likelihood of detecting all target species. In addition, I collected and derived common habitat variables for all monitoring sites. A null model analysis of species detections did not show evidence of community structure, but several pairs of species had limited co-occurrence, and coyotes and bobcats co-occurred significantly less frequently than expected by chance. I used regression analyses to test the relative importance of habitat variables and species co-occurrence for predicting the presence of each carnivore, comparing model predictions with and without the inclusion of co-occurring species as dependent variables. The results of my research indicate that the distribution of an individual species can be an important determinant of community composition, and excluding co-occurring species from predictive models could result in misestimation of population size or probability of occurrence.

Keywords: biogeography, species co-occurrence, community assembly, distribution models

Catherine Mary Rees, BA MA, University of Wales, Aberystwyth. Email: cmr04@aber.ac.uk; "I'm an Irish Man" (Marie Jones, A Night in November, 1994): The Performance of National Identity in Contemporary Irish Theatre

Modern Irish studies frequently describes the nation as experiencing moments of revolution; of crises of identity surrounding the deconstruction of national distinctiveness. Ireland and 'Irishness' are thus rendered unstable concepts; descriptions of geographies in states of flux, anxiety and crisis. This paper explores the fragmentation of previously considered national certainties through the study of Irish theatre and dramatic performance. It seeks to describe national identity as narratives; representations which are ascribed, adopted, performed or constructed. The paper suggests ways in which contemporary Irish theatre is involved with a performance of national identity, often through direct interaction with the audience, subverting or problematising traditional spatial boundaries. Thus national identity narratives are literally performed and asserted, but also crucially undermined and rendered unstable, as ambivalence towards the narratives accepted by previous generations is performed. Communities are thus forced to re-address the means of their own national reproduction and take charge of the processes by which they define their existences. The paper concludes by arguing that this is a far from simple process, and often involves postmodern deconstructions of previous narratives and ironic new applications.

Peter W. Rees, University of Delaware. Email: rees@udel.edu; Upstate-downstate: the origin and delineation of vernacular divisions within states

No state, however small, is sufficiently homogeneous that the people in one area do not hold distinctive and often perjorative views about other parts. These spatial distinctions are often bimodal and their borders are usually ill-defined, rarely following the boundaries of formal political sub-regions. Yet to be unaware of such vernacular subdivisions is to not fully understand the culture and social dynamics of a state. A case study of Delaware provides a means of exploring the

origin and delineation of such perceptual divisions. Lying east of the Mason-Dixon line, Delaware straddles a major cultural divide between the south-east Pennsylvania and Tidewater cultural hearths. As a border state, it sent troops to serve in both the Federal and Confederate armies in the Civil War. Mapping the home location of these soldiers, together with other cultural manifestations, may help to explain how the Chesapeake and Delaware canal that had crossed the state from 1829 became the dividing line between upstate and downstate and colors the views each group of citizens holds about the other to the present day.

Keywords: states, vernacular, divisions

Carl A. Reese, Ph.D., University of Southern Mississippi. Email: Carl.Reese@usm.edu; *Geologic evidence of Hurricane Katrina recovered from the Pearl River Marsh, Mississippi*

Hurricane Katrina made landfall on the morning of August 29th, 2005, as a category 3 storm at the mouth of the Pearl River on the Mississippi/Louisiana border. Between October and December of 2005, 16 cores were recovered along two transects in the Pearl River Marsh; one across the width of the Pearl's mouth, and the second running south to north from the mouth of the delta to Honey Island Swamp, Louisiana. Loss-on-ignition analysis clearly identifies the sediments deposited by the storm and the resulting 19.5 foot storm surge. This overwash layer is marked by high clay content and lower percentages of water and organic materials. The layer is unevenly distributed throughout the study area, and is thicker and more pronounced towards the center of the marsh. Coupled with additional research, the results of this study may benefit the science of paleotempestology by helping to establish a modern analog for hurricane strength/storm surge height that sharpens all future paleohurricane reconstructions in marsh environments.

Keywords: paleotempestology, hurricane, Pearl River Marsh, Louisiana, Mississippi

Jane Reeves, Dr, University of Greenwich, UK. Email: gouldreeves@handbag.com; *Social and demographic factors of young fatherhood in the UK and USA.*

Research on disadvantaged young fathers has been minimally addressed in the literature, particularly in the UK. In both countries teenage pregnancy rates are high and costly in terms of social policy and community provision. This paper explores 2 studies involving 24 young men with an average age of 17 on the transition to young fatherhood; one study was conducted in the UK with white young men and the other in the USA with black young men. The findings from both studies indicated common themes from their stories, particularly with regard to the high levels of disadvantage and social exclusion they had been exposed to in their demographic environments and the anti-social behaviour they described engaging in, prior to the birth of their child/ren. Specifically, a significant proportion of the young men described how they had been immersed in drug and gun crimes and how this shaped their lives and neighbourhoods. Becoming fathers is presented by both sets of young men as rescuing them from this criminal lifestyle.

Keywords: Social, Demographic, Culture, Fatherhood, Young

Joel Regehr, York University. Email: joel.regehr@gmail.com; *Rethinking Politics and Place: Red Power Activism in San Francisco and Vancouver*

Since the early 1950s, Aboriginal communities have become increasingly urban. This shift has tended to be viewed as a way of successfully assimilating Aboriginal people into non-Native, capitalist democracies. It reflects a still common colonial interpretation of Native and non-Native space in North America that relegates 'authentic' Aboriginal space and culture to reservations, thereby defining Aboriginal people in cities as 'out of place.' This paper will explore attempts by Aboriginal people in Vancouver and San Francisco in the 1960s and 1970s to reassert a claim to Aboriginal place in the city. In San Francisco, the occupation of Alcatraz Island in 1969 marked the emergence of the Red Power movement to a much wider audience, yet was part of a local movement that had been making claims to the city for at least a decade. Vancouver did not produce a similar activist event, yet activists were involved in the growth of a number of locally-controlled social, political and economic initiatives, including Native-controlled housing and craft cooperatives. Red Power activism in cities included not only a vocal and often public demand for the right of political and economic self-determination, but also through local, place-specific indigenous political, cultural and economic practices, an affirmation of Aboriginal place in the city. This affirmation of local economic and political difference offered a powerful critique of the widespread view that the Aboriginal 'problem' was a problem of lack of access and integration into non-Aboriginal capitalist economic and political practices, rather than one of western capitalism and colonization.

Keywords: place; indigenous; migration; urban; activism

Michael Reibel, California State University, Pomona. Email: mreibel@csupomona.edu; Aditya Agrawal, University of Redlands, Redlands Institute. Email: Aditya_Agrawal@institute.redlands.edu; *Areal Interpolation of Population Counts Using the National Land Cover Dataset*

The authors empirically test a relatively straightforward and accurate areal interpolation approach using the National Land Cover Dataset (NLCD), produced by the US Geological Survey. The NLCD data, which is free and downloadable, provide pre-classified information on land cover category types at 30 meter resolution for the entire United States. We interpolate 2000 census tract population counts in eastern Los Angeles County to the 1990 census tract geography. This technique uses the NLCD data to derive a set of weights for very small area (nearly spatially continuous) population densities associated with those urban land cover types via regression. The weighted estimates for the small areas, 30 square meter grid sections in the case of the NLCD data, can then be aggregated to the non-conforming set of regions, making it possible to combine data aggregated to incompatible zone systems. Normally, inferring urban land cover from remotely sensed images requires digital image processing to classify the land cover types from the reflectance values of the image. The NLCD data are ideal for demographers who are not GIS specialists but who seek practical and accurate solutions to spatially mismatched data problems because they are already classified, making digital image processing unnecessary. Weighted interpolations using the NLCD data can thus be performed in a GIS without the need for specialized digital image processing skills.

Keywords: areal interpolation, dasymetric mapping, classified land cover data

Joanna I.E. Reid, MSc, UBC. Email: joannareid@fastmail.fm; *Grassland Ecology and Livelihoods in the Fraser Canyon, BC*

My purpose is to examine the consequences of the imposition of national and international ecological ideas on a local landscape. Specifically, I am concerned with how a changing corpus of scientific work about grassland ecology affects the practices of ranchers and First Nations living in the Fraser Canyon in British Columbia. The Fraser Canyon is the ancestral home to First Nations who recently have sought to reclaim their land and resources. In addition, the Canyon grasslands have been ranched for over one hundred years, and ranchers continue to hold strong economic and social ties to the landscape. Over the last fifteen years, a number of environmental interest groups took an interest in the grasslands of the Canyon. Consequently, parks and protected areas were created, regulations were changed, and new attention was placed on ranch management. These environmental interests, and the science that lies behind their proposals, are transforming the institutions that govern grasslands in BC. As they do so, they are influencing ecology and the people who live there, especially First Nations and ranchers, and often in unintended ways. In my paper, I will discuss the creation of the Churn Creek Protected Area, which has actually caused more grassland degradation than it has prevented. As well, the protected area designation has complicated the just resolution of Aboriginal title and increased the regulatory burden on ranchers, many of whom are, at best, only marginally profitable. In these ways, applying science to a local landscape has many unintended consequences.

Historically, geographers have had a strong interest in the agricultural sector of the economy. In recent decades, however, this interest has waned as the manufacturing sector and, more recently, the service sector have increasingly attracted the attention of geographers. This paper represents an attempt to redress this imbalance. The focus of this paper is the U.S. floriculture industry. Specifically, the paper examines changing trade flows in floriculture between the U.S. and Canada. During the last ten years there has been a widening trade imbalance in floriculture products between the United States and Canada. U.S. floriculture exports to Canada have remained flat, while Canadian floriculture imports to the United States have increased significantly. The increasing penetration of Canadian floriculture products into the United States has the potential to negatively impact the floriculture industry of particular regions of the United States. This paper attempts to identify which regions are most under threat from Canadian floriculture imports. This analysis provides context for a greenhouse cluster-based economic development project focusing on northwestern Ohio, known as Maumee Valley Growers. The project has been developing since 2003 to assist greenhouse growers in northwestern Ohio cope with increasing Canadian imports and other competitive challenges.

Keywords: floriculture, trade, Canada

Liam M Reidy, University of California, Berkeley. Email: lreidy@berkeley.edu; Roger A Byrne, University of California, Berkeley. Email: arbyrne@berkeley.edu; *Stratigraphic Evidence for Holocene Seismicity along the San Andreas Fault at Bolinas Lagoon, Marin County, California*

The San Andreas Fault is well known as the most active fault in North America. In California, it extends from the delta of the Colorado river to Point Arena, a distance of 1200km. Here we present the history of large magnitude ($M=7.0$) earthquake events preserved in sub-tidal sediments at Bolinas Lagoon, California. Bolinas Lagoon is located on the southeastern end of the Point Reyes Peninsula where the San Andreas fault crosses the Marin County coastline. The earthquake "signal" was discovered during the course of an earlier study on changing sedimentation rates in the lagoon, indicated by changes in grain size and sediment chemistry. Also, buried marsh sediments, such as have been widely reported in the Pacific Northwest are occasionally encountered. The longest core we have recovered is 7.25 m long and covers approximately the last 1600 years. The stratigraphy of this core suggests that there were at least 5 major earthquakes during this time period.

Keywords: Earthquakes, Holocene, San Andreas Fault, Pollen,

Ben W Reilly, Graduate Student, Central Washington University. Email: Gallipoli@gmail.com; Robert Hickey, PhD. Geography, Central Washington University. Email: Bob.Hickey@cwu.edu; *Predictive GIS Landuse Modeling: Sustainable Community Development in Sub Arctic Ports*

Fueled by climate change projections indicating a longer ice-free season in the arctic, formerly marginal economic resources in sub arctic regions are experiencing renewed interest. This interest is demonstrated by increased efforts to map the continental shelf in the arctic (which determines sovereignty according to the United Nations Convention on the Law of the Sea) and Canada plans to produce armed icebreakers; each of which will operate out of arctic and sub arctic ports. A longer ice free season in Hudson Bay has resulted in a longer shipping season for the grain trade from the Plains region of Canada, Churchill has been the site of substantial port expansion and is projected to usurp Thunder Bay in eastward shipping of Canadian grain if current warming trends continue. A predictive landuse model for Churchill has been developed to determine the best management practices to implement which conserve the natural environment and properly allocate investment funding in an effort to best utilize these community's resources. This model endeavors to (1) determine the unique variables of sub arctic communities, (2) produce landuse maps for distinct time periods using trend analysis GIS techniques and economic analysis, and (3) effectively predict future landuse/community viability in the absence or presence of given regulatory guidelines.

Matthew J. Reilly, University of North Carolina - Chapel Hill. Email: mjreilly@email.unc.edu; *Re-conceptualizing Havana: the Role of Public Space in Urban Transformation*

After decades of benign neglect, a consequence of the Revolutionary government's anti-urban development policies, the urban landscape of Havana is being transformed as the government, in cooperation with foreign corporations, and newly formed quasi-private entrepreneurial companies, NGOs, and local participatory planning groups, are re-investing (materially and symbolically) in the built environment and public spaces of the city. This represents a rapid and systematic shift in the location and quantity of capital being invested in the built environment and public spaces of Havana, and is part of a broader cultural shift as the state markets and (re)develops the city's cultural and tourists sectors. Cuba's efforts at aggressively marketing the cultural economy of Havana, through urban redevelopment, heritage preservation, and tourism development, can be seen as an attempt to marshal space and place as a means of capital generation in line with neo-liberal strategies being employed throughout the West. Havana is undergoing a period of instability and transition as it occupies a contested hybrid space between capitalism and socialism; and therefore understanding how public space has been/is produced can provide tremendous insight into the future of Havana's urban landscape and the processes of change that the global and the local co-create. The argument of this research is that the crisis of the 1990s, and the ensuing politico-economic restructuring, have altered the 'spatio-temporal structuration' of social life in the city (Soja 1985), and this research intends to use the public spaces of Havana as the vehicle through which to examine these transformations.

Keywords: public space, heritage preservation, neoliberalism, Cuba

Michael Kaston Reilly, Stanford University. Email: mkreilly@mac.com; *Modeling the Influence of Agglomerative Effects on Business Location Choices in California*

A variety of geographic approaches over the last decade have stressed the importance of agglomerative effects in influencing the spatial trajectory of economic activity. For example, the "new economic geography" employed endogenous models of agglomeration to understand international trade. Fujita and Krugman (1994) have theoretically extended this framework to models of endogenous urban subcenter formation and growth but little empirical work has followed. The research here applies this approach to an empirical examination of the spatial dynamics of business establishments in California's largest metropolitan areas between 1996 and 2004. All business establishments are categorized according to their expected sensitivity to within-industry agglomerative effects: business & law, media, research & development, high-tech manufacturing, other manufacturing, and population-serving (e.g. retail). The increase in the number of establishments of a particular type at an employment location is modeled as a function of access to other employees in the same category, local congestion, and a variety of site-specific controls. A reduced-form Poisson regression approach allows for the relative assessment of the important of agglomerative effect by industry. As expected, the agglomerative variables are generally strongest for employment categories emphasizing face-to-face contact and weakest for population-serving businesses. These relationships vary between metropolitan regions partly as a result of specific local policy regimes.

Josephine V. Rekers, University of Toronto. Email: josephine.rekers@utoronto.ca; *Communities and knowledge circulation in the innovation process - A relational approach*

Although relationships, face-to-face contact and the social and institutional embeddedness of economic activity are important themes in research on the innovation process, the 'relational turn' has a broader potential to inform this field in terms of research approach. 'Turning' further would add considerable insights to debates surrounding knowledge-intensive production, which attempt to tease out which processes are necessarily local and which are potentially global. Bodies of literature that put networks and communities at the center of research, including social network analysis and the sociology of science, see knowledge as practice, rather than as possession. This perspective takes the innovative and creative processes and relationships as the 'subject' - rather than the region - and explores their geographical sensitivities and characteristics. This approach raises a different set of interesting geographical questions regarding the circulation of

knowledge and ideas, and the ways in which institutional and cultural processes facilitate or hinder this diffusion. How does geography affect the actors' role in a network, the relationships between actors, and the network as a whole? What forms of 'proximity' are important between actors, but also within the network, and at which stage of the innovation process? In this paper, I review theoretical and empirical work on networks, communities of practice and epistemic cultures, as well as present preliminary findings of my doctoral research which compares two communities and their mechanisms of circulating knowledge.

Keywords: innovation process, community of practice

Recent studies have examined the interactions between people's Internet use and their activity-travel patterns from different focuses. One such focus is on generalizing the impact of the Internet use on people's activity-travel patterns. Although empirical studies have made great progress, the results are still inconclusive due to the lack of needed data and the complexity of people's activity-travel behaviors. This study aims to explore what changes in activity-travel patterns will occur as a response to Internet use. An activity-Internet diary data set collected in Columbus (Ohio, U.S.A.) will be applied. The data set provides information about the respondents' activities and trips in the physical world as well as their Internet activities. Analysis will be performed using structural equation modeling technique in order to reveal hidden patterns embedded in the data. The research results are expected to help us gain more insights into the interrelationship between the use of the Internet and people's participation in physical activities and travel.

Jianhua Ren, Department of Geography, National University of Singapore. Email: RenJianhua@nus.edu.sg; *Mainland Chinese Transnational Corporations in Asia: Spatial Embeddedness and Knowledge Transfer across Borders*

This paper examines the organizational convergence and/or divergence of practices between the parent and foreign subsidiaries in transnational corporations. While existing literature recognizes the importance of embeddedness of firms in institutional environment, the precise mechanism and process remain unclear. This paper develops a comprehensive theoretical framework that synthesizes the embeddedness theory with the concept of spatial knowledge transfer from a relational network perspective. To establish a foreign subsidiary is a process of de-embedding some practices from the home country and re-embedding in the host country simultaneously. This process is accomplished through spatial knowledge transfer of transnational corporations with involved actors. This paper illustrates these conceptual arguments through empirical investigations on transnationalization of transnational corporations from mainland China. I have interviewed more than 80 executives both from headquarters in China and subsidiaries in Hong Kong, Singapore and Malaysia from about 60 biggest firms in China. The study compares strategy, finance, human resource management of headquarters and foreign subsidiaries and analyzes how and why differences come about from regulatory and institutional level, organizational level and individual level. In conclusion, I argue that regulation is direct and influential force that leads to parent-subsidiary divergence. The relationship between parent and subsidiaries and key decision makers in transnational corporations also play a role.

Hydrologic changes wrought by infrastructure development in a watershed, alter the sedimentation and erosional regimes of fluvial systems in the watershed from their pre-development functionality. Rohrer and Rosner (2005) have developed a method for quantifying flow frequencies and shear stress in order to show changes in erosive capacity at multiple recurrence intervals when hydrology has been altered. We have expanded on this method and suggest that it can be used effectively for quantifying fluvial geomorphic change based on recurrence interval. Beginning with hydrology, existing flows at many recurrence intervals can be plotted along with predicted flow alternatives. The difference between the area under each curve is calculated to determine the overall percent change between the existing flows and predicted flows. Subsequent parameters such as sediment transport capacity and stream power can be plotted versus recurrence interval for existing and proposed conditions, and percent change can be

determined similarly to flow. Percent change results for many alternatives can then be displayed graphically so that parameters indicating either erosion or sedimentation can be evaluated. With this technique a single graph can be constructed with multiple erosion/sedimentation parameters showing changes between alternative hydrologic regimes over many recurrence intervals. Alvin Rentsch, President, University of Louisville Geography Club, Department of Geography and Geosciences, University of Louisville. Email: arrentsch@hotmail.com; *Spatial variation of precipitation surrounding Louisville, Kentucky: Heat island effect?*

Storms originating from the west display a pattern of diverging to the north and south when approaching Louisville. Louisville is the major urban area in the region located in Jefferson County, Kentucky and has a demonstrated heat island. An analysis of variance of monthly precipitation records was performed for 32 meteorological stations in West Central Kentucky and Indiana region. The dataset used consists of records of monthly precipitation for the 36 year period from 1970 to 2005 and were retrieved from the NCDC website. Stations were chosen to be spatially representative of the region surrounding Louisville. Analysis of variance was performed on the annual and seasonal precipitation for each station. Variation detected by the different analyses were compared and clustered in groups according to their patterns. They fell into geographic clusters of northern, southern and central regions. Linear regression was used to determine the magnitude of the relationships between the stations. Once identified as significant the Tukey test was executed to identify the level of significance found between the stations. Several patterns were found to be of importance during various months of the year. One such pattern indicates regions to the south and west of Jefferson County as having higher rates of precipitation than the areas immediately surrounding Louisville Kentucky

William H. Renwick, Miami University. Email: renwicwh@muohio.edu; *Regional Analyses of Spatial and Temporal Trends in Reservoir Sedimentation*

Reservoir sediment surveys provide one of the most reliable and readily available long-term records of sediment export from the landscape. Despite clear evidence of changing upland erosion, overall trends in reservoir sedimentation remain uncertain. In addition, the proliferation of small upstream impoundments is likely to reduce sediment inputs to streams and thus downstream reservoir sedimentation. In some areas of the U.S., sufficiently large numbers of recent resurveys are now available to begin to address questions of long-term trends in reservoir sedimentation in the context of land use change and related erosion patterns at the decade- to century-time scale. Recent sedimentation data for Ohio, Texas, Kansas, and other areas suggest that on average sedimentation rates are not declining. In some areas there is evidence that sediment sources are shifting from upland to channel sources. The combination of growing numbers of reservoirs and sedimentation rates that are not declining implies that subaqueous reservoir sedimentation is increasingly the dominant sink for terrestrial sediments in the U.S.

Email: ; *Global Agriculture Monitoring: Current State and the Requirements for Enhanced Agricultural Observations*

Agriculture is an essential component of societal well-being. Improved monitoring of agriculture could lower barriers to obtaining comprehensive information on agricultural production and markets, enhance the ability to manage food insecurity risk, and reduce malnutrition. Assessing the needs for enhanced agricultural observations is an activity of the Integrated Global Observations of Land (IGOL) initiative and developing a 10 year strategy to obtain these observations and generate and distribute the necessary information is a task of the Global Earth Observing System of Systems (GEOSS) program. GLAM - The Global Agriculture Monitoring Project is one of the most advanced initiatives for an agricultural monitoring system. It is a collaborative project between USDA Foreign Agricultural Service (FAS), NASA, and UMD that aims to enhance the agricultural monitoring and the crop production estimation capabilities of the FAS using the new generation of NASA satellite observations. To this end, GLAM developed customized web-based information-analysis and

data-delivery system to monitor crop conditions and to locate and track the factors impairing agricultural productivity. This system provides crop analysts with a suite of MODIS temporal composites of vegetation index data, false color imagery, and a dynamic crop mask. Complementing these data products is a range of web-based analysis tools that allow analysts to interrogate these data and to drill down to the pixel level of detail. Using these data and tools analysts track the evolution of the growing season, make inter-annual comparisons of season dynamics and inform decision makers of agricultural conditions and impediments to worldwide food-security.

Whitebark Pine (*Pinus albicaulis*) is considered a keystone species in high elevation ecosystems and is a dominant treeline species in northern Montana. Extensive surveys indicate that the introduced fungal pathogen *Cronartium ribicola*, which causes white pine blister rust, has resulted in severe declines in whitebark pine throughout the northern Rockies during the last decade. However, the prevalence of blister rust in whitebark pine at the alpine treeline and its impact remain to be determined. We gathered data on blister rust infection incidence in the treeline ecotone at two continental treeline locations in the northern Rocky Mountains. Our specific objectives were: 1) to determine if blister rust is present at alpine treeline, 2) to characterize the incidence and intensity of blister rust in krummholz tree islands, and 3) to examine the potential importance of whitebark pine in tree island formation. Our method included detailed field surveys of tree islands, individual whitebark pine, and blister rust cankers using five belt transects to delineate sampling areas at each study site. We found that 35% of all sampled whitebark pine were infected with blister rust cankers. Statistical tests also indicated that whitebark pines are initial colonizers in tree island formation significantly more often than other tree species, suggesting that whitebark pine plays an important role in generating pattern at alpine treeline. In the context of ecological hierarchy theory, these results have important implications for alpine treeline dynamics on a landscape scale.

Carlos E Restrepo, PhD, New York University. Email: cer202@nyu.edu; Zvia S. Naphtali, PhD, New York University. Email: zvia.naphtali@nyu.edu; Rae Zimmerman, PhD, New York University. Email: rae.zimmerman@nyu.edu; *Using GIS to Examine the Proximity of Major Highways to Public Schools in Urban Areas*

According to the literature on traffic and health effects, people within 150 meters of major highways or high traffic density roads are exposed to air pollution concentrations that are higher than the ambient background concentrations. Hence, highways and truck routes may pose significant environmental risks to sensitive populations like asthmatic children in dense urban areas that attend facilities such as public schools for significant amounts of time. This paper uses GIS to examine the number of public schools and the percentage of children that attend schools located within 150 meters of major highways in New York City, Chicago and Los Angeles. The results indicate that the proximity of public schools to major highways varies significantly among neighborhoods in an urban area. In the South Bronx, an area of New York City that has among the highest asthma hospitalization rates in the United States, about 20% of pre-Kindergarten to 8th grade students attend schools within 150 meters (or two city blocks) of a major highway. The figure for New York City as a whole is less than 10%. Using GIS to visualize this kind of information is an important tool for land use planning and can be used to prioritize resources for school programs such as the use of air filters to improve indoor air quality and protect asthmatic children in urban areas.

Craig S. Revels, Central Washington University. Email: revelsc@cwu.edu; *Not so Far from Home: Ethnicity and the Transformation of Place in the Pacific Northwest*

The idea of the cultural landscape remains one of the most enduring and useful concepts in the geographer's toolkit, providing a foundation for analysis and understanding of the relationships and processes that shape the world in which we live. In the agricultural towns of central and eastern Washington State, recent focus has been on the emergence of new ethnic landscapes, particularly those associated with the influx of Hispanic immigrants into the region. One of the ongoing questions surrounding recent arrivals to the region concerns the permanence of their presence. Simply, where lies home, in the place where transitory economic opportunity exists, or in the distant place where one has extended family, friends, and strong ties to place? This poster explores the idea

of permanence as it is reflected in the creation of place. Two of the notable and oft-commented upon components of these new landscapes in the Pacific Northwest, transportation and remittance networks, provide evidence of continuing attachment to distant homes. Yet the well-known restaurants, groceries, and churches that are the most visible representation of the new cultural landscapes indicate a deeper sense of place, and are complemented by other, sometimes subtle, ways that further claim these spaces in a way that can only be thought of as permanent. The ongoing transformation of the material landscape is thus not temporary, but a process in which the idea of home is being established.

Serge Rey, San Diego State University. Email: sjsrey@gmail.com; Xinyue Ye, San Diego State University/UC-Santa Barbara. Email: xinyue.ye@gmail.com; *Exploratory Comparative Spatial Dynamics: Integrating Computational Geometry with ESTDA*

This paper introduces a class of new graphical methods for the exploratory comparative analysis of geographical patterns and spatial dynamics. It draws on computational geometry to develop graph-based indicators of space-time association. Directional segments, bounding box, rank convex hulls and voronoi/delaunay diagrams are illustrated as new approaches towards detection of complexities of space-time patterns and trends for lattice data. Measures derived from these spatial objects provide useful complements to existing global and local measures of spatial association, and space-time cluster detection as well as multivariate spatial analysis. These measures are implemented as part of an effort to integrate computational geometry and exploratory space-time data analysis in the open source package STARS: Space Time Analysis of Regional System.

IFDC is conducting a project in Morocco to improve the agricultural efficiency in the NENA (Near East and North Africa) region. This effort will help stakeholders to improve production of cereals by reducing risks. Purposes of the project are to increase income and food availability and improve agricultural planning and decision-making. The project outputs include fertilizer recommendations that consider agro-ecological and socioeconomic factors that influence the farmer to use the best management practices. Key system components are: (1) databases for soils, weather, crops, and prices of inputs (fertilizers, pesticides, and seeds) and products (food crops and cash crops), (2) expert systems, and (3) geographic information systems (GIS). Geo-referenced soil and weather data are used as inputs to the crop models to estimate N response for rainfed wheat and barley crops. This is in combination with management information (cultivar, planting date, planting density, etc.) and nitrogen (N) fertilizer management (rates, timing, and method of application). The optimum N rates using mean Gini coefficients are determined from production costs and income from the crops. Maps showing the best management recommendations for planting date, cultivars, and N fertilizers are presented for bread wheat, durum wheat, and barley. Recommendations from the model are based on climate (rainfall, solar radiation and temperature), soils, and prices of cereals production in Morocco.

Andrew Reynolds, US Department of State. Email: reynoldsAW@state.gov; *EARTHMAP: A Vision for S&T in the 21st Century*

Bill Wood was a visionary. His EARTHMAP initiative in 1993-1994 assembled stakeholders from government, industry, and academe in a public-private partnership to map the globe with greater geospatial precision than had previously been attempted. He understood the power and importance of science,

technology, and engineering in the process of globalization and foreign policy long before many of his contemporaries. This paper briefly recounts EARTHMAP and related projects and initiatives and why they were prescient in laying a foundation for the following decade by engaging the Science and Technology (S&T) communities to address holistically such pressing 21st century issues as population growth and urbanization, natural resource development and exploitation, environmental protection and sustainable development, health care, and man-made and natural disaster management. Building on Bill Wood's vision, since 2000 the Office of the S&T Adviser to the Secretary of State has led efforts to address these global issues by recruiting more scientists and engineers to work at the State Department, strengthening alliances with S&T communities and foundations, and fostering international dialogues to anticipate directions — positive and negative — of key S&T research areas. Most recently the Department has led an interagency effort - Project Horizon - to outline global challenges in the year 2025 and to identify government capabilities, including a strategic S&T framework, needed to address these challenges and ensure that U.S. vital interests and national security are preserved. Bill Wood's EARTHMAP vision continues to unfold, and the State Department is moving ahead to help make it a reality

David Reynolds, University of Calgary. Email: dmreynol@ucalgary.ca; Dianne Draper, University Of Calgary. Email: draper@ucalgary.ca; A Vulnerability Assessment of Skiing-Dependent Businesses to the Long-Term Effects of Climate Change in Banff and Jasper National Parks, Canada

This vulnerability assessment examined potential socioeconomic impacts on skiing dependent businesses in Banff and Jasper National Parks, Canada, from the long-term effects climate change may have on snow and temperature conditions in 2020 and 2050. Climate model results from 30 years of local weather data were interpreted and incorporated in face-to-face interviews with government officials and skiing-dependent businesses, including ski hills, tourist accommodations, ski shops, car rental agencies and ski shuttle buses. The climate model suggests there will be 8% less snow accumulation in the valleys at the 1,400 metre level and 3% less snowfall at the 2,600 metre level on the ski hills for 2020. Twenty percent less snowfall is expected in the valleys at 1,400 metres and 11% less at the 2,600 metre level by 2050. This data suggests sufficient snowpack will exist in the upper levels to support skiing in the future. However, the socioeconomic viability of skiing-dependent businesses relies on ski hills continuing to operate. Three of the area ski hills are above the rising snowline and should, with supplementary snowmaking, continue to operate. The larger skiing dependent businesses interviewed have demonstrated diversification and are less dependent on skiers while other businesses have the adaptive capacity to diversify by reinventing themselves during the summer months as clothing and equipment stores. The skiing dependent businesses most vulnerable and less adaptable to the socioeconomic effects caused by a changing climate appear to be small accommodation businesses.

Drought conditions have been historically monitored using monthly indices for climate divisions. However, drought monitoring at this scale ignores spatial variability within climate divisions. Monthly temporal resolution often fails to provide timely drought information. Higher spatial and temporal drought information should be provided to improve drought preparedness and to enable efficient drought management. The objective of this study is to provide methods to obtain drought index values in detailed spatial and temporal resolutions and to examine the effect of the spatial and temporal resolutions for North and South Carolina. A method to obtain drought index values in various spatial resolutions using interpolation and spatial aggregation was introduced and used to calculate drought index values for counties and various scales of watershed basins. For temporal resolutions, a method to calculate weekly Palmer Drought Index was introduced. The empirical cumulative distribution functions and discrete frequency distributions for drought severity categories were compared for different spatial and temporal resolutions.

Unions operating in non-mobile sectors of the economy—especially public and service sector unions—have played an important role in building contemporary progressive urban coalitions in U.S. cities. However, fiscal crisis, devolution and privatization have continually threatened public sector unionism during the past two decades. This paper presents a case study of SEIU Local 715, the largest union in Silicon Valley, which has pioneered a model of public/nonprofit sector organizing currently being replicated throughout California. Founded as a county workers union, the local dramatically re-tooled itself in 1995 in order to organize privatized jobs in health and human services. Since then, the union has grown from 11,000 to 28,000 members and has raised labor standards in the regional nonprofit health and human service sector. The process entailed the forging of crucial linkages between organizing, community coalition building, local policy development, and electoral work in order to build political support for public social expenditures and workers' rights. The paper examines the successes and challenges met by Local 715 in forging such linkages; the union's role in the emergence of organized labor as the driver of a new progressive urban coalition in the Valley; and the potential for replicating the model successfully in other locales.

Email: rdarnott@uoguelph.ca; A Stochastic Approach to Modeling the Dynamic Effect of Moisture upon Aeolian Sand Transport on a Beach

The dynamic effect of surface moisture is one of the urgent issues in understanding aeolian sand transport on a beach. A number of laboratory and field observations indicate that spatial and temporal variability in the drying or wetting process and in deflation together produce spatially and temporally varying conditions of the sand surface and thus influence the spatial and temporal pattern of sediment entrainment. These all combine to induce intermittent saltation. Based upon the assumption that the above three processes cause the temporal and spatial variability of the threshold velocity on a moist surface, we constructed a simplified stochastic model, and explore how well the model reproduces the magnitude and frequency of aeolian sand transport patterns on a beach by comparing the model output with the measured data. According to the results, the model reproduces the stochastic properties of the measure data on the foreshore area. The model, however, has the tendency to underestimate the frequency of saltation events in the middle and upper beach. The reason may be that our model does not consider the effect of impact by transported sand grains on the saltation event. Another disadvantage is that there is much arbitrariness in the parameterization of the surface drying processes. The further research is directed to explore the possibility of integrating a standard evaporation model into this model, and to find the proper strategies to include the influence of grain impacts on particle entrainment from a damp surface so that the model can cover the whole beach

For centuries the Caribbean has relied heavily on traditional forms of export agriculture limited to only a few export crops or their by-products. Consequently, domestic cropping systems have largely been neglected and therefore lack the sectoral capacity to meet existing and future market demands. Within the context of a changing global economy and increasing environmental vulnerability, most Caribbean states are becoming evermore cognizant about the need to reform their respective agricultural sectors. Part of this reform includes an emphasis on non-traditional crops as well as non-traditional markets such as tourism. If destination countries, particularly those in the Caribbean, are to maximize benefits from tourism development, ways must be found to increase backward economic linkages, including utilizing local food products in the tourism industry. This paper is part of an ongoing study that explores the complex and multifaceted relationship existing between tourism and local agriculture in Negril, Jamaica. The research is informed by data collected through a series of surveys, focus groups and in-depth interviews between key players in Negril's local food chains. This paper will explore cooperatives as an alternative to traditional farming systems in forging a viable link with the tourism industry. Evidence will

be drawn from detailed case studies of two farmers' cooperatives; one has been able to successfully supply the Negril tourism industry, and the other has failed to do so. The paper contends that despite many existing and impending challenges, these changing forms of social organization provide a practical means of forging stronger linkages between both sectors.

Estimating Bank Erosion Along a Mercury-contaminated Reach of the South River

Comparison of digitized stream channel boundaries, based on visual interpretations of georeferenced aerial imagery from 1937 and 2005, were used to calculate a minimum estimate of the total volume of bank sediment eroded between Waynesboro and Port Republic, Virginia. Because of historical industrial contamination, bank sediments store mercury (5 to 90 ppm, mostly in the upper 50 cm), which becomes a source of mercury input into the river system and is of environmental concern. Because the processes involved with eroding banks are so slow, the river has remained fairly stable over the 68-year study period. The interpretation of the resulting datasets suggests that bank erosion occurs in small areas along the channel that are difficult to classify or explain (i.e., along bends in the river, through the development of islands, and where deposition of cobbles on confluence bars pushes the main flow into the opposite bank). Nominal annual rates of bank retreat (averaged over the 68-yr period) for several example locales along the study reach are very low, ranging from 3 to 15 cm per year. A minimum estimate of the total volume eroded for the study reach is approximately 107,000 m³. This analysis shows that floodplain erosion can be an important source of sediments loading into rivers and needs to be analyzed when developing hydrological models for river systems.

From Nations to Networks: A Political Geography of Climate Change in the US

During the 2005 United States Conference of Mayors Meeting, the US Mayors Climate Protection Agreement (MCPA) was unanimously endorsed. The Agreement states that individual cities "will strive to meet or exceed Kyoto Protocol targets for reducing global warming pollution by taking actions in [their] own operations and communities." The MCPA represents a fundamental shift in climate governance, whereby global environmental change is addressed not through the actions of the federal state, but through a network of more than 300 participating US cities. Recent work in social and political theory on flat ontologies, social networks, and political assemblages suggests that an understanding of this (re)configuration of climate governance as a "devolving" politics of climate change is far from sufficient. Instead, the MCPA might better be understood as predicated upon an extensive collaboration of people and objects, both human and non-human, operating within and across multiple sites. This paper will examine the MCPA to illuminate the relationship between state actors, other social agents and the non-human in political practices and spaces of authority. Central to this formulation is how the actors involved in the agreement understand climate and climate change, the ways in which climate itself is political, and the technological and environmental systems of expertise developed in response to climate change. One of the objectives of this project is to understand the relationship between social natures and political theory given the complex associations of human and non-humans that constitute political practice.

SRTM DTED accuracy in the Pacific Northwest

The Shuttle Radar Topography Mission gathered terrain elevation data for more than 80% of the Earth's land surface. The accuracy of the resulting terrain elevation data has been shown to be better than the original design goals of 16-20 meters in vertical and horizontal resolution. This research looks at the accuracy of this elevation data in the Pacific Northwest US through comparison with a high-resolution LIDAR elevation dataset collected during the same time period. Of particular interest is correlation between accuracy and landcover, which has been explored by authors recently such as Shortridge (2006). An analysis of an auxiliary accuracy dataset, the Terrain Height Elevation Data (THED), shows general agreement with other error estimates.

Spatial Interlocking Directorates: The Geography of Corporate Board Membership in North America

This study examines the location and spatial linkages associated with corporate board members in North America. Interlocking board memberships form an interurban network that facilitates the transfer of both information and influence. This paper examines the use of interlocking directorates by corporations in North America. Our findings demonstrate the spatial structure of the interlocking directorate network, focusing on two key types of inter-city director linkages: outward flows (where directors travel out from a city to serve on a board based in another city) and inward flows (where corporations bring in directors from other cities). Contrary to expectation, some of the most dominant corporate centers on the continent, including New York, send out more directors in the North American interlocking network than they bring in from other centers. Our conclusion interprets these results and outlines an agenda for further research into the geography of corporate boards.

"Her Attention Wandered Back to the Map": Mary Hunter Austin's Cartographic Adventures

Mary Hunter Austin (1868-1934) is best known as a regional writer, author of "The Land of Little Rain" (1903) and other environmental meditations on Western landscapes. In her life and in her work, maps and mapmaking appeared in various ways: for example, she wrote adventure stories featuring maps and cartographers among the miners, prospectors, and homesteaders of turn-of-the-century California; later, she made maps herself, hired by sociologist Robert Park to trace the ethnic communities and cultural features of Taos, New Mexico. Austin was a member of the Society of Women Geographers, priding herself on local knowledge of the West more intimate than simply "thinking of it as a place on a map." In this paper, the cartographic adventures Mary Austin wrote, and those she plotted for herself, are considered in light of recent scholarship on gender and map use.

Long-Term Aerosol Transport Patterns in the Southern Hemisphere as Observed by TOMS

A majority of biomass burning can be attributed directly or indirectly to human activities and their effects on landscape-scale processes. For this reason, emissions from biomass burning and the impacts of these emissions on radiative and biogeochemical processes of ecosystems within and downwind of regions of burning have been topics of intense research. Today it is possible with better sensors and, now, longer time records to look for patterns and trends in aerosol distributions over regions of biomass burning. Focusing on the three southern hemisphere continents where the majority of this biomass burning occurs, twenty-four years of TOMS-AI data over South America, southern Africa, and Australia are analyzed using GIS-derived spatial characteristics of aerosol distributions coupled with mixed discriminant analysis / decision rule routines. Observed daily aerosol observations are classified and the dominance of various prevalent aerosol distribution patterns determined during the July to October dry seasons. Systematic changes in the distributions of these patterns over a given region as they vary with shifts in the El Nino-Southern Oscillation (ENSO) are found for each sub-continental region. Consistent trends in the frequency of occurrence over time of these patterns were also found that are consistent with others' observations of global dimming and brightening over continental areas. Our findings suggest a hemispherical response in aerosol distributions that varies according to the phase of the ENSO and therefore may have implications for regional scale radiation and biogeochemical balances.

Locating Sexualities: Sexual Politics and Social Change?

Sexual politics and identities have fragmented as new patterns of social interaction and 'lifestyles' have emerged. Since the 1990s, the dominant political discourse of social movements concerned with 'sexual politics' has been that of seeking access into mainstream culture through demanding equal rights of citizenship. Equality is interpreted through notions of similitude with heterosexuals and it is through claims to normalcy that social integration is justified. This is

a significant shift. Earlier women's and gay liberation movements were not seeking to be normalised, but were highly critical of mainstream society and contested many of its core institutions and practices, in particular what we would now refer to as heteronormative assumptions about family and gender. Processes of detraditionalization and pluralism have enabled lesbians and gay men to make their case for equal rights, through the inculcation of norms of respect for social diversity as part of good citizenship. Paradoxically, by drawing on respect for diversity lesbian and gay movements may further their efforts in seeking social conformity as 'normal lesbian/gays', who espouse the norms and values of the 'ordinary' (heterosexual) citizen. This paper considers how the new story of the 'normal lesbian/gay' has the potential to lead to both social cohesion and to 'cause trouble' through its impact on hetero/homonormative ideologies and practices.

Kathrine E. Richardson, Ph.D., University of British Columbia. Email: kathrine@interchange.ubc.ca; NAFTA, North American Labour Mobility, and Dispute Resolution - Post 9/11

This paper examines the dispute settlement mechanisms of Chapter 16 of the North American Free Trade Agreement (NAFTA), which is dedicated to the liberated transborder movements of 65 North American professions, treaty traders, investors, and intra company transferees. Many would argue that Chapter 16 of NAFTA is a success since it has allowed over 75,000 Canadian professionals to seek entry into the U.S. for purposes of work, and it has also allowed freer movements of U.S. and Mexican professionals throughout North America. However, NAFTA has proven imperfect for some professions, especially in the high technology and biotechnology fields, for a range of reasons, which shall be explored in this paper. However, to this date, all disputes, whether rules or norms based, have been resolved informally through a variety of avenues. Surprisingly, no dispute, so far, has actually gone through NAFTA's well developed formal "Dispute Settlement" mechanism found in Chapter 20 of NAFTA. Thus, the primary focus of the paper will explore why such a contentious issue such as international labour mobility has been dealt with in a very intricate and complex conciliatory fashion within the NAFTA. The research methodology is based on in-depth interview with key Canada and U.S. policy advisors that oversee Chapter 16 of NAFTA, Canada Border Service Agency and U.S. Department of Homeland Security port of entry directors and supervisors between Vancouver and Seattle, and various high tech and biotech firms based in either Seattle or Vancouver.

Amy K Richmond, PHD, USMA. Email: amy.richmond@usma.edu; James Chastain, USMA. Email: ; Chris Oxendine, USMA. Email: ; Natural resource dependency and United States' national security interests

Fifty per cent of total oil consumption in the United States comes from foreign sources. This is expected to increase to 65% in 2020 based on current trends in economic growth. This research assesses the challenges the United States faces from energy dependencies in the 21st century. We analyze the relationship between global distribution of United States military assets and the location of global oil resources. Specifically, we investigate if there is a relationship between the widening of the gap linking domestic production and consumption with increased utilization of military assets in oil rich areas. To investigate this relationship we create a series of maps that display temporally the relationship between military spending and oil imports.

Marina Richter, University of Fribourg (Switzerland). Email: marina.richter@unifr.ch; National Immigration Policies Between Economic Interests and Protection of National Cohesion: Impacts on Migrants' Identities

In Switzerland and other European countries, the connection between immigration policies and policies of the national labour market was exemplified by the term "guest worker". But state policies have always been a double edged sword regarding immigration policies. On the one hand they have to address the demand of labour power. On the other hand they need to protect national interests regarding the needs for security and identity of the citizens. At the moment, Swiss immigration politics represent a difficult combination: The borders have been opened up for EU-citizens and work and residence is free of constraints for them. For citizens of any other country the restrictions have recently augmented. In September 2006 a new more restrictive law passed a public vote with 67.9% of the Swiss people voting in favour. Immigration policies put a legal frame to migrants' access to a country, to the labour market, to social benefits and finally to citizenship. But they also influence the social role migrants identify with. Migrants who arrived at different moments of the public discourse on immigration have encountered different models or images of "the migrant" and these images have become social roles to identify with, social roles

that constitute their position and possibilities in society.

Keywords: migration, policy, identity, labour market, national cohesion

Timothy J. Rickard, Central Connecticut State University. Email: rickard@ccsu.edu; Alternative Agriculture in the Rural-Urban Fringe

The theoretical binary opposition between conventional agriculture and alternative agriculture is far from distinct in the rural-urban fringe. Conventional producers can exploit the diverse urban and suburban niche markets that define alternative agriculture. Alternative agriculture is itself increasingly heterogeneous in rural-urban fringes such as Connecticut's. The "Connecticut grown" state campaign implements the basic forms of alternative agriculture. Direct marketing via farm stands, pick-your-own and 65 farmers markets have brought together the producers and consumers of fresh local food. Organic farming is usually alternative but becomes conventional when sales are to supermarket chains. Dairy farmers can receive contracts from local supermarkets or sell ice cream to tourists to diversify. Agritourism allows farmers to stretch the definition of agriculture. Connecticut wineries are allowed to purchase up to 75% of their grapes out-of-state and diversification includes hay rides, corn mazes, wedding facilities and golf courses. Alternative agriculture also includes horiculture and direct retailing of greenhouse and nursery products although the latter generates more than half the state's income largely through wholesaling. The heterogeneity of farm enterprises is matched by the mosaic nature of Connecticut's remaining farmland which, if saved, will enhance lifestyle rather than produce commodities.

Keywords: alternative agriculture, Connecticut, rural-urban fringe

Jillian M. Rickly, Indiana University. Email: jrickly@indiana.edu; Spring Mill Pioneer Village as Symbolic Landscape

Spring Mill Pioneer Village, located within the Spring Mill State Park of south-central Indiana, functions as a historic representation of the original Spring Mill Village. In what follows I will examine the history of the Spring Mill Pioneer Village, how the village is represented today, and the effectiveness of the landscape at portraying its symbolic meaning to the visitor. As an ordinary landscape Spring Mill Pioneer Village is mixture of 19th century restorations and replicas, however, as a symbolic landscape it conveys a message of the "pioneer lifestyle" of early American history. Participating in this complex landscape raises the question; how important is accurate historical representation to conveying the "pioneer lifestyle" message to the tourist? It is argued that tourists visit heritage sites because of the message they symbolize and not necessarily their authenticity.

Keywords: symbolic landscape, heritage tourism, authenticity

Joerg Rieckermann, San Diego State University, Geography Department. Email: jriecker@mail.sdsu.edu; George Christakos, San Diego State University, Geography Department. Email: ; Can In-Sewer Quality Measurements Improve Our Understanding of Local Drug Use Patterns?

Current estimates of the prevalence of illicit drugs use in the general population are mostly obtained from self-reported surveys, although scepticism regarding the accuracy of self-reports of drug users is widespread. To overcome this dilemma, the idea of non-intrusive drug monitoring at sewage treatment facilities has been proposed to determine collective drug usage parameters at the community level. This procedure has been implemented in several European countries, where cocaine loads measured at wastewater treatment plants (WWTP) and rivers surpassed current figures up to an order of magnitude. Unfortunately, it is currently not possible to relate drug use to neighbourhood characteristics. Also, no rigorous uncertainty analysis on the results of these studies has been presented so far. In the present study, we are investigating two innovations: First, we suggest measurements in sewers instead in WWTPs and rivers to relate observed substance loads to neighbourhood characteristics. Second, we will investigate how the observations can be linked to predictions using general and specific knowledge bases such diverse as sewer transport and processes, mobility of the agents and pharmacokinetic processes. We apply Bayesian Parameter Estimation Techniques to integrate information from different sources and quality levels and investigate the associated uncertainty. The results from an ongoing case study in the catchment of San Diego, CA, will allow for i) a comprehensive error assessment (e.g., Does the major uncertainty come from the sewer transport, the drug metabolism or the mobility of the people?) and ii) to evaluate whether the proposed methodology useful to support prevention science.

Keywords: drugs, sewer, Temporal GIS, water quality, bayesian, data analysis, integrated modelling

David L. Rigby, UCLA. Email: rigby@geog.ucla.edu; John Baldwin, Statistics Canada. Email: john.baldwin@statcan.ca; Desmond Beckstead, Statistics Canada. Email: desmond.beckstead@statcan.ca; W. Mark Brown, Statistics Canada. Email: mark.brown@statcan.ca; Agglomeration and the Geography of Localization Economies in Canada

In this paper we map the spatial variation in productivity levels across Canadian cities and we model the underlying determinants of that variation. We have two main goals. First, to confirm the existence, the nature and the size of agglomeration economies, gains in efficiency related to the spatial clustering of economic activity. We focus attention, after Marshall (1920), on the impacts of buyer-supplier networks, labor pooling and knowledge spillovers. Second, we identify the geographical extent of knowledge spillovers using information on the location of individual manufacturing plants. Plant-level data developed by the Micro-Economics Analysis Division of Statistics Canada underpin the analysis. After controlling for a series of plant and firm characteristics, the analysis reveals that the productivity performance of plants is positively influenced by access to buyer-supplier networks, labor market pooling and knowledge spillovers. The analysis also shows that the effect of knowledge spillover on productivity is spatially circumscribed, extending at most only ten kilometers beyond individual plants. The reliance of firms on place-based economies varies across sectors defined by the factors that influence the process of competition: access to natural resources, labor costs, scale economies, product differentiation, and the application of scientific knowledge.

Keywords: agglomeration, knowledge spillovers, economic geography

Lesley Rigg, Northern Illinois University. Email: lrigg@niu.edu; Projected population transitions for sugar maple under different climate change scenarios

In this study we used life table data and transition matrix modeling to estimate projected sugar maple population dynamics in Lake Superior Provincial Park, Ontario, Canada. We established five life-stage categories from seeds and seedlings through to three categories of adult tree, based on age. Using annual height growth remeasurement data for seedlings and saplings permanently tagged in 2000 (n=7750), seedling establishment surveys, and tree growth rates from 2000 sugar maple in Lake Superior Provincial Park, we calculated demographic summary tables (life tables) and transition matrices to examine the future stability (projected change through to 2110) and rate of increase of the tree populations. Information obtained from the transition matrix analysis included stable stage distribution, the finite rate of natural increase (λ), and relative importance of different input parameters (i.e. fecundity, growth from one life stage to another, and persistence within a life stage) on λ based on sensitivity and elasticity. Our model designs will include stochastic matrices incorporating the masting cycle of the species based upon available fecundity data, the rate of population increase (λ) for sugar maple based upon two different climate change scenarios. The comparison of both the rate of population increase and the modeled stand structures under the various transition scenarios will be presented. Using elasticity analysis, the relative importance of the modeled life stages in the survival of sugar maple under the manipulated climate change scenarios is examined for management and conservation purposes.

Mari Ludmila Riipinen, University of Oulu. Email: mari.riipinen@oulu.fi; Scales of justification. Competing land use discourses in the village of Nellim in Finnish Lapland.

Land use or the rights to natural resources are often perceived as global issues. What is best for our globe is resolved in the international meetings. These global decisions have their effect on the national legislation and also on the land use possibilities in local communities. Indeed, in many peripheral areas land use has received an important role in the survival of local communities. Natural environment has also specific and situated symbolic meanings for the local people. There are often conflicting political, cultural and economical aims on the land use between global, national and local interest groups. Yet, there is seldom a unanimous perspective on the environment within any of these levels. There are simultaneously competing land use discourses within and between different levels. This study focuses on the land use questions in the village of Nellim in Finnish Lapland. The main land users in the area (reindeer herding, forestry, nature conservation and tourism) bring livelihoods to the village, but they are also increasingly conflicting with each other. Local competing land use discourses are constructed and categorised with the help of empirical data (questionnaires and interviews). The study will discuss the constitution (ideologies, structures and actors) of these discourses as well as the scales of land use justification within them. The argument of the study is that the means of justification which emerge in local land use discourses manifest the relationship between global processes and local perspectives.

Christopher Riley, Ohio State University - Geography. Email: riley.212@osu.edu; Scaling Multicultural Discourses and Frictions of Difference in High School: A Case Study from Columbus, Ohio

Despite institutional enforcement of numerous multicultural discourses, racist attitudes persist in a school in which white, African-American, Latin American, and Somali students are enrolled. To explore this persistence of racism, I employ open-ended interviews with the high school students and critical discourse analysis to analyze the interview data. Through these methods, I demonstrate how racist attitudes continue to shape both place and personal identity through processes operating both within and beyond the scale of the school. Within the school, policies of reward and punishment (such as acceptance into honors or college prep curriculum) are established in ways that implicitly and institutionally reinforce a white racial hegemony. Racist attitudes are reinforced through processes beyond the scale of the school, from relationships in the home to depictions in the media. These multi-scalar processes suggest that undoing race, in any place, requires change at multiple scales in multiple ways.

Keywords: race, high school, critical discourse analysis

George A. Riner, Salem State College. Email: griner@verizon.net; Three Dimensional Road Inventory Mileage

Road length inventory reporting to state and federal agencies plays a major role in allocating funds for maintenance and development of highway infrastructure. A large and growing inventory of roads demands greater expense to determine accurate road mileage, including the component of length that is due to road gradients. Using 3-D information, such as high quality Digital Elevation Models (DEM), and accurate planimetric data, GIS can compute road lengths for large inventories faster, consistently, and cheaper. Various components and types of roads in Massachusetts are analyzed for a successful computation of their lengths over a 3-D topography using GIS.

Noel Ring, Retired university instructor, Private Consultant. Email: NoelRing@msn.com; Elaina Hyde, Astronomer, Max Planck Institute of Astrophysics. Email: ehdyde@yahoo.com; Ken Goss, Retired General Mgr., AeroGraphics Corp.. Email: ken_goss2000@yahoo.com; Atlantic Trace Settlement Update: Geography, Cartography and Archaeoastronomy

Seventy stars replicated in stone on landscapes in maritime Canada, New England, Great Britain and Ireland form the central pattern of the Atlantic Trace Settlement, first identified by air photo interpretation in the mid-1970's. Likely the largest maps on earth, the lithic celestial charts are of as yet unknown cultural origin. They are predictably located near Bronze Age copper mines, carbon-dated ca.3000B.P., in western Europe and copper ore outcrops in northeast North America. To date, API and groundtruth field surveys place ATS stellar maps, constructed of large boulders often connected by stone walls, at over 25 sites in New Brunswick, Nova Scotia, Maine, Vermont, Ireland, England, Scotland and Wales. Two wedge-shaped and a kite-shaped feature comprise the repeated ATS pattern, which spans an annual view of the night sky. Native American star lore encompasses portions of the ATS complex, such as the Big Dipper (Plough), Polaris, and major planets along the Line of the Ecliptic, also discerned via API. Nothing in European cosmological cartography or colonial cadastral traditions provides precedence for the ATS pattern. As reported at the 2004 AAG Annual Meeting, land use development continues to endanger ATS sites on both sides of the Atlantic. They merit urgent multi-disciplinary research funding for additional detection, dating, GIS application, and site preservation. The co-authors hope the AAG will support efforts to investigate and preserve these unique cartographic monuments.

Keywords: TransAtlantic Stone Star Charts

Claus Rinner, Ryerson University. Email: crinner@ryerson.ca; Sensitivity Analysis for Geographically Referenced Argumentation

Argumentation Maps support public participation and spatial group decision-making in various fields such as urban planning. As map-based online applications, they support a visual, distributed access to geographically referenced discourse. Through linking of discussion contributions to geographic features, references to places become more explicit and a network of geo-argumentative relations unfolds that can be further analyzed in order to understand the course of a debate. In this paper, we are interested in how sensitive a debate is to the granularity of discourse and the accuracy of geo-referencing discourse contribution. The sensitivity of discourse "results" can be measured by the level of agreement, satisfaction, and the length and depth of debate. We are approaching this assessment by reviewing two previous Argumentation Map case studies and comparing their development over time. We conclude that map-based discourse is highly sensitive to spatial and argumentative accuracy and granularity, and that control over these factors is required in order to allow for the comparison of

results from future public participation GIS experiments.

Michael Rios, Ph.D., The Pennsylvania State University. Email: mrx43@psu.edu; *Scale and the Branding of Collective Action: The Governance of Obesity Prevention in Pennsylvania*

In using the case of the Pennsylvania Advocates for Nutrition and Activity, this paper describes the role of scale in collective action between policy networks and community mobilization focused on obesity prevention. In approaching scale from an organizational perspective with respect to collective action, the paper addresses the question: what is the significance of scalar discourses in the strategies pursued by governance coalitions? Governance coalitions can be defined as alliances between multiple sectors and between politically recognized levels of jurisdiction. Their primary function is to facilitate interaction between policy and mobilization networks, while simultaneously coordinating the implementation of targeted action. The characteristics of governance coalitions include the reflexive participation of independent groups, despite the existence of mixed motives and competing interests. To situate the case study within methodological discussions of scale, qualitative inquiry was chosen as the preferred approach to draw connections between theoretical constructs and empirical data. Key data sources included participant observations of coalition activities over four years, coalition documents and promotional materials, and key informant interviews with coalition members. The evidence presented in the paper reveals that governance coalitions purposefully and strategically construct scale to create diagnostic, prognostic, and motivational frames resulting in a collective identity among different interests. In the paper, a typological framework of scale is presented to demonstrate the use of scalar representations to structure the issues and agendas of social actors in ways that facilitate collective action in response to the constraints and affordances available.

Yu Luo Rioux, University Of Colorado at Boulder. Email: yluo@colorado.edu; *Environmentalism in Jiangxi's Tourism Development*

Due to rapid tourism development spurred by the desire of economic profit in Jiangxi since the late 1990's, the advent of "constructive damages" has been cause for concern. The rise of environmentalism is one answer to the national call to solve such development-induced problems, which is synthesized in the new theory of "scientific concept of development." Yet on the other hand, environmentalism is partly used by local governments, tourism agencies and institutions as a marketing strategy for the image creation project of building up a friendly tourism destination to further attract potential tourists and capital investment. The constraints created by environmental destruction for tourism development may have rendered environmental protection superficial on many levels, an ironic and unintended result. This essay explores the controversial relationship between the environment and the economy by illustrating how environmentalism is promoted and implemented in the tourism industry of Jiangxi. It also examines the dynamics of how the tourism industry at the local level is incorporated into, yet differentiated from, the grand national scheme of modernization. A case study of cultural tourism sites in Jiangxi indicates that local tourism practices may not necessarily be environmentally constructive despite the governmental and elite efforts of environmental protection.

Michael Ripseester, Brock University. Email: mripmees@brocku.ca; Russell Johnston, Brock University. Email: ; *Memory on a Stick: Historic Plaques as a Gauge of Mnemonic Tradition in the Niagara Region*

In his recent book *Time Maps*, Eviatar Zerubavel suggests one can understand key moments in a group's past through the compilation of a commemograph: a graphic representation of the dates or time periods publicly acknowledged as having significance. As scholarship in public memory and/or nationalism suggests, these mnemonic traditions are significant in the construction of collective identity. Furthermore, geographers, among others, have suggested that the material and symbolic manifestation of mnemonic traditions are equally crucial to their study. This project represents an initial attempt to tie these trajectories together. We have two goals. First, we hope to discover where the memory entrepreneurs in the region have thrown their weight. That is, we are interested in the intersection of places, events, and persons that have been deemed critical to the construction of what it means to be a Canadian, a resident of Ontario, and/or a local resident in the Niagara Region. We have created a database of all historic plaques in the Niagara Region as a material representation of this effort. Second, given that the cumulative effect of this commemoration is, at least in part, to build consensus concerning the past, we hope to discover the degree to which residents of the Region have internalized specific mnemonic traditions. To that end, we interviewed residents in various locations in the

Region to understand the ways in which they have engaged material forms of memory.

Clare M Rishbeth, Ms, University of Sheffield. Email: c.rishbeth@sheffield.ac.uk; *Walking Talking Urban Life: real time roving recordings by first generation migrants.*

What are the individual personal experiences of a Pakistani nurse, a Yemani steelworker, a Jamaican allotment holder and a Kurdish refugee walking the same streets? This project aims to investigate perceptions and values of neighbourhoods as described by first generation migrants. Focusing on the spatial, temporal and sensory context of the local environment, the research addresses how experience of place contributes to settlement processes and cultural identity. How might memories of homelands contribute to a sense - or absence - of place attachment in the adopted city? Deepening understandings of both motivations and barriers towards engagement in the public realm can help inform initiatives regarding cohesive communities and healthy lifestyles. Twelve participants from a range of home countries and currently living in north Sheffield were loaned mini-disk recorders and made real-time commentaries of walks or journeys in their daily lives. Supported by training from BBC Radio Sheffield, the recordings were made on a weekly basis over a three month period spanning late summer to early winter, commenting on their own movements and reactions to their neighbourhood. Individual interviews and group sessions help contextualize their immediate accounts, and inform an ethnographic and social mapping of place. The research scope includes interviews with environmental and community organizations to relate findings to policy and practice. The recordings also form the basis of a specifically commissioned BBC local radio programme.

Adena Rissman, University of California, Berkeley. Email: arissman@nature.berkeley.edu; *Assessing Conservation Outcomes: Conservation Easements in the Context of Development Threat and Environmental Planning*

Conservation easements are one of the dominant tools for conservation of private lands in the United States, but assessments of easement outcomes for biodiversity conservation have been limited. The protected area effectiveness literature includes numerous approaches for measuring biodiversity protection, including gap analysis, before and after comparisons, and ranking schemes to evaluate projects. How well might these assessments work for conservation easements, which differ from many protected areas in that they guarantee only partial land ownership, typically determined by a one-time contract? A review of protected area effectiveness literature reveals that many studies do not consider development threats, despite the importance of threat in prioritizing protected area investments and the likely impact of threat on conservation outcomes. In addition, the land use planning or regulatory context is not always incorporated, even though conservation investments may be redundant if they do not exceed regulatory requirements. I collected data on conservation easement size, purposes, restrictions, permitted uses, and regulatory context across a development gradient in California to test the influence of development threat and land use planning on protected area effectiveness measures. The literature review and conservation easement analysis indicate the importance of integrating land use planning and regulation into assessments of biodiversity conservation strategies.

Keywords: conservation easements, protected areas, measuring effectiveness, land conservation, land use planning, California

Ron R Risty, Usgs/eros/saic. Email: risty@usgs.gov; *Supporting Disasters Yesterday, Today, and Tomorrow*

Is how we deal with disasters changed? Natural and human induced disasters, such as hurricanes, tornadoes, earthquakes, volcanoes, landslides, wildland fires, floods, oil spills, tsunamis, drought, and now terrorism impose a large and growing burden on our society. In the U.S. alone, disasters impose many injuries and deaths with the annual cost to the Nation of nearly \$20 billion. Disasters can have a disproportionate impact on developing countries as well as a major barrier to sustainable development. Because of this, these disasters can also affect our own U.S. assets and interests. So, improving our own ability to assess, predict, and monitor these hazardous events can be a key factor as to how we prepare for the readiness, response, and recovery. In so doing, we must rely heavily on the use of geospatial and integrated earth observation systems to fully realize the benefits gained, derived, and disseminated with products tailored to the needs of the emergency response community and the general public.

Alpan Risvanoglu, University of Oklahoma. Email: alpanax@yahoo.co.uk; *Green Spaces in Istanbul*

In a city of more than 12 million inhabitants, one of the most important questions to address, arguably, is the lack of recreational spaces. The current land use map of Istanbul is evidence that this issue has been overlooked by authorities and city planners for some time. Obviously, people's needs for leisure and recreation areas have to be met. This paper presents the results of face-to-face interviews with Istanbul residents who suggest that green spaces be taken into immediate consideration in future urban development plans. My findings provide insight into human-nature relations, the sense of belonging and spatial attachments in Istanbul, as well as into the expectations of people who desire to live in a better city.

Keywords: Istanbul, urban planning, recreation, green space

Natasha M Rivers, UCLA. Email: riversn@ucla.edu; *Migration of Nigerians to Los Angeles: Examining Human Capital & Barriers for Assimilation (tentative)*

In the most recent wave of migration, there has been a significant increase in the number of African immigrants making the United States their permanent home. Important differences in the migration flow before and after 1980 raise questions about the push and pull factors driving these population flows. The behavior associated with first wave suggested that African immigrants would return to Africa upon receiving economic and educational training abroad. Presently, African immigrants are acquiring human capital, but are now choosing to stay in America. The opportunities that exist in America are drawing large flows of immigrants from an increasingly dispersed set of origins, and those from Africa have steadily increased in proportion to the previous decades. Using the Public Use Microdata and US Government Census files, I will examine the demographic profiles for the Nigerian, African Alone (which includes total African from Africa population) and African American population living in Los Angeles. The data will show that Nigerians successfully assimilate based on the accumulation of human capital characteristics of high levels of education, which translates into higher incomes. Nigerians outperform both the African alone and native Black population in educational attainment and prove to have higher per capita, median family and median household incomes to respective populations. The research also poses the question of how being well connected through human and social networks impacts the ways in which Nigerians transcend previous barriers of race and discrimination experienced by native born blacks in America.

Stefanie S. Rixecker, Dr., Lincoln University. Email: phoenix2@paradise.net.nz; *Renegotiating the natural resource map: The political ecology of oil*

Access to natural resources, including oil, has required special, privileged relationships premised upon hegemonic power and geopolitical influence. This has previously been determined in a relatively simple bipolar manner, whereby the natural resource map was drawn according to colonial legacy and Cold War allegiances. Post-Cold War relations saw an increased interest in 'environmental security' where either scarcity or abundance was blamed for endemic conflict and (re)newed hegemonic intervention. Now, post-9/11 and with the attendant rise of China and India (so-called 'developing countries') a new geopolitics is underway to re-negotiate and rewrite the planet's natural resource map. In so doing, a new political ecology of oil is being drawn which includes nation-states, corporates, NGOs and local peoples. This contested space will yield the new geopolitical dynamics of natural resource exploitation and the re-conceptualised political ecology of oil, in particular. As such, the purpose of this paper is to outline the contemporary geopolitics of oil and provide some possible trajectories for future natural resource policy and action. To do so, content analysis, discourse analysis and policy analysis are deployed to construct a critique of contemporary oil exploitation. Reports from nation-states, corporates, Non-Government Organisations and relevant local groups and individuals are used. The conclusions suggest a hegemonic shift is underway, whereby the political ecology of oil exploitation and access will tilt the developed/developing axis towards a different hegemonic discourse and consequential policy.

Keywords: Natural resources, oil, political ecology, environmental security

Jose Roa-Lobo, University of Maryland - College Park. Email: jroa@umd.edu; *The Geomorphological, Multi-criteria Evaluation and Statistical approaches in a regional landslide susceptibility mapping. A comparative study*

This paper explores a comparative analysis of three approaches used to achieve landslide susceptibility mapping: the Geomorphological, Statistical and Multi-criteria. The Geomorphological approach rather than traditional is still the battle line of the Geomorphological community in the practice of landslide hazard zonation however, the need for faster and GIS / remote sensing related

procedures has prompted researchers to survey the capacities of methodologies based on different frameworks as the statistical and multi-criteria evaluation approaches. These three methods are founded upon different conceptual models. The Geomorphological depends intensively on the researcher's experience and familiarity with the study area via fieldwork, which is circumvented in the statistical one where the role of each factor causing slope instability is determined on the basis of the observed relations of the past/present landslide distribution to a full set of related geomorphic variables via weights of evidence. On the other hand, the Multi-criteria Evaluation divides the landsliding process into a number of simpler compounds related to geographical factors that form a decision hierarchy in order to be combined utilizing knowledge-based user preferences to identify and rank areas that are suitable to landslides without necessarily the input of a landslide inventory map. From these methods three subsequent landslide susceptibility maps are compared to the study area landslide inventory map using a success rate curve, which allows a more objective assessing of the landslide predictability accuracy of these approaches. The study area is located in a tropical mountain environment of the Venezuelan Andes.

Paul Robbins, University of Arizona. Email: robbins@email.arizona.edu; Anil K Chhangani, Ph.D., Department of Zoology, JNV University, Jodhpur, India. Email: chhanganiak@yahoo.com; *Territories of Prehension: Human/Animal Interaction in Indian Conservation Areas*

It has become increasingly clear that conservation boundaries are porous at best and fictional at worst. What this means for flows of people and non-humans along and across such boundaries is less clear, however. Do humans and animals "compete" for resources, as traditional conservation theory would suggest? Or do they rather produce conditions for their mutual transformation, pushing against one another, providing one another resources, and predating on one another at the margins? This paper argues for the latter view, providing evidence from village surveys, wildlife census, and scat analysis from the Kumbhalgarh Wildlife Sanctuary in Northern India that shows the subsidies that monkeys, herders, blue bull, farmers and panthers produce for one another along with the sometimes violent extractions and encounters these subsidies predicate. The provisional results suggest that social and environmental systems are non-discreet and that the borders between each are produced through inter-species adaptation and coercion. Conservation lines and rules imposed on the map to suggest or enforce otherwise, face systems that resist control.

Martin Roberge, Towson University. Email: mroberge@towson.edu; Angela Carlisle, Towson University. Email: arosbrook@aol.com; *A Comparison of Four Methods for Measuring Impervious Surfaces*

Impervious surface coverage (ISC) is a convenient measure of urban land cover for hydrologic research. Asphalt and concrete have a distinctive radiometric signature that is easily identified in remotely sensed imagery. These impervious surfaces impact urban streams preventing infiltration and promoting flash flooding. Empirical research has found high correlations between percent impervious surfaces and hydrologic variables such as rainfall/runoff relationships, flow variability, percent of annual discharge as direct storm flow, and peak storm discharge divided by baseflow discharge. Unfortunately, empirical studies of urban impacts frequently cannot be compared to one another due to differing methods for estimating ISC. This study compares four methods for estimating ISC over a variety of scales and land uses. Results indicate that planimetric methods (building outlines and edge-of-pavement digitized from airphotos) consistently underestimate ISC at urban sites. Two Landsat methods (supervised classification and the regression tree methods used in the National Land Cover Dataset) underestimate ISC at rural sites under 10% imperviousness. Land use methods (multiplying land use map polygons with published percent ISC factors) produce highly variable estimates of imperviousness due in part to intensity of land use. These findings may have implications for stormwater regulations. Permit applicants will base their estimates of impervious cover on site diagrams, producing a low estimate of ISC similar to planimetric methods. However, regulations may be based on scientific literature that uses other methods of ISC estimation. These other methods will produce higher estimates of imperviousness. The end result will produce ordinances that are less effective than intended.

Justin Roberson, University of South Carolina. Email: robersjl@mailbox.sc.edu; John Kupfer, University of South Carolina. Email: kupfer@sc.edu; Kimberly Meitzen, University of South Carolina. Email: ; Ashley Pipkin, University of South Carolina. Email: ; *Early successional patterns on recently logged areas at Congaree National Park.*

Congaree National Park, located near Columbia, SC, protects and manages

the largest remaining tract of old-growth bottomland hardwood forest in the U.S. While the impacts of natural disturbances such as flooding and hurricanes have been examined at Congaree, ecosystem responses to large-scale anthropogenic disturbances such as logging are poorly understood. The presence of several invasive, non-native plant species within Congaree, for example, suggests that park forests may be subject to rapid changes in species composition following disturbance. It is therefore critical for park managers to understand the role of forest recruitment, seedling establishment, non-native plant invasion and hydrological processes in order to devise strategies to manage and protect this unique and diverse floodplain forest. The purpose of our research was to test hypotheses about the interactive effects of site conditions and seed availability on early, post-logging forest succession in an area of bottomland hardwood forest that was partially clearcut in 2001 before its acquisition by the Park Service in 2005. Vegetation and soil sampling involved the use of paired vegetation plots located along forest-to-field transects as well as individual plots located in unlogged interior stands. Preliminary analyses showed that species patterns were strongly related to environment gradients and disturbance intensity but suggested that species composition on recovering areas did not vary as a function of distance to the nearest intact forest. An examination of colonization strategies of floodplain species suggests that seed limitation may not have been a factor because of the importance of root sprouting.

Carolyn Roberts, University of Gloucestershire, UK. Email: croberts@glos.ac.uk; A need for 'joined up thinking': Groundwater management in rural Uganda

Central Uganda's rural population is highly dependent upon the supply of groundwater, and to accommodate population growth, rapid expansion of the number of accessible and functioning boreholes has been a priority. Over the last decade, some progress has been made through central government, local government and international development aid programmes working in partnership. However, studies on the ground have revealed a more complex picture. In many smaller settlements, achievement of the Millennium Development Goals has prioritised borehole drilling in areas lacking effectively managed sanitation systems. Even using very basic field analytical techniques, the groundwater sources closest to peoples' houses can be seen to be contaminated with a variety of health-damaging compounds, with the environmental 'foot-print' of each village spreading well beyond the edge of the built-up area. Questionnaire survey reveals that borehole users are walking into the settlements to buy this water, and further that they are also at risk from malaria whilst queuing for long periods in boggy conditions where borehole maintenance is poor. The study demonstrates the importance of science and social science enquiry being undertaken in tandem, and used to inform the development of effective environmental policies.

Evan Roberts, Minnesota Population Center, University of Minnesota. Email: eroberts@hist.umn.edu; Sula Sarkar, Minnesota Population Center, University of Minnesota., Email: sula@socsci.umn.edu; The comparative historical geography of women's work

For the first time ever social scientists have access to both complete individual data and digital boundary files for historical population censuses. These data?from late-nineteenth century censuses of Canada, Great Britain, Norway and the United States?are now freely available to researchers through the North Atlantic Population Project. Most sources of population census data for use in Geographical Information Systems (GIS) are either microdata samples or aggregate statistics. Microdata samples allow the creation of customized variables, and measures of association between variables at the individual level. Researchers then create customized variables for larger geographic areas. Complete-count historical population data combined with GIS boundary files for small areas (counties) has the potential to revolutionize our understanding of the geography of social and economic processes in the late nineteenth century. This paper demonstrates the possibilities of this new data by analyzing the spatial distribution of women's work in Canada, Great Britain, Norway and the United States. Using choropleth maps we show patterns of women's involvement in paid work across counties in every country, data never tabulated at the time, and previously unavailable as aggregate statistics, highlighting an advantage of combining complete population data with GIS. Women's work varied substantially across counties within every country, reflecting the different available employment opportunities women had in areas with different industrial structure. Taking further advantage of the complete-count microdata, we show how women's work varied as families, not just individual women, responded to employment opportunities in different regions and countries.

Jed Roberts, Oregon State University. Email: jed.roberts@geo.oregonstate.edu; Morphological interpretation of seamounts in American Samoa

The purpose of this study is to construe the dominant mechanism for seamount genesis in the Eastern Samoan volcanic province employing geographic techniques applied to a high resolution deep sea multibeam bathymetry dataset. A stepwise approach toward this end includes four principal objectives; (1) a compilation of disparate multibeam bathymetry datasets into one contiguous dataset, (2) production of maps and three-dimensional visualizations of the study area for preliminary inspection, (3) statistical analysis of seamount shape and distribution, and finally (4) the inference of probable seamount genesis using shape and distribution analyses in tandem with available corroborating petrological and geochemical data. A comprehensive geographic analysis of deep sea morphology in the Eastern Samoan volcanic province has never been undertaken. An added value of this study lies largely in the creation of a dataset both broad in extent and precise in resolution, for use beyond this particular effort. This study accompanies a burgeoning collection of academic investigations using multibeam sonar technology to characterize seamount morphology.

In September 2005, the Pacific Islands Forum issued the finalized Pacific Plan. The overarching goal of the Plan is to "Enhance and stimulate economic growth, sustainable development, good governance and security for Pacific countries through regionalism." In this paper we focus on the salient role of (good) governance in the Plan. Governance has become a keyword, albeit a deeply ambivalent one, in development and foreign policy realms and the Pacific is now a particularly intense site of activities understood in terms of governance. Using interviews with persons connected in various ways with the development of the Pacific Plan and from a documentary history, we address questions about the political closures and openings the governance agenda enables; we ask about the kinds of work that gets done in the name of governance through an analysis of the ways that it is understood, deployed and redefined in practice. To do this we turn to the Pacific Plan as our case. We find that governance, as it is defined and operationalized in the Plan, is pulled in a highly technocratic direction such that a particularly narrow conceptualization of governance dominates. Despite this disciplining process, however, the continued salience of governance as a framing device within struggles for racial and gender equality and the emergence of Pacific-based projects that act to remake governance in unexpected ways leads us to conclude that the term retains fields of meaning that allow for alternative political openings and possibilities.

Keywords: Pacific; Pacific Islands Forum; Pacific Plan; governance; good governance; development.

Colin Robertson, University of Victoria. Email: colinr23@gmail.com; Trisalyn A. Nelson, University of Victoria. Email: trisalyn@uvic.ca; Barry Boots, Wilfrid Laurier University. Email: bboots@wlu.ca; Michael A. Wulder, Canadian Forest Service. Email: mwulder@pfc.cfs.nrcan.gc.ca; STAMP: Spatial-temporal Analysis of Moving Polygons

Research questions regarding temporal change in spatial patterns are increasingly common in geographical analysis. In this research, we explore and extend an approach to the spatial-temporal analysis of polygons that are spatially distinct and experience discrete changes through time. Events are used to describe spatial changes occurring in polygons related by two types of spatial relationship: overlap and proximity. Spatial-temporal measures of events for size and direction are presented for two time periods, and multiple time periods. Size change metrics are based on area overlaps and a modified cone-based model is used for calculating polygon directional relationships. Quantitative directional measures are used to develop application specific metrics, such as an estimation of the concentration parameter for a von Mises distribution, and the directional rate of spread. The utility of the STAMP methods are demonstrated by a case study on the spread of a wildfire in northwestern Montana.

Keywords: spatial-temporal analysis, GIS, polygons, events

David Robertson, State University Of New York, Geneseo. Email: robertsd@geneseo.edu; S Whitney Snyder, SUNY-Geneseo. Email: sws3@geneseo.edu; Place-Based Attachments in Picher, Oklahoma: Updating a Community Buy-Out

The historic lead and zinc mining town of Picher faces an uncertain future. Located in the Tar Creek Superfund site, one of the oldest and most costly Superfund sites in the nation, the Picher community has long been plagued by a range of seemingly intractable environmental problems. The most troublesome include widespread lead contamination and mine subsidence. Despite these problems, however, many Picherites have maintained a strong attachment to place, a bond to community rooted in the mining way of life and in a history of perseverance in the face of adversity. In *Hard as the Rock Itself: Place and Identity in the American Mining Town* (2006), the author suggested that this bond to place would complicate a potential community buy-out which had not yet been implemented at the time of publication. This presentation updates the community buy-out story in Picher and confirms that a significant number of its residents are resisting voluntary buy-out offers due to attachments to community and home. As predicted, Picher's hold-outs are facing additional hardship as their community is dismantled around them, and the likelihood that the Tar Creek Superfund site will remain inhabited is limiting future remediation options for the area.

Morgan M. Robertson, US Environmental Protection Agency, Wetlands Division. Email: robertson.morgan@epa.gov; "Cultivating This Green Frontier": Branding Ecosystem Service Credits

Neoliberal economists have urged the privatization of ecosystem services for decades, reasoning that if the free services of the earth - clean air, clean water, biodiversity, carbon sequestration - could be owned and traded, their real value would be revealed and resources in demand would increase. These notions have jumped from the pages of Science and The Economist to the brochures and web pages of hundreds of private firms around the United States, which over the past decade have sprung up to offer ecosystem services for sale. Cultivating a market for such novel commodities requires unique marketing strategies, including particular uses of natural imagery and efforts to educate the consumer about the tangled web of incentives and regulations that undergird such markets. Because most customers in United States ecosystem credit markets are making purchases to fulfill regulatory directives rather than to satisfy an innate desire for conservation, the task of marketing is complicated by having to advertise environmental quality while actually selling regulatory relief. This paper focuses on the local, entrepreneurial end of the larger trend towards the marketing of ecosystem service credits, to examine what challenges of information, representation, and subject-interpellation are faced when a capitalist must at last close the deal on the sale of nature's services. At stake is the creation of the appropriate kind of consumer for this new market, and the exploration of a new language of desire infected by regulatory compulsion.

Keywords: Neoliberalism, ecosystem services, marketing, commodification, political ecology

Susan Lee Robertson, Professor, University of Bristol. Email: s.l.robertson@bristol.ac.uk; Constructing a Competitive Europe through Higher Education: Space, Strategy, Subjects

'Europe's' approach to internationalising higher education is a multi-faceted set of political strategies that, over time, has become more complex as an array of European-level actors, and most importantly the European Commission, respond to pressures in the regional and global economies. In this paper I explore this complexity, suggesting that Europe's inter/nationalising and recent 'externalising' project for higher education is a long standing set of projects: culturally?to contribute to the construction of Europe as a distinctive entity; economically?to construct a competitive Europe; and, politically?to locate greater power at the supranational scale that would enable European-level actors more control over regional and global affairs. The discourses of 'internationalising' and 'externalising' higher education suggests that the power to direct education is still primarily located within Member States. However, in this paper I argue that these two discourses are more accurately represented as processes of regionalisation and globalisation, and are the outcomes of social forces, both governmental and non-governmental, engaged in the progressive restructuring of European social relations in the global political economy.

Keywords: Europe, knowledge economy, globalisation, regionalisation

Scott M. Robeson, Indiana University. Email: srobeson@indiana.edu; On the Spatial Scale and Intensity of Recent Thermal Anomalies

Estimates of the rates of air-temperature change are the primary evidence of recent climatic change. Typically, hemispheric or global averages of near-surface or satellite-derived air temperature are used. Trends also are estimated at individual grid points and then mapped. On an annual basis, the global warming

from 1978 to the present spans more latitudinal zones than did the warming episode from 1925 to 1944. The spatial characteristics of the individual (daily or monthly) thermal anomalies that contribute to these trends and variations, however, are relatively unknown. Here, using data from both Microwave Sounding Unit (MSU) and surface-based instruments, geostatistical approaches are used to estimate the spatial scale and intensity of atmospheric thermal anomalies. Specifically, the range and sill are estimated from spherical variogram analysis of gridded monthly air-temperature datasets. In addition, parametric and nonparametric estimates of range and sill are compared. Both the range and sill exhibit distinct seasonal and temporal variations that are used to quantify the spatial scale and intensity of recent climatic change in new ways.

Keywords: climatic change, global warming, geostatistics

David A. Robinson, Rutgers University. Email: drobins@rci.rutgers.edu; Thomas Estilow, Rutgers University. Email: esti@rci.rutgers.edu; A hemispheric snow cover extent climate data record

It has been 40 years since satellite-derived maps of Northern Hemisphere snow cover extent (SCE) began being produced by National Oceanic and Atmospheric Administration meteorologists. No other environmental variable has been mapped from satellite data in a generally consistent manner for such a long period. Information generated from these maps has been used in international assessments of climate variability and change, and in numerous investigations regarding the role of snow cover in the climate system. Despite their proven climate utility, meteorological forecasting has long been the driving force behind producing these maps. As such, changes (documented and undocumented) in mapping methodologies have occurred over time, without a focus on their climatological continuity. In particular, 1999 brought a change from weekly to daily maps and a greatly increased resolution to the map's digitized grid. Members of our Global Snow Lab, as well as others elsewhere, have kept a watchful eye on changes in this satellite environmental data record (EDR). We saw the need to thoroughly scrutinize the EDR and to develop a satellite SCE climate data record (CDR). This presentation will discuss efforts within the Global Snow Lab to do just that, and will introduce this CDR. Updated time series analyses of regional to hemispheric SCE through 2006 will also be discussed, along with efforts underway that will integrate visible and microwave satellite and station-observed estimates of extent and depth into valuable new CDRs.

Jennifer Robinson, Open University. Email: J.D.Robinson@Open.ac.uk; Cities in a world of cities

Theorising urban experiences invites a comparative approach, by the simple fact of cities existing in a world of cities. However, urban studies has for some time restricted its formal comparative efforts to cities which are in many respects similar, to "control" for key explanatory variables. In addition, as a result of developmentalist thinking, there has been a longstanding custom of considering wealthy and poorer cities broadly incommensurable. More recently, analyses of globalisation in cities have been drawn to trace networks and nodes across different contexts, but in relation to a limited repertoire of economic processes. This paper will set out the existing parameters of comparative urban theorising, and then consider some alternative tactics for thinking across the diversity of cities, inspired by the spatialities of cities themselves. Without abandoning the idea of cities as distinctive places, the paper will explore how the varied circulations across and between cities might draw us to new ways of theorising cities. It will also reflect on the ways in which citizens and managers already imaginatively inhabit a diversity of distant urban contexts as they set about constructing their more immediate environments.

Email: sperz@soc.ufl.edu; Methods of Data Standardization for Image Processing and Land Cover Change Analysis in the Tri-National Frontier of Madre de Dios (Peru), Acre (Brazil), and Pando (Bolivia) - MAP

A large remote sensing database is being constructed to analyze land cover change in the MAP region of Southwestern Amazonia. This database will provide

baseline observations to measure land cover changes in response to new road construction and paving in the region. Satellite imagery obtained with NSF HSD acquisition funds will provide a time series of Landsat (TM and ETM+) data for the MAP region across a period of 20 years (1986-2006) to evaluate land cover change. Time intervals from 1986 to 2001 will be every five years, and a one year interval from 2000 to 2006. The image season will be austral winter, specifically July, with cloud-free images as temporally close as possible given the large geographic area. Climatic variability among image dates will determine the exact image month and day to acquire each scene. The Landsat data will be radiometrically calibrated, geometrically registered, normalized for precipitation differences (if necessary), and mosaiced. We will combine the spatial data into a GIS with multiple layers for administrative boundaries, various land tenure parcels, roads and rivers, social and agricultural data, vegetation, and satellite data. This database will be constructed with in collaboration with the Universidad Amazonica de Pando (UAP); Universidade Federal do Acre (UFAC); and Universidad Nacional Amazonica de Madre de Dios (UNAMAD). This project highlights the need for institutional collaboration, and data and method standardization across the tri-national boundary and applicable to other multinational research projects.

Cornachione, U. of Sao Paulo / U. of Illinois at Urbana-Champaign. Email: prezotto@usp.br; Brazilwood Trade Economic Relevance: an historical analysis between the 16th and the 19th centuries

The purpose of this research was to investigate the economic relevance of the Brazilwood trade, between the 16th and the 19th centuries, based on estimated metrics involving quantity, average weight of exported trees, and additional economic indicators. Brazilwood was one of the top-traded commodities in this period, and one of the most relevant products explored by Portuguese navigators. Brazilwood is an arboreal-tropical species, which experienced a high value in Europe, used as a red dye. When Portuguese first arrived at Brazil, Brazilwood was abundant along the coast, soon becoming a very profitable operation as an official monopoly. Due to the trade volume, strong logistics operations were developed via trading posts established near Brazilwood locations to receive and export the commodity to Europe. The economic law of demand and supply explains the stimulus of other expeditions (e.g., French and Dutch) to explore the Brazilwood black market. This is a nonexperimental study based on a descriptive design, supported by both documental and historical techniques, mainly with historic files from the Ultramarino Historic Archives (Portugal) and the National Archives (Brazil). Findings about Brazilwood trade between the 16th and the 19th centuries include a total 527,182 trees (15 meters) which were transformed in 6,082,867 standard pieces (1.3 meters), reaching 91,243 tons of exported wood in this analyzed period. These findings are based on both formal and informal (black market) records. These numbers aligned with the contextual review of this operation are strong evidence of the economic relevance of the Brazilwood trade in this period.

Keywords: Brazilwood, Portugal Exploration, Brazilwood Trade

Stéphane Roche, 1, Université Laval. Email: stephane.roche@scg.ulaval.ca; Deconstructing Google Earth's images with the Spatiograph

In a recent research we have developed a new model aiming at analyzing and classifying geospatial representations (Roche et al, 2006). The Spatiograph is a conceptual and visual framework based on the main characteristics of a geospatial representation (focus, dimension, scale, continuity, physicality, temporality and dimension), allowing us to deconstruct such a representation. In this paper we firstly present the spatiograph. Secondly we use it in order to analyze a set of geospatial images provided by Google Earth and compared it with other geoportals(local windows, mapquest). Finally we propose a theoretical analysis of Google Earth's images compared with their potential uses.

Keywords: Spatial representations, Spatiograph, Geoportals

Dianne E. Rocheleau, Clark University. Email: drocheleau@clarku.edu; Rooted Networks/Relational Webs: Theories and Models for a Socio-Ecological Science

Network theories and models can bridge qualitative/quantitative, physical/social and critical/positivist divisions, to address questions central to Geography and Ecology. The paper addresses problems and promises inherent in partial, parallel and scattered network theories and models in the "natural" and "social" sciences. Despite the compelling advantages of a model that moves beyond the culture/nature dichotomy there is a clear need to theorize and model : 1) power relations within and between networks; 2) rooting systems that anchor networks

to territories/resources; 3) applications spanning social and ecological sciences and 4) integration of static network structures and dynamic systems behavior. Geographers can use network metaphors, models, formal theories and analyses to address questions of power (in patterns, degree and terms of connectivity and autonomy), integration of culture and nature, and relations of rootedness and mobility within and across territories. I advocate a radical empiricist approach to complex assemblages, treating them as networks, observing and evaluating them from multiple standpoints (nodes) within a given set. The methodology is one of "seeing multiple", from situated perspectives within polycentric models. I propose an integrated conceptual model to describe and analyze socio-ecological formations (assemblages of diverse elements commonly divided into biological, physical and social domains). The paper illustrates description and analysis: Mapping power in networks; Mapping rooted networks onto territories; Tracing network topologies of connectivity, autonomy, and sovereignty, as well as mobility, circulation and rootedness; and Reconciling complex systems and networks to include assemblages of humans and other beings, their habitats, technologies and artifacts.

Keywords: Networks, Rooted, Ecology, Power, Territory

Branda Rochwerger, Independent Scholar. Email: miss_rochwerger@yahoo.com.br; Ingolf Vogeler, University of Wisconsin. Email: ivogeler@uwec.edu; House Styles in Urban Brazil and United States in the last 110 Years

Only a minority of urban Brazilians live in detached single-family houses today. Particularly since World War II, the historic residential areas of Brazilian cities have been replaced by high-rise residential buildings. In United States, on the other hand, new houses have been added mostly on the outskirts of older housing areas, adding "concentric rings" of houses by decades, styles, and densities. This poster presents the results of field work in Brazil and USA comparing single-family house styles from the last 110 years in Belo Horizonte and Eau Claire. Maps of the age of housing, by decade, provide the basis for comparing house styles in these two cities. For each decade, photos of major house styles are compared. House styles from the 1890s to the 1950s are more similar in the two cities; thereafter, styles diverge markedly. Regardless of style and age, Brazilian houses are mostly multi-storied and stuccoed with pastel-colors; mansions have light-colored cutstone; and all gabled houses have red-tiled roofs. Brazilian houses look more like California houses than Midwestern ones, where horizontal sliding (wooden, vinyl, steel) is so common. Houses that have survived urban development in Brazilian cities are disproportionately larger, elite houses with dramatic molded-facades. Come see, appreciate, and compare the rich residential fabric of urban landscapes in Brazil and the United States for yourself.

Keywords: urban geography, house styles, age of housing, Brazil, United States

Jan Ketil Rod, Department of Geography, NTNU & Centre for the Study of Civil Wars, PRIO. Email: jan.rod@svt.ntnu.no; Civil Wars: Prospects and Problems by using GIS-generated Local Indicators

Civil wars rarely span throughout the territories of the host countries. More frequently, they are confined to specific sub-national regions where government authority is limited, where its population is dominated by minority groups, and where the rebels have access to contrabands or other sources of finance. In order to avoid the ecological fallacy, or explaining local phenomena with country-level measures, an increasing number of quantitative studies of civil war are applying disaggregated data and research designs. Although such approaches are certainly promising, they introduce or emphasize problems related to classical statistical inference. A fundamental underlying assumption is that of independence, that the units of analysis are unrelated to each other. With geographical data, this assumption is questionable, and particularly so for disaggregated observations. Disaggregation also presents another challenge, known as the modifiable areal unit problem (MAUP). In this paper, we investigate possible effects of spatial autocorrelation and MAUP by conducting a series of disaggregated analyses on the incidence of civil war in Africa, 1970-2001. To test for the zoning effect of MAUP, we use two grids with identical resolution (100 x 100 km) but with different zoning (52% overlap) to generate alternative datasets, which are then analyzed and evaluated. The scale effect of MAUP and the influence of spatial autocorrelation are explored by estimating similar regression models on three alternative samples, generated from grids with a resolution of 50 km, 100 km, and 200 km, respectively.

Keywords: Civil War, GIS, Disaggregation, Ecological Fallacy, MAUP

John C. Rodgers, Mississippi State University. Email: jcr100@msstate.edu; Interactions between Australian pine (*Casuarina equisetifolia*) and native animal species within the Bahamas.

The purpose of this investigation is to examine the abundance and diversity of animal species associated with the invasive Australian pine (*Casuarina equisetifolia*) on San Salvador Island, The Bahamas. Association in the context of this study includes herbivory, nesting, perching, or climbing. Field sampling was conducted at three beach sites and at five inland study sites. Study plots were established at each site where the number of Australian pines was counted and the animal species diversity, if any, was recorded. The results show very few native animal species are associated with the Australian pine. To date only three species were climbing or nesting on the invasive trees. The Cerion land snail (*Cerion* sp.) is the most abundant species associated with Australian pine and was found on trees at 1 beach sites and at 2 interior sites. For those trees where *Cerion* were present, the number of snails ranged from 1 to 15 individuals per tree. Nearest neighbor analysis indicates that the *Cerion* distribution is significantly clustered. There appears to be no significant preference of *Cerion* for tree size. In addition to *Cerion*, there were two wasps nest and one hummingbird nests on separate trees. The extremely low diversity on Australian pine is not unexpected given that their cone-like fruits and needle leaves offer little nutritional value. However it does reinforce that there is limited use of this invasive plant by native animals. Further research continues to quantify the organisms associated with *Casuarinas* in The Bahamas.

Keywords: invasive species, San Salvador Island, species diversity

Scott Rodgers, King's College London. Email: scott.rodgers@kcl.ac.uk; 'Reporting live from?': Researching spatial ontologies of journalism

For at least the past 25 years, there have been intermittent calls to better study the geographies of media, of which news media have been one specific concern. Despite this, most recent human geography research and theory has only indirectly been interested in journalism. Instead, most inquiry has been into the epistemological politics of news media representations of spaces and places. Yet even a cursory survey of journalism studies across other disciplines would point to many other spatialities. For example, the extent to which reporters conduct their daily work in both fixed and mobile spaces: press bureaus, the internet, regular beats and far-flung assignments. Or the importance of newsrooms and studios in assembling and circulating the many different spaces of newsgathering. Indeed, it might be said that such studies imply a spatial ontology concerning journalism. Yet these spatialities so often found in journalism studies do not generally transcend the empirical; they are under-theorized. It is here that I suggest human geography has a contribution to make, not by creating a redundant 'geography of journalism', but by entering into interdisciplinary conversations on the spatialities of news media. As a starting point for such conversations, this paper identifies the current ontological concerns in human geography with social practices and materiality as particularly appropriate for studying the changing politics of journalism and news media. This is followed with an associated review of different methodological possibilities for human geographers interested in pursuing such research avenues, including a consideration of some likely problems and tensions.

William Nicholas Rodgers, Western Kentucky University. Email: william.rodgers@wku.edu; Rezaul Mahmood, PhD., Western Kentucky University. Email: rezaul.mahmood@wku.edu; Flash Floods in the Appalachian Region (1993-2005)

Flash Flood (FF) is a major natural hazard in the United States. To better understand its seasonality and inter-annual variations, I am building a FF climatology for the whole Appalachian region. This paper shows FF climatology for the Appalachian region for the years 1993-2005. My primary source of data has been the National Climatic Data Center (NCDC) and their electronic records which can be accessed through the World Wide Web. The analysis of data shows variations in the frequency of FFs during different years, seasons, and months. Also there is a plan to expand this work up to the year 1950 and obtain a better knowledge of FF occurrence. Various parts of the Appalachian Region have been covered thus far. Some states have been completed from 1993-2005 such as, Alabama, Tennessee, Kentucky, West Virginia, and Vermont have all been completely studied from 1993-2005. The states of Ohio and Massachusetts as well as others have been overlooked for the time being. And with this data there is a continuing effort to determine possible patterns monthly, seasonal, and yearly.

Keywords: Flash Flood Event

Jean-Paul Rodrigue, Associate Professor, Hofstra University. Email: ecojpr@hofstra.edu; Theo E. Notteboom, Associate Professor, University of Antwerp. Email: theo.notteboom@ua.ac.be; The Next Fifty Years of Containerization: Inland Freight Distribution

Although the container was an innovation initially applied for maritime transportation, the emergence of global supply chains has placed intense pressures to implement containerization over inland freight distribution systems. Like its maritime counterpart, the inland transportation of containers has limited prospects concerning the improvement in speed, so strategies must be found to use effectively existing modes while abiding to cost and time constraints of logistics. Since inland transportation is bound to accessibility and capacity constraints to a higher extent than maritime transportation, the next fifty years are likely to see attempts to cope with three particular geographical scales. At the continental level, the setting of high capacity long distance rail corridors, in the line of the North American landbridge, will continue to offer a viable option for long distance container movements. Regionally, the process of integration between maritime and inland transport systems will lead to a number of penetration and modal shift strategies where each mode is used in its most cost and time effective way. Locally, the conventional problem of the "last mile" in containerized distribution will cope with increased congestion within metropolitan areas but also around terminals with growing attention placed in city logistics. In all cases, the future of containerized inland transportation will depend on efficient intermodal and transmodal operations as well as energy prices. This contribution is the second in a set of two papers on the theme 'The next fifty years of containerization'.

Alejandro Rodriguez, University of California - Los Angeles. Email: nikanek@ucla.edu; Informal housing markets: How do they work?

This paper explores the informal housing markets in the city of Tijuana, Mexico in order to respond what options do households in poverty have to access the housing market and what are the main correlations for their location? The focus of this research is to unfold the logic behind the informal housing market. This paper will test the hypothesis that informal sub-urbanization is caused by the lack of economic means of the new immigrants to the city. It will suggest that informal housing is expensive and that, structural failures in the formal housing market are the cause of this phenomenon. It also studies the responses from the public sector. With data gathered in the field, this research also explores urban and regional mobility of those living in informal settlements to determine to what extent transportation counts in residential choice in a country with transportation anarchy. All illegal, informal, and socially-charged patterns of residential choices in the world will help to construct the theoretical body of this research. The term informal housing refers to settlements in urban areas that are not planned or regulated by the State laws. By investigating the internal functioning of informal markets and comparing them to formal ones, this paper explores how emerging spatial paradigms affect local housing markets and the social context of urban families.

Keywords: housing, markets, informal

Lourdes Rodriguez-Gamino, MSc, Instituto De Geografia Unam Mexico. Email: lulugamino@correo.unam.mx; Jorge Lopez-Blanco, Dr., Instituto De Geografia Unam Mexico. Email: jlopezblanco@hotmail.com; Gilberto Vela-Correa, Dr., Universidad Autonoma Metropolitana-Xochimilco Mexico. Email: ; Environmental Biophysical Units as a Framework to Characterize Detailed Environmental Indicators for Land Management Purposes in Milpa Alta, Central Mexico

We delineated the environmental biophysical units (EBU) by means of a geomorphogenetic approach in order to obtain a detailed spatial framework to characterize the main environmental indicators (EI) in Milpa Alta, Central Mexico. The geomorphologic units were delineated using aerial photographs (1:75,000 scale) and then the outlines were digitized and corrected by a digital photogrammetric procedure using a GIS. The EBU were integrated according to the general and specific origin of the relief, relief-type, age-lithology and geometric class. The EI considered were defined by means of the relief, soil, water, climate, and vegetation factors. The following morphogenetic classes were obtained: A) Upper Mountain Slopes of Cinder Cones (Andesite-Basalte). B. Upper-Medium-Lower Mountain Slopes of Lava Flows (Andesite-Basalte-Dacite). C. Non-Differentiated Mountain Slopes of Lava Flows (Andesite-Basalte-Dacite). D. Upper/Lower Hillslopes of Cinder Cones (Andesite-Basalte). E. Alluvial Complex-Piedmont (General/Intermountain). F. Accumulative Alluvial Plains (General/Intermountain). All of them from Pleistocene to Holocene. Regarding to altitude the units are found in intervals between 2,390 and 3,530 masl. The EBU alluvial exogenous accumulative plain and the summit slope presented slope classes of 1°-3° and the slopes classes of 7° to 23° correspond to the environmental volcanic endogenous of hillslopes of the monogenetic cone, alluvial

exogenous accumulative of local piedmont and scarp of lava flows. Morphogenetic characteristics control distribution of land use/cover, also the physical and chemical soil properties. The information obtained from the evaluation of EBU and the EI allow us to obtain basic information in the making-decision process into the land management procedure.

Emma Jane Roe, Cardiff University. Email: roeej@cf.ac.uk; Commercialising animals for food products: tales of carcass utilisation, cultural sensibilities and selling sentience in different European cultures.

There is a long geographic history of attention towards the process of commodification, or in other words how nonhumans as resources are given value to become exchanged within commodity chain networks (Whatmore and Thorne 1997, Mansfield 2003, Parry 2005). Yet between the production and consumption of a commodity lies a complex set of commercial practices that work to achieve a commercial position for the product. How do these commercial practices work with the particular socio-material capacities of the embodied nonhuman which often consists of a number of products that culturally and materially vary in their commerciability? Drawing upon findings from the cross-country retailing study - a study of the market for animal welfare-friendly foodstuffs - within the EU funded WelfareQuality® project this paper compares geographies of the process of commercialising different species of farm animals in different European cultures. It will consider how the commercialising of an animal's body for food production is connected to a number of both cultural and corporeal factors that change from one country to another dependent on a complex supra-national geography of legislation, culinary cultural practice, cultural sensibilities towards different animal species and respect for animal sentience. This paper contributes to the development of new cultural economic geographies of materiality situated in the capacities of the embodied nonhuman to be commercialised, or in other words how it becomes subject to the logic of capital (Jackson 2002).

Keywords: nonhuman food animal commodity retail

Robin Jane Roff, Simon Fraser University. Email: rroff@sfu.ca; Engaging with Food: Power, Democracy, and the American GE-Free Movement

On August 28th, 2006 the California Senate shelved SB1056, a bill which would have granted the state sole jurisdiction over the regulation of seed and nursery stock. Ostensibly drafted to ensure "a level playing field" for the state's agricultural and food industries, SB1056 is one of a host of similar legislation drafted across the United States to preempt county and municipal bans on genetically engineered crops. Although such 'preemption bills' are attempts to exclude the local as a source of regulation, they have, in fact, helped re-define the local, and particularly local food, as an important site of socio-political power. In this paper I reconsider the meaning and significance of the GE-Free movement in the United States, arguing that this is not a fight over food but the manifestation of a deeper struggle over state power. Drawing on in-depth interviews with actors on both sides of the fight as it has manifested in Sonoma County, California, I highlight the ways in which food and agriculture are mobilized in efforts to turn a passive consuming public into an engaged citizenry and thereby establish a more 'democratic' social model. In this light, eating local and organic products, frequenting farmers markets, and gardening are attempts to forge new political models as much as agro-food systems. Ultimately this work, and the GE-Free movement, suggests the need to explore the intimate relationship between sustainable food systems and the broader political-economic structure.

Jennifer Rogalsky, SUNY - Geneseo. Email: rogalsky@geneseo.edu; Strategies for Dispelling the Myth of the Culture of Poverty in the Urban Classroom

In the 1990s, William Julius Wilson provided a critical analysis of the structural causes of poverty. Unfortunately, many school teachers are still led to believe (via best selling books and mainstream discourse) that neighborhoods, parenting, and family are the determinants of students' literacy/educational outcomes. This "culture of poverty" thesis still persists in some inner-city schools. It is therefore crucial to inform educators about the structural causes of poverty as these factors manifest themselves in the classroom. Pedagogical interventions should focus on educating educators about the influences of deindustrialization, decentralization, classism, and racism upon their students' educational outcomes. Teachers need new strategies to promote more critical engagement of poverty in their urban classrooms. Some teachers in Rochester, NY are seeking a deeper understanding of their students as they recognize the need to understand how systemic classism, and de facto racism play a role in perpetuating poverty. However, they cannot begin to transform their classrooms

without the insights gained through in-depth knowledge of students' and families' lives. Through projects aimed at uncovering children's perceptions of their neighborhoods, access, and restrictions, I work with teachers to devise curriculum strategies aimed at uncovering the structural realities of poverty. The goal of such interactive methods is to dispel incorrect assumptions about low-income students in order to move away from blaming the individual and "their culture." The result will be more equal power among children, families, and teachers - developing relationships in which parents and children are accepted and respected, thus improving teacher effectiveness and educational outcomes.

Ben Rogaly, University of Sussex. Email: b.rogaly@sussex.ac.uk; Migrant Workers: Using Scale to Deconstruct a 'Progressive' Policy Discourse

The ILO's report A Global Alliance Against Forced Labour (2005) attempts to aggregate global trends in unfree forms of employment, highlighting the vulnerability of migrant workers. The report uses a number of country studies and develops a common position on policies for the protection of workers' rights. Because this position is politically important, and also because it is flawed, the proposed paper develops a geographical critique of the way it was reached. The paper will draw on original multi-scale research with migrant workers and their employers in India and in the UK (Rafique et al, 2006; Rogaly, 2006). It will show that the report neglects the micro-scale, taking insufficient account of individual migrant workers' narratives, and thus too often constructing migrant workers as victims, devoid of agency. Secondly, the use of data at the local and regional scales in the report will be seen to be highly selective, resulting in a neglect of diversity within countries in forms of capitalism reliant on migrant workers. Most importantly, perhaps, the ILO report stops short of a critical analysis of the large scale structures of global capital accumulation and their connections to state action, a process to which the ILO itself has not always been immune. Human geography's engagement with multiple scales, and with the politics of scale, position it well to contribute both to better, more nuanced, understandings of migrant workers' struggles, and to analysing the complex, political issues of policy, regulation and the governance of capitalist employment relations.

Bethany Rogers, Louisiana State University. Email: broge11@lsu.edu; "That Place Goes Along With What We Do:" Neighborhood Places, Cultural Practices, and Preservation in Post-Katrina New Orleans

This paper considers the effects of Hurricane Katrina on New Orleans' built and cultural landscape, particularly current preservation efforts that are impacting the future of the city's architectural record and cultural traditions. Specifically, this paper is concerned with the role of neighborhood places in the transmission of local cultural meaning and identity. Employing participant observation, interviews, and archival work, the paper presents three neighborhood places that illustrate a range of ways buildings and the people that use the buildings create and continue to sustain local cultural meaning over time. Theoretically the work fuses traditional concepts and methods of American cultural geography that are concerned with the material form of buildings with more recent research that emphasizes the embodied and everyday uses of places. This research thus takes into account the material and intangible elements of architectural spaces, exploring how both inform the place-making process and sustain cultural meaning. Further my research considers how both the material form and everyday uses and meanings of buildings combine to determine the local significance of places. Preservation work has traditionally privileged architectural standards in determining local significance because they are easier to document and assess than personal, social, or cultural meaning. The theoretical frame and ethnohistorical methods developed in this paper expand how community values and associations can be accounted for in addition to the architectural significance of the buildings themselves, so that the role of both in the placemaking process can be conveyed and valued in the preservation process in post-Katrina New Orleans.

Christy L. Rogers, Ohio State University. Email: rogers.441@osu.edu; Governmentality, Race, and Housing Policy in the U.S.

Historically in the United States, whiteness, property ownership and citizenship were defined and understood as mutually constitutive. Over time, the parameters of citizenship and property ownership were gradually expanded, and in the post-Civil Rights period, state-sanctioned discrimination in housing and lending was finally rendered illegal. However, racially and economically segregated neighborhoods remain, with the attendant threat of disparate citizenships. How, then, are ostensibly non-racist actors and policies perpetuating racialized spaces? Critical race theorists, while not always using the term "governmentality," have been chronicling the multi-faceted processes that

produce and sustain whiteness as an invisible, unchallenged hierarchical norm. The geographic literature extending Foucault's work on biopower and governmentality can be usefully threaded into this discussion. Foucault conceptualized the governing of a vast political economy effectively at simultaneous scales, in part through the use of "objective," quantitative tools, such as descriptive statistics, charts, graphs, and maps. Coupled with the flexibility and "memory" of law and legal regulations, geographers have shown how quantitative and visual tools of dividing, measuring, and forecasting became entrenched, racialized tools of state- and economy-building, while boasting what Daston has termed the "aperspectival objectivity" of 19th Century science. It is my contention that such an "aperspectival objectivity" has translated well into neoliberal governmentality, particularly with the dependence on market solutions to racial and economic residential segregation. I will illustrate this with a critical review of housing desegregation litigation and remedies, and conclude with qualitative studies that point to promising ruptures in the governmentalities of segregated spaces.

Keywords: governmentality, race, segregation, housing policy

James Colin Rogers, University of Georgia Department of Geography. Email: chewbacaedu@yahoo.com; David S Leigh, University of Georgia Department of Geography. Email: dleigh@uga.edu; *Estimating sediment yield from tributary stream banks in the Southern Blue Ridge Mountains*

Hillslopes of the Blue Ridge Mountains underwent significant erosion due to logging during the late 19th and early 20th centuries, which caused rapid overbank sedimentation in stream valleys. Subsequently, circa 1910-1940, the tributaries incised and left the historical overbank sediment as a low terrace, which provides a significant source of sediment to overall basin sediment yield. We developed linear regression models that predict minimum estimates of bank erosion and yield as functions of the correlations between Shreve stream order, floodplain width, and historical terrace height. The models are based on field measurements from 40 to 50 catchments smaller than 50 km² and a drainage network delineated from digital elevation models using ArcView. Age estimates for incision and floodplain establishment come from stratigraphic, photographic, dendrochronologic, and geochronologic (luminescence and radiocarbon) measurements. Terrace height minus floodplain height is the basis for calculating net yield from bank erosion. Preliminary results indicate that banks erode at 1.0 to 1.5 cm/yr, which yields about 10-20 t/km²/yr. This estimate is equivalent to published direct observations of sediment yield (sediment rating curve and reservoir sedimentation approaches) from fully forested catchments in the region where bank erosion is the primary source of sediment. Thus, our approach is validated as a suitable alternative to other methods of estimating bank erosion, such as process-based models and measurements from erosion-pins. Future research will investigate whether various types and intensities of land uses influence variation in bank erosion rates.

Jeffrey C. Rogers, Ohio State University. Email: rogers.21@osu.edu; *The Annual Cycle of Monthly Correlations between Station Mean Air Temperatures and Sunshine Duration across the United States*

Correlations between long-term monthly mean air temperatures and observed percentage of maximum possible sunshine (sunshine duration) are obtained at 113 U.S. stations and subsequently subjected to a principal components analysis. The component explaining the greatest U.S. variance is characterized by positive sunshine/temperature correlations from April through October, peaking in May and June, while negative coefficients occur from December - February. Regional variation includes high positive sunshine/temperature correlations in October across the northern tier of states while October coefficients are decidedly negative in the southeastern states. Differences in October atmospheric circulation are illustrated and discussed for representative northern and southeastern cities. Stations along the southernmost states can have positive winter sunshine duration/temperature correlations while those at the sunniest U.S. locales have sunshine/temperature relationships that are largely independent of the major principal components.

Robert V. Rohli, Louisiana State University. Email: garohl@lsu.edu; Lynn Copeland Hardegree, United States Army Corps of Engineers. Email: lynn.c.hardegree@sam.usace.army.mil; DeWitt H. Braud, Louisiana State University. Email: dbraud1@lsu.edu; *Remotely-sensed Urban Heat Island Features of Baton Rouge, Louisiana*

Despite recent advances, understanding of urban effects on local climate remains unsatisfactory. This research analyzes the urban heat island (UHI) of Baton Rouge, Louisiana, a medium-sized urban area with extensive forest cover and much potential for future UHI-related warming as a result of increasing growth and deforestation. The spatial variability in surface temperature as depicted by thermal longwave radiative emissions collected from the Advanced Thermal and Land Application Sensor (ATLAS) in May 1998 reveals far more detail than that provided by surface meteorological-station-based air temperatures. LANDSAT-based multispectral datasets from May 1988 and May 2003 were used to derive regression equations to estimate surface temperatures for various land covers from known NDVI values. Color infrared orthophotography produced from aerial photography provided ground truth/accuracy assessment. Results confirmed that altering amounts of vegetation within a given land cover over time produces significant changes in surface temperature values. The regression equations were then used to reconstruct past UHI values and forecast future UHI magnitude for Baton Rouge. Results may be useful for environmental planners in assessing an economic value on the functions provided by urban vegetation.

Carmen Rojas, Department of City & Regional Planning; University of California, Berkeley. Email: crojas@berkeley.edu; *Revolutionary Urbanism: Interrogating Space & Citizenship in 21st Century Socialism*

South America is an emerging geography of radical politics. Venezuela, under the leadership of Hugo Frías Chávez and with massive petroleum revenues, has been a key political and economic force for this shift towards what is being called '21st century socialism'. This '21st Century Socialism' has been praised for providing medical, education, and food services to those who have traditionally been marginalized from the economic wealth of the nation. As interest grows in the nature of this new project, a series of contradictions in this strategy to serve the poor have become evident. These contradictions become clearest when interrogating economic redistribution, the production of urban space, and street vendors in the city. Vendors, who can access the services provided by the state, have been the focus of an attack by local and national leaders in an attempt to 'clean-up' the city. The clean-up operations have taken two forms. Within the densest informal market, vendors are forced out by the military police, stands are destroyed, and a climate of uneasiness is pervasive. If the first operation is characterized by violence, than the second should be understood as 'operation formalization'. Just two metro stops away, vendors are organized by the Chavista mayor into a micro-enterprise project where they will rent out small scale kiosks from which they will be able to sell their products- formally. This paper explores the role of the state in producing a fragmented urban landscape by establishing differentiated forms of regulation and reprisal in Caracas, Venezuela.

Carole Ann Rollins, PhD Candidate, University of Nevada Las Vegas. Email: naturetech@earthlink.net; *Valuing a quasi-public environmental good: revealed versus stated preferences*

There is an ongoing debate concerning how non-market valuation estimates derived from different methods compare for use in evaluating public policy concerning an environmental good. The purpose of this paper is to examine the relationship between the value of a quasi-public environmental good using alternative non-market valuation methods. In this study two types of valuation methods are compared using revealed and stated preference estimates. The hedonic pricing method (HPM) provides estimates of revealed preference values and the contingent valuation method (CVM) provides estimates of stated preference values. The array of benefits associated with residential landscaping policies designed to promote water conservation in Clark County, Nevada is the quasi-public environmental good examined in this study. The results extend earlier works of Carson et al (1996) to show how CVM estimates compare with estimates obtained from HPM, thus providing policy makers with a range of estimates as a potential input into their environmental decision making process. The results also contribute to further understanding the relationship between revealed and stated preference valuation estimations for environmental goods, and contribute to the work of Sudip et al (2005) by providing ways of combining and calibrating different data sources which may be useful for future studies within the economics field.

Keywords: HPM, CVM, xeriscape, environmental good, contingent

Karen Sue Rolph, Ph.D., Stanford University. Email: karenrolph@hotmail.com; *Ecologically Meaningful Toponyms: linking a lexical domain to production ecology in the Peruvian Andes.*

The intention of this poster is to illustrate how traditional Quechua Indian place name knowledge has been mapped, but also, how traditional knowledge is being lost due to changes in culture and globalization more generally. I have detailed two groups of people in a native region, those who live farther from roads, and those who live closer to roads. Those living closer to roads are more likely to participate in the market economy, to speak Spanish, to know less about traditional toponyms, and finally, they are less likely to plant native or indigenous crops. Conversely, those who live farther from roads demonstrate greater traditional place name knowledge, are more likely to speak Quechua, and are more likely to preserve, plant and consume traditional crops. The poster I present will show "mental maps" of indigenous knowledge using GIS, and loss of knowledge based on age and market involvement.

Email: o.verkoren@geo.uu.nl; *Polycentricity as a Context Dependent Concept: the Case of Latin-American Metropolitan Areas*

In the current discourse on polycentric development on the city-region scale, it has been stated repeatedly that this concept is not exclusive for advanced economies but also adequate to characterise recent metropolitan dynamics in the developing world. These are, however, anecdotal suggestions that have not been explicitly investigated yet. Our paper explores this claim in a systematic manner for the contemporary large metropolitan areas in Latin America, by means of a review of existing literature. Since a clear-cut definition of polycentricity or the polycentric metropolis does not exist yet, it first distinguishes some key-elements of polycentric metropolitan development in North America - in many respects the cradle of this phenomenon - as a frame of reference. The answer to the question to what extent developments in Latin America fit in these key-elements is that 'polycentricity U.S. style' is at best dawning in Latin-American metropolises. This observation is explained by some typical social, economic and spatial conditions that, in broad terms, distinguish Latin-American from North-American metropolises. Characteristics like an 'unstoppable' demographic growth by migration of rural poor, a still incipient postindustrial economic development, and lower levels of 'automobilization' have hardly resulted in polycentric forms if we take those in North America as the standard. The lack of a universal definition leaves the door open for a more context dependent concept of polycentricity however. The paper concludes with some adjustments of the concept to Latin American conditions that would reveal a less incipient polycentric picture of its metropolitan regions

Keywords: Polycentricity, Metropolitan Development, Latin America

Kevin Romig, Texas State University. Email: Kevin_Romig@txstate.edu; *Re-Scaling Community Formation and Place Attachment*

While the politics of neoliberalism has created a surge in market-driven housing exemplified by large estate homes seemingly detached from the surrounding neighborhood and broad society, this paper investigates how residents form communities and become attached to place within landscapes reflecting the privatization movement. Based on fieldwork in six communities in Arizona and Texas, this paper reveals a more detailed picture of neighborhood life and sociability than a landscape appraisal might characterize. Through technology, private groups, and an intrinsic nature to know others, residents create meaningful social relationships at different scales than the neighborhood or municipality and tend to focus attention on other community institutions than ones traditionally seen at the municipal level instilling civic pride and awareness. While these new relationships help residents feel connected and a sense of place, they generally promote bonding over bridging social capital. Using post-structural theory, a new diagram of neighborhood social interaction is highlighted representing how people negotiate community interaction and build social bonds. These bonds happen at various scales across space and challenge geographers to consider the re-scaling of community and place attachment.

Keywords: community, place attachment, social capital

Alison Rooke, Goldsmiths College. Email: a.rooke@gold.ac.uk; *Navigating Queer Distinction in Lesbian Space*

This paper is based on a visual ethnography of working class lesbian's everyday life. It focuses on the ways that lesbian and bisexual women navigate, and make sense of, and live in relation the visual regimes, material and embodied practices which construct and occupy two lesbian and gay spaces: a LGBT community centre and a lesbian bar. By drawing on Judith Butler's and Pierre Bourdieu's work on performativity, embodiment, distinction and cultural capital, the paper offers the concept of the lesbian habitus to make sense the ways in which visual and embodied cultures of lesbian identity spaces produce and maintain the homonormativity of the space. This paper points towards some of the ambivalence integral to the promise of indifference, and recognition found in 'identity spaces'.

Esther Rootham, York University. Email: erootham@yorku.ca; Esther M Rootham, York University. Email: erootham@yorku.ca; *The Vietnamese Second Generation in Toronto- Racialization and Labour Market Segmentation*

The focus of my study is on the lived experience of young Vietnamese people who have grown up in Canada and who are not pursuing post-secondary education but rather working in low-paying manufacturing or service sector positions. I take as my starting point that the categories of 'race' and ethnicity are social constructs, and that they intersect with gender, religion, sexuality and class (etc.) identities. I will use Bourdieu's concept of habitus, that is, the matrix of meanings through which we understand our own actions and also against which we are ascribed and we create our identities. This framework allows an exploration of the agency that individuals have, all the while keeping in sight the durability of the meanings of identity. In this way I will explore the reproduction of class in the labour market trajectory of Vietnamese youth in Toronto.

Keywords: youth, second generation, Toronto, labour market, identity

Kathleen Rose, University of California, Santa Barbara. Email: rose@geog.ucsb.edu; *A Surface Feature-Based Model of CA-Code GPS Error*

Data quality information is crucial in evaluating the suitability for use of any spatial dataset. This paper uses GPS accuracy as one example of error that exists in spatial data. Global positioning devices are fast becoming common place items in today's information on demand world. The information produced from these tools is often used as a primary data acquisition source. The accuracy of this information is dependent on a number of factors, including atmospheric delays, clock errors, and ephemeris data. Despite recent improvements in GPS receivers and antenna technology, multipath error has continued to be a major source of error. By collecting coarse acquisition (CA) code GPS observations over a specified area over a given period of time, a model is built to predict the error of a given location based on surface features in close proximity.

Keywords: GPS, spatial data error, multipath, GIS

Leanna Shea Rose, Florida State University. Email: lsr02c@fsu.edu; *An event-based climatology of cloud-to-ground flash patterns for Atlanta, Georgia: Assessment of elevation effects*

Based on earlier studies, an area to the northeast of Atlanta, Georgia exhibits high cloud-to-ground (CG) lightning production in terms of both flash density and numbers of flash days. In order to further understand the processes that contribute to this area of augmentation, twelve years (1992-2003) of CG lightning flashes for the Atlanta region were clustered into individual storm tracks. Storm tracks with flashes that contribute to this northeastern zone were extracted from this dataset and categorized according to synoptic conditions, and wind speed and direction. Regressions of flash counts and elevation within grid cells over the study area were performed for wind groupings and synoptic types with the potential for elevation effects based on local topography and conditions.

Keywords: lightning,gis,urban climatology

Robert Andrew Rose, University of Wisconsin, U.S. Geological Survey. Email: raroel1@wisc.edu; *Changing Farms, Changing Forests: A Multi-scaled Model of Land Cover Change in Northwestern Wisconsin*

To understand the environmental outcome of anthropogenic change, researchers need to empirically link social processes with ecosystem conditions. By modeling land cover changes in relation to social, economic and spatial factors, geographers are able to understand how driving factors affect land cover change over time. With a dynamic land use history and the availability of long-term social and physical data, northwestern Wisconsin presents a unique opportunity to conduct research on the changing pattern of land use and land cover. In this region, land use and land cover patterns are affected by fundamental shifts in agricultural economies as well as the growth of the recreation industry. Using a layer stack method, four Landsat scenes were analyzed to assess land cover change at approximately 10 year intervals, from 1974 to 2001. Land

change trajectories were then incorporated into a multi-scaled, statistical model linking the location and pattern of land cover change to a set of socioeconomic and spatial factors representing the driving causes of change. Results revealed that, in contrast to regional trends of forest recovery, recreation and long-term housing as well as the consolidation of farm operations has led to local loss and fragmentation of forest cover.

Keywords: Land use, cover, change, model, landsat, GIS

Reuben S. Rose-Redwood, Ph.D., Pennsylvania State University. Email: rsr158@psu.edu; From Number to Name: Real Estate Dreams and the Politics of Collective Memory in the Cartesian City

Street naming plays an important role in the formation and legitimization of cultural and political identities through the construction of 'commemorative landscapes.' The politics of street naming is often so contentious, in part, because it opens a space for the contestation of collective memory and the spatial representation of political commitments. In contrast, the numbering of streets is often portrayed as impersonal, unaesthetic, and an imposition of Cartesian abstraction upon the cultural landscape. While many streets in the gridded cities of the United States are sequentially numbered, there have been numerous attempts to re-inscribe urban streetscapes through commemorative naming, some more successful than others. The current paper provides a comparative analysis of two cases in which formerly numbered streets and avenues in Manhattan were renamed for divergent purposes. I compare and contrast the politics of changing the names of the numbered avenues on the Upper West Side during the 1880s-90s with the renaming of Harlem's streets to commemorate civil rights leaders a century later. The former was an elite scheme by wealthy property owners to encourage real estate development whereas the latter project was a means by which a marginalized socio-cultural group could commemorate its heroes and spatialize its socially constructed collective memories. The benefit of examining both of these renaming projects together is that it provides a useful corrective to universalizing and romanticizing the 'symbolic reappropriation' of the landscape by illustrating the divergent interests involved in such shifts from 'number' to 'name.'

Keywords: street naming, collective memory, commemoration, cultural recognition, urban space

Mark Roseland, Dr., Simon Fraser University. Email: roseland@sfu.ca; Sustainable Local Economies

Strong local economies are the foundation of strong communities that can grow and withstand the pressures created by an increasingly urbanized world. Strong communities require a holistic approach that not only provides the traditional deliverables of economic development?jobs, income, wealth, security?but also protects the environment, improves community infrastructure, increases and develops local skills and capacity, strengthens the social fabric, and respects heritage and cultural identity. In this way, strong local economies also provide a foundation for strong national economies. Conventional approaches to economic development leave little room for strengthening local economies. Strong local economies are those that not only generate revenue but also take into consideration the equitable distribution of wealth within communities and the environmental implications of economic activities. How does the overall approach to economic development need to change in order to facilitate the development of strong local economies? This paper explores various approaches to strengthening local economies, some of the tools and strategies available, the actors involved in local economic development, and a development framework that addresses this broad range of concerns. This sustainable community development framework includes six forms of community capital coordinated, balanced, and catalyzed by community mobilization. The cooperative economy of Emilia Romagna in northern Italy, the Grameen Bank in Bangladesh, Vancity Credit Union in Vancouver, the Women's International Sewing Cooperative of Nueva Vida, and the campaigns for local trade across North America are all examples of the potential of community mobilization to help strengthen local economies.

Keywords: sustainable community development, sustainable local economies

Mark W. Rosenberg, Ph.D., Queen's University. Email: rosenber@post.queensu.ca; Sarah Lovell, Ph.D. Candidate, Queen's University. Email: 2sal3@qmlink.queensu.ca; Making 'Space' for Volunteers in Restructured Communities at the Beginning of the 21st Century

Similar to other developed countries, the 1990s was a period of restructuring of health care and communities in Canada. Geographically, restructuring manifested itself as the regionalization of health care and the amalgamation of urban and regional municipalities into single geopolitical units although not necessarily with matching borders. Programmatically, restructuring meant the 'downloading' of health and social services to volunteer organizations and informal service providers. Using the results of a survey of volunteer organizations carried out in 2004 and focus groups held with volunteers in 2006 in

Kingston, Ontario, Canada, the challenges of providing services in the new spaces of restructured communities is examined. We conclude by questioning whether the neo-liberal arguments that favour the new spaces of regionalization, the advantages of volunteer provision, new socio-legal arrangements and social capital as their virtuous framework are as advantageous to volunteers and those who receive services.

Keywords: volunteers, restructured communities, health and social services

Stacy R. Rosenberg, Texas A&M University. Email: srosenberg@bushschool.tamu.edu; Climate Change Scientists and Decision-Makers: Communication Gaps and Information Exchange

Climate change scientists play a significant role in the dissemination of information on global climate change. University and government scientists have their own views on what type of information is relevant for decision-makers who may address climate change issues. Decision-makers, meanwhile, have their own opinions about the kinds of information they need on climate change. This paper highlights the type of information that climate change scientists believe decision-makers need, describes the type and format that decision-makers (e.g. planners, local and state officials, and interest group representatives) prefer, and reviews how decision-makers use climate change information. It also discusses how climate change scientists view the relevancy of their work for decision-makers and the role that scientists believe they played in transforming climate change from a scientific issue to a public policy issue. Surveys were conducted with climate change scientists (N = 544) and local and state decision-makers (N = 500). Public health officials, economic development interests, environmental agencies, and agricultural interests were targeted in the decision-maker survey. This paper will unveil how these decision-makers use scientific information on climate change, and the communication gaps that currently exist between climate change scientists and decision-makers. It will also provide a comparison between the different views of academic and government scientists who conduct research on climate change and among the diversity of decision-makers included in this project. This research will provide valuable insights into how to improve communications between climate change scientists and local and state decision-makers.

Keywords: global climate change, decision-making, U.S.

Christopher J. Rosin, Centre for the Study of Agriculture, Food, and the Environment. Email: cjrosin@stonebow.otago.ac.nz; Life in the Audit Lane: Retail driven audits schemes and the sustainability of New Zealand agriculture

New Zealand, having virtually eliminated government subsidies in the agriculture sector in the 1980s, provides a unique opportunity to examine the processes through which sustainable farm management is adopted under neoliberal governance structures. Rather than receiving state initiated incentives, agricultural producers are expected to respond to market signals and the desires of consumers. The extreme export orientation of New Zealand's agriculture sector, however, requires marketers of agricultural products to explore alternative strategies for achieving access to wealthier markets in North America, Europe, and Japan. In these markets, New Zealand products must increasingly comply with audit requirements developed by retailers seeking to convince consumers of a food's safety and the relatively benign environmental and social impacts of its production. This situation appears to create the context for a classical political economic explanation of management practices subject to the interests of more powerful actors - in this case, large European retailers. Comparative analysis of New Zealand's dairy, kiwifruit, and sheep/beef production systems within the ARGOS (Agriculture Research Group on Sustainability) project has, however, demonstrated the uneven nature in which such audit schemes are incorporated. From the perspective of convention theory, I argue that this unevenness is the result of the varying ability of the diverse actors to employ strategic justifications of quality designations ? specifically those related to social justice and environmental sustainability. I conclude that the origin (domestic vs. international) of pressures to improve social and environmental standards of production strongly influences the character and process of adoption of audit systems.

Keywords: rural geography, sustainable management, audit systems, convention theory, New Zealand

Amy Ross, University Of Georgia, Athens. Email: Rossamy@uga.edu; Genocide and GISci: Using geographic information science (GISci) to study human rights

In this project, we combine GISci technologies with qualitative data to analyze the potential for critical cartography in the study of mass atrocity. The case study we use is Northern Uganda, where millions have been affected by physical violence and hardship, displacement and fear. The United Nations estimates that more than 1,000 persons a week die from violence, malnutrition and disease? an 'excess mortality' that places Northern Uganda among the worse crises of the 21st century. Images of broad spatial extent acquired periodically

over the duration of the displacement and destruction can be used to visualize and analyze these events. Derived classified maps and areal statistics provide quantified data that can be combined with testimonials and ground photographs from field visits. Cartographic functions, geovisualization and spatial analysis available in GIS are then used to extract information from available remote sensing images. The data drawn from GISci technologies will be merged with qualitative accounts from sources such as primary and secondary interviews with victims, scholarly and journalistic reports of events, and other secondary materials. A central goal of the project is to critique each methodology (qualitative and quantitative) in light of the other. We wish to explore how human rights violations and mass atrocity appear in the world of geo-spatial representations. How does GISci succeed, or fail, to complement the 'ground truth' of the qualitative interview data? How does reliance on personal narrative and their interpretation (qualitative analysis) succeed, or fail to depict, the social realities apparent in the GIS data?

Keywords: GIS, critical cartography, human rights

Robert Ross, Syracuse University. Email: rbross@maxwell.syr.edu; *The Scales and Skills of Monopoly Power: the Case of the 1890-1891 Chicago Carpenters' Strike*

This paper further develops Labor Geography by linking the impetus for constructing a geographic scale to historical-geographic changes to the labor process and monopoly power. The 1890-1891 Chicago carpenters' strike is used as a case study. Striking for an eight-hour day and a pay rise, Chicago's United Carpenters' Council (UCC) secured the entry points to the city in order to prevent other carpenters from traveling to Chicago, and thus, to control the labor market. For those non-union carpenters who did manage to gain entry to Chicago, the UCC picketed the existing worksites in order to prevent construction from taking place during the work stoppages. It was necessary, in other words, to produce and contain the scale of the labor market in order to both win the strike and to ensure that they would retain that which they could win. In order to more fully understand the UCC's need to control the scale of the labor market, however, we need to uncover the historical-geographic processes by which a ready supply of outside and nonunion carpenters was created in the first place. The deskilling of carpentry in the nineteenth century created certain social and geographic changes, including the expansion of the labor market, but also a shift in monopoly power from individual carpenters to large contractors. The UCC's strike, and the labor geography they constructed in order to wage it, was an attempt to reclaim some of what had been lost from these transformations.

Eliana Consoni Rossi, Universidade Federal Do Rio De Janeiro. Email: consoni@acd.ufrj.br; *Global links configuring a South American/Brazilian polycentric city-region*

Since the 1980s, the regional connections of globalization in South America have been addressed to Sao Paulo. While the global flows happened substantially in North-North paths, in a considerable extent South America became part of the global periphery. After 2002, the Brazilian policies were oriented to South-South agreements and the Brazilian annual growth rates were very low. However, this is only part of the story. From the viewpoint of South America, the global linkage to Sao Paulo has a passive tendency in the global arrangements. An anterior study shows the different roles of Sao Paulo in banking circles and its shadow over the former and the contemporary Brazilian capitals - Rio de Janeiro and Brasilia. But after 2002 a new global path - from the periphery to the world - appears in such scenery. It is an active tendency promoted by the Brazilian main firms located in Rio de Janeiro and Brazilian main banks located in Brasilia and Sao Paulo. Despite the effort such firms and banks undertake to surpass the challenges of both country and continent i.e. Brazil and South America, the Brazilian global linkages abroad created by the firms-and banks subsidiary, offices and branches impregnate new capabilities in scattered Brazilian sites. We study the development of a Brazilian polycentric city-region as a consequence of the passive and active global paths.

Jairus Rossi, Pennsylvania State University. Email: jairusrossi@gmail.com; *The (Re)Imagining of Jeju Island: Multi-Scale Construction of Place and the Jeju Free International City*

Historically resistant to large-scale development activities, Jeju Island has escaped the environmental degradation that characterizes South Korea's rapid economic and industrial expansion. Driven by an IMF structural adjustment program, the state and local governments are attempting to transform Jeju into a major East Asian economic hub by integrating free trade, biotechnology, ecotourism and international education in an ecologically sustainable manner.

While local communities previously contested changes similar to those necessitated by this initiative, opposition is surprisingly absent. This research asks how different visions of place discursively interact to induce new types of development on Jeju Island under the auspices of the Jeju Free International City (JFIC). With conceptual mapping and scenario ranking exercises augmenting interviews with community, student, and producer focus groups, the JFIC proposal will be shown to mirror and use competing understandings of Jeju as a place, resource, and natural environment to induce support for this initiative. More specifically, this research examines how diverse local conceptions of place simultaneously contest and embrace different aspects of the development project as it is represented in externally-directed promotional literature and the internally-directed master plan and associated media. As the JFIC is in its early stages, the ongoing multi-scale redefinition and (re)creation of place has significant relevance to the actual implementation of this development plan. The transition of a rural, previously marginalized province to a high-tech internationalized place is instructive in understanding neoliberal development's practical impacts. Word Count: 250

Keywords: Jeju Island, place construction, neoliberal development, cultural representation, special economic zones, South Korea, East Asia

Ugo Rossi, Johns Hopkins University, USA / University L'Orientale of Naples, Italy. Email: urossi@unior.it; *Dystopianism as a growth machine and the normalisation of urban entrepreneurialism*

In this paper I offer a comparative analysis of the politics of urban entrepreneurialism in the cities of Baltimore (US) and Naples (Italy). Both cities have long-standing negative images and representations stressing crime, physical decay and the presence of 'dangerous classes' as distinguishing features of their urban life. The paper takes into account the role that dystopian views on the cities have played in forging institutions, coalitions, and networks of urban growth. Urban dystopianism is usually regarded as a force opposed to urban utopianism and many authors have noticed the way in which this view has deeply informed critical urban research over the last decades (see Baeten, 2002; Merrifield, 2000). In this paper I seek to highlight the potential of urban dystopianism in driving the policies of cities' economic regeneration and physical renewal towards the adoption of an entrepreneurial imperative which obliterates the social issues that are at the origin of the negative representations of the city. In particular, I explore two different stages in entrepreneurial urbanism in the two cities: an early-entrepreneurialist stage in the 1980s, in which entrepreneurial strategies had de-stabilising effects on the institutions of urban government (I define this mode of governance as "subversive entrepreneurial governance"), and a post-entrepreneurialist stage in the 2000s marked by the 'normalisation' and the culturalisation of urban entrepreneurialism ("normalised entrepreneurial governance").

Keywords: urban governance, dystopianism, cultural turn, Baltimore, Naples

David Andrew Rossiter, Western Washington University. Email: david.rossiter@wwu.edu; *Negotiating Nature: Colonial History and Environmental Politics in the Trans-boundary Pacific Northwest*

Since the early-1990s, the Pacific Northwest region of North America has been the setting of several intense and well-publicized environmental conflicts. In addition to expected confrontations with a variety of resource extraction industries, environmental non-governmental organizations (ENGOS) advocating for landscape and wildlife preservation have often, and with surprise, found themselves to be at odds with First Nations over prescriptions for future land and resource use. In this paper, I consider the different colonial histories experienced north and south of the Canada-USA border and trace these through modern environmental politics. I focus on two case studies: Greenpeace's campaign to "save" British Columbia's Great Bear Rainforest and Sea Sheppard's campaign to stop the Makah Nation from pursuing the grey whale hunt off of the coast of Washington State. Drawing evidence from the comments of a variety of stakeholders and deploying a concept of political ecology advocated by Bruno Latour, I argue that the Makah's historic treaty with the US Government has not provided a satisfactory guarantee of resource rights and, in fact, has limited the Nation's ability to negotiate with the opponents of the hunt. I then contrast the situation in western Washington with that of First Nations in coastal BC who, I claim, occupy an increasingly powerful place at the table in negotiations over resource use in their traditional territories because of the presence of serious and ongoing land claims in the province.

Robin J Roth, PhD, York University. Email: rothr@yorku.ca; Constrained by Conservation? The Bounded Territories and Rooted Networks of Livelihood Change in Northern Thailand

This paper documents livelihood change associated with protected area establishment in Northern Thailand. The paper is based on research conducted in two villages located inside newly established Mae Tho National Park. In conjunction with park establishment, these communities have been told to reduce their farming land and increase cash crop farming to compensate for lost resources. Consequently livelihoods are becoming both spatially constrained on smaller plots of farming land, and spatially flexible and diverse, as some residents migrate, seek wage labour far from home and sell goods to national and international markets. Livelihoods are less and less conducted within bounded territories but increasingly connected through a variety of networks rooted in territory. This paper explores preliminary results of research into livelihood change associated with park establishment and (following Rocheleau and Roth, 2007) argues for a theoretical lens that reconciles classic notions of territory with emerging notions of social and ecological networks as appropriate for investigations into conservation-induced livelihood change.

Keywords: livelihood, thailand, political ecology, conservation, networks, territory

Tamar Y. Rothenberg, City University of New York. Email: tamar.rothenberg@bcc.cuny.edu; "Conserving the American Race:" American Geography and the Immigration Debate, 1910-1925

This paper examines ways in which American geographers and outlets of popular geographic knowledge such as the National Geographic Magazine and World's Work portrayed American immigrants and the issue of increased immigration to the United States, especially that of immigration from non-Northern-European countries. Harvard climatologist Robert De Courcy Ward, for example, was a leading advocate of immigrant restriction who called for "conserving the American race." National Geographic Magazine published an article by Ward in 1912 that lambasted lenient immigration laws and called for a eugenics policy in immigration. But after the U.S. entered the World War, the magazine ran an article favorable to the new immigrants. This shift has been contextualized by Richard Slotkin in his 2005 book, *Lost Battalions: The Great War and the Crisis of American Nationality*. Slotkin argues that as the United States went to war, there was a change in the national rhetoric regarding the country's newest immigrants. As new recruits were needed to join the volunteer U.S. Army, it became impractical to argue that immigrants from central and southern Europe (in particular) were inferior and unable to assimilate. Immigrant battalions in World War I demonstrated their courage, American patriotism, and American-ness, but that moment was short-lived. In my paper, I will explore the participation of American geography educators in these varying representations of immigrants and immigration.

Keywords: history of geography, immigration, eugenics

John Round, University of Leicester. Email: jpr15@le.ac.uk; Everyday Tactics and Spaces of Power: the role of informal economies in post-Soviet Ukraine

Through exploring de Certeau's concepts of daily life and the development of tactics as a response to economic marginalisation this paper examines the role of informal economies in post-Ukraine. Based on 700 household surveys and 75 in-depth interviews, conducted in three Ukrainian cities, the paper argues that individuals/households have developed a wide range of tactics in response to the economic marginalisation the country has endured since the collapse of the Soviet Union. After discussing a variety of these tactics the paper then goes on to explore how unequal power relations shape the spaces in which these practices take place in and how they can be simultaneously sites of exploitation and resistance to economic marginalisation. Through a critical reading of social capital theory the paper then moves on to demonstrate the importance of informal networks in facilitating such tactics. The paper concludes pessimistically by suggesting that the way in which these economic spaces are shaped precludes the development of state policies which might benefit the economically marginalised.

Keywords: Economic marginalisation, coping tactics, everyday life, informal economies, Ukraine, social capital.

Paul Routledge, Dr., University of Glasgow. Email: Paul.Routledge@ges.gla.ac.uk; Kristina N Weaver, University of Glasgow. Email: Kristina.Weaver@ges.gla.ac.uk; Major Disasters and General Panics: Affinity, Autonomy and Affect in the Clandestine Insurgent Rebel Clown Army.

In this paper, we will run away (all too briefly) from the capitalist/war circus and (re)join the Clandestine Insurgent Rebel Clown Army (CIRCA). This paper considers the work of the CIRCA during, and after, the protests against the G8 in Gleneagles, Scotland, 2005, from the perspective of two 'clownbats', General Panic and Sergeant Ina. In so doing, the paper considers the deconstructive discursive potential of Rebel Clown logic, and how the practices of affinity, autonomy and affect are worked through in a particular CIRCA battalion, Glasgow Kiss. The paper argues that CIRCA activists draw upon what Laura Pulido (2003) terms the 'interior life of politics' articulating a 'vulnerable present' in conflict contexts. Relationality and mutual responsibility are worked through in active practice in imaginative, material, emotional, and political spaces in an attempt to invert the operational logic of certain conflict scenarios.

Keywords: autonomy, politics, performance

Michael J Rovito, PhD candidate, Information Technology in Society Research Group, Temple University. Email: mrovito@temple.edu; A Deontological Ethical Evaluation of GIS

The blending of health applications and GIS has transformed the way diseases are studied by health officials and the way that society views and reacts to disease. In other words, the manner in which maps can transform raw, sometimes convoluted quantitative data into tangible visual information has led to many discoveries in public health. However, there are many issues surrounding GIS and health applications, including ethics. This paper seeks to elaborate upon the usage of GIS in health applications and the ethical issues surrounding said usage from a Kantian deontological perspective. In contrast to a consequentialist perspective, a Kantian deontological perspective of GIS suggests that the ends do not necessarily justify the means. Instead, how a health GIS is built should be of greater concern to what the product is. For GIS health applications, there must be uniformity of responsible and accountable behavior in order to produce a GIS that not only serves the community, but upholds the moral fabric of society. This is done by the treating each individual as a free and rational being. A built GIS has the power to implicate social change and political action within public health. It is within this realm where the availability of good information is a means to good policy. GIS data collection, information creation, and presentation of said data should be consistent and grounded in the preservation of the free and rational being. Consistency breeds responsibility. Responsibility breeds accountability. Accountability is inherently good and doing one's duty according to Kant.

Keywords: deontology, GIS, ethics, duty

Gwyn Rowley, University of Sheffield. Email: gk.rowley@talk21.com; Uncovering Israel: Myth to Reality?

This presentation considers the initial separation, emergence and subsequent development of Israel as a people within a specific territorial area. The background is comprised of four parts. Firstly, a brief overview of the Pentateuch and its component inputs, Priestley, Yahwist and Eloist, facilitates a deconstruction of the scriptures. Secondly, we consider the 'Heretic Pharaoh' Akhenaton's (c.1353-1356 BCE) worship of Aten, the sun disk and, soon after his demise, the return to 'the old ways', and a departure (exodus) of a 'few thousand' Atenists to Canaan (Mendenhall 1961). Thirdly, a Levi-Straussian structural analysis of certain Biblical myths serves to clarify their meaning, specifically for societal endurance and kinship practices (Leach 1970). Fourthly, we refer to the late Bronze Age (later 13th century BCE) coastal- marauder activities within the Eastern Mediterranean and the havoc caused to communities about the littoral. Certain base hypotheses concerning Israel's separation within the Canaanite Central Highlands relate to a Peaceful Infiltration Model, Invasion of Sea-Peoples, Attack-Retreat Models, a Peasant Revolt Model, ideas of Cultic Separation and an amalgam of these variants (Harel 1977; Rowley 1999; Fieldstein and Silberman 2001). Finally, Stephen Jones' Unified Field Theory 1954 provides a base theoretical structure to contextualize notions of idea/field, and the subsequent maturation and development of both ancient and modern Jewish-state formations.

Rex Rowley, University of Kansas. Email: rjrowls@ku.edu; The Other Side of Las Vegas: A Local's Sense of Place

"Which hotel do you live in?" It wasn't long ago that Las Vegas would hear this question regularly from outsiders. The query is not so common anymore as the city has matured over the past two decades. Yet, even today, Las Vegas is one of the least understood famous places in the world. Although people now recognize that it has many full-time residents, they still have very little

knowledge about what this “other” Las Vegas is like. In the minds of its residents, as I discovered through ethnographic research, the local’s Las Vegas has a unique, multifaceted personality. Life in Las Vegas is similar to other American cities with the exception of an overwhelming presence of casinos and gambling related activities. Las Vegas typically live their lives separate from the neon and glitz of the Strip, but are inevitably connected to the mystic and pervasiveness of its image, which provides a cohesive effect on the city’s sense of community and place. At the same time, the connection to place and sense of community that one might expect in a typical American city is quite different in Las Vegas, partly because of that ‘Vegas image’ and partly because of the city’s rapid growth and the diversity within its population. Understanding this aspect of Las Vegas allows geographers and others to see the pervasive nature of the insider vs. outsider dichotomy as it exists, not only for a tourist destination, but also within the most remote town.

Ananya Roy, University of California - Berkeley. Email: ananya@berkeley.edu; Development Evangelisms: USAID, Hezbollah, and Other Terrains in Egypt and Lebanon

This paper examines geographies of development in Egypt and Lebanon. With a particular focus on poverty-alleviation policies, it traces flows of official development assistance and aid as they condense and congeal in a landscape of institutions that broker ideas, money, best practices, and expertise. The paper also examines “other” terrains of development in each geopolitical context, for example, Hezbollah, which is Lebanon’s most influential provider of development resources and services. The paper is particularly interested in comparing and contrasting these various forms of “development evangelism,” thus exploring the possibilities and limits of counter-hegemony.

Keywords: development, imperialism, neoliberalism

Anurupa Roy, The Ohio State University, Department of Geography. Email: anuruparoy@hotmail.com; Spaces of Labour Process: A Case Study of Call Centres in Kolkata, India

Of the many recent developments in the sphere of economic globalization, Business Process Outsourcing (BPO) stands out to be one of the most important. Call centres epitomize the new service-based economy in the globalizing world and form an integral part of the BPO (Business Process Outsourcing) sector. Particularly, in the less developed countries, call centres represent an important aspect of the landscape of economic globalization. At present India is the foremost location of outsourced call centre work from the advanced world. The call centre sector (within the broader Information Technology and Information Technology Enabled services) in India is viewed as one of the promising solutions to its development problems. There is, therefore, a relentless promotion of the call centre sector by the industry’s supporters, which is being backed up by the Indian government and the media. Even though some exciting images are presented describing call centres, the rate of attrition (labour turnover rate) is markedly high in this sector. To understand the reason for this, it is important to explore the spaces of labour process, i.e. the workplace, where capital and labour directly interact. This paper examines the nature of the labour process in call centres, taking Kolkata (India) as my study area. My study suggests that the call centre labour process is characterized by long and odd working hours, deskilling, and emotional labour. This results in spaces of alienation, which is further exacerbated by the stringent labour control system.

Keywords: labour process, call centres, India

Parama Roy, University of Wisconsin-Milwaukee. Email: proy@uwm.edu; Civil Participation? A Means Towards Environmental Equitability or Perpetual Inequality?

Growth of grassroots efforts within processes of urban green space production and management can be conceptualized as a reflection of changing state-market-civil society relationship under present neoliberal economy. These community-based efforts are often thought to be potential means towards enhancing socio-environmental equitability and empowering marginalized communities. Thus Walnut Way Conservation Corp., a neighborhood greening and revitalization effort by a predominantly African-American community of inner-city Milwaukee, lacking equitable access to urban green space (Heynen et al, 2006), have important implications for future environmental equality. Yet, being embedded within complex geometry of differential socio-political power relations, these organizations remain vulnerable to the interests and decisions of political/business elites and other non-profit foundations, which provide them with financial and administrative support (Moulaert et al., 2005; Swyngedouw, 2005). This often results in further perpetuation of social exclusion and inequality. Through an ethnographic study of Walnut Way Conservation Corp. and in-depth interviews with their representatives and members of Walnut Way’s social network, this paper will uncover the extent to which a grassroots organization may mobilize its role within this new tripartite institutional

arrangement towards actual empowerment and equitability (in this case, equitability in enjoying the benefits of access to urban green environment). This will help shed light on the broader implications of grassroots participation within the neoliberal economy to affect, support or prevent creation of a more inclusive, emancipatory and equitable urban environment.

Keywords: grassroots organization, neoliberalism, urban green space, environmental equitability.

Shouraseni Sen Roy, University of Miami. Email: SSR@miami.edu; A Spatio Temporal Analysis Of Urban Thermal Structures In The Twin Cities Metropolitan Area

Urban Heat Island (UHI), defined by considerably higher temperatures over densely built urban areas, has been the focus of study for different parts of the world. Studies focusing on UHI have placed much emphasis on analyzing spatial thermal patterns of either canopy layer or surface heat islands. In the present study, the spatial and temporal characteristics of UHI development in the Twin Cities Metropolitan Area (TCMA) of Minnesota were examined using both long-term climatic and multi-temporal remote sensing data. Daily maximum and minimum temperatures and precipitation data from eleven stations were examined to determine the differences in trends over space. Land surface temperature was calculated based on the thermal band of Landsat TM imagery. Different spatial analysis techniques will be used to investigate the driving factors behind the development of UHI in this area. The results of the present study will help in understanding the interactions between urban climate and other physical/social infrastructure.

Keywords: UHI, Remote Sensing, Extreme Temperatures

Rinku Roy Chowdhury, Ph.D., University Of Miami. Email: rroychowdhury@miami.edu; Eric G Keys, Ph.D., University of Florida. Email: ekeys@ufl.edu; Bridging Theories of Landscape Ecology and Agricultural Change

Landscape ecology has progressed from its initial focus on the quantification of spatial pattern to the study of ecological patterns and processes, more recently incorporating the anthropogenic dimensions of ecological change. Process-pattern research in landscape ecology that integrates human/social systems focused initially on the imposition of human disturbance regimes and their spatio-temporal effects on the landscape. Social dynamics were generally factored in as the immediate environmental constraints affecting land use or as the direct effect of land use on the landscape. More recently, research on social-ecological systems has begun to connect theories, data and analysis from the social and natural sciences, although methodological and empirical advances in such integration may have outpaced theoretical bridging. In this paper, we canvass in particular the areas of complementarity between landscape ecological and geographic/economic theories of agricultural change, and analyze the potential, promise and challenges in their joining. To this end, we also undertake a representative rather than comprehensive review of research that has demonstrated such theoretical integration, and report on the theoretical gaps identified as well as unrealized potentials and challenges. Among the lines of inquiry that hold the most promise for reconciling agricultural change theories with landscape ecology are diachronic approaches, the significance of perceptions, resource-use strategies and decision-making, neighborhood effects, hierarchical scales and chains of explanation.

Keywords: landscape ecology, agricultural change, decision making, perception

Dan Royall, UNC-Greensboro. Email: pdroyall@uncg.edu; Anita Henderson, UNC-Greensboro. Email: aahender@uncg.edu; Zhi-Jun Liu, UNC-Greensboro. Email: z_liu@uncg.edu; Downstream Reduction of Urban Influence on Channel Processes: a Case Study

The impacts of urbanization on the fluvial system, water resources, and aquatic biota are of increasing global concern. Locally, within more populous portions of the US, the most rapidly urbanizing areas face potential land and water resource conflicts with neighboring urban centers. How far downstream do urban influences extend? The answers to this question apparently vary widely with environmental and geographical specifics. In this study, we consider the case of fully urbanized headwaters exiting into rural landscape. The headwaters of North Buffalo Creek lie entirely within the urbanized area of Greensboro, NC (population 230,000) in the Appalachian Piedmont province. The stream exits abruptly into rural landscape at the city’s eastern margin, and its watershed begins to acquire a growing proportion of pervious surface area with downstream distance. The purpose of this paper is to document the nature of the resulting transition in stream hydrology and form for North Buffalo Creek. Indices of urban streamflow regime (e.g., days exceeding mean annual discharge; TQmean) suggest substantial urban influence after more than 5 km down-valley distance (~45% rural). Channel cross-section area switches from general conformity with published urban regional curves to greater rural curve similitude soon after exiting

the urbanized area (~ 15% rural). Both physical effects and choice of urban streamflow regime indices can account for the apparent difference in location at which rural dominance is reached.

The aim of this study is to characterize the structure and evolution of the global air transportation network. Using data from the ITA database for both 2000 and 2004, we analyze the topologies of the networks with a new approach based on weighted graphs from a small world perspective (Watts, 1999; Barabasi, Albert, 1999; Barat et al. 2005). The analysis is carried out in three stages: First, we look at classical graph metrics like centrality or connectivity of nodes; this first step shows that the most connected cities are not necessarily the most central ones (Guimera et al., 2005). Second, we explore the structure of the network. This step is performed through graph clustering algorithms unfolding the different "small worlds" together making up the whole network. The clusters are seen as communities and are captured with the use of edge metrics conveying topological properties of the underlying communities. The outcome of the clustering procedure provides a multilevel presentation of the most interconnected airports in the world. In a third stage, we identify the position of each airport in the network (satellite, hub or bridge?) and their cohesive role at three different levels: 1) inside their own cluster; 2) with all other clusters; 3) and inside the whole network. Finally, we compare the two networks, from 2000 and 2004, in order to detect an eventual dispersion/polarization tendency of the air traffic, the transformation of the different clusters and the stabilization or evolution of major hubs' individual position

James M. Rubenstein, Miami University Of Ohio. Email: rubensjm@muohio.edu; Impact on Employment of Changing U.S. Content in Motor Vehicles

This paper examines changing employment in the U.S. motor vehicle industry and assesses impact on employment changes of market shifts in the United States from the traditional "Detroit Three" (GM, Ford, and Chrysler) to foreign-owned brands (led by Toyota and Honda). As foreign-owned carmakers open production facilities in the United States, they argue that their vehicles are "just as American" as the traditional Detroit Three. Local and state governments provide generous incentives to international carmakers to locate in their communities. This study first discusses whether vehicles produced in the United States by foreign-owned carmakers are truly as "American" as those produced by the Detroit Three. Results are based on disaggregated data for submitted by carmakers and parts suppliers for each model, in compliance with the American Automobile Labeling Act of 1992, and stored at the U.S. Department of Transportation (USDOT) headquarters in Washington, DC. Access to data has been with the support and cooperation of the Federal Reserve Bank of Chicago. This study concludes that the market shift from Detroit Three to international carmakers has not been "job neutral" in the United States. More U.S. jobs have

been lost than gained in the shift. However, a significant portion of the job loss is attributable to productivity gains rather than market shift.

Keywords: auto industry

Gilles Rudaz, Department of geography, University of California-Berkeley. Email: rudaz@berkeley.edu; They are, we are mountain people!

The official motto of the International Year of Mountains (2002) was "We are all mountain people!" It highlighted the fact that a large part of humanity, even if not living directly in mountains, depends on them, notably on their waters. But to identify oneself as mountain people is something. The first part of the title of this presentation refers to the fact that, traditionally, communities do not define themselves as mountain people but are qualified as such by outsiders. The second part refers to some cases, where, as an effect of this outside qualification, these communities define themselves or at least present themselves as mountain ones. This presentation addresses the process of the building of mountain identities. It will start from long established ones to the current trend of mountain worldwide networks. Parallel to the international rise of mountain issues, communities have established worldwide contacts among themselves. One emblematic example is the World Mountain Population Association, founded in 2002. How to conceal the diversity of the mountain communities under the same banner? What interests do they have in common? If these communities benefit from exchanges of experiences in various fields, especially resources management, by presenting themselves as mountain people, they gain legitimacy and audience for their own claims.

Keywords: mountain people, identity

Susan Ruddick, University of Toronto. Email: ruddick@geog.utoronto.ca; Dead Dog Dialectics

Spinoza seems, perhaps, an unlikely source for the re-invigoration of a dialectical materialism now widely critiqued for its teleology and a dynamism derived from the abstract power of negation. Spinoza was dismissed by Marx as a "dead dog"; and castigated by Hegel who summarized his philosophical system in the phrase "every determination is a negation". But Marx himself never provided a full blow account of dialectical materialism per se, and his project to "turn Hegel's dialectic back on its feet" took as its starting point a Hegel who critically misread Spinoza. This paper explores a Spinozist re-visioning of dialectical materialism. It begins with Macherey's critical rereading of Hegel and Spinoza, and drawing on his work and others offers the (Spinozist) possibility of thinking a materialist dialectic that is positive and open-ended.

Keywords: dialectics Spinoza Hegel Marx Macherey

Purba Rudra, rutgers university. Email: purba@eden.rutgers.edu; Medical tourism in India; who benefits and who pays

The last decade or so has seen a tremendous increase in the number of medical tourists heading towards the developing world for cheap hi-tech treatments and for a wholesome body and mind rejuvenation experience. India is fast emerging as one of the preferred destination for this increasingly visible section of tourists. The amalgamation of age old traditions of healing and modern day medical practices is creating a deep niche for the Indian brand of medical tourism. The Indian Ministry of Tourism and the Ministry of Health and Family Welfare have worked to bring tourism and health care together into a more or less mutually beneficial form of Medical Tourism. They have taken steps like giving subsidies etc. to promote this sector. Though this has spelled good news for tourism in India, when seen in the larger context of globalization of health services, medical tourism has had a mixed impact on the health care sector in India. There is an increasing trend towards islands of medical excellence which are becoming more and more remote for the general public. It has also led to an "internal brain drain" of health care professionals from the public sector health services into the corporate health services sector. This paper takes a preliminary look into the rationale of the continuation, or not, of government subsidy to the private health care sector in India, given the gains to be had from it because of the increasing popularity of India as one of the foremost medical tourism destinations.

Keywords: Medical tourism, India, health care

Jana L. Ruhlman, United States Geological Survey. Email: jruhlman@usgs.gov; Leila Gass, United States Geological Survey. Email: lgass@usgs.gov; Barry Middleton, United States Geological Survey. Email: bmiddleton@usgs.gov; Comparison of Contemporary Land-Cover Trends among the Sonoran Basin and Range, Madrean Archipelago, and Chihuahuan Deserts Ecoregions

The Land Cover Trends project, a joint effort between the USGS and EPA, uses satellite imagery to classify land cover and estimate contemporary (1973-2000) changes in land use and land cover in the United States. Using ecoregions defined by Omernik and the EPA, estimates of land-cover and land-use change are derived from interpretations of a statistical sampling of image blocks from

five dates of Landsat imagery. The statistical results, in conjunction with site visits, geographical research, and socioeconomic data, are used to assess regional driving forces of land-use change. This poster examines and compares three adjacent southwestern ecoregions — the Sonoran Basin and Range, the Madrean Archipelago, and the Chihuahuan Deserts. Combined, these ecoregions stretch along the U.S.-Mexico border from south-central California to western Texas. They each have their own distinct landscapes, contain high amounts of biological diversity, and share common as well as disparate issues that affect land use. Increased oil and gas extraction, availability of ground-water resources, and reduction of natural grasslands because of overgrazing and other desertification processes are some of the factors affecting contemporary land use in these ecoregions. Using the Land Cover Trends research and interpretation results, the rates and types of land-cover change are being compared to find similarities and contrasts among these three contiguous areas. Initial findings indicate that change is infrequent and occurs mostly within the grass/shrub, agriculture, and mining classes. A closer examination and comparison will provide a look at regional land-cover trends for the border areas of the southwest.

Stevie R Ruiz, San Diego State University. Email: SRRuiz1982@yahoo.com; *Re-Producing Fear in the City: Film, Rape, and Women's Hysteria in Ciudad Juárez, Mexico*

Since 1993, Ciudad Juárez has gained considerable international media attention surrounding the rapes and murders of over four hundred young Mexican women. Yet, most of this international coverage has primarily been purely sensational. In this paper, I examine competing representations of femicide victims in activist documentaries and popular docudramas. I analyze how activist madres (mothers) have used film space as a tool to re-codify memories of the young victims as virgin women. Yet, I also examine how sensational news stories and U.S. rape culture have reinforced the discourse that victims were prostitutes. I argue that although femicide victims are represented differently in each set of films, there is an underlying similarity between activist documentaries and Juárez docudramas. Both sets of films reinforce women's fear of urban public spaces at nighttime and thus use film spaces to incite women's hysteria in Ciudad Juárez, Mexico

Robert Rundstrom, University of Oklahoma. Email: rrundstrom@ou.edu; *Race and Resettlement in the Arbuckle Uplands of Oklahoma Prior to Statehood*

Prior to statehood in 1907, the Arbuckle Uplands in southern Oklahoma were part of a vast federal protectorate termed "Indian Territory." Before the U.S. Civil War, the area was home primarily to Chickasaws and their African-American slaves. Whites from Texas and other parts of the south and newly freed Blacks came soon after the war, first in a trickle, then in a stream. By the twentieth century, the region had a complex social structure molded by Indians, Blacks, and Whites whose impact on each other and on the physical environment varied considerably. This paper uses maps drawn from our database of more than 5,000 post-war immigrants to Indian Territory and other sources to reveal these relations in the Arbuckles.

Melissa Rura, . Email: melissa.rura@utdallas.edu; Jacqueline Carr, . Email: ; *Automated Turn Table Creation For Street Network Modeling*

In street network modeling it is important to model many different aspects of the street network when calculating a drive time. One of these aspects is the intersections that themselves include many components that can influence driving time calculations. The purpose of this paper is to detail the algorithm used in a tool that automates the turn table creation process for a given street network. This turn table is used to find the total driving time in the calculation of the best route algorithm. Two examples turntables are described. The first is a simple two-intersection dataset easily checked for accuracy through manual calculation, the second dataset is the city of West Lafayette, Indiana street network with 1029 intersections, which is then spot-checked for accuracy visually. A GUI is also created to allow the user to add additional information about the intersection that could also be incorporated into turn time and drive time calculations such as type of intersection (i.e. stop sign/stop light) or amount of traffic flow (number of cars per hour).

Dereka Rushbrook, University of Arizona. Email: dereka@u.arizona.edu; *Three stories: local responses to migrant flows through northern Sonora*

Over the past decade, U.S. enforcement strategies along the U.S.-Mexico border have shifted migrant traffic to more remote areas of the boundary. While these policies have had dramatic and well-documented consequences for nontraditional crossing areas in the U.S. border zone and the migrants themselves, they have also impacted the economies and communities located along the migrant route in Mexico. This paper explores the consequences for small towns along the border in the state of Sonora that have found themselves at the "epicenter" of these flows. The landscapes of the prosperous agricultural centers and remote outposts alike bear witness to the variety of businesses and networks that have sprung up to cater to the migrants moving north and to those who have been deported south, posing both challenge and opportunity. The most recent shift in enforcement efforts highlights the cyclical nature of these economies and the transnational links that shape them, as illustrated in three cases of civic responses examined here.

Laura Russ, UCLA. Email: lruss@ucla.edu; *Exerting Organizational Legitimacy through Strategic Conflict: A Case Study of the South African Homeless People's Federation*

Although the literature on interorganizational conflict and collaboration has spanned many decades, this literature are only recently been adapted to examine NGO relations. Further because much of the literature on NGOs assumes a high level of altruism, the discussion has focused on NGO capacity for collaboration - both as a bridge between community and the government and in terms of partnerships with other NGOs. This paper explores the ways in which conflict, in addition to collaboration, have been used in the restructuring process of civil society coalitions with varying degrees of success. Based on the concept of organizational power as a function of access to multiple types of capital and subsequent ways to assert legitimacy, it is possible to think of different scenarios when conflict or collaboration is most strategic. This case study of conflict amongst housing service providers in Cape Town, South Africa seeks to uncover underlying structural, organizational and individual power relations as a means to understand the extent to which conflict can be considered strategic for the individual organizations involved and for the growth of the sector more broadly.

Rachel Russell, Arizona State University. Email: Rachel.Russell@asu.edu; *Commodification of Tempe Town Lake: Changing Perceptions of Landscapes*

Through the construction of the Tempe Town Lake, the City of Tempe, Arizona reconstructed its cultural landscape and changed the image of the city in the process. By lining the lakeshore with luxury high-rises, Tempe Town Lake emerged as the focal point for new businesses and economic redevelopment of the city. This commodification of urban space is transforming Tempe from a college town to a city of high-rise development. This paper uncovers the critical landscape images around Tempe Town Lake and the local government, development companies, and neighborhood groups use of the symbols to further their development goals. An examination of current and archival newspapers opinion pieces, development documents, and promotional material revealed that major actors manipulate landscape symbols for their own development objectives. A survey of lake-users exposed community attitudes towards new economic development and its affect on local identity. The results indicate that the commodification remains unsuccessful at removing the connections to traditional local landscapes and critical cultural landscapes remain prominent fixtures in promotional and advertising materials. These findings are crucial to policy-makers who will use this research to design future development to better serve the community.

Keywords: Cities-commodification, cultural landscapes, place-making

Richard A. Russo, University of Maryland. Email: rarusso@umd.edu; *Cooperatives in the Function and Meaning of Local Food Systems*

With corporate and industrial farms now dominating a global organic food supply chain, alternative food advocates are going "beyond organic" and focusing on re-localizing food systems. This paper investigates the extent to which cooperatives are a factor in creating and strengthening local or regional "foodsheds" (Kloppenborg et al., 1996). Cooperatives are important institutions in the decentralization of decision-making and in the economic empowerment of local communities. What economic and cultural impacts do producer and consumer cooperatives currently have on local food networks? How do cooperatives act to spatially define a foodshed? How do they imbue local food landscapes with cultural meaning?

Keywords: cooperatives, food, local, landscape

David J Rutherford, PhD, National Geographic Society. Email: david.rutherford@geo.txstate.edu; *Advancing Geography as Integrative Discipline of Synthesis: A View through the Lens of Geography Education*

Long-standing claims assert that geography is an integrative discipline of synthesis, and one recent essay even proposed geography as the center of an "emerging new transdisciplinary synthesis science" (Skole 2004, 739). Additional - and sometimes the same ? voices make observations about the perceived incompatibility or "outright conflicting" nature of geography's traditions/specialties (Kwan 2004, 756) that are "more akin to a confederation of feudal fiefdoms than to a union of mutually interdependent states" (Gober 2000, 3). Such claims, observations, proposals, etc. exist primarily as anecdotal and/or literature-based arguments and interpretations that are often advocacy-oriented and, at their best, may encourage disciplinary synthesis. One way to move beyond mere encouragement is to utilize theoretically informed, empirical research to help "engineer the synergies that are now latent" in the discipline (Abler 1992, 224). This research used theory from geography education as the framework for a mixed-method design that identified and analyzed the subject matter and faculty disciplinary identities across three broadly recognized sub-disciplines ? human, physical, and regional geography. Results tested and refined existing understandings and demonstrated the existence of: (1) limited commonality of subject matter among the three sub-disciplines; (2) significant differences in disciplinary identity between faculty members in physical geography and the human and regional sub-disciplines; (3) a set of subject matter items and disciplinary identities that may promote synthesis; and (4) suggestions for approaches that can foster research and teaching across sub-disciplinary specialties. Results also served to refine and advance the theories that provided the basis for the research.

Keywords: human geography, physical geography, regional geography, interdisciplinary, geography education

Stephanie Rutherford, York University. Email: stephier@yorku.ca; *"The wild was never this wild?": nature, power and the consuming subject at Disney's Animal Kingdom*

Much of the scholarly work on governmentality (with notable exceptions) has focused on the state, adeptly exploring the operation and circulation of neoliberal policies and their attendant impacts on subject formation. This paper, however, takes as its starting point the notion that power can and does operate outside of the state, often through cultural institutions that shape how different subjects come to understand the world and their place within it. To that end, my paper examines Disney's Animal Kingdom Theme Park as a site of green governmentality. Using Foucault and his interlocutors, this paper argues that theme parks can generate particular forms of power, specific biopolitical agendas and kinds of environmental subjectivities, which are the hallmark of the 'conduct of conduct'. While governmentality functions as my theoretical scaffolding, I also seek to bring Foucault into conversation with other theorists of power - namely Gramsci, McClintock and Baudrillard ? to explore how they might inform, extend and refine notions of green governmentality at this site. In doing so, I will attempt complicate notions of governmentality by signaling the ways in which commodification and governmentality often work in hand in hand to produce a political economy of nature consumption.

Keywords: governmentality, subjectivity, nature recreation, theme parks

Tod D. Rutherford, Syracuse University. Email: trutherford@maxwell.syr.edu; John Holmes, Dept of Geography, Queen's University. Email: John Holmes [holmesj@post.queensu.ca]; *Governance and Global Production Networks in the Southern Ontario Auto Industry*

In this paper we argue that the theoretical approach which characterizes clusters research is drawn mainly from an eclectic heterodox perspective which emphasizes institutional embeddedness and the importance of often localized governance. We recognize the important insights by heterodoxy/governance approaches but argue also for an engagement with marxian value theory and its stress on how value via price and profit pressures inflect firm competitive and innovation strategies. Drawing on the work of Jessop, 2002 Smith et al, 2002 and Coe et al 2004 we examine the key role of the state via accumulation projects in capturing, creating and enhancing Global Production Network (GPN) value and creating economies of scale and scope at the cluster scale. We examine the development of the Canadian auto industry and the Kitchener and Windsor clusters as the result of successive federal and provincial state projects. Despite their success these clusters and the Canadian auto industry are being threatened by neo-liberal policies and the restructuring of North American auto industry GPNs due to overcapacity and falling profits. Both firms and the state have reflexive capacity and the Canadian state is adopting more Schumpeterian Competition Strategies (SCS) involving a wide range of stakeholders. We argue however that because institutions are both constitutive of and often subject to value flows, firm

innovation and cluster coherence are being negatively impacted by the current restructuring process.

Ted Rutland, University of British Columbia. Email: tedrutland@yahoo.com; *Scales, Agencies, and Socio-Natures: Governing the "Local Environment" in Portland, Oregon*

Studies of local environmental policies typically take the "local environment" as given, and proceed to examine how local political actors struggle to actualize their visions of how it should be governed. But what if the constitution of the "local" is a crucial influence on that struggle? In this paper, I explore how the local scale, local actors, and the local environment were each constituted in the process of developing a municipal climate change policy in Portland, Oregon. Attending to the practices that allowed citywide carbon dioxide emissions to be estimated, I show that the "local environment" did not pre-exist the struggle to govern it; rather, it emerged in a long process of political contestation and consultation, gradually becoming an object that could be governed in an acceptable way.

Lanham L Ryan, Virginia Tech. Email: rlanham@vt.edu; Katherine F. Lanham, Virginia Tech. Email: klanham@vt.edu; *Re-Centering Greensboro: The Center City Park and the Re(creation) of Community*

The paper discusses the actions of a coordinated group of nonprofits and foundations called "Action Greensboro!" and its effort to build a new park in center city of Greensboro. The park was dedicated December 1, 2006. The theme of the paper suggests that nonprofit organizations in general and foundations in particular, are working to create spatial identities in ways formerly associated almost exclusively with state or governmental organizations. This transformation of actants results in a decentering of the state as the definer of spatial identity opening up not prospects for the recreating of urban areas by new entities.

Keywords: nonprofits, urban geography, urban parks, actor-network-theory

Meghan A Ryan, Boston University. Email: megryan@bu.edu; Benjamin Bowen Anderson, Boston University. Email: bowenanderson@gmail.com; *Marine Integrated Decision Analysis System for Marine Area Monitoring and Management*

Marine areas are critical regions on the Earth's surface as nearly two-thirds of the world's people live within 150km of a coastline and are dependent on marine resources. Marine conservation has become seminal in this context. The Marine Management Area Science Program (MMAS) was created to advance the science and application of marine management areas in the service of marine conservation. Among the most important products of MMAS are to be model-based decision tools of utility to managers and decision makers working in MMA environments. We present a decision support system framework called MIDAS - Marine Integrated Decision Analysis System that is being developed at Boston University that can integrate spatial and nonspatial data for marine management. MIDAS includes two components ? an Integrative modeling system, and a marine area decision environment that combines ecological, socio-economic and governance variables. The project includes 10 MMAs across the globe. In this presentation, we present results of our spatial analysis models relating to Belize. A GIS database for Belize is developed using primary and secondary data sources 1970-2006. We examine two research hypotheses relating to Belize. How does coastal development specifically urbanization and recreation affect coastal marine resources? How does land cover change impact MMA in Belize? In this presentation will emphasize data quality, spatial accuracy, representation and other modeling issues involved in such large scale projects.

Keywords: Marine GIS, spatial model, conservation, marine management

Patrick J. Ryan, George Washington University. Email: bengee@gwu.edu; Loudoun's Road to Opportunity: The Dulles Toll Road Extension, promises and reality

Through the use of maps and spatial statistical methods this poster details the transportation, economic and settlement benefits of the privately built and operated Dulles Toll Road Extension in Eastern Loudoun County, Virginia. The study uses data from the United States Census Bureau, Virginia Department of Transportation, and Loudoun County Government.

Keywords: Loudoun County, Transportation Corridor

Timothy Ryan, . Email: timryan5749@yahoo.com; Geostrategy in the Long War: A neo-conservative crusade to a neo-realist conclusion

The publicly stated grand strategy of the American "Long War" against terror has been the spread of democracy, by force if necessary, into an autocratic region. The results of this strategy have been mixed, at best. However, it is the contention of this author that a de facto counter strategy of containment has been pursued silently and parallel to the public strategy, with decidedly positive results. This paper examines American progress in The Long War on terror from a politico-military perspective along two axes. On the first axis, the number and location of terror-supporting states and terror-fighting states in the Central Asia/Middle East/North Africa (CAMENA) region in the summer of 2001 are noted and plotted, then compared with the numbers and locations of such states in the summer of 2006. On the second axis, the number and location of states that housed or allowed access to US military forces in the summer of 2001 are compared to the number and location of such states in the winter of 2005/2006. Comparison of the maps of these two measures indicates that the military isolation of Iran is nearly complete. Publicly embracing and vigorously pursuing a containment strategy at this stage of the conflict would pay more long term strategic dividends to the US than the strategies of preemptive war and aggressive democracy promotion.

Winifred L. Ryan, Ph.D., . Email: maritimeresearch@cox.net; The Effects of Recent Storms on Gloucester County, VA

Since mid-2003 three major storms have struck southeastern Virginia, including Gloucester County, Virginia. The county is representative of the tidewater area in that formerly the economic bases of the county were agriculture, fishing, and boatbuilding; however, in more recent years the county has become a bedroom community for the Hampton Roads and Richmond metropolitan areas. The county is situated along the southern portion of the western shore of the Chesapeake Bay, and, like many areas near urban growth centers, has been undergoing substantial recent growth, but has retained some rural character. The storms since 2003 have included Hurricane Isabel, Tropical Storm Eduardo, and an unnamed nor'easter that struck during October of 2006. These storms have resulted in deaths, loss of property, and isolation of property by inundating roads. In this paper I offer a comparison of the severity of each of the storms in terms of winds, rains, storm surge, waves, and pressure changes from local meteorological monitoring stations, and provide damage information from these storms. Finally, local residents and decision makers are interviewed to assess their perceptions of the damage in response to the storms' severity to contribute understanding of peoples' assessment of storm concern and how they may react in future hazard situations.

Keywords: hazards, storms, Gloucester County Virginia, hazard perception

Róisín Ryan-Flood, Dr., University of Essex. Email: rflood@essex.ac.uk; Negotiating Sexual Citizenship: Lesbians and Reproductive Health Care

This paper explores the implications of choosing to parent outside heteronormative parameters at different spatial scales. Drawing on interviews with 68 lesbian parents in two European countries, Sweden and Ireland, the paper examines the practical challenges facing lesbians embarking on parenthood. All participants embarked on parenthood in the context of an openly lesbian lifestyle. Lesbians faced numerous difficulties in accessing reproductive health care services. This occurs at the national level, where assisted insemination services may be curtailed, leaving lesbian women with a difficult situation. They may struggle to find a known donor and only those with sufficient financial resources can travel abroad to avail themselves of donor insemination at a clinic. The paper explores the transnational networks that develop for lesbians seeking fertility services abroad. Secondly, the experiences of reproductive healthcare 'at home' are addressed during pregnancy and childbirth, where heteronormative assumptions about 'the family' are constantly negotiated by lesbian parents. It is argued that prevailing theories of sexual citizenship fail to take sufficient account of gender in relation to biopolitics. The paper also examines how cross-national differences in constructions of homo- and hetero-normativity suggest a reconsideration of the production of queer subjectivities.

Keywords: gender, family, lesbian, reproductive rights, sexual citizenship, spatial scales

Karl Ryavec, University of Wisconsin at Stevens Point. Email: kryavec@uwsp.edu; HGIS and Whither the Historical Atlas: The Case of the Tibetan World

Historical geographic information systems enable the spatial analysis of past cultures and environments. This approach is different from the focus of historical atlases in that geographic information science (GIS) is utilized to reveal dimensions of historical reality and change that cartography alone cannot do. By examining recent historical geographical research on the interrelationships between religion and politics across the Tibetan culture region, this study focuses on the problems and prospects in developing a Tibetan and Himalayan Historical GIS in light of also making a Historical Atlas of Tibet. Preliminary findings indicate that many aspects of the traditional historical atlas approach are not easily transferable to an HGIS venue given the limited state of current knowledge about the nature and extents of historical Tibetan politics and religious sites.

Keywords: GIS, Cartography, Historical Geography, Tibet, China

Greg Rybarczyk, PhD. Student, University of Wisconsin-Milwaukee. Email: gar2@uwm.edu; Changshan Wu, Assistant Professor, University of Wisconsin-Milwaukee. Email: cswu@uwm.edu; Bicycle Travel Demand Estimation Using Urban Morphological Indicators

With the increased recognition that bicycle transportation can be a viable mode choice in Western cities, there remains a need for estimating traffic volumes of bicycles at a disaggregated level. Current bicycle travel demand estimation primarily utilizes aggregate-level methods based on land-use or population for a particular area. Aggregate methods can be further broken down into: attitudinal surveys, discrete choice models, and regional travel models. Unfortunately, the aforementioned methods do not address fine scale bicycle facility analysis needed for bicycle planning, nor do they effectively account for urban morphology and transportation geometry-which has been documented to be closely related to bicycling and walking. In this research, a space syntax model is utilized to predict bicycle volume within an urban neighborhood in the city of Milwaukee, Wisconsin. Space Syntax has the unique ability to describe computationally spatial movement patterns and probabilities at a micro-scale and therefore, can be utilized to estimate bicycle travel at the disaggregated network facility level. In particular, bicycle volumes will be predicted at road intersections then extrapolated to all network links in the study area with road network and urban configuration as major determinants. The results from this model will be compared to field measurements of bicycle volumes to assess the model robustness. This work will contribute to current bicycle demand estimation literature by utilizing a model incorporating facility level conditions in the prediction of bicycle route patterns and subsequent volume estimation.

Keywords: bicycle, travel demand, space syntax

Simon Rycroft, University of Sussex. Email: S.P.Rycroft@sussex.ac.uk; Lightshows, Cosmic Connections and the Countercultural Subject

For a few years in the late 1960s and early 1970s multimedia lightshows became one of the dominant countercultural performance practices in the west. Emerging first on the West Coast of the United States, lightshows had their aesthetic roots in post-war innovations in non-figurative and some figurative art, philosophies of architecture and design, and contemporary scientific discourse. With these influences lightshows shared a technoscientific vision of an holistic, cosmic nature. During the 1960s this new conception of a multi-dimensional, infinitely complex cosmic nature resulted in a range of practices that eschewed traditional forms of representation and attempted to develop more intuitive, embodied and multi-sensory modes of expression. The multi-media lightshow was one such practice, along with related developments in underground cinema aesthetics, performance art, painting, and experiments with the written word on the pages of certain underground publications. The intention of the lightshow was not to produce static, enframed and frozen representations of nature, but to create microcosmic 'models' of the macrocosmos that were intended to be experienced in a multi-sensory embodied mode by their participants. The message in these activities was that the self was fundamentally and inescapably networked, not only to other subjects in the world, but to the objects of nature within and beyond the world. As an aesthetic and representational practice therefore the lightshow has much to say about the significance of 1960s countercultural practices to contemporary notions of representation and nonrepresentation.

Keywords: Lightshows, counterculture, 1960s

Andrew Ryder, University of Portsmouth. Email: andrew.ryder@port.ac.uk; *Gentrification revisited: the case of Tompkins Square*

In the 1990s, New York's Tompkins Square came to epitomise the process of gentrification, allegedly led by rapacious developers and a complaisant government, forcing the poor from their homes and replacing them with wealthy newcomers. However, analyses selectively filtered information and events to paint a distorted picture, ignoring past trends and ongoing processes. In fact, although middle class people are moving into the area, this is not a new development. The latest shifts are part of an ongoing series of changes in ethnic and income composition of residents going back over 50 years. Nor have wealthy newcomers displaced many residents. However, ethnic succession, particularly the northwards expansion of Chinatown, has substantially altered the area's ethnic mix. This shift has happened during a time of exceptional population growth, when the city gained an additional million people. Thus, the neighbourhood has moved "sideways" as much as "upwards", suggesting perhaps that in this case, the gentrification paradigm raises more questions than it answers.

Keywords: gentrification, cities, succession, filtering, social change, economics

Wansang Ryu, Texas A&M University. Email: wansryu@geog.tamu.edu; *Assessment of Blowout Morphometry using a Thinning Algorithm*

Blowouts or erosional saucer- or trough-shaped depressions, act as corridors for wind-blown sand moving from the beach through the dune system. This paper investigates the morphometry of blowouts by using a thinning algorithm. Thinning, widely used for the recognition of patterns in machine/computer science and in Geographic Information System, is the reduction of points or layers of outline from a pattern resulting in arcs and curves of a single pixel wide. Two blowout fields (Morro Bay, CA and Padre Island, TX) were examined and compared in terms of morphometry. Thinning algorithm extracted the middle lines of blowouts from aerial photographs consistently and automatically. Morphometric variables used in this research are length, width, area, perimeter, average spacing between blowouts.

Keywords: aerial photographs, blowouts, morphometry, thinning algorithm

Yeon-Taek Ryu, Chungbuk National University, South Korea. Email: ytryu@chungbuk.ac.kr; *Diverse Perspectives on Urban Housing: Institutional, Political Economy, Identity, and Feminist Perspectives*

In the field of urban housing studies, many Western scholars increasingly devoted their attention to the meanings and roles of housing agents, institutions, capitalist system, identities, and gender in (re)configuring the internal structure of Western housing markets. However, there is no much Korean housing literature that pays attention to these perspectives in the field of urban housing studies. Given this lack of interests in alternative theoretical perspectives on urban housing in Korean housing literature, the purpose of this paper is to draw more attention to and explore discourses on research subjects of urban housing studies such as agent, institution, capital, identity, and gender. Institutional perspectives on urban housing emphasize the roles and effects of institutions and agents involved in the supply and allocation of urban housing and the relationships between conflict, power, and access in the urban housing market. According to political economy perspectives on urban housing, the forms in which urban housing is provided are interlinked with the reproduction of the social relations of capitalism. Identity perspectives on urban housing regard housing as an indicator or symbol of identity, personality, social status, accomplishments, and group values. Feminist perspectives on urban housing are concerned with women's disadvantaged position compared with men's in relation to access into the urban housing market.

Keywords: urban housing, agent, institution, capital, identity, gender

Brooke R. Saari, University of West Florida. Email: brk2gd4u@hotmail.com; *Post-hurricane Interactions Between Vegetation Dynamics, Dune Recovery, and Physical Gradients on Barrier Islands*

Northwest Florida has been exposed to many extreme storm events during the past few years, resulting in varying impacts on the dune morphology of the barrier island. Post-hurricane dune recovery depends on the establishment of vegetation which in turn depends on sediment mobility, exposure to salt spray, lag deposits and topography. In this study the environmental gradients on Santa Rosa Island were examined after significant morphological changes during Hurricanes Ivan and Dennis. Wind speed, salt spray and sediment movement were measured for a one month period at sites that are representative of the range of hurricane changes to the island morphology (from no impact to breeches). Preliminary results suggest that strong environmental gradients exist and that the gradients are significantly different between sites, largely in response to the pattern of vegetation. This suggests that the level of impact, and the resulting distribution of vegetation, affects the rate and pattern of dune recovery.

Keywords: environmental gradients, dune recovery, coastal vegetation, barrier islands

Jarkko Saarinen, Department of Geography, University of Oulu, Finland. Email: jarkko.saarinen@oulu.fi; *Competing carrying capacities and sustainabilities: Setting the limits of growth in tourism*

During the 1990s the issue of sustainability became a discourse which started to direct the economic and political structures that constitute the present context of the tourism and its development ideologies and practices. The major academic concern over the impacts of tourism dates back at least to the 1960s, however, and to the tradition of research into carrying capacity. Over two decades, the idea of carrying capacity formed a basis for approaching the negative impacts of tourism and their management, but after the period of enthusiasm it was realized that the issue of carrying capacity could be somewhat problematic both in theory and in practice. While sustainability has largely replaced the idea of carrying capacity and it has emerged as an important policy issue in tourism, the present realm of sustainable tourism is also arousing growing criticism and conceptual confusion. Resulting from this there is a need to understand and re-conceptualize the nature of the limits of growth in tourism. This paper aims to discuss the conflicting approaches on the limits of growth in tourism and analyze how they have been approached and evaluated in the tradition of tourism development studies. The purpose is to recognize that behind the different understandings of the limits of growth there lie distinct traditions that are different in their focus and relation to space. These are referred to here as resource-based and activity-based traditions. Finally, the relationship between sustainable tourism and sustainable development is critically discussed in an ethical context.

Keywords: tourism, carrying capacity, sustainable development, tourism geographies

Anu Sabhlok, Penn State University. Email: axs456@psu.edu; *Seva in relief: looking at the world downside-up*

This paper draws from my ethnographic study of relief work performed by women in the world's largest trade union of informal sector workers - The Self-Employed Women's Association (SEWA). Women in SEWA are emphatic about their identities as working-class women and yet they describe their labor in relief camps as seva (selfless service). I look at seva as a socio-spatial practice that constructs gendered and national subjectivities in particular ways in particular contexts ? here the context being post-1990s Gujarat of intensified economic liberalization and a heightened religious nationalism. In my story SEWA women emerge as active agents in shaping their visions of capitalism, feminism, and nationalism, which contradict and pose a challenge to many of the contemporary understandings of these processes. I rely upon a critical reading of Gandhi to argue for a grassroots theory of feminism, nationalism and capitalism.

Keywords: Gandhi, nation, gender, capitalism

Dorothy Sack, Ohio University. Email: sack@ohio.edu; Jahan Kariyeva, University of Arizona. Email: jahank@email.arizona.edu; Valentina Marochkina, Amu Darya Nature Reserve. Email: ; *Status of Nature Reserves in Turkmenistan in the Post-Soviet Era of Transition*

Nature protection is a very broad topic that ranges from such activities as identifying and protecting rare and endangered species, through establishing and managing spatial units with broad public access, such as American national forests, wildlife refuges, and national parks, to the almost total isolation of other areas from the public at large, as in American wilderness areas. The U.S. has a long tradition of extensive governmentally administered nature protection programs, but many non-first world countries are struggling to maintain minimum protective measures. As globalization continues to impact nature as well as society, nature protection efforts in all countries are becoming increasingly important for the world as a whole. Understanding the quality and status of

existing nature protection systems in non-first world countries can help the international environmental community in prioritizing the distribution of research, education, and financial resources. This paper assesses the current status of the nature reserve system in one of the former Soviet central Asian republics, Turkmenistan. Results from a 2006 case study of the Amu Darya Nature Reserve, established in 1982, reveal the great importance of dedicated individual reserve employees in maintaining the status of the protection area despite limited financial support during the present post-Soviet period of transition. Careful selection of reserve administrators and scientists by the Turkmenistan Ministry of Nature Protection, contributes to the continued quality of each of the country's nature reserves.

Keywords: Turkmenistan, Amu Darya, nature reserve

Warren SACK, University of California - Santa Cruz. Email: wsack@ucsc.edu; *The Spaces of Open Source Software Design*

For the last five years, I have been working with students and colleagues on a project in which we are trying to understand the "complex geography of the writing of software" (Thrift and French, 2002), specifically the virtual spaces articulated by the designers of Open Source Software (OSS). OSS systems are built by potentially large numbers of volunteers; work is not assigned: people undertake the work they choose to undertake; there is no explicit system-level design, or even a detailed design; and, there is no project plan, schedule, or list of deliverables. As such, OSS represents an extreme but successful case of geographically-distributed design. Co-designers work in arbitrary locations, rarely or never meet face-to-face, and coordinate their design activity almost exclusively in three information spaces; spaces that my students, colleagues and I call the implementation space (usually via CVS - Concurrent Versioning System), the documentation space (frequently the web), and the discussion space (which includes mailing lists, newsgroups, instant messaging exchanges, etc.). Our approach to understanding these spaces integrates qualitative and quantitative methods from ethnography, science studies (especially actor-network theory), discourse analysis, cognitive science and information visualization.

Jovian Pfeil Sackett, University of South Carolina. Email: sackett@mailbox.sc.edu; *Political Ecology and Rural Sprawl on the Front Porch of Western North Carolina*

Rural land-use change in the United States is different from land-use change in urban and suburban areas and therefore must be measured with these differences in mind. Land-use planners unsuccessfully apply urban and suburban planning philosophies to rural areas. Their failure is reflective of an emerging problem known as rural sprawl. Rural sprawl occurs when intensive residential development springs up in rural isolated areas, usually driven by a desire to live in scenic rural areas. Rural sprawl is known to cause parcelization, habitat fragmentation, and alteration of local socio-economic structures. This study looks at emerging rural sprawl in the Swannanoa Valley of Western North Carolina to show how rural land-use change evolves in a relatively short period of time. It is part of a larger study, which is attempting to answer the question: what is zoning meant to conserve in the Swannanoa Valley? The Swannanoa Valley is composed of two zoned municipalities and public lands nestled in an unzoned area of Buncombe County, NC. Concerns over uneven growth and development are at the forefront of concern for this area, which is well known for its scenic views and tourism and recreation based economy. For this paper I will show how examples of recent rural residential development changes in the Swannanoa Valley fit into the larger issues of first world political ecology and rural sprawl in the United States.

Keywords: First World political ecology, rural sprawl, Western North Carolina

Yukio Sadahiro, University of Tokyo. Email: sada@okabe.t.u-tokyo.ac.jp; *Analysis of Unidirectional and Spreading Event Occurrences*

With the widespread of spatiotemporal data in GIS, demand for spatiotemporal analysis has been rapidly increasing. Among various types of objects treated in spatiotemporal analysis, zero-dimensional objects such as events in the spatiotemporal dimension are the most fundamental. Existing studies, however, mainly focus on the detection of clusters in the spatio-temporal point distribution, though spatio-temporal dimension has a wider variety of concepts useful for analysis. This paper proposes a new method for analyzing spatiotemporal point patterns. A focus is on the detection of unidirectional and spreading patterns in point generation processes. Given a set of points in a spatiotemporal dimension, the method determines a principal direction of point generation that fit the observed data. The significance of direction is evaluated by a randomization test. Assuming that points are distributed from a certain location to its surrounding, the method determines the center of point distribution that fit the observed data. Significance test is again available that uses random assignment of point generation order. The method was applied to the spatial data of clothing shops in Tokyo from 1990 to 2003. Among 213 point clusters, 10 clusters were extracted

to have a significant principal direction. Spreading pattern, on the other hand, was detected in 8 clusters. The clusters detected represent shops around big railway stations and those along major traffic roads near railway stations.

Keywords: spatiotemporal analysis, unidirectional event occurrence, spreading event occurrence

Grant Saff, Dr, Hofstra University. Email: Grant.Saff@hofstra.edu; Charlotte Lemanski, University College London. Email: charlotte.lemanski@gmail.com; *The value(s) of space: the discourses and strategies of residential exclusion In Cape Town And Long Island*

This paper analyses the discourses and strategies surrounding attempts to enforce residential exclusion in Muizenberg in Cape Town and Farmingville, Long Island (New York). Although these two case studies represent vastly different regions, both are historically middle-class residential areas that have recently undergone significant immigrant influx. The responses of long-term residents and local governments are analysed to consider the factors that affect discourses and strategies of residential exclusion - in particular, the role of 'values' (socio-cultural, territorial, physical and economic) in shaping exclusive attitudes. Particular attention is paid to the way the exclusivist discourse is framed in the press coverage of the events in these areas. The use of positivist (e.g. 'improvement') and technical/neutral (e.g. 're-zoning', 'code-enforcement') language to justify residential exclusion of those deemed as 'other' is also considered. Qualitative data from the two case studies are analysed, recognising that while long-term homeowners sometimes express very 'real' and 'valid' reasons for their exclusionary attitudes (and do not just mask racism as often implied in the literature), the consequences of homeowners actions in excluding an already underprivileged demographic group are problematic. The opposing needs of immigrant communities and the long-term residents in the areas in which they choose to reside are analysed, and the possibilities for common-ground are considered.

Daniel Sage, University of Wales, Aberystwyth. Email: djs98@aber.ac.uk; Laura Jones, University of Wales Aberystwyth. Email: lj00@aber.ac.uk; *Introducing New Directions in Critical Geopolitics*

This paper provides an introduction to a series of session entitled 'New Directions in Critical Geopolitics' which challenge the critical geopolitics constellation to address a new set of problematics of writing the global. Recent non-representational approaches emerging within geography have problematized the idea that spaces, including global space, can be exclusively produced and understood through discursive constructions. These debates pose important questions for the ways in which space is understood across geography, critical geopolitics is no exception. Indeed in response, critical geopolitics is increasingly being reworked in relation to non-cognitive bodily capacities of spectacle, affect, percept, movement and emotion. While concurrently, the unfolding of such bodily capabilities can be situated across and within quotidian techniques, discourses, tactics and regulations that attempt to police the body as an intelligible, self-recognizing entity through notions of "good" citizenship and national identity. This conceptual momentum is also matched by a political aptness, as the aftermath of 9/11 and the ensuing 'war on terror' has drawn into sharp focus, both inside and outside academia, the dovetailing of grand geopolitical discourse and lived and bodily geographies of the home, the street, the combat zone, the factory or the prison camp. The contributing speakers explore various dimensions of these innovative debates across a wide variety of spaces, scales and contexts from the biopolitical regulation of borders and biometric identities to the use of grand strategies that articulate the global war on terror.

Asato Saito, National University of Singapore. Email: jpsas@nus.edu.sg; *Japanese Transnational Workers with Non-expatriate Contract in Asian Cities*

Going abroad for work is not unusual for Asian youth in some countries like Philippines and some parts of China. Usual explanations are attractiveness of economic opportunities abroad and underdevelopment hence lack of job opportunities in domestic economies. Japan too has a history of sending many migrants to abroad before the WWII based on similar reason. After the high-speed economic growth in the 1960s, the migration stopped and the place for employment is mainly confined to domestic arena. Most of those who work abroad are male full-time workers employed by Japanese corporation as core workforce and sent as expatriate for a limited period. There are, however, increasing number of young generations, mainly 20s and 30s female, who are working in the Asian cities like Bangkok and Singapore for the last ten years or so. They are not working with traditional expatriate contract, but as local employees. They seem to have opted for less favorable economic condition and life course as their payment is significantly lower and don't have fringe benefit which expatriate enjoy. Japan has highly developed economy which usually works against sending economic migrants. Thus there seems to be some contradictions

and paradox. It may be possible to hypothesize that this is related to a significant transformation of labor market and working practice in Japan after the 1990s. Based on that assumption, the paper will explore this phenomenon by investigating the background, causes of increase, and individual pathway to work abroad.

Keywords: Migration, labor market, globalization, Japanese

Chie Sakakibara, University of Oklahoma. Email: depochie@ou.edu; *Drumming for the Whales: Climate Change and its Impact on Iñupiat Music*

As the fruit of my 2005-6 fieldwork in the North Slope Borough, Alaska, this study explores how climate change has recently influenced the Iñupiat cultural identity as the People of the Whales. The traditional Iñupiat whaling cycle reveals strong indivisibility of music, emotions, and place-based human identity. To illustrate such integrity of the Iñupiat and their culturally critical bowhead whale, I look for specific ways in which climate change in the Arctic influences Iñupiat spiritual and physical ties with the bowhead whale in relation to traditional music-making. The Iñupiat people say that it is the whale who brings music to the people, thus no whale harvest means no music. Without music, the continuity of Iñupiat heritage is threatened. Therefore, the place of music and its integrity with Iñupiat identity are closely linked with the northern cultural survival. The whale remains as the provider of music on multiple scales for the Iñupiat, and music serves as a powerful inspiration to retain the Iñupiat kinship with the Arctic homeland. Within the annual whaling cycle, traditional performances connect indigenous spirituality to sacred whales. However, when the environment is less predictable, the homeland eroded, place-based songs gone, and human-whale integrity threatened, how specifically are these changes manifested in the Iñupiat-whale relationship? Providing detailed descriptions of Nalukataq (the midsummer whale feast) from the post-whaling periods of 2005 and 2006 in the North Slope Borough, this paper examines how the Iñupiat respond to environmental changes in the emotional and cultural dimensions through their music-making.

Keywords: climate change, Iñupiat, music

Arun Saldanha, University of Minnesota - Minneapolis. Email: saldanha@umn.edu; *Spicy Trade: Calvinism and Squandering in the Early Modern Netherlands*

The Dutch exploration and colonization of the Indian Ocean world was from the start driven by a hedonistic demand for luxury items such as spices, silk, gold and porcelain. Understanding the acceleration of mercantile capitalism in the sixteenth and seventeenth centuries through the alternative political economy of Georges Bataille, this paper will take the Dutch example to think through the implications of this hedonistic drive for contemporary theorizations of capitalism, which are still mostly based on Malthusian norms of scarcity. In particular, as Simon Schama has argued, the Dutch case exemplifies the contradiction between a particularly Calvinist emphasis on frugality and rationality (Weber's 'spirit of capitalism') on the one hand, and new metropolitan tastes for the exotic and the on the other. The paper will conclude that at the heart of capitalist expansion there has been a thirst for difference which cannot be reduced to Orientalism or the intentions of capital.

Zia Salim, California State University, Fullerton. Email: ziasalim@hotmail.com; *Downtown Redevelopment and its Impacts on the Homeless: Los Angeles' Skid Row*

The hyper-marginalized status of the homeless makes them particularly vulnerable to processes of urban restructuring, including downtown renewal. Downtown Los Angeles is a hub of both homelessness and urban renewal. Within this context, I examine some of the effects of this redevelopment using Los Angeles' Skid Row as a case study. How does downtown renewal impact the lives of the homeless? To answer this question, I undertook a spatial analysis to determine the extent of redevelopment as it encroaches on Skid Row. I also interviewed individuals involved in, and impacted by, downtown redevelopment. There are direct and indirect impacts on the homeless, and I conclude that understanding these impacts can help mitigate negative effects.

David S. Salisbury, University Of Texas. Email: dsalisbury@mail.utexas.edu; *Coca Cultivation, Trafficking, and Eradication in the Amazon Borderlands*

The cultivation, traffic, and eradication of coca, *Erythroxylum coca*, is currently transforming land use and livelihoods in the Amazon borderlands shared by Brazil and Peru. The isolated nature of this region characterized by indigenous populations, conservation units, and forestry concessions provides fertile ground for the boom and bust cycle of coca production and facilitates the international transport of the product by ground, water, and air. This paper explores the social and environmental impacts of coca production, trafficking, and eradication through an analysis of both spatial and ethnographic data on land use and

livelihood strategies in four sub-basins of the Ucayali River. Results map out the distribution, cultivars, and recent history of commercial coca fields in the region and identify transboundary transportation routes used for the coca product.

Alda Anibal Isabel Salomao, Centro Terra Viva. Email: asalomao@tvcabo.co.mz; *An Assessment Of Legal And Institutional Arrangements For Community-Based Natural Resources Management With Reference To Regional Experiences*

Theories on CBNRM consider it important that communities be given the responsibility to manage resources sustainable as well as the right to exercise power over them and accrue significant benefits resulting from that use and management (Gibson, 1999). The objective of this paper is to assess whether the legal provisions for community participation contained in the environmental laws from Mozambique take into account the various factors that shape the effectiveness of participation and decentralization (Agrawal and Ribot, 1999) and the elements that promote the achievement of the dual objective defined for CBNRM. Granting natural resources management powers and the right to accrue benefits from such management to local communities is a complex task (Ribot, 1999). The complexity results from the political, legal and institutional issues that must be addressed in order to enable the effective exercise of management powers by local communities. Furthermore, ensuring that the powers devolved to local communities contribute to the efficient and equitable satisfaction of their economic and social needs, and simultaneously to natural resources conservation interests may not be simple. This paper will also try to identify existing gaps and discuss alternatives to fill them.

Keywords: Natural resources, local community

Pere A. Salva-Tomas, Dr., University of Balearic Islands (Spain). Email: PSALVA@telefonica.net; *Processes and tendencies of the residential tourism in the Balearic Islands (Spain): ¿ Immigrants of luxury or tourists of long stay?*

The aim of this paper is to analyze one of the main aspects of the human mobility related with the irruption of new ways of tourist practical. Among them highlights the notable increment of the residential tourism that shows up as a qualitative important change in the traditional pattern of sun and beach tourism. The international residential tourism can be considered as the new location of different sectors of the people in foreign destinations in those that reside during long periods of time, using basically non tourist lodgings. The Balearic Islands (Spain), registered 11.486.668 tourists (2004), of which only 8.031.398 travelers used the tourist lodgings. The rest used apartments and/or second houses of its property and/or rented in way not to regulate or they declared to reside in friends or family houses. It highlights the retirement international migration that correspond to tourist that inaugurated the mass tourism in the 60's and 70's of the or 20th Century that have transformed into the last decade in an important part of the permanent or temporary foreign residents that they have chosen to the Balearic Islands as place of their second or main residence. From this perspective one can affirm their transformation of tourists to migrants. It is imposed the necessity to debate if the residential tourism is tourists of long stay or deluxe migrants.

Keywords: Residential tourism, Retirement international migration, New tourist practices, Spain

Regina Salvador, New University Of Lisbon. Email: regleo@netcabo.pt; *Regional Planning and Development in the European Union*

The paper provides a review and assessment of a number of the major features evident in regional planning and development in Europe. A series of regional case studies will be presented which are drawn from current research in various European countries; France, UK, Spain, Germany, Poland, Greece and Portugal. These studies will illustrate a broad range of theoretical views which offer different perspectives on; the operation of the EU Structural Funds, regional restructuring, development, key concerns evident in spatial planning and environmental management lessons from past experience. In particular, the Community Strategic Guidelines for Cohesion policy for 2007-2013 will be examined, trying to get conclusions and suggestions for future policy priorities.

Vidyamali Samarasinghe, American University. Email: svidy@american.edu; *Gender and Geography in fieldwork in developing countries: analyzing two decades of field research*

Field surveys are not unique to geographers. However since, place and location continue to be core areas of the geographical discourse geographers enjoy a unique "subject-specific" comfort in researching at the field level. For feminist Geographers researching gendered dimensions of socio-cultural and economic issues pertaining to women, field-based surveys become uniquely

important since it gives the feminist researcher the most appropriate tool to understand and analyze the “place-specific” dimensions of women’s lives. It also creates the space to situate the research -participant-women’s point of view in the center of the research agenda. As a feminist and a geographer whose focus of research is in developing countries of Asia, doing fieldwork has been intellectually and emotionally both rewarding and frustrating. In this paper I review more than two decades of my direct involvement in field-based feminist research and I attempt to analyze the methods used from the prisms of varying themes, locations, time-lines and time periods of research undertaken, the gendered situation of the researcher and the research participant, I probe the appropriateness and pitfalls of field-based feminist geography research

Richard Alan Sambrook, Ph.D., Eastern Kentucky University. Email: richard.sambrook@eku.edu; *The Battle of Richmond Re-enactment: An Examination of an Emerging Living History tourist destination in Madison Co., Kentucky*

An historic farm located approximately ten miles south of the City of Richmond, Kentucky served as the site for a small scale but still decisive conflict between northern and southern forces during the American Civil War. Approximately five years ago, much of the farm site where the thrust of the battle took place became available for purchase as a result of a failed housing development project. Members of the Madison Co. Historical Society were able to successfully build the capital to purchase the site and create a county park that serves as a staging area for an annual two day battle re-enactment tourism event. Due to the sites location and situation relative to a major Interstate and population centers, the developers believe this new Civil War living history theme weekend will soon rival the long held success of similar battle re-enactment events in Perryville, Ky. This presentation reports an assessment of the overall success of the Madison Co. endeavor in light of the tourism development plan currently in practice, and makes a comparison to the nearby re-enactment event in Perryville, Kentucky.

Keywords: Civil War Re-enactment, living history, tourism development

Arthur N. Samel, Bowling Green State University. Email: ansamel@bgsu.edu; *The Promise and Challenges of Integrating GIS into the 7-12 curriculum in Toledo Public Schools*

East Broadway Middle School (EBMS) and Waite Senior High School are located in the economically depressed east side of Toledo, Ohio. All students from EBMS attend Waite, where graduation rates are approximately 50 percent. Few of these graduates then pursue post-secondary education. Since 2000, Bowling Green State University has been funded by a Federal “Gaining Early Awareness and Readiness for Undergraduate Programs” grant to work with both EBMS and Waite to increase the graduation rate as well as the number of graduates who pursue post-secondary education. Geography faculty worked with EBMS and Waite faculty throughout 2006 to integrate GIS into classroom content that cuts across the core subject areas. During this time, the teachers substantially increased their understanding of geography, as a discipline, and developed several exciting content rich units that provide students with the opportunity to learn and use GIS. These units are being taught in the classroom during the 2006-2007 school year. In spite of these positive developments, there exist several barriers to success. These include antiquated computers, teacher resistance to learning new technologies, and institutional obstacles to installing GIS software on school owned computers. Solutions that address these obstacles are continually being developed and will be discussed.

Michael Samers, University of Kentucky. Email: michael.samers@uky.edu; Jane Pollard, University of Newcastle. Email: J.S.Pollard@newcastle.ac.uk; *Is the concept of neo-liberalism, neo-colonial? Kuala Lumpur and the history of Islamic Banking*

In this paper we interrogate the concept of ‘neo-liberalism’ with respect to the emergence of ‘modern’ Islamic banking in 1940s Malaya, and the Malaysian government’s twenty-first century campaign to construct Kuala Lumpur as the Southeast Asian capital of Islamic banking and finance (IBF). Our paper is designed to contribute to the debate around the growing dissatisfaction with the concept of neo-liberalism, and we ask whether the development of IBF in Malaysia offers an economic and financial history that is substantially different from that supposed by the literature on ‘neo-liberalism’. More specifically, we ask whether such a history reveals a set of historical and contemporary ‘power geometries’ involving a specific set of techniques (e.g. the fatwas of Shari’a boards; banking and financial products such as Murabaha), and technocratic organizations (e.g. the AAOIFI, and the Association of Banks in Malaysia) which diverge markedly from typical neo-liberal accounts. And we question the extent to which ‘market orthodoxy’ is a feature of the practice of twenty-first century IBF. Our provisional argument is familiar in its post-colonial critique - in other words, that the (normative) concept of neo-liberalism rests partly on a certain

‘western-centric’ romanticization of Keynesian-inspired capitalism in the ‘global north’ (and its transformation). We argue further that this theorization - through an erasure of ? an alternative history of financialization and economic development ? may be a form of academic ‘neo-colonialism’. In the conclusion we return to a classic question about the status of ‘meta-theory’ and its contemporary role in understanding world development.

Keywords: neo-liberalism, economic geography, Islamic banking

Cyrus Samimi, University of Erlangen-Nuremberg. Email: csami@geographie.uni-erlangen.de; *Protected Area Networks in Southern Africa. Benefits or Restrictions for the Commons.*

In spite of general expectations that nature reserves established during the colonial period might have been disintegrated after independence, the concept of nature conservation is nowadays integrated into the political agenda of most countries in Africa. Especially in Southern Africa many large nature reserves are located and often countries large portions of countries are protected areas. The close economic relations with South Africa as a driving force and the tradition of nature conservation result in visions of a network of protected areas and the establishment of transfrontier conservation areas. Since many of the nature areas and habitats are fragmented by national borders, transnational protected areas are a suitable concept of an international cooperation for ecological security and biodiversity. Beside efforts to ensure ecological integrity, transboundary management systems could also create valuable impulses for rural development and for the strengthening of economic and political ties. But on the other hand the growing influence of regional and international actors, e.g. safari companies and NGOs, could weaken the control of local and regional authorities and of the commons. So through existing conservation area and their extension or linkages it could come to more restrictions on access to land and the exclusion of commons from developments in their area. The Peace Park Foundation initiatives have already shown result through projects and many more are in the planning phase. Our contribution reflects on the current status of planning and realization. Perspectives and problems are discussed in the background of examples from established and planned parks.

Val Samonis, The Viessmann Centre on Modern Europe. Email: val@samonis.com; *Special Economic Zones in CEE: An Attempt at Clusterization?*

The paper looks at the efforts to instill modern development in CEE based on the theory of clusters by Harvard’s Prof. M. Porter. Early post-communist reform initiatives entailed policies to attract Western FDI by offering tax and other incentives (privileged treatment) to foreign investors on the strength of the traditional FDI theory. While such policies have been and still are controversial, a sort of “infant industry argument” can be made that they prepare a ground for more modern frameworks of development, e.g. clusters of high tech and other knowledge-based companies. While North American policies at clusterization and actual cluster practices do not usually stem from any special economic zones, it is worthwhile to examine more closely, based on the PSEZ case, if the opposite might be more appropriate for CEE given the shortcomings and the uneven pace of reforms, esp. in the context of the EU regional policies.

Eric Samson, Texas State University-San Marcos; Mayan Esteem Project. Email: eric.samson@txstate.edu; *Geopolitical Subdivisions in Chiapas, Mexico*

This research considers the geopolitical history of the state of Chiapas, Mexico and the most recent catalyst to change in geopolitical stasis - the Zapatista rebellion of 1994. Four municipios in a transportation corridor were examined by administrative size for parity in services including, police, public works, and health. The concepts of service area and allocation theory are discussed in relation to the Chiapan problem and an index of administrative carrying capacity is proposed to avoid conflict hazards. Normative solutions for inequity of municipio service areas are also proposed. Concluded is that the Zapatista solution of municipios en rebeldes is an organic solution to a geopolitical shortcoming.

Keywords: Chiapas; Zapatista; EZLN; Allocation Theory; Service Area; Political Ecology; Central Place; Mexico

Luis D. Sanchez, Florida State University. Email: luisitopip@hotmail.com; Elections in Florida and Puerto Rican Migration

Florida's electoral patterns for the last decade have given the state the status of the biggest "swing state" in the U.S. The increasing influence of Hispanic voters has been important in this transformation. These patterns put great pressure on candidates' ability to connect with increasing influential Hispanic voters, and more so in their ability to understand the diversity and different interests of these groups. For decades, Florida's Hispanic vote has been synonymous with South Florida's Cuban-Americans, a solidly Republican voting bloc. But the population of non-Cuban Hispanics is growing rapidly and dramatically shifting the state's political landscape. Currently the Hispanic population in the Orlando metropolitan area has experienced a dramatic increase by nearly 900 percent since 1980, making the area the very important in the battle for the Florida's Hispanic vote. Among the non-Cuban Hispanics in Central Florida, Puerto Ricans are the fastest growing community. Puerto Ricans now account for nearly 60 percent of the Hispanic population in Osceola County (Kissimmee), nearly 50 percent in Orange County (Orlando), and nearly 30 percent in Hillsborough County (Tampa). For Puerto Ricans voters, a candidate's stance on whether their homeland should become a state, continue as a commonwealth, or become an independent nation is an important issue. In this regard Florida's elections are becoming a battlefield for issues concerning Puerto Rico's political status definition.

Erick Sanchez Flores, University of Arizona, Universidad Autónoma de Ciudad Juárez. Email: ericks@email.arizona.edu; Hugo Rodriguez Gallegos, University of Arizona. Email: hugor@email.arizona.edu; Steve Yool, University of Arizona. Email: yools@email.arizona.edu; Landscape dynamic and vulnerability to invasion. Integrated spatial modeling for plant invasion assessment in desert ecosystems

Invasive species are considered an agent of ecological change with more significant effects than global warming. Robust predictive models of invasive species inform long term resource management strategies. We used a scaled down modeling approach, based on field data and high spatial resolution multispectral imagery, to assess the predictive skill of combined Genetic Algorithm Rule set-Production (GARP) and Change Vector Analysis (CVA) models. We hypothesized that highly dynamic desert environments are unstable, thus more vulnerable to invasion by exotic plant species. Initial model results confirm this hypothesis. The GARP-CVA models identified areas vulnerable to invasion by *Brassica tournefortii* (Saharan mustard) and *Schismus arabicus* (Arabian grass) over dynamic landscapes in the eastern portion of 'El Pinacate' Biosphere Reserve (ePBR), a natural area under potential increasing pressure by humans. The GARP-CVA models showed low accuracy when tested against confirmed locations of the invasives due very likely to the large modeling scale. Land cover characterization showed that *B. tournefortii* is associated with landscapes occupied by microphyllous desert scrub and grassland, as well as sarcocaulous desert scrub. *S. arabicus* was found more abundantly in the flat low lands occupied by microphyllous and crassicaulescent desert scrub. The GARP-CVA models representing the most dynamic landscapes with high probability to invasion showed a good spatial agreement with the distribution of invasives per the land cover type. This relationship needs however to be investigated further because the ecology of these invasives is likely more complex than we can model.

Scott E Sandberg, Central College. Email: Sandbergs1@central.edu; Developing a Land Management Plan for Central College's Carlson Kuyper Field Station.

Land management is essential to the restoration of prairies and conservation efforts for a preserve area. Invasive species management must be used to ensure native species prosper and are not forced out. The Carlson Kuyper Field Station was donated to Central College in order to help restore a natural prairie. The field station is 60 acres which includes planted prairie and woodland ravines. Management to date has been haphazard, with efforts depending on interests and time available by Central College faculty since the college acquired the land in 2000. Proper management will entail a long term land management plan for the field station which I will be developing, focusing on addressing important issues. These issues include: invasive species, tree line encroachment on native prairie, and gully erosion. I will use GIS and surveying techniques to lay the ground work for future work, while establishing a management plan that can be followed to guide future work in restoring and maintaining the prairie and the field station. In this presentation, I will discuss the process of developing a plan and the management guidelines for this area.

Heather A. Sander, Ph.D. Candidate, Conservation Biology Department, University of Minnesota, Twin Cities. Email: evans324@umn.edu; Steven M. Manson, McKnight Land-Grant Professor, Geography Department, University of Minnesota, Twin Cities. Email: Manson@umn.edu; Artificial Structure Locations and Heights in Viewshed Calculation: How Much Accuracy Is Necessary?

Landscape change can reduce view quality with associated socioeconomic costs. Forecasting the visibility impacts of proposed land use changes prior to their approval is thus desirable. Viewshed calculation can be used to do this, although with difficulty as future structure's locations and heights cannot be known with certainty. We examined how generalizing building locations and heights impacted properties of viewsheds created in a geographic information system. We tested two location methods (actual versus estimated) and two height assignment methods (realistic versus uniform) by calculating viewsheds for 220 identical viewpoints. We considered viewsheds generated using realistic heights and actual locations accurate and compared them to viewsheds generated using generalization methods to assess their impacts on accuracy. Viewsheds generated using uniform heights and actual footprints differed significantly from accurate viewsheds in their areal extents and areas of many land uses. Viewsheds produced using estimated locations and realistic heights did not differ from accurate viewsheds in their areal extents and differed significantly in only two land use type areas. Viewsheds generated using both uniform heights and estimated locations did not differ significantly in their areal extents from the accurate viewsheds, but differed in the areas of many land uses. All generalization methods resulted in viewsheds with complexity measures that differed significantly from accurate viewsheds. When areal extents and land use class areas are central to viewshed analysis, it is thus feasible to generalize building locations, but not building heights. When complexity metrics are critical to an analysis, location or height generalization is ill-advised.

Andrew Michael Sanderson, University of Memphis - Department of Earth Sciences. Email: a.m.sanderson@gmail.com; Hsiang-te Kung, PhD, University of Memphis - Department of Earth Sciences. Email: hkung@memphis.edu; Does Sediment Supply or Deficiency Influence Biodiversity in Regulated Rivers?

Navigational and hydroelectric development of river systems has the potential for significant positive and negative effects upon aquatic habitat and biodiversity. As evidenced through extensive development of large-scale dams in the United States during the 20th century, vast transformations in geomorphologic processes have occurred with the conversion of natural flow regimes to regulated reservoirs and downstream reaches of streams and rivers. While general assumptions may be made concerning the effect of sediment trapping and the subsequent downstream channel-armoring and incision accompanying dam construction upon biodiversity, few studies focus on the effect of sediment supply upon habitat structure. Analysis of how sediment supply/deficiency does or does not impact aquatic habitat structure in modified channels along multiple stream reaches should be combined with historical and recent flow data for the purpose of deriving an enhanced awareness of what occurs on the small scale. Moreover, data from similar systems in various stages of development may be compared in order to provide information not only on the spatial, but also the temporal scale. The result should be a more refined method of analysis where information on a coarser scale may be used as for more rapid prediction and subsequent development and maintenance of sustainable watershed management as it relates to the preservation of aquatic habitat.

Sarah Sanford, University of Toronto. Email: sarah.sanford@utoronto.ca; Constructing 'Vulnerable' Populations in Understandings of Infectious Disease

This paper investigates the experience of infectious disease in current contexts, with a focus on the connection between existing systems of oppression and inequality in society and notions of vulnerability with respect to dominant understandings of disease. I assert that the scientific and medical representations of health and infectious disease as solely biological entities, contributes to the naturalization of inequality and simultaneously neglects and obscures profoundly important social circumstances impacting upon the understandings and embodiment of disease. These social factors are exemplified through processes such as the feminization of disease, or the disparate power relations epitomized by existing structures of neo-colonialism on an international scale. In addition, discourse involving 'security' concerns, 'choice' and 'self-control' with respect to infectious disease will be discussed, along with their implications for the construction of difference in current contexts. Through an analysis of the

representation of emerging infectious diseases and their connection to ideas of vulnerability, both locally and globally, I seek to problematize dominant conceptualizations of vulnerability that govern everyday understandings of infection and normalize processes of differentiation and inequality.

Keywords: vulnerability, choice, security, medicalization, infectious disease

Sangtin Writers, Sangtin. Email: sangtin002@gmail.com; Richa Nagar, University of Minnesota. Email: nagar002@tc.umn.edu; *Translations in Struggle: Reflections on Intersectionality, Activism, and NGO-ized Feminism through Sangtin's Ongoing Journeys...*

The NGOization of grassroots activism has emerged as an important theme in recent conversations around "globalization from below." Feminist critics have focused on the ways that agendas of many NGOs in the south have come to be dominated by northern donors, and on how knowledges and strategies produced in/through such NGOs are often constrained by what donors such as World Bank or Ford Foundation wish to see based on their assumptions about the "basic needs" and priorities of "poor women." Thus, there is often funding for addressing such issues as violence against women, but there is little support for projects that refuse to see bodily violence in isolation from processes such as landlessness, privatization of water, or elimination of subsidized education and health care. In this paper, four authors situate such processes in relation to the complex journey of their own organization, Sangtin, which works with poor women, peasants and laborers in the Sitapur district of Uttar Pradesh (India). We specifically ask: What happens when feminist activism is limited to a predetermined list of issues, and when a complex political and cultural economy at multiple geographical scales becomes invested in such a ghettoization of "poor women's problems"? We frame our reflections in terms of challenges associated with a radical conceptualization and practice of intersectionality at a time when women's empowerment and activism have become "respectable" jobs in Sitapur's NGO sector, complete with the blessings of the rural development machinery at the village and district levels.

Keywords: NGO-ization, empowerment, intersectionality, India

Johanne Sanschagrin, University of Toronto. Email: jo.sanschagrin@utoronto.ca; *Engendering Family Earnings in Canada*

In past decades, partnered women with or without children have become increasingly conspicuous in the labour market. Dual-earning arrangements are now the norm for Canadian couples. While arrangements where the male partner is the sole earner continue to exist, the number of couples in which women are the sole earners is slowly increasing in the population. However, changes toward more equal earning arrangements are not occurring uniformly within the country. In urban social geography, little attention has been given to these differences at the regional level. Based on a demographic and basic statistical analysis at the Canadian census metropolitan area (CMA) level, this paper focuses on regional and urban differences in the light of other socio-economic characteristics.

Keywords: earnings, couples, gender, Canada

Fernanda Santos, Hunter College Department of Geography. Email: fsantos@hunter.cuny.edu; Haydee Salmun, Hunter College Department of Geography. Email: molod@ocean.mit.edu; Jochen Albrecht, Hunter College Department of Geography. Email: jochen@hunter.cuny.edu; *Quantifying the Scales of the Land Surface Heterogeneity*

The heterogeneity of the Earth's land surface plays an important role in regulating the climate and maintaining water resources. The land surface heterogeneity varies at a wide range of scales, and current research has demonstrated that different scales of the land surface variability have different impact on the surface-atmosphere flux exchanges. The physical processes involved in the mechanisms by which the heterogeneous land surface influences climate dynamics have been studied and are well known. However, a global quantification of the dominant scales of surface variability has not been addressed directly. The present study discusses research to quantify the scales of heterogeneity in the land cover vegetation globally. We used an 8km spatial resolution dataset derived from satellite imagery, the Global Land Cover Classification provided by the University of Maryland, to quantify the characteristic patch area of thirteen land cover classes. The area of patches for each land cover class was calculated using a spatial pattern program, Fragstats. A criterion based on the scales relevant to global climate models (subgrid, meso-scale and large scale resolvable processes) guided the analysis of results. A distribution of patch size according to this criterion indicates that, on average, large scale surface vegetation patches dominate the landscape, followed by subgrid and meso-scale size patches, respectively.

Keywords: landscape ecology, land-atmosphere interactions, land cover change, surface vegetation heterogeneity

Gonzalez Sara, University of Leeds. Email: S.Gonzalez@leeds.ac.uk; *Scaling up European cities while/ by skewing territorial justice concerns*

Cities across Europe are taking a more proactive urban governance style. In Europe, however, the State is still the main promoter and investor. Another characteristic of European urban entrepreneurialism is that is embedded in a complex web of, sometimes competing, territorial political projects. Bilbao, Newcastle and Milan are neither global nor capital cities and belong to the second or third tier in the hierarchy of European cities. The three cities have significantly changed their economic base, lost population in the central areas and heavily invested on new infrastructures to compete internationally. They are embedded in complex scalar choreographies from the European Union to the neighbourhood level that shape and constrain their governance mechanisms. In Bilbao, the Regional Government is the main political and economic player and tensions with the Central Government have put at risk several major infrastructures to internationalise the city. Milan is not anymore a defined urban centre but forms part of a diffused mega-city region in the North-west of Italy which is trying to re-establish its role as the economic capital of the nation. In Newcastle, the central government plays a significant role in defining urban policy but there are new emerging sub-national arrangements in part aimed at raising the international profile of the city. There is no unique mode of entrepreneurial governance in European cities as they are embedded in complex scalar politics, but there is a common trend towards developing more competitive urban policies.

Michael Said Sarhan, Texas State University - San Marcos. Email: ms1484@txstate.edu; *A Comparative Assessment of the Flooding Caused by Tropical Storm Jeanne in Haiti and the Dominican Republic*

Tropical Storm Jeanne devastated the city of Gonaives and extensively damaged the Haitian countryside in 2004, killing more than 3,000 people and leaving hundreds of thousands homeless. The landscape of the Dominican Republic, however, was comparatively unscathed and their death toll was only in the dozens. This study examines the possible influences of land-use practices on the disparity in damages and deaths, and discusses the influences of geology, hydrology, topography, and socio-economic pressures. This study employs satellite imagery, geographic information systems (GIS), thematic cartography, and field observations and interviews to ascertain the relative influences of the physical and socio-economic factors listed above. The results indicate that despite the well known problem of deforestation in Haiti, poor land-use practices alone cannot explain the differences in damages caused by Tropical Storm Jeanne. Rather a hierarchy of factors generated the landscape damage patterns. Topography and hydrology are the most important physical influences and land-use itself was the least important factor.

Keywords: Hispaniola, Dominican Republic, Haiti, Tropical Storm Jeanne.

Philip Sarre, Dr, The Open University, UK. Email: p.v.sarre@open.ac.uk; *Crime, corruption and crisis: the role of international finance.*

Free movement of capital has been a central feature of the new international financial architecture that has evolved since 1970, promoted by the Reagan and Thatcher governments, then widely imitated and frequently imposed by IMF and World Bank. The system, dominated by New York and London, but also including dozens of on- and offshore financial centres (many of which have strong secrecy laws) now moves huge amounts of bank assets, securities, currency and derivatives across international borders every day. Geographers have studied financial centres, but few have looked at the effects of the new system. Recent ngo, practitioner, academic and official critiques have made it easier to specify the effects in a number of areas. Highlights are- 1. Facilitation of crime and corruption; perhaps \$150 billion of profits from crime laundered into the banking system each year. 2. Encouragement of tax avoidance and evasion; HNWIs moving assets offshore (\$600 billion a year, over \$12 billion in total); corporations 'move' assets and profits to low tax jurisdictions through transfer pricing. 3. Destabilisation of emerging economies: high incidence of financial crises 1970-2000, culminating in Latin America and East Asia, where some countries lost 20% GDP over a year or two, and many years of growth were cancelled. On balance the system moves capital from poorer to richer countries. The overall outcome has been greater inequality, both between and within more and less developed countries, without any identifiable increase in global economic growth.

Keywords: international finance

Jade Sasser, University of California - Berkeley. Email: sasserja@berkeley.edu; *Shifting The Agenda From Economic Growth To Social Development: A Historical Analysis Of Large Scale Mining Projects In Madagascar*

Madagascar has recently adopted a set of neoliberal political and economic policies that place mineral resource development at the top of the economic agenda, encouraging the development of large scale, corporation-based mining projects. This paper charts the historical trajectory of mineral resource extraction in Madagascar, highlighting the changing ways large scale mining projects have positioned themselves in relation to local Malagasy communities, moving from the role of drivers of economic growth to agents of social development via institutional programs in education, public health, and the development of protected areas. The contradictions produced by these changes manifest in struggles with local communities at mining sites, at the same historical moment in which mining projects have been repositioned as providers of wide-ranging social benefits. Drawing on political economy and development studies literature as well as preliminary ethnographic data collected in Madagascar, this paper argues that the drive to intensify and expand mining operations in Madagascar has produced new struggles over access to and control of natural resources at the same time that social benefit programs attempt to mask these conflicts. My analysis also underscores the importance of understanding the historical contexts of the situated struggles produced at the sites where local communities, mining corporations, government and multilateral donor groups converge.

Afton Sather-Knutsen, Michigan Technological University. Email: aesather@mtu.edu; *The Politics of Parcels: Community and Land Ownership Change in Michigan's Keweenaw Peninsula*

This study examines the politics of rural residential development in Michigan's sparsely populated Keweenaw Peninsula on Lake Superior. Keweenaw County is Michigan's least populous county, but during the 1990s experienced the second fastest rate of population growth. Land ownership in the Keweenaw has long been dominated by a few large corporate owners, who have traditionally allowed public access to their lands, leading local residents to view these lands as a public resource. Since these companies began selling parcels along lakeshores for development and forest tracts for hunting land in the mid-1990s, land sales and land access have become the major political issue in the Keweenaw. The politics of land ownership parcelization are best understood in terms of a local culture of private property that both overlaps and conflicts with an orthodox conception of private property. Whether lands are conceptualized as public or private often is a question of parcel size and the specific owner. The political response to parcelization in the Keweenaw has been manifold: local governments have become more active in zoning and planning; and a diverse group of public and private organizations have begun protecting lands for public access and conservation values. The problems faced by residents of the Keweenaw are common to areas across the country where rural residential development is changing the landscape and altering patterns of land use. Research was conducted during the summer and fall of 2006 and consisted of approximately 30 semi-structured interviews and textual analysis of print articles and public hearing comments.

Field trips for undergraduates have become increasingly difficult to arrange, expensive of both time and dollars, and generate considerable anxiety in terms of safety. They remain, however, invaluable experiences for the application and demonstration of skills taught in the classroom. A site activity has been developed over time at Livermore Falls, Pemigewasset River, New Hampshire, where upper level undergraduate students are quickly introduced to the site, divided into teams, and assigned the task of developing a management plan. Previous to the field activity, students are introduced to the process of describing the elements of the site, evaluating the value of the resources there, and prescribing recommendations for its use. This field activity is guided by one or more faculty who stand by as a resource; additionally, faculty gather the students at three different points during the day to debrief, clarify, answer questions, and encourage their work. We have found this model to be a particularly useful means by which students can practice the skills which are discussed in a classroom setting.

Keywords: Field work, geographic education, undergraduates

Noriyuki Sato, Indiana University. Email: nosato@indiana.edu; *Trends and Relationships between Air Temperature and Snowfall Characteristics in North America*

Air temperature is an important variable that determines the type of precipitation during cold months. With rising air temperature during winter, the frequency of snowfall diminishes as that of rainfall increases in certain areas, whereas the amount of snowfall increases in other areas due to an increased availability of moisture in the air. Since air temperature also is one of the important variables of climate change, it is expected that the distribution, timing, and amount of snowfall will change dynamically as climate change progresses. While several researchers have studied this relationship between air temperature and winter precipitation, those studies are based on the temporal trends and spatial patterns of the monthly and seasonal characteristics. The timing and magnitude of snowfall events over a winter period may be changing, and this study examines those characteristics of snowfall events at a finer resolution. The study employs linear regression with possible breakpoints to determine temporal trends of air temperature and snowfall relationships at representative weather stations and then the spatial patterns of the trends are analyzed. In the process, the frequency, timing, duration, and amount of snowfall will be examined together. The study utilizes the daily air temperature and snowfall amount data from the United States Historical Climatology Network (USHCN) for the U.S. and quality-controlled datasets for Canada. The study period is from 1948 through 2002.

Keywords: climate change, air temperature, snowfall, trend analysis

Toshiaki Satoh, University of Tokyo. Email: toshiss@csis.u-tokyo.ac.jp; Atsuyuki Okabe, University of Tokyo. Email: atsu@ua.t.u-tokyo.ac.jp; *The nearest neighbor distance method for point pattern analysis in relation to sub-networks of a network and its application to the analysis of street burglaries*

This paper proposes a statistical method for analyzing the distribution of activity points (e.g., incidence points of street burglaries) with respect to the shortest-path distances between the activity points and their nearest nodes on sub-networks (e.g., arterial streets), termed base sub-networks, of a network (e.g., a street network). The shortest-path distance can consider the direction of the shortest-path, that is, the shortest-path distance from an activity point to the nearest node of a base sub-network, termed the inward shortest-path distance; and the shortest-path from the nodes of a base sub-network to an activity point, termed the outward shortest-path distance. The method is designed to test the null hypothesis that points on the network are randomly distributed according to the uniform distribution over the network. The paper develops a computational method for measuring the average shortest-path distance from every observed activity point to its nearest node on the base sub-network, and derives the expected shortest-path distance under the null hypothesis. The comparison between the observed average shortest-path distance and the expected shortest-path distance statistically tests whether the points are clustered, random or regular. This method is implemented as a GIS-based tool using the directed network Voronoi diagram for sub-networks. The method was applied to the analysis of the distribution of street burglaries on streets, and it was found that street burglaries tended to occur around arterial streets and difference existed between the outward and inward shortest-path distances.

Keywords: point pattern analysis, network, GIS

Allison Sauer, York University. Email: alisauer@yorku.ca; *Constructed Illegitimacies: Nationalism, Racialization and Citizenship-based Inclusions and Exclusions*

This paper examines how the cultural construction of nationalism is shaped by concepts of inclusion and exclusion often mediated through hegemonic discourses of differential citizenship and racialization with specific reference to the mass round-up of non-status Portuguese people in the City of Toronto, in the summer of 2006. Dominant national discourses rationalize exclusionary, racialized immigration policies as protecting and enhancing national security (Bannerji 1997). Nations and citizenship are frequently defined through membership to an 'imagined community' (Anderson: 1983), and, significantly, non-membership, or exclusion. Differential citizenship status serves as an historical and contemporary regulatory framework through which heavily racialized projects of nation-building can protect the integrity of the imagined community while still accessing the labour-base of non-citizen residents. Stricter immigration controls correspond to ever increasing migrations flows exposing that border regulation is predominantly an ideological apparatus (Yuval-Davis 1997) that seeks to limit access to citizenship rather than barring people from crossing borders.

Keywords: Citizenship, Nationalism, Illegality

Angharad Saunders, Glamorgan University. Email: angharad@saundersweb.org.uk; *The practice of the text: the geography of walking, talking and writing*

This paper explores the spatial practices of writing within Britain at the turn of the twentieth century. Through the work and journals of the journalist, editor and author, Arnold Bennett (1867-1931), it considers how his writings are inextricably bound up with what Lorimer (2003) terms the 'livedness' of experience; the routines and tactics of being in the world and the rhythms which stimulate social life. It does so through an examination of the friendship which existed between Arnold Bennett and the novelist and dramatist Eden Phillpotts (1862-1960), and the practices through which this was expressed during a long weekend Bennett spent with Phillpotts in October 1899. During his stay Bennett and Phillpotts spent much of their time walking on the south coast and conversing over the development of their respective works and ways of writing. This paper explores these practices of walking and talking and suggests that in fundamentally shaping Bennett's social world they simultaneously activated his writing strategies and the narrative styles of his future work.

Houston Saunderson, Wilfrid Laurier University. Email: hsaunderson@rogers.com; *Structure of Volcanic Eruption Clouds*

The equations of motion are used to predict the structure of clouds formed during volcanic eruptions. This approach has yielded typically a three-part structure: a ballistic section close to ground level, a column in which motion is mostly vertical but from which fall-out may occur at the sides, and an umbrella section at the top of the cloud. Iterative loops have been used to date to model the paths of ejecta in these clouds, reflecting variations in particle diameter, velocity, take-off angle and other quantities. Although the paths have been animated to show details, the serial nature of these plots is a significant limitation of the method. The use of multiple threads is being explored as an alternative to a strictly serial approach.

Keywords: paths, ejecta, threads

Carol F. Sawyer, Texas State University-San Marcos. Email: cs1123@txstate.edu; David R. Butler, Texas State University-San Marcos. Email: db25@txstate.edu; *Patterns of seasonal frost heaving and surface clast movement in turf-banked terraces, eastern Glacier National Park, Montana*

In Glacier National Park, ongoing research seeks to determine the processes, patterns, and rates of movement of miniature patterned ground on alpine tundra. Observations of sorting of markers and surface clasts within turf-banked terraces began 3 years ago, whereas observations of vertical heaving, using nails, began 14 months ago. Field data and repeat photography techniques were used to measure and observe changes over time. New data continued to show evidence of seasonal movement of markers and clasts around the markers; however, some markers showed minimal movement compared to previous observations. In 2 months, 53% of the nails at the first site were heaved to a maximum height of 7 mm. In a 12 month time span, 70% of the nails at a second site were heaved to a maximum height of 14 mm. Markers were re-located with varying success rates, ranging from 33 - 100 % one year to 40 - 93% the next year. Success of re-locating markers was not dependent on length of placement in the field; two sites established 2 years apart had location rates of 93%. Miniature sorted circles with fine sediment enclosed by gravel were observed at one site 3 years ago but not since that time. New miniature sorted circles were recently observed at a nearby site. Final analysis will show the patterns of movement of nails, marker, and clasts, both laterally and vertically, attributed to frost processes.

Keywords: patterned ground, Glacier National Park, frost processes, alpine tundra

Claudia Sawyer, Syracuse University. Email: crsawyer@maxwell.syr.edu; *Setting the Stage: Guanajuato's Historic Center*

Guanajuato, located in northern-central Mexico, has focused its efforts on becoming a cultural tourism hotspot. A former mining center, its colonial architecture and canyon topography give it unique appeal among Mexico's nine UNESCO World Heritage historic city centers. Its yearly Cervantes Festival attracts international attention and increasingly, large numbers of spectators that severely challenge the city's capacity to provide services to visitors and citizens alike. In the wake of preservation investment, original pavements have been removed in favor of Romanesque patterns seen in Europe. Simultaneously, the Tourism Secretariat has rewarded neighborhood associations for their own clean-up efforts, fostering a top-down yet seemingly grassroots approach to heritage preservation. This paper will focus on state and municipal preservation efforts in Guanajuato, draw on interviews with local officials and experts, and suggest where Guanajuato might be headed in its attempt to position itself as a major urban tourism destination.

Keywords: heritage, tourism, preservation

AnnaLee Saxenian, University of California, Berkeley. Email: anno@simms.berkeley.edu; *The New Argonauts: Regional Advantage in a Global Economy*

Like the Greeks who sailed with Jason in search of the Golden Fleece, the new Argonauts?US-educated, foreign-born professionals who travel between Silicon Valley and their home countries?have pursued the risky but economically rewarding project of starting new ventures far from established centers of skill and technology. Their contributions to the growth of formerly peripheral economies, from Israel and Taiwan to China and India, illuminate a developmental trajectory not anticipated by standard models of development. By experimenting with innovations in the organization of local production, institutions, and policy, while maintaining cross-regional collaborations with their counterparts in Silicon Valley, the new Argonauts have created a context for technology entrepreneurship and growth in locations that are "poorly" endowed by standard economic metrics (property rights, rule of law, investment climate, etc.) These locations rarely provide lasting cost advantages either: as producers continue to cluster and upgrade their capabilities, they contribute to rapidly rising wages. The creation of regional advantage in the periphery underscores the need to view entrepreneurs, firms, policymakers and other actors as endogenous to the growth process. Professional and technical communities like Silicon Valley's new Argonauts have assumed unanticipated economic significance by providing flexible and responsive search networks that link local and global actors.

Keywords: clusters, high skilled migration, entrepreneurship, globalization

Andrew Sayer, Lancaster University. Email: a.sayer@lancaster.ac.uk; *What's Critical About Critical Geography?*

The meaning of the terms 'critical' and 'critique' has undergone a remarkable dilution, de-valuation and de-politicisation in the last three decades in the social sciences, including radical geography. Eight different concepts of critique are identified. Once associated with the identification, evaluative explanation of avoidable suffering (domination, exploitation, abuse, neglect) critique has turned inwards and reduced to a concern with reflexivity and examination of presuppositions. While these are undoubtedly academic virtues, the justifications for dropping the ethical-political critique of suffering are argued to be feeble.

Keywords: critique, reflexivity, suffering

Kristi L Saylor, United States Geological Survey. Email: saylor@usgs.gov; Terry L Sohl, SAIC, contractor to United States Geological Survey. Email: sohl@usgs.gov; *Projecting land use change in the southeastern United States using a scenario-based modeling technique*

The carbon cycle, climate, hydrology, and biodiversity are all affected by the consequences of land use and land cover change. The FOREcasting SCEnarios (FORE-SCE) model was developed to create high-resolution, regionally projected land cover products to aid in predicting the effects of land use and land cover change. The model uses information about contemporary rates of land cover change, thematic categories of change, and components of landscape pattern that were adapted from the USGS Land Cover Trends project. FORE-SCE uses theoretical, statistical and deterministic modeling techniques to project future land cover change for a range of plausible scenarios. The FORE-SCE model was first applied in the Great Plains. The second application of FORE-SCE was in the southeastern United States. In this region, the dynamic timber industry was an important factor in model development. Because the age of forest stands strongly affects carbon and climate applications, FORE-SCE was augmented with data on forest cutting and regrowth provided by the Land Cover Trends project. Changes in forest were tracked through time, enabling the model to more realistically simulate the cutting and regrowth of forests in the southeast. Additional applications of FORE-SCE are planned for the mid-Atlantic region and for southern California.

Keywords: modeling, southeast U.S., land use change

Nathan F. Sayre, University of California, Berkeley. Email: nsayre@berkeley.edu; *The Western Range Goes Global: Post-World War II International Pastoral Development Projects in the "Third World"*

The post-World War II period saw the rise of international development agencies and lending institutions as mechanisms of modernization around the world and across a wide range of industries. Beginning in the 1950s, shortly after the formation of the Society for Range Management, the US model of commercially oriented, capital-intensive livestock production became hegemonic in international development projects aimed at pastoralists in "third world" countries in Asia, Africa and Latin America. This paper reports on the extent and characteristics of this hegemony, based on a review of published reports and literature from the UN, World Bank, USAID, and other development agencies and NGOs. The main features of the Western Range model?including land tenure "rationalization," fencing, water development, "improved" breeds of animals, and imposition of carrying capacities?have been consistent features of these projects both before and after the rise of neoliberalism in the 1970s, albeit with

myriad regional peculiarities and perverse outcomes. I suggest that extensive range livestock production continues to be both a frontier and an elusive target of liberal market and state formation.

Roger Sayre, Ph.D., United States Geological Survey. Email: rsayre@usgs.gov; Jill Janene Cress, United States Geological Survey. Email: jjcress@usgs.gov; Harumi Warner, United States Geological Survey. Email: hwarner@usgs.gov; Landforms and Bioclimate in the Contiguous United States

Ecosystems are commonly conceptualized as interacting systems of biota and their physical environment. Bioclimate and landforms are two aspects of the physical environment which strongly influence the differentiation and distribution of terrestrial ecosystems. The Rocky Mountain Geographic Science Center developed national landforms and bioclimate datasets as part of a larger, U.S. Geological Survey-led effort to map the ecosystems of the nation. The landforms consist of classes derived from Dikau et al.'s (1991) method, which is a modified and automated version of Hammond's original manual classification method, along with the addition of coastal plains and river valleys. Dikau et al.'s (1991) method was translated into spatial models and applied to the 30 meter National Elevation Dataset. The coastal plains were identified by overlaying the plain classes with Omerik coastal plain ecoregions (Environmental Protection Agency, 2006). The river valley class was identified based on the slope position. It was derived by applying Weiss's (2001) method which used the Topographic Position Index to the 30 meter National Elevation Dataset. For the delineation of the bioclimate classes, Rivas-Martinez et al.'s (2006) classification system was used. This classification algorithm was executed in spatial models using the Daymet data distributed by the Numerical Terradynamic Simulation Group at the University of Montana as input. Generation of landforms and bioclimate data for the contiguous U.S. marks significant progress towards the completion of a national ecosystems map.

Keywords: national landforms, national bioclimate, national ecosystems, terrestrial ecosystems, U.S. Geological Survey, geomorphology, spatial modeling, spatial analysis, GIS

Roger G. Sayre, Ph.D., United States Geological Survey. Email: rsayre@usgs.gov; Meso-scale Mapping of Global Ecosystems for Terrestrial, Freshwater, and Marine Environments

Ecosystem-based management is a fundamental element of the sustainable development paradigm, and has been advocated by the Convention on Biological Diversity (CBD), the Millennium Assessment, the Global Earth Observation System of Systems (GEOSS) and other major protocols and collaborations. Appropriate management of ecosystems is necessary to ensure the continued delivery of ecosystem goods and services (e.g. flood control, food, fiber, and forage production, biodiversity, etc.) upon which human societies depend. An understanding of the types and distributions (maps) of ecosystems is a requisite input into the management process. Unfortunately, standardized, robust, and practical ecosystem classifications and maps are not commonly available at management-appropriate scales. While macro-scale ecoregionalizations of the planet are available (Bailey, 1998; Olson et al., 2001), these are most useful for regional analyses, and are generally too coarse for on-the-ground conservation and resource management applications. A new set of finer resolution, meso-scale, global ecosystems for terrestrial, freshwater, and marine environments is in development as a priority task of the GEOSS effort. This presentation will describe the GEOSS global ecosystem classification and mapping approach, including descriptions of sub-regional efforts for the US and South America.

Keywords: ecosystems, mapping, global

Joseph L. Scarpaci, Virginia Tech. Email: scarp@vt.edu; Land-use Change, Gentrification, and Discourse in the Southern Cone: Case Studies from San Telmo and Ciudad Vieja. Joseph L. Scarpaci and Jose' Antonio Borello

Neoliberal policy changes have etched their mark into the built landscapes of Southern Cone cities. Perhaps nowhere are these changes more evident than in the real-estate markets, particularly undercapitalized ones in historic districts. Divided into two parts, the paper begins with the results of an empirical study of land-use change of over 5,000 buildings in San Telmo (Buenos Aires) and Ciudad Vieja (Montevideo) from the 1990s and mid 2000s. Results indicate a decline in residential uses which have been offset but a rise in commercial establishments, especially in tourism and up-scale marketing outlets. The latter half of the paper draws on the local press and official statements about these rapidly changing neighborhoods. It also includes field research notes and interviews with local residents. While the pace of change has quickened in San Telmo, Ciudad Vieja's local market appears to be less attractive to investors. In both places, there appears to be little official discourse about the indirect costs of gentrification and

housing prices, despite evidence of residential displacement and the left-center leanings of both governments in power.

Keywords: gentrification, land use, built environment, Latin America, real-estate, displacement

Werner Udo Schade, Padagogische Hochschule. Email: schade_udo@web.de; The Early Development of Cover Design of Foldout-Maps

This study aims at the gap in the developing field of map history, an area which can be called the history of map design. The physical map, its production methods, its cover illustrations, its producers themselves, and the economics of its distribution methods and materials all seem to be on the fringes of map history. The front cover of a foldout-map has acknowledged influences on its readers. Its appearance owes much to the producer's expectations of his market - the purchasers and the readers of the map. The cover can be said to embody his expectations of how the map will be used, where and when it will be read, whether its readers need illustrations, etc. Thus it holds many clues about reading practices and the reader themselves. It does not yield these clues quickly, for many reasons. A survey of historical and contemporary front covers of foldout-maps has been undertaken at an international scale. The results demonstrate that the cover design depends on several factors. To read the clues about a map's intended readers, these factors need to be understood.

Keywords: map history, cover design, tourism

Melissa Schafer, Technical University of Munich - Weihenstephan. Email: melissa@schafer.net; The Development of Sustainable Food Systems in Portland, Oregon and Munich, Germany

Portland, Oregon and Munich, Germany are both cities with strong sustainable agricultural and food movements. It is hypothesized that the key actors for the success of these movements are the retailers and political institutions that are supportive of environmental and land use issues. The actors involved in both cities include: political institutions (governance), consumer and environmental organizations, retailers (natural and organic food stores), farmers involved in direct marketing and cooperative farm marketing, and restaurants serving organic and local food. Social network theory is the key methodology for identifying the actors and their relationships to each other, and to describe the network of actors in these movements. The goal of this research is to determine similarities and differences between these successful food movements by drawing conclusions about critical actors and their roles to provide insight on how such movements could be replicated in other cities. Although the manifestations of these actors take different forms, the outcomes are similar. For example, in Germany, where small retail businesses are traditional, small retail stores dominate the organic food market. Likewise, in Portland where large supermarkets are common, natural food stores mimic large supermarkets. Another example is Munich's governmental encouragement of farmers to convert to organics in a region used for the municipal drinking water and starting a marketing campaign for their products in urban retail shops. Similarly, Portland's urban growth boundary created in the 70s has kept farms close to the urban area enabling successful direct marketing.

Keywords: sustainable food and agriculture, organic food, social network theory, international comparisons, comparative methodology

Jeffrey P. Schaffer, Napa Valley College. Email: jeffreypschafer@yahoo.com; Seeing the Elephant: How Perceived Evidence in the Sierra Nevada Biased Global Geomorphology

During the 1800s, many geologists believed that the Earth was molten except for a thin crust, and that converging waves of magma collided to produce "instant" mountain ranges. Harvard's Louis Agassiz used this erroneous mechanism in 1847 to explain the instigation of the Ice Age: ranges recently rose, glaciers developed, and these carved deep canyons. Taught at Harvard and Yale, this became the late-Cenozoic major-uplift, major-glacial-erosion paradigm. Whitney and Brewer brought it to California, and in 1862 Brewer recorded a Sierran miner's fable that "confirmed" this paradigm. In 1863 they entered the Sierra Nevada and recorded contrary uplift evidence, but Whitney's 1865 report stressed the fable, which became widespread as fact. A pseudoscience was born. By the 1890s, geologists had mapped the Sierra sufficiently to refute the paradigm, but it had become dogma that expands today. Huber (1981) deleted an underlying stratum, added an imaginary canyon, and ignored contrary evidence. Harbor (1992) produced a numerical model of Yosemite Valley radically transformed by glaciers, field evidence to the contrary, and appears in geoscience texts as fact. Sawyer (2001) proved recent Sierran uplift with a geologic cross section of a "typical" (nonexistent) Sierran canyon. Caltech geoscientists (2005) used helium isotopes to reconstruct multistage uplift of the Sierra, while Stanford geoscientists (2006) used hydrogen isotopes to refute it. None know the crucial field evidence. Now, gophers (not mass wasting) are denuding California's coast ranges.

Dogma encourages the creation of imaginary “facts” that advance our pseudoscience, which is more creation science than real science.

Kelsey Nicole Scheitlin, Mississippi State University. Email: kns87@msstate.edu; Grady Dixon, Mississippi State University. Email: pgd4@msstate.edu; Variations of Diurnal Temperature Range in the Southeast United States Due to Land Use/Land Cover Classification, 1995-2004

Variations in daily temperature across an area can often be ascribed to differences in surface-atmospheric interactions related to land use/land cover classifications. The study area includes over 100 weather stations located in portions of Mississippi, Tennessee, Louisiana and Arkansas, and is dominated by agriculture, urban areas, deciduous forests, coniferous forests, and mixed forests. This study area is unique in that it looks at a constantly changing landscape, and very few studies have looked at smaller scale urban areas similar to the ones found in this region. Also, an area known as “the Delta”, located in the alluvial sediment of the Mississippi River in Louisiana, Arkansas and Mississippi, is known for its agriculture and holds enormous economic influence in all three states. The diurnal temperature range of the five land use classifications in the study area will be compared between the years of 1995 - 2004 for each of the Spatial Synoptic Classification air mass types. In order to isolate land use/land cover as a variable, all days that are synoptically active are not included, as well as days where the entire area is not under the same air mass. Paired sample T tests, discriminate analyses, and multivariate analyses are employed to make comparisons of the diurnal temperature range between each of the land uses.

Nicolai Scherle, Katholische Universität Eichstätt-Ingolstadt. Email: nicolai.scherle@ku-eichstaett.de; Good-bye Humboldt, welcome McKinsey - Tourism and Leisure Geography in Germany in the context of current educational policy changes and the complex challenge of globalised educational structures

Germany's university system, rich in tradition, whose structures and values continue to be shaped by the humanist educational ideals of the famous German universal scholar Wilhelm von Humboldt, is currently undergoing the most drastic paradigm shift in its history so far. This paradigm shift is inseparably linked to the so-called Bologna Process, which primarily aims to harmonise and internationalise European university structures in the context of the complex challenges of an increasingly globalised educational landscape, and will ultimately lead to a comprehensive implementation of Anglo-Saxon educational structures. Those in favour of this paradigm shift hope that the universities will become more competitive, their teaching more efficient and that graduates will be more employable. Its critics, however, fear a drop in the quality of teaching and research, a gradual departure from the Humboldtian educational concept and, with reference to the German sociologist Beck, a sort of “McKinsey-Stalinism” which will be dominated by a network of accreditors and evaluators and which could at worst degenerate into increasing academic managerialism or academic capitalism. The planned contribution will provide an up-to-date overview of the implications of these transformation processes on Tourism and Leisure Geography in Germany from a holistic perspective, and will look at the ways in which the scientific community is addressing the complex challenges of a post-Humboldtian era of internationalisation, modularisation and evaluation.

While some geographers have embraced active learning as a means to actively engage students in a course, many others stick to conventional teaching methods. They are often deterred by suggestions that it can be difficult to implement active learning where students have no prior knowledge of a subject, that active learning requires too much work of lecturers and students, and that there are significant institutional constraints to implementing active learning. In this article the authors draw on their experiences of utilising active learning in five different countries before dispelling myths which continue to constrain the uptake of active learning methods. Finally, we provide simple guidelines for successful integration of active learning in geography courses.

Paul D. Schilke, University of Wyoming. Email: schilke@uwyo.edu; Responsibility, Avidity, Club Participation, and Other Variables in Three Categories of Off Highway Motorized Recreationists.

Increasing demand for nature's resources calls for increasing responsibility regarding their use and stewardship. Motorized vehicles used for off-highway recreation represent just one facet of that demand. Travel management taking place in the Forest Service System, the Bureau of Land Management and other land management agencies seeks to address careless, motorized travel occurring off designated routes and riding areas. 193 effective letters mailed to OHV clubs and advocates throughout an eight state region, invited club members and OHV users to participate in an online survey. The purpose of the survey was to understand the relationship between OHV club participation, responsibility and eight other variables of the motorized recreation experience. Preliminary results indicate a relationship between club participation and responsible behavior. However, a percentage of respondents who report responsible and safe behavior also report having received an injury while engaged in OHV recreation.

Beth Schlemper, Association of American Geographers. Email: bschlemper@aag.org; Antoinette WinklerPrins, Michigan State University. Email: antoinet@msu.edu; Balancing Professional and Personal Lives

As an aspiring academic, learning to navigate the decisions you need to make regarding ‘balancing’ your career and your personal life is key to your future success and life satisfaction. Academic geography is at once an all-consuming as well as a flexible type of work. This results in both a challenge and an opportunity to craft a life that is professionally rewarding and personally fulfilling. In our profession we find a range of partnerships with different demands and expectations. At times the boundaries between various aspects of our lives intersect and can be mutually enhancing. Many successful academics have crafted lives that have brought them professional success as well as personal fulfillment. This process includes career preparation, selecting an appropriate career path, and situating yourself for changing professional and personal priorities that occur throughout the course of a career. This paper includes a guide to strategies in setting priorities, negotiating work/life balance, and recognizing and utilizing institutional policies that are in place to enhance this effort. Balancing Professional and Personal Lives is part of a larger project entitled Aspiring Academics that is associated with Enhancing Departments and Graduate Education (EDGE) in Geography funded by the National Science Foundation.

Email: ; Dr. Scott A Lecce, Department of Geography, East Carolina University. Email: ; Using geochemical and sedimentological trends to identify pre- and post- settlement boundaries in floodplain deposits of the North Carolina Piedmont

The environmental history of a watershed can be preserved in vertically-accreted floodplain deposits, offering the potential to reconstruct major disturbances to the fluvial system. Human settlement and land clearing tend to increase sedimentation rates on valley floors, particularly during forest to agriculture conversion. Mining pollution tracers are useful to date historical floodplain units and study watershed-scale patterns of sedimentation. The upper Dutch Buffalo Watershed (253 km²) in the North Carolina Piedmont was first introduced to mining activities in 1842 by the Gold Hill Mining District located near the headwaters. Mercury released during gold ore processing, along with a well-documented mining history, enables the dating of overbank units during the mining period (1842-1915). The geochemical and sedimentological response of the basin during the pre-mining period, however, is largely unknown due to the lack of a geochemical mining signal. This study will address using geochemical and physical properties of pre/post settlement overbank units to characterize pre-mining floodplain deposits. Floodplain sediment cores were collected along three cross-valley transects downstream of the mining district in the upper, middle and lower reaches of the watershed and analyzed for 32 elements and physical properties including organic matter, pH, grain size, and color. Preliminary results indicate that geochemical profiles are sensitive to subtle changes in land use. Pre-settlement deposits are indicated by the presence of buried A-horizons and/or shifts in elemental ratios and other physical properties. This will improve on understanding the history of channel and floodplain changes caused by anthropogenic processes on the North Carolina Piedmont.

David Schlosberg, Northern Arizona University. Email: david.schlosberg@nau.edu; *Defining Environmental Justice: Theories, Movements, and Nature*

How are we to define the conception of the “justice” of environmental justice? How do movements for environmental justice define the concept of justice? Do different groups define the concept in varied ways? Have movement groups articulated notions of justice that go beyond traditional distributive conceptions, as many political theorists have in the past two decades? Is there a major difference between the definition of environmental justice (justice on environmental issues among the human population), and ecological justice (justice between humans and the rest of the natural world)? Can the language used in environmental justice movements also be applied to conceptions of ecological justice? In this paper, I argue that movements do not have a single definition of justice; in fact, they articulate many. Justice is about distribution, but it is also about individual and community recognition, participation, and functioning. Groups emphasize different notions of justice, on different issues, in various contexts. I also explore whether it is possible to use this expanded set of justice discourses - on distribution, but also on recognition, participation, and functioning? when discussing relationships of justice between the human and non-human realms. My argument is that in both environmental and ecological justice, we can use a similar set of concepts, tools, and languages. Realizing this may help us get beyond the divide between environmental and ecological justice, and into a practice of recognition, equity, expanded decision-making, and provision of the capacities necessary for individual and community functioning to human and non-human alike.

Kolson Lee Schlosser, Penn State University. Email: kls393@psu.edu; *The Bio-Politics of Bodies Politic: Nature and Metaphor in Classic U.S. Geopolitical Discourse*

A now robust critical geopolitics literature has achieved a number of important insights, including the role of naturalist epistemologies in traditional geopolitics, critical explorations of gender and geopolitics, and now intersections of militarism and the environment. This paper contributes to this literature by examining the discursive economy within which classic U.S. geopolitical discourse is embedded. While critical political geographers have demonstrated the role of naturalist epistemologies in classic geopolitics, I ask how naturalist metaphors of the body to describe the state and its defense have informed the geopolitical imaginary. I argue that invocations of the ‘body politic’ in 20th century geopolitical texts are a version of bio-politics informed by a proliferating biomedical discourse over a similar time period. Such body metaphors also involve gendered discourses of power iterating state practices as the rational, masculine head disciplining the wild, feminized torso. I furthermore argue that such metaphors work to create a spatial abstraction of a nationalized self often used to promote state policy. This paper, then, shows militarism as not only destructive of the environment, but as discursively produced in contradistinction to an essentialized, abstracted nature.

Christian Schmid, Swiss Federal Institute of Technology Zurich. Email: schmid@arch.ethz.ch; *Henri Lefebvre's Triadic Dialectics*

Henri Lefebvre's writings on everyday life, the urban and the production of space have attracted remarkable interest in recent years. Despite this renewed interest, a thorough analysis of Lefebvre's epistemology is still only at the beginning. Such an analysis must take into consideration that Lefebvre's thinking is rooted in the German philosophical and epistemological tradition of the 19th century as well as in the urban practice in 20th century Paris. One of the key elements of Lefebvre's epistemology is his triadic conception of dialectics which combines the dialectics of Hegel, Marx und Nietzsche in a surprising and fascinating way. This dialectics is at the basis of Lefebvre's triadic theories of language and representation and especially of his famous theory of the production of space. This contribution reconstructs some of the basic elements of Lefebvre's dialectics and presents a dialectical understanding of the three-dimensional concept of spatial practice, representation of space and spaces of representation.

Keywords: Lefebvre, space, dialectics

James A. Schmid, Ph. D., Schmid & Company Inc. Consulting Ecologists. Email: jaschmid@aol.com; *The Missing Geography of Wetlands in the United States*

There is an unnoticed disconnect between the airphoto-based wetland maps in standard sources of environmental data such as the National Wetland Inventory, US Geological Survey topographic quadrangles, and various State and local inventories on the one hand and on the other, those scattered wetlands delineated in detail and surveyed for regulatory purposes on individual tracts of land. The results of costly, labor-intensive, on-ground wetland delineation

typically serve a one-time regulatory purpose. There is no consistent effort to compile or preserve such map products in an accessible format for use by scholars, delineators, regulators, or conservationists. Wetland delineation remains a contentious undertaking, much affected by slowly improving technical methods for recognizing boundaries and rapidly swirling political currents, particularly in non-tidal, forested ecosystems. I illustrate specific examples of technically complex projects chiefly in New York, New Jersey, and Pennsylvania, and argue that the settled results of such delineation should be made publicly and permanently accessible. Geographers should serve as advocates working at the forefront of such efforts, given their expertise with maps and geographical information systems. Relatively little systematic use has been made of the numerous Environmental Impact Statements, Environmental Assessments, and similar reports that have been required by various levels of government for many kinds of development projects since the early 1970s. If the comparable opportunity is lost to utilize systematically maps of delineated wetlands, the ever-growing human population of these United States will have greater difficulty than necessary trying to adapt to and coexist with our remaining ecosystem.

Deanna H. Schmidt, University of Wisconsin-Milwaukee. Email: dbenson@uwm.edu; *The (Re)Production of 'White' Park Space, Milwaukee, Wisconsin*

This paper examines the practices (re)producing whiteness in racially-changing neighborhoods. During the 1970s and 1980s, ‘white’ residents in Milwaukee's neighborhoods faced not only racial change, but threats by neoliberal policies that reduced public spending, sent family-supporting manufacturing jobs overseas, and undermined the financial security of working and middle-class families. Residents sought to stabilize their neighborhoods through collective action. Their neighborhood organizations attempted to (re)produce neighborhood space including park space to match their conceptions of a good, ‘white’ neighborhood. This research does not find overt racism, rather the (re)production of whiteness and white privilege set within a discourse of ethnic and class diversity.

Keywords: neighborhood politics, parks, white privilege, neoliberalism

Mathew C Schmittlein, University of South Carolina. Email: schmittlein@sc.edu; *Social Vulnerability in Charleston, SC: 1970-2010*

The impacts of Hurricane Katrina on the Gulf Coast, and on New Orleans in particular, highlight the importance of differential social vulnerability on the outcomes of hazard events. Many efforts have been expended recently to develop methods for describing the spatial variations in social vulnerability across regions. These approaches are also being adapted to yield understandings of the temporal changes in these distributions. This paper furthers these spatio-temporal approaches by proposing a methodology for representing the historic spatial distribution of vulnerability in the Charleston-North Charleston Metropolitan area in South Carolina, and then extending this to 2010 and beyond. Twenty-six variables influencing social vulnerability were identified at the tract level for the study area from the decadal censuses of 1970 to 2000. Multivariate linear regression models were used to predict values for these variables for 2010. Social vulnerability indices, based on the algorithm used for the Social Vulnerability Index proposed by Cutter and others in 2003, were created for 2010 using the lower and upper prediction interval bounds for each variable and tract, resulting in a range of possible social vulnerability values for each tract in the study area. By knowing the potential spatial distribution of future vulnerability within the study area, planners and policymakers may be better able to make decisions regarding where to expend mitigation funds. They may also be able to utilize other policy tools to affect change that will decrease the likelihood that polarizing trends in vulnerability will occur.

Charles Schmitz, Towson University. Email: cschmitz@towson.edu; *Guantanamo's Devilish Details: the legal terrain of freedom and terror*

Military Order No. 1 of November 2001 authorizing the detention and trial of non-citizens in Guantanamo was a bold rewriting of domestic and international law to assert new presidential powers and to forcefully reshape international law to legitimize the White House's agenda in its War on Terror. The legal smokescreen used by the White House in Guantanamo attempted to strip the detainees of Habeas rights, perhaps the oldest check against tyranny. The White House's equally suspect semantic manipulations of international law tried to justify the stripping of protections of international law, and the Geneva Conventions in particular. In the summer of 2004 the Supreme Court rejected the White House's legal fictions and asserted jurisdiction over the detainees; then in the summer of 2006 the court went further, declaring that the president had no authority to write a new body of law for detainees and that Geneva Conventions did apply to the trial of detainees. In response to the Court's decision, the

Republican Congress wrote the Military Commissions Act in the fall of 2006 to achieve the same outcome the White House had intended in Military Order No. 1, but this time with Congressional authorization. Once again the Courts have been stripped of Habeas review and though paying lip service to Geneva Conventions, the Act brashly sidesteps legal difficulties in the Pentagon's War on Terror. This paper will interrogate the new MCA in order to interpret the uneven and ironic terrain of freedom and terror in Guantanamo.

Camille Schmoll, european university institute. Email: camilleschmoll@yahoo.fr; *The impact of trans-Mediterranean trade on regional economies. Some remarks in light of the case of Naples, Italy.*

There is little evidence in the scholarly literature about the effects of transnational activities on the regional economies of the receiving countries. This paper aims at discussing the relationship between trans-national entrepreneurship and regional development by analysing the case of Naples in the South of Italy. In recent years, the Euro-Mediterranean region has witnessed the emergence of trans-national marketplaces being mutually inter-connected through informal exchanges and circulations of people and commodities. In this context, the city of Naples has emerged as an important destination for North-African traders. The development of trans-Mediterranean informal networks has important influence on the city's regional economy in stimulating the formation of new commercial spaces and local industrial districts. These developments urge us to critically rethink some of the assumptions made within the literature dealing with local economic development in Italy, to the extent to which these studies have paid scant attention to the impact of international migration and trans-national trade on the evolution of industrial districts and other spaces of localised production and consumption. Moreover, research on these trans-national economic spaces make a contribution to the general literature dealing with transnational economies, challenging commonly held binary assumptions between transnationalism from below and transnationalism from above as well as between formal and informal economies.

Keywords: transnational trade, southern Europe, regional development, transnational networks

Phillip Schmutz, Louisiana State University. Email: phillip.schmutz@gmail.com; *Investigation of utility of Delta-T probe for obtaining surficial moisture measurements on beaches*

Recent studies have reported on the use of a new device to measure beach 'surface' moisture content, the Delta-T probe. However, a major weakness of the Delta-T probe is that the sensor rod length (about 60 mm) is too long for measurement of true 'surface' moisture conditions. This study was conducted to investigate the accuracy and reliability of the Delta-T probe as sensor rod length is reduced to approximate a 'surface' moisture measurement. Field investigations for this study were conducted at sites, in Texas, Florida and North Carolina during the summer and fall of 2006. Sites were selected to provide a range of natural sediment sizes. Surface moisture levels representative of the full range of beach conditions, from fully saturated to dry, were measured with Delta-T probes. The test sediments were sealed in airtight bags and returned to the laboratory for determination of natural gravimetric content. To assess the influence of probe length, various thicknesses of dielectric foam were used to adjust sensor rod length from 60 mm to lengths of 15 mm, 10 mm, and 5 mm. In most cases several repeats were conducted with two or more probes to allow an assessment of variability. The data are analyzed to assess the capabilities of the Delta-T probe for use in determining 'surface' moisture measurements.

Email: bhecht@umail.ucsb.edu; *Mapping global urban extent, intensity and vegetation using the fusion of MODIS satellite imagery and ancillary data sources*

Despite growing recognition of the important and complex role of cities in economic, political and environmental systems, urban areas have been understudied in the analysis of global environmental change. Although only a small percentage of anthropogenic land modifications, urban areas can significantly alter climate, biogeochemistry, and hydrology at local, regional, and global scales. Our knowledge of the cumulative impacts of urbanized areas is limited, however, by a critical lack of data sources: we have very poor estimates of urban extent, and virtually no information on geographic variations such as housing density or urban vegetation. Building on our early efforts with MODIS data, our current work focuses on: (1) completing a new, validated map of global urban extent; and (2) developing methods to estimate the subpixel fraction of impervious surface,

vegetation, and other land cover types within urbanized areas using coarse resolution satellite imagery. For the first task, a technique called boosting is used to improve classification accuracy and provides a means to integrate 500 m resolution MODIS data with ancillary data sources. For the second task, we present an approach for estimating percent cover that relies on continuous training data for a full range of city types. Combined with temporal information from one year of MODIS data, these data are used as inputs to fuzzy neural network and regression tree algorithms to predict fractional amounts of land cover types with increased accuracy. Preliminary results for the US show good agreement with the expected morphology of cities in the region.

Email: matthew_vandecouver@brown.edu; J. Mustard, Brown University. Email: jack_mustard@brown.edu; *The effect of legacies on human-environment coupled systems: 200 years of land change dynamics in Grafton County, New Hampshire*

Recent syntheses of case studies are revealing an emerging broad conceptualization of land-use and land-cover change intricately linked to socio-economic changes and the ecological characteristics of the landscape. Beginning with a largely unsettled or native landscape, land-use commonly evolves from frontier clearing and resource extraction to agriculture and managed resources to urban settlements and intensive agriculture. Coupled to this linear representation are socio-economic changes that are critical drivers to the magnitude, rate and ecological impact of the land-cover and use change. With land cover changes specific impacts are observed on the coupled systems. These impacts constitute legacies or conditions that constrain subsequent land-cover and use and define the type of coupled human-environment system. Revealing and quantifying the influence of legacies on current landscape patterns and processes based on an understanding of the historical socio-economic drivers and landscape conversion is the critical first step. In Grafton, NH spatial patterns of development are closely associated with colonial road patterns, which relate to previous land-uses, forest composition and water quality. In addition these lands provide some of the highest rates of carbon sequestration, as the soils accumulate carbon at a faster rate than non-agriculturally disturbed soils and the rates of biomass accumulation do not differ from those on cutover lands. Yet these lands are the most sought after for development, as they are proximate to existing town-maintained roads. The only way to accurately predict future surface water quality and carbon sequestration in this region is to understand spatially explicit patterns of historic land-uses.

We evaluated Moderate Resolution Imaging Spectrometer (MODIS) data regarding its potential for wildfire susceptibility assessment in southern California. The Fire Potential Index (FPI) is the most widely used measure for remote sensing-based wildfire danger assessment. Its remote sensing component requires maps of relative greenness (RG), which have been traditionally derived from NDVI images of the spectrally limited NOAA Advanced Very High Resolution Radiometer (AVHRR) sensor. In this study, the Visible Atmospherically Resistant Index (VARI) was utilized to compute RG from a 6-year time series of 16-day MODIS composites. The RG images were validated through regression analysis with ground-sampled observations of live fuel moisture at several sites within Los Angeles County. For 12 out of 14 test sites, the MODIS/VARI-derived relative greenness showed a much stronger correlation with live fuel moisture than NDVI, with increases in R² ranging from 5% to 110%, depending on site. Based on these results, a prototype of a second generation FPI for Southern California using MODIS data was implemented. In addition to the use of VARI, advancements included spatial interpolation of meteorological information using kriging with external drift. The fire susceptibility maps derived using this system correlated closely with the operational approach, but showed slightly higher FPI values. A comparison of VARI- and NDVI-derived FPI points towards a higher seasonal sensitivity of the VARI approach to fire susceptibility. Overall, MODIS imagery appears to be a great asset for wildfire susceptibility assessment in southern California, providing improved estimates of life fuel moisture through indices such as VARI.

Izhak Schnell, Tel Aviv University. Email: schnell@post.tau.ac.il; A multilayered model of Segregation: The Case of Tel-Aviv-Jaffa

Abstract Urban social space is analysed in terms of a realistic model in which it is assumed that human beings actively respond to socially structured reality. It is assumed that globalization increases discrepancies between physical and social time-space frameworks decreases ethnically conform behavior. Traditional social area analysis tends to view the city as constituted of a mosaic of socially homogeneous containers. The Chicago model views the mosaic as compactly organized around one centre and as a response to geometrically deduced forces. The Los Angeles model views social areas to be socially constituted in a more dispersed geometry. Our model verified in this study shows that globalising cities may produce highly heterogeneous residential spaces, even in highly ethnic societies. We propose to start the analysis from individuals' behaviors, in respect to their actual daily life spaces and social networks. We argue that under these conditions, a multi-layered spatial model better describes the socio-spatial reality of cities that integrate people in the globalising world. These trends will be demonstrated on Arabs, migrant workers and Bucharian Jews who live in Tel-Aviv-Jaffa. We will show that the models that associate desegregation and assimilation and acculturation do not work in the case of Tel-Aviv-Jaffa and we will suggest a realist mode of explanations for the understanding of segregating trends either in residential, activity spaces or social networks. We will show that each type of segregation may be explained by different mechanisms and different individuals from the same groups may differently respond to these structural forces.

Keywords: A multi-layered model, Residential, territorial and interactive segregations, A realist approach

Tatiana Borisovna Schoenberg, SUNY At Buffalo. Email: TBS3@buffalo.edu; What do we see around us and how do we see it? Differences and similarities in perception.

What do we see around us and how do we see it? The answer will be based on the individual's visual process. One of the strategies of geographical research is to look into the environment we perceive with our senses. Problems of defining perception connect us with the long history of philosophy. One key idea is that perception is essentially subjective, and that it depends on some contribution made by the observer, and that it varies from one observer to another. People perceive the environment in different ways and see things differently in the same landscape. Each person learns the meaning of the things of the world for himself. Observers from different cultures not only might pay attention to different features, but also might understand and organize features differently. A member of a culture has his own model of psychological validity, which directly connects to subjective perception. This research is designed to test theories that are based on classic works on perception by Grano (1929), Gibson (1979), Lynch (1960), and Tuan (1974). The authors proposed a new ways of thinking about perception, and all four of them try to find the right conceptual levels for their approaches. Some empirical research, based on interviews with American-English and Spanish speakers will be presented. This study is a part of a new science, Ethnophysiography. Ethnophysiography seeks to document and compare terms and meanings from various languages and cultures.

Keywords: visual perception, landscape, toponophilia, ethnophysiography

Andrew Scholl, Pennsylvania State University. Email: aes176@psu.edu; Fire-Climate interactions at interannual to multidecadal scales in Yosemite National Park

Fire regimes are known to vary in response to variations in climate that occur on annual to century scales. We studied the influence of climate variation (i.e., drought, teleconnections, etc.) on fire events at different temporal (intra-annual to decadal) and spatial (individual to watershed) scales within the mixed conifer forests in Yosemite National Park. Fire Scars were collected within two watersheds, each covering 20 km² in order to assess size of fire and determine any synchronizing effect of climate variation. At the seasonal scale, fire events occurred primarily at the end of the growing season that coincided with the onset of the summer drought. At the annual scale, fire events were found to be more frequent and extensive during drought years that were preceded by wet years. Widespread fire occurrence was also related to phase changes in the Pacific Decadal Oscillation (PDO) from positive (warm) to negative (cold) conditions. At the multi-decadal scale, fire size was significantly negatively correlated with the Atlantic Multidecadal Oscillation. No relationship was found between fire events and the Southern Oscillation Index.

Bruce Scholten, 90012144, University of Durham. Email: B.A.Scholten@durham.ac.uk; bruce.scholten@btopenworld.com; Incomparable work? Organic apples & oranges in Seattle & Newcastle upon Tyne

Bruce Scholten, Durham University Geography Department (UK). Chair & co-convenor with Melissa Schafer of the session: Comparing Organic Urban Papers (COUP). www.durham.ac.uk/b.a.scholten/ bruce.scholten@btopenworld.com This talk draws on a thesis titled: 'Consumer risk reflections on local and organic food in Seattle with reference to Newcastle upon Tyne' to illustrate methodological and logistical issues inherent in international comparative research. It notes the a priori difficulty of finding 'similar' cities for quantitative comparisons, as well as the possibility of empirical and theoretical breakthroughs when superimposing the profiles of cities with different socioeconomic or municipal policy profiles. We'll discuss the notion that the quality of organic periurban food systems may differ little among different cities because, still not far from its pioneering roots, such alternative food networks are led by actors in a global movement which prioritizes some or all values such as environmental sustainability, human health and social justice. However the quantity, or depth, of organic consumption may be more variable, contingent not just on the local agricultural factors, but especially contingent upon local government policy and regulation (Shafer 2006). We will also list a number of 'knowns' - lessons learned after a decade of the organic boom. These include the multiethnic character of organic demand in the US (Hartman 2004); and the apparent preference of most people for local conventional produce over organic imports (Soil Association 2004; Scholten 2006).

Keywords: international comparative research, methodology, rural-urban organics

Yda Schreuder, University of Delaware. Email: Ydas@Udel.edu; The Corporate Greenhouse: Globalization and the Kyoto Protocol

From the ongoing debates in climate change policy and the apparent ineffectiveness of the current Kyoto regime dealing with GHG reduction schemes in order to halt/reverse climate change, it is obvious that something is wrong in the world order dealing with global environmental problems. Much debated presently, but not considered at the time when the Kyoto Protocol was signed, is the recognition that national emissions reduction commitments have little effect in a global economy that is driven by intensive competition and is organized around trans-national corporations and international production networks. Furthermore, the North-South divide proved to be much more divisive than was anticipated and the emergence on the world economic scene of, in particular China and India - has re-kindled the debate on "who is to blame, and who is to pay". That development and environment concerns are closely related is no longer in question, but how to deal with the reality of the global market place and the urgent problems associated with climate change remain a major issue of debate.

Keywords: Kyoto Protocol, GHG reduction, Global economy, North-South conflict

Jonathan P. Schroeder, Middlebury College. Email: js@middlebury.edu; Constructing Time Series of U.S. Census Tract Data to Analyze Long-Term Urban Population Trends

Historical U.S. census tract data have recently become available in a standardized digital format through the National Historical Geographic Information System (NHGIS), which provides not only summary statistics but also boundary data for historical tracts. We can now therefore easily obtain census tract data for many U.S. cities from multiple censuses stretching back to 1910 and then map and analyze these data using GIS and statistical software. There remain, however, several significant complications that we must address in order to study long-term trends in census tract data within and among multiple urban areas. This paper summarizes the major complications that arise because of two general problems? tract boundary changes and tract coverage inconsistencies? and then identifies and assesses options we have for addressing the complications. To link data through time where tract boundaries have changed, we can use areal interpolation to estimate the populations of one year's census tracts at the time of other censuses. I present a novel, relatively simple method of areal interpolation?cascading density weighting? which is uniquely appropriate for constructing time series. I then present results from an analysis of a census tract time series, exploring how long-term population trends have varied within and among major U.S. urban areas.

Kurt A. Schroeder, Plymouth State University. Email: kschroed@plymouth.edu; *Strategy and tactics in the Vietnam War, 1964-1975*

The Vietnam War (1964-1975) was a remarkable conflict with a remarkable military geography. The Vietnam War resembled the conflict which preceded it, the French War in Indochina (1946-1954), and not only because it involved war in the same nation. Both conflicts were characterized by poorly-defined theater boundaries. Both conflicts were poorly insulated from larger geo-political considerations. Just as the Tonkin Delta region was critical to French and Vietnamese strategy in the first war, the more developed areas of the Republic of Vietnam were the key to the later conflict. The North Vietnamese military leadership still demonstrated a lack of comprehension of the geographic flexibility and importance of naval power, and especially the effects of riverine craft. They also still failed to grasp the potential of the American and South Vietnamese air power and artillery. Regardless of these failings, the North Vietnamese and Viet Cong forces prevailed in the end. The poorly-defined theater boundaries, geographic sanctuaries allowed them by the United States, and an inconsistently applied air strategy all helped them to recover from the mistakes noted above. The lack of a unified command structure led to the fragmentation of strategies and tactics used by the armed forces of the United States, the Republic of Vietnam, and their allies. Ultimately, the North Vietnamese and their allies in the South were able to use one of the basic characteristics of revolutionary war, its protraction, against the limited war aims of the United States to create the conditions for their victory.

Richard A. Schroeder, Rutgers University. Email: rschroed@rci.rutgers.edu; *Tiffany's, Terrorists and Tanzanite: Constructing "Ethical" Routes to Market for Tanzania's National Gem*

In the aftermath of the 9/11 attacks in the United States in 2001, the Wall Street Journal published an account alleging that Tanzania's unique deposits of blue zoicyte, the precious gemstone more commonly known as tanzanite, were being used by Al Qaeda to launder funds used to support terrorism. Tiffany's and other major jewelry retailers quickly halted tanzanite sales in the US, which comprises 70% of the world market. While the alleged terrorist connections were eventually disavowed by the US State Department, the retailers refused to resume sales until steps were taken to construct an "ethical" route to market for the striking blue gems. This paper analyzes several different constructions of mining and gemstone marketing ethics that have surfaced in efforts to "sanitize" the tanzanite commodity chain. Data sources include the so-called "Tucson protocol," a detailed plan to secure the tanzanite market developed in response to the Wall Street Journal article at the annual meeting of the International Gemstone Trading Association in Tucson, Arizona in 2002; the "conflict diamond"-influenced marketing strategy of the South African-run mining firm which controls the core of the tanzanite deposit; the political and moral claims of activists representing thousands of small-scale artisanal miners whose mines ring the corporate holding; and repeated allegations of child labor violations in the small-scale mines most recently publicized in a film produced by international human rights monitors.

Keywords: mining, fair trade, commodity chain, resource access, child labor, Tanzania, South Africa

Dirk Schubert, HafenCity Universität Hamburg - C/o TU Hamburg-Harburg. Email: d.schubert@tu-harburg.de; *A new Cycle of Urban Waterfront Transformation?*

This paper focuses on projects of the new cycle of waterfront transformation and retransformation on a regional scale. Case studies of three European port cities (London, Barcelona, Rotterdam) will be presented and evaluated in a broader framework of urban and regional redevelopment and restructuring. Meanwhile much experience in transforming central urban waterfronts has been gained. But the targets of the projects are not adequately defined and it is not clear what the indicators are for best practice and success stories. Often this kind of project-based "research" is done with local studies merely comparing the situation before and after revitalisation. It is not just a matter of architectural design, but of a complex set of planning, institutional, political, client related, economical, ecological, governance, legal and financial issues. Generally, transformation began in the oldest parts of the port and the city, slowly moving to more peripheral areas which were developed later. Often this was done in a step-by-step approach, beginning with the most attractive sites, but not integrating these developments into a sustainable urban or regional development strategy. The thesis of this paper - to define this process as a new cycle? must be looked at in comparative studies, while complex problems at the macro, meso and micro levels need to be reflected. In the context of stronger competition between seaports and the challenges of globalisation, waterfront transformation is integrated into a city-wide and regional perspective of research.

Janis L Schubert, University of Texas at Dallas. Email: janis.schubert@comcast.net; Kevin M Curtin, University of Texas at Dallas. Email: curtin@utdallas.edu; *Assignment of hazardous materials risk to transportation networks: A GIS methodology*

The danger inherent in the transport of hazardous materials through populated areas is an important public safety issue. In order to determine appropriate routes for hazardous materials, the risk of transporting the material must be determined, these values must be associated with the transportation network, and a routing analysis must be performed based on that network. We present an integrated Geographic Information Systems (GIS) method that incorporates linear referencing techniques with risk weighting and routing to determine the relative risk values of alternative hazardous materials routes.

Nina Schuldt, University of Marburg. Email: nina.schuldt@web.de; Harald Bathelt, University of Toronto. Email: harald.bathelt@utoronto.ca; *Temporary face-to-face contact and the ecology of global buzz*

International congresses and trade fairs bring together agents from all over the world and create temporary spaces of presentation and interaction. They have become important expressions of new geographies of circulation through which knowledge can be created and exchanged at a distance. These events produce a rich ecology of information flows about the dynamics of global production chains within a specific institutional setting, referred to as "global buzz". This buzz allows agents to act as both recipients and broadcasters of information and knowledge flows from and to other agents, respectively. Participants not only acquire knowledge in having face-to-face communication with other agents, information is also carried by observing and systematically monitoring other exhibitors and visitors. The fact that firms do not necessarily have to be in direct contact with a specific source of information makes participation in a trade fair so valuable. Since new information is constantly transmitted from one agent to another, it is repeatedly interpreted, evaluated and enriched with additional relevant information. The potential benefits of applying this knowledge become clearer as the trade fair evolves. Overall, "global buzz" and shared technological and organizational institutions support the reduction of uncertainties and help firms distinguish important from less important trends and information. This paper analyses the various aspects of "global buzz" and aims to dismantle the complexity of this phenomenon in a multidimensional way. The analysis draws from extensive empirical evidence collected during seven national and international trade fairs in Frankfurt/Main, Nürnberg and Hannover, Germany.

Rich Schultz, Elmhurst College. Email: richs@elmhurst.edu; *Demonstrating a Problem-Based Learning (PBL) Approach to Teaching Spatial Concepts*

One approach that may be successful in teaching with GIS in order to promote spatial awareness is problem based learning (PBL). In problem based learning, teachers and students integrate concepts and skills from one or more disciplines to investigate a problem (Jones, Rasmussen, and Moffitt 1997). Problem based learning with spatial concepts requires that teachers structure their teaching around a series of challenging and practical "problems". Problems are used to frame, focus, organize, and stimulate learning and align with Fink's (1999) Active Learning Model. Students, working alone or in small groups, constructed based on learning styles, investigate these problems using a variety of research tools and technologies, particularly GIS. A case study of an introductory GIS course is described in which it was transformed from a technology-laden course to an active learning experience. The preliminary results show that this kind of instruction on spatial problem solving, previously unknown (Bednarz, 1999) is an effective and enjoyable experience for students and underscores geospatial learning in an active learning environment.

Keywords: Problem-Based Learning (PBL), Geospatial concepts, GIS, Active Learning

Nadine Schuurman, Simon Fraser University. Email: nadine@sfu.ca; *Defining rational hospital catchments for non-urban areas based on travel-time*

The sustainability of a publicly funded universal healthcare system has become an increasing preoccupation of federal and provincial governments in Canada. In most provinces the rising cost of healthcare delivery has led to reform and restructuring to contain costs. Attempts at cost containment typically involve rationalizing healthcare service delivery through centralization of services to achieve economies of scale. As hospitals comprise the largest budgetary component of the public healthcare system they have been the chosen site of cost containment and rationalization. Socio-demographic and geographic characteristics make hospital service allocation more difficult in rural and remote

regions. This research presents a methodology to model rational catchments or service areas around rural hospitals - based on travel time. The tool permits modelling of alternate scenarios in which access to different baskets of services (e.g. rural maternity care or ICU) are assessed. In addition, estimates of the percentage of population that are served ? or not served ? within specified travel times are calculated. The modelling tool described is potentially valuable to policy makers and health services allocation specialists.

Keywords: GIS, catchments, medical geography, modelling

Barbara L. Schwab, Wilfrid Laurier University. Email: blschwab@shaw.ca; Barry Boots, Wilfrid Laurier University. Email: bboots@wlu.ca; Gordon B. Stenhouse, Foothills Model Forest. Email: gordon.stenhouse@gov.ab.ca; Conceptual approaches for modeling consecutive GPS data - grizzly bear movement in space and time

Satellite telemetry or global positioning systems (GPS) - based wildlife studies have allowed for considerable research advances regarding the modeling of animal movements. For grizzly bears, the process of movement is continuous in nature, yet GPS radio-collar data is recorded at discrete time intervals providing static information in two-dimensional (x, y) space. As such, researchers are left with the difficult problem of how to model or simulate a spatially continuous process based on discrete physical locations. Conceptually, moving point data can be modeled using three primary approaches: 1) as point data representing locations on the landscape, 2) as vector data representing linkages between consecutive locations, or 3) as a continuous grid or density surface representing simulated movement across landscapes. While spatial statistics, specifically point pattern analysis (PPA), have furthered our understanding of spatial patterns associated with point distributions, the spatial modeling of consecutive point data has remained limited in scope, primarily dealing with simple movement rates, direction and path delineation. As such, we explored the utility of vector and grid-based models for visualizing and quantifying spatial movement patterns between known GPS locations. Both models provided a visual approach for exploring the spatial scale and patterns related to movement. However, we found that vector-based movement trajectories best demonstrated differences between travel and potential habitat use. More research is needed to understand how spatial movement patterns are influenced by underlying landscape characteristics.

Keywords: GPS data, modeling, movement, grizzly bears, data representation

Tim Schwanen, Utrecht University. Email: T.Schwanen@geo.uu.nl; Toward Situated Quantitative Geographies of Mobility and Everyday Life

Geographical research about everyday mobility has recently been diversified now that not only spatial-analytical but also social/cultural geography has turned toward this theme. Despite partially overlapping research foci and potential complementarities, there is as yet limited interaction and communication between these two research traditions, which at least to some extent reflects important differences in epistemology and methodology. This paper seeks to connect insights and notions from these two approaches, among others by drawing on recent attempts to advance the methodologies of 'new' economic geographies and quantitatively-oriented feminist-geographical mobility studies. A processual and hermeneutical approach to theory and methodology is proposed, which comprises multiple rounds of abstraction, deconstruction, borrowing and reinterpreting notions from diverse theoretical and methodological traditions. The approach is illustrated through a research project of how parents in dual-worker parents negotiate time constraints stemming from the need to combine work and domestic responsibilities separated in space-time, that combines multiple theoretical sources and mixes qualitative and quantitative methods. The result is a form of quantitative analysis that is more reflexive and better grounded in everyday practices than conventional spatial-analytical mobility studies.

Keywords: methodology; epistemology; mobility studies

Lee R. Schwartz, U.S. Department of State. Email: schwartzLR@state.gov; Documenting Atrocities: Geographic Information Support for War Crimes Analysis

Atrocities, crimes against humanity, and war crimes occur under chaotic conditions where belligerents often come together with noncombatants, aid workers, journalists, and peacekeepers. Yet there is agreed-upon methodology for each of these distinctive groups to capture systematically - and protect appropriately - the types of information and data that can be used to identify, locate, and document atrocities and eventually provide evidence to bring accused war criminals to justice. Geographic information systems and remote sensing analysis offer what would appear to be obvious tools for capturing incident data across time and space. Nevertheless, opportunities are too often lost because those on the ground at the outset of a crisis do not have the means, the training, or the mandate to apply such tools or comprehensive rigor to their data collection efforts, being concerned primarily with protection and advocacy priorities. This paper argues that the use of coordinated GIS data collection and compilation by groups involved in immediate complex emergency response efforts would greatly

assist investigators and prosecutors in building cases against both indicted war criminals and regimes accused of genocide. Examples of the effective use of geospatial methodologies in support of war crimes analysis will be selected from the Balkans, Sudan, Rwanda, and Iraq.

Leigh Schwartz, University of Texas at Austin. Email: leighs@mail.utexas.edu; Othering Across Time and Place in the Suikoden Video Game Series

As geographers begin investigating the imaginative geographies of media spaces, attention is drawn to the landscapes of interactive media. The virtual environments of video games continue to grow in complexity and use, and questions remain as to the experience of the users of the designed environments. Focusing specifically on messages and metaphors in written representations, this paper investigates the changing experience of gamers through time and place by examining the Suikoden fantasy series. Beginning with the adaptation of the Chinese classic Shui Hu Zhuan into Suikoden in 1996, continuing to the release of Suikoden V ten years later, the virtual environments of the Suikoden series are embedded with mythological and cultural messages about self and other. This paper utilizes visual and textual analysis to examine these changing representations over time and place in terms of the experience of these ideological messages by the players of this series.

Keywords: media, othering, virtual, cyberspace

Mark D. Schwartz, University Of Wisconsin - Milwaukee. Email: mds@uwm.edu; Liang Liang, University of Wisconsin - Milwaukee. Email: lliang@uwm.edu; Applications of Spatially Concentrated Phenological Measurements

The timing of tree leaf flush and subsequent expansion during spring, which is highly sensitive to climate change, in turn has a profound impact on lower atmospheric energy-mass exchange through differential carbon assimilation and transpiration totals across the landscape. Thus, phenological data collected in a spatially explicit manner offer considerable opportunities for gauging landscape-level variations crucial for accurate scaling-up of flux measurements to larger areas or downscaling regional-scale atmospheric circulation models. In this project, spring tree leaf phenological data from a spatially intensive sampling area (216 trees, 250m x 600m area) located in a mixed forest of northern Wisconsin will be recorded during several annual field campaigns. These data, together with concurrently collected microclimatic, soil, terrain, and biotic information, will be analyzed and characterized with spatial association methods and spatial regression models across the landscape, and compared to MODIS-scale (250m) remote sensing data. The nature of phenological variability in space and time has not been previously recorded over a large area and combined with supporting measurements to assess its impact on plant processes, especially water flux, and the subsequent impact of these changes on lower atmospheric characteristics. This paper will report results from the first (2006) field campaign, which include: 1) phenological events can vary by up to 27 days among the same species, but the primary cause of this variation appears to be non-environmental; and 2) while air temperature is a good overall predictor of spring phenological development, other factors appear more important in explaining differences between sites.

Keywords: phenology, spring, climate, remote sensing

Sarah E. Schwartz, University of South Carolina. Email: sarahelizabetschwartz@gmail.com; Selling Uniqueness and Authenticity in Columbia, South Carolina: Bohemian and World Market

Based on the descriptions appearing on their respective websites, one might anticipate similar shopping experiences from Bohemian, a boutique operating in Columbia, SC, and World Market, a chain with nearly 300 locations across the United States. However, while the stores sell a similar array of what they describe as "uncommon" products, the shopping experiences they offer are in fact markedly different. This paper uses a series of comparative images of the two stores to explore how locations, layouts, product descriptions and product displays can intersect to create distinct consumer experiences and impressions in stores that carry similar items. The paper pays particular attention to the ways in which display tactics and the use of place names in product descriptions may (or may not) signify uniqueness and authenticity. Further, the paper compares and contrasts product arrangements at Bohemian and World Market with arrangements of similar products in sub-Saharan Africa.

Keywords: cultural economy, South Carolina

Allen J. Scott, University of California - Los Angeles. Email: ajscott@ucla.edu; *Capitalism and Urbanization in a New Key? The Cognitive-Cultural Dimension*

Different regimes of capitalist accumulation engender different forms and logics of urbanization. The cognitive-cultural dimensions of contemporary capitalism are identified by reference to its leading sectors, basic technologies, labor relations systems, and market structures. Cognitive-cultural systems of production and work come to ground preeminently in large city-regions. This state of affairs is manifest in the diverse clusters of high-technology sectors, service functions, neo-artisanal manufacturing activities, and cultural-products industries that are commonly found in these regions. It is also manifest in the formation of a broad stratum of high-skill cognitive-cultural employees in urban areas. Many of these employees are engaged in distinctive forms of work-based learning, creativity, and innovation. At the same time, the cognitive-cultural economy in contemporary cities is invariably complemented by large numbers of low-wage, low-skill jobs. The ideological-cum-political ramifications of this situation are subject to analysis in the context of a critique of the currently fashionable idea of the "creative city." I advance the claim that we need to go beyond advocacies about local economic development that prescribe the deployment of packages of selected amenities as a way of attracting elite workers into given urban areas. Instead, I propose that policy-makers need to pay more attention to the dynamics of the cognitive-cultural production system as such, and that in the interests of shaping viable urban communities in contemporary capitalism we must be more resolute in attempts to rebuild social solidarity, sociability, and democratic participation.

Christopher Scott, University of Arizona. Email: cascott@email.arizona.edu; Francisco Flores-Lopez, Cornell University. Email: ff35@cornell.edu; Jesus R. Gastelum, University of Arizona. Email: jeragape@hotmail.com; *Appropriation of Río San Juan Water by Monterrey City, Mexico: Implications for Agriculture, the Environment, and Basin Water Sharing*

Monterrey's growth has resulted in water transfers from the Río San Juan basin with significant impacts for downstream water users, especially farmers in the Bajo Río San Juan (BRSJ) irrigation district. El Cuchillo dam is the centerpiece of the basin's water management infrastructure and has become the flashpoint of a multi-faceted water dispute between Nuevo León and Tamaulipas states as well as between urban and agricultural water interests in the basin. Compensation arrangements for farmers have been established, including crop loss payments on the order of US\$ 100 per hectare un-irrigable due to the diversion of water to Monterrey plus 60% of the water diverted to be returned to farmers as treated effluent, a process with its own water competition and environmental implications. The Mexican irrigation sector will continue to face intense competition for water given: a) low water productivity in agriculture, b) priority accorded to the domestic use component of municipal water supply coupled with expanding influence of urban water interests resulting from Mexico's water management decentralization, and in the BRSJ case c) the irrigation district's spatial and political "sandwiching" between Monterrey upstream and the United States downstream. Because the San Juan is a tributary to the Río Grande/ Bravo, outflow from the basin must contribute to Mexico's obligations to the water sharing treaty with the United States. This paper documents the Río San Juan water transfer process, whether compensation arrangements have been followed, the fate and environmental implications of wastewater flows, and broader irrigation-urban water dispute mediation.

Damon Scott, University of Texas. Email: dscott@mail.utexas.edu; *Sexual Politics and the Remaking San Francisco's Central Waterfront*

In 1958, San Franciscans got their first glimpse of city leaders' plans for modernizing the urban landscape with the opening of the double-decked Embarcadero Freeway. The first segment to be completed of a much more extensive system of freeways, this waterfront section brought cars from the Bay Bridge into the heart of downtown. The landing spot of its terminal ramps was in the center of one of the city's highest priority urban renewal projects—a nearly eighty acre section of light industrial and warehouse buildings oriented toward the waterfront and blocking the expansion of downtown office space. The freeway stood as an eyesore at the foot of Market Street and severed the downtown from the waterfront Ferry Building—once the primary gateway into peninsular city. Over the next several years, the transformation of the waterfront, however, had affects beyond aesthetic considerations. It significantly rearranged the sexual geography of city. An initial period of disinvestment and neglect corresponded with the proliferation of increasingly visible forms of gender and sexual transgression in the area. As construction of new modern residential and office towers and parking facilities neared completion, the police and city leaders

aggressively targeted and successfully eliminated a number of gay and lesbian-oriented establishments in the area. These events show how urban redevelopment both created opportunities for and incited retribution against same-sex social and political organizing in the city. This reading suggests a more complex assessment of the political culture of the city than its reputation for social tolerance implies.

Dorris Scott, Kent State University. Email: dscott7@kent.edu; *No Space for Children: The Falling Birthrate And How It Relates To Women And Space In Japanese Society*

It is widely known that Japan's total fertility rate is falling every year. In the 1970s, Japan's fertility rate fell below 2.1 births per woman, the number of births required to maintain the population at its current size. There have been initiatives in the past to promote a pro-natal policy and equal employment, but the problem is that they are not enforced, not stringent enough to cause any change, or reinforce the status quo. I will discuss the spatial constructions that arose from government policy, which are main contributors to the falling birthrate. I will first examine social, economic, and cultural factors in the in the post-World War II period. I will then go on to explore the effects of the urban sprawl that occurred after World War II. Finally, I will explore how the Japanese government has limited women's space by reviewing the government policies to gender discrimination, solutions such as the two-track employment system and Japan's pro-natal policies.

James Wesley Scott, Leibniz-Institute for Regional Development and Structural Planning. Email: jscott4636@aol.com; *Wider Europe Seen From the "Margins": Regional Transformations at the EU's External Borders*

Cross-border co-operation (CBC) at the EU's external borders will be increasingly dominated by attempts to negotiate a new quality of political community between the EU and its regional "neighbourhood". The principal instrument available for this purpose is the European Neighbourhood Programme (ENP) within which CBC ostensibly enjoys priority status. However, research carried out at the EU's external boundaries reveals numerous contradictions between security, identity and regional cooperation discourses and hence between policies of inclusion and exclusion. These contradictions manifest themselves at several different levels (European, national, local) and affect perceptions of both borders and cross-border cooperation. It also remains uncertain whether ENP will provide a sufficient opportunity structure for creating dense regional interdependencies across EU borders. Present policies, whether designed by the EU or by national governments, appear to show little consideration for border region interests. This paper will therefore discuss how the notion of a "European Neighbourhood" is being both perceived and translated at the EU'S external borders. Focusing on border regions, I will illustrate how both border confirming and border transcending attitudes and practices might contribute to an emergent sense of cross-border neighbourhood.

Kevin Scott, Pole To Pole Leadership Institute. Email: amanda@poletopoleleadership.com; *Pole to Pole Leadership: A Journey for Sustainable Development*

Starting in North Pole, an international team of young adults will embark on one of the most arduous and ambitious human-powered journeys ever undertaken on the planet. The Pole to Pole Journey 2 Expedition begins April 2007 and will be undertaken by two international teams of twelve young adults from countries around the globe. This never before attempted epic journey will start at the North Pole and travel south 35,000 kilometers over eighteen months by ski, foot, sail, bicycle, canoe and kayak to Antarctica. Along the route the Pole to Pole Expedition Teams will join Pole to Pole Advance Teams who will be working with local organizations on issues such as support for AIDS orphans, climate change, poverty in Africa, wildlife habitat protection, and other critical social, economic and environmental issues of our time. They will visit schools, colleges and community groups providing inspiration and leadership training to encourage youth to go out and make a positive difference in their communities. This presentation and training work will be augmented by Pole to Pole Education Teams who will travel Europe and North America presenting the inspirational Pole to Pole story and leadership training. Pole to Pole is partnering with the MyCOE program to link geographic and sustainable development experts with the activities underway. The attention of the world will be focused on this journey to generate world-wide awareness and support for the environmental, social and economic issues that local youth are addressing.

Email: declan.redmond@ucd.ie; Alistair Fraser, University College Dublin. Email: alistair.fraser@ucd.ie; *Politics of the rural: civil society and the contested countryside in Ireland*

This paper seeks to explore the significant growth in civic engagement and activity surrounding the issue of new development in rural areas, drawing on recent experiences in Ireland. In particular, the paper will investigate the contested views of the countryside that underpin this activism and that are used to frame the debates on new development in rural areas. In particular, the paper will focus on the issue of accommodating new housing in the countryside, which in recent years has witnessed widespread civil society activism in support for rural housing development. This has developed from initial defence of individual's rights to build in local areas, to a groundswell of public support and a growing national movement. The paper argues that this 'rural housing movement' represents a form of active citizenship and development of civil society which has actively opposed the local and centre state. This movement is not merely a lobby group but represents, at least in part, a radically different understanding of the rural as compared to the local and central state and environmental groups. The paper provides an overview of the rural housing movement at a national level, before undertaking in-depth local case studies of activity and engagement in rural areas. Finally, conclusions are developed to identify wider lessons from the production of new rural social movements in the context of contested ruralities.

Sam Scott, University of Sheffield. Email: s.scott@sheffield.ac.uk; Katie Walsh, University of Sussex. Email: Katie.Walsh@sussex.ac.uk; *Embodying White Migrants: An Exploratory Review*

This review paper explores the complex relationship between whiteness and migration by first mapping the extant literature, and then exploring the value of whiteness in terms of our own research into British 'expatriates' (in Paris and Dubai). Interest in 'white migration' has grown over recent years and we believe that now is an appropriate time to reflect on how whiteness has been examined by scholars, both explicitly and implicitly. A number of core issues stand out as pertinent when considering the pathways, networks, lifestyles and identities of white migrant groups. These include: the embodiment of white migrants in different national, local and transnational settings; the applicability of traditional theoretical and conceptual approaches for 'non traditional' white migrant groups; the importance of dominant migrant/ minority stereotypes in migration research; the complex relationship between whiteness, class, gender, nationality and life-stage; and, in light of this complexity, the value of 'whiteness' as an approach for guiding future migration research. To develop these issues, we will first map the existing literature and identify six areas of white migrant research: (1) 'western' mobile professionals in global cities; (2) internal EU mobility; (3) diasporic belonging; (4) migration policy; (5) minority politics; (6) colonial-settler migration. All of these literatures intersect with notions of whiteness in different ways and to differing degrees, but only some explicitly recognise this. Following our review, we then reflect on the value of critical studies of whiteness in terms of both our own research and for future studies of white migrants more generally.

Peter Scull, Colgate University. Email: pscull@mail.colgate.edu; Jennifer A Miller, West Virginia University. Email: Jennifer.Miller@mail.wvu.edu; *Using geographically weighted regression to study continental scale soil landscape variability*

The factor model of soil formation has been a dominant paradigm in soil geography for over 60 years. The model states that soil character is a function of five different factors: climate, organisms, relief, parent material, and time (Jenny, 1941). While conceptually sound, in practice the model is difficult to use because of the lack of independence among factors. Jenny recognized this and suggested that soils be studied along different factor sequences (e.g. toposquence, lithosequence, etc.) where only one of the five factors would be allowed to vary. The study of soil sequences, very much active today, has led to many valuable insights. Since it is difficult to find soil sequences that span the entire range of global factor variability the paradigm has made studying soils in the context of global change difficult. In addition, soil datasets covering large geographic areas have been slow to accumulate. The purpose of this research is to move away from soil sequences and investigate what kinds of insight can be derived from working with new statistical methods and a massive soil database. While there is no control for the five soil forming factors in the database, we believe we can put that multi-dimensional variation to work for us using geographically weighted regression models (GWR). GWR allows model coefficients to vary spatially, taking advantage of the likely nonstationarity that would obviate the use of more

traditional regression methods and enable us to begin to unravel some of the processes that control continental scale soil formation.

Keywords: Soil formation, geographically weighted regression, continental scale

William Todd Sealy. Email: wtsealy@una.edu; Michael Pretes, PhD, University of North Alabama. Email: mjpretet@una.edu; *Is There a Beer Terroir?*

Terroir is a French term that recognizes the geography of place in wine production. The concept of terroir relates directly to the physical geography of wine production but also implies the labor and history behind the vineyard. Physical geography is unique to a particular wine's production, so that even if the process of vinification were copied in a different location the quality would not be replicated. There is an ongoing discussion in the beer community concerning whether the concept of terroir can be applied to beer. This study will investigate whether the geographic concept of terroir can be applied to beer. Terroir will be tested by examining ingredients used in artisanal beers, brewing locations, and geographical aspects of ingredients (e.g., water mineral content). Standard tasting terms derived from internet and industry journal sources will be used to assess taste differences. Our conclusions suggest that many artisanal beers reflect their distinctive geographic locations and that the concept of terroir can be applied to beer.

Jorn Seemann, Jorn Seemann, Louisiana State University. Email: jseema4@lsu.edu; *Revisiting the Cartography of Reality: A cultural geographer's mapping impressions from Northeastern Brazil*

Despite a metaphorical use of cartographic terms like "maps", "mappings" and "cartographies" in cultural geography, maps are still widely overlooked in the cultural geographer's research practice and craftsmanship. The predominant image of cartography as an objective, neutral and precise science prevents many geographers from mapping the ambiguous and polyphonic nature of cultural phenomena and ideas that cannot be described in mathematical terms and in accordance to laws and models. Based on Denis Wood's humanistic approach to cartography from the late 1970s, I will present non-Cartesian representations of space in different scales drawn by school teachers and students from Northeastern Brazil. Rooted in human experience, these mental maps and spatial drawings must be considered valid sources of information for qualitative research. As cultural constructions, they reveal how people think, perceive and represent space and place and serve as a medium to express and communicate attitudes, concerns, values and emotions that cannot be transmitted through texts. This humanistic approach includes the cultural geographer in the mapping process and permits different perspectives and views of how human beings produce space and create "geographies".

Keywords: Humanistic Cartography, mappings in cultural geography, non-Cartesian maps, Northeastern Brazil

Anne-Marie Seguin, INRS-UCS. Email: anne-marie.seguin@ucs.inrs.ca; Philippe Apparicio, INRS-UCS (University of Quebec). Email: philippe.apparicio@ucs.inrs.ca; *Are residents of poor neighbourhoods in Montreal suffering of a bad accessibility to public and private services and facilities?*

The literature about neighbourhood effects has identified the lack of public and private services and facilities in the poor neighbourhoods as a factor of exacerbation and reproduction of poverty in the US metropolises. Is Montreal, as a middle size Canadian metropolis, experiencing a similar pattern? Is the spatial accessibility of services and facilities much better in middle or upper classes than in poor neighbourhoods? Our research explores the relation between concentration of low income population and accessibility to urban services and facilities grouped into several main categories (cultural, health, educational, sport, recreational and banking facilities and services). From the methodological point of view, our study is based on GIS for calculating accessibility measures and on multivariate analysis for constructing an accessibility indicator. Our results reveal that Montreal shows a clearly different pattern. The final results demonstrate that neighbourhoods of poverty have a better accessibility than neighbourhoods inhabited by better-off population. We interpret these results as partly an outcome of the architecture of our welfare system which is financed and designed mainly by the Provincial Government, and by the fact that many costly municipal infrastructures are, partly at least, financed by the Provincial Government.

Keywords: poverty, low-income, spatial accessibility, GIS, Montreal

E. Clark Knighton Seipt, The Pennsylvania State University. Email: clark.seipt@gmail.com; William E. Easterling, Ph.D., The Pennsylvania State University. Email: billeasterling@psu.edu; *Understanding Argentine farmers' perceptions of the utility of seasonal climate forecasts*

The Argentine Pampas is one of the world's most productive agricultural regions. The region's sensitivity to El Niño-Southern Oscillation-driven climate variability and changing decadal precipitation trends support growing interest in farmers' use of seasonal climate forecasts in agricultural decision-making. While progress in climate prediction has provided skilled forecasts for the Pampas, lack of understanding of users' perceptions of climate forecasts hinders optimal forecast design. I contend that understanding these perceptions ? that is, how individuals evaluate forecasts and judge their utility in decision-making ? fosters increased compatibility between forecast design and user needs. Furthermore, I argue that features of place (i.e., crop-climate suitability) distinguish farmers' forecast preferences. I examine Argentine farmers' perceptions of seasonal precipitation forecasts. First, conjoint analysis evaluation exercises determine how farmers trade off forecasts' attributes (e.g., spatial resolution, lead-time) when judging their utility in on-farm management decisions. Regression analyses of farmers' responses provide individual and group utility functions that express attribute preference structures. Next, I ask what differences exist, if any, between farmers' trade-offs and preferences in Pergamino and Pilar, locales that represent a contrast between near-optimal versus relatively marginal agricultural conditions. I investigate and characterize observed differences, emphasizing important links between place and user needs. To conclude I discuss how the adaptation of forecast design to complement users' perceptions and needs encourages greater utility in future climate forecasts.

Keywords: climate forecasts-seasonal, forecast design, agricultural decision-making, Argentina, Pampas, conjoint analysis, perceptions, user needs

William A. Selby, Santa Monica College. Email: wselby@smc.edu; *Sustainable California?*

How are California communities, businesses, schools, and residents becoming more efficient? How is a state with such a fast growing population (more than 37 million) and economy (nearly 6th largest in the world) building more sustainable industries and neighborhoods? How is it possible to clean up the environment, improve living and working conditions, and grow the economy at the same time? Learn, share and discuss how many Californians are changing the ways they are living and doing business as they look ahead into new and promising 21st Century landscapes.

David Selkowitz, SAIC/United States Geological Survey. Email: dselkowitz@usgs.gov; *Developing the National Land Cover Database for Alaska: Challenges and Solutions for Statewide Land Cover Mapping*

The National Land Cover Database (NLCD) 2001 will provide a consistent 30 meter land cover classification based on circa 2001 Landsat imagery for the 50 U.S. states and Puerto Rico. For the state of Alaska, the NLCD 2001 product will be the first 30 meter statewide land cover classification and is slated for completion by 2008. Using 12 mapping zones, the NLCD mapping effort in Alaska has faced numerous challenges not typically encountered in other state or regional land cover mapping efforts. These challenges include high costs for collecting in situ training data, limited availability of prior land cover classifications and high resolution imagery, limited availability of cloud-free and snow-free Landsat imagery, and poor quality and limited availability of ancillary data. The standard mapping protocols developed for NLCD product generation in other states have been adapted to deal as effectively as possible with these limitations in Alaska. These adaptations will be explained and highlighted using land cover classifications that have been recently completed or are currently underway in mapping zones from three distinct physiognomic areas: the Yukon Flats (central interior Alaska), Cook Inlet (South Central Alaska), and Prince William Sound (Southeast Alaska). I SAIC, contractor to the US Geological Survey (USGS) Center for Earth Resources Observation and Science, Sioux Falls, SD. Work performed under USGS contract 03CRCN0001.

Keywords: land cover classification, remote sensing, Landsat, Alaska

Christian Sellar, University of North Carolina-Chapel Hill. Email: sellar@email.unc.edu; *European Continental integration at the level of firms and institutions: the case of Italian foreign investments in Central and Eastern Europe*

In the Eastern European landscapes, there are visible manifestations, such as factories with foreign names and ads of EU sponsored programs, of the material and financial fluxes that come along with the enlargement of the EU and the growing fluxes of foreign direct investments from Western to Eastern Europe. I argue that these economic aspects of European integration entail shifts in the perception of what the 'East' and the 'West' of Europe is by the relevant actors

involved in the public and private West European investments in Eastern Europe. Investors, local partners, representatives of local institutions have to work together and establish personal relationships as part of the investment process. As consequence of this, the perception of the 'other' people and lands changes along the lines of inclusion/exclusion, understanding of geography, power relations and hegemony. This paper analyses Italian foreign investments in the textile and clothing sector and the bilateral partnerships of Italian and East European institutions. It highlights the issues of hegemony - i.e. the assumption that the Italian technology and organization is the best in the textile and clothing industries ? changing in the perception of geography ? Eastern Europe shifts from being exotic and far to being familiar and close, ? the reciprocal evaluation of personal and professional skills between Italian and local partners, the relations of power within factories brought by investments. It demonstrates that both material/financial and imaginative fluxes are part and parcel of the process of establishing foreign direct investments and institutional partnerships.

Keywords: European Union enlargement, foreign direct investment

Sylvia Sellers-Garcia, University of California, Berkeley. Email: sylvi@berkeley.edu; *Spatial and Temporal Geographies of the Postal Service in Guatemala, 1770-1850*

This paper examines the temporal and physical geography of the Bourbon-era mail system in Guatemala (an area which today includes southern Mexico and all of Central America). Through an analysis of mail itineraries and charts, the paper explores late colonial conceptions of place and space. It traces a fundamental change in how terms quantifying physical distance were understood. Early uses of these terms incorporated a temporal element, while later uses increasingly quantified distance in physical terms only. Considering this shift in the context of the late-colonial mail system makes it possible to see both how communication and broader conceptions of space evolved in this period.

Donna Senese, University British Columbia Okanagan. Email: donna.senese@ubc.ca; *Introducing National Park Reserves into Rural Tourism Industries: Assessing the potentials for integrated, sustainable tourism in the South Okanagan and Lower Similkameen areas, British Columbia, Canada.*

There are relatively few places left in Canada where rural landscapes of scenic or ecological significance are not already exploited for tourism development. Proposals to establish national parks in Canada now encounter increased opportunity costs and a concurrent increase in local resistance. The impact of park establishment in economically undeveloped areas has been documented, while little is known of the impacts of new parks where tourism industries are established. This research examines the impacts of a proposed National Park Reserve in the South Okanagan Lower Similkameen area of British Columbia Canada. The objective of the research is to better understand how national parks network within local communities and how they impact regional tourism industries. Personal interviews were conducted with local tourism stakeholders, followed by a debriefing dialogue with community tourism partners. The interview and dialogue results were synthesized with a market assessment of the regional tourism network Results indicate that while tourism markets might be expanded and key tourism resources further protected, the addition of a national park would also place additional political pressures and infrastructure demands on rural communities that could make sustainable park and regional tourism difficult to maintain. Park establishment in developed tourism areas requires a model of national parks localized to community politics and inclusive of ecological protection and existing tourism networks.

Keywords: Tourism, National Parks, Sustainability, Rural Communities

Bongman Seo, Hitotsubashi University, Japan. Email: seob@econ.hit-u.ac.jp; *Geo-Political Economy of Russian Energy Policy and Regional Development of Sakhalin*

The paper examines the ways in which three multi-scalar conflicts over energy development projects has limited future prospects for the regional economic development of Sakhalin. The first conflict is over the ways in which the profit from the energy development projects has been shared between Russian federal government and Sakhalin state government. Under the current quasi-socialist regime, federal government has determined almost every detail of energy development projects, leaving local government without much control over current developments. Second, the tension between Russian federal government/capital and Western majors over the ownership in these energy development projects has also interfered with ongoing projects, well illustrated in the recent environmental controversy over Sakhalin II project. Despite their dependence on majors regarding various aspects of oil production and sales, Russian federal government and monopoly oil capital has tried to raise their share in these development projects against foreign capital. In a way, at the national level, Russia tries to re-territorialize the energy development while

furthering de-territorialization at the regional level. Last, I investigate the extent to which current forms of development in Sakhalin has generated economic opportunities for the Sakhalin residents, focusing the types of job opportunities and business opportunities that has become available through energy development plans. This paper argues that despite the massive inflow of foreign direct investment flows, domestic and international conflicts and de-territorialized forms of struggles has limited opportunities for Sakhalin regional economy.

Keywords: Russia, energy policy, regional development, Sakhalin

Jeong Chang Seong, University of West Georgia. Email: jseong@westga.edu; *Amazon or Nile? Issues on Distance Measurement with GIS*

Most GIS packages measure distances on the projected reference ellipsoids, which causes various accuracy problems. Possible error sources are irregular scale factors, measurements on ellipsoids, ill-defined geographic features and operator/measurement errors. In this research, I developed a GIS application (GEODISTZ) which allows users to measure distances directly with a shapefile in the geographic coordinates. Specifically, the application allows users to use elevations for measuring distances. The application was tested with the two longest rivers in the world — Amazon and Nile. Rivers and elevations were delineated with the SRTM and GLCF datasets.

Keywords: Distance, Ellipsoid, Geodesic, GIS, Amazon, Nile

Tatiana N. Serebriakova, Ph.D., University of Connecticut. Email: geography160@hotmail.com; *New Maps of Chernobyl Contamination in Belarus*

The explosion at the Chernobyl nuclear power plant in the northern Ukraine in 1986 caused the release of enormous quantities of radioisotopes that were dispersed heterogeneously throughout a large geographic area with Russia, Ukraine, and Belarus most affected among the republics of the Former Soviet Union. Belarus received 70% of the total fallout. The purpose of this research is to show a series of maps of external, internal, and total sources of radiation associated with the Chernobyl disaster in Belarus. These maps were created using Geographic Information Systems (GIS) and based on measurements of ground contamination and food contamination taken at 3,326 population settlements in 1991-1992. During this period, those population centers located on the territories with cesium-137 pollution densities were investigated by the Government of Belarus. In those settlements, 31,628 specimens of milk and 35,055 specimens of potatoes were selected for the determination of the concentration of radionuclides. These measurements were converted to an Annual Effective Equivalent Dose (AEED). Unlike the published map of contamination, which was based only on ground contamination by cesium, the new maps show Annual Effective Equivalent Dose from external (ground) and internal (food) sources. . Additionally, the difference map reveals regions of the country where radiation exposure from internal sources exceeded exposure from external sources. The southern rayons of Brest oblast were more affected by Chernobyl when radiation from internal sources is taken into account than it would appear from the published map of contamination

Keywords: Maps, Chernobyl, Belarus, Contamination, Annual Effective Equivalent Dose

Roberto J. Serralles, Serralles Environmental Technologies. Email: roberto@donq.com; *Energy in the Local Tense: Competitive Advantage through Energy Sustainability*

Energy costs are a significant component of most industrial manufacturing operations in the Caribbean. In order to achieve an economic advantage in an increasingly competitive and globalized market, industrial operations in this region have been forced to look at ways to minimize energy consumption and develop energy generation mechanisms that reduce waste and maximize energy utilization. As a result, waste-to-energy technologies and efficient cogeneration applications have significantly expanded in the region over the last decade. This paper explores how a rum distilling operation in Ponce, Puerto Rico has defined and implemented an aggressive energy sustainability program as part of its efforts to maximize the competitiveness of its industrial activities. Specifically, Destileria Serrallés, Inc has implemented a wastewater-to-energy facility that yields a significant amount (1000 scfm) of Biogas. This self-generated source of energy in turn fuels a Combined Heat and Power (CHP) system that produces essentially all the electricity and steam vapor required at the distillery. Although there are some tax incentives in place at the state level that facilitate the investment structure in this type of project, in Puerto Rico the impetus for energy sustainability in industrial operations emanates from a localized economic necessity to create competitive advantages and thus achieve long-term commercial sustainability.

Keywords: energy, sustainability, cogeneration, Puerto Rico

Nathan J. Sessoms, University of Southern California. Email: sessoms@usc.edu; *Landscapes of Inclusion and Exclusion: A Multi-Faceted Analysis of the Changing Geographies of Poverty and Affluence Concentration*

Long considered an 'urban' phenomenon, the face and topography of concentrated poverty have undergone significant changes over the past 15 years. In stark contrast to its dramatic increase during the 1970s and 1980s, recent research has highlighted its substantial decrease throughout the Midwestern and Southern regions of the United States, as well as its simultaneous emergence within inner-suburbs. Such findings portray concentrated poverty as a phenomenon that carries implications for not only urban areas, but entire regions as well. Meanwhile, in light of its predominant focus on the poor, their spatial distribution, and perceived behavioral tendencies, urban scholarship has rarely discussed the notion of affluence concentration. Therefore, little is known about this particular stratum. However, in light of new developments in the spatial distribution of concentrated poverty, numerous questions remain which warrant further consideration. Who are the affluent and where are affluent concentrations located? Most importantly, what are their behavioral responses to the 'suburbanization' of concentrated poverty? These and related questions, although foundational, remain critical to the development of a greater understanding of emerging conditions of economic polarization. Employing a mixed-methodology, this research investigates emerging trends in the spatial distribution of concentrated poverty and concentrated affluence. In doing so, it (1) investigates their changing metropolitan geographies; (2) examines the factors responsible; and (3) assesses the physical and social characteristics present within their local landscapes (Los Angeles County). These research tasks are expected to aid in validating the proposed hypothesis that an interdependent relationship exists between poverty and affluence concentration.

Keywords: Concentrated Poverty, Concentrated Affluence, Globalization, Urban Underclass, Mixed Methods

Anji Seth, PhD, University of Connecticut. Email: anji.seth@uconn.edu; Jeanne Thibeault, University of Connecticut. Email: ; Magali Garcia, PhD, Universidad Mayor de San Andres, La Paz, Bolivia. Email: ; *Climate Variability and Change in the Andean Highlands*

The Altiplano region of Bolivia and Peru is vulnerable to both climate variability and climate change. Its proximity to El Nino and the Southern Oscillation (ENSO) yields substantial changes in the critical rainy season from year-to-year. In addition the region depends substantially on snowpack and glacial meltwater for its water resources during the long dry season, which are diminishing rapidly due to greenhouse warming. As part of a larger study to understand change in market forces and climate which affect highland agriculture, this research explores recent and future climate variability and change in the region. The observed 20th century climate, its year-to-year variability, and long term trends are evaluated using global gridded datasets as well as station data. This is followed by evaluation of the global climate models employed in the Intergovernmental Panel on Climate Change (IPCC) Assessment Report Four (AR4) for the recent period. We also present preliminary analysis of the multi-model ensemble 21st century climate scenarios emphasizing changes in mean and variability of temperature and precipitation, and extremes.

Keywords: Andes, Altiplano, climate, climate change, climate models

Mona Seymour, University of Southern California. Email: monaseymour@hotmail.com; Jennifer Wolch, Ph.D., University of Southern California. Email: wolch@usc.edu; *Living in Harmony with nature*

Do new communities designed around environmental sustainability goals and progressive nature-society relations meet expectations? This paper uses the case of Harmony, FL, one of the newest 'conservation communities' in the U.S., to question whether and to what degree communities designed around environmental and coexistence ideals can actualize these objectives. Harmony is located within 11,000 acres of ecologically valuable swamplands, prairies, and forests, approximately 40 miles southeast of Orlando. Harmony's founders developed this community with two main nature-related goals in mind. First, the town was to embody ecologically sensitive development - for instance, 70% of the property is to remain undeveloped. Second, Harmony's founders believed in the health benefits of human interactions with animals and the outdoors, and created the town as an environment designed for humans, companion animals, and wildlife. This qualitative study uses ethnographic and interview data to look at the ways in which nature-oriented goals have and have not been articulated in the community's code and urban design, and how residents have responded. We conclude that despite some progressive urban design elements, the community missed important opportunities to enhance sustainability, and although the community covenants and restrictions embody an impressive set of ideals for nature-society relations, residents' awareness and adherence has been mixed. This study suggests that urban political ecologists and scholars of nature and society relations should focus on both issues of urban structure, design, and governance,

but also resident perceptions, attitudes, and behavior in communities ostensibly designed to promote ecological justice, coexistence, and sustainability.

J. Duncan Shaeffer, Arizona State University. Email: shaeffer@asu.edu; *Europe as Setting: Evoking Feelings of "Being There" Through the Genre of Espionage Fiction*

The spy novels of Eric Ambler, Alan Furst, and Graham Greene are illustrative of the critical role that fiction can play in forming senses of place and time. All three authors, while entertaining their readers with the actions of fictional spies and espionage-driven plots, make effective use of their European settings to elucidate strong senses of place and time and give their readers strong personal connections to the European landscape. Ambler, Furst, and Greene all regard their settings as crucial elements in their books (indeed the setting often IS the story) and readers frequently feel they are in Europe "at the scene" of the events. Because fictional literature is much more widely read than non-fiction, and that novels may be educational as well as entertaining, geographers need to be aware of these important sources for understanding the European landscape.

Keywords: Literature, Landscape, Europe

Michael Donald Shambaugh-Miller, Ph.D., University of Nebraska Medical Center. Email: mdmiller@unmc.edu; *Development of a Rural Typology GIS for Policy Makers*

There is no single, universal way to define rural. The definition that one selects will affect the way in which Federal legislation works. The definition of rural used should be driven by the objective you want to achieve to insure that the intended people, places and providers receive the desired benefits. Rural, including components within rural (remote, frontier, nonadjacent to urban) can be defined using one of several ways of thinking about geography: zip codes areas, counties, census tracts, population density, distance. Most geography used to define rural do not have common boundaries. Seemingly small differences in the definition of rural can produce dramatically different results in terms of who is affected by the policy. The application of definitions will sometimes drift from intent of authors because target populations were not carefully specified or because what seemed to be a reasonable definition in concept changes because the geography used in data construction is not the same as the geography in available data. Oftentimes a definition will produce consequences not anticipated by the authors because potential implications were not considered during the development or selection of the definition. To better understand the spatial aspects of the various definitions of rural and frontier a GIS was created so as to aid the researchers in addressing the impacts of the definitions upon Federal policy. Both the GIS construction, the differences in spatial and demographic attributes of the various definitions and further research potential for the GIS will be discussed.

William E. Shanahan, III, Ph.D., Fort Hays State University. Email: wshanaha@fhsu.edu; *Settler Colonialism, "Peopleless Spaces," and Geography as Biopolitics*

This paper examines the historical and ongoing biopolitical extermination of indigenous peoples in North America. Giorgio Agamben argues that Auschwitz altered Foucault's modern biopolitical formula from "make live and let die" to "make live and make die." Actually, Agamben's apparent lack of familiarity with the native North American genocide engenders a vanishing point in his own work. In order to make certain European life live, colonialist, biopolitical authority first made indigenous life die. Specifically, Agamben describes Hitler's 1937 decision to formulate the "extreme biopolitical concept" of *volkloser Raum* or "a space empty of people." Biopolitical caesuras isolated zones of indigenous lives along the biological continuum and produced these peoples as demographic populations. As happened in Auschwitz, these indigenous populations eventually were produced as an "absolute biopolitical substance" that was known in Auschwitz as *Muselmänner* and in America as Indian. All of North America became a camp in which the status of various forms of Indian bare life was decided. Most were declared to be *homo sacer* and either killed with impunity or "resettled" in new camps called reservations. Only once the European settlers' biopolitical machine was established in this "determinate geographical space" could they transform Turtle Island into an "absolute biopolitical space." Sadly, the reservations themselves became desirable again for their mineral wealth and the biopolitical process continued unabated throughout the 20th century. Today, the sovereign imperative to produce more energy in order to make its citizenry live translates into "a process of increasing *Entwürdigung* and degradation" for native North America.

Email: mduever@sfwmd.gov; *Use a GIS model to study black bears' habitat connectivity and roadkill risk in southwest Florida, U.S.A.*

Historically (1500's to 1900's), the Florida black bear (*Ursus americanus floridanus*) population has significantly declined due to habitat loss and over-hunting. After bear hunting closed statewide in 1994, Florida black bear populations were threatened by habitat fragmentation and an increasing number of roadkills. We developed Geographic Information System (GIS) models using C# and ESRI ArcEngine to study habitat connectivity and roadkill risk to black bear in southwest Florida. A recent land use and land cover map was used to classify the whole landscape into 5 types: primary habitat, secondary habitat, traversable matrix, open water and urban. A GIS model was developed to study habitat connectivity. Model outputs showed that a large proportion of the habitats have been lost to urban or agriculture. Only 37% of the whole landscape in southwest Florida is good habitat, among which 20% is well-connected primary habitats and 17% is well-connected secondary habitats suitable for bear population. We examined road maps (basemaps, median types, average annual daily traffic and speed limit) and habitat connectivity together to study bear roadkill risk. Results showed that high roadkill risk roads have some common features: 1) no barrier or fence, 2) high traffic speed (≥ 45 miles per hour), and 3) crossing well-connected primary and secondary habitats. A final map that showed the road segments with high roadkill risk was created and proposed to the state government, which will be considered for conservation efforts.

David Shankman, University of Alabama. Email: shankman@bama.ua.edu; *Historic Flood Control Failure in China's Poyang Lake Region.*

Poyang Lake in Jiangxi Province is the largest lake in China and is historically a region of significant floods. During the past five centuries (1500-2006) Poyang Lake experienced 54 severe floods, which is about once every 9 years. These floods occurred with some regularity throughout the period, but with greater frequency since the 1950s. In 1596 there were 827 separate, unconnected levees in the province. As the population in Jiangxi increased, new levees were built or expanded to protect areas at the lake margins. Until the past few decades, levees were poorly designed and maintained, and during severe floods there were innumerable levee failures causing great hardship and many deaths. Levee construction during the past few decades greatly limited the area for floodwater storage resulting in more frequent severe floods. The 1998 flood had the highest water levels ever recorded. However, if rainfall patterns in the future match those that occurred during earlier severe floods, Poyang Lake would experience the most destructive flood ever recorded because of the smaller area available for floodwater storage.

Keywords: China, floods, levees, Poyang Lake

Sarah Shannon, Hesperian Foundation. Email: sarahs@hesperian.org; *People's Health Movement: Health and Organizing for Social Change*

From a grassroots perspective, health is completely integrated with issues of access to food, livelihood, decent housing, class, gender and ethnic discrimination, etc. This integrated approach is what motivates people to organize and provides the spark that allows health to be a powerful motor for organizing around a wide range of interconnected issues. The disconnect between that grassroots reality and the ways in which health is talked about, taught, and professionalized in the academy disempowers movements to improve health and change its social determinants. Health is transformed into what can fit into the concept of health care delivery. Health becomes an investigation of a specific disease or set of diseases. This narrowing undermines the possibility of an integrated approach to primary health care in theory, and in practice leads to a collection of vertical programs that focus on treating specific diseases. The integrative concept of primary health care, first codified in the Alma Ata declaration in 1978, has been watered down and weakened ever since as narrower programs and health focuses were adopted by WHO under the pressure of various funding mechanisms. We will discuss the experience of the transnational People's Health Movement over the past six years in trying to break out of the narrow confines of vertical programs and reinvigorate a global movement for primary health care. Academic practice that has supported, and opposed these aims will be discussed in the context of this popular organizing strategy and movement.

Keywords: primary health care, politics of health, political organizing

Yang Shao, UNC-Chapel Hill. Email: shao@email.unc.edu; *Characterizing the Spatial Pattern of Imperviousness for Bangkok, Thailand*

A sub-pixel classification is used to derive impervious surface from time-series Landsat TM/ETM images (1993-2002). The composition and spatial structure of imperviousness are characterized using landscape pattern metrics. The pattern indices are derived across a variety of spatial, directional, and temporal scales. The size, shape, and structure of impervious patches in Bangkok positioned along defined urban-rural transects provide an effective approach to understand the spatio-temporal dynamics of urban change and the dynamic nature of pattern-process relationships as part of the evolution of urban and rural landscapes. In addition, GIS data and socio-demographic data are used to model the spatial pattern of imperviousness. A set of geographic, biophysical and socio-demographic variables are derived in a GIS and used as predictor variables for a spatial-statistical model.

Keywords: Imperviousness, pattern metrics

Elizabeth N. Shapiro, Doctoral Candidate, University of California, Berkeley. Email: eshapiro@nature.berkeley.edu; *The Discourse of Value: Payment for Environmental Services in Mexico and Beyond*

Payment for environmental service programs, which attempt to create markets for the products of ecosystem function such as green house gas sequestration, biodiversity, and water quality and quantity, are currently being promoted and implemented worldwide by governments and international conservation organizations. This paper draws on an analysis of the international discourse surrounding payment for environmental services and field work in Mexico. It discusses three distinct narratives employed by the actors involved in payment for environmental services and how these narratives directly impact program design and implementation. The first of these narratives, employed by economists, natural scientists and international conservation organizations, represents payment for environmental services as a more efficient and effective conservation mechanism than traditional command and control regulation with little emphasis on social equity. The second narrative has been generated by NGOs and think tanks based in the global south and by international advocates of community-based conservation. It views payment for environmental services as societal recognition of the inherent value of traditional natural resource management practices and as a source of income to support those practices. The third narrative has been employed by critical academics and some rural social movements and warns that these programs may foster resource privatization and loss of access by the poor. The disparate focus and intent of these narratives reflect more profound disagreements about the ability of rural inhabitants to benefit from the commodification of open-access and common resources, the role of traditional rural livelihood strategies in development, and the human/nature divide.

Madhuri Sharma, Ohio State University. Email: sharma.113@osu.edu; Lawrence A Brown, Ohio State University. Email: brown.8@osu.edu; *Residential Mixing and Neighborhood Diversity: Examining Change in Columbus, OH*

This paper examines changes in tract level diversity and residential mixing for 1990 and 2000 in Columbus, Ohio. Columbus has seen relatively fast population growth (14.45%) from 1.345 m in 1990 to 1.54m in 2000. Share of minorities has changed from 15% (1990) to 20% (2000), a gain of 25%; and its diversity scores changed from 0.51(1990) to 0.65(2000). The share of Hispanics has shown largest growth by 180%, whereas those of Asians from 1.5% to 2.7%, an increase by 80%, and for African Americans from 12% to 14%, a gain of 16.7% only. Changing ethnic structure is no longer a large-city process, but has dispersed to mid-sized and smaller metros. In particular, this study examines tract level changes while computing and mapping Theil's Entropy (H) indices to examine patterns. It also employs cartographic and statistical analyses where Theil's Index serves as a dependent variable, and independent variables include MSA size and diversity score; proportion of the population that are foreign born, below poverty level, minorities, lived elsewhere in 1985 and 1995, are in managerial and professional occupations, and have achieved various education levels; median year built for houses, median housing value, median household income, and a new-housing construction index. This analysis enables us to determine the degree to which the variables explain variation of racial/ethnic mixing across neighborhoods. Data is obtained from the 1990 and 2000 Census of Population.

Keywords: Residential mixing, neighborhood analyses, MSAs, diversity score, Theil's Entropy Index, Census, etc.

Paul John Sharman, BA (Hons), PGCE, University of Exeter. Email: p.j.sharman@exeter.ac.uk; *A Passionate Land*

English national landscape is a passionate place. It is sacred. Belden Lane in *Landscapes of the Sacred* (2001) suggests sacred places choose, they are not chosen. English national landscape is a passionate reification birthing an unholy ghost, a secular spirit of place. This ecological and self-referential Genius loci generates passionate support for itself. Humberto Maturana and Francisco Varela in *Autopoiesis and Cognition: The Realization of the Living* (1980) suggest living units modify their environment in their own interest. In this paper I will consider how Exmoor as an ecological unity has become a national passion and how the Exmoor landscape sustains itself through such passion. David Matless in *Landscape and Englishness* (1998) describes pilgrims of scenery taking part in a sacred performance. Appropriately attired, they undergo penance. As outcasts from Eden, they wipe away their 'sins' of urban life by collaborating in industry built on a national desire to return to the Garden. The ghost is not in the machine, the machine is in the ghost needing energies of passion to keep it in perpetual (e)motion. Passions that can overheat and become political when Genius loci meets the Zeitgeist. In the face of social and climate change, quasi-religious zealotry of The Free Church of Country Sports and impassioned resistance to wind turbines in the toposphere are but two examples of this phenomenon. Through photographic analysis I will attempt a dispassionate demonstration of how current passions to determine the landscape of Exmoor are themselves determined by passion.

John I. Sharp, PhD., SUNY-New Paltz. Email: sharpj@newpaltz.edu; J. Ryo Kiyan, SUNY-New Paltz. Email: kiyan58@newpaltz.edu; *Reporting on Iraq: A Discourse Analysis of Truth Claims*

In the recent U.S. led invasion of Iraq, serious questions have arisen over truth claims made to justify the war. These include allegations about weapons of mass destruction in Iraq and possible links between Saddam Hussein's regime and terrorist groups like Al Qaeda. Prior to the invasion of Iraq there was some debate over the legitimacy of these claims and subsequent information from Iraq reveals that there were serious inadequacies in the reporting of such connections. This paper explores truth claims in the media prior to the U.S. led invasion of Iraq in 2003 at both the national and international scale. The paper examines the extent to which American newspapers and their counterparts in Canada, India and the United Kingdom accurately presented information on Iraq to their readers as the build-up to the invasion was taking place and consent was being manufactured. A content analysis of the specific claims was performed on articles during the period between 9/11 and the invasion of Iraq. Results were compared between American papers and their international counterparts, including a discussion of how language was carefully crafted to justify certain ends in the discourse

Keywords: Iraq, mass media, truth claims, discourse analysis

Kathryn Sharpe, University of Minnesota. Email: shar0056@umn.edu; *Between the Ivory Tower and the Street: Activist Explorations in Academia*

The activist geographer who simultaneously participates in activism and conducts research related to that activism is engaged in a constant dance of negotiation. This entails navigating between the rigorous nuances of critical geography and the complex demands of participating in a grassroots social change movement. In particular, it raises the question whether the academic can truly maintain a full engagement in the movement, or whether academic "detachment" is necessary in order to produce meaningful critical research. Particularly in movements of marginalized populations, such as the current immigrants' rights movement, the question of trust is fundamental, and detachment would violate that trust from the perspective of many participants. Yet if a researcher commits her research entirely to being "of use" for the movement, she can lose the sophisticated critical analysis which academia could offer social movements. As a geographer invested in social change, one must bridge the often contradictory tendencies within these realms. Yet unique synergies also emerge from this interaction, yielding powerful hybrid benefits. Drawing on lessons learned through experience, this paper will explore the interfaces between academia and activism, illuminating both the tensions and the mutually enriching potentials that lie within these tensions.

Ian Shaw, University of Arizona. Email: ishaw@email.arizona.edu; Barney Warf, Florida State University. Email: bwarf@css.fsu.edu; *Warped Dioramas: The Rhizomatic Spatialities of Videogames*

From the manic mazes of Ms Pacman to the epic sieges of Age of Empires, video games have evolved from simplistic constructions to multi-million dollar productions. They continue to whet our appetites with radically alternate universes, imaginations, and spatialities. The spaces and places animated within

the videogame thus present the critical geographer with a unique horizon of investigation. Drawing from both Lefebvre and Deleuze and Guattari, we cast the videogame as a landscape of possibility in which the everyday laws and constructions of the material world are inverted and warped into virtual terrains of becomings, imaginations and radical perversions of history. Moreover, we argue that rather than being a closed object of production, the video game is an open site in which meanings are produced through the interactions of producers and users. We conclude by stressing the rhizomatic territorialization embodied in the discursively manufactured videogame.

Jerad L. Shaw, U.S. Geological Survey Center for Earth Resources Observation and Science (EROS). Email: jshaw@usgs.gov; Pamela J. Van Zee, U.S. Geological Survey Center for Earth Resources Observation and Science (EROS). Email: pvanzee@usgs.gov; Level 1Gst Data Product Availability from Earth Observing-1 (EO-1)

As part of an effort to enhance the quality and usability of image data from the Earth Observing-1 (EO-1) satellite, the U.S. Geological Survey (USGS) Center for Earth Resources Observation and Science (EROS) has developed a systematic terrain-corrected (Level 1Gst) data product for both the Advanced Land Imager (ALI) multispectral and Hyperion hyperspectral sensors. Processing ALI and Hyperion data to Level 1Gst improves image quality and geometric accuracy, and represents an important milestone in the evolution of the EO-1 mission from technology validation to operational image acquisition. Previously, ALI and Hyperion images were processed to either Level 1R, radiometric correction (both ALI and Hyperion), or to Level 1Gs, radiometric and geometric correction with georeferencing (ALI only). The new Level 1Gst product has automated terrain correction based on a digital elevation model (DEM), which corrects parallax error caused by local elevation and topographic relief. This processing also includes radiometric calibration and geometric correction using satellite ephemeris data. In addition, ALI processing stitches image data from each of the four individual sensor chip assemblies into a single file. The Level 1Gst product can be ordered in either Hierarchical Data Format (HDF) or GeoTIFF format. Image data from the existing EO-1 archive, located at USGS EROS, may be searched and ordered on Earth Explorer (<http://earthexplorer.usgs.gov>) and GloVis (<http://glovis.usgs.gov>).

Keywords: EO-1, ALI, Hyperion, Terrain-Corrected

Jon Shaw, University of Plymouth. Email: jon.shaw@plymouth.ac.uk; Iain Docherty, University of Glasgow. Email: i.docherty@mgt.gla.ac.uk; Changing Spaces of Transport Governance in the United Kingdom: the Scottish Experience

This paper critically reviews how the Scottish Executive's approach to transport has developed since devolution. Although there is much to commend, a number of concerns can be identified, including the possibility that a number of strategic infrastructure schemes appear to have been approved on political rather than on technical grounds. It is difficult to know whether the current set of transport infrastructure investment plans represents good value for public money.

Kate Shaw, PhD, University of Melbourne. Email: kates@unimelb.edu.au; Ruth Fincher, Professor, University of Melbourne. Email: r.fletcher@unimelb.edu.au; The place of international students in Melbourne

The northern fringe of central Melbourne?the location of the University of Melbourne and RMIT University?has a student resident population of 50 percent. Most of these students are from overseas, and are clustered in purpose-built, high-security student housing which has been aggressively promoted in Southeast Asia, the primary source of Australia's international students. Much of this housing is more expensive than the broader private rental market, unlike in many European cities where student housing is significantly cheaper than private rental. As fewer Australians travel to another state or town for tertiary study than their European and North American counterparts, the market for this purpose-built housing is also highly defined. Local students are more likely to find alternative, cheaper accommodation further away from the university, if they are not living with their families. The result is a segregated and artificially-inflated housing stock with discernible impacts on international students' experience of Melbourne. This paper discusses the ways in which cross-cultural interactions are limited by this largely supply-driven housing phenomenon, considers its effect on notions of Melbourne as a 'creative city', and explores student responses to lower-cost, lower-security housing options rarely made available to them at the commencement of their studies.

Keywords: student housing, transnationalism, creative cities

Shih-Lung Shaw, University of Tennessee. Email: sshaw@utk.edu; Hongbo Yu, Oklahoma State University. Email: hongbo.yu@okstate.edu; An Extended Time-Geographic Framework for Studying Human Activities in Physical and Virtual Spaces

Human activities interact and intertwine to create a complex social system to fulfill our physiological, economic, and social needs. Hägerstrand's time geography suggests a useful conceptual framework for studying human activities in a space-time context under different types of constraints. Recent developments in information and communications technologies (ICT), such as the Internet and cell phones, have offered people with an environment to expand their activities from physical space to virtual space and are expected to lead to important changes in human activity patterns. The classical time-geographic framework, however, does not offer adequate methods of representing and analyzing virtual activities and virtual interactions. For example, concepts such as space-time path, space-time prism, activity space, bundle and station in the classical time geography require modifications when we deal with activities and interactions in virtual space. Furthermore, the classic time geography does not offer analytical functions for examining interrelationships among various activities in an individual's space-time path or interrelationships between space-time paths of different individuals. Lack of an analytical framework significantly limits the usefulness of time-geographic concepts in research and real world applications. This paper presents an extended time-geographic framework of concepts to address the needs of representing and analyzing virtual activities and their interactions with physical activities. In addition, this paper places an emphasis on the design of a space-time geographic information system (GIS) to support the extended time-geographic framework.

Keywords: time geography, space-time GIS, information and communications technologies, virtual activity

Tony B Shaw, Ph.D, Brock University. Email: tshaw@brocku.ca; A Climatic Characterisation of Sub-Appellations in the Niagara Peninsula Wine Region

This study used climatic and topographic data to characterize the sub-appellations that have been recently delineated in the Niagara Peninsula viticulture area and assessed their potential for ripening early to late season Vitis vinifera varieties. To determine whether each sub-appellation possesses a unique set of climatic characteristics that are likely to influence grape quality, the study analysed such factors as the length of the growing season with a threshold temperature >10°C, the mean daily temperature distribution, the diurnal temperature range and fluctuation, distribution of heat units, and frequency of occurrences of maximum temperature.

Keywords: Niagara Peninsula, climate, sub-appellations

Email: jbeau@siu.edu; Modeling Land Use and Cover Change: Predicting Re-Enrollment in the Conservation Reserve Program Using GIS and Data Mining Procedures

The aim of the study was to develop models for predicting the probability of farmers' re-enrollment in the Conservation Reserve Program (CRP) in the Cache River Watershed, in Southern Illinois. In this research, the concept of the CRP lands being re-enrolled or returned to crop production was considered as a part of a larger conceptual domain of land use and cover change (LUCC). The results of these analyses showed that the probability of the CRP re-enrollment is a function of a number of factors including both the economic incentives to farmers as well as the spatial and non-spatial characteristics of the farms and the CRP land parcels. Both logistical regressions and decision tree models confirmed the importance of seven individual variables. It was found that the probability of CRP re-enrollment was higher for parcels located closer to a stream, the national forest, a road and a town. Also higher re-enrollment was indicated for predominant farm location adjacent to the national forest and within a floodplain and on dry soils, higher proportion of farmland in pasture and higher elevation and population density. Overall, the results of this study indicate that the spatial heterogeneity of farms and land parcels (as accounted by spatial variables that were found to be relevant) should be taken into account while making the plans for the CRP re-enrollment for the 2007 farm bill.

Keywords: land use, GIS, data mining, spatial heterogeneity, predicting CRP re-enrollment, Conservation Reserve Program

Richard G. Shearmur, INRS-UCS. Email: richard.shearmur@ucs.inrs.ca; William Coffey, Université de Montréal. Email: william.coffey@umontreal.ca; Christian Dubé, INRS-UCS. Email: ; Rémy Barbonne, INRS-UCS. Email: ; *Intrametropolitan Employment Structure: Polycentricity, Scattering, Dispersal and Chaos*

There is little consensus on where and how employment is decentralizing in metropolitan areas. However, a number of key processes have been brought to light, and different cities have tended to display different processes: strong CBDs, suburban polynucleation, job dispersal, scattering, edgeless cities, and perhaps 'keno capitalism'. In this paper we explore the distribution and growth of employment at a fine spatial scale. We show that, at this scale, there are very dynamic processes of growth and decline throughout metropolitan areas, but that these processes are organised at a wider scale by stable employment centres and by links between these centres. The structures and processes thus revealed suggest that the spatial economy of metropolitan areas should be approached as a chaotic system. From an empirical perspective this means that, depending on the scale of analysis and the way data are considered, polynucleation, dispersal and chaos are all observed: this may partly explain the lack of consensus in the literature. The only process not evident within Canadian cities is scattering, but this process may in fact be occurring within some areas identified as suburban employment zones.

Keywords: Intra-metropolitan; employment; polynucleation; scattering; chaos theory

Andrew B Shears, Kent State University. Email: ashears1@kent.edu; Indiana and the War on Terror: An Examination of Scaled Discourse

Residents of Indiana seem to be quite isolated from the War on Terror. No terrorist activity has been recorded in Indiana, nor does the state supply a significantly different number of soldiers or materiel to the effort, yet support for the War continues to remain higher than the national average. Meanwhile, discourse used by Indiana's Congressional delegation remains strongly focused on support of the war, thus far successfully used to retain power. An examination of the speeches of these representatives reveals a discursive transformation of scale, adjusting the role of an distant international conflict to one relevant to Hoosier voters.

Keywords: Indiana, war, terror, scale, discourse

Rebecca A. Sheehan, Oklahoma State University. Email: rebecca.sheehan@okstate.edu; "Stray animals to be kept at the stables of the City Hall": Urban Refinement and Rural Rudiment in New Orleans' Jackson Square

In this paper, I discuss how tensions between cultivated and unrefined spaces and processes pattern Jackson Square in New Orleans' French Quarter. Specifically drawing from both archival and ethnographic work, I show how animals then and now are integral to meanings and contestation over the Square, linking normative understandings and histories of parks, public spaces, and the urban landscape. My study also draws on post-Katrina research to show how animals and uncultivated processes work in the rebuilding of lives in New Orleans.

Mimi Sheller, Swarthmore College. Email: MimiSheller@msn.com; Re-thinking Smart Mobilities: Agency and Creativity in the Appropriation of Space

Software is restructuring and reconfiguring spaces of movement, transport, and mobility in many ways. The field of mobilities research has highlighted emergent "movement-spaces" in relation to three main arenas: a) new forms of personal mobility enabled by mobile communications devices, mobile computing, and wireless connectivity; b) new forms of transportation mobility enabled by "smart" cars, intelligent transport infrastructures, and user-responsive public transport systems; and c) new "scapes" enabling the automated sorting of mobilities, including software-enriched urban architectures, airport and road surveillance systems, and the design and building of digital cities. This paper reviews developments in each area, highlighting the tensions between issues of control versus agency, and empowerment versus social exclusion. Although the application of software to mobility space is often connected to new modes of surveillance, governance, and capitalist spatial restructuring, there are also ways in which agents and actors exceed and escape systems of control through forms of imaginative play, subversive communication, reflexivity, and counter-surveillance. The second half of the paper focuses on new forms of agency, play, and creativity in the spatial practices of various software-enhanced mobilities. Examples are drawn from geolocated mobile gaming; computer-aided design in the fields of architecture and landscape; and a range of recent artistic explorations of software, space and mobility. The conclusion addresses the emergence of alternative counterpublics that are using agencies of mobile connectivity to navigate, disrupt, and possibly subvert the logics of automated control and surveillance that are governing emergent movement spaces, especially in urban contexts.

Fred M. Shelley, University of Oklahoma. Email: fshelley@ou.edu; Adrienne M Proffer, University of Oklahoma. Email: amproffer8@yahoo.com; Academic Advising in Geography

Faculty members and graduate students in geography often overlook the importance of academic advising. Effective advising can and often does make a considerable difference in the lives of students. In this paper, we examine the geographer's role in the academic advising process. Linking our analysis with the academic advising literature, we discuss best practices for those charged with academic advising. We discuss how geography's unique heritage as an integrative discipline poses special challenges, but great opportunities, for the geographer as academic advisor. Finally, we present several scenarios intended to generate discussion about how a geographer can advise particular students effectively.

Keywords: academic advising, geographic education, mentoring

Bradley A. Shellito, Youngstown State University. Email: bashellito@ysu.edu; Using 3D Visualization, Google Earth, and GIS for University Planning

This project details the use of GIS and 3D visualization techniques to create an interactive three-dimensional model of Youngstown State University (YSU)'s campus and surrounding area. Campus buildings and objects are designed using the ArcGIS and SketchUp software packages and the full model can be utilized through Google Earth. SketchUp allows for the creation of highly detailed replications of the campus buildings and can be used in conjunction with ArcGIS and Google Earth to deliver fully-rendered representations of YSU's campus areas. Details such as building design, the design of unique campus objects, texturing issues, and correct terrain placement and modeling are examined, along with delivery platform specifications (including interactive web versions and graphical presentations). The final campus model is available via the web in a format compatible with Google Earth.

Xiaoping Shen, Central Connecticut State University. Email: shenx@ccsu.edu; Shangyi Zhou, Beijing Normal University. Email: ; Women faculty in China's higher education

There is a saying in Chinese that women can hold half of the sky. Do women faculty today really hold half of the sky in China's higher education? Based on interviews, survey and statistical data, this paper will study women faculty's role and status in China's higher education from the following aspects: China's position in the world, promotion and rank, administrative positions, regional differences, changes during the past 50 years, and future development. This research also attempts to identify regional characteristics, as well as social, economic, culture, and political changes that influence women faculty's position in China's higher education.

Keywords: women faculty, higher education, China

Jingfen Sheng, Department of Geography, University of Southern California. Email: sheng@usc.edu; John Wilson, Department of Geography, University of Southern California. Email: jpwilson@usc.edu; Simulating changes in surface runoff behavior in two small Mediterranean catchments

Geographic Information System (GIS) processing of spatial information is now commonly used in parameterizing and simulating rainfall-runoff processes. In the present study, two models, TOPMODEL and MIKE-BASIN, were implemented and compared in simulating changing rainfall-runoff characteristics due to urbanization in two catchments in southern California. Both models were calibrated using the observed data at a daily time step for the time period of 1940-1945. Recent surface runoff at the outlet for the time periods of 1967-1969 and 1997-1999 was simulated using both calibrated models, and the simulation results were evaluated against the corresponding observed stream flow data. The model performance in runoff simulation varied with watershed land uses; the latter was developed using GIS linked tax map data and recent land use/land cover data. The calibrated TOPMODEL produced stream runoff with high model efficiency for the calibration period and effectively predicted runoff in the natural watershed for the validation period. However, the model efficiency in simulating stream flow in TOPMODEL was insensitive to changes in surface runoff processes due to land use/land cover changes; as such, TOPMODEL is more appropriate for estimating base conditions of water flow and water quality in a catchment-wide scale. On the other hand, the MIKE-BASIN model performs better at incorporating land surface change over time and predicts the increasing flood magnitude and base flow in the urban watershed based on its empirical components of Soil Conservation Service Curve Number, runoff coefficients, and infiltration laws in a non-linear basin model.

Email: lixin@lzb.ac.cn; *Shrinkage of Paleo Tibetan Lakes Identified from High-Resolution Satellite Imagery*

Tibetan lakes serve as a sensitive indicator of global climate and water cycle variability. Tibetan lakes have shrunk greatly since the Greatest Lake Period (GLP, between ~40 and 25 ka BP). It is crucial to determine how much the Tibetan lakes have shrunk since then. We address the problem using high-resolution Landsat ETM+ imagery and digital elevation models (DEMs). Abandoned paleo shorelines of paleo lakes typically appear in high-resolution imagery as concentric rings surrounding the contemporary lakes. The GLP shorelines at the highest elevations are normally preserved, provided water levels have not subsequently risen, and therefore represent the maximum GLP lake extent. Therefore, through data fusion of ETM+ imagery and DEMs, both paleo lake extents and corresponding bench elevations can be obtained. The paleo shorelines or coastal features can be identified in high-resolution imagery, and their corresponding elevations of the paleo lake water level can be determined from the DEM data. Paleo lake extent can thus be recovered from the DEM data by tracing the contour line at the highest paleo shoreline elevation. We developed a user-friendly interactive mapping environment that allows paleo-lake mapping in an efficient manner. With the mapping environment, we recover the spatial extent and volume during the GLP period for hundreds of Tibetan lakes with visible paleo shorelines. The spatial pattern of lake shrinkage throughout the plateau is analyzed. The effectiveness of this approach in various tectonic zones is also evaluated.

Michael James Shepherd, University of Wisconsin-Madison. Email: mshepherd@wisc.edu; *Enclosing the Oasis: Metabolic Rift, Cyclical Nature and the Modern Relationship to Water*

This paper proposes a re-conceptualization of the modern dialectical relationship between humans and the hydrologic cycle. Employing a political ecology approach, the paper addresses the interwoven connections between waste, pollution, and water, under the acting influences of culture, commodification and capitalist market forces. Water increasingly exhibits characteristics of extractive economies, including extractive economies' fundamental tendency to promote further extraction. Furthermore, through market pressure for simplification, development of the hydrologic cycle increasingly resembles the process by which monoculture became the norm for industrial farms. Instead of serving multiple functions simultaneously, today water more often serves one function, beyond which it becomes a waste product requiring disposal. Any conception of waste in relation to water use is determined by our cultural construction of the relationship, and the subsequent design choices. This, in turn, leads us to a rethinking of the relationship between pollution and water. Water Pollution generally brings to mind pollution of water. For example, raw sewage infiltrating drinking water. But in relation to the salinization of some irrigated farm fields another process becomes visible: pollution by water. Currently we discover staggering amounts of pollution along waters' guided path through society. To understand this phenomenon, the paper draws on Marx, and re-conceptualizes his theory of metabolic rift in relation to the hydrologic cycle. Pollution, both of and by water, is not coincidental but follows from a fundamental disconnection between human society and the hydrologic cycle; water is not only polluted, in the hands of capital, it is also polluting.

Eric S. Sheppard, University of Minnesota - Minneapolis. Email: sheppard@atlas.socsci.umn.edu; Paul S Plummer, School of Geographical Sciences, University of Bristol. Email: Paul.Plummer@bristol.ac.uk; Luke Bergmann, Department of Geography, University of Minnesota. Email: berg1388@umn.edu; *Mathematical dialectics: Exploring the spatial dynamics of capitalism*

Emergent computational methods, drawing on qualitative econometrics, complex systems theory and agent based modeling, are making it possible to systematically examine the out-of-equilibrium properties of spatio-temporal systems. Paradigmatically, such systems exhibit non-linearity, path-dependence, context-sensitivity and often unpredictable dynamics. Marxian theories of accumulation and competition in a capitalist space economy exemplify such dynamics. Marxian models characterize capitalism as conflict-ridden, evolutionary, unpredictable, often far from equilibrium, and incapable of self-regulation. Such complexity is compounded when space is introduced. Analysis of the out-of-

equilibrium dynamics of such systems has been dominated by non-mathematical reasoning, fueling the split between political economy and mathematical and statistical analysis that has dominated economic geography for the last two decades. We argue that these new tools enable an approach that is simultaneously mathematical and suggestively dialectical. In general, the ontologies of these new mathematical and computational forms are considerably more resonant with much of contemporary social theory in human geography than were past 'positivist' and statistical methodologies. In this paper, we review the methodological challenges of characterizing the complex out-of-equilibrium dynamics of such systems, in order to make generalizations about their behavior; and of analyzing whether the theoretical properties of such systems are consistent with empirical observations. Drawing on mathematical characterizations of the out-of-equilibrium dynamics of Marxian spatial competition, and on different strategies for analyzing such systems, we explore the potential insights to be gained from the application of computationally-based reasoning for understanding the contradictory spatial dynamics of capitalism.

Email: jsekbeil@kent.edu; *A further evaluation of the spatial and temporal variability of aerosols across North America: influence of lower tropospheric flow*

In previous work, we performed the first large-scale analysis of the role of the atmosphere in explaining the observed temporal and spatial variability in aerosols. In that research, the atmosphere's influence upon aerosol variability across North America was evaluated via the Spatial Synoptic Classification (SSC), which groups surface weather conditions into one of several 'weather types'. We further our analysis by utilizing the 850-hPa geopotential height field. Whereas the SSC classification is based upon surface weather at each individual location, the 850-hPa field on each day was classified into one of nine 'flow types' for the entire eastern two thirds of North America. The 850-hPa field was normalized for interseasonal variability before classification (via Principal Component Analysis and Cluster Analysis) occurred. Aerosol data from 27 stations have been analyzed, with a period of record averaging 7.3 years. Both the aerosol optical depth (τ), a measure of the total amount of aerosols in the atmosphere, and Ångström's wavelength exponent (α), a measure of size distribution of aerosols, have been compared to the flow types. Results show that, as with the SSC classification, the 850-hPa flow types differentiate days with statistically significant differences in τ more than differences in α . However, with both variables, the 850-hPa flow types are associated with fewer statistically significant differences than with the SSC. Further, these differences are less consistent from place to place and season to season, as a particular flow pattern may be associated with higher values in one location and lower values in another.

Thomas E Sheridan, Professor of Anthropology, University of Arizona, University of Arizona. Email: tes@email.arizona.edu; *Beyond Research: Environmental Anthropology and Environmental Politics*

Environmental anthropologists are citizens as well as scholars who can and should engage in environmental politics as well as research. Success in politics, like success in fieldwork, depends upon understanding the cultural logic and economic motivations of diverse interest groups, the agency/agenda of individuals, and the hierarchical/overlapping bureaucracies of government. Unlike fieldwork, however, political engagement involves taking sides, forming alliances, and making compromises. Using Pima County, Arizona's Sonoran Desert Conservation Plan as an example, I explore how the insights of environmental anthropology inform the construction/contestation of space through the following issues: pristine vs. anthropogenic nature, biodiversity and working landscapes, biocentrism and urbanization, science and the discourse of science. I also analyze three major discursive strategies—economic, ecological, and aesthetic—and argue that all three are shaped by and help generate the capitalist restructuring of the American West.

The purpose of this research was to obtain measurements of the distribution of saltating grains above a movable bed. Field work was conducted in a coastal dune system at Esposende, Portugal, in May and June, 2006. Mass-flux gradients were measured with vertical stacks of 4-7 hose traps with vertical openings ranging in size from 25 to 100 mm. Wind speed was measured with a vertical

arrays of 4 Gill-type anemometers (at $z = 0.25, 0.50, 0.75$, and 1.00 m) sampled at 10 Hz. Twenty-one sets of mass-flux measurements were collected. Grain sizes ranged from 0.25 to 0.40 mm, with a mean of 0.30 mm. We evaluate appropriate curve fitting functions and test the maximum and mean saltation height models of Zingg (1953) and Owen (1964). We also compare logarithmic, power, and exponential functions for best descriptor of the flux gradient (Namikas 2003), plot the data as Rouse-type profiles for normalization, and calculate Rouse Numbers so that the behavior of the aeolian system can be compared to that of hydrodynamical systems. Preliminary analysis for normalized mass-flux gradients indicates that the exponential function best represents the measured distribution.

Jill E. Sherman, MPH, UNC-Chapel Hill. Email: jes@email.unc.edu; The AKC's Canine Good Citizen ®: Risk, responsibility, and the moral geographies of more-than-human citizenship

In this paper I will examine the emergence of "canine citizenship" as a kind of hybrid citizenship, through the theoretical frames of risk and moral geography. Conflicts over the place of dogs in human society have resulted in an increasing number of anti-dog movements, restrictive regulations, and pro-dog countermovements. Much discourse on the "pro-dog" side blames a small minority of "irresponsible" dog owners for causing problems for the majority of "responsible" dog owners. The Canine Good Citizen (CGC) program, developed over the past decade and administered by the American Kennel Club (AKC), can be seen as a risk management technology to distinguish "good/responsible" dogs and owners from "bad/irresponsible" dogs and owners and offers an alternative to blanket anti-dog regulation. The CGC ultimately seeks to shift blame for (potential) harm from dogs (in the collective) to individual humans; the irresponsible dog owner functions as Matless' "anti-citizen" who can be punished with the justifiable revocation of citizenship rights to space and place. The CGC promotes an ideal of good citizenship that is a hybrid of behavioral norms for the human-dog dyad, with important socio-spatial implications for both species. Importantly, the AKC is controversial within the diverse collective of animal movements; it is viewed as an elitist organization with strong ideological and financial interests in maintaining dogs' legal status as property. Thus despite a common discursive strategy focusing on responsibility among many groups, how responsibility is defined and by whom remains problematic and contested among other pro-dog groups.

Keywords: human-animal relations, dogs, risk, responsibility, citizenship, moral geography

Kathleen Sherman-Morris, PhD, Mississippi State University. Email: kms5@geosci.msstate.edu; Hurricane Fatigue: A Media Myth?

Evacuation fatigue has occasionally been used by public officials to explain decreasing evacuation rates in seasons with multiple storms. One such season was the 2004 hurricane season in Florida, although a study examining why residents chose not to evacuate did not support the claim of fatigue. If hurricane fatigue did not cause decreased evacuation rates in the later part of the 2004 hurricane season in Florida, then who is responsible for this explanation? One possibility is the local media. This paper provides a closer look at media coverage of the 2004 hurricane season. Specifically, it will discuss the frequency of coverage, and residents' quotations in local newspapers as the season progressed to determine whether reports of hurricane fatigue increased between August and September, 2004.

Kathy Sherrell, University of British Columbia. Email: kathy_s@interchange.ubc.ca; In Search of Home: negotiating the legal and economic barriers to housing

The cost of housing has been rising in Canada, relative to household income levels, especially over the past decade (Moore and Skaburbskis 2004, Murdie 2004, Bunting et al. 2004). The proclivity of newcomers to concentrate in large urban centres - which are the "most expensive and competitive urban housing markets" in the country (Ray 2004, 45) ? means that immigrants are particularly exposed to housing affordability problems. Recent research in Canada has documented something of the scale of this issue, showing that, upon arrival, many immigrants experience economic disadvantage, marked by lower incomes and higher poverty levels (Picot 2004, Picot and Hou 2003, Ley and Smith 2001, Smith 2004). In other words, recent immigrants face the difficult situation of reconciling below-average incomes with above-average housing prices. But the category of 'immigrant' is too broad, and contains many sub-groups. Those who have entered Canada as refugees, through government or private sponsorship, or as refugee claimants, face the greatest challenges in acquiring sufficient income for adequate housing. This paper will present preliminary results from an ongoing study on the housing trajectories of government-assisted refugees and refugee

claimants in three Canadian cities: Winnipeg, Toronto and Vancouver. Through consideration of the housing trajectories of government-assisted refugees and refugee claimants this research considers what effect legal status ? and by extension the rights and services to which people have access ? have on their ability to obtain adequate and affordable housing.

Rosemary L. Sherriff, University of Hawaii at Hilo. Email: sherriff@hawaii.edu; Thomas T. Veblen, Department of Geography, University of Colorado, Boulder. Email: Veblen@colorado.edu; Variability in fire-climate relationships along an elevation gradient in ponderosa pine forests in the Colorado Front Range

Understanding the interactions of climate variability and wildfire has been a primary objective of recent fire history research. This study characterizes the influence of ENSO, PDO and AMO on fire occurrence using fire-scar evidence from 58 sites from the lower ecotone to the upper elevational limits of ponderosa pine in northern Colorado. A major finding is that at low versus high elevations within the montane zone climatic patterns conducive to years of widespread fire are different. Differences in fire-climate relationships are manifested primarily in antecedent year climate. Below ca. 2200m, major fire years follow moister antecedent conditions by two years that favored fine fuel accumulation prior to dry fire years. In the upper montane zone, fires were dependent primarily on drought rather than an increase in fine fuels. Fire is strongly linked to variations in moisture availability that in turn are linked to climate influences of ENSO, PDO and AMO. Fire occurrence is greater than expected during the phases of each index associated with drought. Regionally widespread fire years are associated with specific two-phase and three-phase combinations of ENSO, PDO and AMO. In particular, the combination of La Niña, negative PDO, and positive AMO is highly conducive to widespread fire.

Keywords: fire history, climate variability, Colorado Front Range, ponderosa pine

Ira M. Sheskin, University of Miami. Email: isheskin@miami.edu; Jewish Immigrant Groups in Miami

Consistent with the general growth in Florida's population, Florida has seen significant growth in its Jewish population over the past decades, particularly in Broward and Palm Beach Counties. In contrast, from 1994-2004, the number of persons in Jewish households in Miami-Dade County decreased by 18%, from 147,000 persons in Jewish households to 121,000 persons in Jewish households. Some of this decrease is due to migration to Broward and Palm Beach Counties and some to a negative rate of natural increase. The rate of decrease in the Jewish population of Miami-Dade County has decreased in recent years in part due to an influx of Jews from Middle and South America. The number of Hispanic Jewish adults in Miami Dade County increased by over 80% in the past decade and show an increasingly diverse set of origins. This paper examines this growth and some of the differences between Hispanic and non-Hispanic Jewish households in Miami-Dade County. In addition the paper looks at Jewish immigrants from Israel and the former Soviet Union

Keywords: Jews, Hispanics, Israelis, former Soviet Union, Miami

Alpen Sheth, University of Miami. Email: alpen@umiami.edu; The Predicaments of Precariousness: Housing and Labor struggles from Miami to Mumbai

Mobilizations around the workplace have been fundamentally challenged by recent economic and political forces, many of which have fractured the very structure of class. These forces include the dissolution of work security and spread of casualization in Euro-America, in addition to rapid divestment ("capital flight") and the enforcement of inhumane labor conditions throughout the rest of the world. Under these conditions, social movements at the urban scale have begun to focus more intently on organizing around the home. Indeed, some of the most vibrant and effective social movements in the past few years have been formed through neighborhood-based organizing rather than through any strictly labor-based strategy. Examples from Mumbai and Miami illustrate how organized housing struggles have emerged successfully, forming a basis for broader social justice agendas in the wake of "neoliberal discipline." In Mumbai, India, the SPARC organization has gained global acknowledgment for its ability to successfully negotiate with the state and a multiplicity of non-state actors around issues of land rights, provision of water and electricity and political participation for slum-dwellers. Their examples highlights how even the precariousness of squatters can be overcome through neighborhood-level organizing and strategizing. Similarly, in Miami, organizations like the Miami Workers Center have organized residents in low-income neighborhoods, largely victims welfare reform, to fight urban renewal and displacement. They have even gone further to form coalitions amongst other community-based organizations to assert a "right

to the city” ultimately working towards “urban land reform.”

Sujata Shetty, University of Toledo. Email: sujata.shetty@utoledo.edu; Jane Morgan, JFM Consulting. Email: jfmorgan@gte.net; Planning for Regional Equity in Detroit

Historically, the Detroit metro region has seen city-suburb inequities in access to resources and basic services. More recently, there appears to be some convergence in the planning issues faced by some Detroit neighborhoods and the inner-ring suburbs that are their neighbors (Orfield and Lusk, 2003), among them, increasing proportions of minority populations, increasing unemployment and poverty, declining housing stock, troubled public schools, and declining tax bases. This is consistent with findings in other mid-western cities (Puentes and Warren, 2006). Metropolitan Detroit is the site of an important pilot project that seeks to implement the idea of community-based collaborative planning to achieve regional equity (reducing social and economic disparities within a metropolitan region). This paper employs a mixed methods- surveys, focus groups and interviews - to critically examine the process and outcomes so far, providing the opportunity both to refine theories of regional equity and find specific lessons for practice. References Orfield, M. and T. Lusk (2003) Michigan Metropatterns: A Regional Agenda for Community and Prosperity in Michigan, Minneapolis, MN: Amerigis. Puentes, R. and D. Warren (2006) One-Fifth of America: A Comprehensive Guide to America's First Suburbs, Washington, D.C.: Brookings.

The presenter will discuss the problems in the main approaches for (semantic) Web services development and why/how Ontology-enhanced Semantic Request and Response (OSRR) approach could be a new paradigm for geographers and GIS community to develop semantic Web services in the following days.

Keywords: Web Services, OSRR, GIS

Xun Shi, Dartmouth College. Email: xun.shi@dartmouth.edu; A GeoComputational Procedure for Characterizing the Spatial Pattern of Lung Cancer Incidence in New Hampshire

Some innovative methods were applied to demographically and spatially detailed data to characterize the spatial pattern of lung cancer incidence in New Hampshire. The lung cancer incidence data were from the NH Cancer Registry, containing information about the patient address, age, and sex. The population-at-risk data were created by integrating the LandScan data and the US Census data. The local density of disease was estimated using the widely-used kernel method, but the bandwidth was adaptive and varies according to the local density of population at risk. The density of population at risk was measured around the disease case location rather than around the site for which the disease density was estimated. Restricted Monte Carlo simulation was used to handle some special addresses such as PO Box numbers. The restricted randomization maximizes the utilization of the imprecise spatial information contained in those addresses and meanwhile evaluates the uncertainty caused by that utilization. Probability of the disease at a location was calculated for each age-sex category. The probabilities for all the categories were then integrated to obtain the overall probability at that location. This whole procedure is highly computationally intensive and is an example of employing geocomputational methodology to take advantage of detailed data in health study.

Rob Shields, University of Alberta. Email: rshields@ualberta.ca; The Liminality of Delta Cities

New Orleans is unusual amongst American cities but typical of ‘delta cities’ around the world. Challenges of physical geography, hydrology and geology undermine stability, solidity and a sense of permanence. Delta cities occupy thresholds between land and sea, riverine and ocean systems and as ports are thresholds to foreign cultures. These are in a perpetual state of between-ness: they are both physical, economic and cultural liminal zones. Hurricane Katrina and the post-hurricane reconstruction expose the liminality of New Orleans in time as well as space: the city was not quite reduced to nature but has struggled to demonstrate continuity with local memory, New Orleans’ urban culture and history.

Keywords: New Orleans, Katrina, liminality, delta cities, spatialization, memory

Mi Shih, Rutgers University. Email: swmbfy@eden.rutgers.edu; Legal Development and Inner City Renewal Practices in Shanghai: An Analysis of Disputed Relocation in Property Development, 1990 - 2005

This paper uses “disputed relocation” to understand the large-scale community displacement arising from the real estate development process in Shanghai since the city government initiated its first 10-year inner city renewal project in 1991. China’s acceleration of urban growth means that displacement due to city renewal and land-use change is a significant source of local-scale migration and social conflict in contemporary China. Situating the analysis of disputed relocation in the context of legal development, this research approaches the relevant texts as reflective of underlying state-society relations in China’s transformation to a capitalist society. The paper aims to critically analyze the evolving discourses of the relevant statutory texts promulgated to address disputed relocation between 1990 and 2005 in Shanghai. Using data collected in the official archives and interviews during two research periods in Shanghai, including statutes, judicial decisions and residents’ experience, this analysis focuses on how these statutory texts are implemented by the government in regulating, adjudicating and shaping conflicts over disputed relocation. Building on theoretical debates in two areas of literature - the relation between property law and society and the social construction of law - this research examines the instrumental use of laws which has greatly realized Shanghai’s rapid inner city renewal process. The paper challenges the conventional view of conflicts over disputed relocation as economically determined and thus resolvable by correcting the currently impaired compensation methods. This research also argues that the current regulations hold back residents’ resistance actions to disputed relocation and increase the social exclusion associated with it.

Keywords: disputed relocation, legal regulations, city renewal, Shanghai

Nikolay Shiklomanov, Department of Geography University of Delaware. Email: shiklom@udel.edu; Frederick E Nelson, Department of Geography, University of Delaware. Email: fnelson@udel.edu; James G. Bockheim, Department of Soil Science, University of Wisconsin. Email: ; Temporal and Spatial Variability of Active-Layer Thickness in Characteristic Landscapes of Northern Alaska.

Data from 12 years (1995-2006) of extensive, spatially oriented field observations at several 1000 m x 1000 m CALM (Circumpolar Active Layer Monitoring) sites in northern Alaska were used to examine the spatial and temporal variability of the active layer, and its relation to such landscape-specific parameters as landforms, land cover, and organic-layer thickness (OLT). Observational records indicate that active-layer thickness (ALT) exhibited pronounced interannual variability with a decreasing trend over the study period at all sites. Each landscape unit is, however, characterized by distinct sensitivity of the active layer to climatic forcing. Significant differences exist in ALT between land cover and landform categories. The close correspondence between spatial ALT variability and land cover at all sites indicates that the spatial variation of vegetation can be used as a good indicator of that for active-layer thickness over large areas. Although traditional bivariate analysis indicates that OLT and ALT are not closely correlated, directional geostatistical methods demonstrate spatial correspondence between these parameters along the main landform units. This result indicates that other factors, such as soil texture and soil moisture, contribute to the poor overall correspondence between active layer and organic layer obtained from traditional measures of statistical correlation. Although landscape-specific regularities found in the active layer of northern Alaska may not be present in other areas, the methodology presented here can facilitate geographically oriented CALM investigations throughout the Arctic.

Laura J Shillington, York University. Email: lshillin@yorku.ca; Producing Habitable Spaces: Everyday Socio-ecologies, Gender and Patio Politics in Managua, Nicaragua

Just as in rural areas, everyday urban life requires dealing with the complexities and changes of both social and ecological factors. Urban residents rely on, adapt to and (co)produce their ‘natural’ environments and socio-natural spaces. The ways in which urbanites attempt to cope with social and ecological changes shapes urban spaces, struggles and identities, and the ways people cope are as diverse as the spaces and identities produced in cities. This is just as true in the Global North as in the Global South. This paper examines the everyday natures of patios in a poor, marginalised community in Managua, Nicaragua. It looks at ways in which backyard ecologies, or rather socio-ecologies, are used in the quotidian to assist in producing habitable places and spaces in Managua, how such practices are gendered, aged, classed, and racialised, and how these socio-ecologies are critical in dealing with livelihood challenges not just economically but also socially and personally. The paper concludes by exploring what this means for larger social-ecological and economic-political struggles in the production of

Managua as urban space in Nicaragua.

Keywords: gender, political ecology, urban, Nicaragua

Jacqueline J. Shinker, University of Wyoming. Email: jshinker@uwyo.edu; Patrick J. Bartlein, University of Oregon. Email: bartlein@uoregon.edu; *Spatial and Temporal Variability of Western North American Climate during ENSO Events*

The superimposition of different scales of spatial variability in western North America leads to steep gradients and in some regions considerable spatial heterogeneity in the seasonal cycles of precipitation and surface water- and energy-balance variables. To understand large-scale climatic controls and surface feedbacks related to modes of variability (e.g. El Niño Southern Oscillation), composite-anomaly maps of strong positive and negative phase ENSO events are used to illustrate how climate variations associated with such modes of variability are propagated through the climate system. Data from the NCEP North American Regional Reanalysis (NARR) are analyzed to determine interactions among atmospheric circulation and surface energy- and water-balance components of the climate system at a 32-km grid spatial resolution to represent the spatial heterogeneity of western North America. The translation of anomalies from the equatorial eastern Pacific to North America during El Niño events appears to be consistent over time. For example, positive temperature anomalies in the equatorial eastern Pacific during the peak of El Niño years leads to positive 500mb height anomalies in the region, allowing moisture to be advected into the southwestern region of North America. This in turn causes both positive moisture anomalies (wetter-than-normal conditions) as well as negative temperature anomalies (lower-than-normal temperatures resulting from increased clouds associated with the precipitation). However, the strength and coherency of this relationship is reduced in the interior intermountain west, with weak or inconsistent moisture anomalies occurring during both positive and negative phase of ENSO.

Shino Shiode, University of Tokyo. Email: shino@ua.t.u-tokyo.ac.jp; Narushige Shiode, Department of Geography, University at Buffalo, SUNY. Email: nshiode@buffalo.edu; *Spatial-Temporal Agglomeration of Shock Points and Survival Points*

This study proposes a conceptual framework for analyzing distribution patterns of spatial-temporal agglomeration of socio-economic phenomena. Most of the events around us, including the agglomeration of retail facilities occasionally extend over a certain period of time, affecting and triggering other events in the surrounding space and in the subsequent time points. Existing literature on spatial-temporal analysis stems from either a standard spatial method, or non-spatial temporal analysis, and their methods tend to treat the spatial and the temporal dimensions discretely from one another. In order to simultaneously capture the distribution of events over space and time, we propose a spatial analytical method for estimating the spatial-temporal density distribution of point events. Points representing the spatial-temporal coordinates of events are fitted in a hypothetical standardized cube. The density distribution of spatial-temporal points is then measured in terms of the spatial-temporal proximity among them. In addition to the analysis of shock points (i.e. events that occur and complete in an instance without having their own temporal duration), this method is also applicable to the interpretation of the spatial-temporal relationship among survival points, i.e. events that have temporal duration themselves. The duration of such spatial-temporal events is represented with a set of spatial-temporal bars in the standardized cube, and the distribution pattern and the overlap among these line segments are also considered.

Keywords: spatial-temporal analysis, density estimation, shock points, survival points

David Shively, Ph.D., University of Montana. Email: david.shively@umontana.edu; *The McKenzie River Driftboat: a Co-opted Icon of Regional Identity*

The McKenzie River drift boat, an element of Oregon and Pacific Northwest folk culture, is examined as a symbol or icon of regional identity. The craft which has its origins on the turbulent rivers of the Oregon Cascade and Coastal Ranges, underwent a long period of evolution in design and utilization, much of it in response to its growing role as a vehicle for commercial recreation. In keeping with this new charge, the drift boat has diffused across the North American Landscape, and is now poised for diffusion to other world regions. Nowhere, though, has this diffusion and commercial use of the boat been as strong as in the Rocky Mountains. The drift boat has come to be largely associated with the sport and business of flyfishing in this region, to the point at which it has become symbolic of the Rocky Mountain lifestyle, along with skiing and log construction. This paper will review the origins, evolution, and diffusion of the McKenzie River drift boat, and will present preliminary findings from a

qualitative study designed to measure knowledge of the craft and its history by undergraduate and graduate students at The University of Montana. Specifically, the research seeks to assess the degree to which the drift boat is identified as a symbol corresponding to both regions, the mechanisms by which this symbol has been appropriated in the Rocky Mountains, and the implications for these regions in terms of economic activity and infrastructure.

Keywords: McKenzie River drift boat, flyfishing, recreation, rural economic development

Fred L. Shore, PhD, Mississippi Department of Agriculture and Commerce. Email: fred_shore@nass.usda.gov; Thomas L. Gregory, USDA-NASS. Email: Tommy_Gregory@nass.usda.gov; Rick Mueller, USDA-NASS. Email: Rick_Mueller@nass.usda.gov; *Multiyear Data From The Mississippi Cropland Data Layer*

The USDA-NASS has developed a system to use medium resolution (Landsat TM) satellite imagery and Agency collected field data to annually produce the Cropland Data Layer, a classified image showing the spatial range and extent of each major crop type. The resulting data is a cohesive spatial-temporal database of agricultural production across Mississippi. This study describes the preparation of a searchable database using ENVI® and SAS® and uses queries to extract quantitative information for the Mississippi Cropland Data Layer from 1999-2005. For example, in Bolivar County, pixel counts for 11 categories of classification for 7 years for 15,203 individual field polygons were examined. A SAS query of fields that classified as > 50 percent cotton showed that 56 percent of the single year land use for cotton for the 7 year period occurred in 2001. It is likely that the 2001 expiration of the 1996 Farm Bill led to an increase in cotton planting on marginal land for that year. In addition, multiyear ArcGIS® crop overlays provide a visual representation of the data and allow for change detection and crop rotational analysis.

Keywords: Mississippi, remote sensing, agriculture, spatial-temporal database, crop rotation

Ryan L Short, U.S. Bureau Of the Census. Email: Ryan.L.Short@census.gov; *Enhancing Urban Definitions in Response to Evolving Spatial and Demographic Datasets*

The Census Bureau is investigating several possible enhancements to the way in which it defines urban areas, based upon the review of the major methodological changes made for Census 2000. One area of investigation is the use of census tracts to facilitate a more streamlined approach to automating urban area delineation. Comparability of census tract definitions from one census to another and the wide variety of demographic data available for census tracts makes them attractive as building blocks for urban areas. Availability of commuting data at the census tract level from the American Community Survey shortly after Census 2010 will permit the use of place of work and census tract-level commuting flow data when delineating, splitting, and classifying urban area cores. The Census Bureau also is researching the use of USGS National Elevation Datasets to identify and create steep slope features. Identification of steep slopes will enable the Census Bureau to connect densely settled territory separated by mountain passes that may provide a barrier to development, but not to functional ties between urban areas. The Census Bureau is also investigating designation of other landuse features (e.g., flood plains) as potential exempted territory used to link densely settled areas.

Michael Shouse. Email: michael.lee.shouse@gmail.com; *Urban Sprawl Threatens the Floyd's Fork Watershed in the Louisville Metropolitan Area*

Urban sprawl continues to threaten environmental resources in the Midwest. The Floyd's Fork watershed is currently being impacted by increased development in the Louisville metropolitan area. The Floyd's Fork watershed is 62 miles long, beginning in Henry County and emptying into the Salt River in Bullitt County, after draining water from Shelby, Spencer, and Jefferson Counties. In Jefferson County alone, it services 122 square miles of land, making it the largest watershed in the county. Currently, there is very limited land use information on this rapidly growing area, which is making it very difficult for the Louisville Metro Planning & Design Services Department to manage this growth and for the Louisville/Jefferson County Metropolitan Sewer District to provide services to this area. The size and location of this watershed, along with increased human activity, have created a need to determine the land-use patterns in order to quantify the demand on this natural resource. It is also important to determine if these patterns include attributes that will indicate the direction of growth. This study uses remotely sensed data to identify the land use change patterns and determine if there are attributes that will indicate the direction of growth in the Floyd's Fork watershed by creating an unsupervised land classification using the ERDA IMAGINE software.

Namrata Shrestha, University of Toronto at Mississauga. Email: namrata.shrestha@utoronto.ca; Tenley Conway, University of Toronto at Mississauga. Email: tenley.conway@utoronto.ca; *Alternative geomatic approaches to developing spatially disaggregate data on exurban development*

Exurban development is one of the leading anthropogenic causes of land conversion in North America. The unprecedented pace of such growth, attributed mainly to improvements in information technology and changing demographics, is impacting previously undisturbed areas including those with high conservation value. Though the significance of exurban development and its potential ecological consequences are recognized by many in the literature, there are limited studies pertaining to it. One of the major hindrances to such studies is the lack of spatially disaggregate data on exurban development that is indispensable for ecological inferences. In this study, we compared three specific geomatic approaches that have high potential to map exurban developments in our study area (Central Ontario, Canada). First, a remote sensing approach using relatively high resolution (10m) multispectral SPOT/HRVIR imagery was employed to extract exurban buildings (with and without ancillary data). Second, a less direct approach of using the road network as the surrogate of exurban intensity in the landscape was explored. Third, we incorporated census housing data and road data in a dasymetric mapping approach to capture exurban development in the landscape. An accuracy assessment was completed based on digital property parcel data and air photos, and the results of the three approaches are compared. The implications of this analysis for the study of exurban development will be presented.

Avrum J. Shriar, Ph.D., Virginia Commonwealth University. Email: ajshriar@vcu.edu; *Using Political Ecology to Investigate Unsustainable Development: A Case Study from Cochabamba, Bolivia*

Numerous infrastructure projects in developing countries have led to negative environmental and socioeconomic impacts, either through poor planning and/or a failure to fully consider and address the potential for such impacts. This study sought to examine the environmental and socioeconomic outcomes of an irrigation project in Cochabamba Department, Bolivia, and gain insights into how and why the design and planning of the project was so clearly flawed. The research relied on a combination of project and other literature review, as well as fieldwork conducted in the mid-1990s and again in 2005. The fieldwork involved discussions with project technical staff and other professionals familiar with the project, as well as informal conversations and interviews with farmers and other householders in the project area. The research revealed that this \$8 million irrigation project, completed in the late 1990s, has served to destroy a traditional irrigation system that had been used for thousands of years, and has replaced it with a system fraught with numerous problems. The new system provides insufficient and diminishing quantities of water to fewer people within a smaller overall area, appears to be causing land degradation, and has led to deep socioeconomic divisions and, in some cases, conflicts, within and among the area's communities. The study raises compelling questions about the pressures and incentives that seemingly compel the staff of international and local development agencies to charge ahead with projects even when they have obvious potential for significant, negative impact.
