New 10Be terrestrial cosmogenic nuclide (TCN), surface-exposure dating in Shigar and Braldu valleys, coupled with areal lithologic assessment of supraglacial moraines of Baltoro Glacier enable elucidation of glacially-eroded, frost-stressed and debuttressed slope-failure mechanics in Karakoram Himalaya. TCN dates define young glacial stages at ~16 ka and 13-11 ka (Mungo stage); and 5.7 ka, 4.4 ka, and 0.8 ka (Askole stage). Direct ice and melt-water erosion undercut and debuttressed valley walls leading to failure with minor to moderate time lags. The Ghoru Cho, Busper, Gomboro, and Urdokas slope-failure complexes have different causes, mechanics, and timings. Withdrawal of buttressing ice from Shigar valley produced the Ghoru Cho rock-avalanche complex from the southwest side. Rapid emplacement in Holocene time may have forced Shigar River to undercut the opposite valley wall that was already itself similarly debuttressed, resulting in the unusual Busper sackung at the Dassu gneiss dome apex forming Busper ridge. The massive Gomboro rockslide complex blocked the Braldu River to produce lake beds upstream and breakout floods downstream, with boulders producing mean TCN dates of ~0.8 ka. The Late Holocene Urdokas

rockslide complex on the south valley wall of the Baltoro Glacier was caused by north-dipping joints in granite, coupled with debuttressing by downwasting of adjacent glacial ice. The supraglacial moraine composition of the Baltoro and Godwin Austen Glacier from K2 Mountain show that they result from dominant mass-movement of weaker metasedimentary rocks, whereas many higher peaks (K2, Masherbrum) are the more glacier-erosion- and mass-movement-resistant gneisses.

Sergei Shubin, University of Aberdeen. Email: s.shubin@abdn.ac.uk; *Lost in translation: articulating Russian poverty stories*

The paper deals with the theoretical and practical issues related to understanding and articulating poverty and difference. It goes beyond material definitions of social malaise trying to understand its different constructions in social, cultural and political domains. It reconsiders the "problematic" nature of poverty and attempts to escape the logic of existing ways of codifying diverse poverty. The paper achieves this by means of articulating the simultaneity of differences, complex practices and experiences of poverty in a study of different Russian poverty episodes. It allows uncertain connections between the elements of poverty (memories, symbols, artefacts, practices) to unfold and emerge through the stories of people which construct heterogeneous poverty spaces. This fluid approach to articulating social malaise accommodates the messiness of the every day realities of life of needy people and challenges homogeneous and exclusively rational interpretations of poverty. This leads to critical re-evaluation of the links between the poverty-related experiences of different people in various places and policy-making organizations responsible for dealing with poverty issues. The paper demonstrates how innovative approaches to understanding social malaise can prevent "exclusion of the excluded" poor and open up new opportunities to ameliorate their living conditions.

Benjamin J. Shultz, Indiana University Department of Geography. Email: bshultz@indiana.edu; *The Latino Immigrant Experience in Rural Central Kentucky*

Kentucky is demographically an aging state with persistently low natural increase rates and has historically experienced substantial rural out-migration of young individuals. However, the effects of this phenomenon have been mitigated by recent Latino in-migration responding to labor needs, especially in agriculture. Despite this rapid growth rate, very little research has been done to understand the adaptation process in rural destinations in the state. In a qualitative study that took place in a high-growth, rural county located in the "tobacco belt," semi-structured interviews were conducted to pursue information about Latino immigrants' choice of rural destinations, the nature and extent of the social networks involved, their living and working conditions and their social relations with the host societies. The study sample included thirty-one male, Latino immigrants. Most migrants came directly to Kentucky or to other non-traditional gateways in the Southeast, were making their first trip to the US, and had been in the community at least 2 years. Participants universally reported that they were very content with the community and frequently commented on its peacefulness, safety, low cost of living, mild weather, openness to new people and lack of racist or ethnic discrimination. These attributes were in contrast to other places they had lived in the Southeast and cited by many as a reason they chose to work and settle in Kentucky. Results suggest that the hospitality and abundant job opportunities that Latino immigrants encounter in rural, high-growth counties influence their decision to settle rather than move on.

Bryan Shuman, University of Minnesota - Minneapolis. Email: bshuman@umn.edu; Jeffrey P. Donnelly, Woods Hole Oceanographic Institute. Email: jdonnelly@whoi.edu; *Repeated multi-century droughts in the Northeast U.S. since 5600 years before present.*

Strong correlation of sedimentary variation in three lakes up to 240 km apart in Massachusetts document multi-century, regional climate variation since the mid-Holocene. Lake sediments track repeated ~700-yr long episodes of low lake levels in the past 5600 yrs. Evidence for five low paleoshorelines within each lake derives from ground-penetrating radar (GPR) profiles and sediment cores. Loss-on-ignition and scanning XRF data from near-shore cores within the three lakes reveal repeated sand layers that correlate with paleoshoreline features in GPR profiles. The sand layers date between 5600 and 600 cal yr BP. Ages for the events are highly consistent among lakes. For example, the calibrated ages for the beginning of the first low stand are 5340-5730 cal yr BP at New Long Pond, 5570-5690 cal yr BP at Round Pond, and 5655-5605 cal yr BP at Davis Pond; ages for the end of the fourth low stand are 2000-2110 cal yr BP at New Long Pond, 2270-2390 cal yr BP at Round Pond, and 2325-2350 cal yr BP at Davis Pond. The fifth event dates between ca. 1400 and 600 cal yr BP. Sparse

dendroclimatic data indicate that this most recent event coincided with a high frequency (>6 per century) of droughts like the historically-unique AD 1964 drought, which severally reduced water supplies in Boston and New York City. Regional replication of the results supports the interpretation of the lake level changes as having a climatic origin. Therefore, the humid Northeast may be prone to exceptionally dry centuries unlike experienced historically.

Ian George Shuttleworth, QUB. Email: i.shuttleworth@qub.ac.uk; Employment, Spatial Accessibility and Fear in Northern Ireland: A Spatial Interaction Modelling Approach

The labour market has traditionally been an arena in which the implicit (and explicit) political tensions between the two main communities in Northern Ireland (NI) have been expressed. Economic inequalities have been seen by some as a contributory cause of communal conflict. As a consequence, various governments have envisaged labour market reforms through the promotion of communal equality and the creation of greater material prosperity for all through 'peace dividends' as a way in which conflict can be reduced or even done away with altogether. Some important labour market debates concern the spatial accessibility of employment for both communities and the 'chill factor' - the fear of working in or travelling through an area dominated by the 'other' community. These issues are explored using ward-level flow data from the 2001 NI Census of Population to examine where workers move from and go to on a daily basis as they commute between their places of residence and work. A spatial interaction model is used to estimate the various factors that shape daily commuting flows and the magnitude of the 'chill factor' is discussed. The limits of quantitative approaches are explored as far as they relate to providing evidence for policymakers in a divided society. The general conclusion is that there is good evidence that the 'chill factor' exists but that it is difficult to give satisfactory proof to all the people all the time especially in a communally-divided society.

Jason Sibold, Bad Dog Ranch. Email: Jason@baddogranch.org; Thomas Veblen, Dept. of Geography, University of Colorado, Boulder. Email: thomas.veblen@colorado.edu; Kathryn Chipko, . Email: ; Lauren Lawson, . Email: ; Emily Mathis, . Email: ; Jared Scott, University of Northern Arizona. Email: ; Influences of surface fire, mountain pine beetle, and blowdown on lodgepole pine stand development in the northern Colorado Front Range

Although high-severity fire is the primary type of disturbance shaping the structure of lodgepole pine (*Pinus contorta*) stands in the southern Rocky Mountains, many post-fire stands are also affected by blowdown, low-severity surface fires, and/or outbreaks of mountain pine beetle (MPB; *Dendroctonus ponderosae*). The ecological effects of these secondary disturbances are poorly understood but are potentially important in the context of managing for ecological restoration and fire hazard mitigation. We investigated the effects of blowdown, surface fires, and MPB outbreaks on demographic processes in lodgepole pine stands in Rocky Mountain National Park, Colorado, USA. We used dendroecological methods to reconstruct stand characteristics prior to and following secondary disturbances for paired stands with and without secondary disturbances. Surface fire events do not kill canopy trees or trigger pulses of recruitment, and as such do not have detectable influences on stand development. In contrast, both MPB and blowdown kill canopy trees and trigger pulses of tree regeneration of lodgepole pine and subalpine fir (*Abies lasiocarpa*). The amount and species composition of post-disturbance regeneration is dependent on the severity of the disturbance and on the time since stand initiation. The results of this study demonstrate that the high tree densities characteristic of lodgepole pine stands in the southern Rockies are the result of dense regeneration following stand-replacing fires and that surface fires had little or no thinning effect on tree densities. Thus, current high stand densities in the study area are not the result of suppression of surface fires.

Amy Siciliano, University of Toronto. Email: amy.siciliano@utoronto.ca; Stigma and security in the suburbs: The 'Year of the Gun' discourse in Toronto

A year of fatal shootings and gun-related violence in Toronto led popular media to label 2005 as the 'Year of the Gun'. While 'gun violence' in Toronto in particular, and Canada in general is certainly not a 'new' phenomenon, the disproportionate amount of media attention it has received suggests that it is being harnessed for broader practices of neoliberal restructuring, with the role of the state increasingly being framed through a discourse of 'security' rather than 'welfare'. This paper examines how this 'event' was discursively constructed through popular media, valorizing certain citizens and spaces while

problematising others. Such discourses relied on stigmatising images of social and spatial forms of poverty in the city's inner suburbs, while promoting protective images of the gentrified inner city. Accordingly, I document the sites where 'problems' came to be defined, and the modes of description at work to perceive them; how both images and words were selectively arranged to construct and support this narrative. I also document how this heavily mediated event 'jumped scales' from a localized arena to become a national election issue, when the 'Year of the Gun' was deployed by three of the main federal political parties to help legitimate the introduction of severe 'law and order' platforms into each of their campaigns.

James Derrick Sidaway, University of Plymouth. Email: james.sidaway@plymouth.ac.uk; Enclaved space: a new metageography of development?

Notwithstanding crisis and critique, 'Development' remains an enduring frame within which much social and economic transformation is interpreted and envisaged. In the context of arguments about the need for a nuanced spatial vantage point on 'development', this paper asks what this means in the context of new conjunctures and constellations of uneven development? In particular, it argues that a new configuration of and structure of development is increasingly evident: one in which intensified processes and patterns of uneven development are expressed in enclaves. The paper makes this case with reference to examples drawn from Southeast Asia, sub-Saharan Africa and the Gulf.

Keywords: Development, Enclaves, Post-development, primitive accumulation

Ravinder Sidhu, Dr, University of Queensland. Email: r.sidhu@uq.edu.au; Gloria Dall'alba, Dr, University of Queensland. Email: g.dallalba@uq.edu.au; Transnational education & (dis)embodied cosmopolitanisms

The state looms large in any consideration of transnational education - it is engaged in developing policies that support education export industries and in regulating the entry and exit of foreign education providers and students. Transnational education is also used strategically as a solution to the problems of providing educational opportunities and securing a trained professional workforce with the right mix of cosmopolitan sensibilities for a globalised economy. Although often portrayed as discreet autonomous institutions that are the central locus of power, states are constituted by everyday practices and representations. Feminists have long argued for studying the 'embodied state'. This paper takes as its focal point the sphere of transnational education to investigate how the embodied state creates hierarchies of belonging and of otherness. State instrumentalities use branding strategies to attract the desired international student 'customer', holding out the promise of a desirable cosmopolitanism. At the same time, issues of mobility, migration and ethnicity are constituted in terms of otherness. We show that transnational education practices are premised on the notion of a disembodied learner, even though relations between insiders and outsiders are strongly mediated by the embodiments of 'race', colour and gender. We suggest that the disjunctures between disembodied conceptualisations of transnational education, and the embodied experiences of international students present significant challenges for developing cosmopolitan sensibilities. In their current forms, transnational education initiatives are more likely to sponsor an instrumental form of cosmopolitanism inflected by neoliberal and nationalist values.

Keywords: transnational education; education brands, embodiment, cosmopolitanism

Loren Siebert, PhD, University of Akron. Email: siebert@uakron.edu; Historical GIS of Japan's Kanto Region

This presentation will give an update on the historical spatial database I have been creating of the greater Tokyo area using a geographic information system (GIS). Initial work on the project, done in the 1990s as my dissertation (Creating a GIS Spatial History of Tokyo), included mapping and initial interpretation of (1) shoreline changes and land reclamation in Tokyo Bay as well as rerouting of rivers flowing into Tokyo Bay, (2) conversion of administrative units from village to town to city to ward, (3) population changes, and (4) development of the Kanto region's railway network. Subsequent additions to the project pushed its time frame back into the 1800s by incorporating information on the distribution and characteristics of villages and towns in the 1830s and in the 1870s, using historical provincial maps, gazetteers, and military conscription surveys. After a gap in work due to my health, the project is now being revived to expand its geographic scope to include more of the Kanto region rather than just the greater Tokyo area. Additionally, plans are to expand the historical rail database well beyond the Kanto area, with the ultimate goal of covering the entire country.

Thomas Sikor, Humboldt University, Berlin. Email: thomas.sikor@rz.hu-berlin.de; Johannes Stahl, Humboldt University, Berlin. Email: johastahl@yahoo.de; Stefan Dorondel, Humboldt University, Berlin. Email: dorondel@yahoo.com; Property, access, and state legitimacy: Emergent political orders in Albanian and Romanian forests

Property reforms have been cornerstones in the efforts by postsocialist states to create new foundations for economic production and exchange, correct the wrongs of socialism, and provide people with new rights signifying their participation in the new democratic order. The legitimacy of postsocialist states, therefore, rests to a significant extent on the property reforms, the local dynamics associated with them, and the effects of those dynamics on access to productive resources. This paper examines the relations between property, access, and state legitimacy by way of four case studies on forest relations in Albania and Romania. Insights from the case studies suggest that small numbers of powerful actors were able to gain most of the benefits derived from timber logging and firewood extraction in all four sites. The concrete relations of property and access varied among the four sites, however, as they were closely intertwined with local political orders. In addition, they indicated distinct differences between Romania and Albania. Forest restitution allowed the Romanian state to maintain not only its control over access to forests but also its legitimacy in the eyes of rural people despite - or perhaps because of? the predatory actions of local state officials. In contrast, the lack of property reform in the forest sector and inability to enforce the state's legal control over access to forests weakened the legitimacy of the Albanian state.

Email: ; Marcos Pedlowski, Universidade Estadual do Norte Fluminense. Email: ; Deforestation and Development on an old Amazonian Frontier: Spatial and Temporal Patterns in Land Use and Welfare

The frontier development process in the Brazilian Amazon is widely believed to result in increasing inequality and poverty. The apocryphal description of regional settlement is that migrants clear forest and plant crops for a few years and later sell out to ranchers who consolidate large expanses of pasture. As a result, small farmers migrate further into the frontier and continue the cycle of deforestation while large ranchers prosper. However, some researchers argue that with appropriate public services and production choices, smallholders also prosper. In this paper, we analyze welfare and land use of households within six municipalities in a heavily deforested frontier region. Using a three-period spatial panel including survey and satellite data and spanning nearly a decade, we evaluate how levels and the distribution of land use and welfare have evolved, examining whether there is convergence or divergence both across and within municipalities. In the most recent survey round, households generally self-report improved quality of life, but objective measures of income and wealth widely vary. We calculate gini coefficients (to examine the changing distribution of income and wealth) and order statistics (to examine social mobility). We find that levels of welfare (as measured by capital assets and income) have increased at rates that exceed national averages in all municipalities but are persistently higher in municipalities with better market access. The initial distribution of wealth largely determines relative improvements in welfare across households. Land use is generally converging towards cattle pasture, regardless of initial household or municipal conditions.

Carolina PC Silva, Student. Email: cps161@psu.edu; Sustainability and transportation: a contribution to social equity in South America

Transportation systems constitute one of the main structures of urban geography in developed and developing countries. Places of human activity are spatially defined by transportation structures that allow movement, and facilitate interrelationships amongst users and activities. That being so, transportation has major impacts on the landscape, as much in the social dimension as the physical. Because of these strong relationships, planners, architects and designers can further the planning and design of built environment by minimizing the negative impacts of inaccessibility and exclusion to achieve truly sustainable transportation systems. There is major acknowledgement that transportation systems based on private automobiles are not sustainable, although they are increasing globally. Most developed and developing countries face increasing automobile ownership rates with consequential decreases in public transportation ridership, bicycling, and walking. While the disconnection between transportation planning and sustainability affects most countries, it is more devastating in cities of developing

countries, exacerbating issues of access to urban centers and equality of opportunities. This presentation explores the impacts of transportation in the social landscape of developing countries in South America. It defines the spatial dimensions of social exclusion in transportation; and presents a typological framework of transportation systems in South America that are successfully addressing these issues. The research uses comparative analysis among 4 South American cities - Curitiba and Porto Alegre in Brazil, Santiago in Chile, and Bogotá in Colombia - to search for policies and practices that foster social sustainability in transportation systems.

Julie Silva, University of Florida. Email: silva@geog.ufl.edu; Neoliberalization and inequality in Mozambique: A case study in the use of iterative mixed methods

This study uses an iterative, mixed methodology to investigate the effects of agricultural trade on inequality in Mozambique, a country that adopted a neoliberal development program in 1987. The data collection and empirical research were conducted sequentially so that findings at each phase of the analysis could influence the design of later phases. At the regional level, regression results indicate a complex relationship between inequality and agricultural trade. Vegetable trade is associated with higher inequality in southern Mozambique, while cash cropping is associated with lower inequality in the north. Intraregional differences between households may influence trade's impacts on inequality. Qualitative results indicate that the context of agriculture trade and the social status of traders varies greatly across the two regions. In the north, where there are fewer economic opportunities, agricultural trade is perceived as a high status activity and dominated by men. However, in the south, where people have more exposure to other types of employment, the marketing of agricultural goods is seen as an undignified and generally feminine activity. These results suggest that trade increases inequality in rural areas of Mozambique where trading has a low social status, but does not increase inequality in those areas where it has a high social status. Taken together, these findings indicate that social factors are working together with economic ones to generate new landscapes of inequality. Therefore an understanding of the social drivers of inequality is necessary for the Mozambican government to mitigate any inequality-increasing effects of neoliberal policies.

Jose Silvan, Texas State University - San Marcos. Email: js1536@txstate.edu; Sub-pixel confusion-uncertainty matrix for the accuracy assessment of soft classifications

The prevailing concerns on ecological and environmental issues, especially at regional to global scales, have prompted significant advances on the use of remote sensing data for the estimation of land cover information at sub-pixel level. However, the quality of such classification products, as well as the performance of the classification protocol employed, are difficult to quantify. Because of this, and despite the increasing need for sub-pixel and super-pixel assessment of classification products, a standardized assessment procedure has not been established yet for soft classifications. In this paper I review the alternatives for producing cross-comparison matrices when the pixel-class relationship is defined through the proportion of sub-pixel class coverage, and the agreement-disagreement is quantified as the proportion of area overlap among the classes at sub-pixel level. It is shown that, in general, there is no unique solution for the actual proportions of agreement-disagreement at sub-pixel level between the reference and assessed datasets, and the necessary conditions under which a unique solution can be admitted are determined. For a more general case, a new cross-comparison matrix that reports the confusion interval in the form of a center value plus-minus maximum deviation is proposed. The new matrix is referred to as sub-pixel confusion-uncertainty matrix (SCM). The use of the new cross-comparison matrix for assessing the separability among the fuzzy classes is illustrated with a case study of invasive species detection through hyperspectral remote sensing.

Email: ; Co-management as adaptive resistance to the neoliberal governance paradigm

The current neoliberal paradigm in resource management may seem in opposition to the principles of resource co-management. In many ways this is the case. However, both ultimately rest on the tenets of decentralization. Under a regime of neoliberalized resource management, co-managing communities face the dilemma of satisfying the needs of their own members along with the modus

operandi of governing agencies, a task that may involve reconciling divergent visions. Various authors in the co-management literature have in fact emphasized the incompatibility that often occurs between the vision of the state and that of the community. However, communities can combat this by using adaptive strategies to balance their vision for the resource with the expectations of the state. Our paper focuses on this proposition and its implications for prospects for co-management both within, and as a challenge to the neoliberal management paradigm in resource management. We will begin by defining common government-community co-management arrangements in the Western context. Our central examination will rest on the presentation of characteristics from successful co-management case studies, and more specifically, strategies utilized by communities to adapt to, accommodate, or resist the dominant governance paradigm.

Sun Hui Sim, Florida State University. Email: ss06j@fsu.edu; Spatio-temporal dynamics in Seoul Metropolitan Area: Linking Bayesian approach into land use/cover change

The research is concerned with the relationship between land use/cover change and socio-economic information using a Bayesian prediction model based on a likelihood ratio function in the Seoul Metropolitan Area (SMA). Since economic development and the following rapid urbanization of the 1960s in Seoul, the growth and formation of secondary cities in the SMA have been basically centered on the development of Seoul itself. Although land use/cover change seems to have no specific direction and pattern regionally, it has regular direction and pattern when it is seen as a whole of the SMA. The purpose of this study is to analyze the general pattern in terms of land use/cover change with socio-economic information, and to forecast future change with a Bayesian approach in secondary cities, SMA. Here I first classify 4 Landsat satellite images from 1972 to 2000 for time series analysis. Then, extract the changing area using post-classification comparison by time. Thirdly, socio-economic data (population density, road networks, the number of establishments and land regulation) are combined in GIS environment. Fourthly, I produce maps of future land use/cover change with Bayesian approach using a likelihood ratio function. Finally, discussion of the potential of the Bayesian approach for land use/cover change forecasting within remote sensing, GIS and Spatial Modeling.

Cynthia S. Simmons, Michigan State University. Email: simmo108@msu.edu; Agrarian reform in the wake of Latin America's political shift to the left: A case study of social and environmental impacts in the Brazilian Amazon.

Populist demand for agrarian reform that reverberated across the developing world in the second half of the 20th c. has once again become a top concern for a growing international landless movement. From countries as geographically diverse as Zimbabwe, Indonesia, Bolivia, and Brazil, peasants are demanding their rights to land, and many leaders are responding. In this paper, I examine agrarian reform efforts in Brazil within the context of the larger populist agenda being pursued in Latin America in the wake of a radical shift to the political left. I next present a case study that focuses on the social and environmental impacts of land reform in the Brazilian Amazon. I conclude the paper by drawing out potential policy implications for both Brazil, and other nations pursuing agrarian reform.

Keywords: Agrarian Reform, Populism, Brazil, Deforestation

Terry Simmons, Ph.D., Centre for Global Policy Studies. Email: terry@environment-lawyer.com; Multidimensional transboundary environmental challenges and choice of laws across the Washington-British Columbia border

Transboundary environmental dispute resolution between Canada and the United States assume bilateral political and institutional relationships within and among the two federal nation-states. Ultimately, comity is essential between the upstream and downstream or upwind and downwind parties. Canada and the United States have a rich history of transboundary environmental relationships beginning with the Boundary Waters Treaty of 1909 and with the establishment of the International Joint Commission. Indeed, the landmark Trail Smelter Arbitration is among the earliest international environmental law cases, where the downwind farmers in Washington were compensated eventually for crops destroyed by transboundary air pollution from the Cominco lead zinc smelter in Trail, British Columbia. Several unilateral, bilateral and multilateral perspectives and allegiances have been applied at local, regional, national and international scales among relevant rival corporate, non-profit and governmental entities in recent years. Thus, a government agency in Seattle issues a unilateral order to a Canadian corporation. Later, the two parties sign a complex, subnational working agreement that avoids jurisdictional issues. Another government agency demands compliance with the extraterritorial application of NEPA much to the displeasure of British Columbian entities that opt to follow domestic laws. Another major transboundary dispute was resolved with an innovative, subnational agreement between the Province of British Columbia and the City of Seattle, ratified by a bilateral treaty. Regional questions of sovereignty, jurisdiction, choice of laws and conflict of laws highlight or obscure traditional federal and bilateral relationships. However, national or bilateral federalism maintains legal and formal supremacy in transboundary environmental disputes.

Gregory Simon, University of Washington. Email: glsimon@u.washington.edu; Brokering Development: The Commercialization of Household Energy Devices in Rural Maharashtra, India

This paper explores neoliberal development policies designed to establish commercial markets for improved/modern household energy devices in rural Maharashtra, India. I examine patterns of intermediary action, or forms of 'brokering', used strategically by different community groups in four villages - including female head-of-households, village artisans, and employees of local non-governmental organizations. Here, I pay particular attention to the way creative community governance frameworks emerge as a mechanism for translating, integrating and overcoming the primacy of supply-side management strategies and discursive framings of "the healthy home".

Keywords: Development, Household Energy, Neoliberalism, India, Brokers

Laurence R. Simon, Ph.D., Brandeis University. Email: lrsimon@brandeis.edu; A Pedagogy of the Oppressed in the Mississippi Delta

The Delta counties of Mississippi have one of the highest concentrations of poverty and ill health in the United States. A defining characteristic of this population is low-level adult literacy and numeracy with significant functional illiteracy. More than a lack of preparedness for employment opportunities, illiteracy has kept generations of descendants of slaves isolated both physically and psychologically. This paper explores concepts of place among low literacy inhabitants of one of the poorest parts of America and poses the question of what a "pedagogy of the oppressed" based on the seminal work of Paulo Freire might achieve. Reference will be made to Freire's basic concepts and early work in the northeast of Brazil.

Keywords: Mississippi, literacy, place, poverty, Paulo Freire

Stephanie J Simon, University of Kentucky. Email: stephaniesimon@uky.edu; "The well-told and uplifting lie": the 'culture of fear' and the security imperative

The end of the twentieth century saw the proliferation of 'Culture of fear' discourses and theories of the 'risk society' that propose a vision of modernity gone awry. Here, risk has become the banal emphasis of everyday life where anxiety exists everywhere and nowhere. The 'culture of fear' proliferates through 'non-events' and potentials, such as possibilities for identity theft, plane crashes, tainted spinach, flu pandemics, stranger danger, and so on. This paper draws the risk society and culture of fear discourses into the so-called 'post 9/11' world ("forever changed") where an Event provided the basis for security as the paradigm and imperative of government. In the U.S., homeland security has itself indefinitely extended potential risk (and the then concomitant idea of preparedness) infinitely and in all directions. This paper traces some of the geographical approaches to fears and proposes some new directions for thinking fear and space

in the climate of 'homeland security'.

Keywords: homeland security, risk, fear

Richard Simpson, PhD Candidate, Modern Thought and Literature, Stanford University. Email: mordenti@stanford.edu; *The University City as Genred Space*

My paper examines the means by which the North American campus seeks to embody national educational values through local forms of architectural representations and landscape planning. Thus, I argue that the campus and its surrounding community, or university city, asserts a unique spatial semiology. Beginning with Frederick Law Olmsted's land-grant colleges, I track questions of campus formations and the construction of American education values through shifting geographies of power relations between the university and the city. Today this nexus is widely articulated in the rhetoric of service learning pedagogies. Increasing racial, class, and gender conflicts in the contemporary university city, I argue, have origins in nineteenth century American educational values, as well as the way in which these values have been thoroughly redefined by their own spatial and pedagogical practices. Using post-structural cultural theory arising from Saussurean linguistics, I analyze the genealogical transformation of this spatial language through a heuristic I call genred space. Derived from the way in which the campus body engages with nationally shared education ideals, while simultaneously registering the desires and influence of its unique historical context, genred space enables an organic methodology from which to allocate differences in regional pedagogical formations across geographies and histories of the American university city.

Keywords: universities, campuses, education, knowledge production, pedagogy, semiology

Frank Michael Sims, Florida State University. Email: fms03c@fsu.edu; *Utilization of Ancillary Data in Object-Based Classification of High Resolution Satellite Imagery*

The purpose of this paper is to establish the benefit in utilizing object based image classification in combination with ancillary data such as a Digital Line Graph to classify land cover types associated with urban land use versus object based image classification that relies solely on the native image. Specifically, this paper will focus on the classification of roads from multi-spectral IKONOS satellite imagery that has a spatial resolution of 4 meters using the object base classification software eCognition Professional 4.0 by Definiens Imaging Co. and a rasterized Digital Line Graph (DLG) from the United States Geological Survey (USGS). The hypothesis presented in this paper is that the USGS' DLGs can be used to improve object-based classification of high-resolution satellite imagery by improving the creation of image objects in eCognition. A mask of pixels that were known to be representing physical roads in the raw image was used to assess accuracy. The two classified images were then compared with the mask and the accuracies were calculated using the TTA Mask Error method. The Overall Accuracy of the classification of roads from the IKONOS multi-spectral image rose from 0.7989 in the unclassified image to 0.9578. This is an increase of 0.1589 or nearly 15.1%, and is a substantial increase of accuracy that would lead us to the conclusion that the inclusion of ancillary data in the process of object based image classification would increase the classification accuracy of roads.

Audrey Singer, Brookings Institution. Email: asinger@brookings.edu; Jill Huttar Wilson, The Brookings Institution. Email: jwilson@brookings.edu; *Refugee Resettlement in Metropolitan America*

Though comprising only 10 percent of annual immigration to the U.S., refugees are a distinct component of the foreign-born population in many metropolitan areas. While the refugee experience reflects the interplay between international, national, and local actors, in practice it is influenced by the availability and efforts of distinctly local resources and institutions. Prior descriptions of refugee settlement patterns in the U.S. have been based on widely available state-level data. Using a special data tabulation from the U.S. Office of Refugee Resettlement, this paper is the first to report on the metropolitan destinations of refugees resettled between 1983 and 2004. This paper examines where refugees come from?documenting significant region-specific flows tied to various overseas conflicts?and where they land, finding that refugee destinations are shifting away from typical immigrant gateways housing large foreign-born populations to newer, often smaller, places. By linking refugee resettlement to metropolitan areas, this paper highlights differences across places and addresses the implications for service provision and demographic change within receiving areas.

Keywords: immigration, refugees, population geography, urban geography, metropolitan areas

Michael B Singer, PhD, University Of California Santa Barbara. Email: bliss@bren.ucsb.edu; *Flood Risk in the Sacramento Valley: The Status of a Creaky, yet Functional, Flood Control System*

The Sacramento River's flood control system was conceived as a system of weirs and bypasses that would shunt floods out of the leveed main channel into engineered floodways that drain directly into the Sacramento Delta. The system was later augmented with several large dams that heavily influence hydrographs directly downstream, but that have had modest influence on flows in the downstream portions of the basin. The system still relies on the weir and bypass system to keep low-lying communities dry during floods. However, the Sacramento Valley bypass system exhibits widespread evidence of impairment by erosion and sedimentation. Episodic flooding in the basin delivers large volumes of sediment to flood bypasses that probably originates from legacy tailings fans from the hydraulic mining era. These deposits, in addition to decreasing flow capacity, promote colonization of vegetation, which increases roughness and thereby decreases flood conveyance. Deposits forming at the entrance to bypasses increase stage thresholds for floods entering the floodway, increasing flood risk in the main channel downstream of the entrance. These deposits promote lateral channel migration away from the bypass entrance and/or erosion of the bed in the vicinity of the entrance, both of which apply additional pressure to the flood control levees along the main channel downstream of the entrance. These factors and fallout from the Katrina disaster have precipitated bypass sediment removal and levee repair along main channels, but it is unclear how effective these measures will be in the coming decades, especially within the context of regional climate change.

Email: jssmith@usgs.gov; *An Analysis of Trans-boundary Lakes in Africa*

This paper highlights the findings of an analysis of 15 trans-boundary lakes in Africa. Time-sequential satellite images of these 15 lakes were used to show areas of environmental change, including altered hydrology (dams, river diversions, water levels, and drained wetlands) and loss of valuable habitat. The images show the progressive impact of climate change and human activities on these shrinking water bodies. One example of significant change is Lake Victoria, the largest of all African lakes and the second largest freshwater body in the world, whose boundary is shared by three countries: Uganda, Tanzania, and Kenya. The population within 100 km of Lake Victoria is growing at an annual rate of about three percent, outpacing the continental average. Population density (persons per square kilometer) around Lake Victoria is much higher than the continental average (45 vs. 9 in the 1960s, 84 vs. 16 in the 1980s, 218 vs. 32 in 2000, and 246 vs. 36 [projected] in 2010, respectively), increasing human dependence and environmental pressure on the lake's resources. Satellite measurements taken since 1961 confirm the changing water levels of Lake Victoria, which is now about a meter lower than it was in the early 1990s. The lower water level is a growing concern for the population around the lake, because of the accelerated degradation of the entire lake ecosystem.

A primary goal of the North American carbon program (NACP) is to improve our understanding and ability to estimate regional carbon fluxes. A potentially significant component of the regional carbon budget is the lateral displacement of carbon by the human population. In developed countries such as the US food is grown in spatially concentrated areas and then transported to different regions for consumption by humans and livestock. This displacement creates sources and sinks of carbon that are distinct over space and time. In addition, the consumption and release of carbon by humans is dependent on sex and age amongst other factors. The main objective of this study is to estimate carbon expiration and other carbon releases from humans in the US. Having balanced the human carbon budget, we can use food intake as a proxy for carbon expiration from humans. Using demographic and food consumption data, released by the US Census and US EPA respectively, carbon consumption for different age and sex groups were determined. These results were then integrated with Oak Ridge National Laboratory's Landscan population model to produce a fine scale spatial database for human carbon exchange in the US. This database will be

useful in completing land-based carbon flux estimates and for estimating the ultimate fate of agricultural products in the US.

Binita Sinha, Diablo Valley College. Email: bsinha@dvc.edu; *The Impact of School Quality on Real Estate*

Since early 1990s, several reports have indicated that school quality significantly affects residential location choice as well as residential property value. School districts can act as 'pull' or 'push' factor in residential relocation. Case studies have revealed that houses in a top school district sell for several thousand dollars more than the ones in a less desirable school district. Also, the appreciation of residential real estate has a spatial variation that seems to follow the pattern of school district quality. Using GIS as a tool, this paper presents spatial analysis of school quality and residential real estate within the Santa Clara county, CA. This region, centered around the Silicon Valley and the city of San Jose has one of the most expensive housing markets in the nation. With the median cost of above \$600,000 for single family homes, the home ownership is less than 30% in this region. This paper examines whether quality of public school district - as measured by the most common indicators, has any significant impact on the housing price and if there is a pattern across the county of Santa Clara, CA.

Gaurav Sinha, University at Buffalo, The State University of New York. Email: gsinha@buffalo.edu; David M. Mark, Professor, University at Buffalo, The State University of New York. Email: dmark@buffalo.edu; *Extraction, Characterization, and Classification of Topographic Eminences*

Terrain classification systems are usually based on the continuous field-based model of topography. While this has served geoscientific research well, people's naive mental models of terrain are better matched by objects that have boundaries and can possess characteristic properties such as sizes and shapes. An information system for helping people find information about landforms will require methods to extract landform objects from continuous terrain data, assign characteristic properties to the objects, and then classify the objects into types. We report research on the extraction and classification of landforms in a case study of topographic eminences, which we define as landform features that stand above their immediate surroundings, and thus dominate people's visual fields. We extract the maximal extent of an eminence using a reversed drainage accumulation algorithm. We also extract a minimal region, representing the summit of the eminence, using geomorphometric parameters. The maximal and minimal regions of the eminences are then characterized in terms of their shape, size, relief, viewshed, and spatial relationships with other eminences. Using these measures, we investigate whether eminences in a region tend to cluster together in groups based on similar parameter values, which would imply the existence of "natural kinds" of topographic eminences. Because the recognition and classification of landform objects has been shown to vary across linguistic and cultural categories, our results could be useful in estimating the universality of perception eminence types across languages and cultural groups, and in providing language-specific geographic objects from a common environmental database.

Maureen Sioh, DePaul University. Email: msioh@depaul.edu; *Citizenscapes: Performing the Nation-State*

This paper traces Malaysia's postcolonial landscape to its roots in the British counter-insurgency campaign against the forest-based Malayan Communist Party (MCP) after WWII. Colonial reterritorialization of Malaya required both physical reconfiguration and imaginative recuperation of the landscape. The ultimate success of the counter-insurgency rested on two ambitious policies: the New Villages and later, the FELDA agricultural scheme. I explore how the two policies constructed moral 'citizenscapes' based on ethnicity that reflected the state's anxieties of control. The New Villages comprised a punitive landscape designed to contain 20% of the population suspected of supporting the MCP. Curfews and a geometric architecture combined in the New Villages to immobilize its population as well as render them visible to, and manageable by, the state. But I contend that an equally urgent task of the reterritorialization project for the Malaysian post-colonial government who sided with the British in the decolonization struggle, was the creation of a positive moral scopic politics of an essentialized national space inhabited by loyal subject-citizens in place of the anarchic rainforest and its insurgent population. Invoking contemporary scholarship on performativity, I analyze the state-sponsored agricultural FELDA schemes through the concept of biosettlements as theatrical stages for performing national identity embodied in the icon of the male bumiputera settler. The FELDA schemes accomplished two significant projects for producing state power: accumulating agricultural revenue and imaginatively recuperating the space of the nation through the thousandfold enactment of citizenship in the

settlers' quotidian agricultural rituals.

Keywords: counter-insurgency, performativity

Neil G Sipe, Griffith University. Email: n.sipe@griffith.edu.au; Jago Dodson, Griffith University Urban Research Program. Email: j.dodson@griffith.edu.au; *Oil and Mortgage Vulnerability in U.S. and Australian Cities*

Global oil prices have doubled in the past three years. While the impacts on cities of rising transport costs have so far been modest, the longer term strategic petroleum outlook suggests significant cause for concern. Urbanists need to begin comprehending how the impacts of rising fuel prices may impact upon cities and how these impacts will interact with urban social and economic processes. This paper will further this necessary debate about urban petroleum futures by examining the prospects of US and Australian cities. The research presented will extend previous Australian analysis by the authors to the US context. The paper will review the global petroleum context including projected supply constraints and timelines, examine alternative energy opportunities, and consider the likely impacts on US and Australian cities of energy supply constraint scenarios. The paper will present novel empirical research that assesses the likely distribution of socio-economic impacts due to rising fuel cost by incorporating a spatial 'oil vulnerability' assessment methodology constructed by the authors which is able to operate at a very fine level of geographic detail. This methodology is capable of identifying which socio-economic groups will be most impacted by rising fuel costs, and their location within US and Australian cities. The findings from this analysis will then be used to identify likely urban scenarios arising from future energy constraints. The paper will conclude by identifying spatially sensitive urban transport and planning policies that can assist to reduce the socio-economic impacts of urban oil vulnerability.

Environmentalists would argue that a resource is not a commodity. But, short of abolishing natural resource markets, separating policies protecting and sustaining resources from those insuring resource economic viability is uncertain at best. This is particularly true for marine species. The paper examines this dichotomy of purpose in the management of the queen conch (*Strombus gigas*), a univalve marine gastropod of the Caribbean Sea, southeastern Florida, and Bermuda. Accessible, edible and decorative, it is synonymous with the south Florida-Caribbean region, and has served for millennia as food, decoration, utensil, and ceremonial tool. Mid-20th Century capture technology and growing demand led to unsustainable harvest. Coupled with often unreported population data and inability to police illegal trade, commercial harvest threatens species viability. In response, regional and international policies of regulation, protection, and population replacement are being attempted. The U.S. is at the center of the international conch trade controversy. It dominates world import of conch products, leads in formulation of regulatory guidelines, and fosters research into species sustainability. Utilizing descriptive history and available recent catch and trade data, the paper discusses species exploitation. Drawing on recent management policies and practices, it speculates on economic and environmental implications of frequently dichotomous policy meant to both satisfy demand and maintain sustainable population levels.

The equitable distribution of public services is a growing concern in today's increasingly diverse society. Utilizing parks in Southern California as a case study, this paper demonstrates an approach that allows for the representation of accessibility using a continuous surface. If we assume that everyone uses the nearest park at some uniform rate, we can conceivably assign each person in the region to a park and thereby delineate a service area for each park. We accomplished this by generating Thiessen polygons around each park, assuming that everyone within the bounds of any one polygon uses the park at its center. For each park service area (i.e., Thiessen polygon), we assigned the corresponding population count from LandScan's population grid, thus providing an estimate of the potential number of people each park is serving; that is, an approximation of "park congestion" per park. Patterns in park congestion were examined as they relate to the socio-economic characteristics of each service area. Results of our

analysis show a compelling picture of the disparities between the location of park resources and the locations of populations that are disadvantaged and in most need. On one hand are smaller parks mostly located in densely populated neighborhoods, while on the other hand are large tracts of open spaces in areas that are sparsely populated. Areas that have high people to park area ratio, are mostly low-income communities comprised of racial and ethnic minorities. Areas that have lower people to park ratio, tended to be predominantly white and affluent.

Henry Sivak, UCLA. Email: henrysivak@gmail.com; *The Times and Spaces of the Exception: Law, Empire and Sovereignty*

In a recent article, the colonial historian Ann Laura Stoler argues that “that the formation and redistribution of zones of ambiguity [...] accurately describes a long history of imperial contest and expansion” (2006: 141). Taking this claim seriously, this paper analyzes French efforts to define and codify the legal status of “native” Algerian populations under colonial rule. In particular, it focuses on the special criminal penalties (the “régime de l’indigénat”) developed from 1874 and implemented until the end of WWII. It explores how debates over these laws, and over the legal status of Muslim Algerians in general, were bracketed both (i) by multiple and often contradictory visions for Algeria’s place within the broader framework of republican legal norms; and, (ii) by efforts to define France as a territorially expansive state-form. Against this backdrop, the paper turns to Agamben’s (2005) efforts to define the state of exception as a historically transcendent political form located at the metaphysical roots of human life, an approach that dislodges the concept from the particular times and spaces in which “exceptional” laws are crafted. This approach, I argue, marginalizes questions of statecraft, sovereignty and power and fails to capture the spatial and temporal visions that framed French colonial understandings of exceptional legal jurisdiction. I conclude by suggesting that the state of exception and the biopolitical powers it portends can be grasped at historically and geographically specific registers, putting into focus how specific legal orders are crafted and their limit conditions defined.

Jenny Sjöholm, Uppsala University. Email: jenny.sjoholm@kultgeog.uu.se; *Conceptualizing absorptive capacity and observation in economic geography*

In economic geography the importance of knowledge, learning and innovation are now commonly emphasized in our explanations of firms’ and regions’ development. Innovation is looked upon as an interactive and social learning process, which also is territorially embedded. However, there remain a series of interesting questions about how individuals take in new information and how we in fact learn from one another. In many situations we learn through observation, seeing things, or experiencing things; rather than through direct conversations or through working together in concrete situations. The presentation focuses on the absorption of knowledge through observation. It suggests we should focus on how people ‘simply’ absorb knowledge, information and inspirations, and that this form of absorption and observation is an important factor in explaining agglomeration and spatial patterning in a range of industries. It is argued that it could be useful for economic geographers to study how and where knowledge is absorbed, for example: from the street; from working in projects; from interaction in networks; and from involvement in the everyday workings of clusters. These processes can be both passive and active and therefore it is important for us to better understand how economic actors strategically use observation and their milieu in forming their innovative capacity. The presentation draws upon research on knowledge based industries - esp. the cultural industries ? to show how observation and absorption is vital for how individuals become innovative and why they are drawn to certain spaces.

Keywords: economic geography; knowledge absorption; innovation; cultural industries

This paper introduces a framework for conceptualising voluntarism as a critical process at the intersection of the sometimes complementary but often conflicting cycles of change affecting rural communities and health and social care services. We concentrate on the impacts of longer-term socio-demographic changes affecting the availability of volunteers and informal caregivers in rural communities and shorter-term structural changes in health and social care systems that assume volunteers and voluntary organisations have the capacity to play increasingly active roles in meeting the needs of people ageing in place. Using the framework, we analyse key findings from published case studies of ageing rural communities in Ontario, Canada and Waikato, New Zealand to illustrate how to interpret voluntary sector activities as a ‘barometer of change’, a ‘mechanism of adjustment’ to change, and an emerging ‘space of resistance’ to change underway in contemporary health and social care and rural sectors. We argue that developing a more nuanced understanding of the evolving role of voluntarism is a prerequisite for informed policy on rural ageing and care provisioning in Canada and New Zealand and elsewhere.

Emily H. Skop, The University Of Texas at Austin. Email: eskop@prc.utexas.edu; *São Paulo: Historic Immigrant Gateway to Contemporary Emigrant Outpost*

Since the 1960s, São Paulo has changed from a net importer to a net exporter of international migrants. Thus, it is an excellent exemplar of a former immigrant gateway that has become a contemporary emigrant outpost. This paper provides evidence of the key role of former gateways in (re) creating both old and new transnational links. On the one hand, connections from the past have prompted new emigration flows generations later. On the other, contemporary global economic linkages provide a context that promotes the creation of alternative transnational linkages and additional flows of emigration. The paper begins with an exploration of the historical role of immigration to São Paulo in the late nineteenth and early twentieth centuries. Then, we jump ahead nearly one hundred years and describe the ways in which those small numbers of foreign-born that do live in São Paulo today make their mark on the cultural landscape. But subsequently we contend that despite the nearly 200,000 immigrants living in São Paulo, mostly from Europe, Asia, and South America, the metropolis should be considered a former immigrant gateway, since it continues to lose migrants (both foreign- and native-born) every year. We examine the contemporary role of emigration from São Paulo in the late twentieth and early twenty-first centuries to suggest that this former immigrant gateway is now an emigrant outpost. Guiding the paper is the theoretical principle of social networks and transnational theory, which helps to make clear how this process happens.

Keywords: São Paulo, Emigration, Transnationalism, former immigrant gateway, social networks

Maya A Skowron, University of Illinois at Urbana-Champaign. Email: skowron2@uiuc.edu; Monika Stodolska, University of Illinois at Urbana-Champaign. Leisure time physical activity (LTPA) has been shown to have many health benefits, including controlling diabetes mellitus, reducing hypertension, and cardiovascular disease. Clinical studies have consistently reported high rates of these diseases, linked to obesity, among Latino Americans. As the same time, Latinos, and Latina women in particular, constitute one of the fastest growing and least active minority groups in the U.S. Thus, the objectives of this study were to: determine LTPA participation rates and attitudes toward LTPA among

Latina women; establish the levels of social support Latina women receive for participation in LTPA; and examine their constraints on LTPA participation. The study consisted of two phases. First, 269 questionnaires were collected at two community parks in Elgin, IL and at the Stuart Sports Complex in Aurora, IL. Subsequently, 16 in-depth telephone interviews were conducted. The results of both the survey and the interviews show that although LTPA participation rates among Latina women remain relatively low, women have positive attitudes toward LTPA and a strong support from their friends and families for involvement in LTPA. The most often reported constraints were related to women's family roles and to the necessity to take care of their children. Other constraints included lack of money, cold weather, and problems with transportation. None of the women reported any constraints related to negative cultural attitudes toward PA. These results contradict common beliefs that Latina women devalue LTPA and that they are constrained by the Latino culture that does not approve of women's involvement in LTPA.

Keywords: physical activity, women, Latinos, attitudes

Pamela Skraastad-Jurney, . Email: pamela.jurney@okstate.edu; *RAISE-ing the Standard of Education in Oklahoma*

This presentation tracks the progress of R.A.I.S.E., a three-year NSF GK-12 grant program. R.A.I.S.E. (Rural Alliance for Improving Science Education) pairs ten Oklahoma State University graduate students with teachers from three surrounding rural districts. Scientists, as the graduate students are called, work closely with their assigned teacher to design lessons that incorporate spatial technology into their respective subject matter. An overview of the inception of RAISE will present the potential opportunities that higher level education institutions can have in relating to public education. Classroom activities and lesson plans will demonstrate the effort of graduate students as they introduce students to GIS and GPS technology. Actual student work will illustrate the impact that R.A.I.S.E. has had for improving education in three rural Oklahoma schools.

Yelizaveta Skryzhevskaya, Doctoral Candidate, University of Idaho. Email: elizaveta_s@hotmail.com; *Foreign Direct Investments as a Factor of Regional Development in Ukraine*

During the last decade Foreign Direct Investments (FDI) became an important factor of regional development in the countries with transition economies. Ukraine is becoming more attractive for foreign investors because of its strong position in some external and domestic markets. There is a spatial pattern in the distribution of FDI among the Ukrainian regions. FDI tend to be more attracted to the Industrial East and the capital region of Kyiv. Also, there are areas of cross-border collaboration that affect FDI decisions. This research aims to define factors of FDI attractiveness and to estimate importance of these factors in different regions. To test the hypothesis about importance of FDI attractiveness factors, an assumption was made that economic development in Ukraine has a selective nature that is associated with urban and metropolitan areas and with cross-border proximity to FDI source countries. Also, the research provides some insights on the concept of Free Economic Zones (FEZ) and Territories of Priority Development (TPD) in Ukraine and the evolution of its development. We use statistical and cartographic analysis to draw conclusions that highlight spatial differences in FDI distribution in Ukraine.

Spectacular growth has marked the industry initiated by Malcolm MacLean with the sailing of the Ideal-X in 1956. While the growth of container shipping has been typically seen in terms of increasing vessel capacity, traffic growth, financial performance and competitiveness, it has been shaped also by organizational transformations. This paper provides an overview of the major companies that make up the container shipping industry, tracing the rapid adoption of containerization by American carriers to its diffusion to Europe and then Asia. During the last 10 years there has taken place a concentration of ownership, principally through mergers and acquisitions, to the extent that today a growing percentage of capacity is controlled by a handful of carriers. While such a concentration is typical of business sectors requiring large capital investments, the shipping industry has resisted complete corporatization. We demonstrate that over the last few years growth and innovation are being driven by firms that are led by individuals and families. At a time when major North American involvement in container shipping operations has come to an end, the spirit of innovation began 50 years ago by an American visionary is still evident in the entrepreneurial dynamism of many of the industry leaders.

David Slater, BA, PhD, Loughborough University. Email: d.slater@lboro.ac.uk; *Rethinking the Imperial Relation: mutations and resistances*

In a context formed by the re-assertion of imperial geopolitics, this paper considers three interwoven elements of the imperial relation. First, one encounters a politics of invasiveness that is expressed through strategies for the appropriation of resources and/or securing sites for military bases which are accompanied by the laying down of new patterns of infrastructure and governmental regulation. Such invasiveness can be appropriately seen as being cultural, psychological and political as well as being economic since the violation of sovereignty entails a negation of the will and dignity of another people. Second, there follows an imposition of the dominant values, modes of thinking and institutional practices of the imperial power on to the society that has been subjected to imperial penetration. Whilst the violation of sovereignty can be considered under the heading of invasiveness, the related imposition of cultural norms constitutes an effect of that violation where the process of geopolitical guidance can be interpreted in a context of imperial governmentality. Third, the imperial relation carries within it a lack of respect and recognition for the imperialized society. Hence the processes of penetration and imposition are viewed as being beneficial to the societies being brought into the orbit of imperial power. These three facets of imperial power are intimately interrelated and their mutations are affected by the nature of resistance emanating from within the imperialized society as well as by the possibility of anti-imperial opposition within the imperializing society.

Keywords: imperial geopolitics, power relations

Tom Slater, University of Bristol. Email: tom.slater@bristol.ac.uk; *From fighting to managing gentrification: a commentary and critique*

The role of public/urban policy has been a concern of gentrification researchers as far back as 1973, but very little work has examined the huge literature on the process to see how academics have interpreted the policy-gentrification link over time. This paper offers an historical and international lens on the awkward relationship between gentrification, public policy, and academic research. Throughout the 1980s, anti-gentrification activism and several publications were concerned with fighting the erosion of affordable housing and working-class displacement (Hartman et al, 1982). Indeed, Peter Marcuse (1985) argued very convincingly that a "variety of public policies", particularly those concerned with gentrification, foster such displacement. But in recent years, accompanying the 'third-wave' of gentrification, we have seen the 'eviction' of critical perspectives on the process, and an associated move away from fighting the process towards a policy discourse of 'managing' it, most recently endorsed by Lance Freeman (2006) in his book *There Goes The 'Hood'*. I offer a critique of what I have elsewhere called 'municipally-managed gentrification', and argue first, that we should not accept this management as the future of many cities, and second, that thinking about how to manage gentrification will serve no purpose other than to fuel the fires of neoliberalization.

Keywords: gentrification, urban policy, revanchism, displacement

Michael C Slattery, Ph.D., Texas Christian University. Email: m.slattery@tcu.edu; *Forensic fluvial geomorphology: lessons learned from being an expert witness in geomorphic litigation*

This paper presents the results of a field study on potential sediment source areas, soil erosion, and sediment delivery in a 93 ha basin in Gregg County, Texas. The work was conducted as part of litigation pertaining to sedimentation of three water bodies located on properties owned by the plaintiffs. In the case, the plaintiffs contended that the three ponds had been significantly impacted by accelerated erosion from property owned by the defendant, who had constructed a storage facility that had (a) caused significant disturbance of the topsoil, and (b) increased runoff from the impermeable surfaces, thereby eroding and transporting sand into the ponds. While geologists and engineers frequently testify as expert witnesses in geomorphic-type forensic activity, here I argue that geomorphologists should become far more involved in such cases in which they clearly could contribute to an appropriate outcome.

Keywords: fluvial geomorphology, sediment transport, litigation

Benjamin Sleeter, United States Geological Survey. Email: bsleeter@usgs.gov; *Dynamics of Land-Cover Change in the California Central Valley Ecoregion*

The California Central Valley is among the world's most valued agricultural lands. Rich soils, a favorable climate, and availability of water resources, located in proximity to major economic markets, contribute to making the (eco)region a leader in numerous agricultural goods. This research estimates the rates and dynamics of late-20th century land-cover change using Landsat TM and MSS data for five dates and four temporal periods. A random sampling was conducted and images were manually classified using a modified Anderson Level I scheme.

Postclassification comparison is used to provide a complete matrix of changes between 10 distinct land-cover/use types across the five analysis dates. Our results estimate that on average 0.6 percent of the ecoregion changed each year between 1973 and 2000. The highest period of change was between 1973 and 1980 at 3.27 percent. The most common conversions were grassland/shrubs to agriculture (2,175 km²), agriculture to grassland/shrubs (820 km²), agriculture to developed (552 km²), followed by grassland/shrubs to developed (306 km²). The estimated overall spatial change in the ecoregion was 10 percent. Population growth in the San Francisco Bay Area and Los Angeles have contributed to significant amounts of agricultural land converting to various forms of development. Grasslands found at the edge of the ecoregion, traditionally used for livestock grazing, are being converted to grow high-risk, high-value crops such as almonds and grapes. Natural marshes, grasslands, and wetlands are also facing pressures brought about by the changing landscape of the ecoregion.

Rachel Sleeter, United States Geological Survey. Email: rsleeter@usgs.gov; *Dasymetric Mapping for Estimating Populations Exposed to Natural Disasters*

The mission of the United States Geological Survey includes responsibilities to provide reliable scientific information to minimize loss of life and property from natural disasters. A critical first step in planning for natural disasters is to determine where people are located during different hours of the day, to gauge who is at risk at any given time. Communities require information on a scale and accuracy beyond what currently exists in order to prepare meaningful risk-response strategies. Our research outlines a methodology for estimating daytime and nighttime population density at a 10-meter pixel resolution through dasymetric mapping and areal interpolation. For nighttime estimates, parcel-level land use data provide highly detailed attribute descriptions used to delineate 3 residential density classes (high, medium, and low). Source population data from census block groups are interpolated across a 10-meter surface grid based on proportional area and weighted density from the parcel-derived land use data. Daytime population estimates are calculated with a combination of spatial layers including business/employee data, parcel data, and socio-economic attributes from the census block group level. Daytime and nighttime estimates have been measured and compared for 5 coastal cities in Clatsop County, Oregon. The most significant fluctuations in population between day and night are in Seaside and Astoria, where nearly half the population leave those cities during the primary daytime work hours.

Keywords: dasymetric mapping, areal interpolation, daytime population

Bjorn Sletto, PhD, University of Texas at Austin. Email: bjornsletto@mail.utexas.edu; *Miseducating the Pemon: Hegemony, Science and Common Sense in the Gran Sabana, Venezuela*

Conflicts surrounding natural resource management, as in the case of fire control and parks management in Venezuela, are enacted in cultural, linguistic domains, but also intimately linked with structures of political and economic domination. In the Gran Sabana, a mixed forest-grassland mosaic in eastern Venezuela, state environmental management interventions are in part attributable to political, strategic and economic imperatives and structures of unequal growth and development. The principal state agency in the Gran Sabana, the CVG, is charged with fire management in the Rio Caroni watershed, which is of strategic, national economic importance because of hydroelectric production. But everyday state fire management strategies are also contingent on and driven by scientific narratives and inventive histories, which work to depoliticize state fire management practice, forge the education of the indigenous Pemon, and, in Gramscian terminology, eradicate Pemon "folkloric knowledge" and establish state hegemony through a new "common sense" of fire management. However, a Gramscian perspective on the cultural dimensions of power also serves to illuminate Pemon counter-hegemonic practices. The CVG's attempts to investigate and eliminate indigenous fire culture have facilitated Pemon's ability to conceptualize the symbolic value of "burning," and to incorporate this once purely practical practice into their set of counter-hegemonic activities. This analysis suggests that a Gramscian approach to political ecology has the potential to make visible forms of resistance to structural inequalities operating in linguistic, symbolic domains.

Vanessa Slinger, Ph.D. Assistant Professor of Geography, Kennesaw State University. Email: vslinger@kennesaw.edu; *Community-based ecotourism in Ghana*

Lately, well-planned and managed ecotourism has been identified as a means of aiding in regional development while helping to preserve local traditions and biodiversity. In Africa, Ghana is one country where tourism has suddenly moved to the center stage of socio-economic strategies. In this interactive poster presentation I will outline Ghana's ecotourism development strategy, and

highlight the workings of two community-based eco-tourism projects in graph and pictorial format. Though Ghana's tourism industry is at its infancy, there are some indications of its capacity for generating and sustaining foreign exchange income while encouraging the conservation of local eco-systems and cultures. However, the situation in Ghana also shows that without careful consideration of local communities, the anticipated benefits of ecotourism can go unrealized and negative impacts can be produced instead. Further study of the use of ecotourism and the community based ecotourism projects in Ghana will add to our understanding of one such alternative of natural resource management.

Keywords: Ghana, ecotourism, development

Sean Sloan, McGill University; Smithsonian Tropical Research Institute. Email: seanpatrickslloan@mac.com; *Tropical Forest Transitions and the Hollow Frontier in the Bayano Region, Panama: Potential for Simultaneity and Succession?*

The forest-transition thesis observes off-farm employment, rural emigration and land abandonment as drivers of afforestation. Yet, at the landscape scale, few examples confirm the significance of such variables or illustrate how a transition might arise out of earlier patterns of land-cover change. The hollow-frontier model of land-cover change, characteristic of Latin American colonization frontiers, observes similar drivers as having contrary forest-cover outcomes and suggests land abandonment to be unlikely. Nonetheless, both models appear complementary: emigration or off-farm work may promote afforestation as well as pasture's predominance, and land consolidation typical of the hollow-frontier may herald forest plantations. Through interviews with colonist households in Panama's Bayano frontier I reconstructed land-cover histories and utilized regression analysis to associate land-cover change with emigration, off-farm income, and other household variables. At the regional-scale, I combined satellite imagery, GPS-based ground surveys and aerial photographs to produce land-cover change maps (1990-2000) illustrating the spatial dynamic of reforestation amidst pasture expansion and deforestation. Findings highlight the parallel nature of deforestation and afforestation processes respective of each model of land-cover change. Emigration and off-farm employment do not necessarily herald the afforestation expected by the forest transition, but may associate more with deforestation, as per the hollow frontier. Interestingly, reforestation in Bayano depends on land consolidation processes particular to the hollow frontier. Results recommend the refinement of the forest-transition thesis' assumptions as well as variation in the thesis in accordance with the contexts that precede a transition, so producing an array of context-specific forest-transition theses.

Keywords: land-use land-cover change, Panama-Bayano, forest transition, hollow frontier, deforestation, afforestation

Rachel Slocum, St. Cloud State University. Email: rachel_slocum@hotmail.com; *Race at the market*

The Minneapolis Farmers' Market mobilizes practices in support of 'the local' but also lives with a reputation that its goods 'fell off the truck' en route from California. It provides a market for smaller scale predominantly Euro and Hmong-American growers who tend to grow quite different things. The market mingles white, coffee-toting, suburban tourists and East Africans seeking bitter greens; alternative food consumers looking for 'home grown' and Latino families purchasing fruit. All this makes it a place to consider what race is and how to practice anti-racism. Feminist theories of embodiment offer productive analytic paths for this question. Moira Gatens, for instance, suggests understanding bodies as nodes of interconnections in constant interchange with environments. Elizabeth Grosz proposes that a focus on bodily practices, rather than identity, might prove a useful approach to politics. Elspeth Probyn invites a re-consideration of the offspring of contact. The world distribution of racisms, to use Meaghan Morris' term, needs to be confronted in ever more creative ways as old hierarchies persist and new configurations of inequality develop. Anti-racist theory and practice and studies of food spaces might gain creative energy from feminist ideas on embodiment.

Keywords: race, feminist theory, farmers' market

Andrew Sluyter, The Louisiana State University. Email: asluyter@lsu.edu; *Environment, Capital, and Ranching on the Argentine Pampas, 1800s-1900s*

The rapid expansion of ranching and agriculture across the Argentine Pampas in the late nineteenth and early twentieth centuries dramatically transformed the grassland environment and closely related to the growth of the metropolis of Buenos Aires and to foreign investment, immigrant labor, consolidation of national territory, and other features of the emergence of the capitalist nation-state. The economic, political, and social processes involved have generated a substantial and sophisticated literature. The environmental, and in some regards the technological, processes remain relatively unknown, however. This paper presents results of ongoing research into the environmental history of the rapid expansion of cattle ranching across the Pampas. A focus on

water-lifting technology provides one entry into the complex natural/social processes involved. Data include field observations of relict, artisanal water-lifting devices that antedate import of mass-produced windmills from the US, early patents, and cadastral records that span the original land grants to soldiers who fought the war against the former native population of the Pampas and their subsequent assembly into large estates by capitalists. Results are interim but provide a basis for comparison with other, better understood cases such as the US Midwest and Great Plains and for understanding such cases in relation to one another: for example, in relation to commodity markets and technology diffusion.

Keywords: Argentina, environmental history, ranching, technology

Lukas Smas, Department of Human Geography, Stockholm University. Email: lukas.smas@humangeo.su.se; *Consumption and Property Development in the CBD*

This paper highlights that urban consumption and property development are interrelated in multiple ways and that these intersections are important for city formation processes generally, but particularly apparent in CBD reconfigurations, as well as for the practices of the new global cultural economy. The real-estate sector is significantly dependent upon global linkages but also much entangled with local institutions and other actors such as retail firms. The public sector still play an important role in the CBD encouraging particular projects based on a certain type of politics. A global urban politics where the built environment and representations of the city are seen as essential for attracting investments and putting the city on the global map, thus much dependent on property development and the real estate sector, and underpinned by assumptions of interurban competitiveness and specific forms of urban consumption. These different types of intersections and relations are explored through examples from Stockholm, but in a global perspective with Sydney as a particular referent. The paper argues firstly that new spatial configurations of consumer service spaces emerging in and around CBDs are especially important intersections, critical for both local urban development and the global economy as well as for social everyday life in the city. Secondly, that in order to appreciate the value of these spaces it is necessary to populate city formation processes and global urban politics with people and things, i.e. with producers and consumers of the spaces and the service practices and the product transactions constituting them.

Keywords: consumption, property development, real estate, city formation, global urban politics, CBD, planning, Stockholm

Sarah Smiley, University of Kansas. Email: ssmiley@ku.edu; *Colonial Urban Planning and Racial Segregation in Dar es Salaam, Tanzania*

Colonial urban planning schemes implemented in Dar es Salaam produced a racially segregated city. Tanganyika was both a German colony and a British Mandate and both administrations applied Building Ordinances that established construction standards for three zones in the city. These standards segregated the city into European, Asian, and African zones by dictating the type of home that could be built in each area. By requiring certain levels of sanitation, both administrations successfully segregated the city without enacting any formal segregation legislation. Using documents from the Tanzania National Archives, this paper discusses the evolution of racial segregation in Dar es Salaam. Particular emphasis is given to how the British administration justified racial segregation and how it used informal policies to achieve this ideal. Interviews with Europeans, Asians, and Africans living in contemporary Dar es Salaam demonstrate that these colonial patterns of racial segregation have persisted so that the city is still divided into three zones.

Keywords: Tanzania, urban planning, segregation

Olga V. Smirnova, Ph.D. Student, University of North Carolina Charlotte. Email: ovsmirno@unc.edu; Gerald L. Ingalls, Univ of North Carolina Charlotte. Email: gingalls@email.unc.edu; *The Impact of Annexation Policy on the Growth of Central Cities*

This paper reports the results of an ongoing investigation of the relationship between annexation policy and growth of central cities, metropolitan statistical areas, number of municipalities, total number of governments, and number of special districts. Our overarching goal is to see if annexation policies, normally set by state legislatures, have an impact on the health of central cities of metropolitan areas. To test these linkages we employ a classic typology of state annexation laws, which gauges the range of options for public involvement in the decision to annex. All MSAs in the US and their primary central cities are the observations for the analysis. We test the ability of the selected variables to classify MSAs in annexation types by employing Discriminant Analysis. We test the significance of relationships between classification variables using one-way ANOVA. We also examine the misclassified cases, mapping the results of the analysis. We found that annexation policy impacts the growth of central cities and the increase in the number of special districts in MSAs. Those states that encourage annexation see relatively higher population growth in central cities

and lower levels of increase in special districts compared to that of the MSA. Our analysis suggests that flexible annexation procedures (more than one alternative way of annexation) also encourage growth of central cities and discourage in special districts.

Keywords: annexation, central city growth, MSA growth, discriminant analysis

Adrian Smith, University of Wales, Aberystwyth. Email: aas00@aber.ac.uk; *New Methodologies for New Economic Geographies*

Current research into 'soft' capitalism has shifted away from traditional political economy, and has sought to embed the economic in a series of academic and professional discourses and practices. Consultants, think tanks, management gurus and the media, for example, have all laid claim to a descriptive and normative ability regarding the present and future of capitalism. While a number of geographers have sketched out a broad outline for research into this circuit of knowledge, it is arguable that an emphasis on the manner in which sameness, in the form of relational subjects, networks, and embeddedness has been established at the expense of the simultaneous production of difference through which information is generated and dispersed. My research attempts to use ethnographic approaches to engage with cultural circuit of capitalism, and to deal with the difference and diversity of everyday capitalism. One of the major difficulties in researching reflexive in capitalism is in selecting a methodology which is suitable for excavating something so fluid and nebulous as reflexive capitalism is. I have used ethnography extensively to try and engage with reflexive capitalism, by attempting to take a series of 'snapshots' around the circuit, at sites such as professional conferences, within firms, and with the media. This paper illustrates one such ethnographical 'snapshot' with The Leadership Trust, a specialist provider of personal management development services relating to leadership.

A case study in the Nelson River estuary, Hudson Bay*

Marine mammals in arctic ecosystems, including beluga whales (Delphinapterus leucas), often face seasonally scarce resources. Here, small environmental changes can have substantial affects on health and fecundity. Global oceanographic, climate, and general circulation models predict that the most extreme and acute effects of global warming will occur in the Arctic. Most of the current conservation concerns in the Arctic are centered on these effects. Belugas may be vulnerable to changes in their environment for many reasons including their strong philopatry to certain sites of summer aggregation. This research describes aspects of beluga whale summer ecology. We studied the effects of inter-annual water level variations on locations of belugas (Delphinapterus leucas) in the Nelson River estuary, Manitoba, a hydrologically pulsed ecosystem. Radio-telemetry and aerial survey data for belugas collected over the summers of 2002-2005 were used to test the hypothesis that belugas remain farther offshore during a summer with more river outflow. Model variables included tide level, depth, year, Julian day, day quartile, and age-sex class. Belugas were farther offshore during wet years (2005) within the study area. Results are discussed in relation to hypotheses on beluga summer estuary use. Understanding how changes in the estuarine environment affects belugas will help answer the over-arching question of why most belugas use estuaries every summer, and contribute to the knowledge on beluga ecology and management of its habitat.

Barbara Ellen Smith, Virginia Tech. Email: smithbe@vt.edu; Jamie Winders, Syracuse University. Email: jwinders@maxwell.syr.edu; *"We're Here to Stay": Employment Casualization and the Social Reproduction of Immigrant Workers in the U.S. South*

Employment casualization may reach its apex with new Latino immigrants in the U.S. South, where immigrant workers often practice great temporal and spatial flexibility to maximize earnings in labor markets long characterized by extreme exploitation. Research in Nashville, Memphis and rural southern locations suggests that employers frequently favor new immigrant workers not simply for the reason typically explored by labor-market economists (low wages) but also for immigrant workers' reliability in a casualized employment context requiring them to work unexpectedly and move frequently. Adapting to unreliable jobs, immigrant workers stretch family relations not only transnationally across national borders but also regionally within the U.S. itself. However, as casual employment practices, and their attendant labor geographies, construct immigrant workers as ephemeral (in concert with immigration policies that place unauthorized immigrants "outside the law"), immigrants seek to situate them-

selves and their families in place, as permanent social residents of the U.S. This paper explores the structural frictions among employment casualization (as effected by both employer action and state immigration policy), its labor geographies, and immigrant workers' countervailing efforts to locate themselves and their processes of social reproduction within the South. Embedded in these frictions are multiscalar processes and conflicts over space and place that require an explicitly geographical imagination and that can contribute to more robust theorizations of migrant labor within geography. Forming the theoretical basis for a forthcoming study, the paper examines the gendered, classed, and racialized implications of this new geography of transnational and regional Latino migration, social reproduction, and labor.

Benjamin N. Smith, Florida International University. Email: bsmith@fiu.edu; *Who's Afraid of Persian Gulf Investors? A Case Study in Cultural Economy*

As Dubai Ports World's attempted takeover of management contracts at several U.S. ports demonstrated, businesses from and business practices within the Persian Gulf are viewed with suspicion by the West in general and U.S. in particular, because of the oil wealth that underlies them and fears of terrorism. In this paper, drawing on news reports, interviews, and observations gathered during four months of fieldwork in Dubai, I will explore the discourses surrounding Persian Gulf business practices and how the business class of the United Arab Emirates of Dubai attempts to overcome those both domestically and in overseas investments. It is my argument that while Dubai's business culture does have a very long way to go in terms of workers rights, the way their and other Persian Gulf countries' capitalism is discussed in the West has not moved much beyond tropes set during the days of Orientalism - tropes which Dubai businesses often attempt to subvert. This paper augments other work done concerning the cultural economy, in that it shows how cultural-spatial imaginaries are far from absent in supposedly rational economic practices.

Keywords: Cultural Economy, Dubai, Orientalism

Betty Elaine Smith, Ph.D., Eastern Illinois University. Email: besmith@eiu.edu; *Human Dimensions and Tropical Environments of Ecuador*

Expeditions and research have been undertaken in Ecuador during the twentieth century by scholars in the natural and social sciences that would be of interest to geographers. Results have been published in discipline specific journals, often with little interdisciplinary interaction or knowledge. This research focuses on English language articles of the past century. Full text digital availability through online library vendors provides access to new sources of information relevant to Ecuadorian geography. While no one of these articles may suffice to provide an overview of the human and natural history of Ecuador, a geographic synthesis and awareness of prior findings offers the possibility of making new associations and identifying interesting relationships between humans and their past and present environment.

Brenton G. Smith, B.A. Geography, S.F.S.U., 1991, California State University Northridge. Email: theapco@hotmail.com; *The highway landscape as a petroleum landscape, land-use, and wise-use*

Persons with respiratory conditions, or persons with compromised immune systems, as well as younger persons and older persons can all be more sensitive to air pollution, and considered sensitive receptors. In the State of California, of concern from the regulatory perspective is air pollution that creates or increases the health risk to people, especially people considered sensitive receptors. When a new school is required by a school district certain guidelines are to be followed, and a degree of flexibility is afforded. A general rule is to avoid, if possible, locating a school near a source of air pollution that may aggravate or precipitate adverse respiratory conditions or contribute to a long-term health risk. This project illustrates the importance of understanding spatial relationships when making planning decisions. The questions arise: How close is too close, and why is close too close? Highways present a variety of landscapes, the thesis is that this landscape in particular is not a healthy landscape. This project invites the curious to examine similar landscapes, although this particular landscape does not exhibit extremely high traffic flow, the question becomes: Are there similarities to very highly traveled landscapes? How can urban highway landscapes be described? Can landscape land-use be improved? This project investigates these questions.

Keywords: Traffic, air pollution, risk, receptor, petroleum, landscape, waste

Daniel S. Smith, Antioch University, New England. Email: danielsomerssmith@aya.yale.edu; *Environmental Regionalism as Discipline: The Northern Forest of New England and New York*

This talk examines environmental discourse related to the rural, forested margins of northern New England and New York, especially an interstate region called the Northern Forest that has been embraced as a symbol and political vehicle for environmentalism. I examine the origins of metropolitan conceptions and practices related to northern landscapes, how this discourse developed over time, and how it has functioned politically in different historical contexts. I use a post-structuralist perspective, examining power relations both in terms of explicit political struggles involving class and urban-rural relationships and at the overarching level of discourse that gives shape to those struggles. I make use of historical texts related to tourism and environmentalism, as well as ethnographic research. What stands out over time is the persistent coupling of, on one hand, the construction of symbolic difference between the modern metropolis and an imagined, non-modern rurality and, on the other hand, the intensification of material and political linkage between metropolitan and rural areas. The construction of difference lies at the heart of the objectification and Foucaultian "discipline" of rural nature and culture, which in turn facilitates the intensification of linkage. The two trends are functionally related, as the "protection" of seemingly non-modern nature and culture ensures continued production of both material and symbolic commodities, while commodification and economic growth serve as a basis for mainstream environmentalism. Environmental advocacy that relies on a romanticized Northern Forest is problematic both for local communities and regarding environmental problems that transcend regional boundaries.

Keywords: northern forest, discourse, regionalism, tourism, foucault, cultural politics

Darren Paul Smith, University Of Brighton. Email: D.Smith@bton.ac.uk; *The manufacture of new student landscapes and lifestyles*

This paper argues that a second-wave of studentification is unfolding within many British cities, which is tied to the development of large-scale, purpose-built student accommodation by private sector consortiums. It is contended that these new student landscapes may yield detrimental social, cultural and economic effects, which are similar to the impacts of relatively high concentrations of students within housing of multiple occupation, and the private rented sector. The discussion points to the growing prevalence of redefined student lifestyles, and a blurring between student and young professional identities and living arrangements. It is asserted that the manufacture of these new student geographies and lifestyles are connected to neoliberal models of urban regeneration, and wider trajectories of urban gentrification.

Keywords: students, studentification, gentrification

Derek A. Smith, Carleton University. Email: dereka_smith@carleton.ca; *Undoing the Revolution? Regional Patterns and Local Consequences of a National Land Reform Program in Mexico*

The México Indígena research team chose for their topic of the First Bowman Expedition the study of what they now consider to be the most significant land tenure change in Mexican history. The Programa de Certificación de Derechos Ejidales y Titulación de Solares (PROCEDE) is a national program that has involved mapping the external boundaries and, in most cases, internal divisions of over 27,500 ejidos and other "social properties" in Mexico since 1992. The scope of the program is significant, affecting an area of over 880,000 square kilometers, or roughly 45 percent of the country. Some three million people have received certificates for individual land parcels that were until recently considered inalienable common property. This paper overviews the implementation of the program and analyzes regional differences in participation rates, the partitioning of communal lands, and resistance to the program. While some of the ostensible goals of the program are laudable, there are serious concerns. Local social and environmental consequences, including changes in community governance, increased socioeconomic differentiation, loss of forest cover, and threats to the cultural survival of vulnerable indigenous populations, are also discussed.

Keywords: land tenure, neoliberal policies, Mexico, PROCEDE, indigenous peoples

Graham Clarke, University of Leeds. Email: g.p.clarke@leeds.ac.uk;
Joan Ransley, University of Leeds. Email: j.k.ransley@leeds.ac.uk;
Janet Cade, University of Leeds. Email: j.e.cade@leeds.ac.uk; Obesity:
Individual choices or environmental influences?

Obesity and diabetes are increasingly prevalent in the United States and the United Kingdom. Governmental policy focuses efforts to reduce the growth of obesity on individual choices ("Eat less, exercise more!"), however, research indicates that an individual's home and work environments can contribute to increased weight gain (Morland et al 2006). This study explores the hypothesis that where a person lives and works directly influences his/her weight. The research focuses on healthy and unhealthy food access in Leeds and Bradford, West Yorkshire, with the intention of extending the 'food desert' debate into public health. We use a combination of methods to study the complex relationship between food access and obesity. Firstly, a spatial interaction model identifies areas of poor healthy food access (potential 'food deserts'). A spatial microsimulation model, SimHealth, simulates the prevalence of obesity across Leeds and Bradford and cluster analysis indicates regions with statistically significant high rates of obesity. Multilevel modelling techniques identify the significant individual and area level variables that influence high obesity prevalence. These relationships are further explored in the microsimulation model using 'what-if' modelling. 'What-if' modelling estimates the individual level impact on obesity when food access is changed (for example, the addition or removal of grocery stores and fast food outlets). These techniques provide a useful estimate of environmental influences on obesity and predict the possible outcomes of adjusted food access. Although the relationships may not be straightforward, SimHealth is a valuable tool for understanding the individual level impacts of environment on obesity.

Chinese American Identities: Ethno-spiritual Communities and Social Spaces

This project explores ethnic identities among English-speaking Chinese Americans in an ethnic church in the Baltimore urban region. The concept of ethno-spiritual communities is employed to analyze the expression and articulation of Chinese American identities through the mediating beliefs of evangelical Protestant fundamentalism. Chinese American communities and ethnic religious practices are situated within the broader scales of changing geopolitical and structural constraints of neoliberalism and globalization. This analysis of the social space of the informants applies theoretical concepts from Bourdieu such as social capital, habitus and field. Qualitative approaches (semi-structured interviews, participant observation and discourse analysis) allow for an intensive engagement with informants, and affirm the importance of these approaches for any geography that engages seriously with the agency of individuals acting and struggling within structural contexts. In accord with the thematic emphasis of the session, this discussion is developed in detail. Preliminary conclusions stress that heterolocal networking enables individual actors to

reinforce solidarity and accumulate social capital through intermeshed ethnic and religious practices. Likewise, a fundamentalist Christian cosmology shapes specific discourses and imaginative geographies, and commonalities of class frame lifestyle attitudes and socio-political dispositions. These methods and conclusions embed this study of the social spaces of ethnic religious institutions firmly within contemporary and critical human geography.

jssmith7@ksu.edu; The Effects of Transnational Migration on a Small Village
in Zacatecas, Mexico

Each year thousands of people from rural Mexico (both documented and undocumented) emigrate to the U.S. seeking employment. The literature on this pattern of international migration between the U.S. and Mexico is both diverse and substantial. Few studies, however, have investigated the impact that transnational migration and the flow of remittance money has on rural villages and the quality of life for local residents. The purpose of this poster is to share the preliminary results of my field work in the town of Chalchihuites, Zacatecas, Mexico during the summer of 2006. My findings reveal changes in: 1) local cultural traditions (e.g. housing, sense of community, food ways), 2) commercial activities (e.g. personal savings and investment, shopping opportunities), 3) community development (e.g. 3 for 1 program, government programs and expenditures), and 4) quality of life for women (e.g. gender roles, health issues, marital issues). I look forward to sharing the details of my results with you and listening to your thoughts and feedback.

jvsmith@truman.edu; Contrastive religio-cultural impacts of published
Christian and Islamic scriptures in Africa: a spatial perspective

Much has been written about Christian missions as agents of culture change. Less discussed has been the cultural and religious transformations wrought by the advent of mother-tongue scriptures. Even less addressed has been the comparative societal influence between Christian vernacular scriptures versus Islamic Arabic scriptures. And there is a considerable lacuna in the geographic literature. This paper selects a number of African ethnolinguistic groups having published scriptures and examines them according to a set of variables in their cultural geographic context. The intent of the paper is to falsify the compelling hypothesis of Lamin Sanneh that vernacularization was the key to vibrant indigenous Christianity and ethnic solidification, while literacy in Arabic and an extra-local geographic orientation buttressed a robust Islamization while subsuming the local ethnic reality to the greater global Islamic religio-culture realm.

Jonathan M. Smith, Texas A&M. Email: jmsmith@tamu.edu; Free
Thought in the Early Nineteenth Century United States: A Chapter in the Great
Western Apostasy

In the eighteenth century there began to spread through Europe and its dependencies a set of doctrines united in their antipathetic repudiation of Christianity. This great Western apostasy has for more than two centuries been represented as a movement opposed to belief and faith, both epistemologically and politically; however today, when many question the special status the foundational presuppositions of "enlightenment" have long enjoyed, enlightenment beliefs no longer appear so exceptional, noetically speaking. The "grating roar of pebbles" that Matthew Arnold reported in "Dover Beach" was, perhaps, not so much the "long, withdrawing roar" of the "Sea of Faith" as the rushing tide of a new faith. Viewed in this postmodern light, modern free thought, in its many sects and heresies, appears as but one more belief system. It was invented; it spread as much by inveigling as by enlightening; and it has today very possibly run its course and reached its limit. This paper is part of a proposed historical geography of this movement. Using records of free thought newspapers, societies, and evangelists, it begins to map the spread of "infidelity" in the United States, from the rationalist enthusiasm of the late eighteenth century to the early Darwinian apologetics of the mid nineteenth century.

Laura J Smith, PhD, Macalester College. Email: smithl@macalester.edu; *Poor Credit, No Problem? Modeling High Foreclosure Areas*

Many public policies that promote homeownership focus on barriers to becoming a homeowner, but the ability to sustain homeownership is an important policy concern as well, especially in addressing racial homeownership gaps. Analysis of foreclosure data can enhance the effectiveness and efficiency of homeownership preservation programs. This study examines the statistical association of foreclosures with social, economic, and housing variables to assess whether it is feasible to identify in advance neighborhoods at risk of high foreclosure rates. The resultant model shows that foreclosure risks were highest in neighborhoods with elevated credit risk indicators and a high proportion of homeowners who are recent minority buyers. The model also shows that using a popular proxy for credit score data may exaggerate linkages between neighborhood racial composition and foreclosure risks. Because the model allows foreclosure counselors and other homeownership preservation programs to focus their mitigation efforts, there would appear to be social benefits to enhancing public access to data on mortgages, foreclosures, and foreclosure risk factors.

Laurel C. Smith, University of Wisconsin-Milwaukee. Email: laurels@uwm.edu; *Embodying neoliberalism: A video-mediated tale of ethno-development in southern Mexico*

In this presentation I take a look at how indigenous women in the isthmus region of the southern state of Oaxaca come to embody neoliberal development strategies deployed the Mexican state. First I situate a video produced by a woman's association affiliated with a regional organization designed to undertake ethno-development. Here I consider how these women acquired the equipment and technical expertise to make videos by tapping into distinctly gendered geographies of learning produced by the sort of socio-spatial entanglements commonly called transnational networks of advocacy. Then I screen portions of this video so that we might hear indigenous women's critical analyses of how neoliberalism intimately impacts their lives. Afterwards, I draw on recent research on mobility, feminist geopolitics, and indigenous identity politics in order to locate the technocratic testimonials that travel by means of this video.

Laurence C. Smith, Ph.D., University of California - Los Angeles. Email: lsmith@geog.ucla.edu; Yongwei Sheng, Ph.D., University of California - Los Angeles. Email: ysheng@geog.ucla.edu; Glen M. MacDonald, Ph.D., University of California - Los Angeles. Email: macdonal@geog.ucla.edu; *Could thawing Arctic permafrost reduce the abundance of northern lakes?*

The locations of ~200,000 large northern hemisphere lakes (sized 0.1 to 50 km², northwards of ~45° N latitude) are intersected with new global databases on topography, permafrost, peatlands, and LGM glaciation to identify some first-order controls on lake abundance and land area fraction at the pan-Arctic scale. Of the variables examined here, glaciation history and the presence of some form of permafrost appear most important to northern hemisphere lake abundance. Lake densities and area fractions average ~300-350% greater in glaciated (vs. unglaciated) terrain, and ~100-170% greater in permafrost-influenced (vs. permafrost-free) terrain. The presence of peatlands is associated with additional ~40-80% increases in lake density and ~10-50% increases in inundation area. Lakes are most abundant in glaciated, permafrost peatlands (averaging ~13.2 lakes/1000 km²) and least abundant in unglaciated, permafrost-free terrain (~1.2 lakes/1000 km²). Lake statistics are surprisingly similar across continuous, discontinuous and sporadic permafrost zones, decrease modestly in isolated permafrost, and drop sharply in the absence of permafrost. A crude calculation based on "space-for-time" substitution for all glaciated/lowland terrain (~2.7 X 10⁷ km², of which ~48% is currently in some state of permafrost) suggests that in a "permafrost-free" Arctic, the number of lakes could be reduced from ~192,000 to 103,000 (-46%) and their total inundation area reduced from ~560,000 to 325,000 km² (-42%). A more plausible scenario of thawed discontinuous, sporadic and isolated permafrost suggests reductions to ~155,000 lakes (-19%) and 455,000 km² (-19%), respectively.

Marissa Smith, Arizona State University. Email: marissa.lsmith@asu.edu; *Urban expansion in Mexico: Research on the fringe*

The largest increase in future population is predicted to occur in medium sized cities in developing countries. Settlements on the urban fringe of these growing areas find agricultural land being converted to commercial, residential and industrial use. This research examines the land use change on the urban edge of Oaxaca, Mexico, and the associated environmental and social consequences of this transformation in the peri-urban community and municipality of San Jacinto Amilpas (SJA). The city of Oaxaca is expected to grow from a current popula-

tion of approximately 500k to over a million by 2010. The dramatic growth and subsequent environmental change embodied in the process of urbanization is altering the economic, cultural and political face of SJA. Interviews with community members indicate that these changes have resulted in increased crime and conflict, amplified class divisions, and a population increasingly focused on individual pursuits and new sources of livelihood which are slowly eroding traditional community cohesiveness.

The 2001 National Land Cover Dataset (NLCD) includes landcover/landuse, impervious, and canopy data products. These NLCD products were compared with eCognition classified data based on 0.6 m resolution Emerge imagery, and RESAC landcover/landuse data based on 30m sub-pixel classification of ETM+ data. These comparisons were carried out for a number of small watersheds within the Baltimore Ecosystem Study located in Baltimore County, Maryland. The NLCD canopy layer underestimates canopy cover by an average of 12 percent and as much as 61 percent. Larger differences between NLCD and eCognition classified data appear in heavily forested areas than in more developed watersheds, indicating that the NLCD canopy product is more precise in detecting canopy absence than presence. The NLCD impervious product was very similar to the eCognition classified data for pavement and slightly less similar to classified data including both pavement and buildings. Discernment of differences between NLCD and RESAC development density data was difficult given the differences in class definitions. Differences in grass classification are also significant. In the RESAC data, grasses are divided into the classes: pasture, row crops and other grasses. The NLCD grasses are divided into classes: developed open space, pasture, grassland, and cultivated crops. eCognition classified grasses are included in the HERCULES class: fine vegetation. There is no relationship between any of these classes of grass as defined by these three datasets. Thus, determination of grass-related categories, such as lawn area, requires more detailed analysis of imagery.

Monica Smith, MA, National University of Singapore. Email: monsmith68@yahoo.com; *Is neoliberalism an illusion? The case of Sri Lankan domestic migrant workers in Lebanon*

This paper will provide a context-specific examination of the processes and spaces through which neoliberal programs are constituted in particular forms. In attending to the migration experiences of Sri Lankan domestic workers in Lebanon, I will address the constitution of such workers' identities through marketized discourses and policies of the Lebanese and Sri Lankan States. My work will enter with spatiotemporal specificity the debate of the "illusion of neoliberalism" (Castree 2006). Engaging with Agamben's (1998) theoretical work on a modern homo sacer my work will examine how power operates within two state bodies to maintain the position of maids and nannies as persons residing in legal abandonment. Through an analysis of the day-to-day operations of these offices, which simultaneously ensure the demand of cheap, flexible labour while working within a human rights framework, I will examine how such bodies collude to produce and reproduce female migrant workers as residing in a state of exception. Ultimately, I hope to explore: 1) how Agamben's work, which asserts that power is operating differently within the modern democracy so that the political is defined as a border between the human and the inhuman, can inform our understanding of neoliberalisation; and 2) how the articulation between certain neoliberal policies and human rights efforts extend our understanding of neoliberalism.

Nathan P. Smith, Center for Latin American Studies, University of Arizona. Email: npsmith@email.arizona.edu; *Verifying Equity? Regulation and 'Quality' in the Guatemalan Coffee Sector*

The contemporary international political economy of certified coffee is characterized by growing competition among distinct social and environmental regulatory regimes (i.e., certifications) as NGOs, governments, and corporations struggle to legitimize standards and labels. To better understand how these tensions have emerged and evolved, this paper examines the implications of Starbucks' C.A.F.E. (Coffee and Farmer Equity) Practices program. Some observers claim that the C.A.F.E. Practices process of 'verification' allows Starbucks to circumvent working exclusively within certified fair trade and organic networks, diluting stringent social and environmental standards by focusing on increased 'economic transparency' to improve the overall 'quality' of their supply chain. Empirical evidence from Guatemala, long a test-site for

C.A.F.E. Practices, supports this critique. Moreover, in the case of Guatemala, the C.A.F.E. Practices strategy reinforces the preponderance of large-scale coffee plantations. Yet the future implementation of C.A.F.E. Practices, paradoxically, may also generate market opportunities for producer cooperatives and medium-scale farms that successfully combine multiple regulatory regimes. More broadly, the C.A.F.E. Practices strategy demonstrates how the role of the private sector vis-à-vis the future expansion of social and environmental regulation of commodities is increasing in scope and influence, thus introducing new tensions and producing new alliances between corporations, NGOs, governments, and producer associations. In conclusion, I argue that the C.A.F.E. Practices framework represents a larger shift underway in the coffee sector, whereby new regulatory regimes predicted on market-based approaches, which link together notions of 'quality' and 'economic transparency,' seek supremacy and undermine efforts to reform trading practices and mitigate environmental degradation.

Neil Smith, Distinguished Professor, Graduate Center, CUNY. Email: nsmith@gc.cuny.edu; *After Military Geography*

Co-authored with Deborah Cowen, this paper suggests that modern social forms are haunted by a history of national war. National military strength relied on the development of ideals of 'solidarity' and technologies of social insurance, and was only meaningful in a context where military jurisdiction outside the nation was distinguished from police authority within. Although this separation between police and military was never absolute, it was nevertheless the basis for distinguishing a set of social rights and legitimate forms of violence inside the nation state from another world beyond. Today, the separation between 'internal' and 'external' security that was so central to geopolitical military and social forms is giving way. This is occurring through the blurring of police and military jurisdiction and practice and the privatization of security forces, the severing of longstanding connections between citizenship and soldiering, and the decline of national conceptions of social security. These trends challenge geopolitical conceptions of security and may be better captured by a 'geo-economic' notion of political power. In keeping with these shifts we argue that critical investigation of 'security' in its social and state forms, cannot focus singularly on the military, on military geographies, or even militarization, nor can it assume national forms. A geo-economic conception of security underlines conflicts between the logics of territorial states and global flows of production, the proliferation of non-state and private actors entangled in security, and the recasting of citizenship and social forms.

Patrick Caleb Smith, William Carey University. Email: johndeereemcc@hotmail.com; *Hot Water: The Historical Geography of Public Swimming Pools in Mississippi 1950-2005*

Swimming pools have been a part of Americana for many years. Every summer America's youth would end the school year and flood the local public pool for days of leisure and tomfoolery. In the mid-twentieth century, children used pools as places of society building and social development. Pools were places where boys wrestled and tried to physically outperform each other on the diving board. Girls used the pool as a place to catch up on the latest gossip and the model their newest outfits. Mississippi is no exception to the scene of a public pool. For many years these pools were the center of a young person's summer livelihood. Since 1950, an undocumented change has occurred in the quantity and magnitude of these public pools. This study patterns the change across Mississippi and how government and society have managed them.

Richard G Smith, University of Wales Swansea. Email: r.g.smith@swan.ac.uk; *Global cities and the geography of global command: beyond a fundamental aporia*

Saskia Sassen and Peter Taylor have made significant advances to the conceptualization of the 'global city' and the specification of the 'world-city network' respectively. These advances have been made on the basis of a particular argument about the 'strategic control' and 'command and control' of the global economy, which has led Sassen to formulate her 'global-city thesis and model' and Taylor his 'world-city network' thesis. The paper interrogates this body of work, and reveals why the theses put forward by Sassen and Taylor are ineffective as explanations of how global cities are configured. The paper moves on from the structuralism of global urban theory (Sassen, Taylor, and Castells) to engage critically with the potential of actor-networks, social studies of finance, and Badiou's concept of the event.

Keywords: Global Cities, Poststructuralism, Globalization

Sara H. Smith, University of Arizona. Email: shsmith@email.arizona.edu; *New Directions in Post Colonial Geography*

Critics have suggested that the concept of the 'postcolonial' is overly optimistic, and furthermore, that it privileges the 'colonial,' by making it the central, defining moment in the history of former colonies. Despite these critiques, postcolonial scholarship has opened up important questions that must be addressed, as well as a political position from which to engage in research. My comments will address the utility of taking a postcolonial approach to the study of religion and the geopolitics of the body in the Ladakh region of Jammu and Kashmir State, India.

Shannon M Smith, Michigan State University. Email: Smith361@msu.edu; *Gender and Non-motorized travel in Lansing, Michigan*

Overweight and obesity rates are steadily rising, and are cited by the Centers for Disease Control and Prevention as some of the most important public health issues that place second only to smoking as the leading causes of preventable death in the United States. A growing emphasis on combating weight gain by community design geared for active travel is emerging in urban planning and public health literature. However, disparities exist between men and women in the obesity rates, and so they must be studied separately. This paper examines the linkages between these gender disparities, physical activity, active travel, gender roles, lifestyle and community design in six Lansing, Michigan, area municipalities. Travel patterns from residents in six different neighborhoods are analyzed to show underlying factors and behaviors that contribute to different travel patterns, in terms of trip frequency, length or trips, and mode of travel, between women and men, and the relationship between non-motorized travel and public health.

Keywords: gender, travel mode, neighborhood design

Steve Smith, Missouri Southern. Email: smith-st@mssu.edu; *Geographic Imagination, Geography Scale, and Epistemology: contextuality and the limits to spatial justice*

The Geographical Imagination as a theoretical device has impressed upon geographers not only the importance of understanding the relationship between local, national, and global politics, but has also opened up considerable debate regarding the efficaciousness of the concept itself. This paper explores the epistemological dimensions of the Geographic Imagination by examining both the commentary literature on the subject and its relevance to questions of justice, geographic scale, and the Geographical Imagination writ large. This work suggests that in order to more fully incorporate Geographical Imagination as an analytical tool theorizing needs to occur that addresses the deep epistemological issues encountered by asserting the existence and importance of "spatial knowledge." To this end a discussion of philosophic notions such as contextualism, as well as the application of comparative method will be discussed as mechanisms that provide opportunities for advancing our understanding of the Geographical Imagination, geographic knowledge, and geographic approaches to justice.

Susan J. Smith, MA, D Phil, Durham University. Email: susanj.smith@durham.ac.uk; *Housing Futures: Keeping the Options Open*

This paper is about the encounter between housing and financial markets. The title is a play on words. It reflects the concerted effort that is underway to boost the trade in house price derivatives. It is fashionable to worry about this innovation; and it is certainly wise to be cautious. The global economy is fragile and irreparably unequal. On the other hand, without such a market, some of the world's smallest (home) investors and (housing) asset holders are denied the financial instruments that bigger businesses routinely use to manage risk. So I ask the questions: what are the implications if a liquid market in housing derivatives does develop; what are the consequences if it doesn't; and why should geography matter?

Email: matisziw.1@osu.edu; *Decision Support for Network Interdiction Mitigation and Protection*

Our increasing reliance on networks of all types (transportation, communications, energy, etc.), coupled with their increasing vulnerability to disruption, makes it critical to protect these networks from natural disasters, terrorist attacks, and other incidents (otherwise known as interdiction). However, choosing how to best protect, reinforce, and improve a network given a limited budget is a complex problem. Here we discuss methods to support decision-making and planning for network interdiction. We have developed a systematic approach that examines the effects of different interdiction scenarios on a network based on a variety of performance measures. Previous studies have illustrated the difficulty of identifying one clear worst-case scenario that can guide planning efforts, as many scenarios exist that are significant to understanding interdiction impacts. The developed decision support methodology allows for more comprehensive exploration of interdiction impacts, statistically and visually, and facilitates examination of "what-if" planning scenarios.

Ian Snider, Master's Student, Appalachian State University. Email: naturelink@gmail.com; *Documentating Transhumance Adaptation: An ancient lifestyle, a digital approach*

The Niti Valley of the Garhwal Himalaya, India is home to the Bhotiya people. This indigenous group has a long standing tradition of transhumant pastoralism. This way of life has changed due to political, economic, and ecological forces at work in the region. The majority of herders have sold their flocks and taken up other livelihood activities. The remaining shepherds live increasingly on the margins of society and have been forced to adapt their traditional grazing practices to the new political landscape. This paper will focus on how I propose to document these adaptations through field interviews and the creation of a spatial multi-media product. A spatial data base of the region is however difficult to assemble due to its proximity to the northern border with occupied Tibet. However, for the purposes of transcending scale and bringing the perspective of the herders themselves to the academic world the best available data will be used for a global e-conference to be held in partnership with the Mountain Forum. A website will be maintained and updated from the field via satellite internet. A study team will be assembled for the field work and directed by myself and regional partners. The results of the project will be a spatial multi-media product displaying interview footage, audio clips, and pictures upon the modeled landscape.

Stefanie Snider, University of Southern California. Email: ssnider@usc.edu; *Fat Girls and Size Queens: Alternative Publications and the Visualizing of Fat and Queer Eroto-Politics in Contemporary American Culture*

FaT GiRL: A Zine for Fat Dykes and the Women Who Want Them, produced between 1994 and 1997 in the San Francisco Bay Area by a changing collective of self-identified fat lesbians, was a project based in visual and textual self-representations of fat dykes. Seven issues were created during its run; each features what might be called "explicit" photographic self-representations as well as fiction, poetry, recipes, and calls for activism. This essay investigates the discursive and material formulations of this zine as an object of visual culture within the fields of fat and queer activism. The objects of study here, zines, photographs, and fat queer female bodies, are imbricated and analyzed as projects of fat and queer enunciations of empowerment and visibility within a mid-1990s context of identity politics and its backlash. Also considered is the first issue of a new fat and queer zine, *Size Queen: For Queen Size Queers and Our Loyal Subjects*, created by Max Airborne and Cherry Midnight, two former members of

the FaT GiRL Collective. Beginning its circulation in 2005, several years after FaT GiRL folded, with a potentially wider agenda and audience, *Size Queen* might be seen to both complicate and revisit the assumptions and manifestations of fat and queer identity to which FaT GiRL earlier brought attention. Intense visual and textual analysis of these zines begins to tell us about how fatness, gender, and sexuality inform each other and are mapped onto bodily artifacts and politics in contemporary American culture.

Keywords: fat, queer, photography, alternative publication, body, identity politics, self-representation

Todd M Snider, Central Washington University. Email: sniderto@cwu.edu; *The Conversion of Private Timberlands to Residential Development in the Cle Elum River Watershed*

Unprecedented residential development has been occurring throughout Kittitas County, Washington. Many of Upper Kittitas County's private forestlands have been rezoned, parcelized, fragmented, and converted to residential development. Land use in the Cle Elum River watershed, in particular, has experienced significant change in the past decade. Thousands of acres of traditional timberlands have recently been converted to residential parcels and marketed as such, paving the way for continued growth. Despite the quantity of conversions and uncertainties regarding the ensuing effects, no attempts had previously been made to comprehensively document these changes and relate them to the historical resource-use context of the area. The purpose of this research was to document the location of all conversions, the quantity of converted land, the rate of change, and how it has affected area land cover, land use, ownership, road and utility networks, and perceptions of natural resources over the past fifty years. By relating recent land use change to historical trends, we can understand the past and improve planning for the future.

Email: elizabeth.siedlecki@gmail.com; *Soil Development on Alluvial Terraces of the Elwha River, Washington*

The Elwha River has been chemically, physically and ecologically altered for the past 100 years by the Glines Canyon and Elwha Dams. The reservoirs behind the dams have trapped over 13.8 million cubic meters of sediment that would have otherwise been transported downstream. The lack of sediment input has impacted soil development. The dams also stop marine derived nutrients from entering the soil via salmon carcass decomposition. This study evaluates the impact of the dams on floodplain and alluvial terrace pedogenesis. Multiple terraces provide an opportunity to examine soil development characteristics in the drainage by controlling environmental factors to create a chronosequence. We hypothesized that the higher (older) terraces will be more developed than the lower (younger) terraces. Two soil pits were excavated on five different age surfaces; active floodplain, one meter terrace, high terrace, Pleistocene end moraine and Pleistocene terrace. For each soil pit, physical characteristics were recorded according to USDA specifications. The floodplain had the least developed soil with only a thin A horizon (12 cm). The one meter terrace had a thicker A horizon (20 cm). The most developed soils were the high terrace and end moraines sites. The high terrace sites had very developed A (30 cm) and B (40 cm) horizons. The end moraine sites had O (1-2 cm) and E (20-25 cm) horizons with multiple B horizons (70 cm). From our research we realized that pedogenesis at the study site does not reveal a simple chronosequence model for the Elwha River valley.

Keywords: pedogenesis, soil chronosequence, dams, Elwha River

Adriana S Soares, Riverside County TLMA. Email: asoares@rctlma.org; *A Spatial Analysis of Dengue Fever in the Americas, 1995 - 2005*

ABSTRACT A Spatial Analysis of Dengue Fever in the Americas, 1995 - 2005. The World Health Organization considers dengue to be the most important vector-borne viral disease, potentially affecting 2.5 billion people in tropical and subtropical countries throughout the world. Dengue fever (DF) and the more severe manifestation dengue hemorrhagic fever (DHF) re-emerged in the Americas by 1970s and 1980s. In 1998, the Americas reported more than 700,000 cases of DF and more than 12,000 cases of DHF. What are the factors causing the increase in DF and DHF incidences in the Americas? One may think of natural factor such as climatic changes. Natural causes, however, may only be a part of the cause and effect complex. The primary contributing factor to this problem may be man-made such as urbanization. Since 1950s, an increasing proportion of the world's population lives in cities and suburbs. In the last two decades, DF and DHF cases have grown because of increasing human contact with forest areas as well as increasing urbanization. Until now, most researches have

focused on the biological, entomological, and clinical aspects of DF and DHF. Location-specific studies of DF demonstrating an integrated use of socio-economic and cultural practices are very few. This calls for an in-depth study of the factors that influence DF and DHF in Latin America. The main objective of this paper is to show that certain factors such as demographic, social, economic, and environmental changes greatly increase the potential for the spread of DF in Latin America.

Adam D. Sobek, University of Utah. Email: adam.sobek@geog.utah.edu;
Harvey J. Miller, University of Utah. Email:
harvey.miller@geog.utah.edu; *Methods for comparing space-time paths*

Classic travel behavior theory states that the desire of individuals to participate in activities provides the motivating factor which drives human movement. Although individuals have freedom to choose activities, research has shown for a given population, stable clusters of similar activity schedules emerge based on demographics and socio-economic factors such as an individuals' income, household size, and car ownership status. These clusters are termed representative activity patterns. Traditional cluster dimensions include the type of activity, the timing and distance from home or other anchors. A remaining question is whether the detailed geographic properties are also similar and, if so, how similar? This paper leverages the constructs embedded within the theory of Hägerstrand's time geography to investigate the geographic similarities between space-time paths. Specifically, for two space-time paths for two individuals with similar demographics, are the geometric patterns exhibited by the space-time path similar? This paper compares several methods for analyzing the similarity of multi-dimensional vectors and adopts a technique from remote sensing based on the root mean squared error (RMSE) measure for multiple endmember spectral mixture models. This method is computationally efficient and allows quantitative comparison of the similarity of space-time paths.

jconary@utep.edu; *US / Mexico Border Counties in Transition: A New Geographic Perspective*

This paper explores the question, If the 24 southwest border counties were a 51st state in the United States, how would they compare to the other 50 states? In 1998, former Texas Comptroller John Sharp published *Bordering the Future: Challenge and Opportunity in the Texas Border Region*, which provided an assessment of the economic, political, and social condition of the Texas border counties. This report, commissioned by the U.S./Mexico Border Counties Coalition, extends those findings to all of the 24 U.S. counties that are contiguous with Mexico. As a region, if these 24 counties were the 51st state, how would they compare with the rest of the nation? By examining data across 13 dimensions or areas, the conclusion may be that politically the 24 border counties may have more in common across legal jurisdictions (i.e., states) and can logroll their interests to have the federal government better respond to critical regional needs. In addition, the data suggests that the presence of San Diego County as a border county greatly skews the data and in many ways misrepresents the region's overall condition.

sohl@usgs.gov; Roger Auch, Science Applications International
Corporation. Email: auch@usgs.gov; *Contemporary Land Cover Change in the Coast Range Ecoregion*

The Coast Range ecoregion stretches from northwestern Washington to San Francisco Bay, covering a thin strip of coastal land within 125-km of the Pacific Ocean. Forest use, defined as both lands with forest cover and recently cut forest, covers over 80% of the ecoregion. The timber industry is the primary driver of land cover change in the ecoregion. Nearly 11,000 km² of forest was clear-cut between 1973 and 2000, making the Coast Range one of the most dynamic ecoregions in the United States, with nearly 27% of its area experiencing some form of land cover change during that time period. Because of extensive fires in the late 1800s and early 1900s, large swaths of forest in the ecoregion were likely too small for commercial cutting prior to 1960. Cutting increased rapidly after 1960, peaking during the 1986 to 1992 time period. However, rates of cutting during the 1980s may have been unsustainable, given the typical 40- to 60-year cutting cycle in the ecoregion, and cutting declined in the 1990s. Decreases in cutting were also a result of actions taken to save Spotted Owl habitat, including the establishment of the Northwest Forest Plan. Over 95% of land cover change in the ecoregion is directly related to timber activities, with much smaller amounts of change caused by urban expansion and shifts in agriculture.

Youngsinn Sohn, UMBC (University of Maryland Baltimore County). Email: ysohn@umbc.edu; *Urban Forest Characteristics and Patch-size Effects on Urban Heat Islands*

Urban tree canopies efficiently dissipate the solar energy received through evapotranspiration and shade impervious surfaces preventing the original heating of the impervious surface and storage of heats by impervious surface materials. Through urban heat islands mitigation, urban forests also can significantly reduce the air pollution in urban area. Due to this positive contribution of urban tree canopies to urban environment, many studies on urban forests mapping and assessment have been performed recently. The goals of this paper are threefold: (1) map urban forest patches within the Baltimore city and surrounding areas, (2) analyze the urban forest distribution characteristics, and (3) assess the patch-size effects on urban heat island phenomena. The analysis results will provide the urban forest characteristics and the assessment results of functional performance of urban forests in mitigating urban heat islands effects in the Baltimore city area.

Email: ; *Polycentricity, knowledge-intensive business services and space of flows in an emerging global city: Evidence from Dublin*

The paper engages with a polycentricity debate by examining the notion introduced by Manuel Castells (1989, 2000) that a 'new spatial logic' has emerged as a consequence of the informational or knowledge-based economy. Such an economy, it has been argued, is increasingly dominated by a 'space of flows' and is accompanied by the emergence of 'informational cities' taking a form of 'multifunctional, multinuclear spatial structures'. This proposition is examined in the context of Dublin, an emerging global city. Focusing on knowledge-intensive business services (KIBS) in the Greater Dublin Region the paper argues that a much more complex geography is emerging, opening up several fundamental questions and highlighting the need to re-conceptualise the 'informational city'. In this context, the paper makes the point that, in addition to the role of information and communication technology (ICT) emphasised by Castells, there is a need for a conceptual approach that would be more sensitive to a number of other crucial factors that shape the geography of KIBS. In particular, the role of the state (in its various geographical scales) and the labour market conditions are highlighted, alongside corporate locational strategies of KIBS themselves. Furthermore, it can be argued that a combined effect of these factors may not automatically support the emergence of 'polycentric' spatial structures.

Miriam Solis, Undergraduate, University of California, Berkeley. Email:
mvsolis@gmail.com; *(En)Gendering Agricultural Reform: Geographies of Governance in Rio de Janeiro, Brazil*

Brazil was one of two countries in Latin America to explicitly introduce the possibility of granting land tenure to both a man and a woman during the 1980s. Yet, the first and only Brazilian Agrarian Reform Census in 1996 revealed that national rate for women's land tenure was less than 13%, hardly the idealized number. The same Census revealed that the state of Rio de Janeiro (RJ) beat the national average by more than four times over: the percentage of land titles that were granted to women was 53%, about 1/3 third of who were single mothers. To understand political and economic processes that shaped this gendered dynamic, qualitative techniques were used. Specifically, archival data of governmental agencies and social movements was examined and interviews were conducted with leadership of agrarian reform movements in the state, the directors and staff of governmental agrarian reform agencies, and scholar-activists whose work focuses on land distribution in the state. My research findings indicate that the state was the ultimate beneficiary in granting women's land tenure in RJ. This necessitates analysts to go beyond the celebratory expressions driven by the territorialization process shaping the state's landscape. It is from this point of reference that this research further explores notions of the institutionalization of social movements, the (il)legalization of women's work and bodies, and agricultural reform as a highly gendered and capitalistic apparatus of the state.

Katrinka C. Somdahl, Macalester College. Email: somdahl@macalester.edu; Transition Embodied: Bird Brain Dance, at home in motion

This paper is intended to ask the question if it is possible to be at 'home' while in motion. I analyze the work of Bird Brain Dance, who performed a "navigational" dance project in the fall of 2002. Over the course of this dance project, choreographer Jennifer Monson and her company followed the migration pattern of tagged ospreys as they flew south from Maine to Venezuela. Each performance event began with a sensory workshop, followed by the performance itself, and concluded with a discussion amongst the performers and audience members. Ms. Monson uses the idea of "location" to ground her work in the bodily realities of those present. She creates a rooted sense of place, a home, in the moment of sensory awareness. This awareness is then contrasted to an analysis of non-places, specifically understandings of the spaces of migration and travel. I argue that like the migrating birds, humans are also inherently the repositories of their previous points of interaction, up to and including the present moment. In this way identity and home are never 'displaced' even while in motion. In this work, I pull from interviews and the performers on line journals to illustrate their embodied understanding of transition.

Melanie Sommerville, M.A., . Email: melanie.sommerville@gmail.com; 'Terrorist Ducks' and Tainted Salad Greens: On the Need for Critical Geographies of Food Safety in Canadian Food Systems

Over the past two decades, a series of food scares has driven public concern about the safety of food production systems to new levels. These developments, which have been one impetus for the growing popularity of alternative food movements, have not gone unnoticed or unaddressed by the Canadian federal and provincial governments. Indeed, discourses of food safety have become increasingly prominent in Canadian agricultural policy and regulation over the past decade, and, together with the creation of bodies such as the Canadian Food Inspection Agency, are increasingly shaping the structure, modus operandi, and future development of our food production systems. This paper examines the emergence and mobilization of key discourses of food safety in Canadian agricultural policy, their consequences for the everyday functioning of food production systems, and the responses they legitimize to recent 'threats' to and within these systems, such as those associated with the Avian Flu and the bacterial contamination of salad greens and carrot juice. The paper explores the role that linkages between food safety and food quality, and between food safety and food, human, and national security play in dominant food safety discourses. Through these explorations, the paper highlights a growing need for critical geographies of food safety, which explore the ways that dominant food safety discourses and the actions and responses they legitimize may be both reinstalling food production systems with questionable safety records, and limiting the development of the alternative food systems that consumers increasingly demand.

Jessica Rae Sunday, Oregon State University. Email: jsunday@geo.oregonstate.edu; Assessing Green Space in Urban and Suburban Oregon

This study analyzes green space in cities in the Willamette Valley, Oregon to establish sustainability trends in the region based on certain indicators. Green space is characterized using a standard definition of unsealed, permeable land. This definition is extended for the purposes of this study to include land that is classifiable using remotely-sensed data. The cities of Corvallis and Eugene were chosen based on their perceived attention to environmental issues, population characteristics, and educational statistics. The first objective was classification of land cover types in terms of nominative characteristics using Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER). Vegetation

cover is also assessed through a Normalized Differential Vegetation Index (NDVI). This is followed by a comparison to the characteristics of an intermediately located city, Harrisburg, OR, which is not considered politically green. The final objective is an analysis of trends in green space coverage (on a scale of percentage green) over the past six years. It is expected that green space in cities considered to be environmentally friendly will increase over a specified time period, as will the surrounding urban areas, due to their geographical proximities.

Email: ; Modeling the Impacts of Canopy Structure on Energy, Water and Carbon Fluxes through a Loblolly Pine Stand: Uniform vs. Gappy Canopies

The impacts of uniform and 'gappy' canopy structure on fluxes of radiation, latent heat and net photosynthesis are investigated using a series of modeling tools that incorporate the two-leaf concept. We verified model simulations against radiation and eddy covariance flux measurements collected during May to September of 2001-2003 at Duke Forest Ameriflux site, located in a loblolly pine stand in the Blackwood Division of Duke Forest, near Durham, North Carolina. Statistical tests found that the modeled daytime net radiation, evapotranspiration (ET) and net photosynthesis based on the uniform canopy structure are significantly higher than the corresponding values based on the gappy canopy structure. Modeled values of net radiation, ET and net photosynthesis are also significantly different from the measured net radiation, ET and estimated Gross Ecosystem Production (GEP) for both canopy structures. However, the correlation between the modeled net radiation and measured values is highly significant ($R^2 = 0.95$) for both canopy. The modeled daytime latent heat fluxes correlates reasonably well with half-hourly daytime measurements ($0.45 = R^2 = 0.71$), while the simulated net photosynthesis correlates marginally well with GEP estimates ($0.26 = R^2 = 0.43$) for both canopies. Sensitivity analysis found that the differences between the two types of canopies are primarily caused by the fraction of sunlit leaves and the radiation intensity on the shaded leaves. The differences decreases as the canopy cover and LAI increases, but never disappear. Therefore, canopy structure may have significant implications for up-scaling ecosystem processes using remotely sensed LAI measurements.

Guan Song, Northern Illinois University. Email: songguan1981@hotmail.com; Jie Song, Northern Illinois University. Email: jsong@niu.edu; Simulations of Dynamic Vegetation over Grasslands and Croplands

Global CO₂ and water cycle are closely related with each other by CO₂ assimilation and transpiration of vegetation. Grasslands cover 40% of land surface and play important roles on carbon sequestration. Inaccurate simulations of most land surface models (LSMs) are mainly caused by simple descriptions of vegetation dynamics responding to the changing environment; in particular, the importance of belowground dynamics is ignored. The objective of the research is to improve the simulation ability of LSMs on CO₂, water, and heat fluxes between atmosphere and grasslands by integrating detailed processes of vegetation dynamics into one of the current LSMs, called NOAH. The added components include fast processes associated with photosynthesis and respiration, and slow processes associated with allocation, turnover of leaf and root, and decomposition of litters. The improved model will be driven by atmosphere observations, at sites of grasslands and croplands. The simulated results, such as fluxes of CO₂, latent heat, and sensible heat, will be compared with Ameriflux observations. LAI will be compared with remote sensing data. The comparisons will be analyzed and discussed.

Keywords: CO₂ flux, vegetation dynamics, belowground biomass, Land Surface Model

Jie Song, Northern Illinois University. Email: jsong@niu.edu; Guan Song, Northern Illinois University. Email: ; Vegetation and Root Dynamics for the Land Surface Modeling

Global water and carbon cycles are closely linked both aboveground and belowground in the Earth system. Biosphere can potentially become a sink or source for atmospheric carbon dioxide as long-term changes in temperature and precipitation occur. Current climate models consider primarily aboveground components of vegetation because these can be easily observed. However, root distribution in response to environmental conditions is missing in most land surface models. The objective of this study is to construct a dynamic root module that links water availability with root distribution. Primary root stores most of carbon and anchors the plant, while it is the fine root that absorbs water and

nutrient and is especially dynamic. In the dynamic root module, fine root is differentiated from the primary root in their carbon allocation, turnover and function. The geometry of the primary root is assumed to be conical with rooting depth calculated from total biomass in the primary root and stem diameter. The fine root allocation in the soil is assumed to depend on available soil moisture at that depth. The dynamic root module enables accurate account of carbon in primary root, fine root, litter, and soil as well as respiration and moisture at different soil depth. It further enhances the understanding in surface-atmosphere exchanges in energy, water vapor and carbon dioxide.

Kuan Song, University of Maryland. Email: songkuan@yahoo.com; John Townshend, University of Maryland. Email: jtowshe@umd.edu; A Geolocation Accuracy Assessment of NASA Landsat GeoCover

The legendary Landsat program has benefited research, engineering, and education for more than two decades. One of the recent important benefits is the creation of Landsat GeoCover funded by NASA. GeoCover includes three 'Epochs': circa-1970, circa-1990, and circa-2000. GeoCover is free to the users worldwide. Its downloading volume from GLCF (Global Land Cover Facility) exceeds 8 terabytes monthly. GeoCover was orthorectified using the 1990s NIMA elevation, which was the best data available at the time but was also recognized as incomplete in certain but unspecified regions on Earth. This was suspected to have introduced uncertainties into GeoCover. Our study assessed GeoCover so that the researchers can be aware of the geolocation accuracy variations around the world. An algorithm was developed for this purpose, by examining the geolocation difference between GeoCover and the newly available SRTM 'Finished' data. This algorithm is based on the similarity between the shaded relief of elevation data and the natural contrast of Landsat imagery in mountainous regions. This algorithm was applied and can only be applied to the major mountainous regions. The following results are found: 1. In most regions of Earth, GeoCover has very high geolocation accuracy. The errors are simply of the scale of sub-pixel. The accuracy within continental US is close to perfect. 2. A significant amount of errors showed up in certain regions of Earth, noticeably part of the Andes and around the East African Rift. The algorithm can automatically adjust those problematic GeoCover images to the accuracy of SRTM data.

China has experienced a tremendous growth of its domestic air passenger transport in the two decades of transition towards a socialist market economy. The open-door economic policy of China and its obvious attractiveness as a tourism destination have swelled the ranks of visitors and business travelers, from overseas as well as China, while the personal income rise of a large segment of Chinese society is a major factor for business and leisure travel throughout the country. We start with an overview of the evolution of China's aviation industry in the dual context of economic reform and globalization. The breakup of CAAC's monopoly led to the birth of many airlines, currently under consolidation around three major carriers centered in the top cities. We follow by examining the main spatial patterns of the geography of air traffic within China, dominated by three major centers of growth in the East: Beijing, Shanghai and Guangzhou/Shenzhen, where the relevance of the hub-and-spoke concept in the Chinese context is doubtful at this time. We end by assessing the relationship between economic growth, the rise of tourism and the development of aviation in China. Government's aviation policies and economic dynamics are among the key proponents for the expansion of China's domestic air transport system, which is apparently dominated by the East Region, followed by the West and Middle Regions.

Yu-Ling Song, National Taiwan University. Email: yulingsong@yahoo.com; Nora LH Chiang, National Taiwan University. Email: ; Si-ming Li, Hong Kong Baptist University. Email: ; The Mobility and Attachment of Displaced Residents under Urban "Redevelopment" Projects in Shanghai

This research aims to elaborate the community relationships of residents displaced by redevelopment projects after their relocation through a comparative research based on two databases. One is a survey of 1200 Shanghai households conducted in 2006; the other is 10 in-depth interviews of Shanghai displaced residents in 2004 and 2005. The paper draws on the concepts of "place" developed in structurationist geography to understand the community relationship after relocation. Three interrelated aspects structuring community relations are analysed: first, the redevelopment and relocation planning of Shanghai in a

globalization context; second, the everyday life of the displaced residents; and third, their personal experiences and emotions in place. We find that traditional community relationships are replaced by services provided by the estate management company, and the displaced residents are generally satisfied regarding their day-to-day life. The conditions of buildings and the convenience of transportation and everyday life are the most important factors affecting residential satisfaction. The imagination of being a "Shanghai citizen" and "living in the inner city" and the discourse of "the city periphery now is the inner city of the future" make the displaced residents feel better even though they actually reside in the suburb. They look forward to enjoying the beautiful living of Shanghai citizen sometimes in the future.

Lynn Songer, University of Oregon. Email: lsonger@uoregon.edu; Susan Hardwick, University of Oregon. Email: susanh@uoregon.edu; Amy Lobben, University of Oregon. Email: lobben@uoregon.edu; The Effectiveness of Internet-GIS in an Introductory Human Geography

Increasingly, instructors turn to GIS as a teaching tool. Instead of teaching GIS, they harness the power of GIS as a tool for data exploration and explanation. Software such as ArcIMS allows instructors to organize and make available Internet-delivered "learning modules." Such delivery also appeals to the growing number of distance education students. But, what are the consequences of implementing these learning modules, especially in place of traditionally-delivered classroom lectures? This paper presents results from a study assessing the effectiveness of two problem-based learning approaches for teaching human geography. The control approach was designed around the use of static maps for student-centered problem solving activities. The research approach substituted internet-based GIS maps for static maps. Students from the University of Oregon and Lane Community College participated in the study. Assessment data included pre- and post-test efficacy surveys, pre- and post-test content knowledge questions from the released 2001 AP Human Geography exam, and a structured performance assignment.

Helen Sooväli, Tallinn University, Estonia. Email: helen.soovali@tlu.ee; Andres Kurg, Estonian Art Academy, Estonia. Email: andres@artun.ee; Dealing with the Past. Spatial Considerations in Contested Tallinn Town Centre, Estonia

2006 was a turning point in Estonian history. Economically booming, forward looking Estonia represent a success story among the former Soviet bloc countries. At the same time, Estonia has been struggling with its Soviet past expressed in the celebrations of the 'victory day' of WWII on May, 9, Tallinn 'liberation day' on September, 22 by Russian speaking minority; and the presidential elections resulting in the second coming of the national awakening. An emblematic icon of the contested histories, contemporary narratives of different ethnic and social groups and geographical representational belonging is a monument dedicated to Soviet soldiers who perished in WWII. The so called Bronze soldier monument in the heart of Tallinn town centre has been declared as 'no man's land' and guarded by policemen since 05.09.06 in order to avoid any provocative acts. After the downfall of the Soviet Union and the founding of the new Republic of Estonia the place has been reborn to a certain afterlife, becoming a contested site where symbolic battles are held over its meaning, where different territorialisations are literally acted out, thus showing the political meaning of the city as a public realm. With the monument battle, this paper seeks to find out Estonia's geographical imagination based on its multiethnic society. How do different ethnicities identify themselves geographically: with EU vs Russian Federation? Further, as this case illustrates the contestedness of space, we focus on the ongoing political, economical, cultural debates on Estonia's belonging to Europe, Northern Europe vs to Russian speaking territories.

Daniel G. Sorenson, United States Geological Survey. Email: dsorenson@usgs.gov; Rates of Land-Cover Change in the Puget Lowland Ecoregion

A land-cover study has been completed for the Puget Lowland ecoregion in the State of Washington. This national study attempts to describe the rates and driving forces of change on an ecoregion basis between 1973 and 2000. The Puget Lowland is one of the 84 ecoregions determined by the EPA's Level III ecoregions of the United States. Thirty-two 10-kilometer square areas were randomly sampled within the Puget Lowland to adequately characterize the ecoregion. Analysis of land cover change within these sample blocks was based on manual interpretation of Landsat MSS, TM, and ETM+ data for the core dates of 1973, 1980, 1986, 1992, and 2000. The TM and ETM+ classifications were resampled to 60 meters to correspond with the MSS data. Total spatial area

change for the entire study period is 27.8% which is the highest rate observed so far in the national study. The dominant land-cover conversions occur between the land cover classes that are associated with tree harvesting and reforestation. Except for the last time interval 1992-2000, the conversion from forest to other classes accounts for at least half of all conversions. Forest cover loss was 10%. The developed land-cover class showed the largest gain, increasing 6.8% during the study period with 72.5% of the land converting to development coming from forest. The time interval with the highest rate of change was 1986 to 1992, in which the rate was 2.3% per year of total change. This time period also coincides with the peak of tree harvesting.

Alexandre Sorokine, Oak Ridge National Laboratory. Email: sorokina@ornl.gov; Visualization of the US Electric Grid: The Cartogram Approach

GIS is a powerful tool for modeling of geographic networks such as electric grids, road and rail networks, and others. However, network and geographic space are significantly different and often points that are close to each other in geographic space are far from each other in the network space and vice versa. This presents a major problem for the visualization of the networks. The nodes and links that are necessary for understanding of the network operation are often congested leaving other parts of the map devoid of useful content. Also users often need to relate network elements and near-by geographic objects. In this study we suggest a computational approach to combine both network and geographic views on a single display. To achieve this goal we employ a well-known technique for constructing cartograms. In a cartogram the map space is transformed to present qualitative information. In our approach we transform map space to equalize the density of the map features of interest thus enabling user to discern separate network elements while preserving geographic context. First we calculate a map of the density of network elements. Then we use diffusion algorithm to calculate a dislocation matrix. Finally the matrix is applied to the network itself and other GIS layers. We use animation to simplify comprehension of the transformed map. The proposed method helped us to create maps of the electric grid that can clearly present the structure of the grid and show coincident geographic features at the same time.

Matthew Sothern, University of St. Andrew's. Email: msouthern@u.washington.edu; Pacific Queens: fa'afafine and neocolonialism in Aotearoa/New Zealand

Aotearoa/New Zealand, like many western countries, has witnessed dramatic increases in HIV/AIDS infections since the turn of the millennium. A significant proportion of these new infections occur in communities of Pacific Islanders in Auckland. Recent public health HIV prevention campaigns aimed at Pacific Island communities have emerged. Prominent among these campaigns are representations of fa'afafine, a Samoan form of transgenderism. This paper examines the spatial logics of these representations and contrasts them to the ways Pakeha New Zealander's are represented in HIV prevention campaigns. The paper argues that an epistemic insecurity in hegemonic western constructs of gay masculinity and gay sexuality is simultaneously disavowed and secured through the representational and spatial Othering of the Pacific transgenderisms of fa'afafine.

Keywords: Neocolonialism, HIV/AIDS, Transgender, New Zealand

Christopher E. Soular, United States Geological Survey. Email: csoulard@usgs.gov; Landcover Trends of the Central Basin and Range Ecoregion

Few multitemporal landscape-change data currently exist for basin-and-range regions within the United States. As part of the U.S. Geological Survey Geography Discipline's Land Cover Trends project, estimates of change for the Central Basin and Range ecoregion between 1973 and 2000 were calculated by utilizing a sampling strategy coupled with a manual interpretation of 11 landcover classes from Landsat imagery for five dates (1973, 1980, 1986, 1992, and 2000). An appropriate statistical criterion was selected to document and describe the rates of landcover change and how they vary spatially, thematically, and temporally. Harsh climate, infertile soils, and lack of viable resources have historically impeded anthropogenic land-use change in the Central Basin and Range ecoregion. Although these factors continue to minimize such change in the region, various other factors have driven contemporary change. Between 1973 and 2000, the footprint of landscape change in the Central Basin and Range ecoregion was 1.45% (or 4,978 km²). The most prevalent changes during the study period were fire disturbance and agricultural shifts across the region. These landcover changes can have far-reaching consequences, including the elimination of endangered flora, biotic vulnerability due to loss of habitat, and potential loss of human capital.

Keywords: Land-use change, landcover change, ecoregion, Great Basin, fire

Caleb Southworth, University of Oregon. Email: caleb@uoregon.edu; Matthew Allen Derrick, Department of Geography, University of Oregon. Email: mderrick@uoregon.edu; Reconfiguring Russia: How National Identity and Trade Networks Influence Regional Autonomy

Russia is commonly viewed as a monolithic, authoritarian state where the center dominates the politics of the periphery. In 2004, President Vladimir Putin eliminated the practice of directly electing regional governors in the country's 89 regions in favor of direct appointment. Deputies to the State Duma (lower house of parliament) were converted from a system of single-mandate electoral districts to proportional representation where voters chose party lists of candidates. Despite such changes, this paper examines sources of regional power and negotiation with the Kremlin that create varying degrees of autonomy. Why are some regions loyal to the center while others exert greater autonomy and attempt to negotiate for federal resources? Data on the Russia's 89 regions will be used to develop a scaled measure of autonomy based on the extent of majority party control of the regional assembly, the party affiliation of the governor and the proportion of office holders who are of the titular nationality. One expectation is that nationally defined, autonomous republics, such as Bashkortostan and Tartarstan, will exert more autonomy. Spatial data analysis will be used to show the effect of natural resources, economic stability in the regional economy and inter-regional trade ties on political autonomy. The main working argument is that despite authoritarian control of the political system, regional politics within Russia continue to shape the national agenda in terms of trade, privatization and foreign investment - all issues likely to change Russia's future status in Europe.

Jane Southworth, University of Florida. Email: jsouthwo@geog.ufl.edu; Lin Cassidy, University of Florida. Email: cassidy@ufl.edu; Michael W Binford, University of Florida. Email: mbinford@geog.ufl.edu; What's with all the classifications? Using continuous approaches to land cover change analyses within the Lower Mekong River Region

Human activities operating at multiple spatial and temporal scales induce changes in economic, social and demographic structures, land cover and land use, and natural resource extraction. Reciprocally, human activities are themselves influenced by the manner in which climate variation, variability in the quantity and quality of natural resources, and other processes of environmental change interact with sociocultural systems. We are currently working to integrate natural and social science analyses of social, economic, and biophysical variables to address the question of how their complex interactions generated the spatially and temporally shifting dynamics of human development and environmental change in the Lower Mekong River Region of mainland Southeast Asia over the past millennium. This research presents some of the initial results of the land cover change analysis and is used to highlight the often useless nature of land cover classification techniques currently in use. Within dynamic landscapes we need dynamic land cover analyses and we present results from continuous representations of land cover, specifically using thermal analyses and new thermal based vegetation indices of land cover change, to highlight the importance of moving beyond the simple classification scheme within land change science research.

Jacob Sowers, Kansas State University. Email: jsowers@ksu.edu; Desert But Not Deserted

A review of popular and academic literature reveals that the experiential desert landscape has traditionally been understood as wilderness. Narratives focus on adventure and journey in the midst of landscapes antithetical to dwelling and at-homeness. However, millions of acres in the Mojave Desert were opened for settlement in 1938 with the passage of The Small Tract Act. The act allowed people to buy 5 acre plots of land as long as they paid a nominal fee and built a structure. By the 1950s tens of thousands of cabins dotted the southern Mojave Desert. The following decades witnessed widespread abandonment due to inhospitable conditions and the growth of nearby towns converting the home-steaded areas into suburban landscapes. Although a few cabins remain in some places Wonder Valley is the last area to maintain a community and sport a largely unaltered desert landscape. Wonder Valley thus presents a paradoxical situation juxtaposing civilization and dwelling within a supposed wilderness landscape of journey. This paper explores how the citizens negotiate this situation by investigating the cultural landscape, participating in daily events, and conducting semi-structured and unstructured interviews. I have found that the desert landscape plays an essential role in feelings of at-homeness and place identity but the contrasting insider expectations have led to an ambiguous community identity and increasing social tensions. I believe that Wonder Valley is an

excellent example of an existential ecotone, in this case emerging from the overlapping experiential regions of wilderness and civilization.

Keywords: desert, wilderness, at-homeness, experiential landscape, existential ecotone

Stephanie Spahlinger, U.S. Bureau Of the Census. Email: stephanie.m.spahlinger@census.gov; Mapping System Development - Producing Millions of Maps for the 2010 Decennial Census

The U. S. Census Bureau requires paper maps and electronic map files to support the 2010 Decennial Census. Maps are used for a variety of purposes, depending on the census operation. Examples include: navigation (orientation), display of assignment areas for census takers; recording feature, boundary, and address updates to a spatial database; and relating census geography to statistical data. The U.S. Census Bureau will design and produce millions of paper maps to support census operations. Many operations are short term and involve tens of thousands of temporary enumerators. A compressed operational schedule, coupled with high volume map production, requires a non-interactive mapping process. In this environment, a computer performs all mapping functions. To effectively meet these requirements, a mapping system must employ cartographic intelligence such as maximizing scale, minimizing sheet size and numbers of sheets, providing operation-specific content, and supporting geographic entity-based mapping (as opposed to normalized sheet lines based on grids or quadrangles). In its customized mapping system the U.S. Census Bureau employs automated computer algorithms that perform traditional cartographic functions such as scale determination, feature density assessment, inset area identification, map sheet layout configuration, text placement, integrated quality control, parameter driven symbolization, and specifically formatted output. This presentation describes Census Bureau mapping goals, the rationale for this approach, a description of the map production methodology and anticipated issues with this approach.

Jodi Farrell Sparks, Indiana State University, Biogeography and Dendrochronology Lab. Email: dahlia98@hotmail.com, jfarrell1@mymail.indstate.edu; James H. Speer, Dr., Indiana State University, Biogeography and Dendrochronology Lab. Email: jspeer3@isugw.indstate.edu; Use of dendrochronology to study pandora moth (*Coloradia pandora*) outbreaks in the Arapaho National Forest, Colorado USA.

Pandora moth (*Coloradia pandora*) is distributed over much of the Western United States. It is a phytophagous insect that eats only older pine needles; therefore, there is only a 2% mortality in the host trees. Pandora moth leaves a tree-ring signature in ponderosa pine (*Pinus ponderosa*) tree rings that consists of the smallest rings at the beginning of the suppression, thinner latewood throughout the signature, and lasts from 4-20 years. All previous published research on pandora moth has been conducted on ponderosa pine as the host species. This study examines the effect of pandora moth defoliation on lodgepole pine (*Pinus contorta*) and reevaluates the signature criterion for this new species. Ten sites in the Arapaho National Forest in northwest Colorado were collected in 2004 and 2006. Tree cores were mounted, sanded, and crossdated using standard dendrochronological techniques. The site-level chronologies were examined for climate response and pandora moth signatures were identified visually and with the program OUTBREAK. All sites showed some significant climate response but were rather complacent in their ring widths. We have evidence for four possible outbreaks in the 1860s, 1900s, 1930s, and 1960s.

Tony Sparks, University of Washington. Email: tsparks@u.washington.edu; As Much Like Home as Possible: Privacy, Rights Talk, and Negative Freedom in Seattle's Tent City

In the early summer of 2005 SHARE/WHEEL, a consortium of self managed homeless shelters, won a decisive battle against the city of Seattle and its "Safe Harbors" homeless tracking system. Proponents of Safe Harbors had argued that mandatory tracking of homeless individuals was a key component in evaluating the "success" of the county's "Ten Year Plan". SHARE/WHEEL that it was a fundamental violation of the privacy of homeless individuals. In the end, after a long series of mediations between SHARE/WHEEL and city officials, the city capitulated and offered a extensively scaled down version of the program which did not require individuals to offer ANY information as a condition of homeless service utilization. While on the surface this appears as a decisive victory for "homeless privacy rights" in Seattle. The language of rights does a significant disservice to both SHARE/WHEEL's position and strategy. Over three months spent living in Seattle's tent city III, a very different vision of rights and privacy began to emerge as I spoke with homeless individuals about the ways in which the conceived of themselves as citizens as well as how they negotiated the

labyrinthine world of police, service providers, and neighbors. This talk explores conceptions of rights, privacy, and citizenship as it pertains to homelessness as well as how the homeless conceive of themselves in relation to these categories. What emerges, I argue is a complexity that is obscured by an emancipatory vision of legal rights that relies on liberal notions of public and private.

Keywords: homelessness, rights, urban, law

Benjamin Spaulding, University of Connecticut. Email: benjamin.spaulding@uconn.edu; Robert Cromley, Ph.D., University of Connecticut. Email: robert.cromley@uconn.edu; Integrating the Maximum Capture Problem into a GIS Framework

This paper presents a methodology for reformulating the maximal capture problem by using the data representation and manipulation capabilities of GIS to define: 1) the coverage region captured by each potential facility, and 2) each unique demand region covered by a specific combination of potential facilities. The formulation is modeled on the maximum covering problem although the integer restriction on the demand capture variables is relaxed. Because demand regions are not exogenously given, areal interpolation is used to estimate the demand associated with each of these regions. The model is used to determine the location on a network for a set of home improvement stores that are hypothetically in competition with existing Home Depot stores in Southeastern New Hampshire.

Keywords: GIS, location-allocation modeling, maximum capture problem

A complex sequence of stream terraces has long been recognized along the lower Chippewa River valley but these landforms remain poorly understood. The purpose of this project is to provide a map of the stream terraces along the Chippewa River valley from Eau Claire, Wisconsin, downstream to its confluence with the Mississippi River as a first step in a broader investigation of the post-glacial history of the Chippewa River valley. Interpretation of aerial photographs, topographic maps, and digital elevation models (DEMs) were used to identify stream terraces within the study reach. Terraces were then mapped using ArcGIS software. Seven terraces were identified and mapped. The Wissota terrace (graded to the Chippewa terminal moraine), the highest, most prominent, and most extensive of them is preserved across the entire study reach. The remaining terraces are inset below the Wissota terrace. The lowest two terraces are only a few meters above the modern flood plain. Higher terraces generally exhibit lower relief except for the Wissota terrace where large (up to 10 m high and 200 m long) parabolic dunes are present locally. Lower terraces exhibit higher relief. Point bars and abandoned channels are usually readily apparent on the lowest terraces and the modern floodplain. Preliminary ground penetrating radar investigations and coring of several terraces in the study reach have yielded subsurface data suitable for sedimentological and stratigraphic analysis and samples suitable for optical stimulated luminescence dating. Future investigations will focus on determining terrace ages and sedimentological characteristics, and stratigraphic relationships among these terraces.

James H. Speer, Indiana State University. Email: gespeer@isugw.indstate.edu; Multiple-scale disturbance and climatic response across the entire range of ponderosa pine in the western United States.

Ponderosa pine (*Pinus ponderosa*) dominates western North America dry forests from Mexico, through the United States, and into Canada. It is a keystone species controlling fuel loads that affect wildfire and create microclimates in which other plants thrive. Two hundred candidate ponderosa pine chronologies were collected from the International Tree Ring Databank (ITRDB) across the full range of the species. I use cluster analysis to group the chronologies to identify natural spatial patterns based on their common signal. Principal component analysis was used to extract the common signal to determine the disturbances or climate that controls the chronologies on multiple spatial scales. I hypothesize that climate will be the main controlling factors at broad scales while insect outbreaks may control tree variability at an intermediate (regional) scale and fire and gap dynamics may control variability at fine spatial scales (watershed).

Keywords: Dendrochronology, ponderosa pine, western United States, cluster analysis

Karen Speirs, University of Connecticut Department of Geography. Email: Karen.Hanson@huskymail.uconn.edu; *Population Incentives of Rural Areas*

With many rural communities in the Corn Belt and Great Plains region experiencing population decline, local governments are offering incentives in hopes of attracting migrants, or retaining existing populations. These programs offer a variety of incentives, from tax breaks to free land to payment of educational expenses, all designed to stabilize population levels, if not promote population growth. This paper briefly examines past, current, and proposed population incentives, while identifying the issues and problems faced in the participating communities.

Greg Spencer, University Of Toronto. Email: greg.spencer@utoronto.ca; **Tara Vinodrai, University of Toronto.** Email: tara.vinodrai@utoronto.ca; *Varieties of knowledge and the economic performance of Canadian cities*

This paper draws upon recent research on clusters and regional innovations systems that identifies a number of key drivers of economic growth and performance, including the presence of highly skilled workers, R&D investments and venture capital, and a well-developed research infrastructure. More recently, scholars have suggested that the innovative capacity of firms and regions rests upon their ability to capitalize on the quality of the local knowledge base. Similarly, scholars working within the tradition of evolutionary economics have recently emphasizes the importance of related variety to the competitiveness of firms and industries. While this literature examines the importance of the specific knowledge base of firms or industries, it does not tend to consider the characteristics of the overall knowledge base in a particular city or region and its effect on regional performance. This paper addresses this concern directly using data on educational attainment, post-secondary fields of study and a number of other socio-economic characteristics. We examine the prevalence of symbolic, analytic and synthetic knowledge bases within Canadian city-regions to develop a typology of places based on the relative diversity of the local knowledge base. We use a series of descriptive statistics and a multiple regression model to explore the relationship between knowledge diversity and economic performance, while controlling for a series of other place-based characteristics. Our preliminary findings show that Canadian city-regions with a diverse knowledge base have performed better compared to those places with a more specialized knowledge base.

A multi-disciplinary team of researchers used data from the International Adult Literacy and Life Skills Survey, the Canadian National Population Health Survey, and the Canadian Participation and Activity Limitation Survey to reveal the spatial relationships amongst rates and types of disability and levels of literacy. Using Geographic Information Science, statistical analysis, and cartographic methods the team spatially identifies the following: 1) rates of disability and levels of literacy, particularly as it changes over the life course; 2) barriers and accommodations faced by people with disabilities; and 3) components of functional and critical literacy in Canada. The analysis is graphically displayed using easy to read maps designed to engage and empower people with disabilities. A key goal is to support efforts to address the human rights, political, social, and economic issues that contribute to illiteracy among people with disabilities and to support a policy dialogue about literacy and disability in Canada and internationally.

Keywords: literacy, disability, Canada, GIS, cartography

Benjamin Spigel, The Ohio State University, Department of Geography. Email: spigel.1@osu.edu; *Transmission or Transmutation? The Role of Tacit Knowledge and Codification in the Creation of the Linux Operating System*

This paper studies the role that tacit information played in newsgroup discussions among early developers of the Linux operating system. By analyzing knowledge artifacts created by conversations between developers, testers and users, it is shown that instead of merely codifying knowledge, tacit information is exchanged via Information and Communications Technologies (ICT). This conclusion is reached by applying a deeper understand of computer code, one which allows for ideas to be embedded within code just as it can be with any other language. Working within traditional frameworks of knowledge codification and cognitive proximity, this paper studies the circumstances necessary for the

successful transmission of tacit knowledge over spatial distance through ICT.

Kevin M Spigel, Ph.D., Mercer University. Email: spigel_km@mercer.edu; *Environmental Magnetism- and Fossil Pollen-based Proxies for Environmental Change in South-Central Wisconsin*

Sediments from Emrick Lake, south-central Wisconsin, provide evidence of hydro-geomorphic responses to Holocene climate and vegetation change and Euro-American settlement along the prairie-forest ecotone. A 9-m sediment core was recovered using a Livingstone piston corer in February 2004. Sediments were analyzed for environmental magnetic parameters, loss-on-ignition, and fossil pollen. Fossil pollen samples were compared to modern pollen datasets using the modern analog technique (MAT) to estimate Holocene climate and vegetation characteristics. Abrupt warming at ~11,500 cal. yr B.P. was associated with: arrival of Pinus, Quercus, and Ulmus-dominated mixed forest; decline of Picea forest; and accelerated lake productivity. The middle Holocene (~4600 - 3000 cal. yr B.P.) shows increased percentages of non-arboreal pollen, and a decline of total pollen influx suggests climate became slightly warmer and drier and initiated a transition to Quercus woodland. Late Holocene sediments contain evidence of climate changes registered in the environmental magnetism and LOI record; although weak evidence exists in the vegetation record. The vegetation mosaic is still Quercus woodland, but with fewer prairie taxa than the middle Holocene, probably indicating slightly more humid conditions. Climate has been cooler and more humid in the late Holocene compared to the middle Holocene and vegetation stabilized into a mixed forest dominated by Quercus and Pinus. Results of this study confirm that development of the warmest and driest Holocene climates occurred later than along the ecotone in south-central Minnesota and is similar to the environmental history previously documented for northeast Iowa and elsewhere along the ecotone in southern Wisconsin.

Keywords: Holocene environmental change, environmental magnetism, fossil pollen, MAT, geomorphology

Jana Spilkova, Charles University in Prague. Email: spilkova@natur.cuni.cz; *The changing face of the Czech retailing in the transformational period*

Among the most important features of the current Czech retail there is growing importance of the biggest international retail chains, cooperation and integration tendencies of small entrepreneurs as a reaction to the chains' growth and the internationalisation and globalisation trends. The concentration of retail activities is also obvious in the spatial dimension of retailing. The number of new outlets is growing, but among them the large-scale stores are the most common. The second half of the nineties brought a dynamical development mainly in the sector of modern and complex shopping centres. The development of these centres revealed also some problematical aspects. The most discussed are following: inner city stagnation, outflow of the commercial activities to the border of the city, transportation problems, increased need of parking lots, lost of the agricultural land because of shopping centres construction, legislative regulation of the large-scale objects, competition of big stores to small entrepreneurs, and last but not least - changes in the consumer behavior of the shoppers. The new trend represents the connection of shopping with leisure or sport activities. The second fastest growing retail format is the discount store. Since consumer behavior is also very common field of study in the behavioral geography, it is very interesting to study the relations between the consumer behavior and the spatial structure of retailing. It is also challenging to observe the changing preference for the main shopping place throughout the Czech Republic.

Keywords: retail, shopping centres, hypermarkets, discount storers, consumer behavior, transforming economies

Dale K. Splinter, Calvin College. Email: dk5@calvin.edu; *Spatial patterns in the fluvial system: comparisons between three eastern Oklahoma ecoregions*

Ecoregions are homogeneous regions delineated by similar associations of geology, climate, soils, land use and potential natural vegetation (Omernik, 1987). Ecoregions provide a spatial framework to establish whether geographic phenomena differ between ecoregions. A study was initiated to establish whether watershed morphology and the characteristics of stream channels could be differentiated by ecoregions in eastern Oklahoma: the Ozark Highlands, Boston Mountains, and Ouachita Mountains were selected for study. One hundred and forty-nine watersheds and stream reaches were randomly selected for investigation. Four lines of inquiry were used to evaluate whether differences exist between ecoregions. These include morphometric analyses of watersheds, upstream-to-downstream trends in channel morphology, dissimilarity and cluster analysis of watershed and reach variables, and channel reach classification. Statistical results reported at $\alpha = 0.05$. Morphometric analyses report statistical differences between some of the watersheds and ecoregions. Regression coefficients were used

to test for significant differences in the upstream-to-downstream trends in channel morphology. Significant differences exist in particle-size, bankfull width, and width-depth ratio. Cluster analysis and dissimilarity were conducted using a sum of squares method. The most dissimilar watersheds and stream reaches exist in the Ouachita Mountains. A chi-squared test reported no differences between Rosgen stream classifications by region and stream order. However, spatial patterns of reach types could be inferred in the upstream-to-downstream direction. The results of this study show that ecoregions in eastern Oklahoma provide a spatial framework that explains differences in watershed and reach morphology, clusters and dissimilarity, and channel reach patterns.

Eric Sproles, Lane Community College / Ecotrust. Email: sproles@lanec.edu; Charley Dewberry, PhD, Ecotrust. Email: cdewberr@presys.com; Mertens Mike, Ecotrust. Email: mikem@ecotrust.org; A GIS-based analysis examining the distribution of salmonids and forest stand age at the watershed scale

Geographic Information Systems (GIS) were used to investigate connections between forest stand age and salmonid distribution in the Siuslaw watershed of western central Oregon. We used three years of Rapid Bio-Assessment (RBA) data to map the population distribution of Coho salmon within the Siuslaw Basin. The data was then compared to the forest stand age upstream of survey locations to identify trends that exist between stand age and the distribution of salmonids within the catchment. The Siuslaw basin is situated in the Oregon Coast Range, which is composed of steep slopes that are highly sensitive land use practices. Understanding the factors that drive the distribution of salmonids within a watershed is vital in natural resource management plans that encourage healthy salmonid populations. While previous studies have examined fish numbers at the reach scale, we look for relationships that exist between salmonid populations and the forest stand age at the watershed scale.

Janaki Srinivasan, School of Information, UC Berkeley. Email: janakis@sims.berkeley.edu; Reshaping a Development Project : The Case of Information Kiosks in Cuddalore, Tamil Nadu, India

This paper explores the mechanisms by which global context, local relationships and the 'targets' of development mediate the translation of development projects into concrete outcomes. The paper does so by using the case of a village information kiosk project established in 2001 by EID Parry (India) Limited, a leading sugar producer, in Cuddalore district in the south Indian state of Tamil Nadu. Parry equipped 45 kiosks with computers and internet connectivity to provide agriculture related information and services to the 25,000 farmers who cultivated sugarcane for its factory, hoping that this would enable them and, by extension, the company to prosper. By 2005, however, the project was not working as planned and Parry was keen on modifying the project goals. Drawing on a six-week ethnographic study of the kiosks in 2005, the paper analyses the divergence between the goals and outcomes of the project since its inception. It argues that three factors crucially reshaped the project. One was the changing regulatory framework of the Indian sugar industry against the backdrop of a global emphasis on deregulation, which led to a shift in relations between Parry and sugarcane farmers. Two, local production relations between farmers and landless laborers determined who could afford the services offered by the kiosks, who would find them of value and which services were the most sought after. Finally, villagers contested the project goals and outcomes, by influencing the location of kiosks and their accessibility to different sections of the population.

Scott St. George, Geological Survey of Canada. Email: sstgeorg@nrcan.gc.ca; Coherent tree-growth response to multivariate climate controls in the Winnipeg River basin, Ontario, Canada

This study uses a network of fifty-four ringwidth chronologies to evaluate tree growth in the Winnipeg River basin since AD 1783. The basin drains parts of northwestern Ontario, northern Minnesota and southeastern Manitoba, and is a key area for hydroelectric power production. Most chronologies were developed from *Pinus resinosa* and *Pinus strobus*, with a limited number of collections made from *Thuja occidentalis*, *Picea glauca* and *Pinus banksiana*. Empirical orthogonal function analysis shows that nearly half (43%) of the network's total variance is shared among all sites, regardless of species. This pattern can be recovered using as few as nine chronologies, and is not affected by the method used to remove variability related to age or stand dynamics from individual trees. Regional tree-growth (as represented by the first eigenvector) was persistently low during the early 1840s, the 1860s and the early 1900s. Tree growth was more variable during the 20th century, although less interannual variability was observed after circa 1980. Response function analysis shows that growth is significantly, but weakly, correlated with both temperature and precipitation during summer (June-July). However, the significant correlation between tree growth and summer precipitation is only present during years with above-average temperatures. Similarly, ringwidth is only significantly correlated with June-July temperatures during dry summers. These results indicate that tree-growth patterns in this region are regionally coherent and have been stable over the past two centuries, but that the climatic factors that limit growth are multivariate and change in importance from year-to-year.

Kevin St. Martin, Rutgers University. Email: kstmarti@rci.rutgers.edu; Quantitative and Critical GIS Methods to Foster Community Participation in Natural Resource Management

There is a long history of critical engagement with natural resource management regimes in the global South where community and territory are the foundations of alternative (e.g. traditional, communal, commons) management practices. There, where quantitative data is scarce and community-based social relations are assumed primary, qualitative methods have proven crucial to the revelation of alternative resource management approaches and potentials. In the global North, where such foundations are often assumed nonexistent, qualitative methods focus on impact analyses rather than the development of alternative management systems themselves. While these regimes are data rich and subject to a variety of quantitative measures and understandings, that information has remained external to qualitative and critical approaches. Re-examined from a critical perspective, however, the mass of data collected for the management of natural resources reveals surprising potentials. National Marine Fisheries Service data used to assess fish stock, for example, can be processed such that fishing communities and territories emerge where none previously existed. The "Atlas Project" utilized statistics, density mapping techniques, and home range analyses to map the domains of several fishing communities in New England. Labor time by location was computed along with a host of other quantitative measures and superimposed on standard nautical charts. Fishermen were presented the composite maps within the context of a participatory action research project that explored the community inhabitation of space, the lived experiences of fishermen within mapped territories, and the viability of community/territory as an ontological foundation for the formation of alternative economic subjects and management practices.

Patrick Stacy, Graduate Student, The University of Arizona, Department of Geography and Regional Development. Email: pstacy@email.arizona.edu; Stephen R Yool, Associate Professor, The University of Arizona, Department of Geography and Regional Development. Email: yools@email.arizona.edu; Using Soil Moisture Estimates to Model Coccidioidomycosis Incidence: A Remote Sensing Approach

Coccidioidomycosis or Valley Fever is a disease caused in Arizona by the inhalation of spores produced by the soil-dwelling fungus *Coccidioides*

posadasii. Symptoms are usually mild, but if the infection spreads beyond the lungs, skin lesions, bone and joint damage, even death, can occur. Precipitation has proven a valuable predictor in the seasonality and timing of outbreaks, but more may be done to localize predictive models. Precipitation data is collected at point locations and can only be interpolated to an area, limiting spatial analysis. Local soil moisture may be a more useful metric. We use Advanced Very High Resolution Radiometer (AVHRR) Normalized Difference Vegetation Index (NDVI) time series data to produce a surface moisture proxy for Pima County, Arizona. We compare these data with Valley Fever prevalence, enabling predictive analysis county-wide. Surface moisture residence time is examined also for its role in the growth and seasonality of the fungus. We create surface moisture maps and compare them with prevalence maps, refining the predictive potential to local scales and providing clues to the 'spatiality' of the disease. Results could promote timely awareness of incidence peaks, mitigating the disease.

Chad Staddon, University of the West of England. Email: caedmon.staddon@uwe.ac.uk; Alan Terry, University of the West of England, Bristol. Email: alan.terry@uwe.ac.uk; Imperial Europe Redux? implications of enlargement for the 'Global South'

Discussions of EU enlargement tend to focus either on internal dynamics or on the more obvious global scale geopolitics. Relatively little attention has been paid so far to the implications of EU enlargement for the 'Global South' and in particular for those nations whose recent development has depended to a significant extent on the special status conferred on them by their former colonial ties to European nations. Yet the 2004 and 2007 waves of accession are having profound impacts on relations between Europe and its ex-colonies and on the internal dynamics between 'old' and 'new' Europe. In this paper we examine the contours of a new set of (postcolonial) spatial relations that could, polemically at least, be summed up as 'Imperial Europe Redux'.

Keywords: Europe, Enlargement, Geopolitics

Samantha Staddon, University of Edinburgh. Email: s.c.staddon@sms.ed.ac.uk; Forest monitoring by local communities; what impacts for society and the environment?

The poster will present my proposed PhD research which centres on community-based natural resource management (CBNRM) and specifically the monitoring of forest resources by local communities. It aims to merge issues of human and physical geography in gaining an understanding of the impacts of community-based forest monitoring on both local communities and the forest resource-base. Questions which will be addressed include what constitutes monitoring of natural resources, how widespread are various forms of community-based or indigenous monitoring, what the aim of such monitoring is, how monitoring informs forest management, how such monitoring compares to 'scientific' monitoring and what various forms of monitoring achieve in reality, both for society and the environment. My investigations will most-likely be carried out in Nepal, where 'community forestry' has a relatively long tradition and where local communities are actively engaged in the use and management of local forest resources. Fieldwork will include typical human geography methods such as focus groups, semi-structured interviews and questionnaires, and physical geography methods such as ecological assessments and survey work. I will be collecting and analysing social, economic and ecological data. I am currently not able to offer any conclusions as this is a presentation of work in progress, the fieldwork component of which has yet to be conducted.

Email: phillip.bothwell@noaa.gov; Relationships Between Oklahoma Wildfire, Population Density, And Fuel Availability

Winter 2005-06 was the second driest in 110 years in Oklahoma. Given exceptional dryness, large wildfires burned over 240,000 hectares. Can readily available statewide databases be used to assess the spatial likelihood of large wildfires during drought sequences? Within a GIS, we examined the joint occurrences of fire locations, population density, and fuel availability. A 6-month composite of wildfire locations was constructed using the GOES WF-ABBA fire detection product. NOAA gridded population density estimates in 1 km² cells

were included. Fuel availability was estimated in two ways: land use categories from the state's GAP analysis and NDVI change (September minus December values). Using GOES pixel center locations, we constructed 4 km buffers to assess the local percentage of each cover type. The joint occurrence of fire, population density categories, and percentages of land use types were assessed statistically. The most probable fire locations were in forested areas of modest but not sparse population. We speculate this is explained by large fuel availability with enough people to set fires (accidental and intentional) and minimal fire protection so individual fires have time to become large.

Keywords: wildfire, environmental modeling, Oklahoma

Lynn A. Staeheli, University of Edinburgh. Email: lynn.staeheli@ed.ac.uk; Citizenship and the Search for Community

Citizenship is a contested concept. Many of the controversies surrounding citizenship rest, in part, on the relationship between individuals and the communities in which they are situated. As such, community becomes the terrain - metaphorically, politically, and spatially - on which struggles over citizenship are enacted. This paper examines the role of community in constructions of citizenship, focusing on: 1) community as a territorialized concept; 2) community as a social and political construct; and 3) community as a disciplining or regulatory tool. The paper concludes with a discussion of the possibility of democratic citizenship located in community.

Keywords: Citizenship, Community, Belonging

Johannes Stahl, Humboldt University Berlin. Email: johastahl@yahoo.de; Property in the Age of Migration: a Tale of Three Albanian Villages

This paper analyzes property relations on land in southeastern Albania through a comparative study of three villages. The paper argues that different migration opportunities for Vlachs, Macedonians and ethnic Albanians contribute to the differentiation of actors and property relationships in Albania. The three cases demonstrate a change in the value of land after the collapse of socialism. The deteriorating conditions for agricultural production and an increasingly dilapidated rural infrastructure have led to a general devaluation of agriculture. At the same time alternative opportunities have emerged through ethnically differentiated migration strategies. These broad macro-level changes have produced a general shift in rural livelihood strategies from agricultural towards migration strategies. In consequence, new kinds of actors emerged at the local level. The differentiation of actors led to dramatic effects on property relationships. The paper suggests migration as a pathway by which transnational forces affect rural property relations. Migration responds to transnational changes in value and modifies local actor constellations. The changes in value and actors lead to changes in rural property relations, as actors modify property relationships in reaction. The fact that migration has become ubiquitous in rural areas implies that one cannot understand rural property if one does not look at the revalorization of rural objects driven by transnational forces.

Keywords: Albania, property, migration, ethnicity

Dennis Staley, University of Memphis. Email: dstaley@memphis.edu; Linking Process and Form on Alpine Talus Cone Systems: Front Range, Colorado USA

This research examines the relationship between geomorphic process, surface form, and particle morphology on alpine talus cone systems in the Colorado Front Range. High resolution digital terrain data derived from terrestrial laser scanning and airborne laser swath mapping sources provided an unprecedented resolution for the analysis of talus cone system form. Point specific measurements of particle morphology and geomorphic process were made on several talus cones. Rockfall, debris flow, and slushflow are the primary processes that have formed and sculpted the talus cones. Surface forms associated with these processes were analyzed using a three-tiered spatial hierarchy consisting of analysis at the particle scale, feature scale and system scale. At all scales of analysis, talus cone form was related to debris transport mechanisms. Forms associated with rockfall reflect controls related to particle sizes of transported debris and in-situ material characteristics. Debris flow and slushflow related forms represent material shear strength and yield strength. The ability to decipher these properties using measurements of form from high-resolution digital elevation data allows researchers to decipher geomorphic processes at very fine-spatial scales across large areas from remotely sensed terrain data. The use of a conceptual hierarchy of relevant spatial scales elucidated the complex relationship between spatial scale, process, and form evident in talus systems.

Diane M. Stanitski, Ph.D., Shippensburg University. Email: dmstan@ship.edu; *NOAA's Role in the Global Ocean Observing System for Climate*

The National Oceanic and Atmospheric Administration (NOAA) collaborates with national and international partners to build a sustained global ocean observing system for climate. The international system is now 56% complete, with the United States contributing approximately half the system. A total of 4725 platforms are maintained globally. Sea surface measurements continue to be a top priority for NOAA and the global ocean observing community because of their importance for weather forecasting, seasonal forecasting, and droughts. Subsurface heat content and tide gauge measurements are also critical to our understanding of sea level rise. These two combined are essential for hurricane forecasting and forecasting of storm surge and coastal inundation. Drifting buoys were deployed in advance of hurricanes in 2005 and 2006 for improved hurricane forecasting. Improvements to the tropical moored buoy network include expansion 1) in the Indian Ocean, 2) in the PIRATA array, 3) on tropical reference stations, 4) with surface salinity, and 5) with Next Generation research and development. A "systems approach" to international coordination of national implementation efforts is at the fore and the primary goal remains to build a global ocean observing system for climate. Partnerships are critical and all of NOAA's contributions to the international system are managed in cooperation with the Joint Committee on Marine Meteorology. The NOAA Office of Climate Observation promotes the utilization of platform and data infrastructure for several objectives, including understanding the Earth's climate system, documenting sea level change, and monitoring the global carbon and water cycles.

Keywords: ocean observations, sea surface temperatures, drifting buoys

Anna E Stanley, Ph.D., Université Laval. Email: astanley@uoguelph.ca; *Aboriginal peoples and environmental policy making: Scale, Discourse, and the Production of Difference in Environmental Justice Scholarship*

Recently, Environmental justice scholarship has come under fire for its lack of attention to the spatiality of social life and for its inability to move theoretically and methodologically beyond distribution and causality. Together with calls for more critical investigations of the structural and systemic sources of injustice, geographers have urged a more thorough investigation of the role of space, and particularly scale, in the study and production of injustice. These critiques are particularly significant for understanding the politics of environmental policy making where the lands, livelihoods and rights of First Nations peoples might be implicated. I draw on the work of Young and Foucault to outline a perspective and methodology that attends to these challenges. I argue that the insights gained from Young's (1991) thesis that the production of difference is the root of oppression, and from Foucault's concepts of "subjugated knowledges" (1976) and discourse (1972) contribute significantly to understanding the role of space and scale in producing and contesting injustice. Further, that this analytic attention to space and scale allows scholars to uncover the ways in which meanings are made and the structural and discursive processes which maintain and contest them. Through the use of examples from a study of Canadian NFW management policy making and the experiences of the Serpent River First Nation (SRFN) I

propose that such a focus provides a better way to uncover the neo-colonial politics of policy making, and a more sensitive and partial conception of the geographies of the SRFN themselves.

Keywords: Environmental justice, methodology, theories of justice, discourse, scale, production of difference, indigenous geographies.

Kim Stapleton, Oklahoma State University. Email: Kim.Stapleton@okstate.edu; *Using GIS to Incorporate Population Characteristics in Exploration of Potential Radioactive Waste Routes in Oklahoma*

Because of its geographical location, all types of radioactive waste can potentially be routed through Oklahoma from points-of-origin to designated waste repositories located across the nation. Federal and State agencies have implemented numerous regulations to ensure public safety and respond to concern over accident consequence. However, potential conflicts exist in carrying out the routing considerations outlined in the Federal Code of Regulations by the Department of Transportation. Population characteristics are not explicitly included in the routing process and limiting an urban population's exposure along a route to potential harm from radiation is sometimes at odds with limiting transit time. Attempting to introduce explicit consideration of population in identifying potential radioactive waste routes, this study uses GIS techniques to incorporate population characteristics in exploring the routing problem in Oklahoma. Following the 1992 routing guidelines of the U.S. Department of Transportation, potential Oklahoma radioactive waste routes, weighted by total distance or transit time, are first identified in this study for a set of hypothetical origination and destination sites. GIS functions are developed to derive and report the demographic characteristics of people who live along the routes and could be impacted. A new routing criterion of the least population being potentially impacted then is discussed and implemented in GIS to help explore the potential radioactive waste routes in Oklahoma. The GIS functions developed in this study can be used to support better decisions on routing radioactive waste.

Keywords: GIS, routing problem, Radioactive waste, population

Sarah Starkweather, University of Washington. Email: starks@u.washington.edu; *Unknown and Unknowable: The Politics of Counting Americans Abroad*

There are about 4 million to 7 million American citizens living outside of the United States, about whom very little is known. Indeed, even the question of how many there are lacks any definitive answer. The imaginary space of the American nation is thus largely invisible outside US borders. It is arguably in the interests of the state to increase their understanding of this small but not insignificant group of taxpayers/voters/citizens - and for their part, groups representing Americans living abroad view an accurate statistical portrait of the overseas population as essential for lending legitimacy and weight to their advocacy activities. An Overseas Enumeration Test (OET) was conducted in 2004 in order to gauge the prospects for a full census of the American population abroad in 2010. The utter failure of the OET guaranteed that there will be no census of Americans living abroad in the foreseeable future. In this paper, I will outline the origins, implementation, and assessment of the OET. While arguments in favor of the OET focused on political rights, citizenship, and American identity, such concerns were ultimately eclipsed by techno-rational concerns about implementation procedures, statistical validity, and cost. I read this event with (and against) recent literatures on governmentality and biopolitics in the framing of 'the nation.'

Scott Starratt, United States Geological Survey. Email: sstarrat@usgs.gov; *Too Clever To Be Understood: The Record Of Late Holocene Central California Climate From San Francisco Bay Marsh Sediments*

Sediment cores collected from three marshes on the northern margin of San Francisco Bay each provide a somewhat different record of late Holocene climate variation in central California. The timing of changes in the diatom floras illustrates the complex interaction between local and regional climatic processes. Results from Rush Ranch and Petaluma marsh suggest that conditions along the central coast began to dry out prior to the Medieval Climatic Anomaly, and that fresh water became increasingly abundant during the transition from the Medieval Climate Anomaly to the Little Ice Age. In contrast, the Benicia State Park site is dominated by a freshwater flora during the Medieval Climate Anomaly, and conditions become brackish at the beginning of the Little Ice Age. Differences in the timing and duration of the fresher and more saline intervals at Rush Ranch and Benicia State Park are largely controlled by proximity to the main channel of the Sacramento-San Joaquin River system. The short (about 15 km) distance from the mouth of the tidal channel to Rush Ranch appears to have a dampening effect on the expression of climate variation. For example, the transition from brackish to fresher conditions takes place between 3,200 and 3,100 cal yr B.P. at Benicia State Park, but does not occur until several hundred years later at Rush

Ranch. The subsequent transition from fresher to more brackish conditions occurs 150 to 200 years earlier at Rush Ranch.

Paul F. Starrs, University of Nevada. Email: starrs@unr.edu; *The Red Hot GR Papers: Cool Writing, Hot Topics, and Preeminence in the Geographical Review's 25 Most-Influential Articles*

A survey of practitioners in geography and cognate fields elicited opinions about the most influential articles among nearly one-hundred years of work appearing in the "Geographical Review." Favorites clearly prevail, and the range of all-star names within North American geography (including a fair number of foreign-born authors who nonetheless undertook publication in American English) is notable. That selections span the full range of publication dates suggests that citation indices and "readability" can be considered disjunct topics. A roster of twenty-five articles is presented, and with that, some conclusions, both well meditated and marinated, about timelessness, precocity, innovation, and the wielding of the editorial katana as a forceful influence in journal life.

Pierre Stassart, Liège University. Email: p.stassart@ulg.ac.be; *What makes the difference? Short versus long supply chains, learning abilities towards sustainable development.*

The study of alternative agrifood networks (AAFNs) is currently the subject of debate regarding "reflexive/unreflexive localism". This leads us to wonder about the relevance of categories such short and long food supply chains. We approach this question holistically, rather than from a normative standpoint, questioning the learning abilities of the two systems: short and long food supply chains. Two case studies are tackled through cross-intervention research. One is a project for the direct sale of "Semois beef" (short supply chain) and the other is an organic Limousin beef chain piloted by a supermarket (long supply chain). The first case is an emerging project rooted in a specific area that is carried in particular by a farmers' market. The stake is to integrate a "local biodiversity" dimension as a central element of the Semois beef's definition as a commodity. The second case - that of organic Limousin beef ? is piloted by a distributor that is a "leader" on the national organic foods market. It asks the question of the final product's differentiation and the shift from an obligation of means to an obligation of result in organic production. The preliminary findings indicate that the short and long categories are heuristically relevant to a certain extent, especially when it comes to the following questions: "How does one relate environmental issues to a local territory? How can one develop a socially inclusive approach with regard to producers and consumers? What elements of taste are reversible or, on the contrary, irreversible?"

Keywords: Alternative Agrifood Networks, sustainable development, learning abilities, consumer producer cooperation, Organic beef production

Miha Staut,, University of Primorska, Science and Research Centre, Koper. Email: miha.staut@zrs-kp.si; *Contextualizing the Idea of the 'Healthy Mediterranean' in Slovenia: Diverging Processes in Health Related Cultural Practices*

Degenerative and non-communicable diseases are nowadays representing the largest share in mortality of high-income countries. Recently, there has been an interest among health researchers in the positive attributes associated with the Mediterranean lifestyle, areas of interest include family structure, diet, and siesta. Within the Slovenian context there are currently two diverging processes which are actively reshaping the notion of 'mediterranean'. From the period after the 2nd world war, political and socio-economic processes resulted in the weakening of Istrian identity as characteristics associated with the socialist period contributed to the eroding of regional and cultural behaviours and identities across the country. Epidemiology and social studies of health have identified various positive attributes of Mediterranean lifestyle and diet. These positive associations are gradually permeating Slovenian society, however such health beliefs are more widely held among affluent social groups and are not limited to the Slovenian Istria region. By drawing on historical ethnological and epidemiological evidence, the poster will attempt to elucidate the spatial context of the idea of Mediterranean in Slovenia and its perceived influence on the health of people.

Keywords: geography of health, identity, lifestyle, Mediterranean

David Stea, Professor Emeritus, Center for Global Justice, Mexico. Email: ds34@txstate.edu; *Toward a Theoretical Basis for Ethnophysiography*

This paper is based upon ethnophysiographic research conducted over the past several years among cultures of both the Southwestern U.S.A. (Navajo) and Western Australia (Yindjibarndi) under a grant from the U.S. National Science Foundation. It is concerned with the basis for the relation of landforms to language, and is an attempt at, or a beginning of, formulating grounded theory for the results thus far obtained. Several dialectically related concepts are fundamental: "truth" vs. reality and "myth" vs. reality, for example - and the nature of

"reality" itself. Conceptualizing these involves ethnoscience, and ethnography as an identifier of ethnoscientific concepts and principles. In both Navajo and Yindjibarndi societies, landscapes are stories "animated" or "personified" as totem animals or monsters. Palmer (1977) talks about totemic forms, such as those associated with water, as water animals, land animals, and human spirits. These totems (water totems include warlu among the Yindjibarndi, "big snake" among the Navajo) may apply not just to the identification of landforms but to navigation among them (safe travel in marginal landscapes), and to explanations of floods and droughts,

Kimberly Stefanski, Florida Atlantic University. Email: kstefans@fau.edu; Kasama Polakit, Florida Atlantic University. Email: kpolakit@fau.edu; David C. Prosperi, Florida Atlantic University. Email: prosperi@fau.edu; *Regional Spatial Structure: Does It Exist?*

Notions of urban spatial structure are well understood. But if recent researchers and observers, like Hill and Brennan (2005) and/or Lang et al (2006), are correct the "area of significance for most is the metropolitan area." Unlike the well known principles of urban design and its iconic images, little is known about metropolitan scale design and form beyond the almost banal dichotomous descriptors such as "central city/suburb" or more recent abstract notions such as "polycentricity." The purpose of this paper is to report on a systematic review of the notion of metropolitan design and form including, but not limited to, institutions and/or organizations engaged in regional structure and design studies, north American and European formulations of spatial structure and planning, and consideration of themes such as the warring centripetal/centrifugal forces, the role of economic clustering in creating multiple centers, the role of "starchitects" and iconic buildings as single needle acupuncture (ineffective), and the city-management paradigm that emphasizes process over product. Emphasis is placed on the design, economic, and political formulations, in the hope of arriving at a normative and empirically testable theory of metropolitan structure and form. Where possible, examples will be drawn from the South Florida urban region and the San Francisco urban regions, both examples of polycentric development.

Keywords: south florida, metropolitan design

Frederick A. Stehle, BA, MA Geography Student, California State University Los Angeles. Email: frederick.a.stehle@aero.org; *The Geography of the Former Tarim River Delta Complex*

The Tarim Basin, located in China's vast northwest territory is one of the world's largest closed basins and contains China's longest inland river, the Tarim River. The river flows from west to east along the northern edge of the famous Taklimakan Desert. Like other inland desert rivers, the Tarim River transports and deposits abundant sediment in its terminal lake area. Today, a huge fan-shaped delta complex can be seen at the eastern end of the Tarim Basin. The fact that a dense drainage network exists in this former delta complex suggests that the delta complex was sporadically inundated by floodwater from the Tarim River and therefore able to maintain a vegetation cover adapted to the dry and saline desert environment. The river's former delta region was a primary source of subsistence for ancient isolated communities such as the Loulan Kingdom. Due to climatic change, construction of reservoirs, and expanded upstream agricultural activities the Tarim River floodwaters ceased to reach the delta complex. The subsequent collapse of the vegetation cover has exposed abundant and loosely bound fluvial deposits to aggressive northeasterly desert winds making this delta complex a major source of the central Asian dust storms. This study attempts to reconstruct the past environment of this delta complex by re-examining records of early explorers to the area, satellite images, and digital terrain model derived from the Shuttle Radar Topography mission (SRTM) data. The objective is to gain a better understanding on the geography of the former delta complex.

Michael K. Steinberg, University of Hawaii. Email: msteinbe@hawaii.edu; *Landscape Changes in Guatemala's High Cuchumatanes*

The high Cuchumatanes Mountains (above 3,000 meters) in Guatemala presents a fascinating landscape anomaly compared with the surrounding areas. For example, this cold remote area lies above the maize production line; instead, the high Cuchumatanes produces most of Guatemala's potato crop and sheep products. Floristically, it also represents an anomaly compared to other areas in Guatemala and Mesoamerica in general. The high Cuchumatanes are dominated by paramo grasslands and scattered stands of juniper and pines. The paramo in the Cuchumatanes represents the most northerly range of this ecosystem in Latin America. Therefore, culturally, economically, and botanically, it more resembles highland South America than northern Central America. Given the landscape distinctiveness of this region, general descriptions of change in

Mesoamerica often fail to capture the events taking place in the high Cuchumatanes due to globalization, economic and political changes, and population growth. This paper presents an overview of the environmental and cultural changes taking place in the high Cuchumatanes and compares these changes with events taking place in other areas in Guatemala and mountain regions elsewhere.

Keywords: Guatemala, development, population growth, sheep farming, paramo

Philip E. Steinberg, Florida State University. Email: psteinbe@fsu.edu; Thomas E Chapman, Florida State University. Email: tec03c@fsu.edu; Locating Queer Key West: Between the Closet, the Resort, and the Bridge

This paper utilizes data from 52 interviews conducted in Key West, Florida in December 2004 to investigate Key West's attraction as a destination for gay and lesbian tourists. Drawing on the insights of queer theory, as well as critical cultural geography and geophilosophy, we propose that Key West's attraction lies less in its being a destination with distinct queer places, or refuges, than in the way in which it provides an environment wherein individuals can construct space and, in the process, construct themselves and their own identities (including their sexual identities), engaging in a process of self-determination. This finding suggests that place-based metaphors, such as "the closet" and "the resort," are less evocative of the queer tourism experience than is the metaphor of "the bridge," which implies continual processes of crossing, connecting, and transgressing.

Keywords: tourism, queer geography, sexuality, Key West

Alethea Y Steingisser, University of Oregon. Email: asteingi@uoregon.edu; W. Andrew Marcus, University of Oregon. Email: marcus@uoregon.edu; James Meacham, University of Oregon. Email: jmeacham@uoregon.edu; Losing Steam: Human Influences on Geysers in Yellowstone National Park and the World

Geysers are exceptionally rare surface expressions of large subsurface geothermal systems. They are geologic wonders, potential energy sources, provide research opportunities for numerous biologic and geologic processes, are treasured natural resources that provide spiritual meaning, recreation, and stimulate local economies through tourism. Yellowstone National Park was set aside as the world's first national park in 1872 due primarily to its multiple geyser basins; an act that set the stage for preserving lands deemed unique or rare in all countries of the world. The scarcity and importance of geysers is enhanced by the ease by which human activities can destroy them. Human impacts to geysers result from geothermal energy development and exploration, direct physical damage, and land use changes, with the result that few remaining geysers basins persist in their natural state. Globally, there are at least 40 locations where historic geyser activity has been documented, with geysers now extinct in many locations. Yellowstone has lost a small number of geysers to vandalism and urban development, but there is potential for greater damage if geothermal development occurs outside the park boundaries. This paper summarizes the conflicting data on numbers and distributions of geysers around the world and human impacts to these geysers, then explores human impacts in Yellowstone National Park, which has the world's largest concentration of geysers. Data were derived from National Park Service archives at Harpers Ferry and Yellowstone National Park, as well as on-line and library sources. Cartographic visualizations illuminate these concepts.

Keywords: Yellowstone, national parks, geysers, archival research, historical geography, maps, cartography, environmental geography

Anatoly Stepanov, . Email: anatoly_stepanow@mail.ru; Transportation and Siberian Development

Geopolitical position of Russia requires its integration into the system of Eurasian communications and into the world economic flows. Potential accumulated under the Soviet regime has been exhausted; transportation system needs large investments. The Soviet planned economy led to structural disproportion that resulted in recurrent failures of the national transportation system; railways and pipelines (that in 2004 provided for 94 percent of national cargo turn-over) suffered the most. During the recent resurrection of the Russian economy, transportation and energy became the weakest links that on a certain stage could impede transformation and modernization of the country. Both federal and municipal structures are really interested in modernizing transportation systems including construction of high-speed railways, seaports, airports that comply with international requirements, transportation and logistics terminals. To meet new requirements the "just-in-time" principle is implemented, transport turns into a complex goods-producing logistics system. The system of supply chain management should be implemented that would include Russian regions both into world processes of production, storage, distribution, and transportation and into the corresponding information and financial flows. The economic interests of Russian regions demand increase in economic activity of business-

structures (industrial, trading, infrastructural), to increase production and, consequently, to increase finance flows into the budget. Investments into the economy would help to reconstruct and in some cases to build new infrastructures complying with the new technological requirements. The positive effect for society will be in increasing number of jobs, of taxpayers, in improvement of technological culture in logistics, storage, and transportation.

Drew Stephens, The GIS Institute. Email: drew@serviceatsea.org; Service at Sea : Leveraging GIS Training to Conservation Organizations for Greatest Community Benefit

Service at Sea is a ship-based technology assistance program that will begin a circumnavigation of the earth in August, 2007. We have a big objective: We will sail around the world over four years, using adventure as a vehicle to perform community outreach for and service to international conservation groups, and K-12 teachers and students worldwide International Conservation Organizations understand the value of GIS but are hampered by the very limited access to quality GIS training. The GIS Institute, through its Geo3 Program, is prototyping a models to deliver instructor led training to conservation groups all over the world, at low or no cost. Stakeholders in conservation technology are increasingly interested in programs which leverage benefit for the entire community where activity is taking place. This presentation will deliver the results of a proof-of-concept exercise with conservation organizations in Africa and Latin America in 2006 and 2007, and how those activities were leveraged for the local community. The discussion will include the range of cultural, physical, logistical and environmental challenges presented in six African and Latin American countries, along with a discussion of local data readiness, hardware infrastructure, photos, and lessons learned that will be applied to upcoming training deployments. www.serviceatsea.org

Lindsay Stephens, University of Toronto. Email: lindsay.stephens@utoronto.ca; Geographies of the Circus: Transgressive spaces and neoliberal subjects

The Circus has traditionally been seen as a space outside the centre, a marginal or transgressive space occupied by marginal or transgressive bodies. But there have been considerable changes in the circus over the last 30 years, most noticeably the explosion of "Cirque" (The avant-garde 'artistic' form of circus made popular by Cirque de Soleil) as a central force on the entertainment circuit in western industrial nations. Despite its transgressive reputation, contemporary circus has been linked to urban revitalization, growth, creative capital and entrepreneurship, central features in the economic growth of the postindustrial societies. In addition the new "cirque" no longer displays "abnormal" bodies or "freaks", but instead is founded on feats of athleticism that rival the Olympics. My research examines changes in the transgressive qualities of the circus and investigates its participation in the production of neoliberal subjectivity as well as the possibilities it offers for exceeding normative subject positions. Specifically, in what ways does contemporary circus exist as a transgressive space opening up alternative ideas of subjectivity, and in what ways does it conform to and promote ideas of neoliberal subjectivity that are increasingly prevalent in the space of the "every day"? This paper will present my research proposal and initial findings based on literatures of the body, subjectivities, and transgression.

Keywords: circus; transgression; subjectivity; body theory; neoliberalism

Philip Stephens, San Diego State University. Email: phil.stphns@gmail.com; Sergio J. Rey, San Diego State University. Email: serge@rohan.sdsu.edu; Spatial Analysis of HUBZone Determinations in San Diego California

Enterprise zone studies have tended to focus on the econometric measurement of impacts due to zone designation. Despite the stated goal of improving distressed communities, comparatively little research has focused on how distressed zones are chosen. This paper looks at one such enterprise zone program allocation formula and tests it. Application of exploratory spatial data analysis methods reveals that the HUBZone program in San Diego County does not appear to follow the prescribed formula for designation, excluding some qualified census tracts while designating some non-qualified tracts.

Keywords: Spatial analysis

Pamela Stern, Simon Fraser University. Email: pamela_stern@sfu.ca; Media Representation of Indigeneity in the New Mackenzie Valley Gas Pipeline

Inuit and other northern indigenous peoples are joined with multinational corporations in their current efforts to construct a natural gas pipeline along the Mackenzie River corridor in Canada's Northwest Territories. This contrasts markedly with the situation in the 1970s when the Mackenzie Valley Pipeline was first proposed. Then, indigenous opposition to hydrocarbon development on their traditional lands bolstered a nascent environmental movement. The public

hearings on the social and environmental impacts of 1970s pipeline proposal were widely covered by Canadian media. Significantly, the media coverage presented an image of northern indigenous peoples as primordial hunters at the very time that the Mackenzie Valley Pipeline Hearings and related developments were bringing northern indigenous peoples into Canadian citizenship. In this paper I argue that images of northern indigenous peoples and culture that helped unite public opposition to the earlier megaproject remain perversely influential in the contemporary debate. I examine representations of indigeneity in newspaper and other print media stories concerning the current pipeline project. In contrast to the original Mackenzie Valley pipeline proposal, there is little opposition to the current effort. Unable to abandon primitivist images of northern indigenous peoples, reporters have been at pains to explain current indigenous support for hydrocarbon development. Curiously, while reporters have questioned indigenous support for the pipeline on the basis that development brings social change, they have failed to notice the irony of simultaneous indigenous support for hydrocarbon development and concern with the deleterious environmental effects of climate change associated with hydrocarbon use.

Keywords: hydrocarbons, media, Inuit, First Nations

Carolina Sternberg, . Email: sternber@uiuc.edu; Carolina A Sternberg, Ph.D student, University of Illinois at Urbana-Champaign. Email: sternber@uiuc.edu; *Deserving the city? The neoliberal governance in Buenos Aires and Chicago*

Contingent neoliberalism, reveals that different political cultures, social bases, and institutional frameworks in global cities negotiate and mediate a similar drive to discipline urban physical forms and social realities. Based on this perspective, this paper examines urban neoliberal governance focusing on two global cities, Chicago and Buenos Aires. This work outlines the dominant contour of this ongoing process of diversity and therefore, highlights both the key similarities and key differences in the programs and policies offered, responses of people to, and spatial outcomes that result. It is suggested that urban planning administrations, landscape architectural endeavors, and real-state capital combined, constitute a type of urban regime which ultimately facilitate the drive to discipline physical form and social realities. The results are different social and spatial outcomes, particularly with respect to low income and racialized areas (the black and Hispanic belts in Chicago, the Abasto and La Boca communities in Buenos Aires). Key differences are found to exist in outcomes from educational policy, housing policy, economic development strategies, regulating and preservation of public space, and welfare initiatives. I conclude that it may be best to think of urban neo-liberal governance as a diverse and variegated set of regulatory schemes rather than as one ideal-type formation. In addition, it can be considered as a set of regulatory schemes organized to discriminate who are the ones that deserve to live in the city.

Keywords: neoliberal governance, urban policies, comparative studies

Rolf Sternberg, Montclair State University. Email: fsternie@aol.com; *Hydropower's Future, The Environment and Global Electricity Systems*

Hydropower is a well established electricity system on the global scene. Global electricity needs by far exceed the amount of electricity that hydrosystems can provide to meet global electricity needs. Hydropower contributes about 20% of the world's electricity needs. Much of the world's hydropower remains to be brought into production. Improved technology, better calibrated environmental parameters for large projects have become the norm in the past 15 years. How and why does hydropower retain a prominent role in electricity production? How and why does hydropower find social acceptance in diverse social systems? How does hydropower project planning address issues beyond electricity generation? How does the systems approach to hydropower installations further analysis of comparative energy sources powering electricity systems? Attention to the environmental impact of hydropower facilities forms an integral part of systems analysis. Similarly, the political and economic variables call for balanced analysis to identify the viability status of hydro projects. Economic competition among energy systems requires in context assessments as these shape decision making in planning of hydropower systems. The low production costs per kWh assure hydropower at this juncture, 2007, a very viable future.

Anneliese Steuben, University of Washington. Email: asteuben@u.washington.edu; *Pitfalls and Detours in Teaching for Social Justice*

This paper explores the obstacles that public school educators face in their efforts to teach with antiracist or inclusive pedagogies in diverse classrooms, and discusses their experiences and results of negotiating these challenges. This research is informed by the theoretical frameworks of both multicultural and antiracist education literatures, brought to life by qualitative data from teachers in the profession. In today's educational context of the No Child Left Behind Act, continuing de facto segregation in schools and continuing achievement gaps for many minorities, it is vital to understand the work that some teachers are doing to actively counter the racism and other forms of social exclusion that underpin so much of public schooling. The multitude of obstacles that such educators face?in the classroom, the school and the broader social-political-economic milieu?sometimes prevent them from enacting inclusive or antiracist pedagogy, while in other moments teachers find ways to mediate the challenges through pedagogical flexibility and creativity. Through contextualizing the educators' experiences within broader systems of political, economic and social change at multiple scales, the discussion will explore how power circulates in society more generally, and how people use cooperation to challenge and rework their relationships to each other within broader inequalities of power.

Keywords: education, pedagogy, antiracism, social justice

Forrest R. Stevens, University of Florida. Email: forrest@ufl.edu; *Bridging the Landsat Data Gap: Evaluating ASTER as an Alternative*

The NASA Landsat program has provided uninterrupted access to remotely-sensed, multi-spectral land imaging data since 1972. With the failure of the scan line corrector of Landsat 7 and malfunctions of the solar array drive in the aging Landsat 5 platform, ongoing longitudinal research utilizing Landsat data is severely threatened. This study evaluates other space-based alternatives to Landsat data sources for use in ongoing, long-term research. Comparable multi-platform data from the South American tri-national border of Brazil, Peru, and Bolivia are compared. Features evaluated include issues of calibration, viewing angles, scalar mismatch, land cover classification performance and calculated continuous indices. The most likely alternative sensors are highlighted, including the ASTER instrument (Advanced Spaceborne Thermal Emission and Reflection Radiometer). Finding a viable multi-spectral, land imaging alternative is imperative for many applications where Landsat data are used. The research areas of land use/land cover change and human-environment interactions are considered.

James B Stevens, Texas Christian University. Email: j.b.stevens@tcu.edu; *The Trinity River: A Response to Urbanization*

I will carry out my project by locating a stream site upstream, downstream and in the middle of the city of Fort Worth. The sites were selected based on road accessibility, semi-locale urban developments, clear and present tributaries and their confluence points, measurability of stream flow volume, and riverbed cuts for analysis. At the three sites, I will document urban development using historical aerial and satellite images, and note stream cross sections by visiting the sites to make measurements. This data will be analyzed through ArcGIS, and displayed according to spatial references. This method is ideal for the success of the project because it directly addresses the problem of stream channels changing as a result of time, but also urbanization. GIS programming allows up close and personal interaction of measured data combined with aerial images, and should result in precise maps showing these changes over time. Using multiple locations for test points the effects of urban planning can be seen immediately surrounding the focal area as well as downstream. Once the results are acquired, geography theories will be applied for further analysis. This analytical documentation could then be used by many people who might be involved in urban planning models. This could also be used as a starting point for further more in depth research and data collection for future projects.

Keywords: GIS

Quentin Stevens, Bartlett School of Planning, University College London. Email: q.stevens@ucl.ac.uk; *Artificial Waterfronts*

Beginning with Harvey's study of Baltimore's Inner Harbor, geographers have led the study of revitalized waterfronts as archetypal elements of the post-industrial cityscape. Urban waterfronts worldwide have been re-designed to support middle-class leisure, inner-city housing, high-profile business headquarters and cultural institutions. They have also been re-engineered to provide new piers, esplanades, marinas, beaches and wetlands. Several studies have sought to comparatively catalog postmodern waterfronts, identifying different categories of forms and functions, but in a majority of cases focusing only on the built environment above the water line. While critics have often bemoaned the artificial, superficial history, sociability and functional mix of these waterfront settings, less academic attention has focused on the artificiality and superficiality of the geography itself. These sites are almost never natural shorelines. Many leisure waterfronts are, like Baltimore's, built on the ruins of industrial port areas. They are almost entirely synthetic and carefully shaped to accomplish specific experiential effects. This paper examines contemporary urban waterfronts including artificial beaches, lagoons, marinas and rivers; aquariums; floating urban environments; and indoor waterscapes. It analyzes the relation between the physical geography and human geography of these waterfronts, focusing primarily on how these artificial environments are perceived and used by the general public. It explores how designers use engineering, landscape and architecture to control various geographic, climatological and hydrological features of the waterscape and its interface with urban public space, so as to create idealized urban settings which optimize spectacular leisure and place promotion.

Keywords: waterfronts, urban design, public space, landscape architecture

Stan Stevens, University of Massachusetts. Email: sstevens@geo.umass.edu; *Theorizing Protected Areas: Fourth World and (Post)colonial Perspectives on Conservation Enclosures, Commons, and Liberation Ecologies*

Much political ecological theorization has overly-narrowly represented protected areas as state/colonial conservation enclosures which construct "wilderness" by coercively displacing residents. I expand this conceptualization by 1) linking the globalization of exclusionary protected areas to (post)colonial, Fourth World and frontier theory and 2) by correcting conflation of "wilderness" reserves (a small percentage of global protected areas) with protected areas by engaging with a greater diversity of protected area types including community conserved areas (collectively managed commons and sacred places), Indigenous protected areas, co-managed protected areas, "protected landscapes/seascapes," and "managed resource protected areas." From these perspectives I re-conceptualize protected areas as diverse forms of conservation territories with different political ecologies grounded not only in different conservation goals and governance but in different state/colonial "frontier" political contexts and state commitments to social justice and Indigenous rights. I situate exclusionary, state-imposed protected area enclosures in indigenous peoples' homelands within Fourth World struggles over identity and territory, inter-cultural/"ethnic" asymmetries of power, expansionary state imperialism/"internal" colonialism and territorialization, and "frontier"/inter-national/global political economies. State (and international/INGO) promotion of exclusionary protected areas thus is often embedded in larger political ecologies of state/colonial territorialism, "nation-building," and economic nationalization/globalization and concordant oppression/dispossession of Indigenous peoples. Alternative, non-"wilderness" paradigms of protected areas and efforts to repudiate and redress coercive conservation enclosures reflect other social/political/economic dynamics as well as different conservation conceptions. Indeed, truly "(post)colonial protected areas" constitute "liberation ecologies" affirming, defending, and restoring Indigenous peoples' rights, commons, conservation values, knowledge, institutions, and their governance of self determination-based conservation and political territories.

Olivia Stevenson, University of Leeds. Email: geos@leeds.ac.uk; *Windows on the world: Everyday mobility practices of children's access to Information and Communication Technology (ICT) in the home.*

The linkages between geographies of young people, identity, power and space offer opportunities to reflect how children, their families, and Information and Communication Technologies (ICT) have been incorporated into geographical research and contribute to new directions in children's geographies. This paper presents the findings of a project which investigated children and their family's use of Information and Communication Technologies in the home. Much of the existing research into children's use of technology concerns deterministic discourses, and does not focus on the spatialities of the everyday, lived experiences of children and their families. This paper discusses how children's mobility practices, can be explored, negotiated, shaped, experimented with, challenged and transformed within different contexts. By considering the

ways in which children's mobility practices are generated/controlled/resisted in the traditional space of the home, this paper also explores the tensions between children's mobility choices and the demands of family life. The research data was generated by a questionnaire survey of 500 secondary school children in the South East of England, the use of time-space diaries and a series of interviews with children and their families. The paper reflects upon the links between children's technological choices, and their experiences within a variety of sociospatial contexts, and contributes to (re)theorising the linkages between young people, identity and spaces of the home in a technological age.

Angela May Stewart, Graduate Center, The City University of New York & The New York Botanical Garden (Dept. of Plant Sciences). Email: angelasteward@gmail.com; *From the margins: Examining the social dynamics of women-led natural resource management in Amazonia*

The women's association of the Foz de Mazagão Velho (Associação das Mulheres-Foz de Mazagão Velho, Amapá, Brasil) is a non-profit organization composed of ribeirinhas, female residents of the floodplains of the Mazagão Velho River Basin. The primary goal of the organization is to administer sustainable development projects in an area undergoing steady population growth. One such initiative is the association's fresh-water shrimp management project. As part of the project, member households are designated specific zones for shrimp collecting; families also receive fishing materials (shrimp and nursery baskets) purchased with association funds. Members report that zoning prevents encroachment by outsiders, helping to sustain shrimp yields, while the acquisition of fishing materials has increased household shrimp productivity. The current paper examines the socio-political conditions that have allowed for these positive results in light of a long history of failed community natural resource management (CNRM) projects in the Foz de Mazagão Velho. The paper further discusses local conceptions of "community" in this rapidly changing social space. The paper argues that the association's current success is linked to previous efforts to strengthen organizational capacity. In the past, community associations depended upon powerful families with the technical knowledge to drum up support for CNRM projects, and in the process were subjected to manipulation and control. Furthermore, the women's association's incorporation of women from recently-settled households have also facilitated group efforts. The case study offers an example a marginalized group's struggle for self-preservation by engaging with more powerful entities, such as government institutions and universities.

Dona J. Stewart, Georgia State University. Email: djstewart@gsu.edu; *Creating Stereotype(s) in the Middle East - The Role of Early Geographic Thought*

The creation of negative stereotypes of the Middle East, under the construct of Orientalism, has been a subject of considerable inquiry. Most previous research has utilized sources such as "The National Geographic" and traveler's diaries, and focuses on the era when Europeans established defacto control over the region. Utilizing collections of rare manuscripts, particularly volumes produced as 'Geographies of the World', in the 1600s, this paper finds deeply entrenched stereotypes existed well before the onset of 'The Age of Imperialism'. These sources are particularly insightful as they detail varied stereotypes not of the region as a whole, but of specific ethnic groups (Arabs, Turks, Persians, "Moors") in the area now known as the Middle East. Finally, these accounts raise questions as to the role of early geographic thought in creating enduring racial and ethnic caricatures.

Jeffery Stewart, Lawrence Livermore National Laboratory. Email: pierce10@llnl.gov; *The Geospatial Analysis and Modeling Team at Lawrence Livermore National Laboratory*

In the Engineering Directorate of Lawrence Livermore National Laboratory (LLNL), a number of researchers from diverse backgrounds have come together to advance Geospatial Analysis and Modeling within LLNL, the Department of Energy, and for other external customers. In this talk we present an introduction to LLNL Engineering Directorate's Systems and Decision Sciences Section and its context at LLNL. LLNL is a Department of Energy Laboratory, whose primary goal is National Security, supports a number of research topics in Energy and Environmental domains. The Engineering Directorate, which supports Lab research in addition to pursuing research avenues on its own, is divided into a number of divisions, based on areas of expertise. The personnel of the Systems and Decision Sciences Section include people with a myriad of backgrounds, including Economics, Operations Research, and Geography. The focus of our projects is diverse as well. We will present recent and current projects that the

Geospatial Analysis and Modeling Team have been involved with. These include examining spatial significance of stakeholder input in Total Maximum Daily Load Modeling, Energy System End-State Modeling, and Spatial and Temporal Risk Assessment.

Google Earth transformed the public's ability to visualize landscape features through imagery and is amplifying spatial literacy and geospatial awareness. Increasingly this program is serving as a platform for GIS data with more individual purposes. We have begun to use Google Earth to serve data to other users on campus, in order to facilitate communication about research projects, to support teaching, and to aid in community outreach. Beginning with a set of data for a collaborative stream monitoring project, we have used this approach to present our data to the public, as well as to provide cross-platform data access to participants of various projects. We have also used Google Earth with locally-produced data sets to support workshops and demonstrations in non-GIS classes and across disciplines. While this application is in early stages of development on campus, it has proven a useful tool for these communication purposes. The intuitive interface of Google Earth allows us to more quickly and easily produce maps and distribute them by way of the Google Earth community bulletin board than we can if we used an internet mapping service product or traditional GIS software. We present our progress here to show our methods, to demonstrate the strengths and weaknesses of this approach to data distribution, and to help initiate exchanges of ideas on these kinds of directed applications of this software.

Harris Washington Stewart III, University of North Carolina at Asheville. Email: hwstewar@unca.edu; Wind Energy Modeling for the Fort Dauphin Region, Madagascar; Implications for Conservation and Development

Madagascar is a country of contrasts. Disparate poverty and unsurpassed biological wealth are immediately juxtaposed across the island nation, converging starkly in the southeast. The region of Fort Dauphin exhibits the lowest electrification rate, per capita GDP, as well as the highest rates of infant mortality and infectious disease. Collectively, these synergistic indicators of extreme poverty may partially explain the region's extremely high rate of deforestation, as the interrelationships between poverty and environmental degradation have been explored extensively across the developing world. While existing work in the region has focused on quantifying levels of deforestation, little has been done to quantify the potential for developing renewable energy alternatives that could offset the region's biomass fuel requirements and thus prevent the loss of its remaining forests. The goal of this study was to address this need by: 1) modeling the kilowatt potentials that exist in the winds of Fort Dauphin and by 2) identifying locations that would be most appropriate for the siting of wind energy generators. This study involved a combination of ground-work and advanced computer modeling using the Weather Research and Forecasting Model in combination with a Geographic Information System. The work to date has produced the first visual dataset of wind speeds across the Fort Dauphin region, which will soon be analyzed in conjunction with existing infrastructure, population distributions and water source points to explore siting options and the feasibility of providing the residents of Fort Dauphin with basic services developed exclusively from renewable sources.

Claudia M. Stickler, University of Florida. Email: cstickle@ufl.edu; Oriana Trindade Almeida, PhD, Instituto de Pesquisa Ambiental da Amazonia. Email: oriana@ipam.org.br; Daniel C Nepstad, PhD, Woods Hole Research Center. Email: dnepestad@whrc.org; Assessing the economic and environmental trade-offs of two land-use policies on an expanding agro-industrial frontier in the SE Amazon

Explosive growth in Brazil's agro-industrial sector is driving historically high rates of forest conversion in the Amazon Basin, posing a threat to human health locally and to regional and global climate systems. Major concerns include the degradation of riparian areas and the resulting effects on water quality and forest connectivity, and increasing levels of carbon emissions. The principal policies that regulate land-use in Brazil?the Forest Code and state zoning plan (Zoneamento Ecologico-Economico)?have met with limited success. In this study, we review the requirements of each of the two policies, and carry out spatially explicit analyses to compare the current landscape in the Xingu River

headwaters region (SE Amazonia) to the landscape that should exist in theory, according to the policies, as a measure of each policy's performance. We compare the "actual" (based on a 2005 land-use/land-cover classification) and "theoretical" landscapes in terms of several environmental (e.g., carbon stocks, forest fragmentation, water quality) and socio-economic (e.g., income, employment, social indices, opportunity costs of compliance) measures. We estimated that if the region were to be reforested to meet current Forest Code requirements, approximately 0.2 Pg of carbon would be sequestered?nearly equivalent to one year's emissions from the entire Amazon basin. Under the current zoning plan, carbon stocks could be reduced by up to 0.07 Pg over the current landscape and still meet legal requirements of the plan.

John Stillwell, School of Geography, University of Leeds. Email: j.c.h.stillwell@leeds.ac.uk; Kirk Harland, School of Geography, University of Leeds. Email: k.harland98@leeds.ac.uk; Commuting to school: spatial analysis and modelling for strategic education planning

A key objective in planning education provision is to ensure that the number of school places is commensurate with the number of children requiring education at different levels. This objective has become increasingly difficult to achieve in Britain due to changing demographic, behavioural and legislative factors. Reductions in fertility mean smaller cohorts of children reaching different stages in the education system; migration patterns create new patterns of demand; parental attitudes to school selection have changed; new legislation on parental choice of school has accentuated the focus on achievement; and variation in school admissions policies has created constraints on the education market. One of the consequences of these developments is that new patterns of interaction emerge annually between the places where schoolchildren live and school locations. This paper concentrates on understanding the dynamics of what we call the 'journey to learn'. The paper explains how PLASC data is being used to investigate the spatial patterns of pupil mobility, primarily in the context of daily trips in Leeds, a city in northern England, but also in relation to movements between schools and between places of usual residence. Consideration will be given to how these flows can be modelled in order to support the local education authority (Education Leeds) make better decisions when planning the provision of primary and secondary schools across the district. Finally, the framework of a planning support system is proposed that incorporates the tools required for the analysis and modelling discussed previously.

Mitchel James Stimers, Kansas State University. Email: stimers@ksu.edu; A Gis Analysis Of Temporal And Spatial Regions Of Peak Tornado Activity In The United States

The onset of "peak" tornado season does not occur simultaneously throughout the United States. The migration of the polar jet stream northward combined with the influx of moist tropical air from the Gulf of Mexico work in concert to push regions of frequent occurrence of tornadic activity to the north beginning in spring. Traditionally, these data have been displayed in the context of peak occurrence by state. The goal of this project is to temporally and spatially describe the migration of peak onset from the southern to northern United States. Further, it is determined how well peak occurrence is linked to the relative positions of the continental polar airmass (cP) and the maritime tropical airmass (mT). Historical tornado data from the National Climatic Data Center (NCDC), climate data from the Climate Diagnostics Center (CDC), as well as a geographical information system (GIS) and an Integrated Data Viewer (IDV) are used. A description of the relationship between the cP and mT airmasses and peak tornado occurrence could provide a better understanding of the temporal and spatial movement of the "tornado season" through the United States.

David Stinchcomb, National Cancer Institute. Email: dstinchcomb@compuvision.net; Barry Miller, National Cancer Institute. Email: ; Vivien Chen, Louisiana Tumor Registry. Email: ; Post Katrina Population Estimates for Cancer Surveillance

The initial impact of the massive population shifts in the Gulf States due to hurricanes Katrina and Rita has been well documented. However, the significant and ongoing impact of these population shifts on disease surveillance has not previously been described. Accurate estimates of regional populations are needed to calculate disease rates as well as to determine the completeness of disease reporting. With populations gradually returning to former homes, estimates are needed for multiple time periods. Also, differences in population shifts by age, sex, and race/ethnicity are needed since these are important covariates of cancer rates. The purpose of our work is to develop estimates for Louisiana population shifts at the state and parish level in conjunction with the Louisiana Tumor Registry to determine cancer rates and the completeness of case reporting. We

began by developing a conceptual model of the population shifts that includes special consideration of cancer case reporting rules that record the permanent address when cases are diagnosed at a temporary residence. Next, available estimates of post Katrina population shifts were collected and compiled. Estimates over time were then developed using the model to bridge temporal gaps in existing estimates and to convert from actual populations to an estimate of the "cancer base population" or the number of people who considered the area to be their permanent residence. This method provides a range of possible base population values that will help determine the completeness and accuracy of our cancer data in Louisiana.

This article studies the influence of the restitution process and the land ownership in Estonia. The basic question relates to changes in private land ownership and land-use after the dissolution of the Soviet system and the fast transformation to a market economy. Issues related to the actual land-use, processes explaining these changes and individual motives for a changed land-use are central. The legal point of view where private land ownership is regulated by recognised legislation is a central point of departure. The emotional aspect relates to peoples commitment and emotions for their home region. The economical aspect concerns the land-use and the land yield (economic exchange). This study focuses the real estate property and the property holders' relation to the property. The purpose with this article is to study real estate property in two regions in Estonia (Põlvamaa and Länemaa) with reference to ownership, land-use and property holders' economical and emotional relation to the property and how these factors influence the property utilisation. A number of hypotheses related to ownership, ethnicity and economic rationality are tested. The study is based on register data comprising all properties with an area of at least 1 hectares or 2,47 acres in two Estonian regions and questionnaire data. The result from the study shows that many agricultural- and forest properties are quite small which affects the amount of economical exchange. The emotional linkages and the symbolic importance of getting land and property back are important factors.

Mathis Stock, Choros, EPFL. Email: mathis.stock@epfl.ch; Mobility as "arts of dwelling"

Dwelling (wohnen, habiter) and mobility are linked through the individual manners of practising places. For the individuals in (post/late-)modern societies, mobility implies the practice of an increasing number of places - more or less familiar/strange ones ?, actualized through different intentionalities in different situations. This unprecedented situation raises the need of conceptual tools allowing to grasp the different ways individuals cope with space. These "arts of dwelling" are conceptualized here. First, by establishing the conceptual bases of dwelling as practices of places, where the theoretical shift from dwelling as being-on-Earth towards dwelling as coping with space is undertaken. This allows thinking the places as well as the movement, and I will insist upon the notion of experience and the symbolic charge of movement. Secondly, by showing how mobility takes a more and more important part of contemporary arts of dwelling, especially in "poly-topical" modes of dwelling. Finally, by raising the question of how mobile dwelling implies the deployment of geographical competences. These conceptual investigations shall contribute to a more adequate understanding of the very differentiated ways of the individuals' coping with space.

Alison Stokes, University of Plymouth. Email: ajstokes@plymouth.ac.uk; Kirsty Magnier, University of Plymouth. Email: kmagnier@plymouth.ac.uk; Preliminary results from a longitudinal study into student and staff conceptions of geography fieldwork

Whilst much is made in the literature, and anecdotally, of the 'assumed benefits' of fieldwork, its true pedagogic value remains unclear. In particular there is relatively little empirical evidence to substantiate the widely held assumption that fieldwork is a fundamental component of undergraduate geography. It is therefore important that the academic credentials of fieldwork are clarified if its continued inclusion in the undergraduate curriculum is to be justified. This paper will present the preliminary findings from a longitudinal study into the conceptions (ideas and beliefs) of fieldwork held by undergraduate geography students and academic staff at a single UK university. This research is important as students typically develop conceptions that are based on their own experiences rather than 'scientifically acceptable' ideas about the world, and are hence likely to possess a differing set of ideas and beliefs about the nature and purpose of fieldwork to academic staff. Using an open-ended survey method of data collection and analysis based on the phenomenographic method, this study identifies the qualitative variation in responses gathered from geography students and academic staff to the question "what do you think is the main purpose[s] of fieldwork", and investigates how these conceptions vary between students at different academic stages, and between students and staff. By making explicit the ideas and beliefs held by 'novice' and 'expert' geography practitioners about fieldwork and its role within the discipline, the results of this study will inform future investigations into how, as opposed to what, students learn in the field.

Justin Stoler, San Diego State University. Email: stoler@rohan.sdsu.edu; A Spatial Analysis of Self-reported Malaria Prevalence in Accra, Ghana: The Role of Urban Agriculture

Sub-Saharan Africa is experiencing unprecedented urbanization, and many local governments remain unable to meet basic infrastructure needs for these exploding populations. Urban malaria is a growing problem that may be linked to urban agriculture practices. Urban agriculture, which has been shown to reduce poverty and increase food security, may inadvertently harbor malaria's mosquito vector through irrigation and increased water storage. The connection between urban agriculture and malaria prevalence has recently been investigated in several studies, but a clear relationship remains elusive. This study utilizes spatial analysis techniques to examine the relationships between self-reported malaria statistics for 3180 women surveyed in Accra, Ghana in 2003, proximity to sites of urban agriculture, and household characteristics. Self-report data is practical due to its low cost and ease of collection, and it should enhance our overall understanding of the spatial patterns of malaria in Accra.

Christopher D. Storie, Winthrop University. Email: storiec@winthrop.edu; Joni L Bugden, Dr., Western Carolina University. Email: ; Adam Griffin, Western Carolina University. Email: ; Prototype River Cane Geographic Information System

River cane (arundinaria gigantea) is a native cane of the Eastern woodlands that exists within the Appalachian mountains of Western North Carolina. More importantly, this species of cane is of vital economic importance as an artisan resource used by the Eastern Band of Cherokee Indians (ECBI) to produce traditional woven baskets. Funded through a grant from RTCAR (Revitalization of Traditional Cherokee Artisan Resources) this project was designed to build a prototype GIS database that contains biophysical information of selected cane patches within Western North Carolina. Existing cane areas were identified using local indigenous knowledge, and surveyed using differentially corrected GPS units and an in situ assessment of site characteristics. The GIS database is scalable, and can provide information to scientists and resource managers interested in preserving, protecting and/or restoring river cane. This project is the prototype to determine both the feasibility and usefulness of creating a more extensive database. Finally, an overarching goal of the project was to develop educational

opportunities for students and provide an avenue to enhance partnerships throughout the region

Email: lcoulter@geography.sdsu.edu; Comparison of Per-Pixel and Object-based Approaches for High Spatial Resolution Monitoring of Vegetation Changes

Successful preservation of rare, endangered, and threatened (RET) species requires adaptive management practices that are based on monitoring changes in habitat conditions over time. In southern California, coastal sage scrub shrublands provide habitat for a large number of RET species. Biogeographical studies of key RET animal species suggests that change in shrub/subshrub cover may be a useful indicator of change in habitat condition; such an indicator has a high potential for being successfully mapped and monitored with remote sensing. The objective of this study was to compare per-pixel and object-based approaches to monitoring changes in a shrubland habitat preserve in southern California. Very high spatial resolution (1 m) visible and near infrared image data were captured seven years apart with an airborne digital camera system. The seven-year period between image acquisitions was one of the more severe droughts on record. The image data were geometrically corrected, radiometrically normalized, and spatially registered to create a precise multitemporal dataset that was subjected to semi-automated land cover change analyses. Results from both image change detection approaches yielded a net loss in shrub/subshrub cover following drought. Detailed land cover changes were detected that corresponded to both direct human disturbance (i.e., urban edge effects) and drought effects. Based on field validation data, habitat change maps from the object-based approach were more accurate than the pixel-based approach, and habitat change features were more realistically represented in terms of shape and size. Shrub/sub-shrub cover change estimates derived from both approaches were similar.

John Byron Strait, Assistant Professor of Geography, Sam Houston State University. Email: jstrait@shsu.edu; Cherisha Nicole Williams, Louisiana Tech University. Email: ; Rubbing Elbows in the Big Easy: The Impacts of Compositional and Redistributive Forces on Residential Segregation Among Racial and Ethnic Groups in New Orleans, Louisiana; 1990-2000

Most residential segregation studies have focused strictly on the residential experiences of African-Americans and whites, usually relying upon measures of residential evenness to gauge the level of segregation between these two populations. This research broadens the analysis of residential segregation by investigating changes in two different dimensions of segregation evident among the four main racial and/or ethnic groups in New Orleans, Louisiana from 1990 to 2000. Measures of residential exposure were decomposed in order to investigate the relative impacts of metropolitan-wide compositional change and intra-urban redistributive change on segregation. During the 1990s all non-white groups became increasingly segregated from whites and increasingly integrated with one another. Evidence suggests that whites, Hispanics and Asians exhibited some degree of "ethnic (or racial) self-selectivity" that functioned to concentrate these groups residentially, although these forces were generally overwhelmed by other redistributive and compositional changes. The evidence further suggests that the isolation of African-Americans and the levels of segregation experienced by this group were strongly impacted by the residential behavior of whites and Hispanics. Meanwhile, Asians and African-Americans became increasingly integrated, largely as a result of members of these two racial groups relocating to the same neighborhoods.

Thomas P. Strange, University of Tennessee. Email: tstrang1@utk.edu; Carl A. Reese, Ph.D., University of Southern Mississippi. Email: carl.reese@usm; Inter-annual Variability and Seasonality of Modern Pollen Deposition on the Quelccaya Ice Cap, Peru

The interpretation of fossil pollen in ice cores from the tropics has been shown to be a useful tool in the reconstruction of past vegetation and climate. However, a lack of understanding of the relationship between modern pollen spectra and its environment exists. Knowledge of a modern analog (relationship between modern pollen dynamics and modern environmental conditions) is needed in order to better interpret the fossil pollen signatures situated within an ice core. For this study, snow samples were extracted in July 2004 and June 2005 from the Quelccaya Ice Cap in southern Peru in order to gain an understanding of the inter-annual and seasonal variability in pollen deposition on the ice cap. Snow pits were located on the summit, north dome, and south dome of Quelccaya. The pits were dug back to the previous July (winter) ensuring one full year of data. The previous winter's firm is easily distinguishable in the pit as it is darker in color than surrounding layers of firn. Pit depths at the sites ranged from 2.5-3 meters. Samples were collected at 15cm intervals down the entire pit wall and distinct seasonal differences among pollen assemblages are noted in the paper. Pollen results also varied between site locations, probably due to local winds and different depositional environments.

Elaine Stratford, PhD, Institute of Australian Geographers. Email: Elaine.Stratford@utas.edu.au; Inside the Frame: Young Islanders and the Constitution of Sense of Place Through Art

Islandness is a constellation of identifications particular to places smaller than continents and surrounded entirely by water. These identifications include, but are not confined to, strong perceptions of island-self and mainland-other that buffer island peoples from the worst exigencies of modernity. No less powerful than place-based identifications among plains or mountain or forest peoples, and always contingent rather than determined, islandness is nevertheless a particular and potent source of being-in-place. This paper reports on an international community engagement program, Webbing the Islands. Its principal aim is to support island communities to develop and share inventive learning activities that celebrate innovation and resilience in response to long-standing stereotypes about many island(er)s as vulnerable and backward. In particular, the paper focuses on a project among young people in the island state of Tasmania, Australia, encouraging them to explore and value what it means to be a young islander in a sub-national jurisdiction that has been the object of derisive 'mainlander' commentaries. Funded from two philanthropic grants provided by the Ian Potter Foundation and Tasmanian Community Fund, the project involves working with students from grades four to eight based in communities remote from the island's population centres. Students work with a community artist; their teachers are aided in follow-up classroom work by an island studies guide developed by a cultural geographer; and the fruits of their creativity are then shared online. The project illustrates the gains to be made for young people from interventions in the constitution of islandness as an ontological resource.

Kendra Strauss, University Of Oxford. Email: kendra.strauss@geog.ox.ac.uk; Gordon L. Clark, University of Oxford and Harvard University. Email: glclark@ouce.ox.ac.uk; The Challenge of Context in Economic Geography

This paper asks whether a "new quantitative geography" based on critical social/cultural theory is possible in the context of economic geography generally and the study of individual choice in pensions and retirement planning in particular. We explore the limitations of quantitative methods where the intention is to validate a 'strong' model of economic rationality? the logic underpinning much of conventional economic analysis and its related expressions in public policy. Most importantly, we suggest that it is crucial that economic geography take seriously the diversity of "economic" life, bringing into play the significance of context - social identity and attributes including gender, age, social class and aspirations. It is suggested that qualitative approaches focussing on small-scale samples are one way to reintegrate the lived experiences of individuals and communities with more limited but nonetheless valuable quantitative expressions of related phenomenon. These ideas are illustrated through discussion of a large-scale survey of attitudes towards risk and choice among UK defined contribution (DC) pension plan participants. The importance of this project lies in the need to express the diversity of life and scope of experience of real men and women in and through the social sciences, notwithstanding the need for policy-friendly solutions.

Emma Street, King's College London. Email: emma.street@kcl.ac.uk;
Rob Imrie, King's College London. Email: rob.imrie@kcl.ac.uk;
Architecture and the Codification of the Built Environment

Architecture, and the form of the built environment, is influenced and shaped by regulations or rules that are formulated to provide specific and predictable outcomes for all aspects of architectural production, from conceptual design to urban form. Such regulations are not necessarily enshrined in law but are systematic sets of rules characterised and differentiated by authorship, context, and implementation. Referring to postal survey and interview data from the UK context, the paper explores architects' attitudes towards regulation and rule relating to building design, and evaluates the interrelationships between processes of regulation and design form and outcomes. We develop the proposition that regulation and rule interact with, and influence, architects and the design process in complex and unpredictable ways. The data are instructive, we argue, in helping to re-think the significance of regulation, and the constitutive ways in which place and regulations are entwined.

Monitoring Frost Heave and Thaw Subsidence in Northern Alaska with Differential GPS

Vertical movement of the ground surface due to frost heave and thaw subsidence is a common phenomenon in permafrost regions. The magnitude of this movement varies both temporally and spatially, owing to interannual climatic variability at the ground surface and to local variations of soil moisture. Traditional survey methods for measuring vertical surface movement have some disadvantages. Geodetic surveys have good spatial coverage, but are limited to small number of survey benchmarks in the Arctic. Frost tubes and heavemeters allow precise measurements of heave/subsidence, but are usually limited to point locations or very small areas. Differential Global Positioning Systems (DGPS) provides an alternative approach for measuring ground heave/subsidence that can fill the gap between spatial coverage and precision. DGPS technology, in conjunction with survey targets designed specifically for this study, was employed at three sites in the northern Brooks Range Foothills and the Arctic Coastal Plain of northern Alaska. Beginning in 2001, vertical movement of the ground surface was measured twice per year (June and August). The resulting five-year heave/subsidence record, in conjunction with temperature and active-layer measurements, was used to evaluate regional and site-specific factors affecting the spatial and temporal variability of frost heave and subsidence. Results indicate that heave and settlement show patterns of spatial variation similar to those of active-layer thickness. Comparison of GPS-measured ground surface elevations with historic data reveals significant long-term ground subsidence at several sites near Barrow. DGPS methodology is useful for measuring frost heave and thaw settlement over large areas with fine resolution.

Josef Strobl, UNIGIS International, Salzburg University. Email: josef.strobl@sbg.ac.at; UNIGIS - Networked Learning over a Distance

Distance Learning is well suited for GIS professionals aiming at individually enhancing their qualifications. For most adults education works best in an interactive social setting with focussed periods of self study. While the latter is well supported by online learning media and practical exercises, social contexts tend to fall short with distance learning. In order to enhance students' online learning, the UNIGIS program at Salzburg University has developed a multi-pronged strategy for building a social fabric supporting students throughout their entire program. Starting with a residential workshop, students are encouraged to interact and cooperate right from the start. Synchronous (chat) and asynchronous (forums) communication tools are available for study groups, and select assignments are designed as collaborative tasks. Later in the course students work on a collaborative project building teamwork and communication skills. Interaction with faculty of course uses online communication tools, actively facilitated by a class tutor in charge of planning, 'motivating' and moderating online sessions. For specific support requirements one-on-one application sharing and hosted services are used. From a longer-term perspective, UNIGIS is building communities of students and alumni used to collaborating and providing mutual support. Frequently this professional network is cited as the most important asset actively used long after graduation. Countering the potential and risk of online learning leading to an isolated 'home alone' learning experience probably is the most important organisational challenge. Many years of experience across the UNIGIS network have identified a high level of social interaction as key success factor for distance learning

The damage by Hurricane Katrina to the southern Louisiana environment involved interaction between Earth systems, namely the biosphere, atmosphere, and hydrosphere; this interaction led to environmental change which can be monitored using satellite imagery. This poster will demonstrate the result of undergraduate research using remotely sensed imagery, image processing, coupled with GIS analysis, to determine the geographic extent and change dealt to the coastal wetlands by Hurricane Katrina. The image processing analysis will be conducted on Landsat Thematic Mapper imagery collected on August 22, 2005 (pre-Katrina) and September 7, 2005 (post-Katrina). The image processing analyses that will be applied include registration, spatial filtering, and supervised and unsupervised classification, ending with change detection. The expected outcomes are the delineation of inundation areas in southern Louisiana. This research is funded by a grant from the University of North Alabama's Geography Alumni Association.

Environmental Impact of Recreational-Retirement Communities in Southwest Florida

Following World War II a unique set of economic and demographic changes permitted a large number of older Americans to opt for retirement residence in an amenity based location. Amenity based residential developments catering to newly affluent retirees were developed around the nation to serve this new and growing market. Most of these retirement developments were located in Sunbelt states, but no area of the nation is devoid of such developments. The greatest concentration of these developments is in Florida. This paper examines 1) the economic and demographic factors which produced these retirement based developments, 2) the locations of these developments, and 3) successes and problems associated with three of the large developments in Southwestern Florida. Developers of large scale amenity based subdivisions, in their attempt to sell vacation and retirement home sites as rapidly as possible, often create so-called "new communities" that are advertised as places where residents can escape many of the problems associated with urban living. Unfortunately, success in creating such communities has been sporadic and inconsistent. This paper finds many enduring problems that include severe environmental degradation, inadequate public facilities, scattered development, and subdivision designs that do not meet current market demands. Because of these and other problems, more research is needed to find ways to more consistently implement options designed to resolve some of the vexing problems that have been created.

Through the integration of agent-based modeling and simulation (ABMS) and GIS, domain experts gain the ability to model behaviors and processes as change and movement over time in geographic space. Agent Analyst is a new, open-source extension of RePast for ESRI's ArcGIS® that enables this integration. As a result, ABMS modelers are able to create rules for agent change and movement using standard GIS datasets such as terrain models, physical landscape features, infrastructure and other geospatial data both in raster and vector format. Agent actions may be computed using geoprocessing models of complex geospatial processes, enabling researchers to identify relationships between behavior and temporal and/or geospatial constraints. Two agent-based models to test the capabilities of Agent Analyst will be discussed. The first is a bird migration model that simulates the migration patterns of two bird species, taking into consideration parameters related to migration trigger, navigation methods, and other migration behavior rules. This model demonstrates how the integration with GIS can improve the realism of simulations that involve agent movement over actual landscapes. The second model simulates urban growth patterns for a study area in Southern California. In this model, geographic features (parcels)

change state based on underlying parameters such as physical constraints, land use planning policies, development suitability factors and influence from parcel neighbors, etc. This model was developed to support scenario-building through user-defined adjustable weights. This model demonstrates how actual geographic features may be deployed both as agents and as constraining factors in sub-models of geospatial processes.

Diana Stuart, University of California Santa Cruz. Email: dstuart@ucsc.edu; Addressing the Paradox of the "Clean" Field: Conflicts between Food Safety and Environmental Quality in Central Coast Agriculture

The Central Coast represents one of the most productive and high value agricultural regions in California. Two significant problems currently trouble Central Coast agriculture: food safety and environmental quality. At least nine out of twenty outbreaks of *E. coli* 0157:H7 from lettuce and leafy greens in the past decade were traced back to the Central Coast, including the most recent outbreak from spinach in September 2006. Regarding environmental quality, the region suffers from severe water pollution and ecosystem degradation associated with intensive agricultural activities. Current methods to address each of these issues directly conflict. Growers in the region are receiving contradictory messages regarding management practices. This conflict centers on the idea of the "clean" field. As indicated in industry-led food safety guidelines, a "clean" field entails removing peripheral non-crop vegetation, such as shrubs and grasses. It is feared that this vegetation might attract wildlife, seen as possible vectors of disease. This results in a paradox: cleaning up fields for food safety contradicts with practices to clean up the environment, which specifically use non-crop vegetation to absorb and filter out pollutants. Efforts to encourage environmental practices from government agencies and conservation organizations are in direct opposition with market-based pressures to follow food safety guidelines. This paper will explore the dynamics of this opposition, focusing on the role of information and the use of science to support conflicting ideas about land management. I will also examine how principles in sustainable agriculture could be applied to address both issues.

Keywords: sustainable agriculture, food safety, environment, pollution, wildlife

Roger W. Stump, University at Albany. Email: rstump@albany.edu; Scales of Territoriality in Christian Reconstructionism

Christian Reconstructionism has emerged as a small but influential post-fundamentalist movement within conservative Protestantism in the United States in recent decades. While drawing on the renewal of conservative Protestantism promulgated by earlier fundamentalists, Christian Reconstructionists differ from the former in their higher degree of sectarianism, rooted in a specific interpretation of Calvinism rather than in a more generic enunciation of Christian fundamentals, and in their emphasis on the teleological unfolding of sacred history rather than on the secular spread of threats to orthodox beliefs and values. In examining the distinctiveness of this movement from earlier forms of Christian fundamentalism in the U. S., this paper focuses in particular on the distinctive and complex expressions of territoriality that lie at the heart of Christian Reconstructionist thought. Two key factors distinguish these expressions of territoriality: their articulation with regard to spaces organized at a variety of geographical scales, from the body to the local community to the state to the world as a whole; and the explicit integration of these scales of territoriality into a single narrative rooted in the sacred history of postmillennial Calvinism. These factors foreground an exceptionalist view of the United States as the worldly hearth of the postmillennial process of reconstruction and the importance, across different spatial scales, of establishing theonomic structures that unify individuals, families, and states under the domain of Biblical law. This paper finally argues that, based on its distinctive characteristics, Christian Reconstructionism represents significant expression of post-fundamentalism generally.

Janet Sturgeon, Assistant Professor, Simon Fraser University. Email: sturgeon@sfu.ca; Globalizing Rubber: "Out-Sourcing" Rubber to Laos from Xishuangbanna

Globalizing Rubber: "Out-Sourcing" Rubber to Laos from Xishuangbanna With China's entry into WTO (2001), and the privatization of state rubber farms in Xishuangbanna, southern Yunnan (2003), newly-formed "rubber companies" are trying unsuccessfully to extend rubber to neighboring Laos through government-to-government concessions. Minority rubber farmers, meanwhile, are rapidly extending rubber to Laos through share-cropping arrangements across the border. This paper traces how minority farmers have become successful (and rich), and also, through an examination of governance of rubber, minorities, and development in Xishuangbanna, explores how this success is profoundly unsettling to discursive concepts of land use, which divided rubber

production into people and spaces that are modern, productive, scientific, and Han (state farms), and those that are backward, inefficient, unscientific, and minority (upland farmers' fields). How have minority farmers used this globalizing moment to transgress these binaries, and to what extent does this crossing rework governance on China's periphery? Janet Sturgeon Geography Dept. Simon Fraser University

Keywords: China, Laos, rubber, state farms, minority households, WTO

Tristan Sturm, UCLA. Email: tristan.sturm@gmail.com; The Environment as Apocalypse

In this paper I will compare and contrast two Christian theories concerning the environment: Premillennialism and Dominion Theology. With a secular apocalyptic thrust, Bill Moyers' speech following the acceptance of the Harvard Global Environment Citizen Award, deplores these theories but makes little distinction between them. Rather ironically, Hal Lindsey, who is one of the most influential premillennial prognosticators, repudiates Dominion Theology on the grounds of not accepting the Olivet Discourse. In a nutshell, following Genesis (1:26) Dominion Theologists believe the world was made plentiful and that they were to have full dominion over the Earth's natural resources. Conservation, resource shortages, environmental degradation and other environmental concepts are confronted with disbelief: God made a perfect world for us to live. Premillennialists, on the other hand, believe the world is in an evil recession falling farther from God with each passing day. Christ will return at the peak of human and environmental violence to destroy the evil armies of the world and bring forth all people to be judged before "Him". Signs of environmental disasters are to the Premillennialist evidence that the world is falling farther from grace and into the hands of the Antichrist. To some, even taking action to reverse polluting the environment is seen as a challenge to God's sovereignty because ecological crisis is part of "His" divine end time plan.

Keywords: Millennialism, Fundamentalism, environment

I-Jhy Su, Professor, Tainan National University of the Arts. Email: suijhy@mail.tnnua.edu.tw; You-Ren Yang, Dr., National Taiwan University. Email: yyren@ms34.hinet.net; Catching-up in the Global Value Chain: The trans-scalar learning dynamics of TFT-LCD clusters in Taiwan

This article aims to investigate the significance of trans-scalar technology collaboration to territorial innovation system by investigating the development trajectories of TFT-LCD industrial clusters in Taiwan, which based on the Tainan and Taichung Science Park, and explore its relevance to the possibility of catching-up in the global value chain. I find that although the industrial clusters rely on extra-territorial technology collaboration to a certain degree in the earlier stage, but local TFT-LCD companies had showed significant absorptive capacities and further engaged on advanced R&D. Moreover, the territorialized learning networks between local companies and foreign component companies in the host regions also took shape, and even launch the knowledge reverse spillover of TNCs in the clusters to their headquarters. Thus I argue that latecomer's companies can grow fast by obtaining new capabilities and thus change the power relations with the leading companies. In other words, I believe that the control of leading companies over the upgrading of latecomer's companies inserted in the global value chains might be limited. Discussions on the upgrading of vendors in the global value chains from the perspective of firm capacity development and formation of new networking relationships beyond those with the former leading companies in latecomers should have certain values. Finally, I try to highlight a missing link of territorial innovation system by emphasizing the complexity and significance of a bundle of trans-scalar learning dynamics.

Keywords: trans-scalar learning, territorial innovation system, industrial cluster, global value chain, local and regional development

Shew-Jiuan Blanka Blanka Su, National Kaohsiung Normal University. Email: shewsu@nknua.edu.tw; The geographical implication of transnationalism in an island of cultural diversity — Taiwan

The paper is to delineate the many geography-implied faces of transnationalism in Taiwan, where the urban and rural boundary is blurred, and the geography of places is dominated by type of family, type of job and type of project, rather than geographical proximity or collective images of places. This paper uses both macro level statistical data and micro level qualitative interviews of migrant workers and their employers to construct how the transnationalism in Taiwan's cities and rural areas are manifest, how the geography of places matters in constructing the cosmopolitanism that is shown through life style, life experience, life-work relations, and even gender relations. Macro level data show the increasing dependence of the national economy on migrant workers and increasing number of household depending on domestic helps from overseas to complete their daily life practice. Qualitative interviews show the cultural and social changes, that are witnessed by the employment of migrant workers, are far more complex than one might have imagined through a daily life base. The

concept of transnationalism is mainly and often focused on interconnectivity between people around the world and blurring boundaries between countries. More importantly, however, this paper argues that the local geographical implication of transnationalism lead to the discussion of locality, cultural changes, social transformation, political negotiation, and economic integration. The overarching issue for all the change and transnationalism is scalar and re-scalar.

Keywords: transnationalism, cosmopolitanism, daily-life, culture-diversity, Taiwan

Pere Suau, PhD Candidate, Universitat Autònoma de Barcelona. Geography Department. Email: pere.suau.sanchez@uab.es; Montserrat Pallares-Barbera, PhD, Universitat Autònoma de Barcelona. Geography Department. Email: montserrat.pallares@uab.es; *New Challenges in Western Europe Airport Planning. Environmental Strategic Assessment in Airport Development Strategies*

The current European airport framework presents socio-environmental and territorial conflicts that have difficult resolution. There is a need for air-infrastructure development; but such development can damage the environment and the interests of the nearest inhabitants. Technical features of the airport infrastructure would not be relevant for increasing air traffic volume. Enlarging airport capacity will depend, in the short term, on controlling environmental impact of such development in surrounding areas. This paper deals with the decision making process of airport planning system based on the Environmental Strategic Assessment model in Catalonia's airports. Environmental Strategic Assessment model (ESA) considers several elements, such as biophysics, economic, social, politic, and territorial variables to evaluate the environmental consequences of several alternative future scenarios. Results of the ESA decision model are to be included as basis for airport policy makers to avoid future social disruptions. Catalonia's airport network has quite a few airports; in which three of them are international and Barcelona's is by large the most important one. Several stakeholders are interested in expanding and developing the current airports. However, this interest for growth and new opportunities is not reflected in airport planning policy. Specifically, the increasing volume of air traffic in low-cost flights and executive aviation that have taken place is making the government to consider new strategies to achieve a good performance with the actual infrastructure, or enlarge the air-infrastructure undertaking the shortcomings of the negative externalities generated to avoid undermining the Catalan economy.

Keywords: Environmental Strategic Assessment, decision-making process, socio-environmental conflicts, airport development

Trudy A. Suchan, PhD, U.S. Bureau Of the Census. Email: trudy.a.suchan@census.gov; *The Demographic Map in the Twentieth Century*

This paper discusses the development in the twentieth century of a sub-genre of thematic maps, the demographic map. A demographic map shows spatial pattern in human characteristics such as age, race, income, language, education, and home ownership. The review of the last century's maps includes a look at significant individuals and institutions, aesthetic and technological shifts, varying styles of symbolization, and general acceptance of the demographic map, for instance, widespread use of population maps in the mass media after Census 2000. The presentation will be a narration with slides of discussion-worthy demographic maps including pages from the Census Atlas of the United States and earlier Census publications. The material is being researched for the History of Cartography, Volume 6, Cartography in the Twentieth Century. Audience critique of material included/excluded will be encouraged.

Keywords: cartography, demography, thematic map

Kazuaki Sugiyama. Email: ksbasebox-research@yahoo.co.jp; *The Juvenile Curfews and the control of public spaces in contemporary Japan*

The trend of entrepreneurship on urban governance is growing phenomena in developed countries. It seems that the process as the global urban strategy have potent influence on young people and their everyday life especially. It is necessary for us to consider the relationship between youth and nation-state in specific context that take different forms in various regions in the world. In Japan, however, there are a few geographers who mention to the significant issues. In these circumstances, the aim of this paper is to illustrate local trend of legal geographies, taking account of the recent revision of the 'Seisyounen-jyousei' (the Juvenile Protection Ordinance) and the use of juvenile curfews in Japan. Firstly, the paper describes theoretical framework and the general political situation in the era of recent dramatic reorganizations of municipalities in Japan. It is important to consider and criticize the problematic aspect of the ordinance because it is related to recent neoliberal political agenda and the transformation of governance. Secondly, the paper explicates the context of the ordinance which has influenced upon legal geographies in local area. Especially, the paper explains the major point of the recent revision of the Juvenile Protection Ordinance in the case of Osaka prefecture and Aichi prefecture. The legislation

provides a legal basis to prepare the policing activities demanding sound social environment for young people. And the paper will clearly show the expansion of such kinds of activities in closer cooperation with crime prevention policy.

Ramanathan Sugumaran, University of Northern-Iowa. Email: sugu@uni.edu; Nick Phillips, University of Northern Iowa. Email: phillipn@uni.edu; *E-learning: A Web-based Interactive Remote Sensing Education Course using Macromedia FLASH*

One major barrier to federal, state, and local, tribal government agencies and other private sectors in the use of geosciences and related geospatial technology and data is the lack of education, shortage of personnel trained in the acquisition, processing, and analysis of such data and technologies. Thus, there is a great need for basic geospatial education for these agencies. The main goal of this project is to develop web-based interactive remote sensing education materials that allow these agencies to learn about the basic concept and principle of remote sensing. This web-based program was developed using Macromedia FLASH and MySQL. The interactive program allows users to understand the principle step by step on the web. In this paper, an outline of this package, how this course was developed, and some of the limitations will be discussed.

Keywords: Macromedia FLASH, Remote Sensing, Education, Web

Allen E. Sullivan, PhD., Central Washington University. Email: sulliall@cwu.edu; *The Native American Water Right as a Territorial Right*

Discussion of Native American water rights in the United States most often focuses on irrigation rights and instream flow rights. Recently, power production rights and groundwater rights have received increasing attention. However, water rights for Native Americans may also take the form of territorial holdings. Alternately, status as a territorial water has implications on the ability of non-Native Americans to use, or make use of, such water or the resources found within the water. An overview of the evolution of federal Native American policy, the basis for Native American water rights, is provided. A series of Native American territorial water rights issues are presented, along with their precedent legal cases, to illustrate the various forms of Native American territorial water rights within the United States.

Donald G. Sullivan, University Of Denver. Email: dsulliva@du.edu; Kevin P. Gilmore, University of Denver. Email: kegilmor@du.edu; *Late Holocene Changes in Peat Humification and Implications for Carbon Sequestration*

We analyzed peat in cores taken from fens (minerotrophic peatlands) on Grand Mesa, in western Colorado, for bulk density, organic content (LOI), humification, and pollen content. The combination of analyses provides high resolution, environmentally sensitive information about paleotemperature, paleomoisture, and vegetation changes. In this paper we focus on the paleoenvironmental record for about the last 3000 years, with particular emphasis on the responses to climate changes associated with Little Ice Age, the Medieval Climate Anomaly, and other similar relatively low magnitude climate fluctuations in the late Holocene. Chronology for the cores is based on AMS dates on the peat. We compare the records obtained from multiple cores within the same fen, and fen to fen results to evaluate replicability. Results indicate that, while rates of peat accumulation within a fen may vary from site to site, changes in physical characteristics and microfossils observed through the core are uniform from one core site to another within the same fen. Comparability between fens in the same region is also very good. Our results show that changes in rates of organic accumulation and peat humification in response to relatively low magnitude climate fluctuations can be readily determined using fairly simple techniques. Pollen data suggest that vegetation changes are consistent with the climate changes, though the pollen signal is often subtle. The well-established chronology on the cores permits us to estimate changes in annual carbon sequestration with decadal to centennial scale temperature fluctuations.

Keywords: peat humification, carbon sequestration, Holocene

Kendra Lynn Sullivan, New Mexico State University. Email: skendra@nmsu.edu; *Conservation and Management Challenges at the Valles Caldera National Preserve*

The 89,000 acre Valles Caldera in Northern New Mexico has been described many ways: an innovative experiment in land management, a national treasure, a working ranch, a geological wonder, and a playground for the rich. As of 2000, the official name changed to the Valles Caldera National Preserve (VCNP). Once a private ranch, it was bought by the government to be managed by a Trust and made a National Preserve to be used and enjoyed by the public. The goals of the Preserve include operation as a working ranch, scientific research, and public use/recreation. Within 15 years, the goal is to operate the VCNP as a financially

self-sufficient entity, essentially as a business, that would profit only from users of the Preserve. This paper explores a new venture in land management, the people and resources that are affected, what it will take to succeed, and why this place is so unique, legally, culturally, and physically. Using personal interviews, media archives, government documents, pertinent literature, and first-hand observation, the story and science of the VCNP is explored and analyzed.

Keywords: Valles Caldera, Conservation, New Mexico

Thomas Sullivan, Louisiana State University. Email: sullyman142003@yahoo.com; *Long Day's Journey into Night: Exploring the Irish American Connection to Place through Literature*

The history of the Irish in American society is well-documented within the literature of Irish American novelists. The beginning of the twentieth-century witnessed a small number of "realist" writers who, by the 1930s, emerged with stories of gritty city life, tales of mobility and desperation, and the constant struggle for acceptance by a seemingly impenetrable Protestant elite. Their stories described an Irish population wanting to leave behind the poverty of inner city neighborhood life for the prosperity of the suburb. In addition, scars left from the famine generation before them exacerbated their vision of Ireland as a destitute place of little hope, deprived of dignity, and devoid of prosperity. Conversely, some contemporary writers of Irish American fiction (and nonfiction) seek to reconstruct these same places as spaces of remembrance?places that generate a romantic sense of nostalgia and an imagined return to the past. Recently, a resurgence of "Irishness" is in evidence within the Irish American community and this is found within the confines of a number of contemporary novels, each emphasizing a reconnection to one's roots either through memories of the urban ethnic neighborhood or ancestral ties to the Irish homeland. Within the literature, these "imagined" connections are reinforced through a number of avenues, whether it be the inheritance of land or long-lost love affairs. By evaluating a number of popular twentieth-century Irish American novels, I explain how the Irish in America have come to view their connection with these places and the multiple meanings they represent.

Keywords: literature, heritage, nostalgia, ethnicity, Irishness.

Farhana Sultana, King's College London. Email: ; *Watery discourses: Community and Participation in Water Resources Management*

Notions of 'community' and 'participation' have become popular in water resources management discourse and practice, particularly in the global South. Greater involvement of people in decision making, implementation and evaluation of water management practices is expected to increase efficiency and equity in water projects. However, scholars have pointed out that such discourses are often problematically used and idealized, leading to exacerbating gender, class, and other social differentiations. Drawing from a case study of drinking water contamination by arsenic in Bangladesh, this paper looks at the mobilization and outcomes of notions of 'participation' and 'community' in water provision and arsenic mitigation. It is seen that there is greater gendered water hardship, exposure to poisoning from arsenic, and conflicts over water because of not only the contamination of erstwhile safe water sources and ensuing water scarcity and poisoning, but also from the ways 'community' and 'participation' notions are conceptualized and practiced. Through the process of this water crisis, while both conflict as well as cooperation emerge around notions of 'community' and 'participation', there is increased differential access to safe water within and between places, and gendered/classed exclusions and marginalization as a result of changing water management institutions and interventions. As such, the research argues that scholars studying 'community' and 'participation' should pay greater attention to changing power relations, the role of nature, and geographical location in how water management interventions fail and succeed, and are thereby critiqued.

Keywords: Gender, Water, Community, Participation, Bangladesh

Selima Sultana, University of North Carolina at Greensboro. Email: s_sultan@uncg.edu; *The Journey to School by K-12 Children: Why Fewer Children are Riding the School Bus?*

Many public school systems in the USA require that each child should attend his or her nearest school, and those that live beyond a specified walking distance will be provided bus transportation. These policies are undermined by low-density residential development. In addition to increasing bus miles and time traveled and placing stress on school budgets, tight household time budgets may often override these policies as parents drive their children to and from school. This research examines these issues in the Guilford County, North Carolina school district, using a survey of parents to identify their choice of transport mode for their child's travel to school. Among children who travel by school bus, those living in newly developed low-density neighborhoods are traveling much greater distances and times than children in older high-density urban areas. As a result, many parents, especially stay-at-home parents, choose to drive their children by car as they can get up later in the morning. Picking them up after school preserves

time for after-school activities. This paper also concludes that parental attitudes toward the car culture and environment influence mode choice for their children's transportation as well.

Keywords: School transportation, low-density development, Mode choices

Rini Sumartojo, Simon Fraser University. Email: wsumarto@sfu.ca; *Community, Ethnocultural Identity, and Multiculturalism: Indo-Canadian Youth Violence in Vancouver*

Violence among youth of South Asian descent in Greater Vancouver has become the subject of widespread public concern following the unsolved murders of over 100 Indo-Canadian young men throughout the 1990s. The local media has often portrayed the Indo-Canadian community as plagued by youth gangs involved in the illegal drug trade. The greatest concern for many within the community, however, is not organized criminal gangs per se, but the popularity of the 'gangster image' and the apparent glamorization of violence among young Indo-Canadians. 'Indo-Canadian youth violence' has become a rallying point for a range of politicians, community organizations, and state institutions. Youth gangs and violence are often framed as problems internal to the Indo-Canadian community and the struggles faced by its youth are often attributed to intergenerational family conflicts arising from the clash between 'Indian' and 'Canadian' norms and practices, which serve to position youth as 'out of place,' or "in-between" cultures." As a result, much effort has been directed at 'bridging' the real and perceived social divides between this community and the 'mainstream.' This discourse has important implications for the Canadian state, particularly for its popular and political understandings of multiculturalism. This presentation will explore some of these implications, in particular how the widespread correlation of a 'displaced' identity with violence impacts ongoing attempts to implement multicultural policies and reduce violence.

Keywords: youth violence, multiculturalism, ethnocultural identity, community

Robert E. Summerby-Murray, Mount Allison University. Email: rsummerb@mta.ca; *Consuming the industrial past: public and private landscapes in the industrial heritage of Nova Scotia mining and steel towns*

In many deindustrialized North American cities and towns, public landscapes have become sites of struggle over memories of the industrial past. While the many forms of public commemoration have been explored in detail as part of cultural interpretations of deindustrialization since the early 1990s, the tension between public and private landscapes of commemoration is rarely broached. This paper draws upon landscape examples, informant interviews, and real and constructed 'artifacts' to provide an interpretation of the tension between public and private commemoration. The paper concludes that interpreting community-initiated industrial heritage (whether public or private) only as a form of local resistance to global restructuring processes or a means of asserting place identity in the face of placeless mobile capital is overly simplistic. Instead, it is noted that these heritage landscapes reflect an ambiguous amalgam of personal motivation and public spectacle for those presently consuming representations of the industrial past.

Keywords: Deindustrialization; public memory; landscape; mining; place identity; heritage

Percy Manuel Summers, Virginia Tech. Email: pesummer@vt.edu; John O Browder, Virginia Polytechnic and State University. Email: ; *Property size dynamics and land ownership patterns in the Brazilian Amazon post-frontier*

Property aggregation and fragmentation processes, as well as farmer ownership changes through time have important implications for the processes of land cover and land use change. However, these have been poorly studied and such changes are yet to be incorporated in conventional theoretical frameworks of frontier studies. Additionally, as most of the original Amazonian colonists reach the end of their life-cycle, these changes should become widespread with important repercussions over the landscape. This paper analyzes changes in property ownership among small landholders in the closing frontier of the Brazilian state of Rondonia. We use a ten year panel survey data set (1992-2002) and a Geographic Information System (GIS) of property boundary grids geo-referenced in the field in 1992 and 2002. These data have been integrated with Landsat TM satellite image analysis of land cover change for each household plot for each year for the entire ten year period of the study. Integrating satellite image analysis with property size and property ownership changes allows us to explore the impact of these changes over land cover and land use change. Furthermore, the use of household demographic and socioeconomic data allows linking changes of household variables over time to the changes in the spatial patterns of the property grid. Understanding the patterns of property size and property ownership changes over time and its impacts over land cover and land

cover change will be important additions to frontier theoretical frameworks and landscape change studies.

Mingjie Sun, University of California, Los Angeles. Email: mjsun@ucla.edu; Rural-Urban Migration in China: Some Findings from the 2000 Census

Rural-urban migration in China has greatly increased over the past two decades or so and it now accounts for the bulk of migration in that country. Rural-urban migrants have also been the key to the economic success that China has enjoyed. Much of the literature, however, has tended to lump all types of migration together rather than focusing on rural-urban migration. Based on the 2000 Census, this paper analyzes the geographic patterns of rural-urban migration and selected attributes of rural-urban migrants. Interprovincial rural-urban migration exhibits geographic patterns similar to that of overall migration, namely, the central region is the biggest donor and most migrants moved to the eastern region. Intraprovincial rural-urban mobility is high in the eastern region as well. Zhejiang, Fujian and Guangdong have the highest rates of intraprovincial rural-urban migration. By focusing on educational attainment, the analysis shows that interprovincial rural-urban migrants are quite different from their intraprovincial counterparts. Consistent with existing studies, I found that interprovincial rural-urban migrants are less highly educated than urban residents. Interestingly, intraprovincial rural-urban migrants have educational attainment similar to or higher than urban residents. This discrepancy suggests that moving to more distant places is a strategy by rural migrants to overcome human capital constraints.

Wanxiao Sun, Grand Valley State University. Email: sunwa@gvsu.edu; Shunlin Liang, University of Maryland. Email: sliang@geog.umd.edu; Gang Xu, Grand Valley State University. Email: xug@gvsu.edu; Hongliang Fang, University of Maryland. Email: hfang@glue.umd.edu; Robert Dickinson, Georgia Institute of Technology. Email: ; Mapping Plant Functional Types from MODIS Data Using Multisource Evidential Reasoning

This study presents a method to infer plant functional types (PFT) from MODIS data. The method first utilizes a suite of improved and standard MODIS products to generate evidence measures for each PFT class. The multiple lines of evidence computed from input data are then combined using Dempster's Rule of combination. Finally, a decision rule based on maximum support is used to make classification decisions. The proposed method was tested over the states of Illinois, Indiana, Iowa, and North Dakota, USA where crops dominate. The Cropland Data Layer (CDL) data provided by the National Agricultural Statistics Services (NASS) of the United States Department of Agriculture (USDA) were employed to validate our new PFT maps and the current MODIS PFT product. Our preliminary results suggest that multisource data fusion is a promising approach to improved mapping of PFTs. For several major PFT classes such as crop, trees, and grass and shrub in the study area, the PFT maps generated with the evidential reasoning method provide greater spatial details compared to the MODIS PFT product.

Keywords: plant functional type (PFT), data fusion, Dempster-Shafer theory of evidence, MODIS data

Wenjie Sun, Carthage College. Email: wsun@carthage.edu; Meta-Comparison of Land-Use/Cover Change Models: Cellular Automata vs. Agent-Based Models- The Case of Indian Creek Township, Monroe County, Indiana

This research compares the ability of a CA model and two Agent-Based Models to reproduce land-cover change occurring in Indian Creek Township, Monroe County, Indiana between 1939 and 1998. In particular, the following research questions are addressed: (1) how well dynamic LUCC models can reproduce observed land-cover change based on different measures, (2) whether selected potential drivers are equally important in determining land-cover change, and (3) what are the comparative advantages and disadvantages of selected CA and ABMs in terms of model objectives, predictive power, complexity, structure, and data requirement. Through the comparison of outputs from different models, we can tell that the ability of different dynamic LUCC models to reproduce observed land-cover change varies across model types, parameter settings, and performance measures. What is significant about this model meta-comparison is that it demonstrates why different models are useful in different applications and under different circumstances. CA models are especially useful for modeling macro level LUCC over time, in particular with respect to the relationship between micro-processes and macro-patterns. Although it is possible to consider the transition rules in CA models as pseudo-decision making, they are still not comparable to ABMs in their capability to represent sophisticated heterogeneity and interactions that characterize real world land-use systems.

Thus most of the time the primary reason that we choose ABMs over CA models may not necessarily be higher predictive power, but rather deeper insights into how the "system" works at the level of actual decision making.

Keywords: LUCC, CA, ABM, modeling

Yifei Sun, Ph.D., California State University, Northridge. Email: yifei.sun@csun.edu; Country Relational Distance, Organizational Power and R&D Managers: Understanding Environmental Challenges for Foreign R&D in China

This paper examines the challenges of foreign R&D in China, based on interviews with 32 senior R&D managers. It confirms the findings from previous studies that many barriers still exist in China for foreign R&D, and such barriers include institutional environment, infrastructure and labor management. Among the three categories, issues related labor management, such as increasing labor cost and mobility, lack of experience and creativity and cultural differences among the research staff, show to be most challenging for management, while China's institution and infrastructure largely have been aligned up with those in many other countries. This study also finds that responses from R&D managers are not consistent, and the differences could be largely explained by three types of factors: relational distance between the parent country and China, the strength and experience of foreign companies, and manager's personal experience and closeness with China. Further studies are needed to explore these issues due to the small sample size of this study.

Keywords: Environmental Barriers, R&D, Globalization, China

Juanita Sundberg, University of British Columbia. Email: sundberg@geog.ubc.ca; "Trashy Transgressions" and the Production of Quotidian Geopolitical Boundaries in the United States-Mexico borderlands

In the mid-1990s, the United States instituted new border enforcement measures to secure its boundary with Mexico. These measures have created a geographical shift in border crossings, from urban areas to remote areas. Undocumented immigrants now walk through remote lands to take up jobs in the U.S. In the process, objects like empty water bottles are discarded, while things like backpacks, shoes, clothes, books, and documents get lost. This paper examines how the objects left behind - overwhelmingly framed as trash - figure in the political mobilizations of diverse citizens groups. As I illustrate, anti-immigrant groups repeatedly equate migrant bodies with trash, inviting visceral, emotional responses characterized by disgust. Such emotional evocations force humanitarian groups like Humane Borders to respond: one of the group's primary volunteer activities is trash clean-ups. These political mobilizations make the body a crucial site of geopolitical imagining. Indeed, I argue, cultural norms about bodily comportment figure prominently in the crafting of quotidian cultural and geopolitical boundaries. In the U.S.-Mexico borderlands, trash has become a new matrix for the elaboration of geopolitical categories like "American" or "those who don't belong in America". Drawing on Lauren Berlant's critique of sentimental politics, I conclude that the politics of trash works to channel public expression in the realm of emotion, thereby privileging the injuries claimed by "Americans" who believe their territory has been trashed and naturalizing the exclusionary measures directed at undocumented immigrants.

Bjoern Surborg, UBC. Email: bsurborg@interchange.ubc.ca; Neo-liberals or New Liberals? Urban Development and Bourgeois Structures in an Olympic City

The hosting of mega events such as the Olympic Games rarely proceeds without substantial controversy amongst different interests in the host locale. Boosterist factions of the urban political establishment are usually most supportive if not the initiators of bids for hosting mega events, while social advocates and grassroots organisations tend to be considerably more cautious regarding the expected benefits of the anticipated urban spectacles. In the current preparation phase organisers of the 2010 Olympic Winter Games in Vancouver are claiming to prepare the most sustainable Games ever and substantial rhetorical attention is paid to the idea of creating long-term legacies from the games. The Vancouver Games are also supposed to be the most inclusive games with a strong emphasis on people with disabilities, aboriginal people and other groups. At the same time, there are substantial business interests in hosting the Olympics. Using the 2010 Games as a case study, I am arguing in this paper that there are many facets of the mainstream political agenda that are often summarised as neo-liberal policies. Specific nuances, however, mark a departure from the neo-liberal project of the last two decades or so. These nuances resemble in their philosophical basis as well as their practical implementation the liberal bourgeois traditions of the 19th century. While the policies associated with these liberal traditions serve the established middle and upper class, the class aspects of this new liberalism are much better disguised than in the neo-liberal project characterised by Thatcherism and Reganomics.

Krisna Suryanata, University of Hawaii. Email: krisnawa@hawaii.edu; Kem Lowry, University of Hawaii. Email: lowry@hawaii.edu; *Framing Changes: The Transformation of Nature and Culture in Rural Hawai'i*

This paper examines the struggles over competing uses of agricultural and rural lands in the State of Hawai'i. Hawai'i, which was once a magnet for investment capital for large-scale coastal resorts, has recently become one of several jurisdictions experiencing rapid growth of new homes in rural areas. This influx of 'amenity migrants' has resulted in numerous controversies that concern the rights of land owners, developers, local residents, and Native Hawaiians, as well as raising questions about the appropriate policy mechanisms, about property relations, the impacts of growth, and about the proper scope of government authority to minimize development impacts on resources. We focus on the interface between micro-politics of resource use and formal regulatory framework to understand the cultural and political processes that influence rural transformation. We direct particular attention to the processes that shape the "framings" - the principles and assumptions that underlie political debates and actions of rural management policies in Hawai'i. Unlike other areas of high amenity values in the United States where the narrative of 'nature' dominates the discussion on rural planning, we posit that other equally powerful competing frames have played important parts in policy processes that shape rural transformation in Hawai'i. By evaluating rural management tools that have been developed by state and county officials in Hawai'i, we seek to understand how policies derived from alternative frames affect diverse constituents that include indigenous groups and poor working class residents.

Arvind S. Susarla, Dr., Department of Geography, Texas A&M University. Email: asusarla@geog.tamu.edu; *Mass Media's Construction of Risk: A comparison of media reporting on hurricanes Katrina and Rita by a newspaper and citizen journalists*

Mass media reporting of hurricanes Katrina and Rita episodes was intense in the United States, and this flow of risk information shaped, in part, peoples risk perception and responses to the hazard. To better understand media's role in the aftermath of risk events I analyze content of media reporting by the Houston Chronicle, a newspaper published from Houston, TX. Furthermore, for this event the newspaper had facilitated flow of risk information directly through citizen journalists, and I examine the content of this initiative also. To provide a sharper interpretation on media coverage of the risk events the focus of this paper is to compare reporting by the newspaper and citizen journalists. For example, how was assignment of blame different in the news reports of the two sources? Similarly, I discern, for instance, description on nature of risk in these media reports. Both quantitative and qualitative methods were employed in the analyzing media reports. The results contribute in advancing theorization on media's construction of risk events and subsequent consequences over space and time.

Laurel Suter, University of California, Santa Barbara. Email: laurel@geog.ucsb.edu; *Modeling Pasture Establishment in the Agricultural Frontier: Sierra de Lacandón National Park, Guatemala*

Forest conversion to agriculture is counted one of human's most significant impacts upon the earth's surface, with rural-rural migrant farmers acting as the primary direct agents of this change, especially along colonization frontiers in Latin America. This presentation explores farmer land use in an agricultural frontier, the Sierra de Lacandón Park (SLNP), in the departamento (equivalent of a state) of Petén, Guatemala. In particular, I examine hierarchically nested, spatially explicit demographic, political, social, economic, and ecological variables acting on decision makers located within the current agricultural frontier to determine under what circumstances smallholders invest a portion of their land in cattle pasture, an understudied land cover given its increasingly dominant role in terms of relative and absolute areal extent, its high growth rate, and its implication for further land cover change, both on site and elsewhere. To this end, I examine pasture as a categorical outcome in a logistic multilevel regression model, with independent variables derived from a Community and Household Survey administered in the SLNP in 1998-1999. Additionally, female partner survey responses, which have yet to be analyzed, are examined in relation to their influence on this possible land use outcome.

Keywords: Land use, pasture, agriculture, Latin America, deforestation

Lindsey McSherry Sutton, Arizona State University. Email: lindsey.sutton@asu.edu; *The Border Experience: a narrative cartographic approach*

As part of my dissertation research, this poster contributes to a larger dialogue on transborder networks and transnational spaces. My goal is to employ a narrative cartographic approach that could potentially allow a targeted audience to experience the border through an interactive web-based map interface. Through a series of links, a potential map-user has access to timelines, historical thematic maps, current thematic maps, and photographic analysis of Palomas, Chihuahua-Columbus, New Mexico and Naco, Sonora-Naco, Arizona from a central base-map. A comparative mapping study of these small rural U.S.-Mexico border towns will analyze how day-to-day contact across the border creates transnational spaces, multidimensional planes of social, cultural, political, and economic interaction occurring across international boundaries (Jackson et al. 2004, Pries 2001, Vila 2000).

Keywords: U.S. Mexico Border, Transnationalism, Narrative Cartography

Paul C. Sutton, University of Denver. Email: psutton@du.edu; *Coastal Wetlands and Storm Protection: A spatially explicit estimate of ecosystem service value*

In this study we estimate the extent to which coastal wetlands in the United States reduce the damages to built capital from storms and hurricanes and how much this storm protection service is worth. The following datasets were assembled for the analysis: 1) tracks of cyclones, hurricanes and typhoons from 1980 to 2005, which included wind-speed; 2) National boundaries with year 2000 GDP as an attribute; 3) Nighttime light imagery of the USA; 4) The 30 meter resolution National Landcover dataset. Total damage was obtained from the EM-DAT (2005) database. With these, spatially explicit GDP and wetland cover were mapped and then hurricane swaths were overlaid within a 100km x 100km area. The GDP calculated within each hurricane swath and the reported total economic damage (TD) were used to generate a ratio of TD/GDP, which was used to represent the relative economic damage caused by each hurricane. A multiple regression model with TD/GNP as the dependent variable and wind speed and wetland area as independent variables was highly significant ($P < 0.01$) and explained 48% of the variance in TD/GNP. The model shows that damage increases with wind speed but decreases with wetland area. A spatially explicit estimate of the value of storm protection service at 1 km² resolution was developed using spatial regression based on the GDP and wetland area in the neighborhood of the pixel and the historical frequency of hurricanes over that pixel.

Martin Svensson Henning, Lund University. Email: martin.svensson-henning@keg.lu.se; Karl-Johan Lundquist, Lund University, Sweden. Email: karl-johan.lundquist@keg.lu.se; Lars-Olof Olander, Lund University, Sweden. Email: lars-olof.olander@keg.lu.se; *Creative destruction and economic welfare in Swedish regions. Spatial dimensions of job-less growth?*

Evolutionary theories on regional economic growth stress the importance of structural transformation and change to long-term economic growth. At national level, research results from evolutionary economics, economic history, and innovation studies show the relevancy of modernized versions of the Schumpeterian theories to understand the relationship between innovation, restructuring and economic growth. Renewal is seen as central in the learning or post-fordist economy, but similar arguments could also be made with reference to previous capitalist growth regimes. Aiming to explore some of the concrete consequences of regional renewal, this paper deals with the question to what extent dramatic structural transformation and renewal in Swedish regions is paralleled by favourable developments of household income, employment growth and total growth in value added. We study the period of 1978-2004, building on previous research concerning the regional consequences of the dramatic technology shift process that has been taking place in Sweden. We analyse long-term changes in the relationships between Swedish regions by establishing conceptual connections between regional long-term economic transformation and welfare. It is argued that there are time-lags as well as systemic spatial asymmetries when it comes to technology-induced restructuring, overall regional economic growth, employment creation, and income growth. We use data from the DEVIL (Databases of EVolutionary economic geography In Lund) combined with additional data sets from Statistics Sweden. The results of the paper should also be of interest to policy makers interested in the connections between innovation and industrial restructuring on the one hand and its welfare results on the other.

Joseph B. N. Swain, M.A., The University of Oklahoma. Email: jbn_swain@yahoo.com; *The Resettlement of Oklahoma: An Examination of Source Areas for White Pioneer Migration, 1889-1907.*

In 1988, geographer John Hudson published an iso-latitude map showing the birthplaces of early North American white settlers moving into the Middle West. He found what he termed a "latitudinal zonation" where the general result was a latitudinal occupation of the mid-continent U.S. ordered along the same lines as their places of origin. In following Hudson's general methodology, this research suggests a similar settlement pattern for the state of Oklahoma with some significant exceptions. Our Hudsonian iso-latitude map shows the full resettlement pattern in the twin territories at statehood (1907). A north-south latitudinal ordering does exist for Oklahoma, but gradients are steep and radially twisted in several places. Also, Oklahoma emerges with more isolines and, it might be inferred, more diverse origins than any of the states in Hudson's Midwest. In conducting this research, we compiled a database of the origin locations for 10,808 white settlers to Oklahoma. An examination of these data utilizing standard deviational ellipses indicates significant regional patterns in the diaspora from the South and the Midwest. As suggested by the previously established westering process, standard deviational ellipses generally trend east to west along the same lines suggested by the previously examined iso-latitudes. In those cases of radial twisting and concentration, these ellipses will provide a more detailed measure of directionality and dispersion.

Mary Swalligan, Kent State University. Email: mswallig@kent.edu; *Memorializing Flight 93: a Changes in the Landscape*

When United Airlines Flight 93 crashed in Shanksville, Pennsylvania on September 11th it not only marked a tragic day in American history, but it also transformed the land use of the crash site. A once tranquil plot of farmland changed overnight into a national historical memorial park, and with it, the surrounding quarry and hunting reserves were opened up for development. Various actors are attempting to support this development. These actors range from local mourners who make the pilgrim to the site to federal government representatives who are pushing for memorialization. All of these various actors involved can be examined through Cox's interpretation of scale, or more precisely, Cox's spaces of dependence and engagement. Furthermore, these agents interpret the story of Flight 93 by constructing memorials within the local vicinity. The area of Shanksville, in a sense, then becomes a stage that tells the story of United Airline's Flight 93 through various memorials and monuments. Although their main focus concentrated on urban development, Lefebvre and Harvey also have explored the transformation of landscape and the abstract meaning behind these changes. Because the story of Flight 93 is dramatically changing the use of the surrounding environment, I will explain such changes through Lefebvre and Harvey's interpretation of space.

John D Swann, Portland State University. Email: jswann@pdx.edu; *Norwegian Memory Crisis of the Second World War: Collective Memory versus the Forgotten Groups*

This paper is part of a larger social history / cultural geography study in progress that examines how memory of the German occupation of Norway has recently diverged between the war generation, the current generation, and historians. Today, places of commemoration constructed during and after the war have become sites of contestation between the authors of the country's collective memory (such as partisans) and those who have traditionally been forgotten or purposely excluded from the accepted narrative of German occupation and Norwegian resistance during WWII. This paper will consider how monuments (including place names) and resistance museums have physically commemorated a war story that has excluded a number of groups including Norwegian Jews, Tyskerbarn (Norwegian children fathered by German soldiers), communist partisans, and Soviet POWs. Based on very recent research in Norway, this paper will use specific case studies to illustrate how forgotten groups are entering the memory debate and have generated a crisis of collective memory.

Kate Swanson, PhD, University of Glasgow. Email: kate.swanson@ges.gla.ac.uk; *"Do you have a cure for our faces?" The racialization of indigenous youth in the Ecuadorian Andes*

In this paper, I explore the racialization of indigenous youth in Ecuador through an 18 month case study on migrant indigenous street vendors and beggars. Since the construction of their first road in 1992, young women and children from a rural Andean community have been migrating to work on the streets of both Quito and Guayaquil. As this community's young people become

increasingly engaged with the urban sphere, they are forced to negotiate their identities through everyday encounters with racism - a racism that inferiorizes Ecuador's indigenous peoples by ascribing both physical and cultural differences. Perceived as 'out of place' in the urban sphere through imaginative geographies that construct rural/urban racialized boundaries, indigenous youth have begun to internalize the racist discourses that inscribe their 'othered' bodies. This deeply affects their understanding of themselves and their place in Ecuador's racialized hierarchies. However, given few other options within Ecuador's social and racial hierarchies, I also explore how begging has become an entrepreneurial way for indigenous women and children to capitalize upon gendered and racialized readings of their bodies. In this paper, I examine how indigenous children and youth actively negotiate, traverse, embrace and resist racialized constructs to weave their individual identities.

To transform the type of international educational experience commonly undertaken by undergraduates, we have developed a summer study abroad program in southern Africa that utilizes collaborative teaching and experiential learning. The objective is to provide students from the U.S. and Africa with firsthand experience of the environmental and social complexity of southern Africa. The course is an intensive introduction to the physical geography, history and culture of the region, involving a blend of in-class lectures, field trips, and daily discussions. During the month-long program, students are exposed to physical and human geography, geology, ecology, hydrology, and atmospheric science in order to understand how the interconnectedness of these different aspects of the physical and social environments help shape the history and culture of the people in the region. The study abroad program builds on over 15 years of relationships developed during regional scale research programs involving UVA and southern African researchers. Participants operate out of northern South Africa and southern Mozambique. The small class size (15 students from the US; 6-8 students from southern African) and pairing with in-region students provides a unique, 'round-the-clock' learning experience. Former participants have pursued a variety of related interests, both domestically and internationally, including the creation of a University wide service organization focused on the developing world. Program alumni have also gone on to join Peace Corps, Teach for America, Americorps, as well as to volunteer both domestically and in South Africa, and have pursued graduate degrees often related to various aspects of their experience.

This presentation focuses on the combined use of ground-based, airborne and remotely-sensed data, primarily from NASA Terra, to provide insight into the physical processes associated with aerosol and trace gas emissions over southern Africa, a region of significant biomass burning. Issues concerning the up-scaling of point data required to inter-compare observations made at specific points in time and space with remotely-sensed observations over regional landscapes will be presented with focus on three areas: 1.) The complexity and difficulties inherent in scaling up of in-situ observations derived from aircraft profile flights as compared with vertically-integrated estimates from airborne lidar transects and ground-based single point observations, and how these different approaches compare with remotely-sensed and modeled data. 2.) The manner by which landuse/landcover, fuel loads, and fire frequency due to human activities might be incorporated into the predictive models, and comparisons between ground-based point observations, model predictions, and remotely-sensed estimates of vegetation structure, net primary productivity, and fuel load. 3.) The optimal conditions and regional settings for estimation of biomass burning emissions using remotely-sensed measurements of burn scar extent versus using

active fire count and intensity products. Understanding gained from explorations of these three topics will be synthesized and presented as a case study to show how the local ground-based or aircraft observations can be tied in with regional satellite coverage data via transport models.

Elizabeth Sweet, PhD, University of Illinois Urbana Champaign. Email: esweet1@uicu.edu; *Spy or Feminist: "Grrrila" Research on the Margin*

The marginalization faced by many feminist scholars in terms of teaching assignments, research opportunities, conference presentation times, representation in faculty unions, and publication opportunities is still a factor and a burden in many disciplines, even though we are more than 30 years into the recognition and study of these discriminatory and sexist environments in which we try to grow and develop as scholars (Etzkowitz, Kemelgor, Neuschatz, and Uzzi 1994; Stout, Straiger and Jennings, 2002, Svarstad, Draugalis, Meyer, and Mount, 2004). Even in the context of marginalization, agency as a feminist academic exists and, in some cases, the marginalization enables us to continue our feminist projects. This paper describes my experience as a marginalized feminist academic. It is based on fieldwork practice, academic training, and encounters as a professor at several universities in the United States, Russia, and Latina America. Currently, in the milieu of the USA Patriot Act, when academic freedom seems to be on the cutting block, we must, more than ever, continue to be grrrila fighters in order to continue our feminist projects and move feminist perspectives from the margins to the center.

Andrew Swift, University of Cincinnati. Email: andrew.swift@uc.edu; Lin Liu, University of Cincinnati. Email: lin.liu@uc.edu; Jim Uber, University of Cincinnati. Email: jim.uber@uc.edu; *The Effect of Confounding Variables and MAUP Bias on Correlation between Water Quality and GI Illness*

A systematic bias on correlation statistics due to the Modifiable Area Unit Problem (MAUP) has been demonstrated using public health data. Illness event patterns were simulated using a linear dose-response model based on drinking water quality data. This theoretically modeled association should yield a correlation of 1.00. However, alternate spatial aggregation using standard methodology produces an average correlation of 0.35, demonstrating a MAUP bias of .65. So, MAUP is an important factor in the spatial analysis of illness event patterns. Also, the spatial structure of these patterns is an important factor. Consideration of the 'network constrained' structure of geocoded illness data has shown a 41% reduction in this MAUP bias. This research will provide new insight into the magnitude of the MAUP bias when a confounding variable is present. Systematically introducing a confounding variable to a dose-response illness simulation model should demonstrate that MAUP bias decreases as the theoretical correlation between two variables changes from one to zero. Consideration of network constraints should still provide some reduction of MAUP bias in the presence of confounding variables.

Email: jpwilson@college.usc.edu; *Decision-Support Web Tools for the Green Visions Plan for 21st Century Southern California*

Sophisticated online decision-support tools are currently being developed for the Green Visions Plan (GVP) for 21st Century Southern California. These planning tools are essential for the full realization of the GVP, providing governmental agencies tools to evaluate proposals for grant funding, and increasing the capacity of local, grassroots organizations to identify properties to restore or acquire scientific data and analysis in support of such proposals. The tools are designed to allow end-users to investigate the existing conditions in this region and to evaluate potential sites for their suitability in achieving habitat, watershed, and recreation goals. The tools are basically a highly customized, interactive map interface. The GVP data layers include hydrological information (watersheds, stream networks), habitat information (target species and their linkages), and parks information. The tools analysis functionality will include both display of "static" layers such as network-based park service areas, watershed features and habitat potential relative to surrounding parks, and innovative "dynamic" tools that will perform analyses related to park access, integration of park and watershed analysis tools, and coordination of park planning with habitat features. These advanced geospatial tools are custom coded

using a combination of web scripting languages, and Microsoft and ESRI proprietary software. It is anticipated that these online tools will be available by Fall 2007. The GVP is funded by a consortium of public agencies led by the San Gabriel and Lower Los Angeles Rivers and Mountains Conservancy and implemented by the USC Center for Sustainable Cities and GIS Research Laboratory.

Jon Swords, University of Newcastle upon Tyne. Email: j.g.swords@ncl.ac.uk; *The Northumberland Heritage Cluster: Beyond the Economic*

The Northumberland Heritage Cluster is theorized as an embryonic cluster formed at the intersection of five heritage related sectors. These include tourism, land-based industries, regional food and drink, cultural industries and heritage in its more traditional forms. It is at this intersection where one can find the institutions and relationships on which clusters are formed. Four case studies have been examined to delve further into the workings of the cluster: Northumberland National Park Authority; Northumbria Larder; the Northumberland Cultural Strategy; and Hadrian's Wall. The preliminary results seem to show that the various crises this area has suffered in the past (whether it be the decline in heavy industry and coal mining or more recent events such as foot and mouth) have created a culture of cooperation within and between the heritage industries. People are incredibly willing to work together and possess the drive to get things done because they know nobody else will. Perhaps most the most interesting outcome of this, in the light of the growth of many clusters which focus primarily on economic gains, is that the heritage cluster in Northumberland, both implicitly and explicitly, embraces community and environmental benefits alongside economic growth. This presentation will present the finding of this research to date as well as the process which lead to this point.

Ludek Sykora, Charles University in Prague. Email: sykora@natur.cuni.cz; Jakub Novak, Charles University in Prague. Email: kubanov@natur.cuni.cz; *The paradox of post-socialist transition: decreasing residential differentiation in the context of ongoing segregation processes*

We analyse the whole Prague metropolitan region using population data from Censuses 1991 and 2001 for 1307 basic settlement units. First, we identify which population characteristics decisively contributed to the socio-spatial variation in 1991 and 2001 and for which types of characteristics there was major change during first 10 years that followed departure from centrally planned economy. Second, using indexes of segregation we answer whether there has been growth or decline in spatial variation for particular population characteristics. As title suggest and against expectations, the overall residential differentiation diminished during capitalism. Third, we identify concentration areas of subpopulations with particular characteristics (such as university educated, elderly or Roma) that exhibited highest levels of segregation indexes, through the identification of basic settlement units with the highest shares of these subpopulations on the total population. We especially focus on those areas that exhibited major changes between 1991 and 2001. The analysis shows that the level of concentration in these geographical areas has increased between 1991 and 2001. Finally, we place the results of previous analyses to a wider context of changes in socio-spatial structure in post-socialist Prague with an emphasis on ongoing processes of segregation pointing to the paradox of post-socialist urban change, when segregation processes lead to decline in the segregation understood and measured as residential segregation while leading to increasing spatial concentrations of particular social groups and in some cases producing distinct forms of segregated and separated localities.

Marie-Eve Sylvestre, University of Ottawa. Email: Marie-Eve.Sylvestre@uottawa.ca; *Ensuring Homeless Persons' Rights: Law, Soft Law and Police Discretion in Montreal, Canada*

Despite their relatively old history, policing practices emphasizing enforcement of criminal laws against disorder enjoyed a renewed popularity in the 1990s and continue to draw a lot of public attention in different cities around the world. Drawing on insights from American broken-window theorists, Canadian cities participated in reaffirming and developing these policing trends as they resonated with local and national concerns. In Montreal, contrary to other Canadian and American cities, the provincial legislature and the municipal council did not adopt new legislation in order to fight against antisocial behavior. The police rather decided to adopt a directional statement or policy on disorder, agreed on a list of antisocial acts to be closely monitored and followed at a regional level, included 26 new operational codes and asked every neighborhood station to establish their own priorities and enforced existing pieces of legislation related to such priorities. In this paper, I look into how homeless people's rights and access to public spaces are negated by law enforcement, but more importantly by internal policies, operational codes and directives (sometimes joined under the label of soft law) and daily use of police discretion. I show how a general concept such as disorder takes on a very specific meaning in the field focusing on public disorders (as opposed to private) and on certain groups or individuals, chief among them, the homeless and the poor. I finally point out to some of the consequences for ensuring homeless people's rights.

Kristin M. Sziarto, University of Minnesota. Email: szia0001@tc.umn.edu; *Spacing negotiations in religion-labor alliances: the Twin Cities Workers' Interfaith Network*

The Twin Cities Workers' Interfaith Network (TC-WIN) is one of seventy religion-labor alliances in the U.S. that have formed since the early 1990s. This paper investigates the co-constitutive practices and spatialities that characterize these emerging political actors. First, the paper outlines the formation and socio-spatial practices of TC-WIN. Then, through a case study of TC-WIN's support of a hospital workers' contract campaign, this paper examines how the progressive agenda of the group has been thwarted by the space-times of contract negotiations and knowledge production (on the union side), and the space-times for creating legitimacy (on the faith side). The union's well-crafted strategy included rank-and-file intensive organizing and a corporate campaign?the latter demanding public accountability of a non-profit hospital system providing inadequate health insurance to its own workers. TC-WIN's campaign role required negotiation of not only the power relations within religious adjudicatory bodies, but also of allied clergy and core alliance members' commitments to faith-tradition-based criteria for 'respectful' interaction, to particular standards of truth verification, and to maintaining their legitimacy (in the eyes of congregants, religious leaders, and other faith-based organizations). This analysis is based on participant observation throughout the campaign, interviews with coalition members and other union staff, and internal documents and public reports from the campaign.

Gregory Taff, Univ of North Carolina. Email: gtaff@email.unc.edu; *Drivers of Landuse and Landcover Change in Gauja National Park, Latvia*

The fall of the Soviet Union has led to new patterns of landuse and landcover change (LU/LCC) throughout the former Soviet Union and Eastern Europe. Differing post-Soviet land reform policies and differing social and economic conditions within the region have led to a diverse array of landscape dynamics in protected areas throughout the region. To identify influential drivers of LU/LCC in the region, a case study of Gauja National Park, Latvia is studied, and multivariate statistical models are employed to assess the effects of geographic variables, land management zones, political boundaries, and geo-referenced social survey variables on LU/LCC within the Park. A time series of Landsat TM satellite images spanning from the late Soviet era (1985) through recent times (2002) is used to create outcome regression variables representing LU/LCC. Multiple data layers in a Geographic Information Systems (GIS) database are used to represent the aforementioned independent variables explaining variation in the LU/LCC variable. Results may be used to identify commonalities in landscape dynamics in post-Soviet countries, determining likely drivers of landscape changes throughout the region.

Keywords: remote sensing, GIS, landuse change, landcover, Latvia, post-Soviet, drivers

Derek James Tait, Northeastern Illinois University. Email: djtjune3@hotmail.com; *Consumption of Place: Exploring the Sociospatial Implications of the Coffee Trail and Agrotourism in North Central Nicaragua*

In recent years there has been an increase in the promotion and development of rural tourism in Nicaragua. The growth in foreign aid to foster "sustainable development", rural tourism, and tourism marketing has led to an increase in various sectors of tourism, including agrotourism. More specifically, this growth can be evidenced in phenomenon like the nascent coffee trail in the north central highlands of Nicaragua. This poster explores the sociospatial and cultural implications of coffee agrotourism.

Lois M. Takahashi, UCLA. Email: takahash@spa.ucla.edu; *Disruptive Social Capital: Exploring (Un)Healthy Socio-Spatial Interactions among Filipino Men living with HIV/AIDS*

Social capital has become widely accepted as a means for addressing a large range of issues. Its popularity is due in large part to its commensurability with community-centered strategies on the one hand, and neoliberalist state retraction on the other. But, as scathing critiques have asserted, expanding trust and reciprocity in resource poor communities cannot enhance economic opportunity and overcome social inequality precisely because of limited access to resources. But more importantly, there has been little engagement with the spatial dynamics of social interactions. This paper uses these critiques as a starting point to offer a conceptual framework assuming socio-spatial disruption in daily and life paths. The disruptive elements of social capital provide an opportunity to understand how the simultaneous advantages and disadvantages argued by scholars presented by social capital results in both enhanced coping with life disruptions, but also increased illness, injury, or death. HIV/AIDS among Asian Pacific Islanders (APIs) provides the focus for exploring disruption in social capital. While HIV/AIDS is recognized as critical for communities of color in the US, APIs are characterized as underrepresented in reported AIDS cases, and therefore, at low risk by both policy makers and by the communities themselves. Qualitative analysis of interviews with 52 Filipino men living with HIV/AIDS in Los Angeles highlights the particular socio-spatial dimensions of disruption influencing the linkages between social capital and health. The paper concludes with suggestions about ways to move research forward to highlight the disruptive dimensions of social capital.

Richard Taketa, San Jose State University. Email: rtaketa@email.sjsu.edu; *GIS Support for Habitat for Humanity-Guatemala*

Geographic information systems are widely applied to many aspects of hazards research. These include identifying hazardous locations, assessing vulnerable populations, and designing and evaluating mitigation, response, and recovery plans. Often, we have to take what data we can get and use it to address problems of interest. For example, data to examine Hurricane Stan's impacts on houses built by Habitat for Humanity in Guatemala are limited. However, the USGS performed a detailed examination of Guatemalan mudslides in the aftermath of Hurricane Mitch in 2000. This presentation will discuss how data gathered for Hurricane Mitch is being integrated with other data, more recently acquired data to provide information supporting Habitat's location planning.

Christine Tamasy, The University of Auckland, SGGES. Email: c.tamasy@auckland.ac.nz; *Regional Entrepreneurship Dynamics in a Neo-liberal Context*

The presentation analyses entrepreneurship dynamics in New Zealand's Territorial Authorities over the 2001-2005 period. Using the Business Demographics Statistics (BDS) database, it first examines the variation of entries and exits of firms over space and time. The empirical investigations show that New Zealand exhibits marked spatial differences in entrepreneurship dynamics, while the entry and exit rates are rather steady over time at the level of Territorial Authorities. The second part of the presentation is devoted to the impact of entrepreneurship on spatial variations in employment growth figures of the whole business population in New Zealand. Theory-based linear models are developed to explain regional economic performance over a five-year period. The level of entrepreneurial activity, concentration, firm size, industry intensity and business density are significantly associated with differences in employment growth rates at the regional level, while business diversity and the level of skilled entrepreneurs have no explanatory power. Implications of the findings for policy makers and politicians in New Zealand are discussed.

Keywords: Economic geography, entrepreneurship dynamics, employment growth, New Zealand

James D Tamerius, University of Arizona. Email: james.tamerius@gmail.com; Andrew C Comrie, Ph.D, University of Arizona. Email: ; *Subregional Winter Precipitation Variability in US Southwest*

Winter precipitation in the US Southwest is highly variable both temporally and spatially. Ocean-atmosphere teleconnections can cause large inter-annual variations in winter precipitation, while topographic features play a pivotal role in the spatial distribution of precipitation through orographic processes. General climatological rationale suggests that the ratio of winter precipitation accumulation between neighboring sub-regions in the US Southwest to be relatively consistent from year to year since large scale synoptic systems are the source of such precipitation. However, recent analyses of fine-scale precipitation has indicated that neighboring sub-regions within the Southwest often experience precipitation anomalies that significantly differ from one another. Utilizing PRISM 4km-gridded precipitation data and fine-scale atmospheric data from the North American Regional Reanalysis (NARR), we identify local and regional atmospheric factors that cause the anomalies, and highlight sub-regions most prone to deviations from broader regional patterns. Understanding these phenomenon may lead to improved seasonal climate predictions for the US Southwest.

Ilona Tamminen Moore, University of Minnesota. Email: moorei@umn.edu; Rethinking Responsibility: the question of the subject of ethics

This paper is a theoretical engagement with conceptualizations of space and the ethical subject; particularly, the aporia of social justice (as it is a liberal framework with implicit universals that is necessary to appeal to while recognizing that it constantly violates) in postcolonialism. In postcolonial studies, questions of historicist time and the universal subject have been widely written on; the role of conceptualizations of space has been less discussed. Taking up the issues of time and the universal subject in the context of liberal justifications of empire, I discuss the work of geography and conceptions of space in producing certain understandings of responsibility. Questioning the roles of history, geography and the subject in liberalism and in colonialism, I follow the work of Spivak to ask the question of the subject of ethics (particularly the aporia of social justice in postcolonialism). Spivak's writings on responsibility, which emphasize it as a right not a duty, make the subject of ethics a question while posing the ethical as never fully knowable. This approach allows me to draw out aspects of what discussions of the ethical subject can bring to conceptualizations of space and geography, and thus in turn what rethinking space (with Massey) can bring to engagements with ethics and responsibility. Questions of space and responsibility tie into postcolonialism, because to rethink the subject and the ethical, we must also reconceptualize our understandings of space.

Keywords: postcolonial, geographies of responsibility

HungJen Tan, . Email: brucetan@ntnu.edu.tw; Regionalizing tea development or developing tea region: a case of the Formosa Oolong tea

Longtan and Peipu are two rural areas situated in separate counties. Their developmental processes would be introduced about how tea industry regionalized the two areas, and how the areas binds each other and forms a production network where resources are utilized and network relations are conditioned by conventions. These areas are Hakka settlements and Hakka cultural is the stereotypical image of the areas. Hard-working, diligent and solidarity are the most well-known conventions of the Hakka people. These conventions also show that the people-place relations in these areas, which are still common, play an important part in agricultural production. Tea has been one of the main agricultural products in these areas. It had been the main export from the Japanese colonial period to the late 80s and dominated local economy. However, since it had been overridden by its foreign competitors, the local tea industry has been shrunk as a local food providing for local people only. Not until recently, some quality changes occurred and the tea soon gains high reputation and market price. Not only has it revived local economy but also connected other areas as more tea farmers take it as the resolution to the depressed local economy. The paper would examine how the northern rural Taiwan restructures itself and forms a new region. It is argued that relational proximity has been as important as, if not more important than, geographical proximity in forming a region.

Serene Tan, York University. Email: serene@delightt.com; Chinatown: Clashing Cosmopolitan Civilisations?

Vinay Dharwadkar named, "the empowerment of new immigrant communities in the national public spheres of the North and the West, as diasporic populations from the South and the East attained an economic and demographic critical mass in their host societies" as one of the "three large-scale developments around the world between about 1975 and 1995 [that] contributed directly to [a] transformation of cosmopolitanism" (2001:1). In this paper, I

name Chinatown an "immigrant communit[y]" that has evidently "attained an economic and demographic critical mass" (ibid.). I posit that the distribution of Chinatowns over the world is an example of globalisation as it is commonly understood. Pheng Cheah notes that "the Chinese diaspora in Southeast Asia - cosmopolitans in the colloquial sense of rootless merchant sojourners - have become the best example of Chinese cosmopolitanism in the normative sense" (2001:135). This paper explores the creation and propagation of a 'Chinatown identity' that is informed via geographical imaginations. A comparative analysis of case studies from both North America and Southeast Asia will draw out a preliminary conception of the nature of Chinatown identities and explore how the constructed imagery of each locale informs these identities. These myriad identities contribute to create a globality that informs its geographical imagination.

Keywords: Chinatown, globalisation, Chinese diaspora, cosmopolitanism

May Tan-Mullins, National University of Singapore. Email: maymullins@yahoo.com.sg; Re-mapping the politics of aid: The changing structures and networks of humanitarian assistance in post-tsunami Thailand

The 26 December 2004 Indian Ocean Tsunami caused massive human and economic destruction. In this paper we argue that the international response to the tsunami exemplifies a shift in the way humanitarian aid is sourced and delivered, and tease out a framework for understanding the continuities and discontinuities that led to differential distribution across a range of sites in Southern Thailand. On the one hand we examine the degree to which we can understand differential aid distribution in terms of persistent characteristics in the political economy such as lack of transparency and corruption. We also consider the importance of 'traditional' structures, networks and resiliences and their role in influencing aid distribution. But these sorts of explanations must be nuanced in light of the emergence of new aid linkages and networks, particularly the move from formal organisations to individualised and direct donations. We suggest these patterns reflect new abilities of communities to mobilise transnational networks, a more participatory approach to aid donation and an opportunity to re-map the multi-scalar politics of aid.

Keywords: Politics of Aid, Boxing Day Tsunami, Southern Thailand, Networks, Structures, Power Relations.

Junmei Tang, Texas State University - San Marcos. Email: jmtang@txstate.edu; Modeling urban landscape dynamics through fuzzy CA model

Understanding the extent, distribution and evolution of urban landscape provides key information in analyzing and explaining urban structure. The most commonly used data for the spatiotemporal model is the crisp classification results from satellite data. These results are often not valid for urban landscape process model due to the complex spatial arrangement of artificial and natural material in the urban. In this paper, we focus on the development, implementation, and evaluation of a new fuzzy Cellular Automata (CA) model to measuring the urban landscape change in downtown area of Houston, Texas using Landsat ETM+ imagery. Particularly, we will investigate how the input data affect the model development, calibration, and validation and attempt to provide a research linking the advanced remote sensing method and the urban process model. The validation results indicate that the fuzzy CA model performs better than the crisp CA model. Further, this research indicates that the fractions maps from the fuzzy classification can also be integrated into a wide range of model concerned with physical and socioeconomic phenomena in cities.

Keywords: fuzzy, CA model, Urban

Kathy Xiaoyu Tang, . Email: ktang28@uwo.ca; Jason Gililand, . Email: ; Isaac Luginaah, . Email: ; Using a GIS-Based Floating Catchment Method to Measure Spatial Accessibility to Family Physicians

It is well known that primary healthcare service especially access to family physicians is an important form of healthcare for the overall population health. The national family doctor shortage and unbalanced geographic distribution of family physicians has long been recognized as a problem in Canada. In the province of Ontario, over one million people do not have the services of a family doctor. Traditional measures of geographic accessibility to healthcare service, such as a straight line distance to nearest provider, and a simple supply level within bordered area, do not consider either real travel distance or the interaction between supply and demand across administrative borders. With GIS technology, better measures of spatial accessibility can be achieved. This research mainly presents a GIS-based floating catchment method for measuring spatial accessibility to family physicians based on 2006 Census and family physicians' data in London, Ontario, Canada. A sensitivity analysis is also conducted by experimenting with various threshold values ranging from 15 to 30 minutes travel times in the GIS-based floating catchment method.

Keywords: GIS, spatial accessibility, floating catchment method

Sheng-Jung Tang, Texas A&M University. Email: dudu0726@yahoo.com.tw; Hongxing Liu, Texas A&M University. Email: liu@geog.tamu.edu; Kenneth C. Jezek, Ohio State University. Email: jezek@frosty.mps.ohio-state.edu; Derivation of Ice Motion measurements of the Antarctic Glaciers from Sequential SAR Images using Hierarchical Image Matching Method

This research studies the glacial dynamics of the Antarctic Ice Sheet using sequential orthorectified Radarsat SAR images respectively acquired in 1997 and 2000. We have improved an image matching algorithm using hierarchical strategy to track ice motions and to derive their velocities. The hierarchical strategy is based on an image pyramid processing. The earlier image correlations are performed with coarse-resolution images. Then the matching at a coarse-resolution will be propagated to guide the later high-resolution searches. It achieves the computation efficiency and high matching density by reducing search space. In addition, the introduction of interesting points operator also increases the matching rate and improves the density of velocity measurements. The ice motion velocities for a number of major glacial systems have been measured using our algorithm.

Wenwu Tang, University Of Iowa. Email: wenwu-tang@uiowa.edu; David A. Bennett, University of Iowa. Email: david-bennett@uiowa.edu; Agent-based modeling of adaptive spatial decision-making in complex geographical systems: a reinforcement learning approach

The objective of this paper is to investigate the significance of reinforcement learning in an agent-based model of spatially adaptive decision-making entities within a complex adaptive geographical system. To test the utility of this approach elk in the Northern Range of the Greater Yellowstone Ecosystems are modeled as geographically-aware intelligent agents, which often play a key role in driving complex systems dynamics. Reinforcement learning is a machine learning approach that uses temporal difference learning and delayed reward mechanisms for problem-solving and it is well-suited to modeling the adaptive behavior of decision-making entities that interact in complex systems. To maximize winter survival during migration, elk agents employ reinforcement learning strategies to develop adaptive migratory behavior. This behavior is based on spatiotemporal knowledge developed through interaction with dynamic biophysical processes (e.g., biomass and snow). We use observed and simulated biomass and snow datasets to test our model and gain insight into the complex ecosystem dynamics within which elk interact. We examine the performance of different reinforcement learning algorithms in modeling the adaptive behavior of elk within a spatial and temporal context. Experimental results from Monte Carlo simulation show that reinforcement learning efficiently support the exploration of spatial adaptation of individuals in response to landscape heterogeneity.

Keywords: Intelligent agents, adaptive behavior, reinforcement learning, elk

Yanbing Tang, University of Georgia. Email: ytang@uga.edu; Exploring Atlanta's Urban Poverty by Spatial Regression Models

The majority of existing statistical analyses on urban poverty assume spatial stationarity, which in reality may be inappropriate. This research investigates spatial nonstationarity of urban poverty by using spatial econometrics. The causal relationships among poverty, demographic, and socio-economic variables in the Atlanta metropolitan area are investigated. This research has two objectives: the first is to enhance statistical methodology in the analysis of urban poverty and the second is to identify those variables that affect poverty rate and determine the strength of the influences. Exploratory spatial data analyses are first used to describe spatial association and spatial heterogeneity of poverty distribution. After spatial weights matrix is constructed, several spatial statistical models (including the spatial autoregressive-regressive model, the spatial autoregressive error model, the spatial Durbin model, and the general spatial model) are employed and the best model is identified based on several criteria. Since spatial models can catch some spatial dependence, they generate better coefficient estimates than conventional statistical models. A general spatial model, which takes the spatial lag and spatially correlated disturbance into consideration simultaneously, is found to be the best model. While generally racial residential segregation, female-headed families, movers, kids and elders, unemployment rate, and low educational attainment have positive influence on poverty rates, household income and employment in primary and secondary industries have negative effects on poverty rates. Surprisingly, higher percentages of African Americans are correlated with lower poverty rate, which raises an issue that needs further research.

Keywords: Atlanta metropolitan area, urban poverty, spatial regression models

Sirpa Tani, University Of Helsinki. Email: sirpa.tani@helsinki.fi; Lieven Ameel, University of Helsinki. Email: lieven.ameel@helsinki.fi; Re-interpreting Urban Public Space: the Case of Parkour

Parkour is a physical discipline created in the late 1980s in the suburbs around Paris. Key figures in its development were David Belle and Sebastien Foucan. Its aim: to move as efficiently, fast and smoothly as possible from one place to another by jumping, vaulting and climbing, using obstacles on the way as a means to reach further. Although parkour can be practised in all kinds of environments, it is usually connected with urban spaces. From the viewpoint of geography, parkour raises some interesting issues. First, it can be seen as a new way to 'read' everyday urban environments. It attaches positive meanings to spaces that have usually been seen as banal, boring or even ugly. Practitioners of parkour (traceurs) interpret their environment by paying special attention to physical structures of space. Buildings, fences, rails and walls offer challenges for traceurs. Modern urban areas, especially suburban neighbourhoods with concrete buildings, rundown industrial areas and business districts, which can usually be seen as non-attractive environments, are valued as the most interesting areas for parkour. Secondly, traceurs' encounters with other people, for example with passers-by, security guards and the police make the unwritten rules of how to use public space visible. In this presentation, the everyday aesthetics of banal landscapes, as well as the possible conflicts in traceurs' ways to use public space, will be discussed.

Keywords: parkour, urban space, banal landscape, public space, everyday aesthetics

Kathryn Tanner, Sarah Lawrence College. Email: ktanner@slc.edu; Networks and Economic Exchange

In what ways are seashells traded internationally for the political and economic advantage of individuals or communities? What implications and global dimensions does this trade involve? While baseline studies have been conducted about seashells in Tanzania (Marshall 2001, Richmond 1997, Spry 1961), this paper will focus on the socio-economic and global dimensions of this trade issue. The global value chain of seashells, traced from production in Tanzania to ultimate user in India, is a deeply embedded economic activity within social networks at every link in the chain. While more formal and large-scale industries rely on other means for vertical coordination systems within the value chain, the seashell value chain relies on personal, familial or religious networks to facilitate trust and confidence in economic exchanges. The link between the export sector in Tanzania and the import sector in India is also socially embedded. These business relationships are formed along ethnic, religious, and (in some cases) familial lines. This paper will show that social networks are essential for the functioning of the seashell trade between Tanzania and India. This essay will demonstrate the connections between power and trade through access, quality, and legislation. While trade is typically considered strictly in the realm of the 'economic', this research shows that the seashell trade is embedded in the 'social', 'religious', 'cultural', and 'political' at every node in the chain.

Keywords: Value Chain Analysis, Networks

Teresa C.H. Tao, University of Waterloo. Email: c2tao73@gmail.com; Geoffrey Wall, University of Waterloo. Email: gwall@fes.uwaterloo.ca; Sustainable Development, Sustainable Tourism, and Sustainable Livelihoods

Since sustainable development was publicised in 1987 by the World Commission on Environment and Economy, it has been incorporated in the regulations of international organizations and the legislation of many jurisdictions throughout the world. Nevertheless, it has not proven to be easy to implement the concept. Also, when conceived as mediating tensions between environment and economy, the role of culture is often underplayed. Nevertheless, many economic sectors have embraced the concept and, in this vein, sustainable tourism is a term that is commonly used. However, in focussing on a single sector and attempting to sustain that, it is possible that sustainable development more generally conceived may not be achieved. The notion of sustainable livelihoods offers a more practical way forward because livelihood is a much more tangible concept than development and it is easier to comprehend and use to guide research and practice. In marginal communities in peripheral locations many individuals are sustained by multiple strategies, both within and outside of the market economy, rather than specific jobs. In such situations, it is especially important that tourism complement rather than replace existing livelihood sources leading to livelihood diversification. Studies of sustainable livelihoods in two aboriginal communities in Taiwan illustrate the relevance and utility of the sustainable livelihoods framework and also suggest modifications that are required if the sustainable livelihoods approach is to be made even more useful.

Wendy Tao, University of California, Berkeley. Email: wendytao@berkeley.edu; Shomik Mehndiratta, World Bank. Email: ; Elizabeth Deakin, University of California, Berkeley. Email: ; *Pedestrian Negotiations on Road Space: Crossing Behavior on Urban Arterials in Fushun, China*

Nearly 100,000 died in road traffic accidents in over 450,000 traffic incidents during 2005 in China. Based on accident characteristics, 26 percent of all deaths occur with pedestrians conflicting with a motor vehicle. This study focuses on pedestrian safety issues in medium-sized cities in China, taking the case study of Fushun. The paper examines the Chinese arterial as a contested space emerging amidst China's fast-paced development, using focus groups, pedestrian count data, and surveys to elucidate pedestrian movement in these spaces China's urban fabric has become textured with arterials of eight lanes or more that efficiently circulate vehicular traffic, but simultaneously create wide crossing distances for pedestrians, increasing conflict exposure, affecting pedestrian safety and having potential longer-term effects on traffic flows. Pedestrians cross mid-block on large arterials because of personal convenience, long distances (300-500 meters) to crosswalks, and perceived crossing safety. With regards to infrastructure, pedestrians dislike skybridges and strongly agree that cars do not slow down at designated physical zebra crossings. Instating fines, barriers and enforcement are all mechanisms which surveyed participants believe would change crossing behavior. Despite perceived danger of arterials, pedestrians also believe that wide streets are symbols of modernization and should not be narrowed. Given crossing behavior and attitudes of pedestrians, investment in road infrastructure must include design for motorized and non-motorized vehicles, but also for pedestrians. Examining how road space is negotiated on a microscopic scale provides an analysis of urban form on pedestrian activity in Chinese cities and lessons for effective long-term transportation planning.

Dana H Taplin, Ph.D., City University of New York. Email: dhtaplin@earthlink.net; *Different Geographies: Imagination and Practice in Geographical Discourse*

What is a geographical imagination? We think, for example, of the mapmaker's survey-like image of geographical space, the planner's color-coded expanse of ordered land uses, and the designer's three-dimensional images of space and mass, or of landscape. Harvey wondered whether the sociological imagination and the geographical imagination could understand each other. I wonder about the different varieties of geographical imagination. How do you get people who incline toward the appearance of things to wonder about social difference and inequality? How can rationalists be made interested in the content and psychological value of people's attachment to places? The answer may lie in exploring the difference between imagination and practice: the mapmaker makes representations, planners rationalize systems of activity and communication, and designers shape masses and give detail to the surfaces. A real estate development controversy such as the Atlantic Yards development proposal in Brooklyn offers an example of different geographical imaginations. The pro-development camp imagines a self-contained urban space on an exhilarating super-scale rising on an ugly rent in the parochial 19th century rowhouse landscape. Opponents, nearly all residents rooted in the pleasant sensibilities of place, fear the disruption likely to result from a new space of colossal size and abstract scale. The different sides in the conflict imagine geography differently in part because of different practice. I hope to give a paper that uses everyday conflicts over urban space like this one to explore the differences in geographical imagination and the possibilities of coming to multiple understandings.

Keywords: geographical imagination, urban geography

Tuna Tasan-Kok, 90019477, Dr.. Email: tuna.tasankok@asro.kuleuven.be; Tom Coppens, KU Leuven. Email: tom.coppens@asro.kuleuven.be; *Complexities of multi-level governance, diverse coping strategies, and implementation processes of waterfront projects: Cases of Rotterdam and Antwerp*

Within the European context, general characteristics of urban policy for regeneration are the overwhelming emphasis on small-area regeneration; discrete projects and output related funding instead of strategic visioning and long-term perspective (Carter, 2000). In addition, the involvement of multi-actors with different expectations makes the implementation of strategic projects very complex. While increasing emphasis is put on developing governance regimes at city (or regional) level, partnerships between public and private actors arouse as policy instruments for implementation. Each city develops a different strategy for coping with these complexities at different levels of policy making and each has different implementation experiences, either long or short. This paper focuses on how complexities of multi-actor governance influence the implementation process of strategic waterfront projects. We start from a game-theoretical theory of collaboration as a foil to explore real collaboration processes in inter-

organisational settings. This allows us to highlight some critical collaboration problems. Next, we examine successful and less successful strategies of different actors to cope with these common issues in different regeneration projects. We compare old-port regeneration projects of Kop van Zuid in Rotterdam and Het Eilandje in Antwerp to see how similar issues were approached in different institutional contexts. Belgium has a federal state system where responsibilities are decentralised to regions (Flemish, Walloon and Brussel regions) whereas in the Netherlands the central government is the strongest and unified authority. These macro level regulatory differences, together with the differences in social, economic and political characteristics, are reflected to the urban policy level.

Jeremy Tasch, University of Alaska, Anchorage. Email: Jeremy@uaa.alaska.edu; Graeme Auton, University of Redlands. Email: Graeme_Auton@redlands.edu; *Nivkhi, Oil, and Justice on Sakhalin Island*

The simultaneity of Russia's on-going restructuring, which includes rebuilding the economy, rewriting legislation while contending with intergovernmental relations, and recreating federal center-periphery relations, effects and further complicates the relations between civil society, international capital, and resource management. The past 80 years of oil development on Sakhalin Island have contributed to environmental disruption, indigenous people's loss of territory, and uneven development. In its current charge into the modern, driven by an international thirst for oil and a Russian eagerness for capital, to whom is Sakhalin's environmental health of critical concern? Have the Nivkhi of Sakhalin managed to redirect Soviet-inflicted misfortune to post-Soviet territorial enfranchisement? How is the current and evolving geopolitical and socioeconomic matrix of interests on Sakhalin shaping rights, investment, and development? With respect to both environmental concerns and indigenous populations, rights are negotiated, often produced through resolution of conflict in specific places and times. Rights can be understood as a counterbalance to the uneven distribution of power in society. This research, by investigating a specific case of international oil, multinational finance, environmental suspicion, and Nivkhi self-determination, addresses the distinctive character of an emerging environmental justice movement on Sakhalin Island.

Keywords: Indigenous, Oil, Justice, Russia

Amanda S Tattersall, Ms, University of Sydney. Email: amandatattersall@gmail.com; Amanda S Tattersall, University of Sydney. Email: amandatattersall@gmail.com; *Coalitions in Global Cities*

Coalitions between unions and community organisations are increasingly used by unions to enhance their power and advance social change, and have become a focus of scholarship on union renewal and labour geography. Yet the elements and dynamics of successful long term coalition practice are not well understood. Similarly, there is little international comparative scholarship on the similarities or variations between coalitions as a strategy for renewal. This paper explores long term coalitions in three global cities, Sydney, Toronto and Chicago. Coalition studies often focus on best practice forms, and present a spatially blind understanding of how context affects coalition practice. In selecting three global cities I seek to locate coalitions as a strategy that can operate as a powerful agent for social regulation in global cities. Methodologically, selecting global cities as a site to explore coalitions provides for some control in case selection to assist comparative research across borders. It also begins to make explicit the geography of those coalitions. The paper identifies three common elements of coalition practice - common concern, structure of organisational relationships and the spatial context. The paper considers how coalitions have common features across these countries, and by developing a framework that seeks to dialectically explore the affects of both context and strategy, argues that there are common practices in coalitions between unions and community organisations across global cities.

Emariana S. Taylor, M.A.G., Texas State University-San Marcos. Email: et1011@earthlink.net; *Perceptions, Risks, and Opportunities for Human/Wildlife Interactions in Urban Environments: An Examination of Bats and Rabies in Texas*

The morphology of modern American urban systems encroaches on natural areas presenting some wildlife species with ready access to food resources, habitat diversity, and safe harbor from natural predators. Consequently, cities have become home not only to growing human populations, but also to thriving populations of urban wildlife. Additionally, cities have become sites of increasing interactions between people and wildlife. Urbanites perceive the presence of urban wildlife populations in myriad ways, ranging from nuisances or hazards to welcomed guests. One strategy to mitigate any negative interactions, and to reduce risks for both humans and wildlife, is through public education. In the absence of a focused public education program, news coverage of human/wildlife interactions becomes a source of public information. In this way, the news media

has the potential to influence public perception, and ultimately, the nature of public perception can influence wildlife management strategies. This research examines the risks and opportunities presented by the close proximity of urban human and wildlife populations through a case study of bats and rabies in Texas. Rabies, a potentially lethal disease, is transmitted to humans through interactions with infected mammals, including dogs, cats, coyotes, foxes, raccoons, skunks, and bats. I use a content analysis of Texas newspapers to compare the portrayal of bat-human rabies transmissions to the portrayal of human rabies transmissions from other urban wildlife. I then compare the news portrayal of bat-human transmission incidents to factual data. Results provide ideas and implications for mutually beneficial management of urban wildlife populations.

Email: jltaylor@usgs.gov; *Land Cover Change in the Erie Drift Plains, 1973 - 2000*

The U.S. Geological Survey's Land Cover Trends project is documenting land cover change in the conterminous United States from 1973 to 2000. The results are based on the geographic framework of the U.S. Environmental Protection Agency's Level III (1999) Omernik ecoregions. The estimates of land cover change for the Erie Drift Plains ecoregion were derived from analysis of 30 randomly selected 10x10 kilometer blocks. The 30 blocks were analyzed with Landsat imagery, supplemented by historical aerial photography, to interpret land cover for five distinct dates within the 1973 to 2000 study period. The Erie Drift Plains ecoregion is located in northcentral Ohio, northwestern Pennsylvania and southwestern New York. The ecoregion, a mix of agricultural, forested, and developed land, covers approximately 30,500 km² (11,776 mi²). Low rounded hills, scattered end moraines, kettles, and areas of wetlands are all common features in the Erie Drift Plains. Areas of urban development include Cleveland, Akron, Mansfield, Youngstown and Canton, Ohio. The overall spatial change?the percentage of land area within the ecoregion where land cover changed at least once between 1973 and 2000?was fairly low. Land cover changed on a total of 6.2 percent of the land area within the ecoregion. The most common conversions were forest and agricultural land converting to developed land. During the entire study period, three percent (925 sq. km.) of agricultural and forested land combined was developed. Other conversions were associated with agricultural and mining abandonment.

Jonathan Taylor, PhD, California State University - Fullerton. Email:
jstaylor@fullerton.edu; *Okinawa: The Political Ecology of a Military Colony*

Okinawa is a subtropical island halfway between the southernmost main island of Japan, Kyushu, and Taiwan. Its location between Southeast and Northeast Asia gives it a distinctive flora and fauna and the highest level of biodiversity of any region of Japan. However, it is currently experiencing an environmental crisis which is endangering many of its unique terrestrial and marine endemic species. Deforestation, soil erosion, the siltation of rivers, non-point pollution from agriculture, public works projects, and residential development are all contributing factors. Underlying these biophysical problems and processes are a host of political-economic issues related to Okinawa's peculiar situation as the host of a large number of US military bases covering some 20% of the island's land area. While the activities of the US military are directly responsible for only a small percentage of the island's environmental problems, the larger problem is the indirect effects the base situation has had upon Okinawa's political, economic, and environmental history. Environmental controversy is continuing with the planned construction of a heliport facility near a sensitive coral reef area.

The ideology of the country and the city in planning for urban expansion

The city's edge is a cultural landscape of conflicting and competing meanings. The visible, physical edge of rapidly urbanizing cities is emotionally charged, representing prosperity to some, and sprawl and environmental destruction to others. This paper is drawn from my dissertation: a cultural landscape study of city expansion at the edge of the Toronto-centred region, where urban growth pressures are as intense as anywhere in North America or Europe. My research reveals the interplay of cultural processes in geographical space and moves beyond contemporary debates of sprawl and smart growth to analyze discourses around urban growth boundary expansion. What cultural values are revealed when country and city collide? On one hand, the social and economic forces behind urban growth are based on embedded cultural values such as single family home ownership, full employment, personal mobility, and engagement with nature. On the other hand, as cultural landscape "countryside"

has agency, by virtue of its material thereness—be it farmland, forests, or plains, it has a powerful presence. In the debate about urban growth, the countryside is valued differently by different individuals and groups. Using discourse analysis (text analysis of public planning process documents and popular media), participant observation of public meetings, and interviews with informants, my analysis reveals that cultural attitudes toward growth and conservation are informed by symbolic landscapes of country and city and these are implicated in the production of real landscapes and places.

Geospatial Information Management and Humanitarian Response

Geography has long served American foreign policy by providing a perspective on issues that are best seen in a spatial context. The themes of location, place, human-environment interactions, movement and region all have bearing on how humanitarian responses to crises are managed in the international context. This paper examines the variety of international and USG venues for harnessing geospatial information management and tools that lead to a dynamic approach to the analysis of humanitarian problems, such as natural disasters (earthquakes and tsunamis) and man-made disasters (Darfur and infectious diseases). Over the past several years, the United Nations has deployed Humanitarian Information Centers in remote locations to support geospatial information management during humanitarian crises. The Department of State has created a new geographic unit composed of geospatial and humanitarian affairs analysts drawn from a spectrum of agencies to identify, collect, analyze, and disseminate humanitarian-related information and data for decision support. This unique character of the unit allows it to draw together information from diverse sources and to provide information to an array of customers. This process of geospatial information management, geographic/humanitarian analysis, and dissemination is invaluable to policy makers and to countries experiencing crises.

mark.taylor@mq.edu.au; *Contamination of natural and human-related environments with heavy metals: an assessment of the exposure and risk to the urban population of Mount Isa, Queensland, Australia*

This paper discusses the storage, transfer and cycling of heavy metals within soil, sediment and water systems around Mount Isa, Queensland, Australia. Mt Isa Mine is a major Pb-Zn-Cu mine that lies immediately adjacent to Mount Isa City that has a population of ~23,000. The ephemeral flowing Leichhardt River bisects the City and the Mine, contributing to Lake Moondarra, the City's primary basin for water capture and storage. Some 200 soil, sediment and water analyses of the river system and the urban area reveal that in many cases heavy metals (Cd, Cu, Pb, Zn) grossly exceed the safe guideline values set by the Australian Government for ecological health and resident housing. Local residents are exposed to potentially harmful doses of heavy metals via a range of pathways: indigenous communities recreating in the contaminated river bed; swimming in contaminated ephemeral pools; consumption of metal-enriched fish caught in Lake Moondarra and inadvertent ingestion of metals within the urban residential area. Presently, there is an absence of knowledge or Government advice relating to any of these potential hazards. This paper discusses the spatial and temporal distribution of soil, sediment and water-associated heavy metals and evaluates the risks they may pose to the environment and population of Mount Isa.

Return Refugees and Biodiesel Feedstock Production on Guatemala's Pacific Coast

Even though biomass provides a vital source of energy to millions of families around the world in places like Guatemala, it is often ignored by politicians and energy analysts who focus on more sophisticated forms of energy. Indeed, thirty to forty percent of the world's population (mainly in less developed countries) already employs a form of renewable energy - biomass, and because alternative forms of affordable renewable energy are not going to reach the rural poor any time soon, it is vital to examine the potential of biomass fuels to alleviate energy poverty in rural areas of the developing world. This paper discusses how return refugee communities on Guatemala's Pacific coast have become involved in the cultivation *Jatropha* (*Jatropha curcas* L.). Seeds of *Jatropha* contain high levels of oil, which is easily extracted. Oil from *Jatropha* can be burned directly in simple stoves or sold to local biodiesel producers. The cultivation of *Jatropha*, which grows in soils not suitable for cash crops, can help alleviate a reliance on woodfuel for cooking and space heating. Moreover, *Jatropha* cultivation can also contribute to household budgets should households choose to sell the oil as feedstock to local biodiesel producers. This paper also discusses the political and economic factors that communities members overcame

to begin their participation in the cultivation of *Jatropha*.

In contrast to many other Arab countries, the United Arab Emirates (UAE) is experiencing remarkable economic growth. Formerly known as the Trucial States under British colonial rule, the region merged the individual states into the UAE in 1971. After the formation of OPEC and the divestiture of foreign companies' control of strategic oil fields, the UAE began to gain substantial income from petroleum sales. Under the leadership of Sheik/President Zayed, the UAE developed a plan for a wide variety of economic development activities funded primarily by income from petroleum sales. A huge and growing success is the Jebel Ali Free Zone which was implemented in 1985. There have been other developments in the basic infrastructure including roads, utilities, housing, and airports. Building upon this infrastructure, the UAE has invested in real estate development, hotels, and the tourist trade. As oil reserves dwindle in the future, the UAE is positioning itself to be a major economic and trade center in the Middle East with connections worldwide. This research traces the economic and geographic infrastructure developments since the country's formation.

S. Martin Taylor, University of Victoria. Email: vpr@uvic.ca; Sulan Dai, University of Victoria. Email: sdai@uvic.ca; *Socio-economic Restructuring and Health in BC Coastal Communities*

Communities on Canada's east and west coasts have experienced profound changes as a result of environmental and economic restructuring associated with the decline of traditional resource-based industries. These have significant implications for the health and well-being of individuals and communities. This study examines the relationship between socio-economic restructuring and health in four BC coastal communities - Port Hardy, Prince Rupert, Tofino and Ucluelet - using data from 66 in-depth interviews conducted to explore factors that influence people's ability to cope with the impacts of restructuring on individual and community health. The findings suggest that differences in health status are attributable to restructuring processes and major events in each community. Economic downturn is clearly linked to poorer health. Employment opportunities are central to the vitality of communities, key to the quality of life of their residents, and related to individual and community resilience or vulnerability. The study concludes that socio-economic restructuring has had an impact on the health of BC coastal communities. While traditional resource-dependent industries have declined, the emergence of new alternative economic activities has not been sufficient to counter the economic decline and associated employment and income stress brought about by the restructuring process. This study adds to the understanding of the complex relationships between socio-economic change in coastal communities and the health and well-being of their residents.

Yvette.Taylor@newcastle.ac.uk; *Turf Wars: Working-class lesbians and scene spaces*

Drawing on an ESRC funded project 'Working-class lesbians: Classed in a Classless Climate', this paper considers working-class lesbians' views, experiences and exclusions from commercialised scene spaces in the UK (Glasgow, Edinburgh, Highlands, Manchester and Yorkshire). The socio-economic inequalities operating in scene spaces have been given attention in terms of the structuring of scene space, via commercialism, regeneration and 'sophistication', serving to

produce upmarket and 'classy' scene space. Scene spaces are being recast as non-threatening commercialised sites and are accordingly hetero/homo-normalized, yet there has been virtually no attempt to understand such processes from the perspective of the meaning that working-class lesbians find in scene spaces. Devaluations occur through 'failure' to display, via appearance, the 'correct', 'gay' signifiers and so the use of these leisure spaces is rarely experienced as pleasurable reclamations. However, the women I interviewed were far from passive and in charting their responses I highlight their significant critiques of scene space(s) as 'middle-class', 'pretentious' and 'male'. Such sentiments ultimately affected a sense that it was not really 'their' space - even if, fraught and fragmentary, entitlement claims were still made upon it. The non-passive stance of interviewees can be seen to challenge and move beyond ideas of homo/heteronormativity and, in turn, confront wider discourses of the normalisation of lesbian and gay scenes/identities: many cannot and will not 'buy into' such processes.

Keywords: class, scene spaces, inclusion/exclusion, Post homo/hetero-normativity

Lake sediment studies have traditionally relied on a single core, taken near the center of the lake, in the hope that it is representative of inputs originating from the entire watershed. This assumption may be true for microfossils such as pollen that may be well mixed by wind prior to deposition, and then subsequently mixed by lake sedimentation processes. However, larger particles of terrestrial organic matter that contribute to sedimentary isotope signals are less likely to be affected by mixing processes so the lake may preserve spatial variations. With this in mind, we hypothesize that stable carbon isotope values may vary spatially in the lake basin due to differences in sedimentation patterns, terrestrial carbon inputs, and autochthonous carbon production. In this paper, we evaluate this hypothesis using stable carbon isotope ratios of surface sediments collected in a high resolution grid from Myracle Pond, TN (35° 38' 19" N, 88° 09' 48" W, 124 m elevation). We chose this pond because of its small drainage basin, rapid sedimentation rate, and watershed neatly divided between hardwood forest, C3 grass, and an agricultural field rotated between corn and soybean cultivation. Preliminary analyses reveal up to 3 ? intra-basin variations in stable carbon isotope values, which correlate spatially with the spatial distributions of these land uses. Compound specific isotopic analyses will allow for the separation of allochthonous vs. authochthonous carbon isotope dynamics and further refinement of our understanding of terrestrial carbon delivery and stable carbon isotope dynamics in small watersheds.

An emerging body of research examines how sociocultural and environmental characteristics of places influence the risk and occurrence of obesity, especially within children. Correlations exist between poverty and obesity and there is a rising prevalence of obesity in African American children. This formative research explores these issues through a case study of Ward 8 in South East Washington, DC, the section of the city containing the largest number of poor people, mainly African American, in the District. While fast food options are numerous, there is a dearth of quality nutritional options available. We examine the neighborhood in depth through an environmental scan, identifying access to fresh fruits and vegetables, and physical activity through parks, playing fields and recreational programs, as well as the safety of the blocks. The block-by-block observational surveys, a canvassing of every establishment selling food, and short surveys to store owners reveal an inadequacy of fresh foods and eating options, as well as a pattern of consumption of junk food amongst local youth. Focus groups with parent/guardians and surveys of youth will further illuminate structural and environmental characteristics of place and the association among environment, culture, nutritional and physical habits of youth.

Carlos Teixeira, University of British Columbia Okanagan. Email: carlos.teixeira@ubc.ca; *Housing Experiences of Black Africans in Toronto's Rental Market: A Case Study of Angolan, Mozambican and Cape Verdean Immigrants*

Since the Second World War, Canadian society has been transformed by demographic, economic, social, and cultural changes. Immigration has played a prominent role in these processes, particularly Toronto - Canada's major urban area and traditional "port of entry" to immigrants. In recent years, the "internationalization" of immigration to Canada has increased the cultural, linguistic, religious and racial heterogeneity of Toronto's population. But while this immigration has been a significant engine of economic growth for Toronto, it has also contributed to the city becoming the most expensive housing market in the country, where new immigrants face the greatest affordability problems. This paper examines the housing experiences of three relatively recent African immigrant groups - Angolans, Mozambicans and Cape Verdeans - in Toronto's rental housing market through an analysis of their settlement experiences, housing search processes, and ultimate outcomes.

Relatively homogenous Czech society started to differentiate during the post-socialist transformation. Economic conditions created by increasing income differences and diversification of housing supply as well as cultural factors stemming from internal heterogeneity and especially from immigration of foreign professionals as well as workers resulted in increasing socio-spatial differentiation in Czech cities. Although segregation has not reached levels comparable to American and West European cities the processes of transformation from previous socially-mixed pattern to more heterogeneous socio-spatial configuration has been shaping the urban social environment since the beginning of 1990s. The voluntary separation and enforced segregation of social, ethnic, cultural or other groups of population from the rest of society creates various forms of concentration. The main aim of this paper is to reveal and investigate the major forms of segregation and separation emerging in the Czech Republic. We summarise the main features of each type of segregation and separation and discuss factors that lead to the establishment and reproduction of identified forms of concentration. We demonstrate that different conditions in various Czech cities give rise to distinct sets of forms of segregation and separation. The research relies mainly on a questionnaire survey among local authorities and non-governmental organizations, fieldwork in selected case areas. We discuss specific features of segregation and separation in Czech cities in the context of theoretical debate of segregation in American and West European urban literature.

Keywords: segregation, forms, Czech cities

Cristina J Temenos, Simon Fraser University. Email: ctemenos@sfu.ca; *Talking Trash: The Politics of Waste Management and Sustainability in Whistler, British Columbia*

There is a growing body of literature that examines the use of the term "sustainability" and of sustainability-influenced policy frameworks as a "fix" for problems of economic, environmental, and social governance. Ideas surrounding economic, social, and environmental responsibility are often a prime motivator for the adoption of sustainability frameworks. The Resort Municipality of Whistler, British Columbia is one local government with a sustainability framework. Yet, in 2005 it began shipping its solid waste to a landfill in Redmond, Washington. According to the municipality this practice is in line with Whistler2020, its fifteen-year comprehensive sustainability plan that follows The Natural Step framework for sustainability. Whistler's waste management policy and practices raise questions of municipal, citizen, and visitor responsibility regarding waste management and the motives behind implementing a sustainability framework in resort communities. Using Whistler as a case study, this research explores the motives and practices involved in implementing municipal sustainability initiatives with particular emphasis on examining the ways in which notions of environmental, economic, and social responsibility are implicated in local policy-making; and clarifies the role that conceptions of responsibility by interest groups and institutions have in the creation of local ideologies surrounding sustainability. It seeks to unpack the mutually constitutive relationship between these ideologies and local policy discourse and practice. The paper will present preliminary research conclusions while considering their implications for the role of responsibility in the adoption of sustainability policies in other resort communities.

Background: People who acquire HIV through injection drug use (IDU) carry a double stigma - that of HIV and that of injector. The social and moral distance such stigma creates differs from place to place. This can carry over to HIV prevention services for IDUs, such as syringe exchange programs (SEPs). Opposition to facilities for stigmatized populations in need of services exemplifies the notion of NIMBY. We present empirical evidence that resistance to SEPs can be rooted in higher macro processes, than that of NIMBY, explicitly defined as LOCAL. This research examines socio-cultural and political processes that shape community and institutional resistance toward SEPs. Methods: Ninety-three interviews were conducted in 32 large metropolitan areas with community experts to explore existence, size, timing, and sources of opposition, support, and controversy regarding services to IDUs. Results: Emergent themes include: 1) repressive drug and syringe distribution laws; 2) harassment of drug users and resistance to services for drug users by local politicians and police; 3) government (in)action; and 4) stigmatization of drug users and location of SEPs in neighborhoods and business districts. Conclusion: Rather than being explained by NIMBY localism, such resistance seems best conceptualized as an "inequitable exclusion alliance" that institutionalizes national and local stigmatizing of drug users. Thus, what SEPs are confronted with is an attitude of rejection and resistance that is firmly entrenched in socio-cultural and national perceptions toward drug users. Thus, we have found, and often is the case, that this is a script by which action can be organized.

Travis Tennesen, University of Wisconsin-Madison. Email: tptennesen@wisc.edu; *Saving the Ranch to Save the Range: Cooperative Conservation in the American West*

Public land ranchers and environmental activists have a long history of conflict over the management of America's public rangelands. Sadly, many recent land use trends in the West?oil and gas development and the conversion of ranches into hunting cabins and hobby ranches, for example?often undermine both the cultural landscape of ranching and the natural amenities that conservationists seek to defend. Though the interests of environmental activists and ranchers may seem aligned in these cases, instances of cooperation between these two groups remains fleeting. My research focuses on several case study locations where ranchers and environmental activists have a history of conflict but recently have worked in cooperation to create land management plans that secure the interests of both groups?plans where both the ranching landscape and the natural landscape are protected. I explore the differences between the social, political, and economic conditions that initially created conflict and those that allowed cooperation, and suggest ways that cooperative relationships can be fostered in other areas of the West. I conclude with a proposal for fostering a cooperative conservation model in Little Missouri Badlands of western North Dakota.

Keywords: conservation, ranching, wilderness, environmental conflict

Jeremy C Tensen, Graduate Student, West Virginia University. Email: jtensen@mix.wvu.edu; *Assessing the Accuracy of Vegetation Abundance Mapping using Linear Spectral Unmixing of Field Collected Endmembers and EO Hyperion imagery in Northwestern New Mexico*

Vegetation abundances mapped at the landscape scale using conventional multi- and hyperspectral image classification approaches may be inaccurate due to the typical assumption that each pixel comprises only one cover class. Spectral mixture analysis acknowledges this scaling problem and seeks to estimate the proportion of each spectral class within each pixel. Linear spectral unmixing in particular is based on the assumption that the spectra combine linearly in proportion to the relative abundance or area occupied by spectral endmembers in the instrument's instantaneous field of view. A linear spectral unmixing model was applied to field collected spectral endmembers and EO1 Hyperion hyperspectral imagery to evaluate the accuracy of sub-pixel mapping of pinyon/juniper and sagebrush abundances for a study site in northwestern New Mexico. Model endmembers were derived in the field using a portable spectrometer. Multiple spectra of sagebrush, juniper/pinyon pine, soils and rocks were averaged over 83 sample sites covering a 1km² subsection of the study area. Accuracy of the spectral unmixing models was assessed using 0.60 m panchromatic and 2.4 m

multispectral QuickBird imagery. Only moderate agreement was found between the Hyperion unmixed data and the QuickBird imagery. Nevertheless, the results of this study are encouraging, given the challenges of scaling up from field collected spectra to the 30 meter Hyperion pixel.

Keywords: remote sensing, hyperspectra, subpixel unmixing, vegetation, abundance, mapping

Peggy Teo, National University of Singapore. Email: geoteop@nus.edu.sg; TC Chang, National University of Singapore. Email: geotc@nus.edu.sg; Singapore's Postcolonial Landscape: Boutique Hotels as Agents

Scholarly work on the connections between the imperial core/metropole and periphery city/colony has focused mainly on the unequal economic relations between them (Forbes 1997; King 1990; Simon 1984). Less is understood about the socio-cultural implications of this binary, and their geographic or landscape expressions. This paper explores how a particular urban tourism landscape - that of boutique hotels - render new, fluid postcolonial geographies of Singapore. By deploying past architectural distinctions and entwining these with the consumer needs of the present, new and innovative environments are fashioned by these hotels to serve as counterfoils to the island's colonial past. In this paper, the tropes of 'hybridisation', 'transculturation' and 'simultaneity' are used to demonstrate that landscapes of alterity represented by postcolonial possibilities are indeed open and discursive for the context of Singapore. By focusing on the "material practices, actual spaces and real politics" (Yeoh 2001: 457) of Singapore's landscapes, we extend alterity in the postcolonial tourism literature beyond the traditional focus on discourses and representations (e.g. representations of the exotic). We do this through the paper's tripartite emphasis on hotel landscapes (entrepreneurial and commercial inventions of new spaces), government ideologies (policy makers and nationalist concerns in urban and tourism development) and social profiles (consumer needs and ownership patterns of the hotels).

Keywords: Singapore, Boutique Hotel, postcolonial landscape

Sin Yih Teo, University of British Columbia. Email: ; Canadian "Sea Turtles" in China: The Return of a Chinese Diaspora?

The term diaspora commonly evokes the idea of a population away from its homeland. In the case of Chinese diasporas, a dominant tendency has been to imagine this homeplace as China. The cultural theorist, Ien Ang, has highlighted the danger of such an approach, arguing that the hierarchical centring back to an imagined ancestral home ultimately homogenizes otherwise heterogeneous diaspora narratives, creating a "prison-house of Chineseness". While acknowledging the differences between Chinese diasporas, I take her argument to another level by questioning what happens when a diaspora actually returns to its supposed place of origin. In other words, I am suggesting that even for a group whose homeland is self-acknowledged to be China, the narrative is one that further challenges the essentialization of Chinese migrants. Specifically, I focus on Canadian "sea turtles" in China - skilled Chinese migrants who previously immigrated to Canada, and are now residing in China. My first concern is to explore the meaning of return. Could it involve processes of re-settlement and re-integration? Might there be transnational movements? Second, what does the relocation reveal about this particular Chinese diaspora's relationship with China - and Canada? Drawing on in-depth interviews conducted with Canadian "sea turtles" in Beijing and Shanghai, my findings suggest that "return" is not a linear process. Instead, there is a circularity that develops out of the wider contexts of "sending" and "receiving" countries as well as the changing expectations of a migrant over his or her lifetime.

Keywords: Diaspora, migration-return, immigration, transnationalism, China, Canada

Adam Terando, Pennsylvania State University. Email: terando@psu.edu; Detection and Attribution of Anthropogenic Climate Change in an Agricultural and Regional Context

Climate is a dominant control on U.S. agriculture. Therefore, there is a strong likelihood that anthropogenic climate change can have a large impact on agro-ecosystems in the U.S. For example, changes in agro-climate indices such as growing-degree days or heat-stress days will have substantial effects on biomass production. Much work has been done to be able to detect and attribute recent climate change to human activities. In addition, recent works have also examined changes in agro-climate indices in the 20th century to provide an agricultural context to climate change. However, little has been done to combine these two approaches. The goal of this research is to determine the magnitude and extent of agriculturally pertinent, anthropogenic climate change in the U.S. during the 20th century. Toward this end, this research hypothesizes that an ensemble of agro-climate indices is an optimized fingerprint for climate change detection in this region compared to surface temperature alone. Indices to examine include thermal time, frost-free period, and heat-stress days. An empirical orthogonal

function (EOF) analysis will be used as a data-reduction technique to determine whether any identified temporal trends are statistically significant and constitute a departure from the expected natural variability of these measures of agricultural climate. Comparisons are then made between the ensemble of agro-climate indices and the raw temperature data to determine whether these indices are superior in their ability to detect regional changes in the climate system.

Keywords: climate change, agriculture, detection, attribution

Carmelle J. Terborgh, Ph.D., ESRI. Email: cterborgh@esri.com; A New Sense of Place - youth, sustainability, and geographic learning

Inspiring the minds of youth is perhaps one of the most rewarding and challenging tasks that one can undertake. Children have a natural curiosity in exploring the boundaries of their world. Exposure of youth to geography is perhaps one of the best ways to give them positive, exploration skills and to prepare them for future careers that address issues of importance to our globe. The future sustainability of our planet will rely on the geographic education of our youth today and their preparation to find innovative solutions for sustainability and regeneration of our Earth's resources. Programs such as the My Community, Our Earth: Geographic Learning for Sustainable Development (MyCOE), which was established over five years ago in preparation for the World Summit on Sustainable Development (WSSD), provide unique opportunities for students, youth groups, and educators to analyze sustainable development challenges with the tools of geography. In addition, youth are developing geographic skills and experiencing ways to explore our world that were hardly imagined just a decade ago; they are creating a new sense of place. This paper will provide an overview of the educational and recreational opportunities for youth and geographic learning.

Theano S. Terkenli, University of the Aegean. Email: t.terkenli@aegean.gr; Landscape as a Matter of Life and Death: Crossing the Sahara

This essay rests on and develops from the experience of the crossing of the Sahara desert by the Canadian contemporary adventurer/ geographical explorer, Jorge Correia. With the aid of qualitative content analysis, the landscape of the Sahara is composed and conceived, indeed enacted, through Correia's personal description and written account as a landscape of alterity. Alterity here lies in the degree of remoteness and distance of the reader/ traveller or subject from the landscape itself and manifests by its enactment through the practice of crossing. The essay brings together two disciplinary areas little so far academically explored: that of contemporary adventure travel writing and more-than-representational cultural geographies, as applied to personal perspectives of landscape embodiment, experience and practice. The disjuncture and distance between the familiar and the 'exotic'/ other here are extended to their extreme level and substantiated at their purest form through the adventurer's contact, experience, embodiment and practice of the landscape of the Sahara: landscape as a matter of life and death. Affirmation of life and death is brought to bear on and articulated in the Saharan landscape through and beyond various themes explored in this work: life as the known and familiar and death as the unknown and the distant; alterity as the landscape of the inner world yet unexplored and death as home, salvation and catharsis; landscape as the reconciliation of life and death through numerous life-affirming and death-skirting practices of everyday collective rituals and rhythms of life in the Sahara, and other.

Keywords: landscape, alterity, Sahara

Travis C. Terpkosh, University of California - Los Angeles. Email: Islandtrees@gmail.com; Species Richness, Floristic Composition, and Structure of Tropical Dry Forests in the Marquesas Islands, French Polynesia

Tropical dry forest is one of the most threatened ecosystems worldwide. Globally, tropical dry forest occurs in frost free regions with an annual rainfall between 500-2000 millimeters and a pronounced dry season of four to seven months with less than 50 millimeters of precipitation. Historically, tropical dry forest was found throughout the tropical world, but today the forests have reached critical status. The isolated Marquesas Islands in French Polynesia lie within the Micronesia/Polynesia Hotspot and contain fragments of the endangered dry forest. Scientific studies of these fragments have the potential to provide information valuable to the conservation of dry forests worldwide. Six of the large and most well preserved dry forest fragments on the islands of Nuku Hiva and Hiva Oa were surveyed in order to compare species richness, floristic composition, and structure. Within each site, 10 transects measuring 2 meters by 50 meters were constructed in which all plants with a diameter at breast height of 2.5 centimeters or greater were identified and recorded. Plant heights were also recorded for all individuals within the transects. Due to isolation and small area, there appears to be very low species richness levels in the Marquesas Islands dry forest. A number of exotic species occur within the transects suggesting that the remaining forest fragments may be degrading. However, there are few endemic

species within the transects, suggesting a low conservation priority for the Marquesas dry forest at a global spatial scale.

Email: ; Healy Hamilton, Center for Biodiversity Research and Information, California Academy of Sciences. Email: ; *Expanding uses for ecological niche modeling: a bridge between systematics and biogeography*

Ecological niche modeling is a rapidly expanding technique that predicts the geographic range of a species from occurrence records and environmental data layers. These models are finding increasing applications in biogeography, conservation, ecology and evolution. We used two methods of ecological niche modeling, Bioclim and MaxEnt, to compare the geographic distributions of two *Arthrostemma* congeners (Family Melastomataceae) that differ in ploidy. Locality data were retrospectively georeferenced from specimen collections housed in natural history museums. Based on a known phylogeny, we compared the morphological, cytological, and environmental variables that separate these species. Preliminary results show that the tetraploid species *A. ciliatum* tolerates a broader set of environmental conditions, and has a larger geographic range, than its diploid sister species *A. primaevum*. This is consistent with the hypothesis that polyploidy confers greater environmental flexibility in plants. Our results suggest that ecological niche modeling may be a useful tool for exploring the relationship between systematics and biogeography.

Christopher Terry, Professional Geography Undergraduate Student, University of North Alabama. Email: crterry@una.edu; Greg G Gaston, PhD, University of North Alabama. Email: gggaston@una.edu; Karst Topography: Influence of Drainage Patterns on the Physical and Human Landscape in North Alabama

The physical landscape of North Alabama is a prime example of Karst Topography. Sinkholes and the associated surface drainage have a significant impact on the development in the area of Florence, Alabama. The purpose of this research is to identify sinkholes in Lauderdale and Colbert Counties of North Alabama and to discern the patterns in their: orientation, proximity to streams, rivers, ponds, and wetlands. The relationship with specific soil types and geologic formations, frequency, and size of sinkholes will also be examined. In examining the human landscape, this research will focus upon the affect that sinkholes and their related surface drainage have had upon urbanization in the area. The methodology involved includes data collection, use of GIS software to create maps and conduct analyses, the creation of a grid overlay to discover patterns in the orientation of the modeled sinkholes revealing a distinct regional joint pattern, and the organizing of the results into tables, graphs, and text. This research illustrates the impact which natural processes can have upon both the physical landscape and upon human activities and development.

Christian Tettey, University Of Akron. Email: christettey@yahoo.ca; Urbanization Problems In Africa: A Strategy For Solution

Urbanization is a problem in Africa and this has its roots from the colonial era, where centers were established at the coast for exploiting resources. These centers grew to become urban centers in Africa. The post colonial era followed the same trend, by means of focusing developments in these centers. These few urban centers are beset with problems such as congestion, sanitation and housing. Efforts have been made by various governments to solve these urban problems to no avail. The paper therefore attempts to provide an alternative solution to the urbanization problem in Africa by using an approach quite a different approach. The research is quantitative in nature using socio-economic data from the United Nations, the World Bank and other sources. Statistical methods were used to analyze the data and GIS used to spatially display the data. This paper believes

that emphasis on the development of social facilities may do the magic more than the usual emphasis on economic facilities.

Eugene Tettey-Fio, SUNY-Binghamton. Email: fio@binghamton.edu; Mark E Reisinger, Binghamton University. Email: mareisin@binghamton.edu; Puerto Ricans and Other Latinos in Berks County, PA: Migration, Settlement, and Employment

The Latino population of Berks County and Reading has increased dramatically over the past 20 years. This paper examines migration, settlement, and labor market patterns of Puerto Ricans and other Latinos to the area. It was found that the origins for the greatest number of Latino migrants are counties in the northeast U.S. Substantial numbers also come from Puerto Rico and other foreign countries. Puerto Ricans and other Latinos in Reading are highly segregated from Anglos and the vast majority has settled in the central city area. Puerto Ricans in Berks County are employed in secondary sectors of the labor market and have higher unemployment rates than Anglos. As a result of residential concentration and a relatively poor position in the labor market, high levels of socioeconomic inequality exist between Puerto Ricans, other Latinos and the Anglo population.

Victor B. Teye, Arizona State University. Email: teye@asu.edu; International Involvement in Tourism Development in a Peripheral Region: Lessons from Ghana

While most African countries use short, medium or long-term planning instruments for internal economic development at the regional and national levels, many of these plans exclude specific tourism development components. Some of the reasons advanced for this situation include low priority assigned to tourism, lack of domestic investment capital, and limited local human resource capacity to support the planning and development of the tourism sector. Some of the few countries that have successfully developed tourism have initially depended on external agencies, foreign expertise, foreign investment capital and technical assistance. This paper examines the involvement of several international development organizations in an integrated nature-based and heritage tourism project in the Central Region of Ghana. It analyzes the role of the international agencies; the objectives of the project; some of the project's unique aspects with respect to funding, capacity building and transfer of technology; and some of the direct outcomes, as well as problems at the local community level.

Baleshwar Thakur, Delhi School of Economics, University of Delhi. Email: chandathakur2003@rediffmail.com; Thirst for Water in Indian Megacities

The megacities of India, Mumbai (16.37 million), Kolkata (13.21 million), Delhi (12.79 million) and Chennai (6.42 million) form the apex of Indian urban system and are characterized by strong diversified economy. The concentration of 24% of urban population in the four megacities has significant consequences for the quality of life of urban residents. The biggest problem associated with megacities dynamism is the provision of an adequate and safe quality supply in the face of greatly accelerated demand. The megacities not only lack adequate supply but also well distributed supply of water. Due to phenomenal growth of the population, water supply did not keep pace with demand. There is a constant demand-supply gap of about thousand million liters of water everyday. Therefore, efforts are made to obtain city water from distant areas and at a great cost. In the past, residential water use was primarily limited to drinking and cooking in the home, but today vast quantities of water are also used for clothes washes, baths and showering, sewage disposal, low sprinkling and car washing. Industrial and commercial uses have changed as well. The use of water for industrial cooling processes, air conditioning and waste removal has grown rapidly. Due to rapid population growth coupled with inadequate infrastructure, the problem in the megacities is getting worsened and requires immediate attention.

Keywords: Water and Indian Megacities

Rajiv R. Thakur, Indiana State University. Email: rthakur@indstate.edu; Jay D Gatrell, Indiana State University. Email: jgatrell@indstate.edu; Science and Technology Indicators: A Policy Geography

Since the late -1980s, strategic science and technology (S&T) planning at the state-level has been considered a key of successful economic development. Focused S&T initiatives have been used to expand nascent industries within states and/or fuel the development of emerging technologies within a state further the competitiveness of local economics. According to policy-makers and academics alike, the technology-based economy is dependent on factors such as: access to venture capital, the highly developed spatial division of labor associate with

metropolitan areas, and the existence of a critical mass of existing industries and associated research & development (e.g., articulated agglomeration economies). Unfortunately, the distribution of these individual resources varies across space and the observed geography of these collective resources complicates S&T planning. In this poster, we will examine key S&T technology indicators for all 50 states since 1995 as well as consider the implications of targeted S&T initiatives, such as the Experimental Program to Stimulate Competitive Research (EPSCoR), in selected states.

Keywords: Science & Technology Planning, EPSCoR, Policy Geography

Sudhir K. Thakur, California State University Sacramento. Email: thakurs@csus.edu; Identification of Regional Development Patterns in North Dakota: Potentials, Prospects and Policy Implications

North Dakota is one of the lagging regions in the US with a slow growing manufacturing output, ageing population and low per capita personal income. The booms and busts cycles of North Dakota's agriculture and energy industries have rippled through the regional economy. The state government has sought to attract new sources of jobs and income and has paid much attention to tourism, historic and recreation attractions. Major contributors to the region's growth are: agriculture, federal government, professional and technical services, oil and gas extraction and information sectors (Economic Brief, July 2005). Given a decelerating trend why should the government invest in a sound development policy? A good regional development policy would encourage the environment of balanced growth, provide a reliable source of high quality agriculture output, provide incentive for population retention and growth, encourage industry location, and attract businesses to the region. Published secondary data from the North Dakota State Data Center and County Business Patterns will be utilized for analysis for the period 1980-2000. A multiple regression analysis will be utilized along with Geographic Information Systems (GIS) for visualization of development patterns and reporting of results. This research examines three questions: (1) What are the trends of regional development patterns in the North Dakota economy? (2) What are the development constraints in the agriculture, manufacturing and service sectors? (3) What are the trends of population movements within the state and between the state and rest of the country?

Keywords: North Dakota economy, regional development

Denis Thalson, PhD, . Email: dtholson@earthlink.net; Bay Area Memorial Shrines: A Typology Based on Place

There are two dominant types of individual memorial shrines in the San Francisco Bay Area. Each type functions through place differently, and their various distinct interfaces with place are the primary distinguishing factors between the two types of memorial. As Charles Collins and Charles Rhine (2002-2003) and others have noted, rural roadside versions of memorials, usually commemorating traffic accident victims, seem to function through the place of death, using it a mediator between the shrine builders and deceased to whom the memorial is dedicated. A new type of individual memorial, dedicated to murder victims, is now emerging in inner city neighborhoods of the Bay Area. Unlike the roadside versions, which can persist for years, these urban memorials are usually highly ephemeral, because authorities do not tolerate them. Because they are usually removed after a very short time, inner city memorials cannot be reliable mediators at the place of the murder. In compensation, more portable memorial customs, such as the use of R.I.P t-shirts, and memorial statements written on car windows, often substitute for, or augment, any of these shrines built at the place of death. Additionally, memorial wall murals in inner city neighborhoods, and the frequent use of secondary and tertiary memorial shrine locations, make the entire immediate neighborhood a diffused memorial place, redefining the home and the reach of the original memorial shrine. The complex layers of address seen at these urban memorials, often emphasizing community involvement, supports this contention.

Brian Thayer, University of Wisconsin - Milwaukee. Email: bpthayer@uwm.edu; Developing a Community Information System (CIS) to Assist Neighborhood Revitalization Efforts: Case Study of the Harambee Community Milwaukee, WI

Public participation GIS (PPGIS) literature has recently explored using community information systems (CIS) in marginalized neighborhood organizations to allow the community itself to play a larger role in the planning and decision-making processes that impact its citizens. Having primary control of a GIS will allow these organizations to ask meaningful questions relevant to their own community and conduct analyses using spatial data without relying on costly experts - a major barrier in developing successful PPGIS initiatives. However, the potential of using CIS to create a more democratic practice of GIS and to provide communities with equitable access to spatial data is poorly understood due to a lack of empirical research on the subject. Drawing upon past studies investigating the local political context of PPGIS initiatives and organizational structure in the

City of Milwaukee, an internet GIS website was implemented and customized for the community-based organization of Harambee. This research explores the factors and conditions that fostered effective use of this technology by the community organizers through ethnographic field research including semi-structured interviews and document analysis. Taking this bottom-up approach and incorporating local knowledge were strongly emphasized and ultimately became the foundation for building the CIS. This research has created an awareness of the value of public information in neighborhood revitalization efforts and contributes to existing PPGIS literature as it has allowed for a better theoretical understanding of university-community partnerships and organizational structure.

Jonathan Thayn, University of Kansas. Email: jonhayn@ku.edu; Kevin Price, Ph.D., University of Kansas. Email: price@ku.edu; William Woods, Ph.D., University of Kansas. Email: woods@ku.edu; Locating Amazonian Dark Earth Soils using MODIS and Harmonic Wave Analysis

Accurate estimates of local to regional scale vegetation biophysical factors and serial developmental stages are required to improve models of terrestrial ecosystem carbon exchange and climate-biosphere interactions. This proposal outlines a robust methodology for generating these estimates in the Amazon Basin using 250-m resolution Enhanced Vegetation Index (EVI) high-frequency multiyear time series data sets collected by NASA's Moderate Resolution Imaging Spectroradiometer (MODIS) and harmonic wave analysis. Advantages of the method include resilience to interference from noise in the data (including cloud and aerosol contamination), the ability to succinctly summarize annual and multiple year patterns of vegetation dynamics, sensitivity to the effects of abrupt stochastic disturbance on vegetation, and sensitivity to gradual trends in climate and forest succession. A literature review indicates that the methodology is novel and a likely improvement on existing methods. The final products include models of moist tropical forest cover, based on vegetation response to yearly and interannual perturbations and cycles, that can be related to below and above ground carbon storage, climate change and biodiversity.

Paporn Thebpanya, Towson University. Email: pthebpanya@towson.edu; The Comparison of Topographic Profile Drawings between Sighted and Non-Sighted Individuals Using Chain Code Differentiation

For learning geographic environments from primary or secondary sources such as maps, vision is the most effective sense and sight is often quoted as the sense par excellence. It is generally contended that people with visual impairment or blindness experience a world different from those who are sighted because they must rely on other senses as the modes of learning, which are sequential in nature. Nevertheless, our understanding of the spatial world experienced by people with visual impairments remains relatively limited. Cognitive mapping research and other allied techniques enable an insight into the mental landscape of people with blindness. They also provide clues as to how spatial information is learned, processed, and stored. This experiment investigated the use of multimodal information for exploring topographic data. Both haptic and auditory modalities were integrated as a means of presenting spatial information for those who are visually impaired. Two sound variables, pitch and duration, were utilized to facilitate the interpretation of contour lines on topographic maps. Because higher pitched sounds have more vibrations per second, the 'higher pitch is up' metaphor was used to associate the perception of sound with elevation. The participants were asked to listen to different sets of sounds and draw topographic profiles based on the sounds they heard. The similarities of these drawings were compared with the actual profiles using the cross chain correlation technique. The results revealed that the integration of sound variables and different modalities enhanced the interpretability of topographic maps for both sighted and non-sighted individuals.

David M. Theobald, Colorado State University. Email: davet@nrel.colostate.edu; Evaluating the conservation value of alternative land use policies using build-out scenarios in Ouray County, Colorado

Scientists are challenged to connect information about conserving biodiversity with the land use planning process. One aspect that has gained increased attention recently has been the need to provide more and better information about the effects of land use change on biodiversity targets. A second challenge is to provide information to inform debate about possible changes to land use planning policies to minimize possible effects from future land use changes. A powerful approach to think proactively is to use spatial modeling techniques to express a series of alternative build-out scenarios. These scenarios are subsequently evaluated against a range of indicators, also developed by community stakeholders to quantify differences in the possible effects associated with different planning options on economic as well as ecological values. I will

present results from a recent study to compare alternative land use policies, including clustered development, transfer of development rights, and preservation of agricultural lands, in Ouray County, Colorado.

Keywords: land use, conservation planning, GIS

Rebecca Theobald, University of Colorado. Email: rebecca.theobald@colorado.edu; International Early-Career Faculty in American Higher Education: "I'm Canadian - should I be included in the study?"

Foreign-born scholars and scientists who pursue careers in geography at American colleges and universities have increased in number and diversity over the past three decades. Canadians comprise over ten percent of these academics; in addition, many individuals from other countries receive graduate degrees in Canada and then migrate to American institutions, bringing with them Canadian-influenced perspectives. While the primary needs and concerns of these foreign-born faculty tend to be similar to those of their native-born counterparts, the international faculty may suffer consequences of poor structural support more quickly or to a greater degree than other members of the professoriate. Canadians are sometimes ambiguous as to whether they contribute to the international population in the United States. This study describes the results of a web-based survey detailing the experiences, abilities, attitudes, and concerns that foreign-born faculty face during the critical early-career period?the time between the doctorate and tenure?when many professional and personal decisions are made about continuing in academic life, categorizing issues specific to individuals from Canada as well as all early-career faculty. Examining the perceptions that Canadians and Canadian-educated early-career faculty bring to the United States demonstrates the degree to which Canadians consider themselves in alien territory when living south of the border. Institutional strategies that support international faculty, particularly those early in their careers, are identified in order to maintain a highly qualified scientific workforce and diversify the U.S. professoriate. Knowledge of these policies is also of benefit to Canadians considering employment in the United States.

Sotiris Theofanis, Rutgers, The State University of New Jersey. Email: stheofan@rci.rutgers.edu; Maria Boile, Rutgers, The State University of New Jersey. Email: boile@rci.rutgers.edu; Virtual Container Yard: An Innovative Approach in Handling Container Transportation Adverse Impacts in Metropolitan Areas

A Virtual Container Yard (VCY) is an Internet based technology platform, which enables users to share information and interchange container equipment, off-dock. A VCY makes freight logistics more efficient by means of street-turns, meaning direct empty container moves from a consignee to the next consignor. Trucking companies would be able to locate an empty container close to the site where they have an export pick-up. This would eliminate an unnecessary trip to a port terminal where empties are typically stored, and alleviate the need for a trucker to return an empty container to the port. Using a VCY system as a platform for sharing and providing information among different port players, such as ocean carriers and trucking operators, is increasingly being considered as a viable option to reduce the adverse impacts of container traffic in major port regions. Implementing a VCY has the potential to reduce the number of truck trips and associated transportation costs, truck miles and diesel fuel consumption, saving truck operators time and money. Other benefits for local communities include emission and commute time reduction. These benefits are expected to multiply as trade volumes continue to grow. The paper presents results from a simulation modeling approach that captures the process of matching empty containers through a VCY system. Results for different scenarios of input parameters, system environments and practical constraints are analyzed, and potential benefits to the users and the general public are estimated.

Keywords: IT, VCY, empty container, simulation

Thomas Thevenin, University of Burgundy - THEMA / CNRS - France. Email: thomas.thevenin@u-bourgogne.fr; Bob Schwartz, Mont Holyoke College. Email: rschwartz@mtholyoke.edu; Estimating Historical Population Densities in Areal Units over the "longue durée" in France

How can geographers and historians construct and analyze population density over time in units whose boundaries change? This paper discusses how the problem is being addressed in a collaborative study of railways and uneven development in Britain and France during the nineteenth and early twentieth centuries. The method being used in the French part of the comparative study applies raster surfacing modeling to estimate population densities within the communes of France from 1836 to 1911. This approach can be then evaluated in relation to an alternative method developed notably in UK by Ian Gregory.

Keywords: Density, Historical GIS, Raster modeling, France

Jeanne M Thibeault, PhD Student, University of Connecticut. Email: jeannethi@hotmail.com; Spatial Patterns of Oxygen-18, Deuterium and Deuterium Excess in Precipitation over Lowland Europe

The isotopes of oxygen in precipitation are important in the study of global climate change because they are reliable indicators of the natural hydrological cycle. The isotopic content of precipitation becomes increasingly depleted with increasing distance from the coast. Long-term monthly means of isotopes in precipitation at low-altitude sites in western and central Europe having a common time period of data collection (1980-2001) were mapped. With the exception of summer, the long-term monthly means of isotopes in precipitation become more depleted inland from the North Sea coast along a NW to SE gradient. During June and July, the isotopic gradient over western Europe runs more directly from the west towards the east. East of the Alps, it runs from the southwest towards the northeast. During August, the isotopic gradient over the entire study region runs from the west-southwest towards the east-northeast. The North Atlantic Oscillation (NAO) is an important influence on climate variability for Europe, especially from December through March. Maps of $\delta^{18}\text{O}$ in precipitation during high and low phases of the NAO suggest that relationships between the NAO and $\delta^{18}\text{O}$ in precipitation affect the direction of the isotopic gradient across Europe as well as the isotopic content of precipitation. Although few statistically significant differences were found between $\delta^{18}\text{O}$ averages in high and low NAO months, NCEP reanalysis data support the idea that variations in the NAO affect the spatial patterns of $\delta^{18}\text{O}$ in precipitation from December through March.

Keywords: isotopes stable, precipitation, Europe, NAO

Claudia Hanson Thiem, University of Wisconsin-Madison. Email: thiem@students.wisc.edu; Charter schooling and the restructuring of U.S. urban governance: towards a socially entrepreneurial city?

This paper uses the phenomenon of charter schooling to advance and critique theories of urban governance and politics. These hybrid public-private schools - now championed by an influential group of 'education mayors' - are a strong and growing presence in the landscape of U.S. urban education. Drawing on examples from a variety of U.S. cities, I use the charter schooling sector/movement to revisit two prominent concerns of urban political theory: (1) the role of the third sector in various governance activities, and (2) the relations between 'elite' and 'grassroots' politics. First, an examination of the charter sector reveals a far more robust, autonomous, and spatially-extensive 'shadow state' than that portrayed in most contemporary scholarship. Chartering's intensive culture of social entrepreneurialism and dense network of parastatal intermediaries (consultants, philanthropies, etc.) signal the development of deep and enduring forms of multi-institutional and multi-scalar governance. Second, the charter movement problematizes popular analytic distinctions between 'neoliberal' political projects and moments of progressive resistance. Its creative blending of economic growth and social justice agendas necessitate a reconsideration of the means and ends of governance projects. In the context of a search for more nuanced conceptual vocabularies around urban governance, I use these features of charter schooling to suggest the emergence of a socially entrepreneurial city. This term - which encompasses the institutional, political, and discursive foundations of urban governance - both elaborates and extends recent discussions of 'soft' and 'partnering' forms of neoliberalism.

Alain Thierstein, Munich University of Technology. Email: thierstein@raumentwicklung.ar.tum.de; The changing value chain of the knowledge economy. Spatial impact of intra-firm and inter-firm networks within the Mega-City Region of Zurich

The knowledge economy is faced more and more with complex forms of corporate collaborations and division of labour - work is no longer neatly organised within intra-firm structures. One of the reasons is the segmentation and growing industrialisation of the value chain of the knowledge economy. Zurich's international reputation is based on its major role within the knowledge-based economies. Based on a general analysis of Zurich's position within the knowledge-based economy, the article focuses on the empirical findings about the spatial behaviour of companies of the knowledge economy and their relevance for polycentricity in the Mega-City Region of Zurich. The paper takes a particular look at the inter-firm and intra-firm interactions of advanced producer services based on quantitative and qualitative empirical analyses. In order to reveal patterns of spatial development and the driving forces behind them, the paper investigates the functional division of labour within the Mega-City Region of Zurich and with the rest of the world. The article concludes with the core

challenges for territorial governance deriving from emerging polycentric mega-city regions.

Jean-Claude Thill, University of North Carolina at Charlotte. Email: jfthill@unccl.edu; Han-Ju Tsai, SUNY-Buffalo. Email: ; *JetBlue Is Coming to Town! Should We Rejoice or Run for Cover?*

JetBlue Airways is part of a new breed of low cost air carriers that have entered the domestic market over the past few years. In many ways, JetBlue has emulated Southwest Airlines, the archetypical low cost carrier. In other ways, it has sought to establish its own brand of low-cost air travel. By all accounts, it has been successful at it, in contrast to many of its predecessors. In this paper, we analyze the impact JetBlue has had on markets it entered. Three complementary perspectives are adopted. First, we look at the market share the airline secures within two quarters of its entry. Second, the growth in ridership induced by JetBlue's entry is investigated. Finally, the magnitude of the deflationary effect of fares is quantified. We seek to explain the effects of the new entrant in relation to market conditions and market structures.

Keywords: Air travel, JetBlue, Low Cost carriers

John Thistle, Geography, University of British Columbia. Email: jthistle@geog.ubc.ca; *"They claim them in an indefinite sort of way": Wild Horses, Rangeland Conservation and Settler Colonialism in British Columbia, Canada*

In the semi-arid interior of British Columbia where fingers of bunchgrass reach into an otherwise forested landscape native people, ranchers, and provincial range managers are debating the future of the region's "wild horses." Indeed, they have been doing so for over a century, albeit from vastly unequal social and political vantage points. In 1891, for example, cattle rancher John Saul complained that "wild horses" were ruining the region's rangelands. "I believe they are descendents of Indian horses and I am told they lay claim to them in an indefinite sort of way." Nevertheless, Saul suggested the horses be shot off, as was being done "to great effect" in Australia. Others echoed Saul's complaint connecting deteriorating rangeland with "the wild or nearly wild horses the Indians own," and despite strong protests from native people in the early twentieth century provincial grazing officials began shooting the "worthless" animals in order to "conserve the range resource," sparking the conflict that continues today. The context, of course, has changed considerably. Yet there are still horses and debates about their relative "wildness;" still Native people who lay claim to them in "an indefinite sort of way" (from the perspective of western legal tradition); and still ranchers and range managers who want to "manage" them to conserve forage for cattle. Drawing on a range of archival sources this paper draws connections between wild horses, conservation and settler colonialism, and assesses the possibilities for a "post-colonial" wild horse policy in the British Columbia interior.

Keywords: rangelands, conservation, colonialism

Anne Thomas, University of Nevada Reno. Email: aesthomas281@yahoo.com; *Landscape Transformed: A Field Tour South of the Slot*

San Francisco's South of Market district adjoins the Financial District, and the two share an historical urban growth timeline that includes the city's founding, explosive population increase as the result of the Gold Rush, devastating earthquake and resulting fire of 1906, pressures of growth and the scarcity of land, and the effects of advances in transportation, industrialization, and globalization. These events, however, have shaped the built environments of the two districts differently. While the Financial District became the site of towering office buildings, South of Market, the site of the city's earliest industries and working class housing, became the subject of intense political and ideological debate, bringing redevelopment plans to a standstill. During the mid-20th century the area became in some ways frozen in time, as land and buildings sat vacant and deteriorating. Redevelopment has been increasing over the past few decades, however, and the South of Market area is now experiencing an explosion of investment. The results are a confounding mix of old and new, commercial and high-tech office, industrial, and high-and low-income residential. My research goal is to unravel and present the puzzle as a field tour of the South of Market landscape today, putting it into a context that is historical and contemporary, physical and cultural, from an urban landscape analysis perspective.

Mary E. Thomas, Ohio State University. Email: thomas.1672@osu.edu; *Is the Unconscious Only Collective In Qualitative Research? The Limits Of Psychoanalysis In Work On Identification and Identity*

What are the limits of psychoanalysis for social identity research that primarily draws on human subjects and their narratives? To what extent can psychoanalysis be utilized when analyzing narrative data obtained, for example, through interviewing? While I advocate an ontology of the psychoanalytic subject, I argue that social science researchers must avoid psychoanalyzing our research subjects. The implications of avoiding analytic practices (given the lack of training or time) therefore restrict researchers' abilities to treat unconscious processes as highly individual; rather, the unconscious to those untrained in analysis must be kept at the aggregate level of the collective or the social. Therefore, the distinction between ontology (what constitutes social practice, for example) and analytic practice limits the ways in which scholars can 'read' personal narratives for unconscious processes. I will draw on the example of racial melancholia from cultural studies to explore the issue of how and to what extent researchers can 'listen' to the unconscious in narratives derived from qualitative research.

Ren Thomas, University of British Columbia. Email: rae.thomas@gmail.com; *Ethnic food on the decline: the preservation of immigrant diets in the postcolonial era*

In Canada, where immigration accounts for 70% of our population growth, the food choices of new immigrants should be a concern. As immigrants settle into their new lives, they go through a process of acculturation to Western diets. Studies show that acculturation to the US is associated with shifts from traditional ethnic diets featuring vegetables and whole grains to the more processed, high-fat and high-sugar foods that are popular and easily available in the US. As a result, second- and third-generation immigrants are at greater risk for obesity, heart disease and hypertension. In Canada, the vast majority of immigrants settle in Vancouver, Toronto, and Montreal. Historically, ethnic food stores in these cities have provided a means for new immigrants to buy their traditional foods within their own neighbourhoods. The variety and location of ethnic food stores in Canada's three largest cities may influence immigrants' diets. There is growing concern that neighbourhoods without supermarkets may not have easy access to healthy food choices. This paper explores the link between diet and neighbourhood food choices, including the location of grocery stores and ethnic food stores. The policies of several municipalities to encourage the establishment of local grocery stores highlights the planner's role in protecting a variety of food choices. The extension of these policies to support local ethnic stores could help new immigrants to access their own traditional foods more easily. The preservation of these diverse diets could have profound impacts on the future health of our communities.

Sarah L. Thomas, University of California, Berkeley. Email: slthomas@nature.berkeley.edu; Sally K. Fairfax, CA-B. Email: sally@nature.berkeley.edu; *Equity in Land Conservation and Land-use Planning after the New Deal: The Durable Influence of the Outdoor Recreation Resources Review Commission*

This paper argues that both current land conservation strategies and recent debates about equity in land conservation have their origins in the work of the Outdoor Recreation Resources Review Commission, appointed by Congress in 1958. Most scholars and policymakers have forgotten ORRRC, yet the Commission's work was fundamental in shaping the institutions, approaches, and ideas that have guided land conservation for the past fifty years. ORRRC's recommendations led to the passage of key pieces of state and federal conservation legislation in the 1960s, prompted the creation of the Land and Water Conservation Fund, and helped to institute widely used conservation strategies such as open space acquisition, conservation and scenic easements, and flood-plain zoning. The Commission's work also heightened the role of land-use planning at a state and local level in both urban and rural areas, informing many of the institutions and policies that drive today's planning process. Most importantly, ORRRC grappled with issues that continue to confound land management today, namely the need for equity in the allocation of environmental benefits and costs.

Fossil ostracod valves and charophyte oospores have proven to be effective paleolimnological proxies in many settings. We have investigated the distribution of ostracod valves and oospores in surface sediments and sediment cores recovered from four lakes located near 1000 m elevation on the south slope of the Cordillera Central, Dominican Republic. Our sediment cores from Laguna Castilla, Laguna de Salvador, Laguna de Felipe, and Laguna Clara each span the last 2000-3000 years. Despite the close proximity of the four lakes (< 2 km), each lake offers unique limnological conditions. The four lakes provide an ideal testing ground for determining the environmental constraints on modern ostracod and charophyte distributions, and then applying surface relationships to downcore samples. Our dredge and core top samples from the four lakes reveal that ostracod valves and oospores are only present in the near-surface (modern) sediments of Laguna de Felipe and, to a lesser degree, Laguna de Salvador. However, both ostracod valves and oospores are present in deeper sediment samples from our core recovered from Laguna Castilla, as well as cores recovered from Laguna de Salvador and Laguna de Felipe. Our preliminary analyses indicate that water chemistry, specifically calcium ion concentration, is likely the primary limiting factor for ostracod valves and oospores in modern sediments of the Las Lagunas lakes. We are now examining downcore changes in ostracod and charophyte presence with this relationship in mind. Our work complements other ongoing analyses of the Las Lagunas cores, including oxygen isotope analyses of these carbonate fossils.

Samuel Thompson, Western Illinois University. Email: S-Thompson@wiu.edu; *The People Change in West-central Illinois*

In west central Illinois, an area with historically homogeneous population, it is now commonplace to hear spoken languages other than English in small towns. An excursion through the region reveals why migration is changing the character of the region. This paper explores the nature of migration in the region, the manner by which immigrants learned of opportunities in the region, and the reasons for choosing the area.

Keywords: Population, migration, small towns

Wiley C Thompson, Oregon State University. Email: wiley-thompson@us.army.mil; *Success in Kashmir: A Positive Trend in Civil-Military Integration During Humanitarian Assistance Operations*

The global community is paying greater attention to natural disasters and their subsequent relief efforts. The modern cast of disaster relief actors includes non-governmental organizations, private-volunteer organizations, and military organizations. Each group, civilian or military, has valuable skills and experiences that it can bring to bear in an attempt to solve the problems encountered in today's ever-increasing complex humanitarian environment. Military organizations possess critical capabilities and civilian organizations bring vast experience from the humanitarian realm. However, civilian relief organizations may fear that an alliance with the military will taint their organizations, make them less welcome in other regions, or discourage donor contributions. Military organizations are concerned that focusing on humanitarian tasks may strain training resources, decrease combat capabilities, or lead to protracted entanglements. In the October, 2005 Kashmir earthquake disaster relief effort, members of the United States military integrated with civilian and other national military organizations to create a cooperative environment and lent their unique capabilities to the relief effort. This ad hoc coalition did a tremendous job of providing relief to the desperate earthquake victims. The Kashmir model, when combined with lessons learned in other civil-military relief efforts, creates a framework in which future successful operations can be executed.

Christopher A. Thoms, Ph.D., Colby College. Email: cathoms@colby.edu; *Nepal's Community Forestry Program: Promise and Pitfalls*

Nepalese Community forestry is one of the world's most ambitious and highly regarded examples of community natural resource management (CNRM). There is considerable enthusiasm for Nepal's community forestry program among government foresters, bilateral aid projects, conservationists, and development workers. Given this high regard, the program is often presented as a model for community-based conservation. As such, critical understanding of the program is important to a broader understanding of comparable CNRM approaches. Building on previous work, in this paper I describe particularities, at the national level, in the history, design, implementation, and outcomes of community forests in Nepal. Briefly, the current community forestry program was developed with the assistance of bilateral donor agencies. A user group approach was piloted and adopted as a way to overcome entrenched, local elite capture of benefits in previous panchayat forestry. Today, community forests are constituted by government foresters who enroll local forest resource users into Community Forest User Groups (CFUG). Even though communities in community forestry are explicitly constructed, government officials and foreign donors frequently "black-box" CFUG communities - ascribing them a false homogeneity. Once formed, Community Forest User Groups have rights of access, use, and exclusion, but no rights of tenure to their forestland. The government's user group formation process, supported in part by foreign financial and technical assistance, reflects and exacerbates existing divisions within communities, leading to or at least maintaining user group domination by local elites. Outcomes are mixed, with the potential for poverty alleviation limited but forest conservation being generally successful.

Curtis N. Thomson, Croft Institute for International Studies. Email: cthomson@olemiss.edu; *Environment, Development, and Environmental Security in Cambodia*

Countries of the developing world face constant dilemmas surrounding the allocation of their limited fiscal resources, the protection of their environment, and the pressing desire for economic growth. Although perhaps better off than many of the world's least developed countries, Cambodia's abundant natural resource base is rapidly being depleted. This study assesses environmental security threats to Cambodia as a result of population pressures, resource demands from its neighbors, and government policies and actions which serve to undermine the sustainability of the country's environment. Rapid population growth, illegal Vietnamese immigration, and questionable business practices are pushing both the agriculture and fishing industries to levels which are not sustainable. Although there is a relatively high proportion of forest cover in the country, current logging practices will deplete the high-value forests within the coming decade. Fisheries provide the most important source of animal protein in the country, but they are now at a point of diminishing per-capita catch. Effective management of these resources could allow them to be maintained at sustainable levels; however, while there is a minimal level of environmental laws and regulations in the country, the capacity or will to enforce them is inadequate.

Keywords: Environmental sustainability, environmental policy, corruption.

Craig Thorburn, Monash University. Email: Craig.Thorburn@arts.monash.edu.au; *The Arthropod Revolution: Community IPM in Indonesia*

Indonesia's rice intensification program is the country's single most important development effort of the past four decades. In 1965, Indonesia was the largest importer of rice in the world. Only twenty years later, the country achieved technical self-sufficiency in rice, representing a major success story for 'green revolution' seeds and technologies. Soon after achieving self-sufficiency, Indonesia began experiencing serious outbreaks of rice brown planthopper (BPH), destroying hundreds of thousands of hectares of crops. BPH is a classic insecticide-induced resurgent pest. There is no evidence to show that increased insecticide use leads to measurable increases in rice yields. In spite of this, more pesticides are applied to rice than any other crop grown. The ecological complexity of wet-land rice agro-ecosystems is unrivalled by any other in the world, with arthropod species surpassing that of most natural temperate systems. Spraying kills generalist predators, allowing rice pests to flourish. The Indonesian National Community Integrated Pest Management (IPM) Program, initiated in 1989, promoted an entirely different approach of working with farmers to find solutions to rice "pest problems." The Farmer Field School model combines concepts of adult non-formal education and an agro-ecosystem approach, enabling farmers to make management decisions based on observation and analysis. Even more impressive than the IPM Program's remarkable technological achievements - in terms of reduced pesticide use and increased yields - are the

sociopolitical shifts that have taken place as the IPM 'movement' transforms the way rice is grown.

Casey Thornbrugh, MA, PhD student, University of Arizona. Email: caseyt@email.arizona.edu; *Global Climate Change & Implications for Native American Communities of the Southwest*

Arctic Indigenous communities are experiencing impacts of climate change on cultural resources and traditional subsistence economies. Research projects in Arctic communities using applied traditional ecological knowledge (TEK), and quantitative methods have placed Arctic communities in the forefront in developing culturally relevant mitigation strategies. Scant research exists on the current and anticipated effects of climate change in American Indian/First Nation communities over the U.S. lower 48 states and southern Canada. A meta-analysis was done to examine the current and anticipated impacts of 21st Century climate change in American Indian communities focusing on the Arctic, the U.S. Southwest, northern Great Plains, and the Atlantic Eastern Seaboard. Peer reviewed articles, American Indian media sources, interviews, international agreements, and legal documents were used to assess the current and anticipated impacts of climate change, the mitigation strategies to climate change, and the development of renewable energy sources across Indian Country. In the Southwest and northern Great Plains severe droughts affecting agriculture, water availability, and cultural resources have initiated the development of drought response plans and the development of wind and solar energy in communities. On the Atlantic Eastern Seaboard development, urbanization, and pollution have, historically been the highest stressors on cultural resources. However, anticipated increases in sea level and concern for existing culturally important plant and animal species have generated interest in developing climate change mitigation. Disseminating information on climate change projections, applying traditional ecological knowledge, and planning for climate change will be essential actions to ensure cultural resources for future generations across Indian Country.

rod_thornton@institute.redlands.edu; *Geographic Database for the Santa Ana River Trail*

A Geographic Database for the Environmental Analysis of the Santa Ana River Corridor The Santa Ana River is the largest river system in Southern California and it flows to the southwest in an arc from the San Bernardino Mountains to the ocean at Huntington Beach. Since 1915, when the idea for a recreational trail paralleling the river originated, the watershed has been under relentless encroachment by urban growth. Despite this pressure, the vision of the trail has grown as well. Its supporters now embrace the concept of a recreational parkway: The Santa Ana River Trail (SART). When complete the trail will serve multiple uses by providing public access into open space areas that can withstand human activity such as hiking, bicycling, equestrian use, camping, environmental education, and health and fitness. Additionally its supporters plan to provide interpretation of the Inland Empire's rich history and natural environment. Ultimately, the trail will parallel the river from its headwaters at the Pacific Crest Trail to its mouth at the Pacific Ocean at Huntington Beach. The purpose of this study served to create a geographical database to improve data access and analysis capabilities for research from all entities (governmental agencies, advocacy groups, etc) involved with the SART planning process.

Thomas Thornton, Portland State University, Anthropology. Email: tthornto@pdx.edu; *Conflicting Topophilias and Historias: Parks and Indigenous People in Southeast Alaska*

At heart most disputes between indigenous people and non-Native managers and constituents of parks and protected areas stem from strong affective ties to place based on opposing constructions of space and time, or more precisely, conflicting topophilias (loves of places) and historias (atlases of now and then). Much of the literature to date has confined itself to conflicts over material resources, which often elides this more fundamental time-space dimension to indigenous-state tensions in parks that goes well beyond resource management to notions of progress, ethics, and metaphysics. Drawing on the pioneering work of Yi Fu Tuan, Anthony F.C. Wallace, and others, as well as my own ethnographic research in three Southeast Alaska National Parks, I examine how conflicting topophilias and historias have played out in contemporary disputes over management of both natural resources (bird eggs in Glacier Bay National Park) and historical resources (Russian and stampeder colonial heritages in Sitka National Historical Park and Klondike Gold Rush National Historical Park). In particular, I evaluate why some Tlingit communities have proven more effective in realizing their senses of place and time within parks than others, and draw lessons for the future development of indigenous-park relations based on these

three case studies.

Jocelyn Thorpe, PhD Candidate, York University. Email:

jthorpe@yorku.ca; *Moose head guaranteed: 'Indian' guides, white tourists, and the politics of race and nature in Temagami, Ontario*

In the late nineteenth century, only a few tourists made it all the way to Lake Temagami to experience canoe trips guided by members of the Teme-Augama Anishnabai, the Aboriginal inhabitants of the area. But by 1905, Temagami had become a prominent tourist destination for upper class white Canadians and Americans, and guides were in such high demand that Aboriginal people came from other areas to work as guides in Temagami. White men, and occasionally white women, wrote about their trips in popular magazines like *Rod and Gun*. They devoted many pages to 'the Indian guide,' representing him not only as singular and male, but also as inhumanly strong, instinctively knowledgeable about the ways of nature, and the key to the success of a wilderness vacation. Writers urged fellow tourists to secure an Indian guide, for as well as paddling, portaging, cooking, and preventing tourists from becoming lost, the guide was said to guarantee tourists a good look, and a good shot, at a moose. This paper examines early twentieth century relationships among guides, tourists, and the Temagami 'wilderness' by analysing tourist literature and the oral histories of members of the Teme-Augama Anishnabai. I argue that while these encounters were full of contradictions and ambivalences?particularly when guides refused to fulfill their prescribed role as subordinates?the encounters themselves and the stories told about them in popular magazines played a fundamental role in constructing Temagami as a white space of national nature, and of rendering illegible Teme-Augama Anishnabai claims to land.

thrall@geog.ufl.edu; Phillip A Morris, Graduate Student, Geography, University of Florida. Email: morrispa@ufl.edu; *Business Geographic Analysis For Colleges And Universities With An Example Of St. Petersburg College, Florida*

Geographic analysis has been adopted by businesses, especially the retail sector. Higher education can receive the same benefits as have businesses by adopting business geography analysis and technology. The commonality between business geography and institutional research for higher education is that both have trade areas, both provide services to clients (students), and clients can be geographically identified by their addresses as well as their psychographic profile. Among the valuable information that institutions of higher education can create using business geography are psychographic profiles of the student body, commuting patterns, and potential enrollment based upon the underlying demographics of the institution's trade area. A benefit of this analysis is the ability to anticipate the needs of the market. Understanding these geographic characteristics can assist in evaluating institutional objectives, and identify constraints on implementing these objectives. St. Petersburg College, Florida, data is applied to illustrate these concepts.

Yong Q Tian, University of Massachusetts - Boston. Email:

yong.tian@umb.edu; *Spatial and temporal modeling the fate and transport of dissolved organic carbon (DOC) from landscapes to coastal waters*

Marine dissolved organic carbon (DOC) is one of the largest reservoirs of organic carbon (about 680 gigatons) at the Earth's surface. However, the dynamics of carbon cycle at the land-sea interface are not well understood due to complex mixing processes, multiple sources of organic carbon, high biogeochemical reactivity in estuaries, and a lack of the high temporal and spatial resolution data needed to assess these fluxes at a global scale during times of rapid (decadal) changes in source and transport mechanisms. This presentation introduces an integrative modeling approach to quantify the sources and transport mechanisms of DOC in the coastal oceans. Dissolved organic matter (DOM) in seawater is one of the largest reactive reservoirs of carbon on earth. The fraction of the DOM that absorbs light is called chromophoric or colored dissolved organic matter (CDOM). Under certain conditions, CDOM can be used as an indicator for DOC concentration. This paper discusses two study results: 1) in situ measurements of freshwater CDOM endmember variability due to watershed and rainfall properties and seasonal cycling; and 2.) use a GIS approach to develop a predictive model of CDOM sources from terrestrial watersheds and groundtruth the predictive model in watersheds of various sizes.

Keywords: colored dissolved organic matters

Michael Tiefelsdorf, U of Texas at Dallas. Email: tiefelsdorf@utdallas.edu; Jielai Ma, . Email: forgp2002@yahoo.com; Jennifer Hubenig, . Email: jmh055000@utdallas.edu; Eigenvalue Spectra Approximations of Spatial Link Matrices

Spectra of eigenvalues from spatial link matrices have broad applications in statistical analysis of spatial data. While the largest and the smallest eigenvalues are functionally linked to the possible limits of stationary spatial processes, the full set of eigenvalues allows the examination of spatial autocorrelation statistics and the calculation of maximum likelihood estimators. Technical and numerical impediments, though, make the exact evaluation of eigenvalue spectra for large tessellations beyond several thousand observations infeasible. This research focuses on the approximation of eigenvalue spectra of spatial link matrices first by identifying the smallest and largest eigenvalue and second by filling in the remaining eigenvalues with a mixture of beta distributions. Parameters of the mixture of beta distributions are linked to particular characteristics of empirical and regular spatial structures in their different coding schemes. In addition, numerical aspects are addressed such as utilizing the sparsity of the spatial link matrices and the implementation in high level statistical software packages.

John P. Tiefenbacher, Texas State University. Email: tief@txstate.edu; Hazard in Space, Geometry and Landscape: The Role of Visibility, Design and Speed in Water Crossing Hazards in the Hill Country of Texas

Since 1950, more than 250 people have died (and many others rescued) in Texas when their automobiles unexpectedly encountered flooded roadways. Though the "low water crossing" on Texas roadways has analogies in other parts of the U.S., the phenomenon is ubiquitous in the karst topography of the Hill Country region and presents particularly unique challenges. This paper reports the results of a project to study a four-county portion of the Hill Country to map and evaluate the risk and hazard of 196 crossings. Particular emphasis is on the evaluation of vulnerability of drivers in a three-dimensional context of the crossings. Using field-collected data in combination with LIDAR and statistical analysis, this paper highlights the roles that road design (slope and linearity), travel speed, and visibility play in the production of hazard.

Keywords: hazards, transportation, floods, Texas

Bryan Tikalsky, Brigham Young University. Email: bryan_tikalsky@yahoo.com; Matthew F. Bekker, Dr., Brigham Young University. Email: matthew_bekker@byu.edu; A Millennial-Scale Precipitation Reconstruction for the Wasatch Mountains near Salt Lake City, Utah

Mountain water resources are essential to those living along the Salt Lake City urban corridor. This study seeks to better understand variability of mountain precipitation in this region on a millennial time scale by utilizing dendrochronology. It is the first climate reconstruction of its kind for this region. A GIS model was used to identify potential sampling sites where tree growth would be sensitive to climate. We obtained over eighty samples from ancient limber pine (*Pinus flexilis*) and Douglas-fir (*Pseudotsuga menziesii*) to perform the reconstruction. Results indicate significant correlation between tree-growth and precipitation from both the current and previous years. They also show a significant inverse correlation with early-summer temperatures in both the current and previous year, indicative of sensitivity to snowpack and soil moisture.

Keywords: Biogeography, Dendrochronology, Climatology, *Pinus flexilis*, Wasatch Mountains, Utah

Karen E Till, Associate Professor of Geography, University of Minnesota. Email: ktill@umn.edu; Julian Jonker, Department of Private Law, University of Cape Town. Email: julianjonker@gmail.com; Thanatopolitics and Transition: Haunted Archaeologies of the Postcolonial City

Prestwich Place was one of many construction sites in the heart of Cape Town, South Africa, until the skeletal remains of more than 1400 slaves and members of the colonial lower classes were unearthed by unsuspecting construction workers in 2003. The unearthing of human remains at Prestwich Place gave rise to discussions about the priority of property rights and urban renewal over ancestral burial site; soon disputes emerged about what should count as national heritage, and whose knowledge and interpretations of human remains should be privileged when evaluating claims to descendancy and belonging. In this paper, we argue that postcolonial sites constitutively marked by violence and injustice might be better understood through their spectrogeographies. By mapping the memorial cartographies and haunted archaeologies of Prestwich Place, we explore the spatial contours of a city historically inscribed through the legal management of death. This colonial thanatopolitics resulted from an excessive biopower that not only regulated life, but also the dead through the spatial management of the very corpse of the colonial subject. The recent 'discovery' of Prestwich Place thus disrupted established zones of social belonging in the contemporary city by invoking repressed pasts, allowing descendants of slaves

and apartheid subjects to reimagine how they might inhabit the urban spaces from which they and their ancestors were displaced.

Benjamin F. Tillman, Ph.D., Texas Christian University. Email: b.tillman@tcu.edu; From Tahiti to Trujillo: An historical geography of the breadfruit tree's Caribbean dispersal.

This study examines the breadfruit tree's Caribbean dispersal. During the late 18th century the British commissioned Captain Bligh to transport breadfruit trees from the South Pacific to feed the slave population of the West Indies. Bligh's first attempt to bring breadfruit to the West Indies failed when his mutinous crew tossed the trees overboard after gaining control of the H.M.S. Bounty. Bligh's second voyage, lasting from 1791-1793 on the H.M.S. Providence, was successful. After retrieving 2,126 breadfruit trees from Tahiti he sailed to the West Indies, arriving at Kingstown Bay, St. Vincent, January 23, 1793, and in Port Royal, Jamaica, on February 5, 1793. Historical documents deposited in the Royal Botanic Garden in Kew and the National Archives in London give a general picture of the breadfruit tree's subsequent diffusion to other Caribbean locations. Breadfruit trees were immediately distributed to plantation owners in Jamaica and St. Vincent, and were subsequently introduced to other British possessions within the next few years. Breadfruit was also introduced to the east coast of Central America no later than 1801, at Trujillo, Honduras. Ironically, breadfruit was initially rejected by the very same slave population it was intended to feed. The non-native tree ultimately spread throughout the Caribbean and today its fruit is an essential part of the diet in many countries, especially in rural areas.

Michael Timberlake, University of Utah. Email: timber@soc.utah.edu; Xiulian Ma, University of Utah. Email: xiulian.ma@soc.utah.edu; Shanghai's Increasing Centrality in Airline Passenger Networks: The Making of a 'World City'

One finds important world cities in all major economic regions, and we expect dynamic regions, such as China, to have cities that become increasingly important to the overall network of world cities. Which cities in China are emerging as important world cities? How do they compare to other cities in the global system of cities? Are there dynamic tendencies that suggest what future patterns will be? This research contributes to answering these questions, and in the course of doing so it contributes to the debates on which of China's great cities is its leading "global city." Our formal network analysis of air passenger flows shows that over the past twelve years, Shanghai has gained steadily on Beijing to finally become the leading city in China. We also examine Shanghai's position in the global system of cities, showing how it has become increasingly central to this network as well. Over the past sixteen years, both Beijing and Shanghai have become more globally central. Between 1995-2000, Beijing and Shanghai climbed from about 160 and 195 (of more than 300 large cities in the world) to about 40th and 60th, respectively, in 2000. Over the next 5 years, both cities rose to join the top 20 -30 cities, and Shanghai finally replaced Beijing as the leading Chinese world city. Both cities rose from the periphery to the semi-periphery (or semi-core) position in the world city network. We interpret Shanghai's rise in the global network of cities through the lens of world city research.

Benjamin F. Timms, Cal Poly. Email: btimms@calpoly.edu; Rebalancing the Peasant Ecology? Responses to Relocation from Celaque National Park, Honduras

In traditional peasant studies the survival of the peasantry is threatened by capitalist primitive accumulation which leads to semi-proletarianization and, eventually, full proletarianization through social differentiation. Here the study of peasant groups is expanded through the theoretical framework of peasant ecology, which ties the traditional peasant social relations of production with their ecological relations of production. It is argued the nexus of these relations is the key to the survival of the peasantry and upsetting the balance leads to environmental degradation and social impoverishment. As the global environmental movement, and its' practice of exclusionary nature protection, becomes increasingly involved in the global political economy it serves as a powerful vehicle for a new round of primitive accumulation. The practice of exclusionary protected areas can disrupt the peasant ecology of excluded groups, resulting in ecopolitical conflicts antithetical to the goals of protected areas and the socio-ecological situation of the peasantry. However, structural forces responsible for the imposition of exclusion have left niches through which peasant agency can be applied to resist social and ecological degradation. In this paper strategies employed by peasant groups relocated from Celaque National Park, Honduras serve as examples of such resistance. Peasants are not simple recipients of

structural changes, they are actively attempting to resist and survive through exploiting the spaces left available to them in the process.

Abbie Hilary Tingstad, M.Sc., University of California - Los Angeles. Email: abbiel@ucla.edu; Glen M. MacDonald, University of California-Los Angeles. Email: macdonal@geog.ucla.edu; *Perspectives on drought across the Uinta Mountains, Utah: Evidence for climatic variability and implications for the prediction of widespread drought in the American West*

The Uinta Mountains are an east-west trending range located in the northeastern corner of Utah and are a source area for the Green River, which, in turn, feeds the Colorado River. Given their geographical position and importance to the water budget in the western United States along with the availability of fairly substantial instrumental and proxy climate data archives for the area, the Uinta Mountains afford a unique opportunity to study both drought on inter-annual to multi-centennial timescales as well as climatic processes such as the North American Monsoon and Pacific frontal activity that affect moisture delivery to areas in the western United States. Multi-centennial chronologies based on ring-widths from drought-sensitive *Pinus edulis* and *Picea engelmannii* demonstrate the presence of recurring severe drought ($PDSI < -3$) along with variability associated with the El Niño/Southern Oscillation (ENSO), the Pacific Decadal Oscillation (PDO), and changes in the strength of the North American Monsoon. These chronologies also highlight environmental changes associated with the continental-scale mega-drought that occurred during the mid- and late-1600s and the Little Ice Age (ca. 1600-1850). Instrumental data for precipitation and stream flow are used to test the hypothesis that the east-west trend of the Uintas shifts monsoonal and frontal precipitation to the West. Seasonal precipitation maps derived from weather station data for the 1982-1983 and 1997-1998 ENSO events indicate that these climatic 'anomalies' impacted precipitation patterns across the Uintas, in some cases augmenting moisture differences across the range.

Keywords: Dendroclimatology, drought, Uinta Mountains, ENSO, PDO, North American Monsoon

Chetan Tiwari, University Of Iowa. Email: chetan-tiwari@uiowa.edu; *Spatial Data Handling Challenges in Developing a GIS-based Disease Surveillance System for Environmental Health*

Disease surveillance is the process of reporting, collecting, analyzing and exchanging information about diseases with the objective of planning and managing control and prevention activities. An important component of this process is the ability of surveillance systems to manipulate and analyze large volumes of disparate geospatial health and environmental hazard data. Although high quality data is increasingly being collected, current surveillance systems have limited capabilities to process and analyze such data in a manner that is generalizable across different geographical regions and different kinds of environmental hazards. Developing such generalizable systems not only requires new strategies for storing geospatial data, but also methods of representing knowledge about those data within the system. In this presentation, I address these issues of spatial data interoperability and knowledge representation for the purposes of developing a disease surveillance system for environmental health that is capable of (a) integrating disparate spatial data from existing data repositories, (b) capable of modeling different kinds of environmental hazards in many different environments, and (c) providing tools to help determine relationships between disease outcomes and environmental hazards.

Keywords: Disease Surveillance, Environmental Health, GIS

Phuc Xuan To, Humboldt Uni. Berlin. Email: txphuc2001@yahoo.com; To Xuan Phuc, Humboldt University Berlin. Email: txphuc2001@yahoo.com; *Rural Producers and Urban Consumers in Vietnam*

In the late 1980s, the Vietnamese government decided to implement the renovation policy by which it shifted central-planning economy to market-oriented one. The Land Law issued in 1993 mandated the state to allocate land previously controlled by the state to local households. The Law profoundly expands the scope of rights and the duration of such rights for local people. It is expected that the Law would enable local people to pursue long-term benefits from the land. A combination of the Law and market economy has substantially changed meanings of agricultural land in the uplands. In this paper I examine local process of these changes in two Vietnamese upland villages and study effects of changes on property relations. I argue in this paper that changes in meanings of agricultural land in the villages have constituted new sets of actors who are highly differentiated in productive resources and capacity. In the process of changes, some of them become better off, some are lagged far behind. These actors have responded differently to market opportunities. Changes in meanings of the land have strong effects on property relations in the village. They have resulted in social differentiation and resource conflicts among households in the villages.

Gerard Toal, Virginia Tech. Email: toal@vt.edu; *The Denial Of Bosnia-Herzegovina: Serbian And Croatian Geopolitical Traditions Before The 1992 War.*

This paper reviews the different geopolitical visions of Bosnia-Herzegovina in the geopolitical culture of Serbia and Croatia before the 1992 war. It seeks to demonstrate that these cultures were characterized by different geopolitical traditions but a similar modernist geopolitical imagination that reduced human places to fixed ethno-governmental objects. Most traditions denied that Bosnia-Herzegovina was a distinctive and unique space capable of its own independent existence should Yugoslavia break apart. Intellectuals, however, varied in their conception of what should happen to Bosnia, with some advocating complete assimilation while others advocated various partition plans and population exchanges.

Waldo R. Tobler, PhD, Doktor Honoris Causa, University Of California, Santa Barbara. Email: tobler@geog.ucsb.edu; *Distortion Properties of a Portolan Chart*

Several methods have been used to examine "The Enigma of the Portolan Charts". The principal question is to estimate how they were constructed, since they are apparently of high accuracy, yet they were produced from the thirteenth century on. A related question is to measure their accuracy and to replicate the projection used. Approaches to the latter question have included guessing the projection, usually a conformal one, interpolating a quadrilateral grid for a visual estimate, least squares fitting to variants of known projections, and attempts at constructions from empirical observations. In this paper numerical values from Tissot's indicatrix are used to infer properties of a portolan chart from 1482, in the hope that this will provide hints as to its construction.

Diana Todd, Montgomery College. Email: dltodd@erols.com; *Examining A Sports Hegemony: Sweden's Domination of Orienteering*

Ever since the sport's inception in the early 1900's, Sweden has dominated the sport of orienteering. While the U.S. regularly produces world champions in other individual sports, such as swimming, gymnastics, and skiing, no American has ever won an international orienteering title. What does Sweden have that the U.S. does not? In examining Sweden's dominance of international orienteering competition, seven factors were compared to a measure of national orienteering success for 46 member nations of the International Orienteering Federation (IOF). The seven factors were: number of orienteers, percent of the population who orienteers, density of orienteers, number of orienteering clubs, age of the national orienteering federation, number of IOF ranking events held in the country in 2004 & 2005, and distance from Sweden. The age of the federation and the number of IOF events showed the strongest correlation with orienteering success, as measured by the coefficient of determination (r^2).

Taiko Todokoro, Ritsumeikan University. Email: lg007999@lt.ritsumei.ac.jp; A role of traditional local colors in urban landscape formation: a comparative study of streets having different regulations in central Kyoto

This paper explores features of urban landscape in colors and a role of colors in urban landscape formation focusing on appearances of buildings and on efforts based on the local government and on residents. To clarify distinctive features of urban landscape in colors, this paper discusses the distribution of traditional local colors. They can be defined as the colors that are geographically and historically fostered in the locality, reflecting local nature, culture and society. They are frequently used in traditional buildings. The main findings are summarized as follows: The urban landscape in colors is determined by (1) location, (2) historical context, (3) laws and regulations, and (4) inheritance systems of traditional local colors including building materials and building construction methods. The sequence of landscape in the physical form of buildings has been disappearing in the course of urban renewal after World War II. Focusing on the appearance of buildings modeled on traditional ones, however, the sequence of landscape has been complemented by traditional local colors used on its building materials and exterior colors. In addition, it is possible even for areas lacking physical sequence to keep some visible sequence and regional characteristics to a certain degree when traditional local colors are used on exterior colors and color harmony is maintained. The use of these colors makes it possible to create regional unity of urban landscape based on the situation in each area. Inheritance and innovation of traditional local colors should be utilized more to reconstruct and enhance regional characteristics.

Keywords: urban landscape, traditional local colors, regulation, resident awareness, Kyoto

Helmuth Toepfer, University of Bonn. Email: toepfer@giub.uni-bonn.de; Changing socioeconomic structures in Japan

In modelling the regionally differentiated structures in Japan three decisive steps were taken. The first step consisted of a factor analysis to find the variables with most information. The second step consisted of an elaboration of the best combination of variables to find the regions of different development potentials, and the third step was a cluster analysis of the combination of variables in order to get different types of communities. The pathway model presented here shows in his centre those two variables which can indicate the dynamic of today and the development potential for the future: a) the proportion of the population at the productive ages between 20-54 years, and b) the employment trend overall between the last two censuses. It can be shown that large areas of the region under examination are included within the zones with stagnating communities lagging behind the dynamic communities. The pre-eminent centres (Tokyo, Nagoya, Osaka), but also a lot of smaller centres are the points of departure for strong development; but almost all of them have relinquished the very top levels of growth to their surrounding communities to a greater or lesser degree. On the other hand this dynamic causes the distant hinterland to become zones of weakness in terms of their socio-economic development. This can be shown by different variables, e.g. population density, population change, average age, percentage of one-person households, importance and development of primary, secondary and tertiary sectors' employment, development of jobs in all sectors, etc.

Nebahat Tokatli, New School University. Email: tokatlin@newschool.edu; Unpacking Asymmetry and Dynamism in Networks: in the Words of Turkish Clothing Suppliers

In this paper, we are interested in the changing power relationships between European clothing buyers and their Turkish suppliers, as both try to adjust to the current seminal change in the culture of fashion from ready-to-wear to fast-fashion. The focus is on the manner in which decision makers in supplier firms verbalize their relationships with their buyers. The fieldwork includes open-ended interviews with 30 suppliers and key informants in Turkey - the second largest clothing supplier of Europe after China. The majority of the interviewees are full-package suppliers of European buyers such as the British Marks & Spencer and Next, the Spanish Zara, and the Swedish Hennes & Mauritz. After briefly setting the scene, both in terms of the conceptual framework and the local context, we allocate most of the paper to quotations from the interviewees themselves. The idea is to understand what the suppliers' own vocabulary highlights with respect to their asymmetrical yet dynamic relationships with their buyers at a time when Turkey tries to adjust to fast-fashion principles.

Keywords: Economic geography, globalization, clothing industry, buyer-supplier relationships, supply chains, power, Turkey

Brian Tomaszewski, The Pennsylvania State University. Email: bmt139@psu.edu; Awareness in Asynchronous Geocollaboration

Inherent to all forms of collaborative activity are basic elements that need to be available to and shared between individuals and groups. These elements include a sense of co-collaborator presence, which resources (such as tools, data, and functions) are available to the individual and the group, what co-collaborators attitudes, goals, and expectations are, how the plan and execution of work is achieved over time, and what relevant information is known within the group. Many of these foundation collaboration elements revolve around themes of awareness. Much research has been conducted on awareness in virtual, real-time collaborative systems. However, less work has been done on awareness support in asynchronous systems. Furthermore, few geocollaboration systems consider or support asynchronous awareness. Awareness support is needed so that co-collaborators can make sense of information that is inherently fragmented as a result of asynchronous interaction processes. A practical example of this can be found in long-term, disaster recovery efforts where situation awareness is derived from information about actions of collaborators and real world events developed over long, asynchronous time spans, especially as collaborators enter and leave the situation. This paper will first address how standard asynchronous awareness issues such as temporal fragmentation and maintaining common ground can and need to be considered with the unique geographical awareness issue of spatial fragmentation in order to maintain individual and group awareness in asynchronous geocollaborative process. Finally, preliminary results of geospatial and temporal interaction techniques and methods being designed to support awareness in asynchronous geocollaboration will be presented.

Melanie N Tomintz, University of Leeds. Email: m.tomintz05@leeds.ac.uk; Graham P Clarke, University of Leeds. Email: g.p.clarke@leeds.ac.uk; Jan Rigby, University of Sheffield. Email: jan.rigby@sheffield.ac.uk; Using Spatial Microsimulation and Location-Allocation Models to find Optimal Locations for Smoking Cessation Services in Leeds

Finding optimal locations for health care service provision is a constant concern of health geography. This study focuses on smoking and smoking cessation services as smoking is a very important and topical issue in the UK and the target is to reduce 9% (55,000) of smokers in Leeds (study area) by 2010. Smoking cessation services are supportive for people willing to give up and therefore it is necessary to locate such centres in the most appropriate locations. Location-allocation models have typically been used to site facilities based on some estimate of small area demand. However, identifying demand is often a non-trivial exercise making facility location challenging. In this paper four scenarios are modelled at Output Area level based on smoking estimates for different population groups. The preliminary results show that there is need for facilities in the eastern and northern part of Leeds. A road network and demand estimations based on individuals using the methodology of microsimulation will build more sophisticated location-allocation models and various what-if scenarios will be useful and supportive for future planning decisions.

Kyla Tompkins, Pomona College. Email: kwazana@pomona.edu; Watch Your Tongue: Race, Speech, Food and the Antebellum Kitchen

My paper focuses on the ground zero of American food culture: the kitchen. Although many feminist critics have discussed the kitchen as a site from which nineteenth-century feminist politics may be abstracted, I see the kitchen, both literary and actual, as a space whose politics must be analyzed in terms of its excessive physicality. It is a space of blood and guts, plucked chickens and cooked tongue, rancid and sweet butter, rising bread and fermenting beers, and other items only semi-formed on their way to the site of ingestion, be it dining room or kitchen table. It is also the space where the embodied politics of the public sphere are most visible: the sometimes violent class- and race-based confrontations between mistress and servant, or slave; the economics of what is available and affordable; the cultural politics of who gets to eat what. In particular I examine the under-treated work of Robert Roberts, the free African-American servant who published the House Servant's Manual (1827). Roberts' text discusses the role of the cook at length, and in particular narrates a close association between training the cook's palate (or tongue) to discern flavor and training her to keep insubordinate gossip - kitchen talk - to a minimum (or, in other words, to "watch her tongue"). Food language is associated with vernacularity, base orality and consumption; at the same time, the cook's mouth becomes a metonym for the subversive and punitive power of the kitchen.

Marla Torrado, Syracuse University. Email: mjtorrada@maxwell.syr.edu; Making way to the interior: Effects of road construction on Amerindian communities of Guyana

Guyana embodies a unique country, characterized by a complex political history and environmental richness. Indians, Afro-Guyanese and Amerindians share this land, having a vast concentration of population in the coast and capital, Georgetown. The Amerindian population, composed mainly of Makushi, Wapishana and Wai Wai, is distributed throughout the west and south of the country, occupying both savanna and forests environments. This paper focuses on the southern part of the country, the North Rupununi savannas. Sixteen Makushi communities inhabit the vast savanna and forest patches of this region. Even though these communities maintain a close relationship with their surrounding environment, the construction of the road that connects Georgetown to Lethem, fourteen years ago, has brought changes in both the environment and lifestyle of these Makushi communities. This paper attempts to identify the environmental impacts of the road, looking at the current land cover of the communities and performing different spatial analysis for susceptibility. Remote sensing was used to identify the current land cover of the area, using GPS data points gathered during field work to develop a land cover classification. Functions like proximity to roads and buffer zones, to mention some, were used in order to understand the possible threats and impacts to the different environments of the region.

Alicia Torregrosa, United States Geological Survey. Email: atorregrosa@usgs.gov; U.S. Geological Survey Ecosystem Mapping Initiative

Conceptually, ecosystems are mappable, co-occurring assemblages of plants and animals that have evolved to share common ecological processes and biophysical characteristics. Practically, ecosystems have been viewed as unique abiotic environments that support a particular land cover type. Mapping ecosystems has traditionally been a labor intensive process that relies on the application of some classification schema designed to spatially discriminate one ecosystem from another. Because various classification methods and schema have been used, there is no single nationally consistent approach to mapping the ecosystems of the conterminous United States at spatial scales finer than large ecoregions. To address the need for a framework to scientifically monitor landscape trends across the nation and provide a baseline from which to calculate ecosystem services, the U.S. Geological Survey is producing a standardized map for the conterminous 48 states delineating meso-scale (10 to 1000 km²) ecosystem units at 30-meter resolution. A key component for performing this mapping is establishing, classifying, and reviewing bioclimate, surficial geology, landforms base data layers and synthesizing them into abiotic environmental units. The environmental "footprints" are combined with land cover into ecosystem footprints and then labeled using the NatureServe terrestrial ecological classification system, a nationally recognized system used by the LandFire and GAP Programs. Review of the methodology and applications are being conducted in the Great Basin, Mississippi Alluvial Valley, and Prairie Potholes regions.

Marko Tomic, McGill University. Email: marko.tomic@mail.mcgill.ca; Robert Bonnell, McGill University. Email: robert.bonnell@mcgill.ca; The Effects of Surface Runoff on Reef Water Quality in Barbados

Nearshore pollution from surface runoff is a known factor leading to the degradation of coral reefs, and has been suggested to have contributed to the degradation of reefs in Barbados. Increased turbidity restricting the passage of light to the substrate and smothering due to sedimentation restricts coral growth. Surface runoff was monitored for various storms during the wet season of 2007 in Barbados. Monitored water levels and velocity profiles were used to calculate discharge, while grab samples were taken and analyzed for turbidity, total suspended solids, nitrates, and phosphates. Discharge data was used to calibrate a hydrological model, TR-55, while the concentration of effluents has led to estimates of pollutant loads. Following storms, the nearshore reef waters were sampled for turbidity, total suspended solids, and chlorophyll-a to better understand the passage and time of dispersion for this pollutant input.

Matthew Townley, Texas State University - San Marcos. Email: townley_m@gmail.com; Votes and Values: Ohio in the 2004 Presidential Election

The 2004 presidential election was widely reported to have turned on issues of values and morality. A casual glance at any choropleth map of county returns (the now well-known "red" and "blue" map) suggests a sharp spatial dichotomy between urban and rural election districts. Because popular perception suggests an alignment with traditional values among the rural populations, it is tempting to conclude that urban populations are less inclined toward behaviors consistent with traditional values such as stable marriages and sobriety. This study focuses on county-level data indicators of "immoral behavior" such as births out of wedlock, divorce rates, STD infection rates, and drug use data for the state of Ohio during the years preceding the 2004 election. Ohio was chosen for its status as a "swing" state and its relative independence from each of the candidates. The study uses ArcGIS to create visualizations of various combinations of explanatory variables of "immorality" over which the 2004 election returns are draped. The results show some surprising disconnects with the clear red county/blue county dichotomy and its putative referendum on traditional values.

Leeann Townsend, MA York University, . Email: leeannt@yorku.ca; Moving Past the South Korean and Japanese Governmental Impasse in the 1990-2006 redress movement for the 1930-1945 Imperial Japanese 'Comfort Women' Prostitution System: Strategies for Action?

Offering a public admission of guilt and remorse has the potential, as Mark Gibney and Erik Roxstrom state, to change behaviours and ensure that the same mistakes are not made in the future (2001, 935). Stanley Cohen, on the other hand, argues that some governmental "acknowledgements" co-opt the issue for the benefit of the state while further victimizing the parties involved (2001, 249). In the case of the Japanese government's and the South Korean government's calculated handling of the 1990-2006 redress movement for the 1930-1945 Imperial Japanese military's 'comfort women' prostitution system: what would it mean for the current Japanese government to apologize for the previous Imperial Japanese government's wrongdoings? How do the power dynamics between countries shape transnational state apologies? What makes for an acceptable atonement? Who decides this? When considering that appeals to both the Japanese government and South Korean government for redress for the systematic sexual violence committed during World War Two (WWII) have been resisted, trivialized, and even ignored for more than sixty years now, researchers and activists must ask what this culture of impunity means for current domestic gender relations, the status of women throughout Asia, security issues, the

Japanese and South Korean states, and the international community. This paper will examine these very pertinent issues and will speculate here on the ways in which Japan and South Korea could begin to confront their roles in this period of militarized prostitution in a meaningful way

Erica Trafton, University of Wisconsin - Milwaukee. Email: etraft@aol.com; Creative De(con)struction in the New Economy: Landscapes of Investment and Disinvestment in the 21st Century American City

Geographers continue to be interested in the process of urban gentrification. This is in part because the process has significantly increased over the past decade. One of the consequences of the process of urban gentrification is a deepening economic and social polarization across central city urban space. Using Milwaukee, Wisconsin as a case study, this paper explores the connections between urban gentrification and socioeconomic polarization. These relationships are illustrated by comparing appreciation in housing values, and per capita incomes at the census tract level. The results of this study confirm that gentrification is indeed resulting in intensifying economic polarization across central city Milwaukee.

Anne Maura Trainor, University of North Carolina - Chapel Hill. Email: atrainor@email.unc.edu; Kenneth R. Wilson, Colorado State University. Email: kenneth.wilson@colostate.edu; Tanya M. Shenk, Colorado Division of Wildlife. Email: Tanya.Shenk@state.co.us; Spatial Response of Preble's meadow jumping mouse (*Zapus hudsonius preblei*) to resource supplementation

Conservation efforts for the Preble's meadow jumping mouse (*Zapus hudsonius preblei*), a threatened subspecies, include habitat restoration. Most wildlife are spatially distributed throughout habitat disproportionately and exhibit site fidelity. This behavior is usually documented for large scale movements and migration. Using radio telemetry, it was discovered that *Z. h. preblei* exhibit site fidelity within riparian ecosystems. Our objective was to determine if *Z. h. preblei* would detect and use supplemental food and cover (simulated restoration) located where the mouse had not been documented for 3 years, thus altering their movement, spatial distribution, and site fidelity behaviors. Through monitoring of radiotagged mice during pre- and post-treatment periods, we documented the mouse's immediate, short-term movement response to the addition of supplemental resources. Results were mixed with only 1 of 11 individuals using a single treatment plot in 2002 compared to 6 of 8 individuals using 50% of the treatment plots in 2003. *Z. h. preblei* use of supplemental resources may have been limited by and affected temporally by a combination of factors including site fidelity, minimal precipitation in 2002 and its potential impacts on habitat, exploratory movements to detect new habitat and elevated predation risk. These results suggest that detection of restored habitat by *Z. h. preblei*, at least in the short-term, may not be certain and underscore the need for direct monitoring after restoration efforts. Significant attention to the spatial arrangement of restoration efforts should be considered to encourage species use and the desired effects such as long-term persistence are attained.

Timothy F. Trainor, U.S. Bureau Of the Census. Email: timothy.f.trainor@census.gov; What Geographers and Cartographers Do At the U.S. Census Bureau

The U.S. Census Bureau employs geographers and cartographers in support of its statistical mission. The type of work performed by geographers varies based on the nature of the required work. A limited example of tasks include: development of geographic area concepts, standards and criteria; management of legal, statistical and administrative boundaries; continuous maintenance of the TIGER database consisting of basic features such as roads, hydrography, boundaries, names, codes, geocoding algorithms, and individual address information; and analysis of patterns of population distribution and redistribution. Cartographers design and develop maps and mapping systems to support statistical data collection, tabulation and dissemination. While most geographers and cartographers work within the Geography Division, some geographers work in other divisions throughout the agency conducting geo-demographic analysis and providing geographic support in a variety of ways. For example, geographers in the Population Division analyze and report on settlement patterns and distributions of population by various demographic characteristics. Geographers in twelve regional offices around the country organize and implement national-level geographic programs including maintaining relationships with tribal, state, and local GIS practitioners. This presentation will offer information on the types of work geographers and cartographers perform at the Census Bureau and the potential job offerings available for the 2010 Census. The presentation will also provide basic information on how to apply for jobs with the Census Bureau.

Keywords: census; jobs; geographic program

Yves Trambly, INRS. Email: yves.trambly@ete.inrs.ca; André Saint-Hilaire, INRS. Email: ; Regional Estimation Of Extreme Suspended Sediment Concentrations In North America

Sediments in streams are considered by The Environmental Protection Agency to be the main pollutants of rivers systems. Extreme suspended sediment concentrations (SSC) possibly carry high amounts of pollutants and are a threat to aquatic life, beyond some thresholds, depending on the species. Extreme events of load, carried during 10% or less of the year, may have a geomorphologic impact on the river channel and highly increase reservoir sedimentation. By adapting some methods used for flood prediction and regionalization based on a probabilistic approach, we estimated extreme suspended sediment concentrations and loads using the physiographic characteristics of the watersheds. The first step performed was an at-site frequency analysis of extreme events and an estimation of return periods for gauged sites. The second step was the delimitation of regions by several statistical or geographical methods then regional estimation within these areas using multiple regressions. A database of 149 hydrometric stations in the USA and Canada with daily SSC and discharge was created. Some regions have a greater density of stations, such as California or North-Eastern States. Watershed characteristics of these stations such as land use, soils parameters, topography, elevation and climate were compiled in a geographic information system. This dataset was used to define homogeneous groups of watersheds based on their physiographic characteristics, in order to proceed to the regional estimation of extreme suspended sediment concentration and loads.

Liem Tran, University of Tennessee at Knoxville. Email: ltran1@utk.edu; Robert O'Neill, TN&A, Inc.. Email: robertoneill4@comcast.net; Watershed-Based Self- and Peer-Appraisal Indices for Integrated Environmental Assessment with a Case Study of the Mid-Atlantic Region

Environmental indicators are often aggregated into a single index in environmental studies. Commonly, an aggregated index is derived in a specific weighting scheme imposed from the outside. The paper presents a novel approach by letting each unit under study choose a set of weights. It applies the concept of self- and cross-appraisal in generating various aggregated indices from two linear programming optimization models. The proposed method is illustrated via a case study of the Mid-Atlantic region. Results show that the derived aggregated indices reveal environmental conditions of the study area in an objective and robust fashion. The proposed method is a valuable tool for integrated environmental assessment.

Scott L. Trapolino, Graduate Student, Delta State University, Cleveland Mississippi. Email: strapolino@hotmail.com; Why is geography education excluded from the Mississippi Delta?

The Yazoo-Mississippi Delta is a needs-based region where education levels of children lag behind state standards. Geography education helps produce better citizens and a deepened sense of place, but is blocked from becoming part of the core curriculum in many delta school systems. It is this author's contention that the lack of topical diversity in education can be correlated with spatial, economic, and cultural segregation. This paper explores how national legislation and local conditions influenced the school systems' and teachers' perceptions of geography as a useful subject in fostering a diverse curriculum in the Mississippi Delta. Included herein is a qualitative analysis of educators' viewpoints who are currently involved with school systems in the Mississippi Delta. Data presented will support the hypothesis that a lack of geography in the curriculum is directly related to the No Child Left Behind Act and similar legislation.

Amy Trauger, Pennsylvania State University. Email: akt122@psu.edu; "Men invited too": The Cultural Politics of Belonging to the Women's Agricultural Network

Activism in, with and through research is increasingly part of feminist praxis, as scholars can find it difficult, if not impossible, to objectively observe injustice when engaging with social change philosophies and progressive social movements. In some cases, however, research subjects actively resist the political project of the researcher and exercise their own agency within the research/activist process. The entirely unpredictable and unexpected outcomes of such activist/research projects can derail the project and leave researchers with few resources to cope with the results. This paper uses a case of identity politics in the development of the Pennsylvania Women's Agricultural Network as an example of how differences over the ethics of exclusionary practices in women's movements posed unexpected challenges and outcomes to the research project. I discuss how the development of deep divisions within the group over the mission and audience for WAGN's educational programming reflects the cultural constructions of gender and femininity that ultimately run counter to the feminist project as I knew it and practiced it. In my conclusions, I use this example to develop ways to cope with the challenges of activist research with analytical and theoretical rigor.

Charles Bartlett Travis, Dr., Trinity College. Email: ctravis@tcd.ie; Placing Beckett: Beyond the Cartesian Imagination

This paper provides a biographically centered discussion/reading of Irish writer Samuel Beckett's early works. The focus of the paper will be on Beckett's first novel, *Murphy* published in 1938, which provides an idiosyncratic representation of social alienation lurking in the corners of the architecture of Cartesian space, as well as describing the Irish emigrant experience in London during the period. Beckett wrote *Murphy* during the early 1930s, while undergoing psychoanalysis in London, which at the time was illegal in Saorstát na hÉireann. The reading of Beckett's novel will be informed by a 1931 essay entitled *Proust* in which Beckett postulated about the perception and representation of experience drawn from the faculties of memory and habit, framed within the perspective of the Cartesian narrator. Beckett's work seem to suggest an embodied practice associated with the phenomenological orientations of German philosophers Edmund Husserl and Martin Heidegger; they also seem to anticipate the critical approach to space afforded in the works of Michel Foucault, nearly three decades on. The paper's spatial history will focus on Beckett's early years in Ireland and London, and attempt to elucidate the embodied practices of

phenomenology which seem congruent with Beckett's various representations of place and identity.

David J. Travis, University Of Wisconsin - Whitewater. Email: travisd@uww.edu; Ryan G. Lauritsen, The Ohio State University. Email: lauritsen.3@osu.edu; Paul A. Lorah, University of St. Thomas. Email: palorah@stthomas.edu; Recent Changes in the Spatial Characteristics of U.S. Temperature Abnormalities: An Indicator of Rapid Global Warming?

Until recently, the spatial extent of U.S. seasonal and annual temperature departures was frequently characterized by co-occurring regions of above and below normal conditions, often on opposite sides of the country, and separated by a narrow region of normal temperatures. Such spatial variations can be explained meteorologically by persistence of a meridional jet stream (ridging-above normal; troughing-below normal), with these offsetting effects resulting in relatively slow changes to the U.S.-wide mean temperature. However, recently there have been marked increases in the spatial extent of above normal temperatures, even in areas where persistent troughing has occurred. This implies that the factors controlling abnormal temperature spatial extent are changing. This study investigates variations in the seasonal and annually-averaged spatial characteristics of temperature abnormalities for the coterminous U.S. for the past 50 years (1956-2005). The ratio of spatial coverage between above and below normal temperatures is determined by individual seasons and also averaged for the year. Magnitude of association of spatial extent of temperature abnormalities and 500mb jet stream is determined for the same time periods. Preliminary results indicate a generally consistent ratio between above and below normal temperatures for much of the first half of the study period (1956-1980), with a significant increase (decrease) in above (below) normal area noted for the latter period (1981-2005), especially in recent years. The association between abnormal temperatures and 500mb jet stream appears to be statistically stronger for the earlier period compared to the latter period, which is characterized by rapid global-scale warming.

Email: ; Eliane Propeck, University of Normandy. Email: ; When territory generates risks: Implementing a vulnerability and stake assessment for a territorial approach to industrial risk in France

The explosion at the Total Group/Grande Paroisse factory (AZF) in Toulouse, on September 21st 2001, has demonstrated the need for a new approach to Land Use Planning (LUP). Due to the significant proximity between the urban areas and hazardous plants, this accident, in fact, turned into a disaster. This explosion, whilst greatly adding to natural risk management experience, has also influenced the passing of a law on July 30th 2003, relating to the "prevention of technological and natural risk and the repair of damage". It has introduced the concept of "stake" and "vulnerability" which will allow the implementation of a new Land Use Planning tool known as "Technological Risk Prevention Plans" (in French Plans de Prévention des Risques Technologiques). Current Ph.D research has highlighted the need to consider local geography and area development when planning Land Use around proposed and established industrial areas. With this in mind, we will first present a brief summary of French risk assessment methods and then, using the Toulouse incident as a model, show how recent Land Use Planning, has increased the level of industrial risk in urban areas. Finally, we will show how the use of geographical data and a Geographic Information System (GIS) when assessing risk, is advantageous when used in conjunction with a territorial approach.

Keywords: Risk, Vulnerability, Technological hazard, Land Use Planning, GIS, France

Eliot Tretter, Texas A&M University. Email: eliottretter@hotmail.com; The Scale of Urban Governance

Over the last two decades, urban regime theory has become one of the most dominant paradigms of thought in urban studies. In particular, regime theory offers a complex account of urban governance or how local governments, the business communities, and community organizations gain the capacity to shape the policies that affect cities, i.e., govern. Although regime theory is a dominant theory in urban studies, it does, nevertheless, have its share of detractors, and one criticism has been its failure to take into account geographical scale. While there is an acknowledgment in urban regime theory of wider economic processes, such as the broad transformations in international and national trade, investment, etc., or the role played by federal or state governments, the bias has remained mostly local, particularly in regards to urban governance. In the literature the policies and actions of international and national institutions either nicely

conjoin with local interests or are nearly totally absent. Due to this oversight, urban regime theory tends to underemphasize how the capacity to govern a city effectively is sometimes the result of the interaction of unrelated actions of people at multiple scales. This paper attempts to address this oversight in an analysis of Glasgow, Scotland during the 1980s. By focusing on the role of the European City of Culture in urban revitalization of the city, this paper demonstrates how the capacity for a ruling coalition to transform the city and to govern effectively was the consequence of administrative actions undertaken at other geographical scales.

Erika N Trigoso Rubio, Oxford University Environmental Change Institute (ECI). Email: erika.trigoso@ouce.ox.ac.uk; *Vulnerability Mapping Analysis of Environmental Change Impacts in Puno, Peru*

In the Latin American context, one of the least understood aspects of environmental change impacts is vulnerability. The actions directed to prevent or minimize impacts of natural disasters are still focused mainly on physical and engineering aspects. In the case of the department of Puno, in Peru one observes recurrent negative impacts from extreme climate events that have become more intense and frequent. In the present study, a detailed vulnerability mapping analysis with a participatory, bottom-up approach is presented. The main objective of vulnerability analysis, especially in a developing country like Peru, is to allow the identification of target areas to allow better development interventions by policy makers. This could involve prioritizing aid for adaptation and guiding decision making on international aid and investment. In order to maximize efficiency when selecting target areas, methods such as spatial correlation and index component analysis will be addressed.

Keywords: Vulnerability, Environmental Change in Latin America, Mapping

Michael W. Tripp, Dr., Malaspina University-College, Nanaimo, B.C. Canada. Email: trippm@mala.bc.ca; *The Emergence of Soviet/post-Soviet National Parks as a Socio-political Phenomenon*

The establishment of a network of national parks initiated in the waning moments of the Soviet Union and continuing into the post-Soviet era can be viewed as a product primarily of regional socio-political forces asserting increasing degrees of autonomy. Emboldened by the weakening of centralized administrative structures, the national park designation repeatedly has been used to support claims to territory wrapped in the mantle of environmental protection. Site selections thus have been driven by attachments to the specifics of place and attendant proclamations of self-identity rather than to normative ecological or recreational national park criteria. As a consequence, the ensuing landscapes embrace complex matrices of historical, cultural and natural features reflective of regional identities. Appearing first in the outlying Republics, the national park formation process diffused inwards to the Russian heartland and eastward into Siberia. This sequential development mirrored the devolution of Soviet sovereignty. Conversely, the current trend towards recentralization of governmental authority in Russia has seen a significant diminishment of momentum in the establishment of national parks. Given the persistence of societal flux, the fate of Russian national parks will continue to act as a benchmark in the country's hegemonic contestations between the state and regions and amongst constituencies, stakeholder groups and empowered individuals.

Austin Troy, University of Vermont. Email: austin.troy@uvm.edu; Morgan Grove, USDA Forest Service. Email: mgrove@fs.fed.us; Jarlath O'Neil-Dunne, University of Vermont. Email: Jarlath.ONeil-Dunne@uvm.edu; *An Analysis of the Predictors of Urban Private Land Vegetation in Baltimore, MD*

This paper examines predictors of vegetative cover on private lands in Baltimore, MD. We generated two measures based on high resolution data. "Possible stewardship" refers to the proportion of private land parcels lacking built structures, and hence plantable. "Realized stewardship" refers to the proportion of possible stewardship land upon which vegetation is growing, either through planting or succession. These measures were generated at the parcel level and averaged by US Census block group. Realized stewardship was further broken down by woody vegetation and grass proportions. Data about expenditures on yard supplies and services by block group were used to help better understand where current vegetation conditions appear to be the result of current activity, past legacies, or abandonment. PRIZM? market segmentation data were first tested as predictors of possible and realized stewardship and yard expenditures at the block group level. PRIZM? segmentations, hierarchically clustered into 5, 15, and 62 classes, categorize neighborhoods by population density, social stratification (income and education), and lifestyle, respectively. We found that PRIZM

15 best predicted variation in possible stewardship and PRIZM 62 best predicted variation in realized stewardship. These results were further analyzed by regressing each dependent variable against a set of continuous variables reflective of each of the three PRIZM groupings. Housing age, vacancy, and crime were found to be critical determinants of both stewardship metrics, although differences in the predictors of vegetation cover versus the predictors of yard expenditures indicate different pathways by which vegetation was established in different parts of the city.

This paper summarizes a collaborative project led by the U.S. Environmental Protection Agency to create a high spatial resolution land use/land cover (LULC) dataset for the entire Little Miami River watershed in southwestern Ohio, USA. We faced a number of challenging classification issues such as starting with 82 flight lines of Compact Airborne Spectrographic Imager (CASI) hyperspectral imagery, correcting radiometric distortions due to cross-track illumination, separating urban from rural land features, creating the watershed mosaic, and considering whether to smooth (remove noise) or not with respect to creating meaningful patches for deriving ecological landscape metrics. The unique, hierarchical classification approach began with image object segmentation for defining broad urban, rural and water strata, followed by "Spectral Angle Mapper," a similarity classifier based on very different principles than typical multispectral algorithms. The final LULC classification was derived from imagery acquired July 24 through August 9, 2002 via fixed wing aircraft and has a spatial resolution of 4m x 4m. Categories within this classification include: water (both lentic and lotic), forest, corn, soybean, wheat, dry herbaceous vegetation, grass, urban barren, rural barren, urban/built, and unclassified. The final classification was completed after an extensive Quality Assurance and Quality Control (QA/QC) phase which included manual editing. The final GIS product, including a technical report and FGDC metadata, are publicly available for download from <http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=151106>.

Elena Trubina, Ural CASE. Email: eletru@hotmail.com; *Privatizing residential life in "the neo-liberal city"*

Gentrification of the Moscow's center follows the logic of neoliberalism because, on the one hand, the state off-loaded its responsibilities regarding regulating real estate market, while on the other, sociospatial structure of the center has been ordered by the market. How do the residents see community's potential in both sustaining their sense of belonging to an exceptional neighborhood and defending its interests in a case of conflict with developers? I attempt to answer this question drawing upon qualitative data gathered from a set of centrally-based neighborhoods in Moscow as part of a project dealing with post-Soviet urban cultures. Interviews of residents in these neighborhoods show that understanding of community is affected, firstly, by the confusion of the uses of the word "public" during Soviet times (especially the slippage of "public-owned" and "state-owned"), secondly, by a mixed attitude many people still have towards privatization and its outcomes, and thirdly, by the fact that public consensus-building seems to be in jeopardy almost everywhere. The islands of social cohesion, the territorial communities, appear here and there in central Moscow when the residents, while facing the prospect of being forcefully displaced, try to fight the developers' growing appetite. However important those communities and organizations are for empowering citizens, however promising they seem in terms of reproducing civic culture, their strength and influence usually extends only to particular buildings.

Daniel Trudeau, Macalester College. Email: dctrudeau@gmail.com; *"We want to be seen as Americans and that means being seen as successful": Minnesota's migrants and the self-sufficiency paradigm in America*

In this paper, I explore how economic independence has become central to discourses of immigrants' belonging in Minneapolis-St Paul, Minnesota. I examine two cases that illustrate how migrants' inclusion in Minneapolis-St. Paul host society hinges on public perceptions of migrants' economic self-sufficiency. The first case shows how discussions among and action taken by leaders in Minnesota's refugee communities, government institutions, and nonprofit organizations focused on cultivating refugees' economic self-sufficiency through labor force participation to correct the perceived failures of some refugee groups to integrate successfully into the host society. The second case examines the activities of a particular migrant organization to use neighborhood-based

economic regeneration efforts to effect change in a migrant groups' marginal social status. These cases offer insight into the social processes through which the promotion of economic self-sufficiency is institutionalized as a model for the successful integration of migrants into American society. In particular, these cases highlight how state and non-state actors at the national and subnational scales contribute to a notion of belonging that is brokered through market participation. I discuss the implications of these cases for the theoretical understanding of the ways in which neoliberal ideas are incorporated into policies and programs for the inclusion of migrants into metropolitan society in Minnesota.

Nathaniel S. Trumbull, University of Connecticut. Email: trumbull@uconn.edu; *Measuring On-the-Ground Effectiveness of State Coastal Management Programs: A Comparative Approach*

This research explores a comparative approach for evaluating the effectiveness of state coastal management programs in protecting estuaries and coastal wetlands in Connecticut and Washington State. The latter has become a national leader in implementing its Growth Management Act (GMA) since 1990. The GMA has played a role in strengthening Washington State's pre-existing Shoreline Management Act. Connecticut has proceeded in its state coastal management largely in the absence of state-wide growth management legislation. Connecticut has relied on its Coastal Management Program, led by the Office of Long Island Sound Programs within the Department of Environmental Protection, to manage its coasts. The Connecticut Coastal Management Act of 1980 provides the primary authority for the state's comprehensive Coastal Management Program (CMP). The author poses the question of the relative value of state-level growth management legislation as an essential and integral legislative instrument for effective coastal management based on on-the-ground Connecticut and Washington State experiences. The evaluative approach of Good, Weber, and Charland (1999) has been expanded to take into account the potential effectiveness of growth management policy mechanisms and coastal management programs of Washington State and to provide a basis of comparison with Connecticut's CMP (in the absence of a statewide growth management program).

Petra Tschakert, Dr., Penn State University. Email: petra@psu.edu; *Staging Smart Farmers: Learning Partnerships in Global Change Science*

Global change science has become exceedingly sophisticated in assessing, mapping, monitoring, and predicting dynamics in land use, land cover, and climatic patterns. Numerous models exist that suggest most appropriate management practices to mitigate negative impacts on natural systems. So do multiple indices that depict differential vulnerability of human systems. What has been vastly absent in the global change debate is the role and capacity of resource managers on the ground to make sense out of 'big science' recommendations, scrutinize their local applicability, and translate them into actual livelihood decision-making. This is particularly true for economically and ecologically marginal environments of the developing world. This paper advocates the role of political ecologists as facilitators in collective learning partnerships to bridge this science-practice divide and inform policies that attempt to reconcile poverty reduction and long-term environmental management. Drawing from research on terrestrial carbon sequestration and adaptation to climate change among smallholders in the Sahel and the tropical forest margin in Panama, I argue that the first step in such a knowledge partnership is to put local resource users, their experiences, and perceptions of social-ecological dynamics at the center of the learning stage. As a second step, social learning processes can help to detect elements and limitations of existing adaptive capacity to multiple stressors. The relevance of political ecology in global change science stems from its ability to critically assess trade-offs for social-ecological resilience at the local level while pinpointing existing bottlenecks with respect to basic development needs and policy responses.

Email: levinnoa@post.tau.ac.il; *The Effect of Climate Change on the Mobility and Stability of Coastal Sand Dunes in NE Brazil*

The coastal zone of NE Brazil consists of sandy beaches and is backed by extensive dune fields. In Lencois Maranhenses, the largest area of coastal dunes in NE Brazil, barchan dunes cover an area of 1,550 square km and penetrates more than 25km inland. Vegetated parabolic dunes are found there at a distance of more than 150km inland from the present coastline. The area is tropical with 1500-2500 mm of annual average rainfall. Our model is based on several fact findings. The mobility of sand dunes is related to wind power. Wind erosion is the

limiting factor for vegetation in sand dunes because seedlings are eroded at high wind power. The amount of rainfall is not a significant factor for vegetation growth on dune sand. A dynamical model, based on the ITCZ migration predicts lower wind speeds during wet periods in NE Brazil, when the ITCZ shifted more to the south than what exists today. That ought to favor the stabilization of sand dunes. Impediment of the southern migration of the Atlantic ITCZ is caused when a north-south temperature gradient drives a low level atmospheric circulation that strengthens the trade winds in NE Brazil, together with a reduction in rainfall. Wind power and rainfall are negatively correlated, both on a monthly and a yearly scale, as shown from the seasonal wind and rainfall variation that accompanies the yearly displacement of the ITCZ.

Keywords: aeolian processes; climate change; coastal sand dunes; NE Brazil

Ming-Hsiang (Ming) Tsou, San Diego State University. Email: mtsou@mail.sdsu.edu; *A New Cartographic Research Agenda for Virtual Globes*

The research focus of modern cartography is changing dramatically in the recent years, especially in the Internet Age. Innovative digital representation methods, such as the virtual globes displayed in the Google Earth or NASA World Wind, illustrate a new research direction for modern digital cartography. Traditional cartography mainly focuses on the plane representation methods and rules, such as projections, generalizations, visual balance, map layout design, etc. Under the architecture of virtual globes (digital earth) with the 3D coordinate system, some cartographic rules might become obsolete and some might become more complicated and more important. This paper will discuss the impacts of the virtual globes for the modern cartographic research and propose a new research agenda for the Internet-based Cartography (i-cartography). The new i-cartography research agenda includes four cartography research themes for virtual globes: 1). the design of direct manipulation user interfaces, 2). the display of virtual globes in extra-large and extra-small electronic mapping devices, 3). the dynamic changes of map symbols and texts in different map scales, and 4). the exploration of new methods for disseminating and integrating Web-based mapping services via the virtual globe framework.

Keywords: Cartography, Internet, Virtual Globe, Digital Earth

Masami Tsujita, University of Hawai'i at Manoa. Email: masamit@hawaii.edu; *Becoming A Factory Girl: Young Samoan Women and A Japanese Wiring Factory*

This study looks at the daily life of young women who work at a Japanese-owned labor-intensive, export-oriented factory in Independent Samoa. They regularly work more than 11 hours a day at a starting rate of U.S. 52 cents per hour to produce wiring harness for automobile markets in Australia. These Samoan factory girls work in a space where the global industrial automobile culture, Japanese business philosophy, the Samoan government's development policies, Samoan tradition, and their own aspirations intersect. In this hybrid factory culture, young women are required to negotiate the conflicting priorities of these distinct interests and ideologies. Since its establishment in 1991, thousands of local women have passed through this wiring factory; however, their voices have yet to be adequately heard. The study challenges conventional representations of factory girls' experiences constructed within structuralist, feminist, and postmodern analyses. It considers what becoming a factory girl means for young women in a small island nation through highlighting Samoan girls' first-hand voices about their multinational employment and life priorities. This study is based on data primarily collected through interviews with Samoan factory employees and Japanese managers, but also includes the researcher's direct observations while she worked on the shop floor in the summer of 2000 and 2006.

This paper reproduces three-dimensional Kyoto during the Edo era. It demonstrates the method of creating 3D virtual city out of 2D GIS data. Two major sources were used for this purpose. Firstly for plan view, the digital image of Rakuchu-ezu, the earliest hand-drawn map (circa 1642), is georeferenced and geometrically corrected in GIS, and its land uses and parcel boundaries of palaces, temples and manors are traced. Land use and the name of parcel owner are added as attributes for each geometry. Secondly, for elevation view, Rakutyu-rakugaizubyobu, a panoramic drawing of Kyoto in a pair of folding screen (circa 1620) is used. The composition of types of building is counted and textures of the building are extracted. We then developed a program to generate 3D models for each feature in GIS based on its geometry (points, lines and polygons) and the attributes. In addition, pedestrians and trees are placed to give life to the virtual

pre-modern Kyoto. The virtual city enables to compare artistic drawings to data-based 3DCG image. Our attempt proves that compilation of historical data using GIS is an efficient and flexible way to produce large-scale 3D urban models. The advantage of our method are that it is based on data if any data exists, or otherwise, it is capable of visualizing alternative hypotheses in 3D to examine the validity of a hypothesis by cross-referencing to historical documents and drawings.

Keywords: GIS, virtual reality (VR), Kyoto, Edo era

Takashi Tsukamoto, Assistant Professor, University of North Carolina at Greensboro, Dept. of Political Science. Email: t_tsukam@uncg.edu; *Is regional rescaling happening in the American metropolis? A study from the local politics perspective*

Is regional rescaling happening in the American metropolis? Many say that city regions are becoming the primary scale of economic activities under globalization. Meanwhile, it is commonplace that elite form regional development corporations and advocate regional economic development. Apparently, the forces of economic structure and local politics converge at the metropolitan scale. Regional rescaling should be happening. However, except for the merger of the city of Louisville and Jefferson County, Kentucky, major political regionalization is hard to come by in American Metropolis since the globalizing 1980s. Is globalization indeed causing "relativization of scale" and working as catalysis for local state reformulation in the US? If it is, what kind of regionalism is happening and in what ways is the new scale being constructed? These basic questions are not well examined from the local political perspective. Against this, in this paper, we make a comparative investigation of metropolitan regions in North Carolina. Differing scalar interests of urban political economy compete one against another. Changing balances of the politics of scale are embedded in the local interpretations of regional rivalries, higher-level government policies and the processes of globalization.

Wei Tu, Georgia Southern University. Email: wtu@georgiasouthern.edu; *Integrating System Dynamics Modeling into Plan Level Strategic Environmental Assessment: The case of Shanghai*

Despite the increasing recognition of and recent preliminary studies on plan level strategic environmental assessment (PLSEA) on urban and regional planning, neither methodological frameworks nor case studies are sufficient in the practice of SEA. In this paper, we attempted to develop a new methodological framework for PLSEA by integrating a system dynamics (SD) approach into the practice of PLSEA. Our new methodological framework was further tested in simulating and assessing the environmental consequences of three land use planning scenarios for the city of Shanghai. First, a SD model, LUP_SEA was developed and calibrated according to the historical land use data. Second, three scenarios of land use plan between 1997 and 2020 were developed and simulated based on the base run model. Third, an environment indicator system was formulated to assess the potential environmental impacts of three simulated land use plans. It is found that the LUP_SEA model is an efficient tool for SEA practitioners, urban planners and managers, and decision-makers to implement PLSEA at a verity of temporal and geographic scales. This case study is also helpful to the long-term sustainable development of Shanghai by providing valuable insights about the complex relationship among development paths, land use economic development, and environment.

Andrew R. Tucker, Cambridge University. Email: art25@cam.ac.uk; *Racing the closet: Visibility and the appropriation of heteronormative space*

This paper will compare and contrast the way queer men in two racially defined communities in Cape Town have been successful at appropriating heteronormative space. A growing body of work has started to criticise the way Western notions of 'the closet' and the heterosexual/homosexual binary do not translate well onto communities away from Western metropolitan environments. By exploring the development of white 'gay' identified men with coloured cross-dressing men in Cape Town, this paper aims to uncover how both have striven to free themselves from secrecy and hiding - to free themselves from 'the closet' ? but in startling different ways. In conclusion this paper will argue that 'the closet' does have strong application in communities away from the West, but that a wider interpretation that takes account of political history, geographical visibility and diverse methods of spatial appropriation is required.

Steven Tufts, Trent University. Email: steventufts@trentu.ca; *Hospitality worker unionism and labour market adjustment: toward Schumpeterian unionism?*

This paper proposes a conceptual model for understanding emerging changes in a North American labour union. UNITE-HERE has been at the forefront of debates on union renewal in the US and Canada and is part of the Change to Win coalition of unions which left the AFL-CIO. It is tempting to characterize UNITE-HERE as a union undergoing a renewal process, but I argue that this often oversimplifies many complex and contradictory labour strategies. Much of the labour union renewal literature remains prescriptive and is only beginning to escape false binaries such as business versus social unionism or the servicing versus organizing model. In this paper, I attempt to conceptualize the strategies adopted by the union as they 'actually exist' in relation to the changing political economic landscape. I characterize the current labour practices as 'Schumpeterian unionism', a model which captures the shifting and contradictory relationships labour has with the broader community, capital and the state. The model is inherently geographical as I argue that Schumpeterian unions organize at multiple scales. The model is illustrated with a case study of UNITE-HERE Local 75's response to the 2003 SARS outbreak through their establishment of a Hospitality Workers Resource Centre and its current efforts to increase labour market adjustment support in the sector through collective bargaining.

Claire Tugault-Lafleur, McGill University. Email: claire.tugault@gmail.com; Sarah J. Turner, McGill University. Email: turner@geog.mcgill.ca; *Diversifying highland livelihoods: Ethnic minorities and forest product use and trade in Northern Vietnam*

Since their migration from Yunnan nearly two centuries ago, the highland minority Hmong in north upland Vietnam have remained relatively autonomous, relying on a diverse production system including wet rice terraces, swidden fields, livestock and, more recently, handicraft and tourist-related activities. Forests also supply households with fuel wood and a variety of non-wood forest products such as mushrooms, bamboo shoots, herbal medicines, honey, game, and construction materials. In 1992, the Vietnamese Government, via Decree 327, officially banned all forms of slash-and-burn practices and opium cultivation, thus cutting off highlanders from important sources of income. More recently, the State has implemented rural development initiatives focused on tourism development and livelihood diversification, impacting on people's relationships with the natural resource base. This paper examines the importance of forest products for the Hmong in Sa Pa district, Lao Cai province, northern Vietnam. Drawing on in-depth qualitative field work undertaken in 2006, we first look at how the local use of forest products has changed from the end of French rule in 1954 to the present-day period. Secondly, we analyse the contemporary dynamics of forest product trade in the region, examining the spatial organisation of commodity flows of these goods. As such, this research explores the impacts associated with the commercialisation of forest products in upland north Vietnam for the many different actors involved.

Keywords: non-timber forest products, exchange networks, rural livelihoods, ethnic minorities, Vietnam

Jahalel Lee Tuil, UC Davis. Email: jltuil@ucdavis.edu; Steven E. Greco, Ph.D., UC Davis. Email: segreco@ucdavis.edu; *Restoration Potential Identified Through Historic Vegetation Reconstruction*

In the Central Valley of California, much of the landscape was converted to agriculture well before the native vegetation was explicitly mapped. Historical vegetation inventories in this region consist primarily of written descriptions. In the absence of a true spatial record, this study seeks to model the potential distribution of historic vegetation, based on soils, hydrology, geology and available written descriptions for the valley floor of Yolo County. Potential

vegetation classes are rather broad, and based on the California Wildlife Habitat Relationships (CWHR) System. In addition, a comparison is made between the potential vegetation distribution and the current distribution of remnant native vegetation. The current vegetation map is primarily derived from 1 meter, true color NAIP imagery (2005). Collectively, these results not only quantify the minimal extents of remaining vegetation types, but prepare a baseline for several additional analyses. For example, these current and historical results can be used to construct an environmental risk index identifying those units most at risk of complete native vegetation loss. Of direct relevance to conservation and restoration planning, these results can be used to generate reasonable priorities and identify restoration potential based on connectivity, network stability and suitability based on historic distributions.

Keywords: historic vegetation, GIS, California Central Valley, Yolo County

Matthew Turner, University of Wisconsin-Madison. Email: turner@geography.wisc.edu; *Mobile capital on the range: Cattle markets, wealth redistribution and market-based environmental management in the West Africa Sahel*

This paper will show how a more deliberate consideration of domestic livestock as an important and unique form of "capital" illuminates how regional trends of urbanization and wealth redistribution affect rural livelihoods, labor contracts and the environment in Africa. Livestock markets, used to fulfill speculative, consumption, and trade purposes, are far from neutral in terms of their social (and ecological) effects. This paper will 1. review the evidence for a changing distribution of livestock wealth in the dryland West Africa and an associated freeing of herding labor; 2. outline the basic structure and functioning of livestock markets in the region; and 3. critically engage with recent proposals to rely on livestock markets as a mechanism to equilibrate livestock to fodder resources across the Sahelian region. The paper will conclude by considering the commonalities and differences between livestock and other capital markets that have elicited greater scholarly interest.

Although exact numbers are elusive, there is a general consensus that in the past 30 years the world's population has had the highest absolute increase in human history. Additionally, it is agreed that more and more of the world population will live in urbanized areas leading to increases in impervious surfaces world wide. Increases in impervious surface area (ISA) have a wide spread impact on our environment. The effects range from altering hydrology and temperature to impact on the carbon cycle. To understand these changes we must first be able to map ISA around the globe. To this end a global map of ISA has been created and made available to the public. Three data sets were used in the process: Nighttime Lights from the Defense Meteorological Satellite Program (DMSP) Operational Linescan System (OLS); population counts from Landsat (2004); and aerial photographs collected along urban to rural development transects for 13 major cities in the United States. All the data were converted to 1km equal area grids. Gridded point counts were performed on a 1km aerial photo tile (matching a 1km grid cell in the other two datasets) to estimate the percentage of ISA in each tile. Linear regression was then used to develop a model for estimating percentage of ISA based on the Nighttime Lights and population. The global map of ISA can be used for studies in a variety of fields including hydrological modeling, analyzing terrestrial carbon dynamics, and urban growth modeling.

Keywords: urban, development, sprawl, nighttime lights, population

Gray Tuttle, Columbia University, Columbia University. Email: gwt2102@columbia.edu; *Demonstrating Local Power by Mapping Chinese and Amdo Tibetan Institutional Centers*

The paper will outline what we can learn by mapping the Beijing-based state's (Ming, Qing, Republican and PRC) and local Amdo Tibetan institutional centers. I will proceed toward this goal in two ways: first, by mapping the local historical sources about the area written since the Ming period, and second by using modern surveys of monasteries and their subordinate temples. By mapping the local historical sources about the area, I believe I can demonstrate the simultaneous growth of two types of institutions: 1) the Beijing-based state's outposts of authority, represented by administrative and military centers (which eventually produced their own histories) and 2) the monastic centers that played

major political and cultural roles in the region. The extension of the Beijing-based state's authority is easy to track by plotting the rise in publications about the Amdo area. The development of written materials about Tibetan Buddhist monastic institutions will be compared to the modern surveys of dominant monasteries with subordinate temples to assess the relationship between these two methods of tracking Buddhist monastic growth. A further comparison will be made between the extension of Beijing-based state's authority as mapped by the China Historical GIS and the dominance of the more prominent Tibetan Buddhist monasteries. I will argue that these two sources of power did not often overlap, because until the period of the People's Republic of China, powerful monastic centers were allowed to command territory much as county based governments did in China proper, thereby saving the imperial government unnecessary expenses.

Julie Tuttle, University of North Carolina at Chapel Hill. Email: jptuttle@email.unc.edu; *A Graph-Theoretical Perspective on Plant Invasion and Land Use*

Human-assisted plant invasions may proceed at the landscape level through the interaction of ecology and human land use. Graph (network) theory has been applied to understand connectivity both in social networks and in ecological systems (e.g., food webs) but is less widely applied in landscape ecology or human-natural systems. With this poster, I illustrate a graph-theoretical approach for investigating how patterns of human land use may influence landscape connectivity for an invading plant species. I investigate hypothesized relationships between patterns of agricultural land use and invasion of *Psidium guajava* (common guava) in adjacent human and natural areas on Isabela Island in Galápagos. Using preliminary field work and classification of a 2004 high-spatial-resolution satellite image (QuickBird), I construct patches of potential guava habitat (nodes), human land use, and actual guava invasion. I create simple graphs for scenarios of connectivity (edges) and dispersal probability based on hypothesized land use practices and mechanisms of guava spread. I compare graph properties for the hypothesized scenarios to each other and to the pattern of actual guava patches. Results reveal hubs (highly connected nodes) for each scenario that may be important in control efforts. Comparison of scenarios to each other and to actual guava patches highlight differences in connectivity and location of hubs that illustrate the importance of accurately representing the human and ecological processes involved. Potential future uses for graph theory include design of future data collection (both social and ecological), modeling of guava invasion dynamics, and spatial prioritization of control efforts.

In 2003, the Office of Electricity Delivery and Energy Reliability at the US Department of Energy (DOE) formed the Visualization and Modeling Workgroup (VMWG) to leverage existing modeling, analysis, and visualization capabilities for energy emergencies. The VMWG is composed of energy infrastructure, modeling, and visualization experts from many DOE national laboratories. The principal function of the VMWG is to conduct pre-, trans-, and post-event geospatial modeling and analysis of the impacts to the nation's energy infrastructure. This paper will include an overview of the VMWG, with particular emphasis on the required collaborative support resulting from multiple organizations working together to provide geospatial modeling and visualization support DOE headquarters. VMWG activities resulting from the historic 2005 hurricane season will be used to emphasize the need for dynamic and responsive geospatial models, responsive communication and coordination infrastructures, and visualization capabilities in preparation for, and responding to emergencies. Particular reference to the application of GIS modeling and visualization of population dynamics, transportation infrastructures, and port/commodity movement, which Oak Ridge National Laboratory is responsible for, will be used to illustrate these concepts. Drawing on our experience in supporting the VMWG as well as our response activities from the Tsunami of 2004, a proposed research agenda for the application of high performance cyber infrastructure, dynamic and near-real time geospatial data inputs, and functionally efficient network solutions to emergency preparation and response management will be provided.

Karin Tuxen, University of California - Berkeley. Email: karin@nature.berkeley.edu; Maggi Kelly, PhD, University of California - Berkeley. Email: mkelly@nature.berkeley.edu; Multi-scale functional mapping of salt marshes using Object-based Image Analysis (OBIA)

Salt marsh restoration projects seek to restore wetlands back to their natural function, which includes complex and heterogeneous vegetation pattern. As salt marshes are multi-scale, hierarchically structured, and contain many interacting components, the question remains about how to map vegetation pattern in a multi-scale manner. Restoration goals often target species or biological process with specific objectives for use or function of the marsh at specific scales. In this study, we map three salt marshes in the San Francisco Estuary (two restored and one natural) using color-infrared aerial photographs and multi-scale object-based classification, with respect to three wetland functions: salt marsh harvest mouse habitat, California clapper rail habitat, and nutrient cycling/carbon sequestration. Pattern and scale are important for each of these three functions, but important in different ways and at different scales. Object-based image analysis (OBIA) is applied to very high-resolution data (20 cm), for segmentation into functional patches at multiple scales in a semantic structure. We will share results of our multi-scale maps, as well as compare results of accuracy assessments and land cover analysis to pixel-based methods.

Keywords: OBIA, mapping, remote sensing, salt marsh restoration

The paper presents the principles of modeling of spatial socio-economics and areal wood-production systems in a three-year (2007-2009) research project, which studies how alternative forest management practices can be used to cope with the transition of the traditional Nordic wood-processing industry towards the modern production clusters of high-quality timber, products of fibers, chemical and pharmaceutical products and energy. The project investigates the potentials of alternative forest management systems to meet the needs of sustainable production of raw material for future industrial needs and maintaining forest ecosystem functions in the boreal forest belt. The project aims at developing the principles and geography of production systems at several geographical scales, from a farm level to multi-regional production systems. It combines single-tree modeling with geographical socio-economic simulations and forecasting. To achieve this in practice the project utilizes high performance computing techniques. Based on forest simulation systems and geospatial and geographical modeling, the socio-spatial outcomes of alternative forest management practices together with anticipated future wood-processing and energy needs will be analyzed in order to outline more sustainable rural socio-economic spatial systems and highly competitive industrial clusters. The overall effort is to develop the principles of more sustainable and efficient production systems based on geographical information, and finally contribute to theorization of the organization of production in geographical space.

James A. Tyner, PhD, Kent State University. Email: jtyner@kent.edu; Anti-Geographies and the Erasure of Space in Democratic Kampuchea

Many geographers have approached Geography from the stand-point that geo-graphy is about the writing of space. In this paper I forward the inverse proposition, namely that anti-geographies constitute the un-writing, or erasure, of space. Though a case study of the Cambodian genocide I detail that the socio-spatial practices of the Khmer Rouge were designed to explicitly eliminate social relations and physical structures: policies of genocide and terracide. In so doing, the Khmer Rouge attempted to erase space and so create a utopian society.

Keywords: genocide, Cambodia, anti-geography

Judith A. Tyner, Ph.D., California State Univ, Long Beach. Email: jztyner@earthlink.net; Women in Twentieth-Century Academic Cartography

Although women have been involved in the map trades for several centuries, their numbers were small and their contributions often marginal. The twentieth century, especially the last half of the century, saw a great rise in numbers and visibility of women in the field. A major influence was WWII, which also marked the beginnings of the discipline of cartography in academia. The first dissertation on cartography by a woman was written in 1969 and women began teaching in the field in the middle and late 1960s. Since that time the number of dissertations by women have increased as have the number of positions in cartography and GIS held by women. We are now in the 'third generation' of women in academic cartography some of whom have been mentored by women. This paper examines

women's experiences in academic cartography in the United States.

Alexander Tziamalis, PhD researcher, University of Sheffield, UK. Email: tzmalex@hotmail.com; Dimitris Ballas, Senior Lecturer, University of Sheffield, UK. Email: d.ballas@sheffield.ac.uk; Megan Blake, Senior Lecturer, University of Sheffield, UK. Email: m.blake@sheffield.ac.uk; The Socio-Economic Profile of Foreign Students in the UK

This paper reports work in progress aimed at unveiling the socio-economic profile of the foreign student in the UK by taking into account all the demographic, geographical and socio-economic information necessary for sketching a comprehensive profile of this category of migrants. It can be argued that this under-researched category of migrants is part of a wider literature on skilled and highly skilled migrants. It could provide a theoretical and methodological platform for exploring the inter-relations of "classical" migrant categories with other types of migrants such as the student, the gap year or the working-abroad tourist. Statistical analysis of secondary demographic and socio-economic data (such as the UK Census Samples of Anonymised Records) will provide a starting point and will be enhanced with the analysis of economic data, including an estimation of the living and tuition fees expenses, and geographical distribution related to the concentration of this particular category of immigrants in the UK space. The paper will assess the importance of this group of people in terms of numbers, expenses and geographical concentration and will provide both the academic community and policy makers with some of the information needed to support policy formulation and analysis in this area. Finally, an effort will be made to integrate this special yet important category of migrants into the mainstream theory for skilled migrants and provide some insights for future directions of research.

Morris L. Uebelacker, Ph.D, Central Washington. Email: morris@cwu.edu; Determination of the Southern Boundary of the Medicine Creek Treaty

The Southern Boundary of the Medicine Creek Treaty has been in dispute almost from signing on December 26, 1854. This treaty, the first in the Pacific Northwest, established the boundaries to land and use rights for the bands and tribes of Indians inhabiting the southern end of Puget Sound and adjoining territory. The cultural dynamics of the Treaty process and subsequent landscape evolution resulted in directed legal conflicts with the Federal Government, State of Washington, and other indigenous people over the location of the Southern Boundary and attendant use rights. Increasing disputes and arrests regarding hunting rights led the State of Washington and the Medicine Creek Treaty tribes to a binding agreement that establishing the southern boundary based on a geographic interpretation of treaty language, actual terrain features, historical accounts, and legal testimony and precedent. Interestingly, the new boundary is not in agreement with the boundaries claimed by either party and is directly disputed by the Cowlitz Nation.

Jeff Ueland, Ohio University. Email: ueland@ohio.edu; Felicia Coleman, PhD, Director Florida State University Marine Lab. Email: ; Will Figueira, Department of Environmental Sciences University of Technology, Sydney. Email: ; Fishing for answers: Constructing a spatial and temporal framework for comparing commercial and recreational fishing impacts in the United States

Understanding the impact of commercial and recreational fishing on the marine environments is critical to track the health of economically important stocks. The collapse of species specific fishing industries such as cod and its inability to recover has shed light on the importance of judiciously monitoring these resources. At the species level, stock assessment data are available to understand temporal trends relative to abundance and mortality. Assessing the spatial distribution of human impacts to economically important fisheries is vital

but hampered by inconsistencies and variability of available data sets This paper presents a construct a spatially and temporally explicit framework for comparing commercial and recreation catch in the United States at a refined scale.

Aggregating spatially disparate data sources from county, state, and federal sources we create a mapping framework comprised of twenty three zones that cover the coastal areas of the contiguous United States. This framework is then utilized to illustrate spatial and temporal patterns of data at the species level over a 24 year period. The results are then examined through the lens of fishing regulation to better understand the dynamics of human activity on the fish stocks of the United States. It is hoped that this research will provide a means for policy makers and researchers to better evaluate the spatial nuances of fishing activity.

Yvonne Underhill-Sem, University of Auckland. Email: y.underhill-sem@auckland.ac.nz; *Empowering' women in out-of-the-way places: the East Sepik Women and Children's Health Project and the Community Based Health Care Programme, Southern Highlands of Papua New Guinea*

This paper questions the extent to which it can be said that women have been 'empowered' in two remote grass-roots health projects in Papua New Guinea. Both projects provide critical development services in places notable for their almost complete lack of government service, vast populations spread across diverse environments and entrenched, and often violently expressed, gender inequality. Both programmes, in different ways, offer useful lessons about dealing with gender inequality and advancing women's 'empowerment' in Papua New Guinea. Small incremental support to women appears to have provided them with opportunities to more successfully negotiate the complex constellations of socio-political relations that characterize all communities in Papua New Guinea. This paper highlights the value of Foucault's (1978) notion of power as being "exercised from innumerable points, in the interplay of non-egalitarian and mobile relations" as a way to examine the project of Foucauldian feminism.

Keywords: empowerment, Foucault, Papua New Guinea, feminism

The Mastodon Matrix Project, coordinated by the Paleontological Research Institution (PRI) in collaboration with Cornell University, allows interested parties to contribute to an actual scientific study. Mastodons are extinct relatives of modern elephants that were numerous and widespread in North America until the end of the last glacial period. In July 2006, PRI loaned us 51 five-gallon buckets of sediment recovered during mastodon excavations at two sites in New York. University of Tennessee GK-12 Fellows are taking samples of this mastodon matrix into rural middle schools to engage students in hands-on, authentic paleontological research about our changing Earth. Students are each given 20 to 30 cc of matrix and are asked to be careful and observant researchers as they sort their findings into these categories suggested by PRI: 1) plant macrofossils, 2) rocks, 3) shells, and 4) everything else. Six classes at Carpenters Middle School found 861 items in ~3,000 cc of matrix. Included were 743 plant macrofossils (twigs, fragments of tree bark, seeds and conifer needles), 116 rocks, and 2 shells. These results were used in a lesson on graphing that was exciting to the students because it involved original data that they had collected. We are using the matrix at other schools and planning additional investigations for the students, including the examination of preserved pollen. The data and actual materials the students find will be returned to PRI where they will be examined and cataloged by PRI and Cornell paleontologists.

Jeffrey Underwood, University of Nevada. Email: jeffu@unr.edu; *A Climatological Perspective on Record Temperatures Recorded in the Central Valley of California during Summer 2006*

The summer of 2006 saw multiple temperature records set in the Central Valley of California. Stations reporting record high maximum temperatures and record high minimum temperatures between 10 July and 27 July included Stockton, Redding, Red Bluff, Sacramento, Bakersfield, and Fresno. The synoptic scale environment for this record setting month included 1000-500mb thickness levels in excess of 5800gpm and weak geostrophic flow?routinely below 15m/s at 200hPa. This paper provides perspective for this record setting summer in the Central Valley by analyzing three-hour temperature changes (0100-2400PDT) for the month of July at the six stations over a period of 50-years. The analysis of 3-hour intervals allows for the determination of heating rates during early morning (0700-0900 PDT), late morning (1000-1200 PDT), early afternoon

(1300-1500 PDT), and late afternoon (1600-1800 PDT). Additionally the analysis will reveal cooling rates at each of the stations during the early evening (1900-2100 PDT), late evening (2200-2400 PDT) and overnight hours (0100-0300 PDT). Heating and cooling rates for each of the eight time intervals for each station are compared in a time series analysis.

Keywords: California, Climatology, Temperature

Jon D Unruh, Ph.D., McGill University. Email: jon.unruh@mcgill.ca; *Post-war Land Tenure in Angola*

Land rights play a primary role in conflict. From the Balkans to the Middle East, to the many civil conflicts in Africa, rights over land(s) are fundamental to both reasons for conflict, and to their recovery. While land law reform is a pervasive feature of countries emerging from war, different approaches are attempted regarding how such reform will create the 'legal geography' of a post-conflict state attempting to pursue multiple objectives in a peace process. Investigating what works and what does not across a variety of circumstances is important, and comparison between experiences of different countries recovering from war is critical. Post-war Angola presents the opportunity to examine the position of not engaging the emerging multiple normative orders regarding land rights after the country's 25 year civil war. In Angola there is an explicit prohibition in the new land law to addressing issues of restitution for large-scale (commercial) and small-scale (peasant, including ex-combatant) interests. There is significant retention by the new formal law of the ability to nationalize, confiscate, expropriate, and intervene in lands held customarily by rural communities who attempt recovery of agricultural lands after the war in order to achieve near term food security. Thus post-war Angola presents a significant opportunity to examine the divergence which likely occurs between formal law and the informal normative orders which govern how most of the population intersects with land and properties after civil conflict.

Christopher Upchurch, University of Utah. Email: chris.upchurch@utah.edu; Harvey Miller, PhD, University of Utah. Email: harvey.miller@geog.utah.edu; *Optimum Facility Location and Scheduling Using Space-Time Prisms*

Locating facilities that serve the general public has long been a concern of both the public and private sectors. Government agencies would prefer to serve the public using the minimum possible number of facilities. Commercial retail and service businesses want to be as accessible as possible to the maximum possible number of customers, while minimizing their investment. These problems have been studied extensively both in terms of explaining the location of existing businesses and government facilities and optimizing the placement of future facilities. There has not been as much research on the operating hours of these facilities, though their interaction with other commitments like work, school, and childcare can have a great effect on the actual accessibility of the facility. This paper uses mixed-integer programming (MIP) and applies the principles of time geography to simultaneously solve for both optimal facility locations and optimal operating hours for those facilities. By using the concept of a space-time prism from time geography, we can simultaneously solve for facility locations and operating hours. A space-time prism defines where a person could travel during a given time subject to certain constraints on travel speed, time at the destination, and their location at the beginning and end of the period. The mathematical definition of this prism is completely linear, and maps neatly to a set of linear constraints. The formulation evaluates these constraints against a set of candidate facilities and possible operating hours in an attempt to offer services to the maximum number of people.

Keywords: time geography, facility location, location science

Caroline Upton, University of Leicester. Email: huiten@yahoo.co.uk; *Poverty and Participation: New Development Initiatives in Mongolia's Pastoral Sector*

The post-collective era on Mongolia's pastoral commons has been marked by institutional flux and the emergence of significant rural poverty. In this paper I explore the impacts of formalised herders' groups and the promotion of new modes of collective action and cooperation under recent international development initiatives on equity, land use and livelihoods. I analyse barriers to cooperation and the differentiated and complex processes shaping herders' participation and exclusion under contrasting development projects. The empirical material on which this paper is based comprises life histories, semi-structured interviews and household surveys with more than 300 herding households at four sites in Mongolia. Drawing on these multiple sites and longitudinal datasets, this research highlights the limitations of particular modes of development action in facilitating cooperation over resource use and initiating co management and devolution of land rights to newly constituted herders groups. Empirical results identify recent historical trajectories of livelihood change, status, kinship and information asymmetries as powerful determinants of

active participation in newly emergent groups and as key elements in shaping land use practices. The research demonstrates limitations in project implementation and the ability of projects to benefit the poorest herders in case study areas.

Keywords: Key Words: Pastoralism, Mongolia, collective action, development.

E. Lynn Usery, Research Geographer, U.S. Geological Survey. Email: usery@usgs.gov; Jinmu Choi, Assistant Professor, Mississippi State University. Email: Jc778@msstate.edu; Michael P. Finn, IT Specialist, U.S. Geological Survey. Email: mpfinn@usgs.gov; Modeling Sea-Level Rise Effects on Population using Global Elevation and Land-Cover Data

Global datasets of moderate resolution have recently become available for population, land cover, and elevation. These data can be used to model the effects of sea-level rise on human population. Whereas the 30 arc-sec resolution of the data are not sufficient to provide details in local areas for results of global warming and the associated melting of icecaps, the data do provide global trends of rising water and allow identification of broad areas where large numbers of people could be affected. The data also support localized modeling of catastrophic events, such as the Indonesian Tsunami and Hurricane Katrina, that lead to large surges of sea water. A global model has been developed that tracks the land area and the population counts affected with a specific sea-level rise. The model is implemented as an animation that shows land areas as they are covered with the rising seas. A key to the development of this model has been the implementation of new projection and resampling methods that provide accurate results for global raster data of continuous elevation, categorical land cover, and population counts.

Ebru Ustundag, Brock University. Email: eustundag@brocku.ca; Architecture Of Modern Subjects: Appropriations Of Turkish Republican Citizenship

In their will to modernize as westernization, Turkish republican authorities have always seen the importance of appropriation(s) of the city. This paper aims to critically elaborate how for various political projects the appropriations of a historical neighborhood in Istanbul (Beyoglu) has been an indispensable part of their struggles. When establishing the link between the city and citizenship in the Turkish Republican context, it is impossible to ignore the importance of appropriation of spaces. Through appropriation, the Turkish republican project has been making itself visible and possible in the city. The key issue explored is how material constructions as well as destructions in the city become a medium as they enable, restrict, conceal and reveal the constitutions, contestations and transformations of Republican citizenship. By focusing on how architecture has been used as a technology of modernization as westernization, I argue that architecture not only enacts the project of creating and governing new republican citizens, it also reveals the paradoxes and contradictions of the projects.

Jacqueline Michelle Vadjunec, Clark University. Email: jvadjunec@yahoo.com; Extracting a Livelihood: The Institutional Dimensions of Deforestation in the Chico Mendes Extractive Reserve in Acre, Brazil

The state of Acre is one of the most progressive "forest" governments in the Brazilian Amazon, promoting people, parks, and working forests. It is also the birthplace of the Brazilian Extractive Reserve System (RESEX), which has been promoted as a major Federal strategy for forest conservation while simultaneously providing a sustainable economic return to rubber tappers and other extractivists. Frontier areas such as Acre, however, may be particularly vulnerable to the social, political and ecological changes occurring within the entire Madre Dios-Acre-Pando (MAP) region, while at same time, offering land managers both opportunities and constraints. This paper explores the institutional dimensions of land-use/cover-change within the Chico Mendes Extractive Reserve (CMER). Using a common property framework, I focus on community membership, rubber tapper identity, migration, and boundary conflicts to explore their impact on individual livelihood decisions and their resulting deforestation trends within the CMER. Methods include multiple logistic regression analysis, participatory approaches and individual ethnographies. Results of the analysis reveal popular scapegoats such as migrants and "outsiders" to not be responsible for recent deforestation in the CMER. However, the real and even perceived threat of invasion and continued boundary conflicts may be encouraging traditional land managers to adopt more intensive land-use practices. In order for the CMER to be successful, community institutions must adapt in the face of the changing landscapes, populations, and livelihoods.

Gabriela Valdivia, Michigan State University. Email: valdivi8@msu.edu; Petro-citizens and the Materiality of Oil in Ecuador

Taking into consideration recent calls for a closer look at how materiality enables, constrains, and/or disrupts social practices of resource regulation, this paper focuses on the case of petroleum in Ecuador to outline the ways in which petroleum—materially and symbolically—matters to the production of Ecuadorian subjectivities. The paper focuses on two questions: how do petroleum's unique physical properties shape political and cultural rationalities of resource appropriation and contestation? In what ways do petroleum's material qualities territorialize and naturalize ethnicity, race, and other forms of collective identity? This paper brings two crucial aspects of resource governance together, 'material relations' and 'matter,' into an analysis of how collective subjectivities are conditioned through petroleum's biophysical properties and the practices associated with its production. I focus on two examples: the struggles of Petroecuador workers against privatization and the claims of Amazonian residents for inclusive citizenship to illustrate my arguments.

Keywords: materiality, petroleum, resource regulation, Ecuador

Gill Valentine, School of Geography, University of Leeds. Email: g.valentine@leeds.ac.uk; Deborah Sporton, Department of Geography, University of Sheffield. Email: D.Sporton@Sheffield.ac.uk; The role of language in processes of belonging and citizenship

This paper draws on empirical material from a research project with Somali refugee and asylum seeker children (aged 11-18) in Sheffield, UK. It examines the role of 'language' as a practice through which children negotiate their cultural identities and sense of affiliation in the context of transnational migration and as they move through everyday spaces in their UK home town. Specifically, the paper considers the different experiences and senses of belonging of Somali children who have different arrival scenarios into the UK (including via transit camps in other African countries and via periods in other European and Middle East countries), and who therefore have a diverse range of linguistic competences that may differ from others in the Sheffield Somali community and indeed their own families. Drawing on theories of spatiality the paper examines how children use different languages in different everyday spaces of home, school, and community; the role of language in their geographical imagination (of home and elsewhere) and the implications of this for their senses of belonging and intercultural citizenship.

Keywords: Language, Belonging, Intercultural Citizenship

M. Basilia Valenzuela, Universidad De Guadalajara. Email: basiliov@fulbrightweb.org; Maria Luisa García Batiz, Universidad de Guadalajara. Email: marial@cucea.udg.mx; Location, Location and Information: the geography of social interests on the impacts of big infrastructure projects.

In this paper we analyze the geography of social perceptions regarding the environmental and social impacts of a hydroelectric power plant scheduled for construction in a region located in Western Mexico. The study shows that location matters but access to information is a key aspect to understand the formation of social perceptions and the creation of expectations regarding the benefits and costs of such a project. The paper presents results of and extensive survey conducted in five municipalities aimed to identify how people are assessing the changes observed in the region due to the project that will eventually bring about five thousand workers for the construction of the dam.

Our project aims to identify and understand the relationships between risks and spaces in the identification, representation and management of risks. The main objective is to devise new instruments for understanding risks in relation to the land dynamics in which they arise and which they themselves help to alter. Various types of knowledge (scientific, technical and popular) are called upon to play a decisive role in risk and crisis management. Such knowledge is produced during the risk identification process (including definition of the instruments used in that process) as well as in the process of devising preventive measures (town and country planning, the promotion of vigilance). We intend to examine how, during both of these processes, types of knowledge are constructed, consolidated, revised or abandoned in order to updating their performative dimension, i.e. their capacity to influence and transform space. This research program is based upon three studies concerning, respectively, fire risk, flood risk and video surveillance, which have demonstrated the usefulness of studying the various types of

knowledge likely to have a spatial impact. This study of what we will call "spatiality of risks" will also lead to the production of a 3D graphic representation, enabling us to see risks on different geographical scales and to get a clearer idea of how these various types of knowledge coexist and interact with one another. This innovative mapping technique will enable us to reveal the connectivity at work in the complex spatiality of risks.

Paul Vallance, University of Newcastle Upon Tyne. Email: P.E.Vallance@ncl.ac.uk; *Relational and practice-based approaches to learning in economic geography*

Some recent work on knowledge in economic geography has moved away from an earlier focus on learning processes at the local or regional scale. A set of new influences and objects of theorisation, such as 'relational proximities', project forms of organisation, and actor-network theory, indicate the emergence of a more relational, less essentialist geography of economic knowledge. The different forms of interaction featured in this work, along with frequent references to the concept of communities of practice, may suggest the beginnings of a 'practice-centred' turn in the field. However, this paper will question the extent to which this constitutes a new practice-based approach, in the sense that their accounts of learning are not sufficiently grounded in the context of what people do in their everyday working lives. It will use the organizational studies literature on 'knowing-in-practice', and in particular the conceptual framework of activity theory, to outline an alternative approach to learning and its spatiality. This considers learning not in terms of the transference and acquisition of new knowledge, but in those of the transformation of peoples understanding through ongoing meaningful engagement with the objects of their work, and interaction with the other members of their work group. The paper will also refer to ethnographic research investigating the relationship between work practices and learning in the UK video games development sector to highlight some of the methodological issues this raises.

Keywords: relational economic geography, organizational learning, knowing in practice

Lara Valley, IUPUI. Email: laravalley@yahoo.com; *Land Cover Change Analysis for a Wetland Restoration Site*

This poster presents a remote-sensing based analysis of land cover change associated with a Natural Resource Conservation Service (NRCS) wetland restoration site in southwestern Indiana. Commonly known as Goosepond and Beehunter Marsh, the restoration site occupies 7068 acres in Greene County, Indiana. The restored wetland complex will include swamp, marsh, wet meadow, and open water components, and is targeted to provide seasonal habitat for migratory waterfowl. Restoration began in 2000 and continues currently. Multi-temporal analysis was performed on an 1128 acre portion of the study area where restoration efforts have been completed. A comparison of vegetation biomass estimates are assessed at intervals between 1989 and 2004. These time periods reflect stages before, during, and post restoration. Biomass estimates are derived from the Normalized Difference Vegetation Index for a time series of Landsat imagery. An analysis of surface water area using near infrared data from Indiana's 2005 Orthophotography Project is also presented and compared against projected measurements used by the NRCS for site planning.

Shawn Van Ausdal, University of California, Berkeley. Email: s_vanausdal@yahoo.com; *Cattle, Power and Profit: an Environmental History of Cattle Ranching in Colombia, 1850-1950*

Since the mid 19th century, the expansion of cattle ranching in Colombia has been one of the principal driving forces of deforestation in the country. While in a number of the classic cattle regions of Latin America, ranching expanded into natural grasslands, in Colombia pastures had to be formed out of the forest. The introduction of African pasture grasses aided this process of forest clearance and pasture formation. Expanding markets for meat and other by-products, the potential profitability and relative ease of cattle ranching, portfolio diversification, and speculation all spurred interest and investment in the activity. The social relations of pasture formation took a variety of forms: the labor of independent peasant colonos, the consolidation and/or appropriation of such lands by larger ranchers, wage labor, and a form of sharecropping in which landowners granted landless peasants the rights to use forested lands in exchange for returning them in grass. Following the ranching operations of Pedro Nel Ospina, president of Colombia in the early 1920s, I will examine these processes in the departments of Antioquia and (old) Bolívar, two of the most dynamic areas of cattle expansion during this period. Contrary to what is commonly assumed in Colombia, I argue that cattle are not principally a means to occupy territory, but must be understood as part of investment strategies of ranching elites. And the often emphasized extra-economic appropriation of peasant lands in ranching

areas should be seen partially as a response to the high costs of forest clearance and pasture formation.

An individual's mental map of a given space results, in part, from his or her interaction and experience with his or her environment. For example, a student who rides a bicycle through a university campus may have a different perception of the campus than a student who walks or rides the bus. The navigational media and tools used to remotely explore a given space (i.e. maps) can also affect how one perceives the environment. In the past, most of these have been of the same basic type: static maps offering a fixed representation of a geographic area, which the map user explores by visually scanning the map. This act of "browsing" the entire map affords the user a geographic context of the represented locations and areas. By contrast, newer interactive maps offer navigational flexibility and fluidity that are absent in static maps, allowing rapid zooming and panning that can limit the geographic context for a given map location. Therefore, a user no longer needs to consider the whole map in order to extract information about a particular location. Just as different means of navigating through physical space can alter one's mental map of an area, so can these different means of navigating a map of that area. In this paper, we analyze how different navigational media and tools affect a map user's concept of space based on user testing of interactive and static maps.

Gregory Alan Van Der Horst, M.A. Candidate, University of Guelph. Email: gvanderh@uoguelph.ca; Alice Hovorka, Associate Professor, University of Guelph. Email: ahovorka@uoguelph.ca; *The political ecology of urbanization: urban fuelwood use and sourcing in Maun, Botswana*

Rapid urban growth has significantly transformed the social, economic and ecological living conditions of rural and urban Africans. While economic and political dimensions of urbanization have been explored, attendant changes in human-environmental interaction have received less attention. In particular, their development across conventional urban, peri-urban, and rural spatial boundaries is poorly understood. Political ecological inquiry has effectively uncovered causes of environmental change, marginalization and conflict, but the socioecological development of urbanizing landscapes remains under-studied. Simultaneously, urban ecologists have examined landscape-scale ecological gradients between urban and rural areas, the socio-economic dynamics shaping their development, and their recursive influences on human environmental actors are not well understood. This study explores the political ecology of urbanization through an analysis of household fuelwood consumption and sourcing in the rapidly growing town of Maun, Botswana. Its findings were that: 1) high international commercial energy prices are important determinants of urban fuelwood consumption; 2) fuelwood harvesting patterns are determined more by deadwood abundance than proximity or transport cost; and 3) house-hold urban-rural socio-economic linkages critically influence harvesters' responses to fuelwood availability patterns. The study concludes that both external and local socio-economic factors have been key to the creation of a socio-ecological urban-rural gradient which significantly influences urban fuelwood sourcing decisions in Maun and its hinterland.

Inge Van Der Welle, . Email: i.c.vanderwelle@uva.nl; *Re-claiming the Dutch youth. National versus local identity politics*

National institutional discourses on nationality and nationalization in the Netherlands have changed considerably over the last decennia. The discourse has sharpened and refocused on the definition of a genuine shared culture or what it means to be or to become Dutch, whereby multiple nationalities are problematized. However, today's context is drawn by EU citizenship, increased interactions across national borders and an increasing amount of people holding more than one nationality. Young people are specifically targeted by these incorporation policies, as they are believed to reflect the future of the nation; they should not only be taught what it means to be a citizen of the Netherlands but also be prevented from radicalization and recruitment by terrorist groups. Young people with a foreign background have received special attention within these policies. Those policies are re-interpreted and renegotiated at the local level, where they have to be implemented. The local policies not necessarily reflect the official national discourse and in some cases even contesting discourses arise. This is the case in Amsterdam, where the identity politics of the

municipality not focus on what it means to be Dutch, but rather question what it means to be 'Amsterdammer'. This paper will investigate the changes in the Dutch (institutional) discourse on Dutch identity, contrast these with the everyday local identity politics of the city of Amsterdam and will especially focus on the (institutional) re-claiming of the 'Dutch youth'.

Keywords: youth policy, identity, Netherlands, Amsterdam

Bas Van Heur, Goldsmiths College, University of London, UK. Email: cop01bhv@gold.ac.uk; *The Clustering of Networked Aesthetic Production: Between Myth and Reality*

This paper focuses on the tensions between networked forms of aesthetic production and creative clusters and the ways in which the myths of urban policy impact on and structure the realities of networked practices. The outline of this paper is as follows: First, I analyze the ways in which aesthetic production is both networked and clustered. The data I discuss are derived from my current research on (electronic) music in the cities of London and Berlin. Having mapped hundreds of music nodes onto the geographies of these cities, it becomes clear to what extent these vernacular forms of creativity are shot through with the effects of the urban political economy in which they have to operate. Empirical analysis, therefore, needs to be sensitive to this mutual imbrication in order to identify the role of each cluster in relation to the larger political economy. The following dimensions are identified: 1) 'customer'-oriented nature of certain nodes within clusters; 2) bias towards consumption in established clusters; 3) spatial dislocation of aesthetic innovation towards the peripheries of established clusters or newer emerging clusters. Second, I address the role of cultural policy as a tool of intervention in such a complex environment. Cultural policy's focus on creative clusters intensifies the already-existing bias towards cluster formation. This contributes to a cutting of the links between clusters and networks - despite the fact that it are precisely these links that are so constitutive for aesthetic innovation and experimentation.

Keywords: networks; clusters; urban geography; aesthetics; cultural production; Berlin; London

Jason E. Van Horn, The Ohio State University. Email: vanhorn.17@osu.edu; Mei-Po Kwan, The Ohio State University. Email: kwan.8@osu.edu; *Urban Proof? Terrorism's Postulate*

We provide a methodology for the analysis of terrorism incidents over space and time as urban or non-urban using terrorism incident data from the Memorial Institute for the Prevention of Terrorism, Terrorism Knowledge Base from 1968 to 2006. We focus on the development of an urban definition for the analysis of terrorism using Spanish incidents as a means for describing steps in the methodology. Analysis shows to what degree terrorism is urban and indicates what forms and targets of terrorism are perpetrated in urban/non-urban locations in Spain. We find that terrorism in Spain is distinctly urban, yet shifting away from the urban sector over time. Benefits are presented from a standpoint of allocation of resources for implementation of counter-terrorism efforts.

Bettina Van Hoven, Rijksuniversiteit Groningen/FRW. Email: b.van.hoven@rug.nl; David Sibley, University of Leeds. Email: D.Sibley@leeds.ac.uk; *Contamination and the production of space in a prison environment*

The literature on the organisation of space in institutions has focused primarily on the controlling regime - prisons, for example, represented as Foucauldian disciplinary spaces where, as Thomas Markus puts it, 'residents' (correctional officers) produce space for 'visitors' (prisoners). Our research, however, suggests that, in the context of the disciplinary regime, inmates also produce their own spaces. In this paper, based on interviews with inmates in a dormitory space in a prison in New Mexico, we assess the affects of anxieties about contamination on space-time routines. We argue that these anxieties are fundamentally about racialised difference and sexuality but they are manifest in a discourse of disgust and practices of distanciation. The ways in which prisoners produce space can be seen as a means of coping with uncertainties in a weakly framed environment (the dormitory) but also as a means of subverting the disciplinary regime.

Willem J.D. Van Leeuwen, Dr., University of Arizona. Email: leeuw@ag.arizona.edu; Jennifer Davison, University of Arizona. Email: davisonj@email.arizona.edu; Grant Casady, University of Arizona. Email: gcasady@email.arizona.edu; Stuart Marsh, Dr., University of Arizona. Email: smارش@Ag.arizona.edu; *Satellite Derived Vegetation Phenology For A Sky Island In Arizona*

Current climate change and variability in the Southwestern US has resulted in prolonged drought events and wildfire disturbances and is shifting the timing of vegetation life cycle events (vegetation phenology). Phenology has significant

ecological and socio-economic consequences on, for example, forest and agricultural productivity and planning, occurrence of diseases and pests, and tourism. Understanding inter-annual and seasonal vegetation phenological metrics (Pheno-metrics: beginning, peak, and duration of growing season, magnitude, seasonality) derived from MODIS NDVI (Moderate Resolution Imaging Spectroradiometer - Normalized Difference Vegetation Index) time series data will allow for the detection and prediction of climate and environmental changes or trends. To analyze the available NDVI time series satellite data (2000-2006), a smoothing filter and fitting function were applied to reduce residual noise and derive pheno-metrics along an elevation gradient and variety of land cover types in the Santa Rita Mountains in Arizona. The resulting pheno-metrics were related to vegetation types, elevation gradients, precipitation and air temperature. Timing and effects of drought and wildfire significantly affected the pheno-metrics and their spatial distribution in different ways each year. Visualization of the patterns in vegetation phenological information in combination with temporal vegetation greenness data provides a tool for monitoring inter-annual and seasonal growth and post-wildfire vegetation recovery. Improved integration of phenology monitoring networks that include phenology observations in concert with meteorological, environmental and remotely sensed data are being coordinated by the National Phenology Network.

Keywords: Remote sensing, phenology, vegetation dynamics

In liberal welfare states such as the United States, the private sector has long played a prominent role in the production and utilization of the urban outdoors. In other countries like the Netherlands, the involvement of the private sector in urban development has not been that evident. Large-scale redevelopments of public space in which the private sector played a key role only came about since the 1990s. The Beurstraverse, a retail complex in the centre of Rotterdam that opened in 1996, was one of the first projects realised within a public-private partnership. The paper first sketches the backgrounds of this pioneering development: who were involved, what were their motives, and how has their involvement affected the public space? The paper then turns to three projects in other Dutch cities: the Burgemeester Loeffplein ('s Hertogenbosch), Statenplein (Dordrecht), and Van Heekplein (Enschede) that were also redeveloped jointly by local authorities and the private sector. The four projects are compared with each other in order to identify differences and similarities with regard to levels of private-sector involvement and the design and management of public space. Which common characteristics do these 'public-private' spaces have (e.g., with regard to design, intensity of surveillance, the strictness of regulation, level of exclusion, etc.). Do similarities point at learning from experience (i.e., applying insights from the same best-case practices)? Conversely, can differences be related to variations in local contingencies? These are the questions we would like to address in our paper and presentation.

Keywords: production of public space, private sector, redevelopment, Dutch cities

Micheline van Riemsdijk, University of Colorado. Email: vanriems@colorado.edu; *Spatializing Race: National Imaginaries of Whiteness in Norway*

Norway has commonly been regarded a racially and ethnically highly homogenous country, even though considerable numbers of migrants have settled in Norway since the 1970s. Norwegian migration debates have mainly focused on visible minorities from countries outside Europe, but this has started to change with the recent EU membership of countries from East-Central Europe (EU-8). Since May 2004, Norway has experienced a significant increase of migrants from the new accession countries. Media debates in Norway have mainly focused on unskilled migrants from the EU-8, and many fear that these migrants will undercut wages in Norway. However, little attention has been paid to skilled migrants from the EU-8. This paper will investigate the perceptions of Norwegians towards skilled white migrants, specifically Polish nurses in Norway. Poles don't fit in with perceptions of white privilege, and Polish migrants often experience deskilling in Norway. This paper aims to contribute to whiteness studies by focusing on an under-researched area, namely Norway. Most research on whiteness has been conducted in the US and the UK, and so far we know little about how whiteness operates in countries without a colonial history. In the case of Polish skilled migrants, markers of difference are mostly based on ethnicity, class and gender, underlining differences between Norwegians and Poles. This paper builds on literatures on poor rural whites and white privilege, as well as theories on processes of identity formation within the recently expanded EU.

Jan Van Weesep, University of Utrecht. Email: JWeesep@ucu.uu.nl; The 'Change of System' and the evolution of gentrification in Budapest

The 1980s renovation policy in the former Jewish ghetto in the 7th District of Inner Budapest has been dubbed an example of socialist gentrification because of its effects. By that time, public policy had abandoned its social equality principles; consequently, the new rental apartments were allocated to households who could afford the relatively high rents by the three public housing agencies involved. This early example of gentrification-promoting policy has become a full-blown development since the change of system. Along with the privatization of the housing stock, some inner-district governments have almost completely abandoned their social housing policy. The effects are clearly visible: while the innermost parts of the districts tend to gentrify, the residential complexes in the 'rust belt' further out are severely deteriorating. Yet other districts having retained significant numbers of social housing were thereby able to establish the conditions for PPP-based regeneration, leading to a significant population displacement. But a closer look reveals an even more intricate pattern for the entire inner city that can be described and understood by applying the perspective of critical realism. This offers insight in the emerging variations between and within the districts.

Keywords: gentrification, change of system, public policy, Budapest

Barbara Francesca Van Wijnendaele, Brunel University. Email: barbara.van.wijnendaele@brunel.ac.uk; Youth, Participation and Empowerment in El Salvador

My research focuses on participatory action research with poor young people in San Salvador as a potentially empowering endeavour and a possible site of resistance. Beside structural violence, criminal violence has become the main preoccupation in El Salvador. Particularly prolific in this country, and much of Central America, is the phenomenon of youth gangs. The growing focus on youth as victimisers has resulted in a climate of distrust and suspicion towards young people. In El Salvador, young poor people are the most marginalized group in an adult-centred society, being the main victims of structural and social violence and very much stigmatized. Given this constraining context they live in, what are young poor people's opportunities and capacities to resist the general stigmatizing discourse and what are their opportunities to be actors of social change? To what extent do participatory approaches, such as action research, offer young people a possibility for genuine empowerment and progressive resistance and what are the opportunities and constraints? Participation has become a buzzword in development but nevertheless has been strongly criticised for not complying with its promise of empowerment and social transformation. Participatory approaches are reproached for having been unable to address power relations and politics, focussing too much on 'the local' at the cost of broader structural relations of injustice. Yet, concepts of empowerment and social change are inevitably linked to theories of power and resistance and therefore, participatory approaches with young people, to be credible, must also theorise and confront issues of power and politics.

Keywords: youth, social exclusion, empowerment

Anneliese L. Vance, Ph.D. Candidate, SUNY University at Buffalo. Email: alvance@buffalo.edu; Cross-border supply chains and antiterrorism border legislation: the story of Canadian and U.S. businesses in a bi-national region.

The permeability of the Canada-US border has long been reason for both concern and celebration. The multifaceted and complex relationship shared by the two countries includes the world's largest bilateral trading relationship, and with this a complex system of interdependencies on the level of the firm. The terrorist attacks of 2001 brought the permeability of the border to the forefront of public discourse in the US?both from the standpoint of possible security concerns as well as concerns surrounding the continued flow of trade. Since 2001, the discourse has shifted, along with Canadian and US border policies, toward goals of achieving and maintaining dual goals of keeping the "bad guys out" while enhancing the efficiency of cross-border trade and transportation. This study explores the effectiveness of new border management regulations at achieving efficient movement of people and goods across the border within the context of new antiterrorism legislation. Firms on both sides of the Canada-US border within the bi-national region of Niagara indicated in a 2004 study that they were negatively impacted by antiterrorism legislation. During the summer of 2006, the same firms were interviewed regarding their strategies to minimize the impact of negative externalities. Firm executives collectively tell a story of learning curves, strategy, and changing dynamics within their cross-border supply chains.

Keywords: Canada, border, supply chain, regulation

Tiffany C. Vance, Oregon State University/NOAA. Email: vancet@geo.orst.edu; Christopher Moore, NOAA-PMEL/UW-JISAO. Email: christopher.moore@noaa.gov; GeoFish - linking fisheries models with GIS

Ideally, spatial ecological models should be easily linked to a geographic information system (GIS). In the past, these two have not been well integrated for scientific uses. In creating GeoModeler, we have provided a prototype of how one might integrate a GIS with a number of oceanographic and fisheries models. With this tool, scientists and managers are able to use a graphical interface to display datasets, select the data to be used in a scenario, set the weights for factors in the model and execute the model. The results are returned to the GIS for display and spatial analysis. The project creates a framework for linking to other types of back-end fisheries, oceanographic, and ecosystem models written in a variety of programming languages. The final goal is an application to visualize and analyze the results of two fisheries models; a model for predator-prey interactions and a model to look at the effects of climate change on the recruitment of an economically important fish species. The first model is an individual-based model (IBM) that models the fate of individuals using characteristics such as age, size and prey consumption. The second model is a nutrient-phytoplankton-zooplankton (NPZ) model looking at the effects of climate change on the early life history of fish.

Robert M. Vanderbeck, University of Leeds. Email: r.vanderbeck@leeds.ac.uk; Less than the sum of its parts? Reflections on theory, relevance, and debate in 'children's geographies'

There has been a recent flurry of debate over the status of theory within the subdiscipline of children's geographies. This is a remarkable and important development within a rather polite subdiscipline where sustained debate or controversy of any kind is rare. In this paper, I question why this debate has emerged at the present moment, suggesting that it originates in an insecurity about the place of children's geographies within the wider discipline (a point made by several other recent commentators). Others have suggested, for example, that 'children's geographers' need to be clearer about how a focus on childhood and youth can inform work on globalization, critical geopolitics, and non-representational theory, among other areas. However, contrary to most other accounts, I argue that lack of engagement with broader theoretical debates in other subfields has been far from the only (or even the main) issue holding children's geographies back. Rather, I argue that there are key deficiencies in how we conceptualise core issues within the subdiscipline that keeps it from influencing a larger audience. I focus on several examples (drawing on my own empirical research) including conceptualisations of children's agency; the nature of intergenerational relationships; and the relationship between childhood and the state. These are but a few of the core subdisciplinary issues that need to be debated in a more sophisticated way if children's geographies is to equal more than the sum of its individual parts.

Keywords: children, relevance, theory

Kelly J Vanderbrink, Pennsylvania State University. Email: kjb115@psu.edu; Assessing Scientific Information Needs for Carbon Sequestration in Pennsylvania Forests

Policy-makers tasked with developing and implementing carbon sequestration initiatives rely on a stream of usable information from the research community in order to successfully achieve established goals. However, there is a fundamental disconnect between the needs of policy-makers and the design, conduct and dissemination of carbon cycle research. For example, much of the knowledge concerning carbon uptake in forest stands is derived from various aged stands on plots smaller than one square kilometer. This information is not easily extrapolated to the larger scales at which management decisions are made. Concurrently, remotely-sensed images of the forest dynamics relevant to carbon uptake are often only available at scales too coarse to assist in practical management decisions. The aim of this research is to improve the information flow between research and program managers responsible for designing and implementing carbon sequestration initiatives. To accomplish this goal a collaborative approach was used which involved participating in the development of the Pennsylvania DCNR's carbon sequestration initiative. Information regarding decision-maker needs will be collected using a preference based methodology called conjoint analysis. This methodology is ideal because it quantifies qualitative information focusing on value placed on specific attributes. In addition to highlighting user preferences, conjoint analysis also focuses on the tradeoffs made while assessing the utility of information. The rankings are used to develop a quantitative decision model of utility/preference for certain bundles of information concerning carbon sequestration. This work will open communication between the carbon sequestration community in Pennsylvania and the research community.

Jan Vang, Circle and Copenhagen Institute of Technology. Email: jan.vang-lauridsen@circle.lu.se; *Policy, Competitiveness and the State in Creative Industries*

Studies on the spatial organization of so-called creative industries have exploded the last decade. This has resulted in an impressive amount of research on the clustering of creative industries, their reliance on buzz and why they are based on projects, and so forth. This literature has, however, neglected paying attention to the role of the state; especially in studies on the film industry; the film industry has been dominated by transaction cost-inspired cluster studies. The extent to which the state is integrated in research on the creative industries is done in an ad-hoc manner. This is a problem as the state plays a central role in constructing competitiveness in many creative industries, especially film industries outside Hollywood. Based on an original empirical study of the Danish film industry, which, both in terms of awards and market shares, has enhanced its competitiveness significantly the last decade, this paper analyses the role the state has played in this process. The findings suggest that the precondition for improved competitiveness is the development of a state-based development model which displays a high degree of systeminess.

Jeffrey A VanLooy, University Of Utah. Email: jeffrey.vanlooy@geog.utah.edu; **Richard R Forster, Ph.D., University of Utah. Email:** rick.forster@geog.utah.edu; *Determining Recent Melt Rates and Potential Sea Level Rise Contribution of Five Southwest British Columbia Icefields.*

Mountain glaciers around the world are important contributors to sea level rise even though they contain only a small percentage of the world's glacial ice. Due to societal concerns of climate change and sea level rise it is important to understand in more detail how glacial melting will affect the world's oceans. However, accurately monitoring glacial changes through mass balance studies on the ground is difficult due to their remoteness. This study has employed remote sensing techniques and methods using Shuttle Radar Topography Mission (SRTM from 2000) and Canadian Center for Topographic Information (CTI from mid-1980s) Digital Elevation Model (DEM) data to monitor glacial changes likely caused by regional climate changes. Using these remote sensing methods allows for a better understand of the relationship between sea level rise and glacial melting of five icefields in southwest British Columbia, a very little studied but significant mountain glacier area.

Barry Aron Vann, PhD, EdD, Lincoln Memorial University. Email: barry_vann@yahoo.com; *Ethno-religious Policies of the Plantation of Ulster, 1590-1690*

The settlement of Protestants in Ulster during the seventeenth century was certainly a manifest function of the Jacobean Plantation scheme, but it unleashed latent functions that ignited and diffused, in the manner of J. K. Wright, "geotheological" imagings that were inspired by the Melvillian notion of "two kingdoms". Michael Perceval-Maxwell metaphorically described the king's policy and its result by noting that "he used Scottish earth for his purpose, in which the seeds of Presbyterian doctrine lay buried. Even some of the Scottish gardeners he employed preferred Presbyterian weeds to Episcopalian flowers. Thus what grew bore little resemblance to that image envisioned by the designer". This study demonstrates that the Scottish Presbyterian seed in Ireland was fertilized and watered by the theology of Calvinists in Geneva and Puritans in England and pruned by their lack of uniformity on issues of polity. This moved the newly formed Ulster Scots community further away from the ideal immigrant population imagined by the king. By examining extant sermons, statements of faith, the National Covenant, and letters, this research explores this process and shows how the dissenting religious leaders and, by extension, their followers embraced an ethnic identity at the popular level, with the primary base for this identity a religious system that incorporated structures of worship, spirituality, political discourse, and a proclivity toward schism, which of course impacted the community's ecclesiastical affiliations and political and national allegiances.

Email:** rcammack@mail.unomaha.edu; *Spatial Patterns Of Thyroid Cancer In Nebraska: Exploring Possible Environmental*

Relationships

In 2006, it is estimated that more than 31,000 Americans and over 160 Nebraskans will be diagnosed with thyroid cancer, and occurrences are rising each year. The thyroid is an endocrine gland that produces and stores hormones that affect metabolism, heart rate, and blood pressure, as well as growth and development in children. Chemicals with low estrogenic activity, or xenoestrogens, mimic estrogen activity in the body and cause endocrine disruption. Xenoestrogens are found in some classes of pesticides, herbicides, fertilizers, solvents, detergents, industrial chemicals, and other chemical wastes. Animal studies have determined that prolonged exposure to xenoestrogens in drinking water will increase the risk of thyroid cancer. Chronic exposure to xenoestrogens and bioaccumulation in the thyroid may lead to cancer. Drinking-water contamination easily occurs with even very low amounts of chemical use in vulnerable soil regions. Previous research shows that in the Nebraska Sand Hills, groundwater contamination occurs via the highly permeable soils with little organic matter (sandy, loamy, and sandy loam) and a shallow water table. For this study, exploratory data analysis is being used to assess spatial patterns of thyroid cancer incidence in Nebraska from 1987 through 2003. This work focuses on establishing a spatial relationship between thyroid cancer rates and environmental conditions, particularly exposure to xenoestrogens in Nebraska's drinking water.

Dalia Varanka, United States Geological Survey. Email: dvaranka@usgs.gov; *Effects of Raster Resolution Changes on Agricultural Non-point Source Pollution Modeling Output*

The objective of this study is to measure the effects of changes in pixel resolution of different Agricultural Non-point Source Pollution (AGNPS) model output data files on output parameter values. Changes in resolution do not change the total output, so variability was expected to be found in the changing relation between levels of generalization per pixel. The pixels of three input file types - land-use, elevation, and soils - were categorized by the majority of the signature captured at 30-meter resolution. The nearest neighbor technique is used to down sample the resolution to 210 meters and 1,920 meters. The 22 input parameters of the model derived from the 3 input files assume the resolutions and generalizations from the input files at 30 meters, 210 meters, and 1,920 meters. Output pixels from the 51 output parameters generated by the model were categorized using the Jenks optimal classification algorithm. Preliminary results were tested by combining output categorization values for soluble nitrogen and soluble phosphorus in cross-tabulation with land-use input values. Graphs of these results suggest that pollution measurements appeared lowest at 30 meter resolution, and appeared higher, but still somewhat evenly distributed at 210 meters resolution. Results showed that at the greatest resolution, of 1,920 meters, pollution levels were clustered and uneven. Results will be discussed in the context of published findings of other related research.

Keywords: raster resolution, AGNPS model, modeling - non-point source pollution

Ann Varley, UCL (University College London). Email: a.varley@geog.ucl.ac.uk; *Gender and property rights: debates from Latin America and Africa*

The importance of land rights for women is well established as a development issue. International agencies argue that ensuring gender equality in market-focused legal reform constitutes a key strategy for expanding women's rights. The World Bank and other agencies, including Hernando de Soto's Institute of Liberty and Democracy, have promoted property titling programs on a massive scale in both rural and urban areas. In Latin America the results have been described as constituting a decisive moment in the history of property rights. De Soto has recently turned his attention to Africa, renewing debates about individual title versus more flexible approaches to land management building on customary practices. The proponents of 'informal formalization' support intermediate forms of tenure, group title, and an emphasis on local authorities, on the grounds that rights are socially embedded. They also argue that titling is against women's interests since it provides an opportunity for men to gain exclusive control over property. Using evidence from Mexico, this paper argues that titling programs relying on equal rights within marriage to protect women's housing rights are likely to do them a disservice, particularly in the light of divergent popular understandings of property. Those promoting alternative approaches to property in African cities have however failed to engage with concerns about the gender implications of customary tenure in rural areas expressed by feminist scholars and activists. This paper questions the ability of either approach to address gender inequalities effectively but suggests that informal responses within state institutions can sometimes help.

Keywords: Gender, property, rights, housing, tenure

Darcy Varney, University of Colorado. Email: darcy.varney@colorado.edu; *Situating Young People in Urban Planning and Design: Lessons from the Denver Skate Park*

The Children, Youth and Environments Center for Research and Design at the University of Colorado recently began working with the City of Denver and other partners to make Denver a "child/youth-friendly city." A key component of the "child/youth-friendly city" concept is the right of young people to participate in decisions that affect their lives, including decisions about the design and use of public space. Where public space is constructed as economically valuable, adult-oriented or important for the promotion of civic agendas, however, young people may be implicitly or explicitly excluded from participating in its design or redevelopment. Young people's participation frequently centers instead around spaces that "ghettoize" their activity, or effectively remove them from the dynamic life of the city. It can be instructive to analyze participatory efforts focused on dedicated spaces for young people, to gain insight into how adult planners, designers, government leaders and citizens conceptualize young people's needs and competencies in the urban environment. One such case is the development of Denver's free public skateboarding park, in which youth were significantly involved. This paper focuses on the youth-adult partnerships and city government practices employed to produce the skate park, drawing from media reports, planning documents and interviews with key participants to discern what happened throughout the process and to provide rich background information for the Denver "child/youth-friendly city" initiative. The findings have implications for approaches to planned projects in Denver and for understanding challenges to environmental justice for young people in the city.

Monica W. Varsanyi, Arizona State University. Email: Monica.Varsanyi@asu.edu; *Unauthorized Migration and the Expansion of Neoliberal Local Membership in the United States*

Unauthorized migrants are now settling in communities throughout the United States, from Dodge City, Kansas to Atlanta, Georgia, thus bringing the phenomenon of "illegal immigration" to communities which had never previously grappled with the issue. As a consequence of this reality, as well as federal foot-dragging on the question of comprehensive immigration reform, many of these communities are starting to formulate and adopt local "membership" policies, such as local noncitizen suffrage; the acceptance, in a variety of cities, counties, and states, of the Mexican matricula consular as a valid form of identification; and allowing undocumented college students access to in-state tuition at public universities. This paper argues that these local policies represent a partial rescaling of membership policy, which enables the nation-state to better manage what political theorist, James Hollifield, calls the "liberal paradox," or the growing tension between neoliberal economic openness and the continued necessity of national political closure. By allowing the rescaling of migration and membership policy to subnational scales (in other words, by allowing subnational communities to formulate neoliberal membership policies which are local, partial, decentralized, and contingent) the federal government can negotiate the liberal paradox without having to choose economic closure (and a resulting decrease in the movement of people) or political openness (significantly liberalizing access to membership, or citizenship, in the nation-state). This emerging neoliberal membership regime enables the presence and residence of undocumented migrants within subnational communities without giving them firm and permanent purchase in the United States.

Keywords: Undocumented immigration, neoliberalism, scale, citizenship, membership, federalism

Liana Tuttle Vasseur, University of Kentucky. Email: ltvass2@uky.edu; *Coastal landscapes: land, sea, and the boundaries of Cuban migration*

This paper questions the concepts of "land" and "sea" that have informed the legal definition of coastal boundaries in South Florida. I consider the "wet foot/dry foot" policy that governs illegal Cuban migration into the United States. Since the policy's inception in the mid 1990s, it has proved controversial?it specifies that migrants who leave Cuba illegally may enter the US legally if they reach "land", while those intercepted at "sea" will be repatriated. The policy assumes a binary of "land" and "sea" through which it attempts to fix a political boundary. The instability of this distinction was demonstrated in January 2005, when a group of illegal Cuban migrants landed on the old Seven Mile Bridge, which once linked two islands in the Florida Keys. A court case was required to determine whether the derelict bridge counted as "land" or "sea", and hence to determine the legal status of the migrants involved. This case illustrates the inherent difficulty of fixing a coastal boundary, and it demonstrates how individual migrants can affect the politics of coastal landscapes and migration policy.

Keywords: landscape, migration, coasts

Alexander P. Vasudevan, Dr., University Of Nottingham. Email: alexanpv@hotmail.com; *Choreographing the City: Gestural Geographies and Performance Cultures in Weimar Germany*

This paper explores the development of modern dance in Germany during the Weimar Republic. It draws attention to the wide repertoire of dance practices which took the city and metropolitan life as such as a chorographical milieu through which to explore the new spaces and rhythms of modernity. Focusing on the work of Kurt Jooss and Oskar Schlemmer, the aim of this paper is to chart the cluster of techniques, dispositions, and performance styles which served to produce a kinaesthetic acumen suitable for registering and archiving the performance of urban modernity. In doing so, it seeks to show how particular congeries of movement, gesture, and touch were not only dependent on a whole host of real and imagined places but were themselves able to construct and re-fashion their own gestural geographies within the contours of a rapidly modernizing society. Theoretically, the paper proposes an historical geography of performance which insists on the possibility of writing about the 'undocumentable' event of performance, whether it be dance, music, or theatre. Ultimately, it argues for an approach to bodily performance and practice that demands an unusual archive, whose materials, in accommodating the performance of the modern, are themselves often ephemeral.

Keywords: Modern Dance, Weimar Germany, Performance and Geography, Gesture, Embodied Practice and the Archive

James W. Vaughan, AICP, Texas State University-San Marcos. Email: jv10@txstate.edu; *Sustainable Development: Does Planning Make a Difference?*

The sprawling pattern of urban growth in America imposes an ever-growing footprint on the environment at a time when planners call for "smart" growth, and geographers and ecologists warn that human demands on the resources and sinks of our global commons are not sustainable. Indeed, this morphology impacts the use of resources, the environment, transportation systems, and the way money is spent and time allocated. The Austin-San Antonio corridor in central Texas is a paradigmatic region which clearly displays the fundamental features and trends of rapidly changing urban systems in America. This research examines change, whether the evolving patterns are sustainable, and the effects that comprehensive planning has on development in the study area. Austin has a long history of promoting sustainable development and Smart Growth, whereas the policy of San Antonio reflects almost the antithesis of this philosophy. Do the growth dynamics and resulting morphology of these two urban systems reveal that "good" planning is effective, ineffective, or irrelevant in promoting sustainable development? I conclude that ecological planning and civic environmentalism are a way to increase the prospect of sustainable development. However the effectiveness of this process is limited unless there is a change in prevailing development practices to encompass an ethic of individual and community responsibility, and recognition of all aspects of land regardless of economic value.

Keywords: sprawl, planning, sustainable development, Texas-central, ethic-environment

Valerie Kay Vaughn, M.A., University of California, Davis. Email: vkvaughn@ucdavis.edu; *Sacred space in Shambhala Buddhism*

Scholars of American religious history and American Buddhism argue that the appeal of Tibetan Buddhism in the West was a historically-situated, demographically and geographically confined phenomenon. White patronage was often described as a fad for counter-culture, Baby Boomers repulsed by the cookie-cutter lifestyles of their post-World War II middle-class parents, inspired by the Civil Rights Movement, and mobilized by the Vietnam War. However, my research indicates that American Buddhist communities are continuously attracting new practitioners as well as retaining their 1970s "lifers". In fact, a recent study suggests that Buddhist teachings and principles have influenced more than 25 million Americans' spirituality. A December, 2005 National Geographic article announced that "Buddhism is no longer just for monks or Westerners with disposable time and income to dabble in things Eastern". Furthermore, the United States religious landscape is now seeing its first generation of White native-Buddhists. But how do these sects socially reproduce themselves? What are the characteristics of these means of social reproduction? How do landscape narratives facilitate social reproduction? What relationships are reinforced in the way of race, class and gender? Through critical ethnography, this paper shows how the sacred landscape embodies social stratification and creates meaning within Shambhala Buddhism. Shambhali's land narratives reflect paternalistic attitudes about Tibetanness and a cosmopolitan disdain for home while their social structure mimics and romanticizes the nuclear family as the unit for social organization. The findings of this research reflect possibilities in future interdisciplinary dialog between the fields of sociology and geography.

Keywords: sacred space, Tibetan Buddhism, landscape and meaning

Alessandra Vecchi, Dr, Trinity College Dublin. Email: vecchia@tcd.ie; Wickham James, Prof., Trinity College Dublin. Email: wickhamj@tcd.ie; *Clusters and Pipelines, Commuters and Nomads: Business travel in the Irish software industry.*

This paper uses research on business air travel to analyse the structure and functioning of business clusters through a case study of the Irish software industry in Dublin. Whereas most cluster studies have focused on the importance of geographical proximity for knowledge creation within the cluster, the importance of extra-cluster networking has only recently begun to receive some attention. Recent work for instance shows that particularly successful clusters are able to build and maintain a variety of “pipelines” with relevant hot-spots around the globe (Bathelt et. al., 2004). However this strand of work tends to “black box” the means whereby such pipelines are created. By using interviews with a sample of software managers and professionals, our paper investigates the particular forms of business travel generated by the software cluster in Dublin. The interviews generated data on both the role of business air travel for individual firms and on the travelling of the most mobile individuals within these firms. At the firm level our findings show that although international travel is crucial for Irish-owned firms, it is more extensive for foreign-owned firms, confirming the lack of linkages between foreign and indigenous firms in the cluster. At the individual level we differentiate between travellers who are commuters, explorers and nomads. Only the commuters travel along clearly defined ‘pipelines’; the travelling of both explorers and nomads shows how all elements of the cluster have more complex external connections than proposed by most of the cluster research literature.

Keywords: industrial cluster, business travel, globalisation, network

Gregory Veeck, Western Michigan University. Email: veeckg@wmich.edu; *Urban and Rural Conflicts and Contrasts in Inner Mongolia, PRC*

China’s Inner Mongolia Autonomous Region (IMAR) has frequently been cited for ambitious economic development policies that concentrate on privatization of commercial activities across sectors in conjunction with rapid state divestiture of publicly owned assets. Both the pace and scope of these policy initiatives make this relatively poor province unique among the arid provinces. Most of China’s other “developmental models” originate in wealthier, better endowed, areas of the East Coast. The IMAR model is important in that it must improve incomes and quality of life under the constraints of a very harsh environment. These policies are credited with raising IMAR’s per capita income to a rank of 21st of 31 first order units. While progress has been made, recent data reflects some important problems with the policies; specifically growing inequity between urban and rural places. Mean annual income in 2004 for urban residents of IMAR was 7,352 yuan (\$931.81), while the value for rural residents was only 31% of this (2,268 yuan/year or \$287.45). The time-series data used in the analyses are at banner/county/city scale and are derived from the state statistical bureau and the published annual yearbooks for selected years during the post-1978 reform era. Regression analysis is used to identify the independent variables that are associated with growing incomes across time and type of location (urban/rural). Results indicate a growing polarization between IMAR’s urban and rural places that extends beyond incomes, to a wide range of socio-economic indicators including access to health care, quality education, and investment capital.

Keywords: China, Inner Mongolia, Income, regression

Anthony J Vega, PhD, Clarion University. Email: avega@clarion.edu; *A Geographic Based OnLine Learning Paradigm*

The recent past introduced a new teaching pedagogy; online distance education. This pedagogy results from both technological innovations and changes in the higher education landscape. The National Center for Education Statistics estimates that between 14 and 20 million adult learners are enrolled in some form of continuing education. Many are involved in online distance education programs and courses and in response to this the number of distance education courses grew an astonishing 70% between 1997 and 1998. The trend is expected to continue with more colleges and universities offering more courses through online distance education, partly in response to an aging student marketplace, job re-training, and/or continuing education requirements. It is estimated that the number of college students 35 years and older will exceed the number of 18 and 19 year old students over this decade. In response to this recent trend, Clarion University joined the distance education fold through implementation of an E-University. This presentation describes the online academic landscape taking shape among the State System (PA) of Higher Education universities. Specifically, aspects are detailed concerning the teaching of geographic based courses over the past four years. Course goals, organization, online technology, the use of discussion board activities, WebQuests assignments, and evaluation methodologies are detailed. Further, general course benefits and pitfalls are discussed and reevaluated. General results indicates that distance

education methods not only supply a learning environment equal to traditional face-to-face courses, but in many cases online learning exceeds learning received through traditional methods.

Keywords: distance learning, geographic education, online learning

Miguel G. Velasco, United States Geological Survey. Email: mvelasco@usgs.gov; JoAnn Isbrecht, . Email: jisbrecht@usgs.gov; Pat Chavez, . Email: pchavez@usgs.gov; *High-Resolution Remote Sensing to Map and Monitor the Risk of Wildfires to the Wildland-Urban Interface*

In the Western United States there has been an increase in the number of people living near wildland areas. Severe drought and large bark beetle infestations, among other factors, has led to unhealthy forest conditions. These factors indicate the potential risk is increasing for catastrophic fires endangering communities. There is a need for high-resolution maps at the local scale to assist in management decisions to assess and minimize the risk to life and property before and during wildfire events. With increased spatial resolution in satellite and airborne digital imaging, remotely sensed image data are another tool to assist in the mapping and monitoring of parameters relating to wildfires. Our work is currently focused on the forested communities of northern Arizona. The primary remote sensing datasets being used are Quickbird satellite images with 0.6 m and 2.5 m resolution and U.S. Geological Survey digital airborne photography with 0.075 m and 0.150 m resolution. These data are being evaluated in the mapping of critical parameters related to wildfire vulnerability, such as percent canopy cover, large trees with potential correlation to old growth, and dead trees (old and recent). These data are also being used to investigate their potential for short- and long-term monitoring of the wildland-urban interface. The short-term evaluation is focusing on detecting and mapping annual vegetation and perennial grasses relating to fine fire fuels. Comparison of Quickbird satellite images with digitized historical aerial photography is being used to investigate detection of long-term change mostly related to coarse fire fuels and forest treatments.

Keywords: remote sensing, fires, satellite, wui

Nicholas Velluzzi, University of Washington. Email: nvelluzz@u.washington.edu; *Labor Market Intermediaries and the Institutions of Regional Economic Development*

Labor market intermediation consists of mechanisms or institutions that intercede between workers and producers. In one instance, labor market intermediaries (LMIs), such as temporary staffing agencies, operate on a national scale with local branch offices, facilitate the end of employer commitment to employee training, and fundamentally alter the employment relationship. On the other hand, LMIs can also be characterized as locally based, sector- or occupation-focused organizations that see skills development as a key part of their function. How do we understand these different organizational strategies? How can labor market interventions take such different forms? In what ways do they impact competitiveness in the learning economy? Though LMIs compose a crucial component in the institutional infrastructure of contemporary capitalism, their role in regional economic development is poorly understood. This paper will offer new ways to think about the role of institutional structure and operation in the development of human capital and social capital, or what is referred to as “communities of practice”. It provides new ways of understanding how organizations can influence institutional practices and opportunities for regional learning.

Basilio Verduzco-Chavez, Universidad De Guadalajara. Email: basiliiov@cucea.udg.mx; Antonio Sanchez-Bernal, Universidad de Guadalajara. Email: antonios@cucea.udg.mx; *Small Town, Big Project: the changing face of a community hosting the construction of a hydroelectric power plant.*

Hosting the construction of large infrastructure projects represents several social, economic and urban challenges for small communities. As a result of the inflow of people, money and vehicles, the small community suffers a sudden transformation of its image and socioeconomic outlook. This essay presents the case of a small town in western Mexico where the Federal Electric Commission -a national utility company- is planning to base part of its operations to build a hydroelectric power plant. The study shows that community changes may potentially transform a long lasting urban geography and social structure in a process that is not free of social tensions that demand new forms of consensus building and decision making at the local level.

Keywords: infrastructure, urban geography, consensus building, community development

Greg Veregin, University of Wyoming. Email: gveregin@uwyo.edu; *The interoperability of planning support systems in a rural land planning application*

Environmental changes that result from rural residential development are poorly understood. The loss of valuable farms and ranchlands, as well as animal habitat, faces the West the population increases. This paper offers an approach to understanding how the interoperability of two planning support systems can play a role in identifying development's effects on the environment. Different technologies allow the incorporation of diverse data sets for decision support, though questions of whether and how they can be integrated remain inadequately explored. These data can be used to protect working landscapes and biodiversity. Scenario-based studies offer a means to visualize the effects of specific trends extrapolated to the future. Analysis was undertaken to determine the benefits and drawbacks of combining different planning support technologies in scenarios for rural planning applications. Scenario forecasts were compared to assess their similarities and differences in a case study environment. Final analysis is predicted to reveal that integrating technologies with contrasting bases (indicator versus scenario) is better used for certain tasks than others. Each technology offers different functionalities which play roles in the planning process.

Luisa Veronis, University of Ottawa. Email: lveronis@uottawa.ca; *Immigrant NGOs and state restructuring in Toronto: Working with, through, and beyond the spaces of neoliberal governance*

This paper aims to better understand the new spaces for empowerment that emerge at the nexus of immigrant NGOs and neoliberal forms of governance. I do this by examining the experiences of the Hispanic Development Council (HDC), a nonprofit umbrella organization representing agencies serving Spanish-speaking migrants, in light of state restructuring in Toronto, Canada. As an advocacy organization providing almost no direct services, HDC struggled to survive in new conditions of governance. Nevertheless, it managed to remain operational and even to become more vocal with regard to local immigrant issues by developing three different kinds of networks: (1) a local network of immigrant service providers; (2) an intra-urban partnership with other umbrella organizations to voice ethnic/immigrant concerns in local politics; and (3) transnational collaborations for projects of international development with NGOs in Latin America. The three networks have been instrumental in allowing HDC to pursue local advocacy activities (through the first two networks) with funding from the federal government for its international projects (through the third network). Key to HDC's activities has been an effort to work with a diversity of actors and at different scales in order to address different aspects of restructuring both locally and globally. This paper contributes to the growing body of work dedicated to critically uncovering the limits and potentials for empowerment and resistance within the neoliberal spaces of governance.

Anna Versluis, Clark University. Email: aversluis@clarku.edu; *Land cover changes over three decades in a Haitian watershed*

While the level of deforestation in Haiti is frequently deplored, there are few land change studies that actually measure the amount, type and location of deforestation and other land cover change. Here I present the results of a land change analysis from one Haitian watershed over the past three decades. This particular watershed has experienced three highly fatal flood disasters in the last dozen years, and also is the main watershed feeding the Blanco River, in the neighboring Dominican Republic, which has likewise been the scene of a recent fatal flood disaster. Common wisdom from both the local and international communities suggests that deforestation in the watershed is a leading driver of these disasters, yet few basin-wide data exist to provide evidence to confirm or refute this understanding. To perform the land change analysis, I used data from Landsat imagery, aerial photographs, archival information, interviews and field research, and I used the combined image processing methods of spectral mixture analysis and classification trees.

Keywords: land change, remote sensing, Caribbean, Haiti

Alexander C. Vias, University Of Connecticut. Email: alexander.vias@uconn.edu; *Investigating Rural/Urban Health Disparities in the US*

A significant number of studies have shown that many health measures associated with mortality and morbidity have improved in rural areas. However, the same studies show that people living in rural areas of the US are generally less healthy than their urban counterparts. In addition, there are significant health disparities within rural areas along a number of socioeconomic dimensions. In this study I begin a research project on health disparities between rural and urban areas through an exploration of the recent literature on the topic. I also sketch out a number of important questions and issues that face researchers examining rural/urban health disparities. Finally, I discuss characteristics of a new research project

being developed by researchers at the University of Connecticut and the CT department of Public Health that will create new geo-coded databases on mortality and morbidity that will permit investigators to analyze some of these issues in the state of Connecticut.

Thomas Joseph Vicino, PhD, University of Texas-Arlington. Email: vicino@uta.edu; *Megalopolis 50 Years On: The Transformation of a Globalizing City Region*

This paper examines Megalopolis fifty years after Gottmann's seminal study of the most urbanized region of the U.S. Eastern Seaboard. His study provides an invaluable datum point, and we use it as a benchmark for reexamining the socio-spatial transformations of a city region. After redefining Megalopolis and showing major aggregate trends since 1950, we analyze 39 selected variables for place level census data for 2,353 places to perform a principal components analysis (PCA). Our analysis shows that the city region of Megalopolis remains a significant center for the nation's population and economic activity. A half-century of urban restructuring demonstrates that the forces of urban decentralization have made the region a more fully suburbanized agglomeration. We reveal a complex socioeconomic pattern of a vast urban area structured by class, education, housing tenure, housing age, and race and ethnicity. The cluster analysis reveals five distinct clusters of urban places identified by our PCA: "affluent places," "underclass places," "Black middle class places," "immigrant gateway places," and "middle America places."

Valerie A. Viehoff, University College London. Email: v.viehoff@ucl.ac.uk; *Water in Tangier. The long and rocky road to a modern water system*

This paper focuses on the water discourses which arose around the introduction of a modern water system in Tangier in the late 19th century. Despite the first proposals for a new water system dating back to the 1870s, none of the many projects put forward were ever executed until the 1920s. With

the help of historical documents from archives in Morocco, France and the USA we will try to trace the sinuous history of Tangier's water infrastructure. The "obstacles" preventing any decision being taken were political, cultural, ecological and social. They ranged from the opposed interpretations of the symbolic meaning of water, the protracted search for water sources and the national(istic) rivalries between foreign diplomats to general debates on public hygiene and sanitation. The breakthrough in finally introducing a new water system was as much due to the discovery of new water resources as to a shift in the balance of power in the international administration of Tangier after the implementation of the French "protectorate". Apart from reflecting changing power discourses, the debates over the introduction of a new water system also revealed fundamentally different ideas about the values and qualities of water, about its "right" use and its "fair" distribution. The paper starts from a generalized thesis of a clash of two opposing views on the nature of water - a gift from God in the eyes of the Moroccans as opposed to a simple commodity for the Europeans - and then proceeds to analyze and challenge this sweeping generalization.

Keywords: water, Morocco

David C. Viertel, Texas State University-San Marcos. Email: dv50188@txstate.edu; Remember the Alamo: Reproduction of Regional Identity Through Iconographic Form

Regional identity is created and reinforced by the repetition of symbols and narratives. Through the processes of historical interpretation and commodification, the Alamo has become a resonant icon in the Texas psyche. Physical manifestations of this regionalization process are examined in terms of business names, advertising and architecture in the San Antonio, Texas area. It is suggested that the role of the Alamo in the regional narrative has changed through time. At one point the structure stood as the archaic foil to modern development, but in recent years it has become a contextualizing element for the otherwise ubiquitous trappings of contemporary life. As generic global forms of style and design become increasingly dominant, references to the local or the perceived-authentic take on added significance. The shared past of the historical narrative becomes crystallized in the shopping centers and office parks of today. In the untethered cultural landscape of 21st century America, even formulaic architectural allusions serve to reinforce the concepts of commonality and identity.

Veeraraghavan Vijayaraj, GIST , ORNL. Email: vijayarajv@ornl.gov; Edward A. Bright, GIST , ORNL. Email: brightea@ornl.gov; Bhudendra L. Bhaduri, GIST , ORNL. Email: bhaduribl@ornl.gov; Automated Extraction of Urban Regions from High Resolution Satellite Imagery

Accurate geospatial modeling of urban land cover is challenging, and is essential to the population mapping efforts of the Oak Ridge National Laboratory (ORNL) LandScan population program. Currently, the LandScan team manually interprets high resolution (1-5 meter) imagery to augment urban maps that are based on medium (30 meter) to coarse (1 km) resolution satellite imagery. The goal of this research is to automate the extraction of urban regions from high resolution (0.6 -1 meter) satellite images. Previous research efforts analyzed Grey level co-occurrence based texture features and edge patterns using high performance computers to extract urban regions from huge volume of data. The algorithm produced promising results. As part of the ongoing research the algorithm was improved to use Gabor wavelet based texture features. The wavelet analysis produces a multiresolution framework in which urban texture can be analyzed at different scales and orientations. The Gabor wavelet representation is localized in space and frequency enabling to differentiate between different textures efficiently. The texture features were classified using an unsupervised clustering algorithm. The classification was further refined using spectral information to filter vegetation, water and shadow regions that were misclassified as urban. The computational performance and efficiency of using parallel processing was analyzed. The urban land cover maps produced were validated using manually interpreted images.

Keywords: Urban Mapping, High Performance Computing

Joaquin Villanueva, Syracuse University. Email: juaco_pr@yahoo.com; Spacing Conflict: Paris and the geography of violence

Responses to 'urban violence' by the French state fostered the production of new violent spaces in the city of Paris. French urban policy (politique de la ville) institutionalized after the 1981 riots in the suburbs of Lyon, has since identified more than 750 'sensitive neighborhoods', or 'neighborhoods at risk', around the French territory and more than 150 in the Parisian agglomeration alone. The designation of 'spaces of violence', mainly located in the periphery or banlieue of big cities, represents a legitimate factor for the deployment of public force against the (ethnic) population of relegated and excluded neighborhoods. French urban policy failed to address the social, political, and economic

fractures affecting the population of the banlieue, but succeeded in mapping the geography of violence. The radical differentiation between 'spaces of violence' (banlieue) and 'safe spaces' (center-city) aimed by the French state has proven to be ineffective in coping with acts of 'urban violence', epitomized by the November 2005 riots. By centering the analysis on the progression of French urban policy I show that the production of spaces of violence in Paris reproduce rather than prevent violent social relations among the young populations of the banlieue, mainly from immigrant origins.

Miguel Villarreal, University of Arizona. Email: miguel@email.arizona.edu; Resolving Burn Severity in Spruce-Fir/Mixed Conifer forests using Multitemporal High Resolution Satellite Imagery

Burn severity maps are critical for assessing post-fire habitat damage and identifying priority areas for restoration. The Nuttall-complex fire (June 2004) burned more than 29,000 acres of Mt. Graham AZ, including a significant amount of endangered Mount Graham red squirrel (*Tamiasciurus hudsonicus grahamensis*) habitat. We developed a burn severity classification that exploited both spatial and spectral information using high resolution, multitemporal Quickbird imagery. Textural change information derived from the 60 cm panchromatic data was merged with spectral information (NDVI differencing and principal components) from pre- and post-fire images. We compared our results with a Landsat TM-based Burned Area Reflectance Classification (BARC) map of the area and assessed accuracy with field-collected burn severity data. While spatial detail of the high-resolution burn severity map was superior to the BARC map, some misclassification was attributed to the spatial sensitivity of the Quickbird imagery, illumination discrepancies due to sun angle differences between image acquisition dates and the influence of pre-fire insect damage on classification.

Peter Vincent, Dr, Geography Department, Lancaster University, UK. Email: p.vincent@lancs.ac.uk; Geomorphic Evolution of the Arabian Shield and Marginal Cover Rocks

This presentation outlines some key events in the geomorphologic evolution of the Arabian Shield and marginal Lower Paleozoic cover rocks. Two key themes dominate the story: i) the erosion and stripping from the Precambrian basement of c.10,000 feet of sedimentary cover rock, and ii) the concomitant exhumation of fossil landscapes developed under wide ranging climatic regimes and plate positions. Cambrian, deeply weathered, exhumed, landscapes are exposed along much of the Shield's margin by the stripping of the Lower Paleozoic Wajid and Saq sandstones. These denudation surfaces (etchplains?) are vast and stretch south beyond Yemen and westward into North Africa. The mid-Ordovician glacial and periglacial Qassim and Sarah Formations have been exhumed by the removal of the Upper Paleozoic and Mesozoic cover. Remarkable examples of patterned ground, pingo scars, roches moutonnées, glacial striations and eskers are exposed. A second phase of deep weathering took place in the Cretaceous/Early Tertiary when north-east Gondwana had moved through the Equatorial zone and much of the cover rock had been deeply weathered and stripped by fluvial action. Mid-Tertiary uplift, associated with the opening of the Red Sea, finalized the stripping where surfaces were not protected by flood basalts (harraah). Subsequent erosion of the harraah has exposed a landscape of laterites and saprolites and granitic weathering fronts. Wadis draining these areas are choked with loessic alluvial silts, not completely wash from the fluvial system due to the onset of arid conditions (river end deposits).

Tara Vinodrai, University Of Toronto. Email: tara.vinodrai@utoronto.ca; Unpacking the proximity puzzle: Spaces of learning in Toronto's design community

The literature on innovation emphasizes the importance of local knowledge circulation to innovative dynamism. Yet, recent evidence suggests that non-local knowledge flows, taking place through distributed, dispersed and distanced networks, may also be important. In fact, some scholars have suggested that relational proximity, predicated on organizational similarity and occupational affinity, may be more important in facilitating the exchange and circulation of ideas, knowledge and practice than geographic closeness (Amin and Cohendet 2004). While 'proximity' matters, what kinds of proximity, how and when it matters remains the subject of some controversy. This paper addresses this debate by focusing on occupational communities to gain a better understanding of how the circulation of knowledge and practice takes place within specific occupationally-based 'networks of practices' (Brown and Duguid 2000). Using interview-based evidence, I interrogate the nature of learning and everyday practice amongst designers in Toronto. The analysis reveals that designers engage in a variety of spaces of learning and knowledge exchange, inside and outside of their

work environment. However, learning and the circulation of (tacit) knowledge remains localized due to the nature of designers' work, the spaces of learning in which designers engage, and the character of labour market mobility. Despite sharing a common institutional context, designers' ability to exchange (tacit) knowledge is limited due to the nature of their work, organizational barriers and other 'rules'. I conclude by suggesting that scholars need to be careful not to conflate the various dimensions of relational proximity in their analysis of learning, knowledge flows and innovation.

Leela Viswanathan, York University. Email: viswanle@yorku.ca; *Contesting Racialization: The Alternative Planning Group, cross-cultural collective identity, and the transformation of Toronto*

Racialized spaces in the city are "contested sites" whereby racial meanings and relations of power inform and challenge established understandings of the city. Thus, the racialization of space engages processes that are not only physical, but political and social. My paper exposes how Toronto as a city-space contributes to processes that racialize individuals and groups. My paper draws from my empirical case study of The Alternative Planning Group, or the Group, a collective of four social planning organizations among groups of Chinese, continental African, Latino-Hispanic, and South Asian communities in Toronto. As a cross-cultural collective, the Group contests the different racialization(s) of its diverse communities by developing a group identity that is based on shared oppression and the negotiation of differences. At the same time, the Group's shared identity contests racialization by reinventing existing norms and practices, particularly approaches to social planning, with new meanings, new understandings of the city, and on their own terms. The Group has formed a collective identity through its approaches to social planning that are politicized, practiced, experienced, and situated within and among their own immigrant and racialized communities. Consequently, both the Group's collective identity and its social planning approaches are always in the process of "being and becoming." My paper examines socio-spatial knowledge of cities and the transformation of the city from the standpoint of a cross-cultural collective of groups that are constitutive of racialized and immigrant communities in Toronto.

Celia Vives González, Grad Student, Department of Geography, University of British Columbia. Email: lunavg@interchange.ubc.ca; *Ambiguous paths towards political citizenship: the case of Argentinean-born immigrants in Spain.*

Spanish legislation regarding the acquisition of political citizenship has traditionally benefited nationals of the former colonies and persons of Spanish descent. However, entry into the European Union and increasing -and increasingly diverse? immigration flows have begun to challenge to this relationship of privilege. The case of the Argentinean community is exemplary of this process. This community, which has the highest rates of European ancestry and literacy of all non-European immigrant groups, is both privileged and proscribed by the narrowing channels towards the political integration of immigrants in Spain. In this presentation I will discuss the results of recent fieldwork in Spain that comprises more than 30 interviews with police officers, lawyers, elected politicians, academics, and Argentinean-born immigrants. My conclusions are three-fold: first, political citizenship remains a crucial aspect for the full integration of immigrants in the Spanish context. Second, there is a growing gap between nationality legislation itself, which benefits Latin American citizens and persons of Spanish descent, and the increasingly restrictive way in which that legislation is applied in the current context of growing hostility towards immigration. Finally, despite these obstacles that bar the way to immigrants' full integration, Argentineans still occupy a position of privilege, due to the easiness with which their social, cultural, and human capital can be transformed into political belonging to the Spanish nation-state.

Keywords: Immigration, political citizenship, Latin Americans, Spain.

Francisco Vivoni, University of Illinois at Urbana-Champaign. Email: vivoni@uiuc.edu; *Wild in the Streets: Skateboarding, Direct Action and Urban Unrest*

The quest for alternative social horizons continues through mounting dissatisfaction towards present day life conditions. Spearheaded by sporadic youthful insurgencies, direct action social movements with imagined political links to the Situationist International seek to undo corporate globalization. A performative framework from which to delve in and out of the complex narratives of resistance that dot the current milieu of unrest is concocted through an exposition of variations on the theme of skateboarding. Politics through play seek to intertwine the centrality of negation with the productive onslaught of creativity focused on the imperative of taking back the streets. This study locates street skateboarding as an alternative use of public space within a wide

gamut of direct action initiatives that challenge business as usual. The city as playground is explored as unintended consequence of capitalist accumulation. Through this study, I seek to broaden meaningful interpretations of the built environment in order to forward nuanced visions of embodied social change. The insights gained through the coupling of skateboarding and direct action are useful for framing future research through critical ethnography of the intersections of spatiality, democracy and public life.

Keywords: social movements, public space

Yvette Vlack, Kent State University. Email: yvlack@excite.com; *Reasons For The Seasons: Creating Hands-On Inquiry-Based Activities From Cookbook Labs*

Cookbook laboratory investigations have effectively removed the fundamental element of ingenious discovery from the classrooms. When used in a classroom setting, cookbook laboratories require students to only follow a set of perfunctory directions, hindering the development of concepts and higher order thinking skills beyond the mechanistic understanding. However, through the utilization of adaptive principles such as allowing students to design laboratory experiments, formulate hypotheses, and use prior knowledge to make predictions, lessons can be transformed from cookbook to inquiry. The mini-unit 'Reasons for the Seasons' was developed from multiple cookbook activities and modified to use inquiry techniques. The activities incorporated into this mini-unit investigate each of the potential explanations for seasons through laboratory activities in which quantitative data is obtained by students. From this data, students draw their own conclusions concerning which potential cause has the greatest impact on the Earth's seasons. Specific exercises call for students to investigate the angle of incoming solar radiation and then determine the change in solar radiation for perihelion and aphelion using flashlights, soccer balls, rulers, and overhead transparencies. Kinesthetic activities, combined with discussions, peer consultation, and critical analyses of results, provides an array of educational tools to reach and engage diverse learners. These techniques require that students incorporate higher order thinking skills such as inference, extrapolation, and implications into their schema, allowing for greater understanding and retention.

Robert A. Voeks, California State University Fullerton. Email: rvoeks@fullerton.edu; *Transformations in Biocultural Diversity: The Complex Case of Invasive Species*

Invasive species affect both biological and cultural systems. Although the ecological and economic impacts of biological invasions are increasingly apparent to scientists and policy makers, the cultural impacts of invasive species remain largely unexamined, and therefore unrecognized. We have yet to address critical questions such as: how have biological invasions impacted our social systems and cultural landscapes? Are these impacts entirely negative, as is the case in most ecological systems? Might biological invasions, seen through a socio-cultural lens, straddle a continuum of positive and negative aspects? This paper aims to identify and compare known cultural impacts of biological invasions by examining the socio-cultural and biogeographical dimensions of biological invasions worldwide. By comparing historical and current data on cross-cultural introductions of non-native species, we propose a conceptual framework delineating the differential cultural impacts of invasive species. In the case of "culturally enriching" invasives, the incorporation of non-native flora and fauna into local cuisines, pharmacopeias, rituals, and other traditional practices results in cultural expansion as new species are adopted and new traditions generated. "Culturally facilitating" invasive species, which precede or accompany human migrations, allow a level of continuity in traditional ethnobiological practices. In contrast, the appearance of "culturally impoverishing" invasive species in local environments leads to cultural contraction, i.e., the displacement of culturally important native species and associated traditions.

Keywords: ethnobotany, invasive species, biogeography, cultural geography

Eve Vogel, University of Oregon. Email: evevogel@uoregon.edu; *Do Japanese fisheries cooperatives promote social and ecological sustainability?*

Japanese fisheries cooperatives have often been held up as successful models of local community, common property management of natural resources. This paper, based on documentary and interview research, considers the influence of salmon fishing cooperatives in Hokkaido on social and ecological sustainability. Fisheries cooperatives are community-based groups with monopolies on salmon fishing in local near-shore waters, self-controlled membership, and tremendous influence on wider fisheries and fishing policy. The cooperative system is built on centuries-old traditions; the modern legal structure was built decades ago after rejection of the western individualized fishing model. Cooperatives are widely lauded as successfully supporting viable fishing livelihoods and vibrant fishing communities, as well as helping to manage fisheries sustainably. For this paper I asked: 1) Have fisheries cooperatives helped sustain salmon population,

biodiversity and ecosystems? and 2) Have salmon fishing cooperatives supported community and livelihood sustainability? I found that cooperatives help maintain salmon populations but are much less interested in biodiversity; and because they fish for chum salmon which may be released directly into the ocean from hatcheries, cooperatives have embraced an unrivaled national hatchery program while condoning widespread transformation of rivers into concrete canals. In contrast, cooperatives are undoubtedly socially beneficial. They have helped Japanese salmon fishermen to weather both national and global market pressures, sustaining both fishing livelihoods and communities.

Brandon J. Vogt, M.A., Doctoral Candidate, Arizona State University. Email: brandon.vogt@asu.edu; Robert Edsall, Ph.D., Arizona State University. Email: robedsall@asu.edu; Geovisualization of laser scanned images as a systemic strategy to aid in stone conservation

Rock art is an invaluable remnant of past cultures. Because it is, by definition, on rock, this cultural resource will ultimately disappear. Some rock art panels are in greater risk of loss than others. A critical step in the preservation of rock art is to develop an objective system for the classification of rock art panel's likelihood for decay, disintegration, or collapse. This paper describes a computer-based system for providing rock weathering experts a strategy to assess and rank rock instability. The identification, quantitative description, abundance, and condition of features such as fissures, textural variations, weathering rind erosion, and tafoni, - major indicators of rock instability - play a key role in the research. Multiple linked views (MLVs), an interactive and exploratory geovisualization technique, supports the project analyses.

Igor Vojnovic, Michigan State University. Email: vojnovic@msu.edu; The Urban Built Environment, Travel Behavior, and Physical Activity: A Michigan Context

Obesity is a leading health issue in the U.S., generating considerable health risks for large segments of the population. According to the Centers for Disease Control and Prevention (2004), approximately 37% of the U.S. adult population is overweight, and 22% of adults are obese. The State of Michigan has been leading national trends in obesity. Michigan ranks sixth in the U.S. in the proportion of population overweight and obese. Physical activity is considered an important variable in affecting overweight prevalence and associated health costs. In fact, the Governor's Council on Physical Fitness revealed that the cost of inactivity in Michigan was \$8.9 billion in 2002. In meeting physical activity objectives, analysts have recognized the role of urban form as one variable that might influence pedestrian activity. While the relationship between accessibility and non-motorized travel is well-known, much less is known of how variations in income, race, age, and gender affect pedestrian activity. The objectives of this research are to: measure neighborhood accessibility for two inner-city Lansing sites, quantify functional differences and the differences among these two sites compared to four suburban sites based on socioeconomic conditions and ethnicity; explore how perceptions of walking vary by income, race, age, and gender; explore whether inner-city residents are walking less in terms of distance and frequency than suburban residents; and explore the association between obesity, based on BMI, and walking, accessibility, income, race, age and gender.

Rainer Vom Hofe, University of Cincinnati. Email: rainer.vomhofe@uc.edu; Saurav Dev Bhatta, University of Illinois at Chicago. Email: sdbhatta@uic.edu; The Importance of Interregional Trade in Regional Cluster Analysis

Space always has been of major importance in industrial cluster analysis. However, defining geographic and/or industrial boundaries for analysis can be challenging given that inter-industry linkages are not confined to political boundaries. In the input-output literature, the question has been posed as one of choosing between a regional and a national framework. But neither framework captures non-local transactions, which may be particularly important for small study regions. This research presents an input-output and principal component analysis based methodology for identifying location-specific clusters that account for both local and non-local inter-industry transactions (i.e., commodity imports and exports by industry). Clusters identified using this methodology are referred to as domestic clusters. Using the Chicago region as a case study, it compares these domestic clusters with regional clusters identified on the basis of local inter-industry transactions alone. The comparison shows similarities as well as some significant differences between the two types of clusters, strengthening the argument that integrating non-local inter-industry transactions into applied

industrial cluster analysis is important for gaining a more complete picture of the industrial clusters in a region.

Keywords: Regional Industrial Cluster Analysis, Economic Geography

Jurgen Von Mahs, The New School - Eugene Lang College. Email: freiher@newschool.edu; The Geography of Homelessness in Post-Industrial Berlin

This paper seeks to explore how geography and the configuration of power-relations in different spaces both serves to enable and constrain homeless people's chances to effectively overcome homelessness depending on homeless people's distinct life courses and the extent to which they are affiliated with the societal mainstream. To conceptualize the geography of homeless people's daily lives and their long-term exit chances, I conducted a longitudinal ethnographic study of 28 single homeless adults in three service facilities in Berlin. Specifically, I examine the impact of punitive policies (i.e. criminalization and displacement) on homeless people survival strategies and mere existence in public spaces, the effects of the spatial distribution of service and shelter facilities (i.e. containment) on homeless people's social networks and their community ties, and the nature and extent of their daily and periodic mobility patterns with regards to their attempts to find jobs, housing, and social contacts. I will provide an argument that the conjunction of these different homeless geographies have an adverse impact on homeless people's exit chances in that they produce and reproduce multiple layers of social and spatial exclusion that ultimately prevent homeless people from moving out of homelessness and poverty. Identifying the multiple geographies of homelessness has important policy implications in that more attention is warranted to the spatiality of homeless people's lives and life chances.

Christiane Von Reichert, University of Montana. Email: Chris.vonReichert@mso.umt.edu; Regional Development Through Tourism in the Republic of Georgia

With the breakup of the Soviet Union, the Republic of Georgia moved from a relatively prosperous Soviet Republic to a struggling independent state. Geographically part of Asia, Georgia seeks to re-orient itself toward Europe, after she all but lost the ties to Russia. Located in the complex Caucasus region, it is culturally distant from its neighbors, such as Turkey and Azerbaijan, and geographically distant from its cultural and political allies, including Europe and the United States. This work draws on Fall 2006 field experience in the Republic of Georgia, a country known for natural beauty, rich culture, and warm hospitality. It explores the challenges that Georgians face, such as shortcomings in infrastructure. It also examines the economic opportunities that Georgians seek to grasp. A sector that holds promise for Georgia is tourism: the country possesses natural and cultural amenities that are suitable for developing niche tourism, including spa and wellness, outdoor and hiking, culinary, and cultural tours.

Keywords: Georgia-Republic-of, tourism, development

Tim Vorley, Said Business School, University of Oxford. Email: trv1@le.ac.uk; Marketisation of Academia: Corporate Universities and the Knowledge-Based Economy

Universities can be seen to have emerged as powerful actors acting as engines of the knowledge-based economy, referred to in terms of 'academic capitalism' or as 'corporate universities'. Although UK universities continue to remain public institutions prevailing regimes of neo-liberal government, and governance, continue to promote and perpetuate Third Mission ideologies of university and industrial/societal engagement. Amidst declining research incomes and the increasing emergence of third stream activities alongside teaching and research as a core mission of universities, the traditional view of the ivory tower university is necessarily changing. The marketisation of academia includes realising the economic potential of universities through various mechanisms of technology transfer and commercialisation, but also includes other forms of market engagement of which attracting students now constitutes an important dimension. The paper draws on two case studies examining an 'ancient university' of national significance and a 'new university' of local significance as corporate institutions to illustrate the importance of commercial engagement and the importance of institutional governance/management in promoting and achieving this. The changing perspectives and practices of academia have had a profound impact on the (corporate) knowledge-based economy, with statistics of university and industrial/societal engagement masking the variation in strategies, motives and forms of corporate institutional engagement.

Thomas Vought, Kansas State University. Email: tvought@ksu.edu; County-Level Geographic Threat Assessment of Biological Terrorism or Disease Outbreaks to U.S. Agriculture

Encompassing a vast area and consisting of a highly specialized and clustered enterprise, U.S. agriculture is extremely vulnerable to bioterrorism. Geographers have helped identify how place, culture, and environment are critical components to better understanding the causes of, and how to best respond to, terrorism. Unfortunately, while many geographers have described issues surrounding the defense of agricultural resources, fewer have undertaken practical research resulting in reduced vulnerability of food supply and production systems. This paper presents two equations for determining county-level vulnerability to agricultural bioterrorism. These equations are used to analyze the vulnerability of U.S. counties to bioterrorist attacks on ten major agricultural commodities. The emphasis is not on finding the individual counties that are most vulnerable to agricultural bioterrorism, but rather on identifying major clusters of high-vulnerability counties. This work can be used in conjunction with future studies to prepare local and regional authorities for quickly isolating outbreaks of agricultural diseases, whether such outbreaks are naturally occurring or human-induced. By better allocating limited resources to the most vulnerable areas, perhaps the threat of agricultural terrorism can be mitigated.

Keywords: hazards, terrorism, disease, agriculture,

Timothy Vowles, University of North Florida. Email: t.vowles@unf.edu; Spatial Domination of US Airlines

The goal of this paper is to determine the extent of spatial domination by US airlines over a five-year period (1998-2003). It reveals spatial domination is higher in the hinterland of hubs and therefore the smaller airports dominated by a particular carrier are subject to higher fares and nuisance (in the form of decreased access to the air transport network) when a carrier, US Airways for example, pulls down a hub. The paper examines the spatial results coming from the US Airways/America West merger. It also illustrates that although low cost carriers are to a degree flourishing in the United States their market dominance is somewhat spatially limited.

Keywords: Air Transport, Airline, Spatial Domination, Hub and Spoke, US Airways/America West merger

Vienne Vu, California State University Fullerton. Email: vienne79@gmail.com; Food as an Indicator of Vietnamese-American Cultural Change

Immigrants to the United States lose the culture of their homeland as they assimilate to the culture of their new country of residence. As new generations are born in the U.S., the culture of the homeland is reduced or lost as a result of the Americanization of the immigrant family. The generational spread of Vietnamese refugees and immigrants makes the ethnicity ideal for this study. There is a strong presence of recent first generation migrants who preserve the culture of the mother country to the best of their ability, while second and third generation Vietnamese Americans have maintained the culture to varying degrees. Language, food, dress, and religion are among the cultural traits that are lost as families assimilate. This study examines food as an indicator of cultural change. Some ethnic dishes are altered as a result of a lack of availability of ingredients that were available in the home country, and others are lost because the preparation of the dish is not learned by the newer generations or because the newer generations find the dishes distasteful. The amount of food that is kept by second and third generation Vietnamese Americans can be compared to those of the first generation to gauge how much of the original culture is lost.

Keywords: Food, migration, ethnicity

David J Wachal, City of Denton, Texas; University of North Texas. Email: david.wachal@cityofdenton.com; Kenneth E Banks, City of Denton, Texas. Email: kenneth.bank@cityofdenton.com; Runoff from Natural Gas Exploration and Production: Deriving a CN Value from Empirical Data

Over 30,000 natural gas wells are constructed nationwide each year. Natural gas exploration and production (NGE&P) disturbs several acres of land, increasing the potential for accelerated soil losses due to modifications of land cover, increased slopes, and concentration of flow. Assessment of soil losses from NGE&P sites can be conducted using water quality models. Many of the candidate models (CREAMS, EPIC, SWRRB, AGNPS, SWAT, KINEROS2, GWLF, and RUSLE2) use the USDA runoff curve number method to estimate surface runoff from rainfall. The method is sensitive to the curve number (CN), which is the parameter used to represent runoff potential. Since a 15-20% difference in the CN can result in a 50% difference in estimated runoff, a reliable estimate of CN is crucial for predicting soil losses using these models. Although CN values have been empirically derived for a wide range of land management conditions, these values are currently not available for NGE&P sites. The objective of this research is to estimate a CN value for NGE&P using rainfall and runoff data collected at three natural gas well sites located in North Central Texas. Specifi-

cally, this study applies two commonly used methodologies for deriving CN values from empirical data, compares their results, and discusses advantages, disadvantages, and techniques for evaluating confidence for each method. Developing a CN value specifically for NGE&P potentially provides a more reliable estimate of runoff, which will result in more accurate estimates of soil losses in future NGE&P water quality modeling assessments.

Alisa Wade, Colorado State University. Email: awade@cnr.colostate.edu; David Theobald, PhD, Colorado State University. Email: davet@warnernr.colostate.edu; Assessing Urbanization's Influence on Aquatic Systems Across Multiple Scales

As urbanization continues to expand across the landscape, it is critical that we understand the dynamic relationship between spatial arrangement of development patterns and influences on ecological processes. Because rivers integrate influences from throughout the entire hydrologic catchment, the study of aquatic systems provides an excellent opportunity to assess how urbanization affects natural systems. Modeling the relationship between catchment land use and aquatic system integrity requires consideration of three aspects of space: scale, neighborhoods, and distance. This research explores the first of the three spatial aspects, spatial scale. Defined here as the spatial extent of the study area considered, it is critical to any ecological analysis as different scales may result in different model inferences. The relationship between the physical environment and the biota may change depending on the scale of observation, and different processes dominate natural systems at different scales. Using Bayesian hierarchical modeling techniques to compare effects across multiple scales simultaneously, the research provides insight into how processes interact across scales and how this affects inferences about urbanization's influence on aquatic systems.

Vandana Wadhwa, PhD, University of Akron. Email: vandana.w@comcast.net; Lessons from the Dynamics of AIDS Awareness Among Indian Women: Case Studies, New Delhi and Hyderabad, India

Women are at inordinate risk of HIV/AIDS infection in India, mostly due to heterosexual transmission from spouses, who often have not or do not adhere to the rules of monogamy that are traditionally enforced upon women (Ghosh 2002). In a country that now has the greatest number of HIV/AIDS cases in the world (UNAIDS report 2006), this is a situation of great concern, and the issue of prevention becomes imperative. AIDS awareness is prerequisite to such prevention. Women in slum areas are particularly prone to being at risk for HIV/AIDS infection since they lack the literacy, urban infrastructural resources and empowerment to arm themselves with prevention tools, or in many cases, even awareness of the issue. The present study, made possible by an AAG Research Grant (2006), examines AIDS awareness and its attributes among slum women from two cities: Delhi and Hyderabad/Secunderabad, based on their similarities as large cities and dissimilarities with respect to AIDS incidence and awareness campaigns. The methodology is qualitative, culling data from structured and semi-structured interviews of slum women as well as government public health personnel immediately responsible for the slum. The preliminary analysis shows low levels of awareness in Delhi as compared to Hyderabad, and a combination of lack of awareness of prevention methods, and lack of autonomy to utilize these

methods. The analysis leads to policy implications for government action, greater NGO participation, and a case for greater empowerment of women, particularly in terms of their reproductive and sexual health.

Jacob A. Wagner, Ph.D., University of Missouri-Kansas City. Email: wagnerjaco@umkc.edu; *New Orleans as a Way of Life: Creole Urbanism*

New Orleans after the levee failure of 2005 is not a "clean slate." Despite the myriad proclamations that the city and its historic neighborhoods are a blank page, nothing could be further from the truth. This essay introduces the "creole urbanism" as a framework for understanding New Orleans and the specific features that have contributed to the city's urban culture. In order to link the New Orleans experience to a broader understanding of urban life we should analyze its particular urbanism. The concept of Creole Urbanism helps to explain the particular characteristics of New Orleans as a deeply urban place while also providing a framework for the restoration of the city in the post-levee failure era. What makes New Orleans rare among North American cities, and worth fighting for, is the city's creole urbanism: the everyday interplay between historic urban neighborhoods with a density of social life that promotes a unique street culture rooted in an ethos of assimilation and diversity. In Lefebvre's conceptualization, New Orleanians now find themselves at the center of a great "trial by space" in which competing ideologies are seeking dominance through the transformation of urban space (Lefebvre, 1991, p.416). Which vision of the future will be realized is a matter of practical politics unfolding daily. The concept of creole urbanism outlined in this essay defines the characteristics of New Orleans as a way of life - as lived space - in an effort to resist the tendency to homogenize the city and its neighborhoods.

David B. Wahl, United States Geological Survey. Email: dwahl@usgs.gov; *Evolution of a Neotropical Wetland: The Paleocology of Lago Paixban*

This paper will present the results of analyses carried out on a 6-meter sediment core from Lago Paixban, a perennial wetland in the northern Peten of Guatemala. Pollen, d13Corg, magnetic susceptibility, charcoal, and LOI have been used to track the evolution of this basin from 10,000 BP to present. Lack of fossil preservation in the basal sediments suggest drier conditions leading into the early Holocene followed by increased humidity and the presence of a shallow marsh by ~9000 BP. By 7400 BP an open-water lake occupied the basin. Around 5500 BP, lake levels dropped dramatically, indicated by a 1-m thick sapric peat horizon dominated by wetland taxa. The shift from lake to marsh at this time reflects the onset of drier conditions in the late Holocene. Anthropogenic impacts are evidenced by a dramatic increase of disturbance and agricultural taxa during the period of prehistoric Maya settlement. This interval, from ~3500-1100 BP, is marked by a 1-m thick horizon of calcareous clay marl, indicating a distinct change in local hydrology. Shortly after the area was abandoned, a perennial wetland dominated by sawgrass developed and has persisted to the present.

Eugene R Wahl, Alfred University. Email: wahle@alfred.edu; Caspar M Ammann, National Center for Atmospheric Research. Email: ammann@ucar.edu; *On Optimization of Last Millennium Climate Reconstructions*

Recent scientific issues with high-resolution (annual to sub-annual) millennial reconstructions of Northern Hemisphere (NH) temperatures have focused on the ability of reconstructions to capture the full amplitude of temperature variation. This issue has been addressed by new reconstructions and by a growing body of climate model-based studies. We performed a sequence of model-based analyses using the truncated empirical orthogonal function (EOF) method of climate field reconstruction (CFR) employed by Mann, Bradley, Hughes (MBH) and Luterbacher et al. to reconstruct global and European regional

climate fields, respectively. Preliminary results indicate that these methods reconstruct temperature variability with only relatively small losses of amplitude when the period over which they are calibrated has excursions reflecting the variability of the climate over the reconstruction period. The use of canonical regression (regressing principal components (PCs) of instrumental values on proxy PCs) exhibits somewhat better performance than the use of indirect regression (regressing proxies on instrumental PCs and then inverting this relationship to reconstruct the instrumental PCs based on proxy values). Improved performance is achieved by using a longer (~50%) time period for calibration (containing greater variability), even though the instrumental data density for this longer period is reduced ~80%. For the NH average, a simpler method (forming a composite of the proxy values and scaling this series to the mean and standard deviation of the calibration period temperature) performs even better, although it cannot reconstruct entire climate fields as can CFR methods. Performance of the regularized expectation maximization CFR method will also be explored.

Emma Wainwright, Brunel University. Email:

Emma.Wainwright@brunel.ac.uk; Elodie Marandet, Brunel University. Email: elodie.marandet@brunel.ac.uk; *'It gives you a lot: in your house, out there, with your children': mothers' belongings through participation in family learning.*

Family learning is now a major mode of education that sits within the UK learning market (Edwards, 1997). Aimed at encouraging social inclusion, family learning refers to formal programmes - often run in schools and nurseries - that engage parents in tackling educational under-achievement (DfES, 2003), encourage family members to learn together, and lead adults and children to pursue further learning (LSC, 2002). Although family type and composition vary, it is mainly mothers who participate in family learning, often as a first step into education after a period of childcare. Focusing on research undertaken with mothers on family learning courses in West London, many of whom are recent immigrants to the UK, this paper explores the motivations for and outcomes of participation in this type of learning. In particular, by drawing on Probyn's (1996) writings on 'belongings', the paper explores how the site of family learning is used to create, alter or expand a sense of belonging to a range of different spaces, including the home, school(s), community and neighbourhood, and how it precipitates general understandings of the 'British system'. Through these sites of belonging, the paper further explores how participation in family learning is tied to desired identities of 'good' mother, neighbour and citizen.

Joel D Wainwright, The Ohio State University. Email: wainwright.11@osu.edu; Trevor Barnes, University of British Columbia. Email: tbarnes@geog.ubc.ca; *The space-place distinction after Derrida*

This paper reconsiders the distinction between the concepts of space and place. We argue that, rather than prioritizing or favoring one side of the place-space debate?or attempting to do away with it by treating space and place dialectically?we should approach this distinction as a key site in (the play of) Western metaphysics. Our paper addresses the distinction and departs from recent attempts to supersede it by Anglo geographers. Drawing inspiration from Jacques Derrida, we discuss three key concepts that both derive from, and in turn structure, the space-place distinction: nature, economy, and temporality.

Keywords: dialectic, space, place

Louise Waite, University of Leeds. Email: l.waite@leeds.ac.uk; *Migrant labourers: The new 'precarious'?*

Despite the circulation of the French term *precarité* since the early 1990s, it is only recently that the neologism 'precarity' has been coined by English speakers and gained prominence in social movement struggles. Precarity has become particularly, although not exclusively, associated with casualisation and flexible exploitation in the labour market which therefore intimately touches the life-worlds of migrant workers. Although such insecurity is not a new experience for working classes, social activists suggest that the precarity labourers are feeling in the 21st century has different characteristics in that it is a product of intensifying trajectories of neo-liberalism and globalisation. This paper will explore what these different characteristics are, and what a geographical imagination can bring to an exploration of whether migrant labourers can and should be considered as the new 'precarious'; either within the proletariat or as a class in/for itself. It will interrogate the concepts of 'precarity' and 'precariousness' and deploy geographical frameworks, especially those of space and scale, to deepen our understanding of these concepts. In particular, the paper will suggest that precariousness of migrants' work is a complex and contested process that is refracted through subject positions to leave precarity as multi-faceted; for example, precarious labour practices can be interpreted as the oppressive face of

post-Fordist capitalism, but they may also contain potentialities that emanate from migrants' own agentic demands for flexibility. The paper will further explore what hope the concept of precarity may bring for strategies of migrants' resistance to hegemonic power.

Keywords: precarity, migrant labourers, neo-liberalism

Elizabeth M. Waithanji, Clark University, Graduate School of Geography. Email: ewaithanji@clarku.edu; *A Feminist Analysis of Sedentarization among Somali Nomads in North Eastern Kenya*

Reduction in residential mobility caused by sedentarization of nomads in Mandera Central Division of North Eastern Kenya provokes other mobilities that help shape and are shaped by gender relations in both sedentarizing communities and the sedentary communities that host them. This study is based on data collected in Mandera central in 2005 through focus group discussions and individual face-to-face interviews with 62 women and 61 men. The extreme competition for scarce resources after sedentarization leads to an out-migration of young men in search of employment elsewhere as older more powerful men restrict access to and control available resources. Because women are culturally restricted from out migrating, surplus marrying age women in the community leads to the erratic marriages and divorces in this polygamous Muslim society. The affected women resist their condition with hostility and through veiling and unveiling. The outcome of resistance by these women is more misery and poverty as they become exploited further by men from outside the community. There are two broad policy possibilities for reducing women's suffering identified here. First, a law could restrict men to a maximum of four living wives during their lifetime, and fathers could be forced to support both legitimate and illegitimate children. Second, to provide a basic livelihood, affected women could be employed in the recently identified potential food processing and packing facilities in times of food abundance.

Relational geographies demand rethinking place, subjectivities, and ethics through the body. We argue that environmental ethics is always more than how discourses are layered over place, by situating moral agency through the body's affective repertoire of being-in-the-world. At Uluru-Kata Tjuta National Park, Northern Territory, Australia, the joint management board is actively refashioning the normative moral terrain through extending a pedagogical arm of reconciliation to make all considerate visitors undergo an opportunity to respect Anangu law. In an effort to communicate to visitors an appropriate ethic for this moral terrain, we rethink scholarship on non-anthropocentric relational ethics to include a more complete picture of what is entailed by addressing the failure to account for environmental justice. Self-reflexive accounts of American students in a study-group are used to illustrate the dilemmas even the most well-prepared visitor has in negotiating moral pathways invoked by the policy of reconciliation. Problematizing the pedagogical arm of reconciliation are personal itineraries loaded with bodily memories of reliving the thrill derived from exploring or witnessing rock-places elsewhere, or expectations of a spiritual enlightenment.

Because numerous women join men in the arduous yet highly rewarding occupation of tree-planting, it allows for a unique study of the interplay of risk, edgework, the body and masculinities. Edgework involves pursuits or occupations

in which an experience of transcendence is achieved in part through skillful controlling of the body to persevere in risky situations. The edgework concept has been criticized for focusing overly on the experiences of men. Our data show, however, women often compete evenly with men in this physically grueling activity and that tree-planting provides a context for the embodiment of masculinities by women as well as men. Drawing from tree planters' articulated experiences in a set of open-focused interviews, we show how female and male planters are compelled to "toughen," to be independent, to control their bodies, to overcome risk, to display skill, and how these practices are oriented towards certain attitudes and ideals traditionally associated with the "masculine". We thus show how previous research on gender and edgework is problematized by the example of tree-planting. We argue further that, for both women and men, tree-planting generates the embodiment of a paradox sometimes present in edgework, as planting blends elements of escape from the late-modern urban world through skillful control of the body under conditions of risk with other elements of laborious monotony that push the body to exhaustion and often harm it severely. Tree-planting simultaneously produces a sense of release from the structural conditions of late-modernity even as it reproduces those structural conditions.

Jayne Walenta, Ph.D. Candidate, University of British Columbia. Email: jwalenta@interchange.ubc.ca; *"I used to work at Enron, but don't quote me on that": an economic geographer breaks silences on fieldwork*

"I used to work at Enron, but don't quote me on that"? My interview subjects never uttered these exact words to me during field research, but the scared looks, dead end contacts and overall reluctance to speak about Enron suggested as much to me. These frustrations characterized my trip to the field and left me with a sense of failure as a Ph.D. student and as an economic geographer. In turning to the sub-discipline for guidance in the practice of research, I was equally frustrated by the lack of conversation within economic geography regarding fieldwork. This dual set of silences, my difficulty in gaining access to interviews and information, and the lack of discussion within economic geography on the practices of research, open this paper. To begin, I briefly outline the ways in which the sub-discipline has approached the topic of methods and field research. In doing so, I suggest this literature scantily acknowledges fieldwork, thereby masking it as an academic practice. In turn, I look to studies written by feminist geographers, which explore the politics and practicalities of doing research. Then, using my own experiences in the field, and drawing from feminist methodologies and strategies, I offer launching points for more open discussions in economic geography regarding fieldwork.

David M. Walker, University of Kentucky. Email: dwalk2@uky.edu; *The adoration of La Santa Muerte, Vernacular Albuere, Spatial Politics and opposition to the Neoliberalization of Space in Mexico City's Historic Center*

In this paper I will present findings of a research project documenting the neoliberalization of space represented by gentrification in Mexico City's Historic Center. Particular attention will be given to how the re-production of space in the Historic Center is driven by the desire of the promoters and financiers of this gentrification project, under the rubric of 'roll-out' neoliberalization, to create an imagined, regal, neocolonial urban space. Juxtaposed to this task, I will then describe how the 'culture of fear' in Latin American urban centers coupled with examples of well organized vernacular, cultural/linguistic resistance and socio-spatial political resistance by opponents to gentrification have prevented the neoliberalization of space in the Centro Histórico. In addition, I will discuss how vernacular religion, in the form of the adoration of la Santa Muerte also works in the configuration of a counter-culture identity that resists the linear development policies of neoliberalization. Finally, I will introduce different ways of theorizing urban change in Latin America that complicate current theory on investment and flows, through a discussion of how the multiple examples of 'timespace' that exist in a post-colonial space such as Mexico City contribute to the reproduction of urban space in this locale and thwart attempts to neoliberalize the spaces where the residents and ambulantes of Mexico City's Centro Histórico have worked and lived for centuries.

David P Walker, University of Nevada, Reno. Email: walker73@unr.nevada.edu; *Climate variability and avalanches at two sites in the Northeastern Sierra Nevada Range*

This research will investigate avalanche activity and associated climate variables at two ski areas in the Sierra Nevada of California and Nevada. Mt. Rose and Mammoth Mountain ski areas are both on the eastern scarp of the Sierra Nevada and have nearly the same ranges of elevation, 7,900-9,700 feet and 7,953-11,053 feet respectively. They are separated by 1.7 degrees of latitude and about 124 miles. Both of these ski areas have collected and archived avalanche data for more than 20 years. Preliminary analysis of the data suggest that during a number of winter seasons both ski areas have increased avalanche activity while other winters exhibit avalanche activity that is high at one area and lower at the other. The research question for this study is: are the differences in seasonal avalanche frequency influenced by storm type? Preliminary findings suggest that Mammoth Mountain and Mt. Rose avalanche frequencies are in phase during winters with anomalously high pressure in the Gulf of Alaska. Storm tracks are much more meridional coming from the north during these winters as well. The winters when avalanche frequency at each area is out of phase the heights and storm tracks are markedly different from winters when avalanche frequency is in phase.

Gordon Walker, Lancaster University. Email: g.p.walker@lancaster.ac.uk; *Exploring the Complex Geographies of Pluralised Environmental Justice*

In evolving spatially, culturally and theoretically environmental justice is taking on a new plurality. The material and sociological themes of concern are extending far beyond pollution, risk and race. The spatio-cultural and institutional contexts in which justice claims are being made and justice-inequality-equity discourses are being articulated are globalising and becoming differentiated and diverse. The conceptualisation of what makes injustice is extending beyond the distributional to more fully recognise the multiplicity that is both needed and practised within environmental justice discourse (Scholsberg 2004). This paper considers the implications of the new pluralism for geographical analysis. In what ways does a geographical concern for understanding space, scale, place and temporality intertwine with a pluralised environmental justice in theory and praxis? Drawing on Harvey (1996) and on recent work in urban political ecology (Heynen et al 2005) this paper explores the implications of new pluralism for the co-constitution of geography and environmental (in)justice.

Keywords: environment justice geography

Ian James Walker, Ph.D., Associate Professor, University of Victoria. Email: ijwalker@uvic.ca; Beca Cumming, MSc candidate, University of Victoria. Email: beca@uvic.ca; *Airflow behaviour over a driftwood-laden macrotidal beach-dune system*

Coastal dune morphodynamics on high-energy, macrotidal beaches are not well understood given complex interactions between near-surface winds, tides, surface roughness (e.g., driftwood, vegetation), and dune topography. These interactions control the effective fetch (f) and resulting rates of sand transport to coastal dunes. This study examines airflow behaviour over a macrotidal, forest-backed dune system with a distinct backshore driftwood jam (DWJ). Measurements from an 8-hr wind event from 2D and 3D ultrasonic anemometers were sampled at seven locations from the beach to the forest. Incident wind speeds at 5-m increased from 10 to >12m/s from 284° (52° onshore). Three sub-events are examined: oblique (f=265m), oblique-onshore (f=250m), and shifting (f=600 to 285m). The population of 10 minute averages (n=55) for key flow properties (U, W, CVU) are also analysed for location-specific responses to over 50° change in flow direction. Near-surface flow over the backshore deviates by 55° from the incident wind due to DWJ roughness effects and flow stagnation from the dune and forest. Turbulence increases in the DWJ and negative relationship exists between turbulence and fetch due to the enhanced boundary layer development distance. Flow accelerates up the dune due to streamline compression effects then expands and decelerates in the lee. The colonizing tree stand causes a flow stagnation of 30-40% and significant flow steering along the treeline. due to a longer boundary layer development distance. Downward velocities are greatest in the lee and at the treeline. From this, implications for sand transport and dune dynamics is discussed.

Jill R Walker, University of Wyoming. Email: jrwalker@uwyo.edu; *From Ozzie and Harriet to the Jetsons: The Geography of the American Family as Demonstrated in Situation Comedies*

Many people identify or at least feel some commonality with the families portrayed in American situation comedies. Also, a large number of people abroad glean much of what they know about the United States and Americans from watching our television programs. Where situation comedy families live, what sort of housing they inhabit, and what that information might tell us is the subject of this study. Data will be gathered based on the following criteria: (1) American situation comedies involving a family, as opposed to those featuring groups of friends or work colleagues; and (2) programs successful enough to run over multiple seasons, enter into syndication and/or be broadcast internationally. Data from situation comedies included in the study will be gathered from internet resources and viewing of programs, then entered into a spreadsheet for ready analysis. Physical locations (or reasonable estimates) of the selected situation comedies will be plotted on a map, and conclusions drawn about the geography of the American family based on the spreadsheet data and the plotted map.

Johnathan Walker, James Madison University. Email: walkerjx@jmu.edu; *They Seek More Than Medals: Taiwan Sports Participation and the Geopolitics of National Identity*

In an ongoing effort to remain a viable political entity, the government of Taiwan has employed participation in international sport both to cement its position in the world and further its political goals. Sports participation has therefore been useful as a tool to establish an identity that underscores Taiwan's de facto separation and secure it a place in the global village. The research investigates identity politics through the variety of tactics used by Taiwan as well as the countermeasures employed by the People's Republic of China to confront, limit, or undermine the effort to forge an expanded Taiwan identity.

Keywords: Taiwan, identity, geopolitics

Kyle E Walker, University of Minnesota - Minneapolis. Email: walke412@umn.edu; *Immigration, Politics, and Place in Metropolitan Minneapolis-St. Paul, Minnesota*

Across the United States, the central city's status as primary host of new immigrants has weakened, as more immigrants now live in suburbs than central cities. Moreover, many of these immigrants settle in suburbs upon arrival without "assimilating" to their host society in the traditional sense, a trend that seemingly contradicts some theoretical models explaining immigrant settlement such as spatial assimilation theory. As immigrants settle in new destinations across the country, the political ramifications of these settlement patterns become increasingly relevant. Immigrant concentrations in non-traditional destinations such as outer-ring suburbs may provoke potent reactions from native-born residents who are not accustomed to immigration in their communities. Using the Minneapolis-St. Paul metropolitan area as a case study, the essay considers the relationship between immigrant settlement geography and the localized politics of immigration. Drawing upon GIS analysis, review of Census

data, observation, and interviews with suburban community members, this paper asks the following research questions: (1) How have immigrant settlement patterns evolved in the Minneapolis-St. Paul metropolitan area? (2) Can spatial assimilation theory adequately explain the dynamics of these settlement patterns? (3) Have immigrants concentrated in outer-ring Twin Cities suburban communities? Have they impacted the cultural and physical landscapes of these communities? (4) What is the relationship between immigrant concentration and a "territorial politics of immigration" in outer-ring Twin Cities suburbs? In addressing these questions, this essay explores how contact with immigrants influences native-born Minnesotans' political views toward immigration as well as how newly diverse communities adapt to changing demographic realities.

Keywords: immigration, suburbs, Minnesota

Margath A. Walker, University of Kentucky. Email: mwalk2@uky.edu; Cultural Production and the Role of Creativity on the US-Mexico Border

Cultural production and the social practices embedded therein play a key role in the revitalization of contemporary cities (Scott 1995; Logan and Molotch 1988; Zukin 1991). Yet, there is a particular geography to the study of the linkages between culture and economy as they tend to privilege capital and world cities while generalizing aspects and outcomes of globalization (Crewe and Beaverstock 1998). This paper is in part a response to such geographical gaps. A key task is an understanding of some of the first sites of globalization in the Global South where reductionism has led to transformations in the urban being conceptualized as primarily an economic phenomenon. Specifically, I situate the larger debate through an analysis of the cultural practices of Tijuana's municipal government- a city whose economy has diversified somewhat beyond maquila industrialization and gained prominence as a cultural mecca. The paper opens by charting elements of Tijuana's new urban imperative whereby the symbolic economy is becoming firmly entrenched alongside the industrial economy. It then moves into an engagement with notions of culture contextualized through the city. The structure and discourses embedded in the Tijuana Municipal Plan 2005-2007 are analyzed to interrogate the work that culture performs with an eye to the impacts (both material and discursive) of official strategies across time and space. The paper closes by questioning the implications of particular mobilizations of culture and the ways in which they are reflective of larger neoliberal agendas.

Email: browder@vt.edu; Eugenio Arima, PhD, Hobart & William Smith Colleges. Email: arima@hws.edu; Globalization, Deforestation, and the Cattle Sector of the Brazilian Amazon

Cattle ranching is the main driver of tropical deforestation in Latin America, and its role in the Brazilian Amazon has been particularly pronounced. Spurred by government fiscal incentives and rural credit programs, herd sizes have grown dramatically, especially in Pará, Mato Grosso, and Rondônia. The Amazon's livestock sector was, until recently, a relatively minor player in Brazil's cattle industry, but by 2002, Amazonian cattle ranchers were herding 57 million animal units, nearly one-third of Brazil's total bovine livestock population of 185 million animals, the largest commercial cattle herd in the world. This increase appears to be a generalized phenomenon throughout the Brazilian Amazon, although rates of growth vary widely by state. Cattle ranching in the region long stirred controversy. Some have argued that ecological factors greatly limit its sustainability, while others have suggested that ranching is not economically viable here in the absence of government subsidies. Recent research shows that ranching can be more profitable than other agricultural land uses. Whether viable or not, in ecological or economic terms, few would deny that ranch development, by small and large producers alike, has become the major proximate cause of forest loss in the Amazon Basin. The paper to be presented provides a political ecological explanation of the emergence of the Amazonian cattle economy, documenting its growth from a minor sector serving local and domestic markets, to an important component of Brazil's globalized agricultural economy.

R Alan Walks, University Of Toronto. Email: awalks@utm.utoronto.ca; The Politics of Gated Community Residents

Perhaps no other urban form is more associated with neo-liberal times than gated communities. Gated communities have been characterized as producing the perfect neo-liberal citizens - sequestered and segregated from the rest of society, it is assumed their residents should be, or become, fearful of others, distrustful of government, and supportive of individualism and self-sufficiency as promoted by neo-liberal political parties. However, despite some surveys which have dealt with social attitudes 'behind the gates', the politics of gated community residents have yet to be explored. This paper fills this gap via analysis of both aggregate

election results at the level of the polling station and survey data from a larger survey of metropolitan residents in Canada, including approximately 300 gated community residents living in 12 different gated communities in four metropolitan regions. This data is analyzed in order to show whether gated community residents vote any differently, and whether they harbour attitudes that are different, from their non-gated counterparts. The implications of gating is then discussed, and the causal relationships between residing in a gated community and political attitudes are explored.

Keywords: Gated Communities, Privatisation, Neoliberalism

Tamara Wall, University of Montana. Email: tam.wall@umontana.edu; Why are Parents Living in the Forest to Raise Their Children in a "Natural" Environment?

In a larger study that focused on concepts of place-based identity, a surprising theme that emerged was how important it was for parents with young and teenage children in the study to raise their children in what they felt was a "natural environment." Parents with children living in several forested communities in southwestern Montana often attributed this desire as a primary reason for moving into their current residence. These parents had often migrated from urban areas located in other regions of the United States to rural areas of southwestern Montana. In some cases, one or both parents were return migrants to Montana who accepted significant wage reductions to ensure that their children had experiences similar to their own childhood and that they passed on specific values to their children. All of the parents felt that a natural environment was inherently safer than an urban environment and allowed "kids to be kids" or a chance to be "normal." In addition, some parents felt that growing up in a forested environment encouraged positive attributes in their children such as confidence and self-efficacy.

Candice Y. Wallace, University of Kentucky. Email: candice.wallace@uky.edu; Wie Yusuf, University of Kentucky. Email: wie@uky.edu; Southern/Eastern Kentucky 511 Tourism Information Service: An Economic Impact Evaluation

In 2003, Kentucky implemented a tourism-based ITS system covering 46 counties in the Southern/Eastern region of the state. Known as the 511 Tourism Information Service, this program enhanced the state's existing 511 Traffic and Travel Information System. The program connects users to "live" telephone operators who have access to an extensive regional tourism database and can provide information such as special events, local points of interest, dining and lodging. This program was intended to promote tourism, thus contributing to economic development in the region. Southern/Eastern Kentucky has continually lagged behind the nation and the state in terms of economic growth and prosperity. Unable to rely on more traditional mechanisms for development, this region has turned to tourism to encourage economic opportunities. Given the importance of tourism and the expectation that the 511 Tourism Information Service will contribute to tourism, an evaluation of the program is both timely and necessary. In this paper we attempt to determine if and how the 511 Tourism Information Service has had an economic impact on tourism in Southern/Eastern Kentucky. We use data from a survey of 511 Tourism Information Service users, and industry data generated by the Kentucky Tourism Board. At this early stage of research, we feel that it is unlikely, given existing and available data, that a conclusive finding can be made. As such, we conclude the paper with a discussion of possible evaluation metrics and suggestions for data collection and program evaluation.

Keywords: economic development, information technology, program evaluation

Cynthia S.A. Wallace, Research Geographer, U.S. Geological Survey. Email: cwallace@usgs.gov; Stuart E. Marsh, Office of Arid Lands Studies, University of Arizona. Email: smارش@ag.arizona.edu; Characterizing the Spatial Structure of Endangered Species Habitat Using Geostatistical Analysis of IKONOS Imagery

Our study used geostatistics to extract measures that characterize the spatial structure of vegetated landscapes from satellite imagery. These measures were used to map endangered Sonoran pronghorn habitat for a study site in southwestern Arizona on the Cabeza Prieta Wildlife Refuge. Fine spatial resolution IKONOS data provided information at the scale of individual trees or shrubs that permitted analysis of vegetation structure and pattern. We derived images of landscape structure by calculating local estimates of the nugget, sill, and range variogram parameters within 25x25-meter image windows. Previous studies have shown that these variogram parameters, which describe the spatial autocorrelation of the 1-meter image pixels, can discriminate between different species-specific vegetation associations. By coupling the derived measures with Sonoran pronghorn sighting data, we constructed two independent models of

pronghorn landscape preference: a distribution-based model and a cluster-based model. The distribution-based model used the descriptive statistics for variogram measures at pronghorn sightings, whereas the cluster-based model used the distribution of pronghorn sightings within clusters of an unsupervised classification of derived images. Both models define similar landscapes, and both effectively predict the locations of an independent set of pronghorn sightings. Such information, although not a substitute for field-based knowledge of the landscape and associated ecological processes, can provide valuable reconnaissance information to guide natural-resource management efforts.

Iain Wallace, Carleton University. Email: iwallace@connect.carleton.ca; *God, Gays and Guerrillas [aka flying bishops]: Postcolonial Ecclesiastical Geopolitics in the Anglican Communion*

The Anglican Communion, the worldwide association of churches originating from the Church of England, has a geographical structure comprising national or regional churches that are essentially independent and territorially mutually exclusive. Institutional cohesion and doctrinal unity among member churches has until recently accommodated diverse expressions of theological understanding and has not been maintained authoritarily. However, recent moves within North American Anglican (Episcopal) Churches to become more inclusive of homosexuals has sharpened doctrinal differences and led to demands from some traditionalist priests, dissatisfied with their bishops, for "alternative episcopal oversight." Permitting such "flying bishops" to create inliers of alternative jurisdiction within existing dioceses undermines both theological and institutional coherence and potentially creates a geography of 'theological franchises.' As part of the changing global geography of Christendom, membership of Anglican churches in Africa now numerically dominates the Communion. These churches and their bishops are generally (not exclusively) theologically traditionalist, so the tensions within North American Anglicanism have created opportunities for traditionalists globally to develop transnational strategies to increase their control of the loosely-structured institutions of the Communion. This paper focuses in particular on links between the Church of Nigeria and traditionalist Episcopalians in the United States and the geographical re-imagining of the Church it entails. Postcolonial Christian theology has developed progressive critiques of western theological orthodoxy. The emergence of a Nigerian-led "Global South" within Anglicanism appears, however, to involve a geopolitics of institutional power that, rather than developing new theological understanding, aims to entrench traditionalist (and specifically anti-gay) doctrine.

Email: bartlein@uoregon.edu; Christopher A Pearl, USGS Corvallis Research Group. Email: chris_pearl@usgs.gov; *Reconstructing the Holocene Fire and Vegetation History of the Willamette Valley, Oregon and Washington, Using High-Resolution Macroscopic Charcoal and Pollen Analysis*

Debate concerning the state of the natural environment of the Americas prior to Euro-American settlement extends to the Pacific Northwest and even the Willamette Valley where it is unclear if pre-settlement vegetation patterns were a construct of the native inhabitants, or the result of natural environmental variations. The goal of this study is to reconstruct the Holocene fire and vegetation history of the Willamette Valley, using high-resolution macroscopic charcoal, pollen, loss-on-ignition, and magnetic susceptibility analysis of lake sediments, in order to understand the influence that both changing environmental conditions (e.g., climate variability) and anthropogenic activity (e.g., land management through the use of fire) had on those histories. Presented in this paper are results from four study sites: Battle Ground Lake, WA (a Holocene-length record), Beaver Lake, OR (a Holocene-length record), Lake Oswego, OR (a 3000-year long record), and Warner Lake, OR (a 1000-year long record). These records are currently being evaluated and compared with local tree-ring records, regional climate records, and local and regional archaeological/anthropo-

genic records in order to assess the role that both climate variability and human activities had in creating the Valley's prehistoric landscapes. So far these histories provide evidence of local vegetation and fire activity responding to both millennial- and centennial-scale changes in regional climate, and provide possible evidence of human influence on the ecological history of the Valley. Although these records go a long way in answering the climate versus human debate in the Willamette Valley, more records are needed to complete the picture.

Keywords: macroscopic charcoal, pollen, fire history, oregon

Stephen J. Walsh, University of North Carolina - Chapel Hill. Email: swalsh@email.unc.edu; Sean A. McKnight, University of North Carolina - Chapel Hill. Email: mcknight@email.unc.edu; *Composition and Spatial Structure of Turf-Banked Terraces in Glacier National Park, Montana, USA*

Turf-banked terraces are studied across five sites within the alpine treeline ecotone (ATE) in Glacier National Park, Montana, USA. Widths of vegetation risers and rock treads were collected along 55 field transects positioned in five distinct basins located on the east-side of the Continental Divide. Slope angle, slope aspect, and elevation of the 50-meter transects were measured in the field and by using a 10-m digital elevation model; their geographic position was described using Earth coordinates collected using a GPS. Run-length coding was used to describe the extent and sequential properties of the risers and steps for the field transects. The transect data were analyzed using measures of composition, spatial structure (i.e., using semi-variograms and pattern metrics), and cluster analysis and Principal Components Analysis to relate field transect of similar compositions and spatial organization to a set of terrain descriptors. Results indicate that solifluction terraces exhibit a typical composition and spatial structure with a greater variety of widths for vegetation risers than rock treads. An association exists between terrace structure and elevation: lower elevation terraces exhibit less spatial structure and higher vegetation composition. Lack of spatial structure and high vegetation content indicate relict turf-banked terraces whose rock treads have been colonized by *Dryas* vegetation present on neighboring terrace risers.

Keywords: Solifluction, turf-banked terraces, spatial structure of steps and risers, semi-variograms, ecological pattern metrics, Glacier National Park, Montana, USA

Andy Walter, University of West Georgia. Email: awalter@westga.edu; *Mapping the Geographical Politics of the Coalition of Immokalee Workers: The Spaces, Scales, and Places of the Taco Bell Campaign*

This paper examines the geographical politics of the Coalition of Immokalee Workers' (CIW) fair wage campaign against Taco Bell. The CIW was formed in 1993 by a small group of farmworkers in south Florida with the goal of improving conditions in the fields and community in which they worked and lived. By 2006 the CIW had received nationwide attention for a variety of successful human and workers' rights campaigns, including one against the parent company of Taco Bell, Yum! Brands, that substantially raised the wages of any worker in Immokalee, Florida, who picks tomatoes purchased by the fast food retailer. The Taco Bell campaign, which represented an important victory for workers' organizations in the contemporary United States, strategically targeted the production chain of a multinational corporation and demonstrated that marginalized groups are not powerless to (re)shape structures of the world economy in which they struggle to make a living. In this paper I analyze the geographies of the CIW's successful Taco Bell campaign, emphasizing its spatial and scalar dimensions and dynamics as well as the crucial role of place.

Claudia K. Walters, University of Michigan-Dearborn. Email: ckwalter@umd.umich.edu; Julie A. Winkler, Michigan State University. Email: winkler@msu.edu; *The Synoptic-Scale Environment of Northerly Low-Level Jets*

In an earlier portion of this study, the airflow patterns of northerly low-level jets (NLLJ) were investigated at the level of maximum wind as identified at individual rawinsonde stations. Jet events were categorized into sixteen airflow configuration types using a subjective map-typing approach based on isotach and streamline patterns on isentropic surfaces. In this portion of the study, the synoptic-scale environment of NLLJs is investigated. First, the sea-level pressure (SLP) fields for all 0000 and 1200 UTC observation times for 1991 were grouped objectively using a K-Means clustering algorithm. Unique sea-level pressure patterns were identified and composite SLP fields derived. Then, the location of a rawinsonde station where a NLLJ maximum was observed was superimposed onto the SLP composite for the corresponding time period. The stratification of NLLJs by airflow type, elevation, and wind speed revealed that (a) the preferred location for NLLJs relative to surface pressure features varies by airflow configuration type, (b) strong northerly LLJs with well-defined speed maxima in the vertical (i.e., jet noses) are observed with only a few configuration types, (c) differences in the elevation of jet noses are evident for different synoptic

patterns.

Keywords: climatology-synoptic, low-level jet, North America

William Walton, University of Aberdeen. Email: w.walton@abdn.ac.uk; *The Changing Geography of Tort Reform in the USA*

The reform of the US tort system is a central objective of the Federal and various state administrations in the USA. They claim that the abuse of private law suits through, for example, the pursuit of so-called frivolous and spurious class actions, imposes high costs on business activity and is prejudicial to wealth creation. At the Federal level the Bush administration has had mixed success in attempting to introduce reforming legislation; its Class Action Reform Act has placed limits on the availability of class actions but its efforts to introduce an asbestos compensation fund to cap liabilities have so far failed. At the state level, however, there have been numerous initiatives successfully introduced including those curbing claims against medical malpractice and malfunctioning products as well as those limiting the availability of punitive damages to successful plaintiffs. This paper considers the arguments for tort reform in the USA and then examines its geographical dimensions.

Keywords: Tort; law; reform; USA; class-action

Margaret W. Walton-Roberts, Associate Professor, Wilfrid Laurier University. Email: mwalton@wlu.ca; *Transnational Entrepreneurs and the Trade and Immigration Debate*

Global economic processes are intimately tied to the global circulation of people, yet convincing illustrations of these linkages are limited by a lack of reliable data. For example in the case of trade and immigration economists have been intrigued by the link, yet struggle to model and quantify it. Recently social scientists interested in transnational entrepreneurs have explored the trade-immigration connection, and the immigrant entrepreneur has been interpreted as the archetypal transnational actor, despite the gendered and classed limitations of this view. In this paper I examine trade and immigration links between India and Canada. In place of economic models and measures I use qualitative material gathered from traders and government officials in order to supply more satisfying examples and explanations for how trade and immigration might be linked within a transnational framework. Using this approach highlights other processes at work such as; the deployment of complex and contradictory stereotypes, the role of the state, and the need to decentre economic explanations in the consideration of complex economic interactions that are actually deeply culturally embedded. I conclude by arguing that attempts to represent these links quantitatively fails to capture the complexity of immigrant actions with regard to trade development between India and Canada, and suggest that this inability to quantify the extent of such relations may actually be a positive thing.

Keywords: immigration, trade, India, Canada, transnational

Wai-San Sancia Wan, University of Hong Kong. Email: wss@graduate.hku.hk; *The Role of the Skywalk System in the Development of Hong Kong's Central Business District*

Despite arguments for decreasing physical interpersonal business contacts, largely concluded from widespread use of new telecommunication technologies, one can still easily find the greatest concentration of offices, the largest vehicular and pedestrian traffic, and the highest density of tallest buildings in many central business districts (CBDs). Because of high functional diversity and development density, the CBD of Hong Kong has an extensive network of pedestrian facilities, including street-level, elevated and underground passages, linking many commercial buildings to accommodate the amazingly high flows of pedestrians, particularly during the daytime of weekdays. In this paper, I firstly examine the spatial pattern of the CBD skywalk network in Hong Kong in relation to the spatial extent and the location of major transportation nodes in the CBD. Using data collected from pedestrian counts on the skywalks during weekdays, I then quantitatively analyse the pedestrian flow patterns characterising commuting and business trips within the skywalk network, as well as exploring the relationship between these patterns and connected structure, including types and densities of buildings and transport infrastructure. In addition, I make general comparisons between the results of my pedestrian counts and those of studies of other cities, such as Lower Manhattan and the CBD of Minneapolis. As evident from the intense connections and dense pedestrian flows, the study finds that, the skywalk system with growing spatial extent has successfully encouraged people from further parts of the CBD to interact, and thus facilitated the internal linkages of the area.

Keywords: central business district, CBD, skywalk, pedestrian walkway, Hong Kong

Baoling Wang, UBC. Email: baoling@interchange.ubc.ca; *Canadian Firms in China's Mining Industry*

The world has witnessed China's growing importance in world mining and metals markets both as a major producer and consumer since the early 1990s. Two decades of rapid industrialization and sustained high overall economic growth has fuelled the demand for industrial minerals in China, which accounted for almost half of the increase in global demand over this period. On the other hand, frequent and rampant explosion and other accidents in China's coal mines also shocked the world and invited more intense attention on the mining industry in the country. This paper thus provides a close examination of the mining industry in China, including its development, regulation/policy involvement, and challenges facing the industry. China's voracious appetite for minerals combined with recent regulation reforms in the industry have led to growing enthusiasm on the part of the international mining community to participate in the development of China's mining industry. As one of the strongest competitors in global mining sector, Canadian companies have been among the leaders in exploring Chinese mining potential since the early 1990s, especially in the gold sector. Canadian presence in China's mining industry is one of the few bright spots of Canadian FDI in the country. This paper explores Canadian firms in China's mining industry, including their entry modes, geographical distribution, and specifically opportunities and challenges these firms face in China. It aims to answer such a question as "on balance are home or host country factors at work in causing difficulties for Canadian companies in China's mining industry?"

Keywords: Mining industry, China, Canada

Cuizhen Wang, University of Missouri. Email: wangcu@missouri.edu; Bo Zhou, University of Missouri. Email: bz9n9@mizzou.edu; Harlan L. Palm, University of Missouri. Email: PalmH@missouri.edu; *Detecting Invasive Sericea Lespedeza (Lespedeza cuneata) in Mid-Missouri with Hyperspectral data*

Weed invasion is a current threat to productivity in croplands and biodiversity conservation in natural ecosystems. Missouri ranks the second in cow-calf numbers in the nation and its pastureland has experienced invasion of many plant species. Sericea lespedeza (*Lespedeza cuneata* L.) is one of these invasive weeds and is becoming a serious threat to pastures in Missouri. Multi-spectral remote sensing application in weed invasion is limited because the spectral signature of the weed is often mixed with natural vegetation. In this study we applied hyperspectral remote sensing to detect sericea and to map its invasiveness in pasturelands. One public and one private grass fields in Mid-Missouri were selected as study areas. From June 15th to August 24th, 2006, we visited the study fields five times to collect the spectral data (350nm-2500nm) with the Analytical Spectral Devices (ASD). A hyperspectral spectral library of sericea and tall fescue (*Festuca arundinacea*), the major natural grass in pasturelands in Missouri, was built. On August 24 the airborne hyperspectral image was acquired with the AISA Imager developed at the Center for Advanced Land Management Information Techniques (CALMIT), University of Nebraska. The image has a spatial resolution of 1 meter and spectral resolution of 2.9nm in the range of 430-900 nm. This study examined the optimal time and spectral bands to separate sericea from fescue. The classified fescue map will serve as a first step in alerting landowners and the general public about the seriousness of the problem in pastures and natural ecosystems.

Keywords: invasive weed, hyperspectral remote sensing

Donggen Wang, Hong Kong Baptist University. Email: dgwang@hkbu.edu.hk; *Activity and Time Use Patterns in Virtual Space: An Empirical Study of Hong Kong*

Time allocation to daily activities in physical space has been an important topic of activity-based travel behavior analysis for decades. The penetration of Information and Communication Technologies (ICT) into individuals' daily life has led to more time spent in virtual space for activities such as internet-based browsing, shopping and entertainment. The fact that every person has a time constraint of 24 hours a day implies that if more time spent for activities in virtual space, less time might be used for activities and travel in physical space. Alternatively, activities in virtual space may lead to more activities and travel in physical space. In order to better understand individuals' activity-travel behavior in physical space, it becomes important and imperative to study their activity and time use patterns in virtual space. This paper presents some empirical evidences on the types of activities that individuals conduct and the time they spend in virtual space. Data are derived from the 2005 thematic household survey on information technology usage and penetration conducted in Hong Kong. The survey involves 10,092 households. Analytical methods including statistical tests and regression models are employed to identify the factors influencing activity and time use patterns in virtual space. The socio-economic variables of individuals and the availability of and accessibility to various ICT products are found to be significant determinants.

Keywords: time use, activity patterns, virtual space

Enru Wang, University of North Dakota. Email: erwang@und.nodak.edu; *Services Growth and Regional Development in China*

The uneven development of regional economies in China has become the subject of increasing scholarly attention in recent years. The patterns of regional variation in service development and the contribution of service industries to regional economic development remain poorly explored. Using newly released data, this paper analyzes the levels and trends in regional variations in services and examines the contribution of services to the economic base of regional economies in China. Although China is now often referred to as a rising "global factory" where manufacturing is of vital importance in the rapidly industrializing economy, the paper demonstrates the increasing significance of service industries in economic growth and their uneven development among regions. It also argues that economic restructuring in China is similar to the trajectory of developed countries in some ways and "tertiarization" of the economy seems to be an inevitable trend; nevertheless, the dynamics of changes towards an increased role for services in China displays some idiosyncrasies, as many transition-related factors (such as market-oriented reforms and shifting developmental strategies at both national and local levels) have played an important role in the processes of economic restructuring and regional development.

Keywords: services; regional development; regional inequality; economic restructuring; reform; China

Eugenia Wang, PhD Candidate, University of British Columbia. Email: ginawang@interchange.ubc.ca; *"this society eats their children": separated youth asylum seekers, refugee determination, and challenges to the Canadian state*

Traditionally, debates about citizenship, democracy, and state formation have largely neglected to include an analysis of the roles of young people within these larger theoretical discussions. This paper will draw upon Arendt's (1986) work on refugees and statelessness as well as contemporary concerns with the intersections of geography and law as a means of exploring the relationship between refugee youth, discourses of citizenship, and the nation-state. In the past decade, Europe and North America have seen significant increases in the numbers of unaccompanied/separated children who are entering their countries and seeking refugee asylum status. Gibney (2004) identifies a kind of 'schizophrenia' that accompanies Western nations' responses to asylum seekers and refugees that is demonstrated through public displays acknowledging their legal responsibilities to refugees, while at the same time implementing ever restrictive measures aimed at keeping the asylum seeker from reaching the territorial borders of the nation. Through an examination of asylum decisions of separated youth that were adjudicated by the Immigration and Refugee Board of Canada, I explore the ways that historical and contemporary representations of 'refugeeness' and 'childhood' merge to perpetuate the construction of refugee youth as 'alien', 'non-citizen', and 'other.' Throughout the paper, a central concern is with developing a theoretical analysis and understanding of the ways refugees, particularly separated refugee youth, call forth certain ethical and political responses and the geographies of how such responses are exercised and enacted upon within the context of larger debates on citizenship and state formation.

Keywords: refugee, citizenship, nation-state, youth geographies

Fahui Wang, Northern Illinois University. Email: fwang@niu.edu; *Cancer Disparities in Illinois: Exploring Multilevel Determinants of Late-Stage Diagnosis*

Early diagnosis is critically important in efforts to reduce mortality and improve quality of life for cancer patients. In the U.S., there are wide disparities in cancer stage at diagnosis that reflect underlying variations in early detection tied to social, economic and geographic disparities. This presentation examines geographic variation in late-stage cancer in Illinois and the relationship with spatial access to primary care, cancer screening services and other socio-demographic covariates. We argue that the risk of late-stage disease varies not only with individual socio-demographic characteristics, but also with contextual factors including spatial access to health care. These associations are examined using multilevel modeling with data from the Illinois State Cancer Registry. Breast, colon and prostate cancers, all of which are amenable to early detection, form the focus of the study. Findings reveal that spatial access to primary health care is important and that it often reinforces inequalities based on race and rural-urban location.

Keywords: Late-stage cancer, healthcare access, GIS, multilevel modeling

Fei Wang, Louisiana State University. Email: fwang3@lsu.edu; Nina Lam, Louisiana State University. Email: nlam@lsu.edu; *Land Cover/Use Classification, Change Detection, and Predictive Modeling Using Genetic Algorithm and Cellular Automata*

Genetic algorithm offers a promising approach to analyzing many complex geographic problems. However, its capability and performance, in terms of land cover/use classification, change detection, and predictive modeling, has not been well understood. The primary goals of study are: 1) To examine the relationships among the accuracy of genetic algorithm based land cover/use classification, genetic operators / parameters, and spatial scales; 2) To examine the capability and performance of genetic algorithm in land cover/use change detection; 3) To examine the capability and performance of genetic algorithm based cellular automata in land cover/use predictive modeling. The study area, namely Tickfaw River watershed (711mi²), is located in the southeast Louisiana and southwest Mississippi. The major dataset includes Landsat TM/ETM images, DOQQs, aerial photographs, topographic maps, transportation maps, and DEM. The finding from this study can be used to better understand genetic algorithm and the process of land cover/use change, which can help in developing sound natural resource management policies.

Keywords: land cover/use study, genetic algorithm, cellular automata

Guorong Wang, California State University, East Bay. Email: guorongwgr@yahoo.com; Gary Li, California State University - East Bay. Email: gary.li@csueastbay.edu; *Seeing the Great Wall of China from Space*

Whether the Great Wall of China is visible from space by naked eye has been discussed by many with conflicting stories from astronauts and media. Chinese scholar Dai et al published a paper in the journal Physics (2005). Based on the analysis of visual recognition to point objects, Dai et al concluded that astronauts cannot see the Great Wall of China from space of 320 km above ground. However, our recent analysis lands on a contradictory conclusion. Based on the visual acuity of the human eye to linear objects which is much more recognizable than point objects from distance, the Great Wall of China should be able to be seen from space although Earth surface or near Earth surface condition may sometimes dampen the success of such an event.

Keywords: astronauts, visual acuity, analysis, Great Wall of China

He Wang, Syracuse University. Email: whqt@hotmail.com; *Global Production Networks, the Role of the Chinese State: the Guangzhou Automotive Industry*

In this globalizing era, the role of the state in its national economy has been reshaped by the footless capital, the supranational economic power and its historical institutional characteristics. Pressures on developing countries are changing the role that state can play both internationally and within their borders. While the Chinese state is still powerful in its economy and other social areas. Even within the global production networks, facing the global auto makers, it still has its own strategies to promote the domestic economic development. The formation and evolution of the Guangzhou automotive industry cluster has become a new hot bed of the automotive industry and regional development policy research. This paper, from the theoretical perspective, examines the role of the Chinese state in the Guangzhou automotive industry cluster within the frameworks of global production network, together cluster theory, state theory and institutional turn in economic geography; from the empirical perspective untangles the process of the formation and development of the cluster, within the context of the changing environment, especially after the access of China to WTO Previous work on China's automotive industry has focused on either the guidance of the government or the typical automotive firms in Changchun and Shanghai. I assert that the Guangzhou automotive industry is one case with on the one hand its special characteristics of the location and the Japanese auto makers cluster; on the other the general mechanism with could be adopted in other regions for their economic development.

Keywords: global production network, Guangzhou automotive industry, the Chinese State

Hungkai Wang, Professor, National Taiwan University. Email: hungkaiw@ntu.edu.tw; You-Ren Yang, Dr., National Taiwan University. Email: yyren@ms34.hinet.net; *The experimental redevelopment of "village in the city" in urban China: The Case of Senzheng*

The phenomenon of "village in the city" had attracted many attentions of scholars in urban China's study. However, few had noticed the redevelopment of such special village in the context of urban development. Furthermore, from our earlier exploration, we observed that Senzheng had become the pilot of urban institutional reform in China. Therefore, by investigating the experimental redevelopment of two "village in the city" in Senzheng?the Yu-min village and Yu-nong village, this article aims to explore the mechanism of such specific urban renew from the perspective of China's urban-rural transition. By such

exploration, we hope to point out some new trends in China's urban development, especially the consequence of China's dual-track land institution, as well as the urban policy to solve such socialist historical debts.

Keywords: urban redevelopment, village in the city, urban-rural transition, property right, land institution, urban policy

James Jixian Wang, Dr., School of Geography, University of Hong Kong. Email: jwang@hkucc.hku.hk; *Economic Coastalization and Port Development in China*

After the economic prosperity boomed in the Pearl River Delta of Guangdong Province and then in the Yangtze River Delta centered at Shanghai, other provincial governments have begun to plan their economies towards the coast wherever possible. Special attention is given to the economical restructuring of coastal cities within each province. A stronger hand of state in each level of local government with huge visible or invisible sunk costs in port and related infrastructure has substantially changed the distribution of ports and terminals along the Chinese coast, leading to a fierce competition among port cities for better global connectivity and accessibility. Each of these port cities however, has to accommodate two 'super powers' in order to go further. One super power is the central government, to which the local needs its 'official recognition' such as the city being listed as 'hub port' in the National Port Development Plan by the Ministry of Communications. The other super power is market forces, often represented by the international shipping lines that choose port of call according to the cargo demand. This paper illustrates how the port cities dance with the two super powers and the possible outcomes of this process of coastalization.

Keywords: Port, China, Economic Development

Jialing Wang, Slippery Rock University of Pennsylvania. Email: jialing.wang@sru.edu; *The Impact of Urban Development on Longleaf Pine Forests in the Red Hills Region*

Longleaf pine-wiregrass ecosystem is an important ecosystem in the Southeastern Coastal Plain. It contains the greatest diversity of plant life ever found in a temperate zone. However, the number of longleaf pine forests has been drastically reduced in the past century. This study intends to explore the relationship between the urban development and longleaf pine forest landscape change in the Red Hills Region of south Georgia and north Florida. The case study region is chosen due to that this area has a significant amount of privately-owned relatively undisturbed longleaf pine forests. The land use/land cover and longleaf pine habitats in this region are mapped using time-series Landsat 5 TM images. The changing characteristics of the landscape from 1987 to 2005 are investigated using landscape metrics.

Keywords: Longleaf pine forest, Urban, Landsat TM, Landscape Metrics

Jiao Wang, Texas State University - San Marcos. Email: jw1501@txstate.edu; *Research for geometric correction method of Beijing-1 remote sensing image*

The Disaster Monitoring Constellation is the first satellite cluster dedicated to monitoring disasters from space and will provide more frequent and reliable images to relief agencies. The aim is to provide the ability to revisit and return imagery from any part of the globe, on a daily basis. China launched a Disaster Monitoring Constellation satellite last year, officially known as "Beijing-1". This study makes some research for the Beijing-1 image geometric correction method. The image was acquired in November 2005, 600 kilometers in breadth, covering the North China area with the capital Beijing in the centre. In this research, the geometric correction is carried on according to 129 pieces of 1: 100,000 topographic maps. Nearly 200 control points are collected, as far as possible distributing in the entire picture, including the boundary and four edges. Geometry distortion is discovered in the mountainous region area, as a result of the hypsography change. While in the plain area, the obvious geometry distortion was little. Therefore, select more points in the mountainous area, with the bigger point density, 2-3 times which of the plain area, regards to the situation. The finite element model is adopted for the space position transformation. The advantage is making the coordinates of the image consistent with its corresponding coordinates on the topographic maps completely. By selecting adequate control points, adopting finite elements to do space position transformation, the geometric correction precision of Beijing-1 remote sensing image can satisfy the following land use and land cover change research requirement.

Keywords: geometric correction, disaster monitoring constellation, finite element

Le Wang, Texas State University. Email: lewang@txstate.edu; silvan jose, Texas State University. Email: ; *Classification and density mapping of Saltcedar using Landsat TM, ASTER, QuickBird and AISA imagery*

In the Rio Grande basin, water shortage has been significantly impacted by the invasion and spread of one invasive weed species: Chinese tamarisk (*Tamarix chinensis* Lour.), also known as saltcedar. In order to gain a better understanding of implications of saltcedar to the water shortage problem, it is critical to map the extent and density of the occurrence of saltcedar in a large spatial area. In this study, remote sensing at various spatial resolutions, ranging from Landsat TM, ASTER to QuickBird and AISA were employed for the purpose of species classification and density mapping. Results indicated that hyperspectral AISA imagery achieved the best classification accuracy at species level and Landsat TM imagery achieved a promising accuracy in estimating the density of saltcedar.

Keywords: classification, remote sensing, invasive species

Lei Wang, Texas A&M University. Email: wanglei@geog.tamu.edu; Hongxing Liu, Texas A&M University. Email: liu@geog.tamu.edu; *Investigating Impacts of Natural and Human-induced Environmental Changes on Hydrological Processes and Flood Hazards Using a GIS-based Hydrologic/Hydraulic Model and Remote Sensing Data*

Natural and human-induced environmental changes have been altering the earth's surface and hydrologic processes, and thus directly contribute to the severity of flood hazards. A detailed flooding scenario analysis using analytical hydrologic/hydraulic models is performed in Houston area of Texas. Using a time series of Landsat images, a retrospective analysis of surface imperviousness has been conducted to assess the hydrologic impact of urbanization. The analysis reveals that with rapid urbanization the impervious surface has been increased from 10.1% to 38.4% for the case study area during 1974 - 2002. As a result, the peak flow for a 100-year flood event has increased by 20% and the floodplain extent has expanded by about 21.6%. The quantitative analysis suggests that the large regional detentions basins have effectively offset the adverse effect of increased impervious surface during the urbanization process. Based on the simulation and scenario analyses of land subsidence and potential climate changes, some planning measures and policy implications have been derived for guiding smart urban growth and sustainable resource development and management to minimize flood hazards.

Keywords: Environmental change, flood, hydrologic/hydraulic model

Linda Q. Wang, Ph.D, University Of South Carolina Aiken. Email: lindawa@usca.edu; *Tourism in China?an industry undertaking capitalism and individualism*

Prior to 1985, tourism in China was a state monopoly. Controlled and regulated by the Chinese government, intra-national tourism in China was more of a political strategy deployed in its international diplomacy rather than a consumer service with economic potentials. In 1985, a law was passed to end state monopoly of tourism and thus started an era of commercial tourism in China. Tourism since has been pursued primarily for economic gains. Active promotion of China's tourism resources has attracted growing number of international tourists and the volume of intra-national tourist flows in China is expanding steadily. Through my participant observation as a faculty escort to a learning tour in China during Summer 2005, this paper attempts to analyze the current characteristics of China's intra-national tourism and the mechanism in place for service quality control. Preliminary results of the analysis point to some fundamental changes in China's service industry and significant growth in business professionalism within the lingering web of collective socialism.

Keywords: China, tourism, intra-national tourism, business professionalism

Lu Wang, Dr., Ryerson University. Email: luwang@ryerson.ca; *Immigration, Ethnicity, and Accessibility to Culturally Diverse Family*

The study concerns ethnicity, spatial equity, and healthcare access in the context of diversity and integration. The paper first explores how Chinese immigrants in the Toronto Census Metropolitan Area choose between ethnic Chinese family physicians and other family physicians, based on a probability survey. It then applies and modifies gravity-type accessibility measures, of which a special type is the so-called floating catchment area (FCA) method, to evaluate three types of geographical accessibility in family physician utilization. The data used in accessibility calculation includes information about the location and language ability of physicians that were obtained from the CPSO (College of Physicians and Surgeons in Ontario), as well as geo-referenced census data at a census tract level. The study suggests a certain degree of spatial inequality among Chinese immigrants in accessing culturally sensitive care. The paper yields important methodological and policy implications.

Keywords: accessibility, ethnicity, and physician

Tropical rain forests are remarkable not only for their high number of species, but for their great spatial heterogeneity, associated with subtle topographic changes, legacies of past disturbances, and resulting habitat diversity and other place-to-place changes in forest structure and composition. This project documented the fine-scale patterns of trees and palms found on two one-hectare plots inventoried for all plants with woody stems >greater than 10 cm in diameter. Each of the two tree inventory plots had approximately 580-620 individuals and consisted of 180-220 species. The dominant genera included Virola, Eschweilera, Oenocarpus, Inga, Ocotea, Pouteria, Licania, and Micropholys. There is little overlap in the composition of dominant species compared to the Amazonian forests in Yasuni National Park about 150 km away in northeastern Ecuador, indicating different forest communities, species distribution, and possible species endemism in the study area. There appeared to be two or three different tree communities within each plot, suggesting spatial heterogeneity of species diversity and distribution even at scales of 10 to 40 m. The average percentage canopy openness and leaf area index of the two plots were 5.6 and 3.7, respectively, and some within-plot heterogeneity appeared to be associated with changes in light environment. Ongoing and planned research will attempt to use this fine-scale detail to generalize to larger areas of rain forest in the study region through the use of high and relatively coarse remote sensing products (Quickbird, Landsat ETM).

Keywords: Biodiversity, Scale, Tropical forests

Qian Wang, University of Iowa. Email: qian-wang@uiowa.edu; George P Malanson, . Email: george-malanson@uiowa.edu; Analysis of Effects of Landscape Pattern on Species Dynamics Using Colonization - Competition Models

Abstract: The objective of this research is to gain better understanding of the effects of the representation of spatial pattern on species dynamics in the competition - colonization (CC) class of ecological models. With the rapid development of human society, habitat destruction, as a global environmental problem, has been realized as an important factor that causes the extinction of species, which interests many ecologists. I will use an extinction debt model, a spatially explicit version of the CC class of model, to study the effects of different quality and structure, and changing pattern of landscapes on simulated species dynamics. The model will include five theoretical species with hierarchical competition, reproduction, dispersal, and mortality inhabiting on an artificial landscapes consisting five landscape types. Landscape metrics will be used to quantify the different patterns and structures of landscapes. Sensitivity analysis will be used to analyze effects of different settings of landscapes; and correlations and visual interpretations will be used to examine the relationships between spatial metrics and species diversity and evenness over the course of the simulation. These simulations can allow me to assess how spatial representations in landscape ecology could affect interpretation of the effects of habitat fragmentation on species dynamics as applied to biological conservation.

Keywords: Landscape pattern, species dynamics, simulation models

Qingfang Wang, University of North Carolina at Charlotte. Email: qwang7@email.uncc.edu; Ethnic Entrepreneurship and Urban Contexts: Asian Self-employment in the US South

Previous research suggests that entrepreneurship can provide ethnic minorities and women a springboard for economic progress and social integration. However, rates of self-employment are different among ethnic groups, between men and women, and in different places. The prevailing literature suggests that personal characteristics, human capital, discrimination, ethnic networking, and institutional regulations are all associated with ethnic entrepreneurship. However, very few recent studies have analyzed how different urban socioeconomic contexts influence this process. Using the Public Usable Microdata Samples (PUMS) in year 2000, this quantitative study examines how Asian ethnic entrepreneurs perform in three different metropolitan areas in the US South. The results show that gender, education, length of stay in the US, and different nationality among the Asian subgroups are significantly associated with self-employment. At the same time, the ethnic diversity, history of immigration, and the economic structure in each local area have provided different opportunities and challenges for Asian ethnic minorities to start up and maintain their own businesses. For example, in the established immigration gateways, the long history of immigrant settlement frequently has evoked an organizational, service-delivery, and advocacy infrastructure familiar with the needs of immigrants and their families. In contrast, the new immigration destinations may not have these facilities. This study suggests that the process of economic incorpora-

tion of ethnic minorities depends significantly on the institutional capacity and social, cultural and political resources of local communities.

Grid computing has emerged as a key focus of scientific research during the past five years. We will present a U.S. National Science Foundation TeraGrid Science Gateway for GIScience. This Gateway is designed to provide user-friendly access to computational Grids, and to help non-technical users directly benefit from access to TeraGrid capabilities. GISolve has been developed based on a service-oriented architecture that allows scalable integration between geographic information analyses and basic Grid services. Several analysis methods have been integrated within GISolve as a way to prototype a workflow engine for generic cyberinfrastructure-based geographic information analysis. This workflow engine supports interoperable access to both TeraGrid and Open Science Grid computational resources based on the GridShell and Globus Toolkit 4 technologies. In this presentation, a Bayesian geostatistical model is used to demonstrate how the GISolve architecture can be adapted to support communication-intensive parallel geographic analysis applications. To fit this Bayesian geostatistical model, Markov chain Monte Carlo (MCMC) methods that require linear algebra operations are used; these are computationally intensive when the number of measurement locations is large. Because an MCMC sampler typically must be run for thousands of iterations, each requiring numerous operations, the run-time for sequential Bayesian algorithms quickly becomes prohibitive. Even with parallel MCMC algorithms running on single clusters, run-times may be unacceptable, especially for large geographic datasets. Therefore, Grid-based cyberinfrastructure provides an ideal platform to develop parallel MCMC algorithms for Bayesian geostatistical models by taking advantage of dynamically configurable Grid resources that can be expanded to accommodate large problems.

Shuguang Wang, Ryerson University. Email: swang@ryerson.ca; Foreign Retailers in China Revisited: Who Are Winners?

Since China's admission to the WTO in 2001, significant changes have taken place in both the market conditions and its regulatory system including the elimination of unconventional trade barriers. This has provided further opportunities for foreign retailers to expand in China. In this paper, the author revisits the major foreign retailers with regard to their growth patterns and performance. It is found that the Western retailers, which possess the most resources and do business with advanced information technologies and in new retail formats, are taking the lead in penetrating the Chinese market. Those from Southeast Asia, which mimic the Western retailers by copying the hypermarket format, have also expanded with impressive results, but their staying power is unclear. Although the Japanese retailers received the least negative publicity, they have made the least inroad into the Chinese market due mainly to the economic difficulties of their parent companies and the less competitive format that they adopted to expand in China. This paper also notes that the battle among foreign retailers for a share of the Chinese market will become more intense, as a number of foreign retailers are moving towards "independence" in an effort to consolidate their power in business decision making, and new players including the American Best Buy, Home Depot and Business Depot, all have firm plans to enter the market through the path of acquisition.

Wenfei Winnie Wang, Ph.D, UCLA. Email: wfwang@ucla.edu; Cindy Fan, UCLA. Email: fan@geog.ucla.edu; Economic and social impacts of return migration in China

Urban-rural return migration may have significant impacts on rural development and reducing urban-rural inequality in developing countries. Through their migration experience in cities, temporary migrants have acquired skills as well as experience, and have been exposed to the urban life style and different social values. Once migrants return, they bring back not only capital and improved human capital, which may facilitate their engagement in economic activities in rural areas, but also new life styles and new points of views on social

life, which may have direct impact on their own family relations as well as the natal villages. This paper analyzes the economic and social impacts of return migrants on their rural communities on the basis of an empirical study of Sichuan and Anhui provinces in China. It examines the economic and social impacts of urban-rural return migration, as well as the factors that influence these impacts, based on analyses including a binomial logit regression model. The findings of the paper have implications for policy makers on rural development strategies and for narrowing the economic gap between urban and rural societies in China.

Xiao Wang, Lan Mu, University of Illinois at Urbana-Champaign, University of Illinois at Urbana-Champaign. Email: xiaowang@uiuc.edu; Evaluating the suitability of the site selection in urban development using computational geometric methods

One of the central issues in the urban development is the site selection. A considerable literature introduces a variety of urban development models and assesses their effectiveness and suitability. Among the diverse approach to evaluate the urban growth pattern, few researches touch the base from the perspective of computational geometry. This paper aims at examining the suitability of proposed urban development sites by using their own internal shapes and external spatial relationship among neighboring areas with different land use type. For example, Alpha shape and Beta skeleton, among others, can be applied to conduct the analyses for external and internal shapes of a set of points. Our experimental designs are based on several simulated areas with various shape and land use function, i.e. from regular square shape to irregular polygon; land use types are changing from residential area, industrial area, open space, to commercial area, etc. We need to modify and expand point-based methods to evaluate polygons. In addition, a set of conversion rules will be generated in order to decide the level of difficulty for making conversion among different land use type. These rules are determined by the empirical research. The expected results include demonstrating that the computational geometry perspective is an effective addition to deal with site selection problems, and also developing a series of empirical rules to perform more complicated analyses for the real world problems. The methods will be implemented in an integrated GIS environment.

Yi-Chen Wang, National University of Singapore. Email: geowyc@nus.edu.sg; Barry J Kronenfeld, George Mason University. Email: bkronenf@gmu.edu; Forest landscape change in the western New York from presettlement to the present

Understanding how human activities influence forest change and where that change occurs are both important issues for ecosystem management. This study compares data on tree species occurrence in Presettlement Land Survey Records (PLSRs) circa 1800 with recent US Forest Service Forest Inventory and Analysis (FIA) survey data to examine forest changes in western New York. Because the PLSRs and FIA have different sampling schemes and potential biases, the study first examines issues of comparability, and then develops appropriate methodology to compare forest composition at the times of the two surveys. Taxa that show the most significant increase or decrease in percentage are then modeled using geostatistical interpolation methods to investigate patterns of spatial change. Finally, possible reasons for observed non-spatial and spatial changes in taxa distributions are discussed. The results show that taxa which declined the most over the past two centuries include chestnut, beech, basswood and hemlock, while the greatest increases are observed in poplar, black cherry, red maple and ash. The decline of slow-growing species (e.g. beech, hemlock), and the corresponding increase in pioneer species (e.g. poplar, cherry) suggest that much of the change in forest composition may be due to the increased frequency of forest disturbance caused by changing patterns of human land use. Accidental introduction of non-native pathogens has contributed to the decrease of certain species, including chestnut and possibly beech. Evidence for the effects of climate change is inconclusive, and some southern species actually decreased in dominance since the presettlement survey.

Yipeng Wang, Department of Geography, Texas A&M University. Email: wingedroc@neo.tamu.edu; Environmental Impacts of the Qinghai-Tibet Railway: An Initial Exploration

The recently completed Qinghai-Tibet Railway (QTR) is a major strategic investment by the central Chinese government for both economic and political purposes. Yet the environmental impacts of QTR have been debated since the project's inception, and currently are still not well understood. Relying on a variety of secondary databases, this paper conducts an initial investigation on QTR's environmental impacts from the perspective of landscape fragmentation. GIS-based RFLI (Road-Induced Landscape Index) analysis was conducted. Preliminary results indicate that the RFLI increased most prominently in cultivated vegetation and temperate steppes areas. Both conceptual and policy

implications of our findings will be discussed in detail.

Linkages between water and energy exist in numerous ways throughout the generation, distribution, and utilization phases of these resources. Water-energy nexus occurs during energy exploration, power generation, pumping water, water treatment, water distribution, and end uses of water and energy. Despite significant synergic benefits to be explored by taking a holistic view of energy-water nexus, the policy-level evidence supporting the link seems to be almost non-existent. To enhance synergic benefits, state and local governments could form partnerships between water and energy agencies in planning and implementation, especially given the initiation provided by federal legislation (as shown in several Sections of Energy Policy Act of 2005, including Sections 135, 136, 979, 1334 and 1860). This paper aims to explore state and local government strategies that can be used to derive water-energy nexus benefits. Current demand- and supply-side practices associated with energy and water integration are to be identified by conducting two surveys. A general fact-finding survey will be conducted to all 50 states and Washington DC. In addition, an in-depth survey will be conducted to those states and local governments that have already employed their initiatives. The survey results are to be coupled with a literature review to suggest the water-energy policy and program options that enhance synergic benefits in most effective ways.

James A. Wanket, California State University, Sacramento. Email: jwanket@csus.edu; A Holocene Pollen Record from Medicine Lake, Southern Cascades, California

A 2.2 meter-long sediment core from Medicine Lake, in the southern Cascades of California, yielded a record of vegetation change for the last 12,000 years. Fossil pollen suggests that this lake, on the dry leeward side of the Cascade and Klamath Mountains, was surrounded by a pine-dominated forest throughout the period of record. However, significant changes in aquatic and secondary terrestrial and pollen taxa through the Holocene are probably related to changes in effective moisture. Artemisia pollen was the dominant secondary terrestrial taxa between 12,000 and 7,000 cal yr BP, probably reflecting a sagebrush-montane forest ecotone that was higher on the slopes than today. From 7,000 cal yr BP until the present, Abies pollen has increased in importance at the expense of Artemisia, perhaps reflecting the lowering of the ecotone and a more consistent winter snowpack in the Late Holocene. This change in vegetation is consistent in timing and nature with those reconstructed from wetter sites in the Klamath Mountains and the Pacific margin. Variations in the abundance of Isoetes pollen in the Late Holocene likely represent regular oscillations in lake level driven by changes in effective moisture

John V. Ward, Environmental Dynamics Program, University of Arkansas. Email: jvward@uark.edu; *Land Use Change in the Illinois River Basin of Northwest Arkansas, 1941-2004*

An understanding of historical land use and land cover (LULC) patterns can provide valuable insight into the impact of human activities on the landscape, and can help to predict future trends with regard to anthropogenic driven landscape changes. This study utilizes aerial photography from the years 1941, 1982, and 2004 to map and quantify LULC changes in the Illinois River basin of Northwest Arkansas. Data sets were integrated into a GIS, and LULC was visually classified and quantified using a map generalization methodology. The preliminary results of this study indicate an increase in land clearing in valley bottoms and in the rural-urban interface, suggesting agriculture and urbanization as drivers of landscape change. In addition, reforestation in some areas of federally owned lands suggests resource management practices as an important driver of overall land cover change in the area. The study is part of a larger project that examines relationships between LULC change, basin morphometry, and stream channel geomorphology within the study area.

Email: polly.russell@bl.uk; Katy Wilkinson, University of Newcastle upon Tyne. Email: k.s.wilkinson@ncl.ac.uk; *Commodities, Materialities and European Agricultural Reform: the Case of Sugar*

Changes in British and European agricultural policy and institutions over the past two decades have been characterised by social scientists as a transition from a productivist to a post-productivist framework. This account of policy change has been the subject of critical re-evaluation in recent years and has been accused of being overly structuralist and deterministic. This paper makes the case for taking a commodity approach to analysing European agricultural policy reform to contribute to understandings of the specificities and contingencies of agricultural productivism, the interplay between external and internal pressures which help drive the reform process and the implications of the material properties of foods in understanding regulatory change. The paper examines the recent reform of the European Union Sugar Regime ? widely regarded as the last bastion of the highly regulated and protectionist Common Agricultural Policy. It argues that the case of sugar helps shed new light on the extent to which, and mechanisms through which, the productivist order is being dismantled, and opens the prospect of a much more international perspective on the drivers of agricultural policy change in the EU.

Keywords: agriculture; Common Agricultural Policy; sugar; productivism; post-productivism

Peter M. Ward, Ph.D, C B Smith Chair in US-Mexico Relations, University Of Texas At Austin. Email: peter.ward@mail.utexas.edu; *Self-help housing and Informal Homesteading in Peri-Urban America: Settlement Identification Using Digital Imagery and GIS*

This paper develops a methodology for integrating Remote Sensing/aerial photographs and GIS techniques to identify low income informal homestead subdivisions (also known as colonias) in peri-urban areas of US metropolitan areas. Unlike their self-build counterparts in Latin American cities which start as illegal occupations of totally un-serviced lots, in the USA housing production is largely self-managed (embracing trailer homes, manufactured homes, modular units with self-help home improvement, etc.), placed on legally developed lots, albeit poorly or minimally serviced. As researchers begin to understand the logic and rationale underpinning their existence, and better appreciate where (spatially), and what (physical) "footprints" to look for, it becomes possible to identify and quantify the full extent of these peri-urban settlement phenomena. This paper reports on a three Metropolitan Statistical Areas in the USA to demonstrate the methodology and argues that this has wider application both in the USA and elsewhere.

Keywords: Housing, colonias, remote sensing, GIS, peri-urban sprawl

Email: joanne.curran@consarc-design.co.uk; Bernard John Smith, PhD, Queen's University Belfast. Email: b.smith@qub.ac.uk; *Superficial sandstone weathering and breakdown under contemporary dryland conditions*

Rock weathering is rarely if ever the product of a single process but reflects the cumulative and sequential effects of many spatially and temporally variable processes. In drylands rock weathering tends to be characteristically superficial and selective reflecting limited moisture availability and high evaporative losses. Despite this superficiality, weathering in drylands is still an extremely important process as it is primarily through the small-scale comminution of rock that

sediment fine enough to be removed by aeolian activity and/or episodic fluvial events is released ultimately providing the basis for long-term landform development. Data are reported illustrating the complexity of interpreting contemporary dryland weathering and breakdown of an exposure of Entrada sandstone (Utah). This sandstone displays widespread evidence of surface scaling and flaking with the associated breakdown and loss of a manganese-rich rock varnish. Scanning Electron Microscopy (SEM) identified extensive evidence of biological colonisation on both the sandstone surface and within substrate material with a hierarchy of biological forms identified from inter-granular biofilms through individual algal bodies to complex algal communities. Evidence tends to suggest that together these different biological forms are contributing to surface lowering of the sandstone and physical disruption of the substrate through hyphal penetration, which in turn facilitates the ingress of moisture that is taken up by interstitial clays. SEM analysis of a section through the upper 2-3mm of sandstone showed a clear micro-structural stratification with surface/near-surface concentration of interstitial clays underlain by a more porous substrate in which clays were present only as isolated deposits.

Keywords: sandstone, weathering, biological, rock varnish, drylands

Michael B. Warner, United States Geological Survey. Email: mwarner@usgs.gov; *Development of Geospatial Datasets for Natural Resource Assessments and Reconstruction Activities in Iraq*

A major challenge facing reconstruction planners in Iraq is the lack of a consistent geographic information system (GIS) that can aid in the decision making process. Currently remotely sensed data, digital elevation models (DEMs), and vector data including transportation networks, hydrography, and geographic place names are a few of the basic datasets required for an effective and operational decision support GIS. The objective of this project is to develop a current, accurate, and publicly available countrywide geospatial dataset for Iraq. Framework geospatial data were acquired first, including post-processed Landsat imagery, void-filled Shuttle Radar Topography Mission (SRTM) DEM data and historical maps. Processing of the Landsat imagery included pan-sharpening the imagery to its highest resolution of 15m, color balancing and histogram matching, orthorectification, storing the imagery in a visible (7, 4, 2) band combination, tiling the imagery in 1 degree by 1 degree cells and storing the imagery in a user-friendly geotiff format. In addition, the void-filled SRTM DEM provides a single consistent elevation model to be used for national scale mapping, GIS, and remote sensing applications. These framework datasets served as the basis to derive a series of vector datasets including roads, hydrography, dams, oil fields, marshes, and cultural features (place names) as well as raster based landform and land cover classification datasets. Together, in a GIS, the framework data and their derivatives effectively aid in reconstruction activities by providing the ability to accurately assess, map, and monitor Iraq's natural resources, cultural resources and infrastructure.

Keywords: reconstruction, natural resource, GIS, Iraq, geospatial data

Stacy Warren, Eastern Washington Univ. Email: swarren@ewu.edu; *The Air Above Us: Pirate Radio and the Struggle to Control Urban Airwaves*

Since its invention in the late 19th century, radio technology has offered an important medium of communication in and across urban space. In the United States, its role as a 'voice of urban America' has been shaped by both its historical connections to military, corporate, and government interests and by the technological opportunities for transmission and reception it presents. Unlike other more costly forms of mass communication, radio from the beginning has been an affordable technology - virtually anyone with a few dollars, tools, and some basic technical skills could build their own community radio station. Thus radio has played a uniquely hegemonic role in discourse over urban spaces and cultures, as the site of struggle between powerful corporate interests and community voices. This paper examines that hegemonic struggle and its urban implications by focusing specifically on unlicensed, or pirate, radio throughout the 20th century to the present. A combination of archival research, interviews, and GIS analysis is used to, first, construct an empirical overview of changes in radio station demographics and the regulatory and commercial environments within which they have existed, and, second, to critically analyze the ways in which people have moved outside the regulatory boundaries to offer unlicensed pirate broadcasts. The paper concludes that the efforts of broadcast lobbies and governmental regulatory bodies to define and restrict access to the airwaves has increasingly discriminated against urban settings, and that a new generation of pirates has arisen to provide this otherwise missing urban voice.

Thad Wasklewicz, University of Memphis. Email: twsklwcz@memphis.edu; Dennis Staley, Ph.D., University of Memphis, Department of Earth Sciences - Geography. Email: dstaley@memphis.edu; *Endogenic Controls on Debris Flow Fans, Death Valley, California, USA*

Spatial patterns are produced from an arrangement of geographic elements in a landscape. Unlike geographic functions (processes), geographic patterns can not be initially weighed or measured, rather they must be mapped. Maps of combined geomorphometric variables from 1-meter Airborne Laser Swath Mapping (ALSM) data of debris flow fans in Death Valley, CA assist in unraveling spatial patterns present in all the fans under investigation in the current study. Semivariance analyses and pixel correlations between adjacent features in debris flow levees, lobes, and channels provide strong evidence for consistent spatial patterns between and within the debris flow fans. The systematic spatial patterns point toward internal factors related to surface topography controlling the surface complexity of debris flow fans. The length of time associated with this internal control is unknown. However, this does not diminish the role of internal controls. Rather, there are strong indications that surface form is a factor in depositional processes and ultimately surface topography for some finite period of time on debris flow dominated fans. Furthermore, the finding runs counter to the concept of external forces (i.e. tectonics and climate) controlling fan evolution. The formation of the spatial patterns across flows of varying age strongly suggests the periodic structures result independently of external forcings.

Anders Wästfelt, . Email: anders.wastfelt@humangeo.su.se; *Continuous landscapes in finite space - analysis of remote sensed images as a source in social science.*

Remote sensed images were created in the era of exploring space and as an instrument in the cold war. In civil use satellite images have been inserted into a tradition of cartography and GIS. In opposite to maps they consist of non classified and boundless information which paradoxically is fully open for different interpretations. The opportunity to interpret satellite images within a social science framework has hitherto not been used to its full potential. This paper will present research which critically examines what the boundless characters of satellite images imply and what it means that for example Google earth creates an understanding of the world as finite. From another angle the qualitative perspectives derived from inside knowledge by local land users will be discussed, and how the remote sensing community has avoided a social and humanist perspective in the interpretation of images. Another question of the paper is the interpretation of the embedded power relations in the images and especially the power created by the panoptical eye.

Rudolf Wastl, University of Klagenfurt. Email: rudolfwastl@gmx.at; *Where is Europe? Cartographic Representations and Imaginations of a Continent*

With the enlargement of the European Union, Europe and its eastern boundary have been dealt with more often, especially by politicians and have been used as an argument for or against further enlargements. In this context the geography of Europe has become an issue. This paper analyses in a first step, how Europe was and still is represented as a continent in school atlases and as a world region in U.S. and European text books. The boundaries examined are very different and do not correspond to any of the European institutions or organisations (EU, OSCE, EUROVISION, etc.). In a second step, the cooperation and integration with European institutions and organisations will be addressed and examined as to what extent these different institutional spatial layers fit with each other and the continents or world regions of Europe, discussed before. The development over the last 20 years will be presented with maps of an integration index with the assumed integration effect of being a member in selected European organisations in 1985, 1995 and 2005. One can see that there is no uniform Europe but many layers. Finally, using the results of an empirical study the imagined Geographies of Europe will be shown.

Stanley Waterman, University of Haifa. Email: waterman@geo.haifa.ac.il; *The 2001 United Kingdom Census and the Jews*

The 2001 United Kingdom Census included a religion question for the first time in which one of the categories was "Jewish". Despite the simplistic form of this question and the fact that the religion question was the only voluntary one on the Census, it has yielded a valuable dataset on Britain's Jewish population. The data both confirm existing knowledge on this group and raise new questions about the location and social organization of this population. Jews are the most highly concentrated group of people in the UK, with 60 percent living in Greater London. At the same time, they live in every Local Authority in the UK bar one, a tenth in areas with no organized Jewish community. Because they often live close to one another, their geographical distribution often straddles Local Authority boundaries, understating the intensity of the clustering. Likewise, the Census undercounts Jews by between 10 and 20 percent, with many people of all outlooks opting not to respond. It also provides data on household composition, intermarriage and cohabitation patterns for the first time. Analysis of a write-in option on the question on ethnicity highlights the need for a Jewish ethnic category in the 2011 Census.

Keywords: Census, United Kingdom, Jews, religion

Garey Waters, North Carolina Central University. Email: gareywaters2@yahoo.com; *Applying Diamond's Criteria for Societal Collapse to Iraq: Comparisons to Haiti and Japan*

The subject of how societies in the past and present have developed and collapsed is a subject surrounded by myth and folklore. With the development of the scientific method and a more accurate understanding of the earth and its systems scholars have been able to explain some of the causes of these societal collapses. Some societies were able to avoid total collapse while others could not change quickly enough to avoid the inevitable. The poster that I have prepared applies Jared Diamond's theoretical platform for societal collapse to present-day Iraq. Five criteria are used to explain societal collapse: environmental change, hostile neighbors, friendly trade partners, climate change and societal response. These criteria are discussed and compared to the situation in Haiti. The two societies being compared have both suffered considerable environmental change and geopolitical degradation. Both societies have endured economic sanctions and have entered a state of constant turmoil and chaos that is rarely experienced in the more developed western world. The response of these societies to the collapse of their governing bodies and the struggles for power within these countries is also a constant reoccurring theme that plagues both of these collapsing societies. In contrast to the societal collapse in Iraq, Japan was able to curtail its societal decline once the root cause of collapse was recognized, and the society as a whole implemented appropriate remedies.

Johanna L. Waters, University Of Liverpool. Email: J.L.Waters@liv.ac.uk; *Cosmopolitan enclaves and transnational spaces: some recent geographies of international education*

This paper explores the socio-spatial implications of recent developments in the internationalisation of education, which includes the growth in numbers of foreign students and overseas-educated graduates, the branding of national education systems and the development of offshore schools and university campuses. Drawing on fieldwork in Hong Kong, Canada and the UK, it argues that international education is transforming the spatial scales over which, and the means by which, social reproduction is achieved. In the West, universities are able to offset cuts in public funding of education through actively increasing numbers of fee-paying international students. These lead to communities of international students that are at once spatially and socially concentrated and transnational. At the same time, upper-middle-class populations in contemporary East Asia are able to assert and secure their social and economic power, ensuring social reproduction through the acquisition of a 'Western education'. This has created distinctive enclaves of overseas-educated cosmopolitan professionals within student-sending societies, with implications for local patterns of inequality and social exclusion.

Email: sraza@ucalgary.ca; *Web-Based GIS Tools for Acquiring Public Input on Transit Service in Canmore, Alberta: Sensitivity to Respondents' Computer Experience and Other Socio-Economic Characteristics.*

The Town of Canmore has over 15,000 permanent and non-permanent residents. Located in the Rocky Mountains just one hour's drive west of the

major metropolitan centre of Calgary, Alberta, this small, picturesque, mountain community is facing unprecedented growth. In 2005 we launched a GEOIDE sponsored project to determine the efficacy of using web-based GIS decision support software to promote sustainable growth in this tourist haven that currently attracts over 900,000 visitors annually. The software that was chosen to implement the web-based GIS was MapChat, a program that is in continuous development at the University of Waterloo. To test the usefulness of this software a web-based GIS questionnaire was designed to gather public responses to four transit routes that were proposed by the consulting company, D. A. Watt in 2006, as a way of introducing transit service to Canmore. This paper analyzes the responses to that questionnaire, the efficacy of the web-based GIS decision support system and suggests ways in which the tool might be developed in the future. The sensitivity of the results to the respondents' computer experience, gender, age and other socio-economic characteristics is discussed.

Stephen F Wathen, Ph.D., University of California Davis. Email: sfwathen@ucdavis.edu; A 2 000 year environmental history of the Sierra Nevada: Abrupt climate change, fire, erosion, and global climate teleconnections

There is scientific disagreement concerning the global extent of abrupt climate change events during the Holocene. There is also concern that additional global warming could trigger destructive changes in the Earth's climates with severe environmental consequences. I investigated the environmental effects of abrupt climate change at Coburn Lake, California over the past 2 000 yrs, testing the hypothesis that Coburn Lake charcoal peaks represent stand-replacing fires in the Coburn Lake watershed in response to climate change. I compared the timing of Coburn Lake charcoal peaks with high-resolution precipitation and temperature chronologies from the Sierra Nevada and Greenland. Coburn Lake charcoal peaks were deposited at the beginning of all ten droughts (with associated cold temperature extremes) in the northern Sierra Nevada over the past 2 000 yrs. Coburn lake charcoal peaks also coincided with seven of eight periods of peak drought conditions in Greenland over the last 2 000 yrs. These results suggest an abrupt climate change-severe fire hypothesis that abrupt climate change during the late Holocene caused vegetation and mountain slopes around Coburn Lake to be seriously out of balance with changing climates - resulting in forest die-off, stand-replacing fires, and severe soil erosion. The results also suggest climate teleconnections between the Sierra Nevada and Greenland over the last 2 000 yrs.

Keywords: charcoal, Greenland ice cores, environmental history, global climate change

Suzie Watkin, University of Wales, Aberystwyth. Email: srw@aber.ac.uk; Welfare to work and youth exclusion in rural Wales: Resistance may not be futile

New Deal is an explicitly governmental state project of welfare to work delivered by New Labour across the UK. The policy attaches a range of client responsibilities, such as attendance on mandatory courses and work experience placements, to the right to receive unemployment benefit. This paper discusses empirical participant observation of 18-24 year olds taking part in one such course in order to provide a detailed tracing of local governmental practices as a way of 'peopling the state' in terms of both the deliverers and recipients of policy. An experiential methodological approach facilitated these tracings, and also revealed moments where the young people were able to undermine the one-size-fits-all workfare policy that they negotiate through brief moments of prosaic, everyday resistance. The paper will use empirical tracings of young people's experiences of a programme designed to help alleviate social exclusion, in order to speak to wider debates about (local and rural) state power and resistance to this.

Keywords: young people, exclusion, welfare, UK, rural geography

Case Watkins, Texas State University. Email: aw1272@txstate.edu; Vulnerability and Hurricane Katrina: Measuring the Social Landscapes of Flood Inundation in New Orleans

This study determines the effects of poverty, income level, and ethnicity on flood inundation levels due to Hurricane Katrina in New Orleans. Most vulnerability inquiries are instruments used in planning and mitigation efforts, and therefore concentrate on the social and biophysical factors that infer vulnerability to a realm of potential hazards. This paper measures the social dimensions of biophysical vulnerability to a specific hazard event—Hurricane Katrina. Using a GIS and statistical methods, this study combines a flood depth dataset with census block group data to measure the socio-economic and ethnic variation of the inundated population. A multivariate regression model reveals the effects of poverty, income, and ethnicity on flood inundation levels. The results of the analysis suggest that ethnicity played a central role in determining vulnerability to Katrina's floodwaters. These results illuminate historical settlement patterns and reveal the relationship between social indicators and floodwater in 2005 New

Orleans.

Keywords: urban geography, hazards, GIS, New Orleans, Katrina, environmental equity, vulnerability

Annette Watson, University of Minnesota. Email: wats0148@umn.edu; Can We Merge Subjects and Objects?: Indigenous Knowledge of the Non-Human and the Scales of Political Practice for Waterfowl Management

Waterfowl migrations necessitate an international scale of management. Thus the US Migratory Bird Management structure attempts to erase this distance by populating decision-making positions with tribal, Federal, and state agency representatives. Yet the collective formed around waterfowl poses immediate difficulties for making management decisions because indigenous people and wildlife biology differ regarding the 'nature' of the non-human. Wildlife biology presents the 'facts' of waterfowl population trajectories to justify managers' season dates and bag limits—derived from scientific practices that separate subjects and objects. On the other hand, Indigenous Knowledges (IK) develop through local subsistence practices, which exhibit a spatiality informing a relational ethics; IK is not exclusively a knowledge about objects, but about how to live with non-humans. However, indigenes at the international scale of waterfowl management, primarily represented through the Alaska Migratory Bird Co-Management Council, are relegated to positions that address the 'rights' of indigenous peoples to harvest resources, rather than positions that recognize their knowledges. Drawing on the literatures from science studies and indigenous governance, in this paper I argue that the very conception of the non-human in the regulatory regime as object rather than agents effectively dislocates indigenous peoples from key positions that impact decision-making, as decisions recognize only their 'values' rather than their knowledges. Yet is it possible to 'scale up' the agency of non-humans to allow more meaningful indigenous participation in waterfowl management? What could such a management system look like at the international scale if it recognizes different ontologies of wildlife?

Keywords: Indigenous knowledge, migratory birds, environmental governance, non-human ontologies, Alaska

Elizabeth Burke Watson, Geography DEPT., UC Berkeley. Email: bethw@socrates.berkeley.edu; Kerstin Wasson, Elkhorn Slough National Estuarine Research Reserve. Email: ; Andrea Woolfolk, Elkhorn Slough National Estuarine Research Reserve. Email: ; Eric VanDyke, Elkhorn Slough National Estuarine Research Reserve. Email: ; Applications of paleoecology to wetland conservation at Elkhorn Slough, California

Elkhorn Slough is the second largest area of estuarine tidal wetlands in California, and the first U.S. estuarine sanctuary. Region-wide, 90% of historic tidal wetlands have been lost or restricted from tidal flow due to diking for agricultural use, salt pond construction, and development. However, wetland loss at Elkhorn Slough is currently being driven largely by tidal erosion, and the subsequent expansion of tidal channels and shoreline recession. This study reports on the use of paleoecological analyses to support and inform current restoration and conservation activities at Elkhorn Slough. Analyses of three sediment cores for fossil pollen, organic content, accretion rates, and the removal and stratigraphic description of twelve additional cores have established the timing of marsh establishment, current and prehistoric estuarine salinity, wetland plant abundance and distributions, and the relative contributions of mineral and organic sediment to wetland sediment accumulation. By understanding prehistoric processes and conditions and past variability more thoroughly, managers will be able to evaluate conservation, restoration, and management alternatives in a more informed fashion.

Keywords: paleoecology, conservation

Kelly Watson, Florida State University. Email: kcw03c@garnet.acns.fsu.edu; Non-Timber Forest Products and Conflicts of Natural Resource Access in a Post-Industrial Context: Tupelo Honey Production in Northwest Florida

Tupelo honey producers in Northwest Florida retain a natural resource-based livelihood, one that sustains a rural way of life and helps define a unique and culturally rich region. Tupelo honey is a valuable regional non-timber forest product, and its production is a long-time rural livelihood practiced by skilled beekeepers for generations. Beekeepers have worked bees along the banks of the Apalachicola River for more than a century, and possess an irreplaceable knowledge of the tupelo forests upon which they depend. However, forests that have long been used for tupelo honey production are undergoing a number of changes that render them either unproductive or inaccessible. One of the most significant changes is the rapid suburbanization of the landscape, as Florida's Deep South is divided up into parcels of real estate prime for development. This development affects beekeepers' access to tupelo forests both directly, through forest clearing, and indirectly through increased costs, renegotiation of leasing

agreements, zoning restrictions, and vulnerability to insecticides. These challenges increasingly leave beekeepers dependent upon public lands, and at the mercy of restrictive public land managers. Using the lens of political ecology, this presentation examines cross-scale power struggles and conflicts of natural resource access faced by this forest-dependent community in a contemporary, developed-world context.

Michael L Watson, ETI, contractor to the United States Geological Survey. Email: mwatson@usgs.gov; *Creation of a standard color palette for LANDFIRE existing vegetation type: Compilation of data from multiple sources to create a national coverage*

Mike Watson, ETI, contractor to U.S. Geological Survey (USGS) Center for Earth Resources Observation and Science, Sioux Falls, SD. Work performed under USGS contract 03CRCN0001. LANDFIRE is a cooperative effort involving the Department of the Interior, the USDA Forest Service, and The Nature Conservancy. The overall goal of the project is to provide spatial data and predictive models required to characterize fire fuels and fire regimes, and to evaluate fire hazard status. One of the integral data layers being developed by LANDFIRE is Existing Vegetation Type (EVT). Mapping of EVT for LANDFIRE is based on the ecological system classification developed by NatureServe, and will result in a total of 500-700 ecological system classes for the conterminous United States. As digital data layers of EVT become available, there is a need to merge the data across map zones to create regional and national data sets and map products. When merged EVT data sets were first developed, it was clear that the colors assigned to EVT classes were not consistently applied across map zones. The objective of this study is to achieve a universal color palette for merged, multi-zone EVT data sets. All unique EVT classes will be sorted and reclassified, assigned new colors, and labeled. Cartographic principles of color will be applied to standardize colors across large regions. Preliminary results show that when similar classes are represented with variations of the same hue, color differences between adjacent zones diminish and the regional map appears reasonably seamless.

H Doug Watts, University of Sheffield. Email: H.Watts@sheffield.ac.uk; *An endangered species? The large manufacturing plant in the twenty first century,*

The last quarter of the twentieth century was characterised by a decline in manufacturing employment. Accompanying this decline was a dramatic fall in the number of manufacturing plants with one thousand or more employees. Data from the UK show a fall from just over 1000 such plants in 1978 to just under 150 in 2004. In employment terms this represents a fall from almost three million employees in 1978 to fewer than 300 thousand in 2004. In employment terms, the large plant sector has been truly decimated! Two mechanisms have been involved in the process of employment decline in large plants: plant shutdowns and enhanced labour productivity in surviving plants. The causes of manufacturing employment decline in general have been well rehearsed elsewhere and the original contribution of this paper is to explore the aggregate date to outline the changing role of large plants in the UK and then, at the micro level, to explore the process of re-structuring among large plants in a number traditional industrial sectors in the former steel town of Sheffield UK. The analysis demonstrates the complexity of the process of change and the important interactions between corporate actors resulting in outcomes discernable in contemporary manufacturing activities.

DRAFT ONLY A political ecology of Warlpiri water rights: land alienation and denial of access to perennial water sources on leased lands. The Warlpiri lands are situated in the Tanami Desert that includes portions of the Great Western Desert in the Northern Territory, Australia. Since the arrival of Europeans in the early 1900s, a radical transition in land and water management regimes has emerged. As a result of this transition Warlpiri people have been marginalized through land alienation and denial of access to perennial water sources on leased land. Political and legal precedence is given to pastoralists over Warlpiri interests to water. This paper examines Warlpiri processes in utilizing Australian legislation based on the foundations of customary law to assert rights to perennial water sources on leased lands. The Pikilyi Movement comprises Warlpiri traditional owners of the most culturally valued permanent water source in the bioregion referred by Warlpiri as 'Pikilyi'. The Warlpiri combines the Western knowledge system with the Warlpiri knowledge system to develop practical strategies that

aim to intercept processes of land alienation and denial of access. A political ecological analysis assists Warlpiri in the development of these strategies that are applied to the Australian legal and political systems to gain greater recognition of Warlpiri knowledge and interests to water. The Pikilyi Movement is a social movement that adopts a collaborative water management approach to prevent further environmental degradation caused by the proliferation of artificial watering points, overgrazing and lack of grazing management.

Paul R Watts, Louisiana State University. Email: junkdepository@hotmail.com; *Turbulence in the stream: counter protesters in New York City and Washington, D.C.*

Public protests are mobile events in which a variety of groups and individuals participate by marching through the streets as a form of political expression. Although ideological disagreements exist among these groups and individuals, there are underlying themes that create a unifying bond among protesters. Counter protesters, on the other hand, generally operate in a small group within the larger protest event and frequently use contentious tactics to express their opposing points of view. Because counter protesters can be provocative, the police segregate them at a fixed location to reduce confrontation with the passing protesters. But even with a police presence, vociferous exchanges between counter protesters and protesters are inevitable. By drawing from fieldwork conducted in New York City and Washington, D.C., this presentation examines how counter protesters contribute to the already dynamic geography of a public protest by creating a spectacle and thereby affecting an event's mobility and flow.

Keywords: Counters protesters, public protests, spectacle

Raymond D Watts, United States Geological Survey. Email: rwatts@usgs.gov; Vivian Queija, United States Geological Survey. Email: vqueija@usgs.gov; *Land Use Density Near the Shore of Puget Sound Correlates With Reduced Probability of Herring Spawning*

Over the past thirty years, the Puget Sound Basin has experienced intense urban growth that has resulted in the degradation of natural habitat for aquatic species. Because of increased toxic levels in Puget Sound and decreased riparian habitat, several salmon species are now listed as endangered and the resident orca population as threatened. Integral to the diets of both salmon and orcas are several forage fish species, such as herring, that spawn in the nearshore zone of Puget Sound. Although upland areas, rivers and streams, and their riparian areas have been investigated for mitigation efforts and restoration projects, greater understanding of the nearshore environment and processes are needed to connect terrestrial and aquatic mitigation efforts. This paper describes an initial effort in a long-range interdisciplinary study by the U.S. Geological Survey and its partners to explore the effects of urbanization on nearshore processes and ecosystems. We examine land use patterns along the near shore of an embayment of Puget Sound to determine anthropogenic indicators of stresses to forage fish spawning. We use a spatial analysis of parcel counts along the shoreline to show that increased urban density near the shore is positively correlated with reduced probability of herring spawning. Scientists in the USGS Coastal Habitats in Puget Sound (CHIPS) Project use results from this analysis of associations between urban and ecological status, and other similar analyses, to focus process-based investigations of causes and effects.

Richard A. Waugh, University Of Wisconsin, Platteville. Email: waugh@uwplatt.edu; *The Persistence of Utopia: Postmodern Geographies of Fantasy*

It can be argued that utopia is an inherently Modern concept, at least in the form originally described by Thomas More when he coined the term in 1516. That original work, as well as subsequent utopias, often reflected these Modernist characteristics: the domination and reworking of nature; the geometric rigor of the physical plan of the utopia; the proscribed and inflexible code of behavior expected of utopian residents; and the essential optimism reflected in the belief that humans were capable of such an audacious accomplishment as the perfection of society. So connected to the Modern worldview has the concept of utopia been that it has been suggested by many that, with the weakening of modernist ideas, "utopia" is no longer a valid concept. Indeed, it has been suggested that the postmodern terms "dystopia" and "heterotopia" are more valid current ideas. This research examines the degree to which these modernist characteristics of utopia are still current in the geographies of fantasy held by people who have been heavily influenced by postmodern culture. Examination of over 500 such geographies of fantasy indicates substantial resiliency of certain modernist ideas, such as the morphological construction of fantasy, in postmodern imaginative geographies.

Kristina Weaver, MPhil, Glasgow University. Email: kristina.nellweaver@gmail.com; *Foolish Deconstruction: Justice as a Gaggle of Clowns*

Kristina Weaver and Dr. Paul Routledge Department of Geographical and Earth Sciences, University of Glasgow, Glasgow G12 8QQ, Scotland. Email: kristina.nellweaver@gmail.com Abstract for AAG 2007 session on Geographies of the Circus One of the most colorful innovations of the 2005 convergence against the G8 summit in Gleneagles, Scotland was the forming of the Clandestine Insurgent Rebel Clown Army (CIRCA). A global movement of autonomous, non-hierarchical clown 'gaggles,' CIRCA combines creativity with local direct action in resisting militarisation at home and abroad. Inspired by the archetypal role of the trickster or buffoon, rebel clowns are fools who have run away from the Circus and into the King's Court. Armed with a methodology that has roots in many fooling traditions (including but not limited to circus clowning), CIRCA critiques state violence and extra-state 'terror' as being intrinsic to a neoliberal agenda for corporate control of human and environmental resources. This paper critically assesses CIRCA's tactics during and since the G8 summit, with attention to its transplantation in the United States, in terms of new strategies for radical deconstruction and the re-making of identity or issues-based politics. A duo of clownbattants, Kristina Weaver and Paul Routledge have been active in CIRCA as clowns, trainers, and theorists since 2005. www.clownarmy.org

Pervasive and ubiquitous computing, federated databases, and location-aware technology allow almost unlimited tracking of individuals in nearly all dimensions of their life in geographical, social, and digital spaces. We use the concept of a digital footprint to capture and commingle these dimensions over individual lifelines. The digital footprint of an individual is the highly dimensional, perpetually-increasing space characterized by geocoded digital transaction data, augmented by surveillance, and influenced by associations and patterns through space and time. In this paper we propose a novel way of inferring digital personae from space-time-activity and other digital footprint data. We illustrate our methods with a use case providing the detailed digital footprint of an individual, covering a span of four months. We apply various exploratory data analysis techniques, specifically relative motion and regular expressions, using multiple spatio-temporal reference frames and granularities. Our approach is twofold. First, we profile our test person by inferring individual partialities in space-time and consumption patterns. Second, by treating each single day of the multi-day itinerary as a new 'personality,' we obtain a rich, dense dataset simulating a closely related peer-group, providing interesting opportunities for social interaction analysis. Lastly, we evaluate the feasibility of our various analytical and visual approaches in helping us understand the space-time-activity

patterns of individuals and cohorts; and we discuss the practical ramifications of using these patterns to then infer digital personae.

Jena Webb, Doctoral candidate, McGill University. Email: jennifer.webb@mail.mcgill.ca; *Black Gold and Quick Silver: Deforestation, petroleum extraction and mercury in the Upper Amazon*

This research employs an Ecosystem Approach to examine human exposure to contamination resulting from deforestation and pollution by petroleum companies in the Ecuadorian and Peruvian Amazon. Work conducted in the Brazilian Amazon indicates that deforestation, and the subsequent erosion of soils naturally containing mercury, is an important source of mercury to aquatic ecosystems. One of the Amazonian regions undergoing rapid land cover change is located in the Ecuadorian Amazon - the Napo deforestation front - where the construction of roads for petroleum exploitation has facilitated the extensive colonization of this frontier region. However, since the 1970s, this region has also seen large-scale contamination by hydrocarbons and the chemicals associated with the extraction of petroleum. The Corrientes and Pastaza watersheds in Peru have also undergone intensive petroleum exploitation resulting in large-scale pollution; however, in these two watersheds no roads were built and consequently little deforestation has occurred. The objective of this research is to disaggregate the potential sources of mercury to these three watersheds using a combination of data and a comparative design. Results from original research on mercury levels in fish and Amerindian populations, benzene levels in human urine, interviews on diet and work history, and focus groups are synthesized and the politico-economic, biogeochemical, and socio-cultural factors which fashion resource use, the dynamics of mercury contamination, exposure to mercury and the consequent health implications are highlighted. The hope is that this research can be used to influence evidence-based policy in directions favorable to the well-being of local people.

Simon Webber, Post-graduate, Queens University Belfast. Email: swebber03@qub.ac.uk; Patricia A Warke, Ph.D, Queens University Belfast. Email: p.warke@qub.ac.uk; Jennifer McKinley, Ph.D, Queens University Belfast. Email: j.mckinley@qub.ac.uk; *GIS Scale Linkage: Case Study of Aeolian Depositional Bedforms*

Landscapes comprise a hierarchical assemblage ranging from micro- to macro-scale features that together give a landscape its distinctive characteristics. A body of literature exists on issues related to these weathering features and the processes that form them. However, much research still needs to be done on identifying links between scale boundaries of such features. The issue of scale linkage is a complex one that incorporates a number of processes and controls that may work independently and in combination in defining the scale boundary. This research attempts to address the issue of scale linkage through the use of spatial analysis, Geographical Information Systems (GIS) and geological interpretation. GIS should provide a useful tool as the characteristics of different scales of weathering feature will be analysed using spatial data analysis techniques and GIS to identify the spatial variability of these characteristics. This information can then be used to identify links between scale boundaries and the processes and controls that define them. Data is reported from a pilot study aimed at testing the technique through a combination of aerial photos and ground survey data, set within a GIS framework applied to a coastal dune system in Northern Ireland comprising a hierarchy of Aeolian depositional bedforms. The ultimate intention will be to up-scale the technique through application to a large desert landscape unit in the South-West United States of America.

Joe Weber, University Of Alabama. Email: jweber2@bama.ua.edu; Brandy Phillips, Alabama-Tombigbee Regional Planning Commission. Email: ; *Accessibility Change and Economic Development along Corridor X*

The relationships between improved transportation, economic development, and resulting socioeconomic changes have been the focus of much debate over the years. Yet proving there is a link between transport infrastructure investment and economic development has been difficult. This research examines the relationships between socioeconomic factors and accessibility change resulting from highway construction along the Corridor X highway project, running from Memphis, Tennessee to Birmingham, Alabama. This new freeway has been justified on economic development grounds, and is expected to open up areas to growth. However the results show only minimal increases for several accessibility measures between 1990 and 2000, largely concentrated in communities already thought to be accessible. When accessibility models used travel costs that were adjusted for inflation and fuel costs, only two locations

experienced any gains. Statistical analysis found that socioeconomic characteristics and accessibility improvements showed little correlation. Regression was then used to examine the relationships of forty-four independent variables to eight socioeconomic characteristics, but the accessibility measures were included in only one model. This shows a nearly complete lack of evidence that a relationship between increased accessibility and quality of life exists, raising important questions about the role of transport in improving conditions in many areas of the U.S.

Email: matt@hawaii.edu; Deriving digital surface models from bathymetric LIDAR data for benthic terrain analysis

Benthic habitat complexity is a major determinant of fish assemblage structure, and these complex areas represent important biodiversity hotspots that have significant implications for marine conservation and management. Considering the documented importance of the relationship between habitat complexity and fish assemblage structure, it is critical to improve methods of calculating spatial complexity in the marine environment at broad geographic scales that are commensurate with resource management decision making. Remotely sensed Light Detection and Ranging (LIDAR) data has recently been utilized to derive measures of habitat complexity in the marine environment. However, there are a number of geostatistical methods that may be applied to interpolate LIDAR data for further benthic terrain analysis. In this study, we compared several geostatistical methods for creating digital surface models (DSMs) of the benthic environment in order to determine the best method to interpolate LIDAR data for benthic terrain analysis and calculation of habitat complexity. We concluded that the geostatistical method of conditional simulation was the most appropriate method for creating DSMs of a complex coral reef environment. The results of this work demonstrate the advantage of the geostatistical method of conditional simulation as a step in measuring habitat complexity, and the efficacy of remotely sensed LIDAR data to provide benthic habitat complexity measures of a coral reef habitat at a scale commensurate with the resources and applicable to regional-level management actions.

John R. Weeks, PhD, San Diego State University. Email: john.weeks@sdsu.edu; Do Slums Promote High Urban Fertility? Neighborhood Differences in Fertility in Accra, Ghana

The achievement of low fertility in the richer nations, and the widespread, albeit uneven, declines experienced by less-rich nations have taken the attention away from fertility levels as topic of interest among demographers. But in countries like Ghana fertility is still well above replacement level and appears to have stalled at about four children each. Even in the capital city of Accra, women are having nearly three children each, and the declines there seem also to have stalled. The average for Accra, however, hides a great deal of variability within the city and explaining that spatial variability is the goal of this paper. We test the hypothesis that slum characteristics of neighborhoods account for fertility variability within Accra, net of individual characteristics. We do this by using data from a ten percent sample of anonymized individual records from the 2000 census. We group enumeration areas into contiguous slum areas by applying a new spatial clustering technique called AMOEBA. We then evaluate the importance of slum neighborhoods as predictors of fertility at the individual level using logistic regression analysis, and at the neighborhood level using spatially filtered multiple regression analysis.

David L. Wegner, Ecosystem Management International, Inc.. Email: emiwegner@aol.com; Adaptive Management and Water Conflicts: Is More Geographic Data the Answer?

In the near future conflicts over water will make the current disagreements over oil seem like small potatoes. Demand for drinkable water and intact ecosystems requires a scientifically valid approach to management of water. Traditional approaches to managing water has depended upon political support, administrative power and single issue management. Today we are faced with developing integrative and cooperative approaches to managing water that reflects the complex issues. The concept of Adaptive Management and its proposed balancing of management, policy and scientific components has been hailed as an alternative approach to managing water. The concept has support - the reality however has been found to be lacking in actual improvement in environmental conditions. This presentation will outline key areas of concern in the use and application of adaptive management in addressing water conflicts, endangered species and societies need for water. The use of scientific tools

including GIS, watershed models and instream flow programs in a geographic context will be explored and discussed with recommendations for the next steps identified.

Email: murray.308@osu.edu; A spatial semiparametric Bayesian model for predicting cancer mortality rates

We present a spatial semiparametric Bayesian approach for predicting future cancer mortality rates at small area level (e.g., county, census tract). On the one hand, the model assumes that the mortality series is linear (or quadratic) over short time intervals. The change (or the rate of change) for any two consecutive time periods is assumed to follow a nonparametric distribution with a Dirichlet process prior. This assumption allows a rich class of distribution as well as clustering of the slopes. On the other hand, the dependence of errors among different locations is considered as a Gaussian process in a hierarchical form in this model.

Email: luyuqi@263.net; Wen Chen, Nanjing Institute of Geography and Limnology of the Chinese Academy of Sciences. Email: wchen@niglas.ac.cn; Government Policies, Global Capital, and Regional Development in China:

The industrial district literature is centered on the Marshallian industrial district and emphasizes SMEs, local networks, and self-sustaining endogenous capabilities in regional development. This literature, however, has been criticized for its failure to take account of the role of states and the importance of external networks. Globalization has transformed core cities and city regions in developing countries into globalizing cities and emerging global city regions. They are often the most globalized places and the focus of foreign investment in developing countries, and more significantly, emerging nodes of the global economy. This is especially the situation in the Shanghai-centered Yangtze Delta, where Suzhou, an ancient capital of China, serves as a sub-center. This paper analyzes the development and transformation of Suzhou Municipality, known previously for its local state-led Sunan model based on township and village enterprises (TVEs). Suzhou, however, has been undergoing drastic restructuring to remake itself a globalizing high-tech center, or in Amin and Thrift's conceptualization, a neo-Marshallian district. We analyze how Suzhou transforms itself from a region dominated by TVEs and state-owned enterprises (SOEs) to an emerging FDI and high-tech center. We argue that the key to the transformation of Suzhou is the efforts of the states in utilizing global and local resources to globalize the municipality. We also argue that Suzhou's development path is heavily dependent on the external forces, with a weak domestic sector. Lastly, we examine the challenges the city is facing to develop into a high-tech center with national, even global significance.

Ryan Douglas Weichelt, University of Nebraska. Email: edwest_86@yahoo.com; Hispanic Influence on the Roll-Call Voting of U.S. House Members 1993 - 2005

After the passage of the Voting Rights Act in 1965, political scientists measured the impact new black voters had on influencing the roll-call voting of federally elected officials. They discovered in areas with large populations of blacks, the roll-call voting of officials became more liberal over time. With the increased number of Hispanics in the United States, similar tests can be administered to measure the impact on the liberalness or conservatism of elected officials in areas with large Hispanic populations. Therefore, this study will analyze the roll-call voting of House members from 1993 to 2004 in states with Hispanic populations greater than 5% of the total population. Using a measurement derived from the Americans for Democratic Action (ADA), this study will determine if growth in Hispanic populations of Congressional districts will lead to an increase in the liberalness of House members over time.

Adi Weidenfeld, BA (Geog), MSc (D&P), Department of Geography, University of Exeter. Email: aw233@ex.ac.uk; Do we need them Clustered? Competition, Cooperation and Innovation between Tourist attractions

The spatial and tourist-thematic determinants of co-operation and competition between tourism attractions are examined in the context of two competing arguments. The first is that distance and proximity between tourist attractions affect cooperation and competition between them. As has been done in previous studies in other industrial sectors, the study explores whether proximity between attractions increases or decreases traded and untraded interdependencies including knowledge transfer, innovations and competition between them. The second argument is whether the sources of such competition and collaboration lie in any tourist-thematic similarity between tourist attractions irrespective of their locations. The study in Cornwall, England is based on in-depth interviews with tourist attractions managers and key informants including tourism officers, local government councillors and representative of tourism associations as well as a survey among 400 tourists in tourism areas of high and low concentration of tourist attractions conducted throughout 2006. Initial findings throw light on the on the interactions between tourist attraction enterprises, which should help operators of individual attractions and policy makers in decision-making on locations for new tourist attractions. As well, the study aids in measuring the impacts on existing attractions of the constant need to remain competitive, productive and innovative while avoiding land-waste and minimising the use of greenspaces. Initial findings from the study improve our understanding of the benefits and disadvantages for tourism destinations of high and low levels of spatial clustering.

Timothy Weigel, University of Nevada Reno. Email: weigeltim@hotmail.com; Mapping Reseeding Potential in Elko County, Nevada: A weights of evidence approach.

The Great Basin region of the western United States is under going rapid change in part due to exotic annual grasses such as Cheatgrass (*Bromus tectorum* L.). Introduction and the spread of these species will effectively decrease native species, increase fire frequency, and indirectly effect watersheds, water quality and livestock grazing. Following one of the worst fire seasons in the summer of 1999, the Bureau of Land Management (BLM) instituted the Great Basin Restoration Initiative in an effort to assess the deteriorating ecological condition of the Great Basin and to develop a strategy for effective restoration. This paper proposes a weights-of-evidence method for modeling areas within Elko County, Nevada with high potential for reseeded success. Restoration and success of recovery is a complex issue requiring consideration of a number of factors. Weights-of-evidence can provide insight into the physical processes from which success is measured allowing for managers to evaluate the effectiveness of current rangeland management methods.

Keywords: GIS, Weights-of-Evidence, Restoration Management

Julie Marie Weinert, Southern Illinois University-Carbondale. Email: jweinert@siu.edu; Gender of Work: A regional study of employees' perceptions of ecotourism jobs

A number of studies have explored how tourism may affect gender roles in surrounding communities, but few have addressed tourism employee's perceptions of the gender of their jobs. This presentation draws on information learned in interviews with employees that worked at seven different ecolodges in Ecuador. One lodge was located on the Pacific Coast (Costa), three lodges were located in the cloud forest west of Quito, three lodges were located in the Andes Mountains (Sierra), and lodge was located in the eastern rainforest (Oriente). A regional comparison highlights how regional labor traditions influence employment patterns at ecolodges.

Keywords: gender, ecotourism, Ecuador

Geri Weinstein, Doctoral Candidate, University of Wisconsin - Milwaukee. Email: geri@uwm.edu; Representations of Nature: Implications for Urban River Access and Use

Urban nature is not a counter intuitive concept. People who want nature nearby come from all walks of life and cultures (Burgess, Harrison & Limb:1988). An increasing significance of nature in urban settings coincides with a growing need to accommodate heterogeneity and difference in its material representation. Using the discursive landscape of river revitalization, I examine conceptualizations of what is nature and what is not nature in a culturally pluralistic community on Milwaukee's south side. The study's focus is the Kinnickinnic River. This river is the most severely impaired of Milwaukee's three rivers. Discursive representations of a revitalized river, articulated by environmental advocates, private sector interests and municipal planners are compared and contrasted with conceptualizations of a 'natural' river held by Polish and Latino residents in the south side Milwaukee community of Lincoln Village.

Through in-depth interviews, the ways in which residents' conceptualizations of a natural river are informed by their life experience in the neighborhood urban park emerge as do dominating, contested and unifying images of what is nature and what is not nature. In the realm of policy and practice, this research, as the first study to examine conceptualizations of nature held by working class residents of a demographically changing neighborhood, can suggest a river revitalization model which recognizes and affirms plural values and life experiences.

Keywords: discourse, nature, river revitalization.

David Weisburd, Ph.D., Hebrew University and University of Maryland. Email: dweisburd@crim.umd.edu; Elizabeth Groff, Ph.D., Institute for Law and Justice. Email: egroff@ilj.org; Sue-Ming Yang, University of Maryland. Email: smyang@crim.umd.edu; Nancy Morris, University of Maryland. Email: nmorris@crim.umd.edu; Micro Level Variation in Opportunities for Crime

The existence of concentrations of crime events across both space and time has been empirically demonstrated. This concentration of crime at certain places is robust to changes in geographic scales of analysis. However, the specific factors associated with this variation across places are less well-known. Many studies have been conducted at meso and macro levels of analysis but only a few at the micro level. These studies have revealed a set of factors that are associated with variation in crime across census tracts, cities, and states. However, most of these are cross-sectional. Taking an opportunity theory perspective this research draws from environmental criminology, routine activity theory, rational choice perspective, and situational crime prevention to examine the factors associated with micro level crime across both space and time. These theories focus on criminal events rather than why individuals commit crimes and thus are well-suited to a place-based examination of crime. A series of environmental and socio-economic factors related to the opportunity for criminal events are identified and analyzed. Specifically, the research describes micro level variation among the individual street blocks in Seattle, Washington over a sixteen year time period. In doing so, the study identifies factors that are associated with changes in crime rates.

Keywords: GIS, micro level, longitudinal

Daniel J. Weiss, University of North Carolina. Email: danweiss@email.unc.edu; Mapping tree height within the alpine treeline ecotone of Rocky Mountain National Park, Colorado

The alpine treeline ecotone in Rocky Mountain National Park ranges from narrow ecotones characterized by abrupt edges of closed-canopy, sub-alpine forests to wide ecotones containing a mosaic of tree patches, alpine tundra, and bare rock. In addition to vegetation patterns, tree height is a useful metric for characterizing and classifying the ecotone because it can be used to differentiate between upright and krummholz growth forms. Tree height is also a critical factor influencing the redistribution of snow and the resulting feedback effects, which are hypothesized to be major controls on potential ecotone responses to environmental change. For this project the tree height structure within the alpine treeline ecotone of Rocky Mountain National Park was mapped from high spatial-resolution satellite and aircraft imagery using image processing and photogrammetric techniques. Modeled tree heights were verified using over 450 field data points acquired during summer, 2005. Tree height within the ecotone was used to perform a vegetation pattern analysis, the results of which were used to make inferences about the controlling variables responsible for creating and maintaining the ecotone.

Evan L Weissman, Syracuse University. Email: eweissma@syr.edu; Food Security in the 21st Century: Lessons from Cuban Agriculture for Materializing Realities

Worldwide, hunger poses a great problem for humanity. Despite popular belief, hunger is not an issue of agricultural production, but is a result of inequality exacerbated by neoliberal globalization. The fast-approaching global peak in oil production, the point at which half of all existing oil has been used, means that hunger, now a problem of inequality, will soon become a problem of production unless agricultural production is transformed. This project examines the promise of urban agriculture in providing food security following the collapse of petroagriculture. The case of Cuba, albeit fostered by political economic conditions and not emerging geophysical limitations, provides a model of agricultural development for the rest of the world. The collapse of the Soviet bloc in 1989 undermined Cuba's agriculture sector, as former inputs (particularly petroleum) were no longer available. As a result, Cuba initiated the largest alternative agriculture effort in history. In so doing, Cuba thwarted potentially devastating hunger and possible famine. Although much has been written on Cuba's successful agricultural transition, often overlooked is the urban response and the unmistakable popular characteristic of the urban agricultural movement.

This paper dialectically examines the rise and ultimate success of urban agriculture as a process whereby Cubans and the Cuban state struggle for self-sufficiency and self-determination in the face of hegemonic globalization.

Gerda R. Wekerle, York University. Email: gwekerle@yorku.ca; Anders Sandberg, York University. Email: sandberg@yorku.ca; *Producing Natural(ized) Suburbs: Capital and Nature in the Greater Toronto Area*

Richard Walker's early work on suburbia saw it as a function of the internal contradictions of capital as expressed in spatial form. As he noted, "Raw land, like raw nature, is of little use to human beings without transformation into an object of utility by means of human labor" (Walker, 1986,384). We build on Walker's insights by exploring capital's ability to harness nature in support of accumulation at the urban fringe. Analyzing two exurban and suburban industries that transform both land and nature- the aggregate industry, essential for the extraction of sand, gravel and stone for urban infrastructure, and the housing development industry- we investigate capital's efforts to naturalize growth by constructing nature as productive or a byproduct of growth. In examining the activities of "the property circuits of capital", we address the creation of exclusive spaces for living and recreation on the urban fringe that are differentiated not only by class and race but also by lifestyle and the consumption of nature. We also emphasize the state's central role in producing a policy regime that supports a new form of natural capitalism that is particularly salient in the suburbs and exurbs. Our paper is based on an analysis of the policy processes associated with recent legislation that establishes a greenbelt and regional growth management plans in the Greater Toronto Area, Ontario, Canada.

Keywords: urban geography, suburban growth, nature, development industry, aggregate industry, Greater Toronto Area

Jason Welborn, Sonoran Institute. Email: jwelborn@sonoran.org; *Monitoring Recreation in National Parks: The Sonoran Desert Network Approach*

Given the National Park Service dual mandate of resource conservation and public enjoyment for current and future generations, changes in recreational activity patterns are of special concern to park managers in the Sonoran Desert Network (SODN), which is comprised of eleven park units in southern Arizona and New Mexico. Each of these public lands has unique qualities which offer challenges to monitoring the types and extents of recreation and visitor use, including park size, management zones, complexity of road and trail networks, access points, and, for some, international migration and trafficking. The recent history of the internal population growth, steady tourist inflows and border activities in the Sonoran Desert ecoregion has accentuated the need for a better understanding of the status and trends in visitation and recreational use patterns over time and space. Thus, park managers have two important information needs: 1) sound estimates of visitation numbers and 2) cogent characterization of visitor behavior, such as routes traveled, activity types and duration of stay in the park. These needs will be addressed by the SODN Inventory & Monitoring Program through an integrative approach using site inventories, administrative data collection, road and trail traffic counting and visitor surveys.

Ivan Burl Welch, PhD (ABD); LTC, USA (Ret), Omni Intelligence, Inc.. Email: ivan_welch@omni-int.com; *Geohomography: What People do, Where they do it, and Why*

Purpose: The purpose of this paper is to present an emerging theory of Geographic Contextualism. In introducing this theory, the paper challenges our understanding of the energies that motivate the machines of culture, commerce, and civilization. Methods: The presentation of an expert model, its variables, and imperatives through the use of Albert Einstein's "Thought Experiment". This expert model of geographic operational dynamics has predictive qualities at several scales of analysis. Conclusion: The time has come to rekindle the fire of exploration and navigation that is the *raison d'être* of Geography. Geographic Contextualism challenges current perspectives of the landscape, rethinks causes of human activity, and introduces a new branch of geographic thought and research: Geohomography.

Keywords: human geography, predictive analysis, geohomography, expert models, geographic operational dynamics, geographic contextualism, geopolitics

Mark R Welford, Georgia Southern University. Email: mwelford@georgiasouthern.edu; *Local effects of ecotourism: a case study of the Nono-Mindo Road in Ecuador*

Since the early 1980s, money has flowed into the Nono-Mindo-Tandayapa region of northwestern Ecuador, largely through a rapid expansion of bird-related ecotourism. Recently, several informal and formal alliances have developed among residents and ecolodge owners within the area, intent on confronting two national economic development projects: (1) the recent construction of the

Trans-Andean oil pipeline following Nono-Mindo road from the top of the Tandayapa Valley to Mindo; and (2) the on-going attempt by the City of Quito to extend its eminent domain to include the Tandayapa Valley, where it has proposed to build up to seven dams to gain more drinking water. These projects threaten not only the local bird populations but also the lifestyles and livelihoods of residents and ecolodge owners in the area. Utilizing interviews with NGO representatives, ecolodge managers, and many employees, as well as ten years worth of oral history interviews with local and expatriate residents, this paper examines shifting power relations, employment strategies, and land use practices in the Nono-Mindo and Tandayapa Valley region, while also linking these changes to national and global transformations.

Keywords: Ecotourism, Ecuador

Barry Wellar, Wellar Consulting Inc.. Email: wellarb@uottawa.ca; *Adapting Walking Security Index Concepts and Procedures to Serve and Promote the Mobility of Children*

The Walking Security Index (WSI) project was approved in 1994 as an element of the Transportation Environment Action Plan of the Region of Ottawa-Carleton. During the design phase (1995-1998) ten indexes were developed to measure the levels of safety, comfort and convenience expected and experienced by pedestrians at intersections. In the pilot study phase (1999-2002) three macro indexes were tested for operationality. Over the course of the project more than 25 documents were published, including Perspectives on Pedestrian Safety (1995), Walking Security Index (1998), Newspapers as a Source of Fact and Opinion on Pedestrians' Safety, Comfort and Convenience (2000), and Walking Security Index Pilot Study (2002). In this presentation the origins of the WSI project are briefly summarized, and the index formulation processes for the Intersection Volume and Design Index (IVDI), the Quality of Intersection Condition Index (QICI), and the Driver Behaviour Index (DBI) are outlined. Consideration is then given to how each of the macro indexes (IVDI, QICI, and DBI) can be modified to explicitly represent the interests of children in road and intersection designs and operations, and in motor vehicle safety and enforcement programs. The presentation is concluded by discussing how the indexes can be applied by parents and advocacy groups, as well as by law enforcement, planning engineering and other agencies, to ensure that the levels of convenience, comfort and safety experienced by children while walking or biking exceed those of private motor vehicle operators, and thereby actively serve and promote the mobility of children.

Christopher Wellen, McGill University. Email: cwellen@po-box.mcgill.ca; Renee E Sieber, PhD, McGill University. Email: sieber@geog.mcgill.ca; *Indigenous Spatial Ontology Application*

For decades indigenous peoples have used GIS to preserve traditional knowledge, manage natural resources, and represent their interests with the state. GIS technology, in indigenous contexts, has largely been implemented as-is, typically with base data and data models created by the dominant society according to their conventions. This has resulted in very effective negotiation with the state, but less effective applications developed for the indigenous peoples, as indigenous peoples conceive of their landscapes differently from those dominant societies. Ontology has become a cornerstone of GIScience in terms of number of papers and presence at conferences. A prime goal of geo-spatial ontologies is improving understanding of and increasing interoperability among different constituencies of GIS users. This paper seeks to apply geo-spatial ontology research to the construction of a GIS for native peoples. We focus on a geo-spatial ontology of hydrographic/river features as conceptualized by the Cree and a GIS of placenames and stories. With input from our Wemindji Cree collaborators we created a conceptual ontology and then formalized it into a logical one. Instance semantics were extracted. Three user interfaces were created using different levels of semantic complexity and will be shown to Wemindji Cree research participants to gauge the usefulness of the semantic relationships. These interfaces will be on display at the conference. It is hoped that the development of participatory frameworks will further understanding of the participatory needs of ontology development among indigenous peoples and provide a geo-spatial ontological template for native/non-native collaborations.

Keywords: GIS indigenous ontology

Sally Weller, University of Melbourne. Email: saweller@unimelb.edu.au; *Trans-sectoral associations, interconnectedness and value creation*

The increasingly interconnectness and interdependence of economic processes in modern capitalism suggest the need for greater research attention to trans-sectoral associations and their role in the creation and realisation of value. Since these associations exist beyond the institutional realms of firms, value chains or places, they are difficult to identify and research, they prompt new way of thinking about the research process. The alternative approach proposed in

this paper is focused on identifying the conjunctural moments and sites at which the trajectories of multiple economic actors meet to concentrate and reinforce economic independencies through mutually reinforcing intersections of circuits of value. These processes are demonstrated in the example of Australian Fashion Week, an event in which the spatio-temporal convergence of multiple interests synchronizes different expressions of fashion ideas to actively construct fashion markets, enhance the value of fashionable commodities and reinforce inter-industry synergies. Re-conceptualising these interconnected industries as components of a globalising fashion complex dedicated to the production and reproduction of value has implications for understanding the structuring of capital, regional development, world cities, production location and the manner in which production systems 'touch down' in different places.

kjwell01@maxwell.syr.edu; Easton Town Center: Creation of the Retail Public-esque

Easton Town Center in Columbus, Ohio is a paradoxical embodiment of the old and the new, the public and the private, and perhaps most curiously, spectacle and reality. This mega-commercial-civic-leisure space appears as a nostalgic interpretation of a mid-twentieth century American urban landscape, but its presence as a cultural artifact only hints at the breadth of aesthetic, political, and economic conditions underlying its idiosyncratic development and enormous success. Beneath its elegant facades is an extensive code of conduct and a systematic attempt to regulate everything from photography to the time spent on a bench. The major goal of this research project is to identify the role played by the aesthetic in developing Easton Town Center and ascertain the particular circumstances under which this more adventurous aesthetics was pursued. Easton's genesis and the public-private partnerships that led to its realization bring into question issues of power between the public and private sector, as urban governance shifts the decision-making process from the public to private investors. The empirical work is based on data collection from news sources, landscape observations, and relatively unstructured interviews with those officials, public and private, responsible for the development of this large and extraordinarily profitable multi-use project.

wwelsh@emich.edu; Feasibility Study of a Closed-Loop Biofuel Industry in Detroit

This presentation reports progress to-date of an interdisciplinary study to determine the feasibility of a closed-loop urban biofuel industry within the City of Detroit. Land use dynamics here have resulted in an urban landscape with approximately ten thousand acres of vacant lots, a consequence of deindustrialization and the tearing down of abandoned housing over the past several decades. Various concerns have come together in an effort to improve the socio-economic and environmental viability of Detroit through redevelopment initiatives. The primary objectives of this initiative are to: develop a modeling and visualization toolkit for use in determining the feasibility and desirability of urban biofuel systems; engage public, private, and nonprofit partners to identify and address barriers to such systems; and to create and disseminate policy recommendations in support of urban biofuel production that are informed by the lessons learned in this program. To begin this process, a geospatial database was constructed of environmental and socio-economic variables. Vacant lands have been mapped and environmental analysis of these lands is being performed using image processing and GIS techniques to assess their potential for growing biofuel feedstock (e.g., switchgrass). Other potential feedstock sources, such as restaurant grease, are being identified and geo-coded. Spatial and statistical analysis of socio-economic and environmental site and situation of potential feedstock locations, and connectivity to a biofuel processing plant, then of processing plant to potential consumers, will be conducted. The results of this preliminary analysis will help determine if further research and development are warranted.

lheitz@uog.edu; Watershed Land Cover Change Detection in Guam

Land cover change (LCC) has been a concern for many years around the world. LCC at watershed scale can be determined using advanced geo-spatial technologies such as satellite remote sensing, geographic information systems (GIS), and global positioning system (GPS). Such geo-spatial technologies may provide an effective and economical method for evaluating watershed conditions related to disturbance from human and natural stresses. Recent surveys indicate that land cover/use changes have a direct and enormous effect on water quality and environmental change. Watershed water quality and ecosystem are threat-

ened constantly by both human impacts like forest fires and development and also natural phenomena like storms and droughts. Therefore, it is critical to conduct research on land cover change in watersheds. This study focuses on extraction of land cover information from satellite imagery back to early 1970s, and determination of LCC in watersheds of southern Guam. Integration of remote sensing, GIS and GPS to assist in land cover classification of satellite images is also addressed in this presentation.

Keywords: Watershed, Land Cover Change, Satellite Imagery, Remote Sensing, GIS

glweng@u.washington.edu; Kam Wing Chan, University of Washington. Email: kwchan@u.washington.edu; The Geography of Non-hukou Interprovincial Migration in the 1990s: Spatial Change and Dynamics

Since the early 1980s China has seen increasing volume of internal migration, an important factor in China's population redistribution and regional development. This paper focuses on non-hukou migration, those moving to places outside their household registration (hukou) place. Non-hukou migrants, mostly from the countryside, are important workhorse underpinning China's successful export-oriented development model. Using non-hukou migration stock data from 1995 population survey and 2000 census, this paper studies the spatial pattern of non-hukou migration stock and its change from 1995 to 2000. In addition, this paper analyzes the spatial changes of hukou migrants and non-hukou migrants through comparing various sets of systematic data including non-hukou migration stock, lifetime migration stock in 2000 and migration flow from 1995 to 2000. The study shows that while the directions of hukou-migration were relatively diverse, those of non-hukou migration were predominantly oriented to Guangdong province throughout the 1990s. However, there were clear regional shifts in the non-hukou migration flows among other provinces between the first and second halves of the 1990s. Since rural migrant labor contribute a great deal to China's success of being the "world's factory", this paper relates the regional shifts of non-hukou migration to those of the industrial structure.

Places and Practices of Automobilities: Case Studies of British Car Use

Automobility (Urry, 2004), examines the automobile as a dominant form of mobility by considering a collection of interdependent components, going some way to transcending the traditionally divided accounts of the automobile within the social sciences. This paper shall present ongoing PhD research in progress into UK automobilities. This paper challenges the conceptualisations of car and car cultures in current literature, and examines, using a theoretical framework developed from problematising automobility, the places and practices of three forms of automobile manufacture, purchase and use (touring caravans, motorcycles and 'post-car' green mobilities/technologies). These case studies have been chosen to reflect the broad range of car uses and flesh out the application of automobility. The caravan is an over-developed, domesticated and 'conformist' car; the bike is stripped-down, fast and 'rebellious'; both case studies challenge the concept of car and investigate dedicated consumers and road-users, ignored by much mainstream research. The post-car study allows this study to consider the "tipping point" (Gladwell, 2001), technological fixes and the development of an important new market as an alternative to the petrol car. All three are used to investigate the range of components which comprise automobility. Using a mixed methodology of manufacturer interviews, modified BNIM user narratives, and recorded in-vehicle discussions, it considers the construction of in-car and related spaces and how these act as sites of social, domestic and economic interaction, the relationships involved between different mobilities and approaches to the work/life balance, and how different mobilities influence and relate to individual moral judgements.

Keywords: automobility, automobile, consumption, car culture, green technology

Urban Land Use Classification of New Delhi India

This study presents the results of classifying land use/land cover for Delhi, India using an expert system approach. For this study Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER) data of September 22, 2003 were used to classify 13 distinct land use/cover categories. One research goal is to report on the extent and structure of area covered by urbanization using the classified image. Thirteen different land cover categories were identified with an 85.55% overall classification accuracy based on 256 random points for validation and 50 on the ground observations. Secondly, we report on our efforts to duplicate an expert system model previously developed for Phoenix Arizona as a generalized approach for urban land use classification. Results suggest that

while some of the methodology could be duplicated; there are local factors (e.g. data availability and specific land features) that required us to modify the approach.

Andrew James Wenzl, University of Washington. Email: andwenzl@u.washington.edu; Composition and shifts of income and household assets in the United States

Regional analysis has often favored income from wages as the means of assessing the structure and economic performance of regions. However, increased attention is being placed upon non-earnings income and household assets as another measure of economic growth. This empirical analysis uses statistical techniques to examine the contributions of wage and non-earnings sources of income and assets to the structure and characteristics of regional economies in the United States. It also measures the components and shifts of income at varying levels of geographic focus, noting key differences among regions in the United States. Finally, the impact of urbanization levels on the relationship of earnings and non-earnings income is examined.

Keywords: Regional analysis, income, economic change, non-earnings income

Corey M. Werner, University of Central Missouri. Email: werner@cmsu.edu; Linking past dune activity to climate: complications caused by geomorphic feedback.

Discrete dune fields are found throughout much of the High Plains of North America, and the timing of past dune activity is often used a proxy for paleoclimate because of the intuitive link between dune activity and a more arid climate. This research investigates the link between paleoclimate and dune activity in southwest Kansas and the Oklahoma panhandle. It suggests that feedbacks in the soil-geomorphic system create a relationship between dune activity and climate that varies both spatially and temporally. Moreover, older aeolian landforms are more resistant to activation because of the presence of finer soil particles in a Bt horizon, which retains moisture and anchors the deposit even during more arid times. Conversely, younger deposits lack these fines and are more easily reactivated. This spatially variable relationship is supported by soil stratigraphy, particle size analysis, and optical age control. Additionally, the water-holding capacity of the Bt horizons is quantifiably greater than that of the soils found in the younger dunes of the area. This complication in the relationship between aeolian activity and climate is important because it suggests that a cautious approach is required when using past dune activity as the lone proxy for paleoclimate.

Keywords: High Plains, aeolian activity, dunes, paleoclimate

Sonia Wesche, PhD (ABD), Wilfrid Laurier University. Email: wesc3156@wlu.ca; Derek Armitage, PhD, Wilfrid Laurier University. Email: darmitag@wlu.ca; Responding to environmental change: Assessing vulnerability and adaptive capacity through northern research partnerships

Based on ongoing interdisciplinary research in Fort Resolution, NWT, this paper examines the human dimensions of social-ecological change, vulnerability and adaptive capacity. Residents are experiencing a range of climatic and hydrological changes, and concurrent socio-cultural shifts towards modernization and Treaty implementation. Using a series of qualitative methods including Traditional Knowledge interviews, focus groups, a household survey, scenario-building, and field visits, we seek to better understand the effects of change on local livelihoods, and to determine where capacity-building efforts may be focused to encourage proactive responses. We also draw attention to the relationship among adaptive capacity and the features of social organization that facilitate collaboration for mutual benefit, such as networks, norms and social trust (i.e., social capital). Results show that relationships among past environmental change, livelihood impacts, and human adaptations are both cumulative and non-linear. Past adaptations have generally been reactive and undertaken on an individual basis; however increasing rates of change may require community-level response. While survey data indicates that contemporary socio-cultural change has disrupted traditional social bonds, a form of latent cohesion based on kinship ties and shared history may offer a vehicle to facilitate collective action. Important foci for capacity-building include local institutional development, improving community-level education, and increasing access to financial and technical resources. This research offers a potentially useful approach that can be adapted to other communities in the North (and elsewhere) confronting complex issues of environmental and socio-economic change.

Eric West, Professor, Department of Geography, Southern Connecticut State University. Email: westel@southernct.edu; An Evaluation of Learning in a Second Course on GIS that Involved Students as Stakeholders in Research on Campus Issues

Previous studies in pedagogical methods of teaching GIS have demonstrated the efficacy of problem-based learning. This study reports the results of an approach to teaching a second course in GIS at Southern Connecticut State University that involved students not only as researchers but as stakeholders in multiple campus-based projects that also included facilities operations, university police, and the department of physics. Various aspects of the course engaged students in activities including interviewing faculty and staff; doing fieldwork and using GPS and other scientific instruments; working with CAD data; and, explaining the results of their work to third parties from the university faculty and staff. This study uses qualitative analysis of a wide variety of sources of data, including course materials, spatial data and output generated by the students, progress reports, results of a poster session, and interviews of students after completion of the course in addition to quizzes and exams. The results indicate that many aspects of Chickering and Gamson's (1987) principles for good practice in undergraduate education and Fink's (2003) components of significant learning were present in the course. Finally, this study develops insights into aspects of the course that did not work as expected and suggests improvements for future courses.

Keywords: GIS, learning, pedagogy, stakeholder

Christopher Scott Westendorf, Morehead State University. Email: cwestend@yahoo.com; Rezaul Mahmood, Ph.D., Western Kentucky University. Email: rezaul.mahmood@wku.edu; Gregory Goodrich, Ph.D., Western Kentucky University. Email: gregory.goodrich@wku.edu; Pacific Decadal Oscillation, Streamflow, and Precipitation in the Mammoth Cave/Upper Green River Watershed, KY

This project focuses on streamflow and precipitation in the Upper Green River watershed of western Kentucky and its relationship to Pacific Decadal Oscillation (PDO). PDO is the 23-year pattern of climatic inconsistency in the tropical Pacific Ocean. PDO data from NOAA was statistically compared with streamflow data. Previously, streamflow data was prepared and analyzed in the context of El Niño and La Niña. Precipitation data was collected from the National Climatic Data Center (NCDC) and streamflow data from the United States Geological Survey (USGS). The data was then used in an attempt to directly correlate a numerical value of precipitation and streamflow with the occurrences of PDO. In other words, it could be possible that a PDO occurrence, along with El Niño and La Niña, is a cause of anomaly in precipitation in western Kentucky, which would directly affect streamflow. The precipitation and streamflow data were extended for most of the 20th century. This study finds that during La Nina-cold events, above average precipitation and streamflow occur more frequently. On the other hand, during Neutral-cold events, below average precipitation and streamflow occur more frequently.

Keywords: Pacific Decadal Oscillation, Streamflow, Watershed, Precipitation

John C. Western, Syracuse University. Email: jcwester@maxwell.syr.edu; Insider/outsider, Alsace/Africa: Testimonies from two retired missionaries in Strasbourg

Among Strasburgers recently interviewed are two retired missionary priests. Raised locally, as young men they left for Africa, one to Madagascar in 1949, and one to Ivory Coast in 1975. Now returned, they are asked "How has Strasbourg changed?" The intended open question permits wide-ranging replies. They allege, for example, that globalization has diminished the city's cherished unique binational culture at the same time as engendering a striking diversity among its new inhabitants. The older priest disapprovingly sees such immigration as a transgression, and truly fears Islam; the younger is more sanguine. The older priest bemoans the loss of spirituality in Alsatian life, and also indicates little real affection for Strasbourg — his heart seems to be in Madagascar. Whereas the younger priest adores the city, and talks of his Strasbourg parish work upon his return from Africa. He was given a gritty suburban public-housing neighborhood, and from his experience there addresses some of the issues that gave rise to the French urban unrest of fall 2005.

Meredith Westington, NOAA's Office of Coast Survey. Email: Meredith.Westington@noaa.gov; Status of the U.S. Maritime Zones—Territorial Sea, Contiguous Zone, and EEZ

With a greater shift toward conserving and managing our resources, more restrictions are placed on ocean activities. Predictability in locating the bounds of a particular regulatory area will help with compliance and improve enforcement. The United States, pursuant to international law, has established maritime zones in which various activities are controlled or restricted. The limits of these zones, among a host of other information, have for years been depicted on NOAA's

paper nautical charts. NOAA is responsible for depicting on its nautical charts the limits of the 12 nautical mile Territorial Sea, 24 nautical mile Contiguous Zone, and 200 nautical mile Exclusive Economic Zone (EEZ). Additionally, NOAA also charts a Three Nautical Mile Line and a Natural Resources Boundary at 9 nautical miles, which may serve as the inner limit of federal fisheries jurisdiction as well as the outer limit of the states' jurisdiction for certain laws. This paper details an ongoing project to create a digital national baseline and maritime zones in accordance with articles set forth in the United Nations Convention on the Law of the Sea and to provide digital versions of the maritime limits to the public.

Annika Wetlesen, University of Oslo. Email: annika.wetlesen@sgeo.uio.no; Implementation of labour standards in developing countries: The case of the construction industry in Chennai, India

This paper seeks to develop a framework to explore the possibilities for and consequences of implementation of labour standards in developing countries, using the construction industry in Chennai as a case. The labour intensive nature of the construction industry in India makes it one of the largest sources of employment in the country, but the majority of the workers are hired on an informal basis and until recently, few of the state governments had implemented the national labour legislation applicable to the industry. The state of Tamil Nadu, however, implemented a legislative framework already in 1982 and a welfare board for construction workers was established in 1994. Construction workers' unions have played an active role in the implementation process. Chennai, the state capital, has been an important centre for this organising and as an expanding metropolitan city the construction sector here is extensive. In the present framework labour regime will be a key concept. Labour standards and labour legislation based on these standards are regulatory processes on the international and national level. How the legislation affects working conditions is, however, dependent on the interaction with locally based processes of labour regulation, both formal and informal. This interaction shapes complex labour regimes in local labour markets. Based on a review of empirical studies from India, this paper will discuss which actors and institutions that may be of relevance when studying labour regimes in the construction industry in Chennai. The role of informal workers' organisations in this regard will be emphasised.

Keywords: Development geography, labour regimes, labour standards, informal economy, India.

David C. Wheeler, PhD, Emory University. Email: wheeler.173@osu.edu; Diagnostic Tools and a Remedial Method for Collinearity in Geographically Weighted Regression

The belief in the field of geography that a relationship between an explanatory variable and a response variable in a linear regression model can vary within a study area has led to the development of regression models that allow for spatially varying coefficients. One such model that is gaining popularity is geographically weighted regression (GWR). In the application of GWR, marginal inference on the spatial pattern of regression coefficients is typically of primary interest. Empirical research and simulation studies have demonstrated that local correlation in explanatory variables can lead to estimated regression coefficients that are strongly correlated. Such dependence in the estimated regression coefficients interferes with the interpretation of the effects of the explanatory variables in the regression model. The presence of local collinearity in the absence of global collinearity necessitates the use of diagnostic tools in the local regression model building process to highlight areas in which the results are not reliable for statistical inference. This paper outlines numerous diagnostic tools for collinearity in the GWR framework and introduces a penalized form of GWR called geographically weighted ridge regression (GWRR) that adds a constraint on the magnitude of the estimated regression coefficients to limit the effects of explanatory variable correlation. The results of applying GWRR to actual and simulated datasets show that this method stabilizes regression coefficients in the presence of collinearity and consistently produces lower prediction error of the response variable than one would obtain with GWR.

Keywords: collinearity, geographically weighted regression, parameter correlation, ridge regression

James O. Wheeler, University of Georgia. Email: jowheel@uga.edu; Poverty in Georgia: Metropolitan, Micropolitan and Rural Regions

In terms of wealth, two separate Georgias exist, sometimes spatially distinct and sometimes in close proximity, one rich and one poor. This empirical study examines poverty in Georgia, a fast-growing state in the 2000s, growing at almost double the U.S. average. Of particular interest is the level of poverty and wealth among metropolitan, micropolitan, and rural areas of Georgia. Micropolitan areas were established by the U.S. Bureau of the Census in 2003 and are defined as a county or counties in which at least 50 percent of the population resides within urban areas of at least 10,000 and less than 50,000 people.

Adjacent counties may be included in micropolitan areas if the surrounding county reaches at least a 25 percent employment interchange with the core county. This new micropolitan classification provides a more refined geographical lens to examine nonmetropolitan areas. Micropolitan areas in Georgia comprise 10 percent of the state's 8.7 million, population compared with 80 percent of the population in metropolitan areas. Micropolitan areas in Georgia have a per capita income only slightly higher than rural counties and far lower than metropolitan areas. Whereas Georgia has several suburban counties with high per capita incomes, especially in northern Atlanta, more than 70 percent of the counties are below the poverty level, including 53 percent of the micropolitan counties, 90 percent of micropolitan counties, and 84 percent of rural counties. Wheeler County has the highest percentage households below the poverty level, 30 percent.

Keywords: Georgia, micropolitan areas, poverty

Ann Whelan, US EPA R5. Email: whelan.ann@epa.gov; Inland Sensitivity Atlases

The U.S. Environmental Protection Agency (U.S. EPA) Region 5 has developed a series of geographic information system (GIS) based map products designed to support oil and hazardous materials spill contingency planning and response. Published as individual volumes of a Region 5 atlas series, these map products are designed to work in tandem with the contingency plans, providing detailed information about potential spill sources and about human and environmental resources at risk. The Inland Sensitivity Atlases (ISA) were created through collection, compilation, and development of a wide variety of data types from a broad range of sources. Using agreed-upon database management and GIS techniques, the ISA group created the atlases from start to finish. The process involved data collection for the various themes (e.g., managed natural resource areas, water intakes, and oil storage facilities), using a wide range of data sources. Data collection efforts included direct surveys of the owners and operators of the facilities and lands in question. Survey recipients were asked to verify that attribute information for database entries was correct and that spatial information was accurate. Once the survey responses were incorporated, draft atlases were created which consisted of mapped features on a USGS quadrangle background, along with linked data tables providing attribute information about those features, e.g., feature name, facility operator, descriptive information, and contact information. When creating the final atlases, there was a QA/QC check, and then the maps and tables were converted into Portable Document File (PDF) format.

James P Whelan, McNeese State University. Email: jwhelan@mail.mcneese.edu; The Sacred Landscape of San Francisco: a preliminary survey.

This paper will present a preliminary survey of the sacred/religious places and landscape of San Francisco, CA. Because it is a preliminary step, it concentrates on the most easily accessible sacred/religious places: churches, temples, etc. A select number of religious structures will be presented and briefly discussed. The proposed end result of the project will be an illustrated guide to the city's sacred places.

Keywords: landscape, sacred, religious, church, temple

Craig Whewy, University of Leicester. Email: cjw37@le.ac.uk; Martin Phillips, University of Leicester. Email: mpp2@le.ac.uk; Gentrification and Public Policy at the Outer-Edges of the Urban

Gentrification and its relationship to public policy has been investigated primarily in the content of urban space. In this paper we examine the gentrification and public policy with respect to rural market towns, places which have recently been portrayed as being at the outer edges of an unfurling 'global urban strategy' (Smith 2002) of gentrification but which are a hybrid space likely to be influenced by processes and policies aligned with rural gentrification. The paper draws attention to evidence of gentrification within rural market towns in England and Wales before considering changes in policy making with respect to these settlements. Attention is drawn to the way that government housing and rural-land-use policies have historically acted as an often-unintended stimulus to market town gentrification and how, in association with moves within urban regeneration policies, there have been movement from the 1990s towards an incorporation of gentrification as a strategy of neo-liberal governmental development. Particular attention is drawn to the Market Town Initiative and its links to neo-liberal urban regeneration policies. The paper concludes by noting that many market towns beyond this initiative are gentrifying and that many within it are not. It is suggested that there is a complex geography to the articulation of gentrification and public policy within, and probably beyond, the hybrid spatiality of rural market towns that warrants detailed investigation.

Keywords: gentrification, urban strategy, rural market towns, England and Wales, geographies of gentrification

Christopher Whitaker, Florida State University. Email: cww4815@garnet.fsu.edu; *Politicizing the Landscape of American Public Diplomacy*

The history of America's official public diplomacy programs has been typified by a political struggle between two ideological traditions seeking to dominate the field's bureaucratic space. Discursive representations about public diplomacy's institutional norms and appropriate relationship with government have generally enabled those with an internationalist philosophy to marginalize those that are more nationalist in perspective. This has been legitimized through an exclusionary narrative that represents the mere presence of nationalists in the field as a danger to public diplomacy's supposedly apolitical heritage. This presentation utilizes critical social theory and discourse analysis to demonstrate how the recent appointment of nationalists to high-level positions in America's institutions of public diplomacy has illuminated the previously unacknowledged politics of the field and of the internationalist group that has traditionally dominated its institutional spaces. It also exposes how power-laden processes operate to enshrine a particular political-culture's perspective in public diplomacy's official institutions, policies, and normative spaces. The outcome of these processes influences who dominates the official sites of public diplomacy production, who defines what the field is, who is included or excluded from the bureaucracy, and whose image of America is projected abroad. This hegemony reinforces existing power structures by entrenching a particular group's ideology regarding the field's relationship with government. It also legitimates whose policies are considered political or apolitical and who has the right to be included in the bureaucracy and to directly influence public diplomacy's official policies, norms and trajectory in the future.

Denis White, US EPA. Email: white.denis@epa.gov; Daniel Campbell, US EPA. Email: campbell.dan@epa.gov; Laura Jackson, US EPA. Email: jackson.laura@epa.gov; *A Landscape Development Intensity Index Map of Maryland, USA*

We present a map of human development intensity for central and eastern Maryland using an index derived from energy systems principles. Brown and Vivas developed a measure of the intensity of human development based on the nonrenewable energy use per unit area as an index to explain the condition of human and ecological systems on the landscape. They called this measure the Landscape Development Intensity Index (LDI). This index uses Odum's concept of energy as the common currency for relating different kinds of energy use. In this study we used a top down method to estimate the average annual energy flow that is characteristic of each category of land use category. For each such land use category in Maryland, we have calculated the renewable and nonrenewable energy flow per hectare per year using the new method. From these data we can make a pixel level map for our study area in Maryland or a map at any level of aggregation of pixels, for example, political jurisdictions, census units, hydrological accounting units, or ecological regions. Such maps are the basis for spatially explicit energy analyses of environmental problems at any scale.

Keywords: land use, development intensity, energy index, energy

George W. White, Associate Professor, Frostburg State University. Email: gwhite@frostburg.edu; *Environmental Determinism and Boundary Delineation at the Paris Peace Conference*

Woodrow Wilson's concept of "self-determination" was applied when the new political boundaries were drawn at the Paris Peace Conference in 1919. It was most clearly manifested in the creation of new nation-states in East Central Europe. The new political boundaries for countries were determined by the "mapping" of the spatial distributions of nations. Common language was seen as the principle national identifier but this paper demonstrates that the idea of language was circumscribed within the broader concept of environmental determinism. A close examination of the ideas of geographers who prepared documents for and participated in the Paris Peace Conference reveals the environmental deterministic views of language.

Misty Layne White, University of North Alabama. Email: mistylayne@gmail.com; Greg G Gaston, Dr, University of North Alabama. Email: gggaston@una.edu; *Electrical Resistance Imaging to Map and Confirm Suspected Burial Sites in North Alabama*

Electrical Resistance Imaging to Map and Confirm Suspected Burial Sites in North Alabama A non-invasive system to help with evaluations of sites selected for development has been needed for a long time. Electrical Resistance (ER) imaging systems has been successfully used to identify and evaluate archeological sites in a number of areas around the world. ER imaging allows you to be able to "see" underneath the ground surface and look for such things as graves, tunnels and other previously undiscovered openings before digging or building. ER imaging works by sending pulses of electric current into the earth and recording

the amount of current that is received from nearby electrodes. Data gathered with the use of ER imaging is done in a quick and non-intrusive manner. We will be using the ER imaging equipment at several locations near Florence Alabama including, Sweetwater and Coffee Plantations. In Alabama many Native American, African-American and other rural sites can be difficult to identify and verify because of the lack of existing documentation and scattered locations of the sites. Historical African-American burial sites, for example, have been destroyed because they appear disorganized and un-kept. These places are significant to the history and culture and need not to be forgotten. With the use of Electrical Resistance Imaging we can search out and locate these forgotten resting places. With this technology in the planned research we will be able to document and recover history that is in danger of being permanently lost.

Keywords: Electrical Resistance Imaging

Scott White, Fort Lewis College. Email: white_s@fortlewis.edu; Heather J Hormell, Fort Lewis College. Email: hjhormell@fortlewis.edu; Colleen Filippone, National Park Service. Email: colleen_filippone@nps.gov; Larry Martin, National Park Service. Email: larry_martin@nps.gov; *Cultural Resources Preservation using Hydrologic Monitoring and GIS at Aztec Ruins National Monument, New Mexico*

Field studies were undertaken at Aztec Ruins National Monument in the town of Aztec, New Mexico starting in 2005 to assess the extent of shallow groundwater-related deterioration of several historic ruins. Aztec Ruins National Monument preserves the ruins of 900-year-old ancestral Pueblo great houses and kivas. These ruins have been exposed to many different types of precipitation events, including winter snowfalls, extended droughts, and monsoon rains in the summer months. Several piezometers were installed near the base of the walls of the main Aztec West great house ruin. Groundwater readings from these piezometers have been collected weekly since 2005. Preliminary analyses indicate that there is distinct seasonality to the groundwater level, and that the rise in late spring groundwater levels can be directly attributed to the onset of water flow in a large nearby irrigation ditch. GIS is being used in the construction of a comprehensive database of spatial data related to the Monument, including field results from the hydrology study, piezometer locations, great house and kiva locations, and visitor facilities (sidewalks, buildings, parking lots, and other visitor-related structures). When completed, this project will allow for the identification of water sources impacting the major ruins sites at the Monument leading to the recommendation of appropriate mitigation measures for protection of the ruins from continued deterioration. The GIS database will be used by National Park Service personnel as part of their ongoing effort to preserve the natural and cultural resources of Aztec Ruins National Monument.

Ted White, University of Massachusetts Amherst. Email: ted@igc.org; *Growing an Economy of Trust: Honor-System Based Exchanges at Small Farm Stands in Western Massachusetts*

Imagine you have just walked up to a store, it is clearly open for business and there are products for sale but no one is there to take your money. Instead there is a small box, tin can, or bucket which says "put money here". There is no surveillance camera. You are being trusted to pay for what you take. All this is normal?if you are a customer at one of the hundreds of small honor-system based farm stands in the Pioneer Valley region of Western Massachusetts today. Honor-system based farm stands exist today as vibrant and enduring examples of local agriculture and are also unusual examples of largely non-capitalist community economies. The rustic humble stands tempt customers with fresh local produce at bargain prices, yet also create a dynamic of trust and community pride between buyers and sellers. In Massachusetts, farm stands exist as informal outposts for regional or sometimes merely neighborhood-scale commerce. Like rummage sales, they are largely unregulated by policy or legislation. Stands are located on roadsides or on front yards and thus invite the public to cross into private often vulnerable spaces. Though farm stands exist as highly flexible and viable markets for the direct sale of local agricultural products? profit is not the only motive for participation in this sector. This paper will attempt to describe the history and future of honor-system based farm stands looking at issues of trust, security, public/private spaces, small scale agriculture, local economies, and community identity and participation.

Jessica C. Whitehead, Pennsylvania State University. Email: jwhitehead@psu.edu; *Incorporating Community Water Systems' Concerns into Climate Change Adaptive Capacity Analyses: A Process for Scenario Building*

In theory, it is simple to say that community drinking water systems should prepare for changes in climate. For community water officials interviewed in Centre County, Pennsylvania, concerns about daily operational matters and future regional issues like development and regulatory changes leave them with little time to consider climate change or their capacity to adapt to it. This paper describes a process created to facilitate the integration of community water system concerns with issues of hydroclimatic change and variation to examine future adaptive capacity. In semi-structured interviews, officials from nine community water systems identify the key drivers and attributes currently affecting their systems' operation. Officials weight these factors to create a working model of local community water systems' current capacities to adapt to changing patterns in floods and droughts. Academic researchers, water system officials, and other community members then meet to discuss local change and create comprehensive narrative storylines. These storylines allow researchers to build scenarios of community water systems' future capacities to adapt to climate change that incorporate these local concerns. Preliminary results suggest that these adaptive capacity scenario suites can support social learning, facilitating community development of comprehensive local water management policies.

Edward Albert Whitesell, Ph.D., The Evergreen State College. Email: whiteset@evergreen.edu; *Protecting Washington's Marine Environments: Tribal Perspectives*

This paper presents the findings of a collaborative project with the Tulalip Tribes Department of Natural Resources examining how tribal communities in western Washington view marine protected areas (MPAs). Using qualitative data, collected through unstructured interviews and reviews of published and unpublished literature, the study aims to improve the process of designing and managing MPAs to better serve both ecological objectives and Native American interests, by improving understanding of the socio-cultural systems that such protected areas depend upon for their long-term success. Tribal perspectives reported in the paper include the over-arching and nonnegotiable significance of treaty rights and co-management authorities; the importance of early and consistent tribal involvement in planning and implementation; the necessity of funding to insure meaningful tribal participation, especially for small tribal governments; the need for power-sharing governance structures; a desire for clear scientific justification of proposed MPAs and clear articulation of their objectives; integration of traditional environmental knowledge and tribal goals as established by the tribes rather than as assumed by others; conceptualization of tribes as part of marine ecosystems; use of MPAs as part of a broader plan to recover and protect marine habitats rather than a more limited focus on harvest pressure; and supplementing MPAs with a major environmental education program for the general public to address widespread degradation of the marine environment in the region. These findings are analyzed within a theoretical framework informed by critical historical geography and political ecology.

Susan K. Whitford, CWB, San Diego State University. Email: whitford@rohan.sdsu.edu; *Coming Home to Roost: Seasonal resource use of forest bats in fire-scarred Coast redwoods.*

Along California's Central Coast, a maritime climate has led to chaparral, coastal prairie, and oak woodland habitat mosaics interspersed with Coast redwood riparian forest. During the 20th century, a 20,000-acre private property has undergone a gradual shift of resource use from Tanoak and Coast redwood forest harvesting through the 1920's to unmanaged grazing in the 1930's, and finally rural residential development and adoption of conservation easements in the late 1980's. The effects of land use, forest pathogens, habitat restoration and fire suppression efforts help maintain distinct mosaics of vegetation communities connected by creeks and roads as patterns on the landscape. An ongoing guano trap survey shows patterns of fire-scarred redwood use as roosts for 12 species of bats and foraging activity of pallid bats throughout the seasons. Traps in 42 large-diameter trees representing a range of land use have identified night roosting by four species of bats using Sonobat echolocation call recording systems and quantified roost use using volumes of fecal material. Key results include evidence of year-round foraging activity by pallid bats provided by culled insect parts. Patterns of roosts may be facilitated by spatial elements of the landscape such as linear corridors (creeks and roads) and oak woodland ecotones, and are inversely correlated to grasslands within the study area.

Keywords: GIS, bat, vegetation community, roost

Robert Whiting, PhD Candidate, University of Illinois, Urbana-Champaign. Email: whiting@uiuc.edu; *Urban Space and National Place: Defining a Nation by Placing (and Re-placing) a Statue.*

The main square of Zagreb, Croatia has been a political-instrumentalist space and national place for over 150 years. As much as any public space in Europe, it demonstrates the profound tendency of national projects to effectively produce semiotically-charged micro-spaces as part of complex multi-scalar strategies. In 1866 the square was transformed into a definitive national place with the instillation of a statue of Ban Josip Jelacic. The statue proved to be a resonant symbol of a sovereign, unified Croatia with Zagreb as its capital. In 1947 the new Communist administration removed the statue to re-code Zagreb's main square as a Yugoslav place. The failure of this effort was dramatically proven with the re-installing of Ban Jelacic's statue in 1990. This paper seeks to explain why the initial placement of Ban Jelacic's statue was successful in transforming the meaning of the square in the public imagination, but the removal of the statue was not. Key to this is the ambivalence of the Communist authorities in Yugoslavia towards both Zagreb as a city and the city's main square as a place. Yugoslav authorities attempted to utilize Zagreb's location and industrial infrastructure to rapidly urbanize and industrialize Croatia, while at the same time diminishing the city's position from the "Croatian Metropolis" to a regional city in a Yugoslav urban network. Similarly, the authorities in Zagreb sought to minimize the square's historic significance, while, still utilizing its tremendous potential as a symbolic space to transmit meaning by holding numerous political and cultural events there.

Email: jmarlon@uoregon.edu; Patricio I Moreno, University of Chile. Email: pimoreno@uchile.cl; *Comparison of Holocene Fire-Climate Linkages in the Mid-latitudes of Western North and South America*

High-resolution fire history data from temperate forests of western North and South America permit examination of regional and hemispheric linkages between Holocene climate, fire, and ecosystem response. Differences in the seasonality of precipitation influence fire regimes at present, and the paleorecord suggests that the intensity of these precipitation regimes was affected by large-scale changes in the climate system in the past. At present, summer-dry areas are dominated by subtropical high pressure systems, and subsidence in these areas suppresses summer precipitation. Summer-wet areas are influenced by monsoonal circulation, which increases convective activity and fire activity east of the Rockies and Andes. In the western US, paleoenvironmental data suggest that summer-dry areas became drier in the early Holocene with the expansion of the subtropical high-pressure system. Summer-wet areas, in contrast, register wetter-than-present conditions, presumably because summer insolation strengthened summer monsoonal circulation. South American records show: (1) an abrupt increase in fire activity at the Pleistocene/Holocene transition at high-latitudes; (2) widespread fire activity and drought in the early Holocene despite the summer-insolation minimum; (3) north-south differences in fire activity in the mid-Holocene suggesting the onset of the current dipole climate, and (4) locally variable fire signals and a shift to smaller surface fires in the late Holocene consistent with cooler conditions and greater interannual variability. Widespread fire activity in southern South America in the early Holocene is consistent with warmer SSTs, a weakened pole-to-equator temperature gradient, and a southward shift of westerly storm tracks as a result of the strong obliquity forcing.

W. Scott Whitlock, University of Arizona. Email: wswhitlo@email.arizona.edu; *Bear Bottoms and Hairy Chests: Nudity, the Woods, and a Creation of a Gay Male Subculture*

This paper considers the role of nudity and nature in the so-called Bear Movement, a gay male subculture that takes as part of its goals the reinsertion of masculinity and body acceptance into popular conceptions of what it means to be "gay" and "male." Although the Bear Movement is mainly an urban movement, many people within it seem to associate urbanity with a "twinkish" or stereotypically feminine "gayness" and use overtly masculinist images of the male body, ruggedness, camping, and nature to somehow mitigate their spatial and identitarian place within the larger gay community. One of the ways they do this is through Bear Runs, events that often take place in remote areas and are most often clothing optional and sexually free. Bears run the gamut from somewhat slim to downright large, and one of the most striking things about a Bear Run is to see all of these body types, naked. This paper not only concerns itself with the role of nudity within the Bear Movement but also seeks to explore the radical potential of that nudity. What importance do Bears within the movement place on nudity? Is it radical to be gay, fat, and naked in public? What declaration does nudity provide for these often "non-traditional" gay male bodies? How is nudity

tied into nature? How are they related? This paper will address these questions through interviews with Bears, images from the Bear Runs, and an examination of personal experience.

Keywords: gay men, homosexuality, masculinity, nudity, subcultures,

Brandon C. Whitney, Yale University. Email: brandon.whitney@yale.edu; *The Political Ecology of Indigenous Discourse in the Ecuadorian Amazon*

Recent Ecuadorian state policies concerning indigenous land titling have opened the door for Amazonian nationalities to assert new levels of authority over their territory. Many of these groups turn to partnerships with NGOs to help advance legal, political and cultural claims. Especially in the face of looming oil-related conflicts in "undisturbed" forests, the indigenous discourse deployed within these partnerships takes on a powerful life of its own. My research examines a transnational, US-Ecuadorian NGO working with several indigenous groups in the south-central Amazon of Ecuador on organizational strengthening, political advocacy and territorial management. What started as a process envisioned as the "accompaniment" of a single indigenous Nation by a group of metropolitan donors and advocates in the US and a professional team of Ecuadorians based in that nation's capital has grown into a complex set of partnerships between a US-based funding and advocacy alliance, an Ecuadorian non-profit and seven Amazonian indigenous Nationalities. Through a variety of methods?primarily multi-sited institutional ethnography, participant observation and detailed interviews?my research seeks to understand the nature of these NGO-indigenous partnerships across spatial scales and, particularly, the role of discursive rhetoric about indigenous peoples and conservation in such transnational relationships. Though often overlooked, it is my contention that discourse about indigenous peoples is itself a powerful force in the world of environmental conservation and development?particularly in the realm of indigenous/non-indigenous partnerships. I explore how such discourse is connected to new understandings of power, identity, agency, representation and interdependence in the Ecuadorian indigenous context.

Keywords: political ecology, discourses, indigenous, non-governmental organizations, conservation, development, Ecuador, Amazon

Risa C. Whitson, Ohio University. Email: whitson@ohiou.edu; *Recycling Dreams: The politics of trash and informal garbage collection in Buenos Aires, Argentina*

In 2005 the city of Buenos Aires passed the "Law of Integrated Management of Urban Solid Waste," also known as the "Zero Trash" law, radically reforming their system of solid waste management. One important aspect of this reform - which aims to reduce by three-quarters the amount of waste being sent to landfills by 2017 ? includes the institutionalization recycling through the informal work of cartoneros ? or trash pickers. While the occupation of scavenging has always existed in Argentina, it has historically been associated with illegal, marginalized populations and activities, thus making its formalization and incorporation into this recycling program significant. In this paper, I address the social, political, and economic implications of this landmark legislation by examining the motives behind its passage as well as the responses of different groups within the city to its passage. I argue that the Zero Trash law, while clearly a victory for environmental activist groups, cannot be understood outside of the context of neoliberalization, as the third sector ? cooperatives and organizations formed by the cartoneros themselves ? becomes a critical component in a system of public service provision. While at face value more inclusive of marginalized populations than previous neoliberal policies of state retrenchment, this law does not indicate a fundamental change in attitude toward either unwanted refuse or unwanted people, and as a result has the potential to be not only beneficial but also harmful to marginalized populations and environmental concerns in the city.

Anne W. Wibiralske, Ph.D., Hobart and William Smith Colleges. Email: wibiralske@hws.edu; James D. Hall, GIS Analyst, New Fields. Email: jhall@newfields.com; Karen Edelstein, GIS Specialist and Stewardship Coordinator, Finger Lakes Land Trust. Email: edelstein@hws.edu; *Mapping Old Stands in the Finger Lakes National Forest, NY: A Community-based, Multi-party Collaboration*

Concern over how to preserve tracts of old forest in the Finger Lakes National Forest (FLNF) has been a key issue in the recent revisions to the forest's management plan. The FLNF's more than 16,000 acres in Schuyler and Seneca Counties, NY contain a rich diversity of grassland and forest ecosystems and a rich diversity of stakeholders, including grazing associations, recreational hunters, loggers, hikers, nature enthusiasts, educators, and others. A number of stakeholders have advocated strongly for the preservation of the FLNF's oldest stands, but a current map of old stands on FLNF and adjacent lands did not exist. This presented an ideal focus for a collaborative community-based learning

project. We developed a mapping project for a college environmental studies senior seminar in collaboration with the US Forest Service and community stakeholders to identify patches of old forest. Based on a set of scanned and georeferenced historic aerial photographs dating from 1944 and using GIS software, seminar students delineated areas of forested land in the FLNF and surrounding land for 1944, 1954, 1964, 1985 and 2002. Analyzing these data layers, we created a map of areas continually forested since the mid-1940s based on aerial photograph interpretation. The resulting map of areas continuously forested since the mid-1940s was shared with regional land conservation organizations and the FLNF staff, contributing to forest management decision-making processes. This project has built a strong foundation for continued collaboration among planners, managers, students, and stakeholders who have not previously worked together.

Melissa Wicks, East Carolina University. Email: mlw0822@ecu.edu; *Latino High School Student Aspirations and Achievement: A Case Study from Rural North Carolina*

The state of North Carolina has experienced a significant increase in its Latino population over the past decade. This new immigrant population has included substantial numbers of school-aged children, which has posed both challenges and opportunities for educators and school systems in the state. This demographic change is particularly dramatic in North Carolina's rural high schools, some of which now serve a student population that is nearly 25 percent Latino. Researchers have identified some disturbing trends among rural Latino students, including low levels of achievement and high drop-out rates, and it is therefore important to better understand the factors influencing educational attainment and aspirations among Latino high school students. In this paper, I present results of a qualitative study of educational attitudes and achievement in one rural North Carolina school district. Through interviews with educators, family members, and the students themselves, I will highlight some of the material, cultural and legal barriers faced by Latino high school students, and suggest possible interventions and policy changes that may help to improve Latino student achievement and long-term success.

Keywords: education, Latino, rural, high school, North Carolina

Randy W Widdis, University of Regina. Email: randy.widdis@uregina.ca; *The Configuration and Reconfiguration of the Canadian-American Borderlands*

Transnationality, and the kinds of relationships it embodies, varies over time and space, a fact that is obvious when considering the history of Canadian-American relations. After September 11, 2001, the boundary between Canada and the United States became more complex. The more permeable border that had resulted from the implementation of free trade agreements stood paradoxically opposed to calls for a more secure boundary. Yet while the transformations taking place currently are noteworthy for their speed, scale and impact, the border shared by both countries has always been subject to change and has evolved over the years. The objective of my current book project is to enhance our historical understanding of Canadian-American relations - a task made more relevant as a result of 9/11 - by focusing upon the regional dimensions of interaction across the international borderlands shared by the two countries. The focus is on connection and disconnection, integration and differentiation, convergence and divergence across a geopolitical boundary that at one level appears relatively simple and at another is incredibly complex. This paper reviews briefly the conceptual frame underlying the project and illustrates the changing historical nature of these relations with some GIS-produced maps that are the product of data collected from a number of primary sources (e.g. Soundex Index to Canadian Border Entries, Canadian Border Crossing Records, Dun & Bradstreet records, U.S. and Canadian Customhouse and Port records) that provide valuable insight into the movements of people, goods and capital across the international border and within borderland regions.

Keywords: borders, borderlands, historical evolution, migration, trade, investment

Patricia Widener, Florida Atlantic University. Email: pwidener@fau.edu; *Faultlines of Environmental Mediation: A Case of Oil Impacts in Ecuador*

This paper examines the convergence of oil multinationals, international institutions, private lenders and international organizations in "governing" Ecuador's environmental resources during the construction of an oil pipeline. International groups mobilized to pressure international entities for higher environmental standards and environmental funds. Yet faultlines in the environmental campaigns remind us of the tenuous nature of international agreements on affected environments and local communities. In this case, two multinationals of the privately-owned pipeline exited the country post-construction. A Canadian firm sold its operations to a Chinese consortium and an American firm's facilities were seized by the state oil company. Such exchanges beg the questions: How

sustainable are agreements between oil entities and international organizations without the commitment of the state and domestic organizations? What is the role of northern advocacy groups when Asian extractors replace northern ones? Second, this case reveals how persistent divisions between environmental groups and affected communities reinforce the isolation and limitation of environmental agendas that are exclusive of oil-saturated communities.

Keywords: petroleum, environment, Latin America

Nichole Wiedemann, Associate Professor, University of Texas at Austin. Email: wiedemann@mail.utexas.edu; Jason Sowell, University of Texas at Austin School of Architecture. Email: jsowell@mail.utexas.edu; *NATURE + ARTIFICE: Investigating New Orleans Through Analytic Mappings and Performative Diagrams*

New Orleans is inextricably linked to place; strategically positioned near the mouth of the Mississippi River as a center for economic and material exchange, the city's urban form developed as an accretion of infrastructural systems and fluvial processes. The engineered responses to this dynamic environment inscribed a hydrologic network onto a shifting terrain as a means of transforming wet land into productive ground. The design research investigated the tenuous interface between nature and artifice through analytical mappings and performative diagrams. The work privileges infrastructure, rather than architecture, in rebuilding New Orleans. The analysis reveals the region's hydrologic and climatic conditions that act as integrated components of a larger ecological and cultural network. Building on typologies of wall, conduit, basin and controls, the resulting scenarios augment existing infrastructure through sectional change. As opposed to a traditional plan based approach, the sectional strategy facilitates opportunities to increase the city's water storage capacity, reclaim river access and elevate land as well as engage in social programs and increased occupational density. The proposed interventions are represented at the scale of operative diagrams responding to the particularities of each site tying infrastructural networks into the city's collective memory. The paper focuses on the representational means, which ask and answer the complexities of rebuilding New Orleans. The maps, as analytic and synthetic devices, are structured by the practices of the place rather than purely spatial proximities. The resulting maps and diagrams are inherently operational rather than static, rendering the inextricable link between nature and culture visible.

Keywords: map, culture, geography, design, New Orleans, water

Rebecca Wienbar, Syracuse University. Email: rlwienba@maxwell.syr.edu; *Bodies and the State: Access to reproductive choice in South Dakota*

On March 6, 2006, Governor Mike Rounds signed the South Dakota 'Women's Health and Human Life Protection Act'. This act makes it illegal for a doctor to perform an abortion in the state of South Dakota, with no exceptions for victims of rape or incest, or to protect a woman's health. Even before this bill was introduced, South Dakota relied on out-of-state doctors, who regularly fly to Sioux Falls to perform abortions at the state's one abortion clinic. This paper examines the intersections of power, access, bodies, and the law in the case of abortion in South Dakota, where a woman's ability to move both within and outside of particular spaces can determine the control that the law has over her body. While a woman's location plays a key role in her ability to access reproductive choice, it can also contribute to the difficulties she may encounter in doing so. Although individual bodies experience the state in different ways, the mobility of both women and doctors is a strategy through which pro-choice bodies can challenge the state, and through which they can manage and/or escape reproductive control and regulation of women's bodies.

Keywords: abortion, access, biopower, body, mobility, women, gender, health, law, political, regulation, state, social justice, reproduction, abandonment, exclusion

Thomas A. Wikle, Oklahoma State. Email: t.wikle@kstate.edu; *The Lighted Airway and Postal Aviation in the U.S., 1924-1933*

During the 1920s and 1930s a system of high intensity navigation lights and emergency landing fields was constructed along the recently established transcontinental airmail route from New York City to San Francisco. By increasing the speed of delivery U.S. Post Office Department officials hoped that night flying would establish aircraft as economically viable alternatives to trains for transporting mail over long distances. As of 1933 the system had grown to encompass 18,000 miles of airways throughout the U.S., illuminated by more than 1,700 beacons. Hundreds of emergency landing fields and municipal airports were constructed along airway routes in support of day/night airmail operations. This paper explores development of lighted airways, their influence on mail delivery times, and their contributions to communication and transportation in the U.S.

Keywords: aviation, historical geography

Andrew Wilcox, U.S. Geological Survey, Geomorphology and Sediment Transport Laboratory, Golden, CO. Email: awilcox@usgs.gov; *Effects of a controlled flood release on native versus non-native riparian vegetation and geomorphic processes in a desert river*

Reoperations and adaptive management of Alamo Dam on the Bill Williams River in western Arizona are emphasizing environmental flow releases to protect a cottonwood-willow riparian woodland system, including controlled flood releases in 2005 and 2006. The 2005 flood release resulted in the establishment of many riparian seedling patches co-dominated by non-native tamarisk and native willow. This work investigates the differential response of these seedlings to a controlled flood release in 2006 and how such changes are mediated by reach- and basin-scale geomorphic processes. At the site closest to dam, the flood caused scour of seedlings and their substrates from mid-channel bars and lateral shifting of bars. In a reach further downstream, tamarisk seedlings were buried as a result of aggradation, and suspended sediment concentrations were approximately twice as large as in the upstream reach. In both reaches, tamarisk suffered greater reductions in density than willow, likely as a result of the substantially greater first-year height and diameter growth of willow relative to tamarisk. Field results are being complemented by flow and sediment transport modeling using the Multidimensional Surface Water Modeling System to assess spatial patterns of velocity and shear stress in an effort to help quantify flow-sediment-vegetation relationships. This work illustrates that floods can differentially affect willow and tamarisk and that such effects are mediated by geomorphic processes on both a reach scale, where local bed gradients and geomorphic characteristics influence shear stress dynamics, and on a basin scale, where sediment supply dynamics can influence morphologic and vegetation responses.

Keywords: tamarisk, environmental flows, adaptive management, shear stress, fluvial geomorphology

Sharon E. Wilcox, University of Texas - Austin. Email: SEWilcox@mail.utexas.edu; *Locating the Grizzly Bear in the Nature-Culture Borderlands: Reconsidering Anthropomorphic Strategies*

In 2005, the documentary/biographical film "Grizzly Man" premiered at the Sundance Film Festival, where audiences greeted it with enormous enthusiasm. Exploring the life and violent death of controversial wildlife activist Timothy Treadwell, the film subsequently reached widespread audiences throughout America. Attaining a level of recognition not normally granted to documentary film, its popularity is indicative of an ongoing fascination with grizzlies in the American imagination. "Grizzly Man" quickly emerged as one of the most prevalent representations of bears, with the film's narratives and images contributing to the social production of the grizzly. Locating the grizzly at the physical and symbolic intersections of nature and culture, this study is concerned with how such representations socially construct the grizzly's animality. This can directly affect human attitudes, actions, and policies in physical spaces shared with these bears. These representations have far reaching implications, not only for this species, but for larger attitudes toward wildlife, nature, and the environment. Through a reconsideration of the place of grizzly bears in American society, this paper examines the need for a reassessment of anthropomorphic representations of wildlife in both popular culture and conservation initiatives. Ultimately, such reassessment could potentially redefine the contours of the nature-culture borderlands, and this wildlife species' positions within these spaces.

Dean G. Wilder, University of Wisconsin. Email: wilder.dean@uwilax.edu; *Prehistoric Clay Sources: A Forensic Exercise in Geoarchaeology*

The prehistoric Oneota culture of the Upper Mississippi River Valley relied on pottery for storage, cooking and ceremonial purposes. Oneota pottery shards recovered from archaeological sites in the La Crosse, Wisconsin area are composed of clay presumed to be from a local source. Un-tempered clay balls have also been found at archaeological sites in the La Crosse area. The un-tempered clay samples from archaeological sites provide the opportunity to compare clay collected by Oneota people to local clay sources. The focus of this research is a "forensic" exercise in which prehistoric clay samples are compared to samples recently collected from La Crosse area ridge-top and terrace clay sources. Comparisons are made on the basis of color, particle size, magnetic susceptibility and x-ray diffraction. Magnetic susceptibility and x-ray diffraction measurements are used to "fingerprint" the clay samples from archaeological sites and match them with the samples collected in the field.

Keywords: geoarchaeology, magnetic susceptibility

Margaret Wilder, University of Arizona. Email: mwilder@email.arizona.edu; Privatization and Deprivation: The Construction of Water "Rights" in Rural Mexico

Drawing on concepts of water and citizenship (Castro 2006) and hydrosocial flows of power (Swyngedouw 2004), this paper interrogates the ways in which the notion of water rights in Mexico is doubly constructed. Central to this discourse is a set of international water principles that promotes a recognition of water as an economic good and prescribes new rights arrangements that are claimed to promote efficiency, equity and sustainability. These—apparently conflicting?rationales are all embodied within Mexico's 1992 and 2004 national water policy reforms, and lead to both confused intentions and outcomes. This paper explores the construction of water rights and the concept of water privatization within the particular context of a marginalized sector of Mexican citizens whose rights to water are challenged by the water modernization strategy, the small communal farming (ejido) sector. I argue that the spread of private control of ejido land and water resources has been accelerated and extensive in northern Mexico, and is detrimental to the livelihood prospects of an economically vulnerable sector. Purely formal and legalistic understandings of privatization?and those focused only on land, not water?are largely missing the point of how Mexico's ejido sector is being reshaped by "hidden" processes of privatization that increasingly deprive ejido families of access to their traditional water resources. The practices of privatization raise questions about the role of the state in pursuing socially acceptable outcomes for marginalized citizens, bringing into relief what really constitute these citizens' "water rights."

Keywords: water, privatization, ejidos, Mexico

Cody J. Wiley, UNM. Email: horde.of.one@gmail.com; Artificial Neural Networks and Prediction of Rangeland Greenness

New tools are becoming available which can increase the sophistication and efficiency of our natural resources management practices. This poster investigates Artificial Neural Networks (ANN) to model a grasslands environment. The network will use areal precipitation from Doppler weather radar, other relevant climatic and environmental variables, seasonality, and the Normalized Difference Vegetation Index in an ANN model of rangeland greening and senescence. The trained network will be validated against independent data. The degree of agreement between the predicted grassland status and real data will indicate the usefulness of this paradigm in rangeland management.

Keywords: Artificial Neural Networks, NEXRAD, NDVI, rangelands, grasslands, precipitation, New Mexico

James Wiley, Hofstra University. Email: ecojew@hofstra.edu; Small Economies, the World Trade Organization, and the Doha Round

As the globalization process broadens and deepens, small economies, especially small-island developing states face new challenges as they seek to improve their development level. The 1995 creation of the World Trade Organization changed the institutional framework within which small economies negotiate their futures. Many developing countries find the organization unresponsive to their needs; their collective dissatisfaction led to the opening of the Doha Round of negotiations in 2001. Subsumed within the Round is a small economies initiative, an effort to explore alternatives beneficial to those states for which the new rules of trade are often harmful. The Doha Round has stalled completely, following disastrous meetings in Cancún, and elsewhere. The refusal of developed countries to negotiate agricultural subsidies caused major developing states to break off talks. Small states were caught in the middle as progress on the small economies initiative was undermined by disagreements on broader issues. This paper examines the small economies initiative and the Doha Round to determine what hope it offers to small states. The author reviews the challenges facing those countries and suggests what is needed to help their situation. The paper is based upon research in Geneva and London, and in several affected small island states. It concludes with an evaluation of whether the Doha Round and small economies initiative will prove beneficial to small states.

Keywords: economic geography, trade, Doha Round.

Justin Wilford, University of California Los Angeles. Email: jwilford@ucla.edu; Out of Rubble: Hurricane Katrina and the Materiality of the House

Studies of the cultural dimensions of natural disasters have largely opposed the social world to the physical world. In such studies, the social world of humans constructs meaning against the implacable force of nature. This paper, following the theoretical lead of 'new materialists' such as Bruno Latour and Daniel Miller, argues that the physical world plays an integral role in the construction of meaning out of natural disasters. By focusing on the various cultural narratives surrounding Hurricane Katrina as well as the particular material genre of the house, the paper analyzes the ways the human and physical worlds participate in the production of meaning. The specific materiality of the house in New Orleans is explored through three key stages of the Katrina disaster: the initial landfall

and flooding, the first week of ostensible chaos, and the return of residents to their houses.

Olga Wilhelmi, National Center for Atmospheric Research. Email: olgaw@ucar.edu; Christopher Koh Uejio, Center for Sustainability and the Global Environment, University of Wisconsin-Madison. Email: uejio@wisc.edu; Jason Samenow, U.S. EPA Office of Atmospheric Programs. Email: samenow.jason@epa.gov; Exploring Spatial Patterns of Societal Vulnerability to Extreme Heat

Currently cities and climate are coevolving in a manner that could place more vulnerable populations at risk from exposure to excessive heat. The magnitude of recent heat waves and their impacts in many urban areas in the U.S. and Europe indicate an urgent need for increased awareness to the heat wave phenomena and understanding the underlying vulnerabilities. As a complimentary effort to the development of the EPA/NOAA/CDC/FEMA Excessive Heat Events Guidebook, within the realm of the Weather and Society: Integrated Studies program, this study focused on a spatial analysis of vulnerability and risk to excessive heat in two urban areas in the U.S.: Phoenix and Philadelphia. Two cities were analyzed in terms of their climatology, environmental and societal characteristics, previous cases of excessive heat impacts, and existing strategies for heat-wave mitigation. Geographic Information Systems (GIS) and spatial statistics were used to identify spatial patterns of biophysical and social factors contributing to the heat-related morbidity and mortality. Combination of social and physical factors allowed for identification of "hot spots" or areas of potential risk from excessive heat that were strongly related with recorded heat-wave mortality. Considering the potential interactions of multiple risk factors produces a more complex understanding of vulnerable populations that may inform mitigation strategies. This kind of spatial analysis, when enhanced with mesoscale forecast (model) data, could be used operationally to inform targeted impacts intervention.

Forrest D. Wilkerson, Minnesota State University. Email: forrest.wilkerson@mnsu.edu; Ginger L. Schmid, Minnesota State University. Email: ginger.schmid@mnsu.edu; Fifteen years of periglacial research in the White Mountains, California.

Since 1991 detailed studies have been conducted on a variety of periglacial landforms in the White Mountains of California. The landforms range from large-scale sorted patterned ground and boulder streams to small-scale sorted patterns or frost boils. Activity rates have varied widely between the types of landforms studied, primarily along an elevational gradient from 3225m to over 4300m. Methods employed have ranged from high-resolution surveying techniques to low-resolution dowels and surface markers. Activity among the large-scale landforms has not been detected in any landforms below 4100m. However, landforms above 4100m are very active with horizontal movements in many cases exceeding 10.0cm per year. Smaller-scale landforms show progressively higher rates of activity with increased elevation. At the lowest elevations, only horizontal surface movement has been detected and is thought to be primarily the result of needle ice movement. Above 3800m frost penetration is deeper and distinct horizontal and vertical components were noted. Wooden dowels placed in landforms above 3800m routinely have heave rates averaging greater than 15cm per year and surface plots average noticeable movement within two thirds of the markers. Above 4100m all landforms are highly active and include a solifluction component that is audible on calm days in late summer. The most recent investigations concern geomorphic activity rates, primarily periglacial activity, surrounding GLORIA sites in the White Mountains of California.

Keywords: periglacial activity, geomorphology, California

David E. Wilkins, Boise State University. Email: dwilkins@boisestate.edu; Richard L. Ford, Weber State University. Email: rford@weber.edu; Kathleen Nicoll, University of Utah. Email: kathleen.nicoll@gmail.com; Multiproxy Evidence for Late Holocene Climate Change, Coral Pink Sand Dunes, Utah

Dune fields can be highly sensitive to climatic change, as variability in effective moisture influences sediment supply and transport. The Coral Pink Sand Dunes, an active dune field in southern Utah, is the site of ongoing investigations into geomorphic system response to climate change in the Colorado Plateau. Stratigraphic exposures of crossbedded aeolian sand capped by a soil have been dated through optically-stimulated luminescence methods using single-aliquot regeneration (SAR) protocols. Those results identify three distinct episodes of aeolian deposition occurring 4.1 +/- 0.19 kyr, 2.8 +/- 0.22 kyr, and ca. 710 -510 kyr. The soil was radiocarbon dated (using the bulk organic matter) to 470 +/- 50 BP, and radiocarbon ages on plant matter in the surface matrix of

the soil and from ponderosa pine snags in the dune field indicating more recent plant communities. Additional evidence of climatic variability is seen in a disjunct living pine stand (*P. ponderosa*) located within the dune field; dendrochronologic analysis of the trees places the oldest to the time when the 470 BP soil was formed. Evidence of aeolian activity is indicative of periods of drier climate resulting in dune surface activity, while the soils and pine stands indicate periods of increased moisture and resulting surface stability. The timing of these alternating episodes is broadly correlative to indications of drought and moisture in dune fields elsewhere in the Colorado Plateau, Rocky Mountains, Great Plains.

Keywords: aeolian geomorphology, climate change, luminescence dating, dendrochronology

Eleanor Wilkinson, University of Leeds. Email: igs5ekw@leeds.ac.uk; 'Bound and gagged': censorship, citizenship, and cyberspace

This paper considers issues of sexual citizenship for the SM community in light of the UK Home Office's proposal to prosecute the viewers of 'extreme pornography'. The paper will address how issues of sexual citizenship must not solely be built upon the right to occupy actual physical places but also the right to inhabit the virtual- cyberspace. The limited spaces in which certain SM acts are permitted will be explored. I shall map how the internet plays a key role in the changing sexual geographies of public and private. Through the public space of the internet SM subculture can easily be accessed by anyone. Government intervention is therefore seen to be needed to defend the 'moral good' of society. I shall argue that protecting people from 'corruption' through the censorship of SM pornography stands at odds with the rhetoric of SM as a valid sexual identity. This paper shall question if SM provides a challenge to existing theories of privatised and generally de-sexualized forms of citizenship. Are SM practitioners just 'too' sexual to ever be granted full sexual citizenship?

Keywords: citizenship, cyberspace, pornography, sadomasochism

Renee Will, PhD, . Email: reneemwill@gmail.com; Variations in US State-level Manufacturing Export Responsiveness 1993-1999

Using US State-level data for nineteen manufacturing industries at the two-digit SIC level for the period 1993 to 1999, this paper set out to accomplish three main goals. First, to establish whether empirical evidence supports the proposition that industrial concentration of manufacturing firms spurs export growth. The second objective is to explore whether industrial concentration and/or export activity translate into higher State-level manufacturing employment and economic performance levels. A final goal is to observe any industrial variations concerning the economic behavior of these relationships. In an effort to address these issues, this paper investigates the economic relationships between industrial concentration, export activity, and employment performance using OLS regression models for nineteen manufacturing industries across the 48 continental US states. ANOVA models are also utilized to observe any regional or industrial variability across these economic variables.

Kanapaux William, University of Florida. Email: kanapaux@ufl.edu; Economic and Ecological Factors Influencing Tourism Operations in Southern Africa's KAZA Region

This presentation describes ongoing research in southern Africa's Kavango-Zambezi (KAZA) region with a focus on tourism operations in northern Botswana and Namibia's Caprivi Strip. The region contains an abundance of wildlife and includes several major water catchments, most notably the Okavango Delta and Zambezi River. Tribal organizations on communal lands have increasingly turned to tourism operations as a source of revenue through contracts with private operators. Questions remain, however, about the effectiveness of these operations and their level of sustainability. This research seeks to determine the economic viability of these tourism lodges by estimating the potential economic demand for them and the ways in which ecological conditions influence their potential value. This research is part of a larger interdisciplinary effort to study ecological, economic and governance factors influencing community-based natural resource management in the KAZA region. This particular component of the project will apply the travel cost method, which assesses potential demand for a particular location based on established tourist preferences, and will collect financial data on revenue flows for individual operations. The research will also seek to determine which ecological factors, such as wildlife density and water conditions, have the strongest influence on tourist demand and whether factors such as ecological sustainability and support of businesses that benefit tribal communities affect tourists' decisions.

Keywords: Africa - southern, tourism, community-based natural resource management

Carol L. Williams, Research Associate, Iowa State University. Email: willico@iastate.edu; Chrisztina Eleki, Iowa State University. Email: keleki@agron.iastate.edu; Richard Cruse, Iowa State University. Email: rmc@iastate.edu; The Role of Economic and Spatial Scale in Assessing Sustainable Biofuel Feedstock Production: opportunities and barriers.

Currently, there is major concern about the ability of agricultural systems to supply human demands for products and multiple services in a sustainable manner. Biofuel production is increasing with demand, but little attention has been given to the sustainability implications of agro-economic transformation from geologically-based to bio-based. A series of scholarly, interdisciplinary, small-group discussions were arranged to collaboratively define a sustainable biofuel industry, and identify barriers to and existing opportunities for adoption of sustainable practices. An early observation was the importance of economic and spatial scale in the type, degree and extent of barriers and opportunities. Subsequently, a conceptual framework was developed to locate sustainable feedstock production, as a component of a sustainable biofuel industry, in problem space. This framework, which focuses on ligno-cellulosic feedstock production, placed large-scale centralized biofuel production, and small-scale distributed biofuel production along axes representing gradients of perceived barriers and opportunities for sustainable production. Single crop and multiple crop feedstock production were also considered. Results indicate that barriers and opportunities differ according to economic and spatial scales of biofuel production, and that ecological, economic and social outcomes will likely differ according to economic and spatial scale of biofuel production. Recommendations are made for future hypothesis-driven research.

Keywords: biofuel production, sustainability, collaborative process

Darrel L. Williams, NASA Goddard Space Flight Center. Email: doclandsat@comcast.net; Samuel N. Goward, University of Maryland, Department of Geography. Email: sgoward@umd.edu; Terry Arvidson, Lockheed Martin, Landsat 7 Senior Systems Engineer. Email: Terry Arvidson ; The U.S. Landsat Data Archive

The long-term, 34+ year record of global Landsat remote sensing data is a critical resource to study the Earth System and the impacts of both natural and human activities on this system. Thus, the Landsat program has become a central pillar of the national and international remote sensing capabilities. The archive of historical Landsat data is a national treasure of immeasurable value, and the responsibility for the creation and maintenance of that archive resides at the U.S. Geological Survey's National Center for Earth Resources Observation and Science (USGS/EROS). The advisory committee for the National Satellite Land Remote Sensing Data Archive (NSLRSDA) requested a detailed analysis of Landsat observation coverage within the U.S. archive, as well as coverage acquired and held by International Cooperator (IC) stations. Our analyses, to date, of the metadata for the U.S. archive has revealed gaps of varying magnitude in U.S. holdings of Landsat global coverage data that appear to reflect both technical and/or administrative variations in mission operations. In many cases it may be possible to partially fill these gaps in our U.S. holdings through observations that were acquired and are now being held at International Cooperator stations.

Keywords: Landsat, archive, global change research

Harry Williams, University of North Texas. Email: williams@unt.edu; William Flanagan, University of North Texas. Email: wflanagan@unt.edu; Stratigraphy, sedimentology and microfossil content of Hurricane Rita storm surge deposits in southwest Louisiana.

Hurricane Rita generated a 4 to 5-meter high storm surge along the southwest Louisiana coast. The storm surge and accompanying waves transported sand and mud into woodland and freshwater marsh environments, located immediately landward of sandy beaches. The resulting storm surge deposits are up to 0.5 m thick and extend at least 500 m inland. Analysis of the stratigraphy, sedimentology and microfossil content of the deposits suggests two distinct phases of deposition: a thin blanket of finer sand and mud, characterized by planar beds, locally reworked into ripples, abruptly overlies the woodland and marsh soils. Calcareous tests of foraminiferal species characteristic of shallow, high-salinity marine environments are common in this layer. These findings suggest deposition from suspension in an early stage of storm surge inundation. The finer sand is overlain by 0.3-0.4 m of coarser sand characterized by prominent foreset beds. The surface of this layer is undulating in woodland areas, due to localized scouring around trees and other obstructions. Foraminiferal tests are rare in this deposit. The coarser sand layer has an abrupt termination about 150 m inland, visible on the ground and in air photographs. These findings suggest the sand is a traction load deposit, formed at a later stage of storm surge inundation. The results of this study have implications for paleotempestology research and efforts aimed at differentiating between geological records of tsunamis and hurricanes.

Keywords: Hurricanes, storm surge, sedimentation, paleotempestology, Foraminifera, Louisiana, tsunamis

Jared L. Williams, Northwest Missouri State University. Email: S271542@nwmissouri.edu; *Logistical Support for Humanitarian and Relief Efforts: A Geo-Simulation Training Exercise*

Many different humanitarian agencies, government entities, and international support organizations exist to provide assistance during humanitarian crises. One of their primary objectives is to facilitate the distribution of resources based on need, availability, and potential access to the geographic location. Training to provide relief in these complex emergencies is very difficult and costly. Thus the use of virtual simulation environments provides for a cost effective training method. This research project attempted to create a simulation that could be used as a logistical training tool for the handling of humanitarian crisis and relief efforts. Tac Ops 4 was the primary platform that was used in the development of this simulation. Since Tac Ops 4 can be configured to use remotely sensed data as the map, the program is customizable for any geographic region, location, or crisis. This provides first responders, aid workers and other personnel with a tool that can be used in emergency preparedness exercises and operations.

John W. Williams, University Of Wisconsin - Madison. Email: jww@geography.wisc.edu; Stephen T Jackson, University of Wyoming. Email: jackson@uwyo.edu; John E Kutzbach, University of Wisconsin - Madison. Email: jek@facstaff.wisc.edu; *How Will Species Respond to Future Novel Climate Regimes? Lessons from the Late Quaternary.*

Three lines of evidence - niche theory, late-Quaternary fossil data, and GCM simulations of late-Quaternary and end-21st-century climates ? together suggest that novel plant communities are likely to arise in response to novel 21st-century climate change. Niche theory predicts that, if species have unique climatic tolerances and optima, then novel species associations should arise in response to climate conditions not found at present. This hypothesis is supported by late-Quaternary pollen data, which show 1) large and individualistic shifts in plant distributions in response to climate change, and 2) the widespread occurrence of 'no-analog' fossil pollen assemblages in late-glacial and early-Holocene sediments. These no-analog pollen assemblages are commonly interpreted to indicate the past existence of plant communities compositionally unlike any modern plant communities. In North America, the spatial and temporal distribution of the no-analog fossil pollen assemblages apparently correspond to insolation and climatic regimes also apparently without a counterpart in present North American climates. Analyses of 20th- and 21st-century climate simulations produced for the fourth assessment report of the Intergovernmental Panel on Climate Change (IPCC AR4) indicate that some end-21st-century climate will lack good analogs in end-20th-century climates, particularly in humid tropical regions. These areas therefore may be at higher risk of developing novel plant associations and other ecological surprises. Additionally, some end-20th-century climates are projected to disappear during the 21st-century, increasing the risk of extinction for species endemic to those climates. Areas with disappearing 20th-century climates are concentrated in tropical montane regions and the poleward portions of continents.

Karen Williams, Montana State University. Email: kmwilliams@montana.edu; *Geomorphic effectiveness and organization described using ALSM-derived, spatial distributions of unit stream power*

Unit stream power, the rate of potential energy expenditure per unit area, has been used as a proxy for fluvial process, but the ability to establish causality between fluvial form (channel morphology) and fluvial processes (stream power) has been constrained by the coarseness of available topographic information and the resolution of the channel networks examined thus far. The distribution of energy through the channel network creates a distribution of channel morphologic types by taking disorganized hillslope inputs of wood and sediment and creating channel structure, organization, and regularly spaced bedforms. Spatial distributions of unit stream power at 0.5 and 1.0 meter resolution were calculated on first- and second order reaches of Stringer Creek located in the U.S. Forest Service Tenderfoot Creek Experimental Forest, Little Belt Mountains, Montana. ALSM (airborne laser swath mapping), i.e.; LiDAR, data was used to create high resolution digital elevation models (DEMs) of Stringer Creek. DEMs, gage data, and field measurement of channel cross-sections and thalweg elevation were used to calculate stream power and examine periodic behavior in the frequency domain. Geomorphic effectiveness can be defined by the ability of the channel to create regularity. Reaches dominated by mass wasting events, or tightly coupled to the hillslope, exhibit weaker periodic behavior than more fully alluvial reaches. The relative importance of alluvial, colluvial and in-situ lithologic controls constrains the degree of organization. Resistant lithologic units exhibit lower frequency periodicity compared to less competent lithology.

Keywords: stream power, geomorphology, organization

Kay R Williams, Shippensburg University. Email: krwill@ship.edu; *Teaching Conservation to Non-majors*

It has become increasingly evident that Americans need to be much more aware of the true state of the environment and the roles humans play within it. Without exposure to knowledge about Earth, we cannot be stewards of it. The majority of college students today are growing up in a time of media frenzy, giving them the perception that it is necessary for information to be delivered to them in a variety of formats. Teaching conservation can incorporate an assortment of experiences that can be effective in enlightening especially non-geography students to their interconnections with nature and how they can become more involved in its preservation. This poster illustrates a variety of techniques that have been utilized over the years to increase student participation in their learning experience and interest in the environment. These attempts have been well received, and according to evaluations of various kinds, seem to be effective in achieving these goals.

Keywords: environment, geographic education, natural resources

Nikki A. Williams, Texas A&M University, College Station. Email: nikki.anne.williams@gmail.com; *The Utility of a Life Path Perspective in Health Geography*

This paper presents a review of time-geography theory, its application to spatial health research, and proposed new work in the field. Hagerstrand's time-geography, first posited in the 1960s, views the location of life events as only a partial 'snapshot' picture: the time component is of equal importance for understanding the processes involved. Individual life paths, Hagerstrand's choreography, are necessary for documenting the chronology of events, not just the summation of aggregate activity periods as is performed in time budgeting research. An individual's choreography of movement through life provides a more refined level of resolution for examining the etiology of ill or compromised health status. Recent GPS human tracking research supports this assertion (Elgethun et al. 2006). The sequence and frequency of health stressors is just as important as their overall duration. No direct applications of time-geography to health issues exist in the literature, though researchers are using related concepts to explore health issues. This paper delineates the advantages of capturing a real-life 'Hagerstrandian' choreography of events to better understand and potentially prevent particular adverse health outcomes. Proposed research utilizing Hagerstrand's idea of choreography in conjunction with modern location-based wristwatch GPS, diary accounts, and biomonitoring (heart rate monitor) to assess individuals locational/stressor relationship will be outlined.

Robert Williams, University of North Carolina-Greensboro. Email: r_willi3@uncg.edu; Michael E Lewis, University of North Carolina-Greensboro. Email: melewis@uncg.edu; *Photographs of the Great Surveys of the American West*

Twenty-five expeditions into the American West were mounted by four competing surveys sponsored by the United States Congress from 1867-1879. Their stated mission was to map and document the geographical and geologic resources of the region, with an eye towards settlement and resource exploitation. Survey leaders utilized photography to produce relatively instantaneous images that were reproduced and distributed across the nation to satisfy the American appetite for information about the West. Similar in popularity to survey maps and artistic renderings, photographs became a means of creating mental images and regional myths. We examine thematic elements of the collected photographs housed in government archives and qualitatively assess their lasting influence. The majority are an obscure inventory of the natural resources, transportation routes, and settlement patterns of the times. A few images form an historical record of native peoples. Powell, in particular, sought to assemble a photographic record of the native people and cultures of the Colorado Plateau. However, it is romanticized images of geologic features that carried through by supporting public sentiment for preserving selected western landscapes. Yellowstone National Park, in particular, owes its early preservation to the photographs of Jackson as well as the paintings of Moran. Historical photographic images now commonly form the basis for measuring human alterations of the western landscapes they helped to change.

Sarah Williams, MCP, Columbia University. Email: sew@alum.mit.edu; *Mapping Data Traces and New York Cities 311 Data:*

Interaction with digital information has become part of daily life. We leave traces of data about ourselves everywhere we go. When we swipe our subway card - information is left about our travel patterns. When we use our cell phones - information is kept about where we used the phone, for how long, and at what time of day. When we connect to internet hubs, the volume of our use as well as what sites we visited is recorded. Mapping these data traces allows us to visualize the dynamic ways that people interact with urban environments. New Yorker's

leave clues about their community every time they call New York City's 311 phone hotline. New Yorkers dial 311 for non emergency city services this include everything from complaining about noise to requesting the repair of pot holes, and noting a rat sighting. When a call is made to 311 the location of the call are recorded in order for a service request to be made. Mapping and interpreting the location of these phone calls tells us a lot about the character of different types of neighborhoods. For example, mapping noise complaints allows us to visualize the activity levels of different neighborhoods at different times of day. This paper will discuss mapping data traces, specifically focusing on my most recent project mapping noise complaints made to 311. I will discuss other project including mapping cell phone use in Milan, Italy.

Thomas B. Williams, Western Illinois University. Email: tb-williams@wiu.edu; *Wind Energy Development in Illinois*

Williams, Thomas B., Department of Geography, Western Illinois University, Macomb, IL 61455, TB-Williams@wiu.edu. Wind energy development in Illinois. With worldwide oil prices reaching record levels and gasoline exceeding \$3.00 a gallon through the summer of 2006, alternative energy sources have become increasingly attractive. Clean, renewable wind energy continues to grow in importance as cumulative wind power capacity passed the 10-gigawatt (10,000-MW) milestone in the United States (American Wind Energy Association, 2006). Last year Texas supplanted historic leader California as the nation's top state in capacity to generate wind power. While Illinois ranks 16th in wind energy potential, several wind farms have been recently developed. The Mendota Hills project, located in Lee County in northern Illinois, has 63 800-KW wind turbines which became operational in late 2003. The smaller Crescent Ridge farm, opened in 2005 just to the south in Bureau County, features 33 larger 1650-KW generators. The newest project currently under construction will bring 120 1650-KW turbines onto the power grid, and is capable of producing more wind energy than all other completed projects combined. This site is located in McLean County near Bloomington-Normal in central Illinois. All of the wind projects are located on favorable sites in the northern half of Illinois where stronger prevailing winds are thought to exist. The purpose of this study is twofold: 1) to document the current status of wind energy development in Illinois; and 2) to examine observed wind data collected from selected meteorological towers located in distinctly different areas of the state.

Keywords: wind energy, Illinois

Carl Wilmsen, Univ of California- Berkeley. Email: cwilmsen@nature.berkeley.edu; *Community Forestry and Social Justice*

Community forestry in the U.S. is characterized by efforts to achieve greater participation in forest management policy and decision making. The assumption is that participation by local residents will lead to more economically and ecologically sustainable and more socially just management policies and practices. But what conditions give rise to meaningful participation? The case of the Vallecitos Federal Sustained Yield Unit in northern New Mexico suggests that racializing discourse, shifts in management priorities, and ineffective engagement with the global economy maintain the social positioning of subordinate social groups and undercut their ability to participate effectively. Although the structuring of management in the past provided strategic advantages for large lumbering firms, shifts in Forest Service management objectives, as well as the approach of environmental groups to sustainability, provide no such strategic advantage in negotiating the terms of forest management to Hispano community residents. Their experiential knowledge of the environment is not recognized as legitimate for informing management in any meaningful way, and the unit's management is still rooted in an environmental/racial discourse that devalues the Hispano way of life and relationship to nature. The case of the VFSYU suggests, therefore, that current practice in integrating economics, ecological science, and social equity in natural resource management may be constituted of processes and discourses that reproduce the racial order. Without explicit attention to social positioning and creating opportunities for, and conditions conducive to, the advancement of socially marginalized groups, the integration of equity with ecological and economic concerns will remain an elusive goal.

Gordon Wilmsmeier, Osnabrück University. Email: wilmsmeier@aol.com; Theo Notteboom, ITMMA - University of Antwerp. Email: theo.notteboom@ua.ac.be; *Determinants of Container Liner Shipping Network Configuration: A two Region Comparison*

The worldwide network of container transport services is becoming increasingly diffuse. The different strategies of shipping lines, the balance of power between shipping lines and shippers and constraints related to inland transportation have a potential impact on the development of maritime shipping networks. Moreover, strategic alliances between the port and the shipping

industry, which have both been driven by strong concentration processes and vertical integration have a profound impact on the maritime network structure and in so far also on the grade of embeddedness of a region in the global maritime transport network. The paper seeks to understand the evolution of maritime networks in and between two differently developed regions, South America and Europe. Based on a classification of network types, the paper analyzes the network structures and the behaviour of shipping lines in different economic contexts and port systems. Profiles for each region are developed, defining the influencing factors on the supply and demand side for maritime transport network development. This analysis is based on the historical and current developments in the two regions under study, illustrating the relative position within the global maritime network and the potential implications of being peripheral or central in this network. We try to answer in how far the configuration of the hinterlands determines calling pattern and if strategic alliances and vertical integration reduce footloose behaviour of shipping lines. Further we discuss the influence of shipping lines on port development or vice versa in how far port accessibility and performance influence maritime network developments.

Peter Wilshusen, Ph.D., Bucknell University. Email: pwilshus@bucknell.edu; *Shades of Social Capital: Elite Persistence and Community Based Forestry Enterprises in Quintana Roo, Mexico*

Dominant views of social capital use the term to represent an accumulation of collective cooperative capacity. This article adopts a relational and contextual view of social capital rooted in Pierre Bourdieu's writings to explore the reciprocal relationships between formal and informal social capital with respect to community-based forest management in Quintana Roo, Mexico. It first reframes dominant views of social capital to bridge key conceptual gaps pertaining to contextuality, social interaction, and formal and informal layers of human action. It then examines the formal and informal exchanges among actors linked to a timber marketing fund. The case reveals how weak norms of enforceable trust within a community forestry association and a timber marketing fund (formal social capital) enabled unregulated lending networks (informal social capital). Unregulated lending, in turn, has contributed to the financial and institutional instability of community-based conservation and development in central and southern Quintana Roo.

Keywords: social capital, power, community, conservation, Mexico

Cyril O. N. Wilson, University of Illinois at Chicago. Email: cwilso20@uic.edu; *Housing Quality, Socio-economic Status and Local Environmental Condition: The Case of Freetown, Sierra Leone*

Research on urban housing quality has been significantly skewed to architectural, technical, qualitative and local environmental conditions. Extensive investigations have been conducted on the effectiveness of housing policy, the interface between socio-economic status of urban household and occupant's health, and the demand and supply of housing. In this paper, I attempt to integrate housing quality, household socio-economic status and the local environmental conditions to unravel the degree of association these variables exhibit in urban space. The study was conducted in three differentiated levels of settlements in Freetown, the capital city of Sierra Leone. Data was mainly obtained by household survey, focused group discussion and personal observation. An upscale, medium level and relatively low strata settlement characterized the study localities. The conceptual framework was guided by the following question: Is the relationship between housing quality, household socio-economic status and the local environment uniform in these settlements, or are there spatial variations? Partial correlation analysis reveals that income is the main determinant of housing quality in high class settlement, while level of education is the dominant factor in middle and low class settlements. Multiple linear regression demonstrates that the association between housing quality and socioeconomic status of households is stronger in the middle and upscale settlement in relation to the low class community. The study shows insignificant relationship between local environmental condition and housing quality in high and middle class settlements.

Dana Helene Wilson, McGill University. Email: dana.wilson@mail.mcgill.ca; *Youth perceptions and experiences with local VLT gambling opportunities in Montreal*

The gambling industry has expanded in recent years resulting in more gambling opportunities than ever before. Gambling has increased as have the public health and social costs incurred by individuals and communities. Video lottery terminal (VLT) gambling has become very popular in Quebec and elsewhere in Canada, and VLTs are now routine features of the local neighbourhoods that youth frequent. This paper presents results from focus group

discussions with youth conducted in three secondary schools in Montreal, Quebec in the spring of 2006 and follows a large scale survey and geographic analysis of VLT locations across Montreal (see Wilson et al., 2006; Gilliland et al., 2005). Youth perceptions of and experiences with local gambling opportunities are described, including factors influencing decisions to engage in or avoid VLT- and other gambling activities. Youth descriptions of local gambling behaviours in home and school environments are also summarized, including those activities most common and accepted in their experiences with peers, teachers, and family. Discussions revealed gambling opportunities to be abundant, accessible and convenient to youth. Further, youth recommended ways to alter gambling-supportive norms, through a multifaceted approach including education and awareness programs, greater enforcement for minors, and the provision of more recreational opportunities that cater to youth. Youth stressed the need for spaces of their own, independent of home and school environments, where quality time could be spent with friends. Discussions demonstrated that while gambling is not always a priority, it is often the most convenient, accessible activity available to youth.

David Wilson, University Of Illinois. Email: dwilson2@uiuc.edu; Dean R. Beck, University of Illinois. Email: deanbeck@uiuc.edu; Chicago's Neoliberal-Parasitic Economy: Space Building And Institutional Reproduction

A distinctive local economy, what Howard Karger (2005) identifies as the parasitic-neoliberal economy, today increasingly blankets low-income racialized communities across America. This institutional network - day labor sites, temp. labor agencies, payday lenders, check cashers, pawnshops - deepens the poverty and marginality of residents here. This study examines this nominally explored economy on Chicago's Southwest Side where it flourishes amid the eclipse of the area's "working-class economy." We interrogate this economy to determine its ascendancy and vibrancy as a space-building institutional formation that extends its brand of economic and social relations (what we term hyper-neoliberal social management) into this area of Chicago. Our goal is to provide depth and specificity to Brenner and Theodore's (2002) general notion that space building is currently one "privileged instrument" that anchors and nurtures such neoliberal economies. We chronicle that this economy, its daily rhythms, operates within an unfolding uneven development across Chicago that manufactures a self-bolstering space. We document this space, following Lefebvre, as being both an "absolute space" and a "conceived space" that is a poignantly hermeneutic terrain. Whereas this kind of local space is widely thought of as a brute, economic-functional terrain, we reveal it as a complex, lived-through turf whose symbolic features are at the heart of its causal prowess

Keywords: parasitic economy, neoliberalism

Iris Wilson, Department of Geography, Kansas State University. Email: iewilson@ksu.edu; Development of LIDAR-based Topography Information for Gulf Islands National Seashore

Gulf Island National Seashore is the largest National Seashore in the United States. Encompassing beaches and barrier islands from Mississippi to Florida, the 54,879.46 hectare National Seashore was authorized in January 1971. This area is subject to dynamic geomorphic processes that continually reshape the landscape. A westward longshore current supplies the quartz sand that makes for white beaches and also tends to elongate the barrier islands in an east-west direction. Shocks to this geomorphic system are provided by erosion and redeposition events associated with hurricanes. In order to provide accurate, user friendly data to track the continuously changing landscape of these barrier islands, the USGS, National Park Service, and Kansas State University have pooled resources to map the area using 'bare earth' LIDAR data. LIDAR data were collected using the NASA EAARL sensor in the days following the passage of Hurricane Katrina in late September 2005. This poster will document the procedures used to process the LIDAR data and create a useful product for park managers, researchers, and visitors.

Keywords: LIDAR, Topography, Gulf Island National Seashore

James W. Wilson, Ph.D., Old Dominion University. Email: hgis@earthlink.net; Validating woodlands information on historic maps for local and regional analysis.

Historic maps can provide important information for the analysis of human alterations of landscapes over decades and centuries. The usefulness of information extracted from historic maps depends however on the spatial and thematic accuracy of their contents and the accuracy of methods used to extract features from the maps. A case study of the North River watershed in the Shenandoah Valley of Virginia (USA) is examined where the thematic and positional accuracy of woodlands information on historic maps is assessed for four time periods (1864, 1906, c. 1945, and c. 1964). Agricultural census data, aerial photography, additional maps, forest inventory data, and landscape images were used to

evaluate the thematic and spatial accuracy of the map contents. The extracted woodlands data were then analyzed with additional data sets for the second-half of the twentieth century to analyze deforestation and reforestation spatial and temporal patterns. The resulting analysis was compared to existing reconstructions and interpretations of the region based on coarser-grained data and showed a marked difference in the timing and location of woodland changes from previous research. Therefore, validated information extracted from local historic maps can be used to provide detailed reconstructions of localized areas and to calibrate larger regional reconstructions based on coarse-grained data.

Japhy Wilson, University of Manchester. Email: japhywilson@yahoo.com; Neoliberalization and the Production of Flexible Space: The Case of Plan Puebla Panama

In the aftermath of the first wave of structural adjustments of the Global South, states and multilateral institutions are now implementing a 'second generation' of neoliberal reforms. An emergent critical literature has concentrated on the institutional restructuring and social engineering implicit in this process, but has neglected its spatial dimension. A historical-geographical materialist analysis of World Bank and regional development bank documents reveals an emphasis within the second generation agenda upon the production of flexible spaces, which are thoroughly integrated into global circuits of capital, and which offer transnational investors the optimal conditions for flexible accumulation. The Plan Puebla Panama constitutes a significant example of the production of flexible space. Introduced in 2001 by Mexico and the Interamerican Development Bank, the PPP is a regional development programme encompassing Central America and Southern Mexico, and including major infrastructural developments, maquiladora zones, agribusiness plantations, bioprospecting reserves, and tourism networks. The PPP is being implemented in conjunction with the Central American Free Trade Agreement (an extension of NAFTA), and is a step towards the realisation of the Free Trade Area of the Americas. However, its progress is being obstructed by indigenous social movements contesting the social, cultural and environmental destruction that the PPP implies. Their resistance demonstrates the contradictory and conflictual nature of the sociospatial relations underlying the production of flexible space, and calls into question the very possibility of the successful creation of such spaces, given capital's inescapable reliance upon concrete and inflexible places of nature and human sociality.

Jeffrey S. Wilson, Indiana University - Purdue University Indianapolis. Email: jeswilso@iupui.edu; Greg H. Lindsey, Indiana University - Purdue University Indianapolis. Email: glindsey@iupui.edu; Biophysical Viewscapes: Integrating Environmental Remote Sensing and Visibility Analysis in Geographic Information Systems

Geographers have long been interested in perception of landscape from both qualitative and quantitative perspectives. In this presentation we explore new methods for integration of biophysical remote sensing and visibility analysis to characterize structural and physical landscape properties from the perspective of the human ground observer. The concept of biophysical viewscapes is developed and evaluated in the context of urban greenway trail use in Indianapolis, Indiana. High resolution surface models derived from airborne LIDAR measurements are used to develop viewsheds along thirty trail segments, each approximately one mile in length. Viewscape variables including greenness, openness, visual magnitude, and land use diversity are summarized along each segment. Infrared trail traffic monitors provide over 20,000 monitoring days that serve as the dependent variable in multivariate regression models. Biophysical viewscape properties, in concert with socioeconomic and temporal variables, emerge as significant predictors of trail traffic, explaining more than 80% of spatial variation in trail use. Potential theoretical basis for the relevance of landscape visual properties are presented and emerging geospatial technologies that can contribute to further development of the biophysical viewscape concept are considered.

Matthew W. Wilson, University of Washington. Email: mwarrenw@u.washington.edu; Learning to laugh at ourselves: Approaching GIS critique from the 'inside'

Those engaged in the fields of critical and participatory GIS conceivably assume different roles throughout the duration of their research projects. Given the various technical and organizational requirements of these projects, researchers may develop software systems, design cartographic materials, meet with and facilitate organizations, as well as perform technical support and maintenance. Additionally, given the various modes of engagement that accompany these roles, including interrogation, consultation, facilitation, and

representation, these diverse responsibilities are conceivably situated within specific epistemologies. How might these perspectives intersect in a research design? In my work, I encounter this question through preliminary research on the implications of geographic information technologies in participatory settings, the development and implementation of which I am also invested. My position of being simultaneously 'inside' system development and interested in critique (which sometimes seems as being 'outside') proves an opportunity to contribute to other methodological approaches in critical, participatory research. This paper briefly reviews the problematics of inside/outside methodologies, including ethnography, participant observation, interviews, and cognitive/behavioral data collection. I then describe another approach, centered on different moments of laughter. These moments that can occur during system development and implementation, I argue, are actually productive openings for critique. To elaborate upon this method, described as 'learning to laugh at ourselves', I discuss Foucault's exploration of the laughter that results from discursive meltdowns - in this case, when the meaning and legitimation prescribed to aspects of system development and implementation no longer comfortably exist within broader critical and theoretical foundations of the system's inception.

Keywords: critique, discourse, participatory GIS, critical GIS

Robert Wilson, Syracuse University. Email: rmwilson@maxwell.syr.edu; *Animals as Technology in Subterranean Environments: Uniting Evolutionary History and Animal Geographies*

Evolutionary history is a growing sub-field of environmental history that investigates the molding of organisms in modern times for industrial purposes. Scholars in this area have argued that domesticated animals such as dogs, horses, and cats should be seen as types of technology, that is, as machines created by people to serve human ends. To date, scholars in evolutionary history have not engaged with research by animal geographers on human-animal relations. This study unites work in these fields through an examination of the breeding, housing, and use of mules in hardrock mines in the western United States during the late nineteenth and early twentieth century. Copper, gold, and silver mines in this period became highly industrialized environments. Despite the complexity of these industrial systems, the use of work animals such as mules persisted in hardrock mines until the 1920s. Unlike other types of mules or horses, mine mules had to be bred for and maintained in underground settings. These subterranean environments posed particular challenges to those wanting to harness animal power underground in mining operations. This paper will look at the interplay between the human sculpting of these animals through domestication and the success in adapting these creatures to industrial work in underground settings. Rather than viewing mine animals as separate from the mechanical settings that surrounded them, this presentation will argue that these animals are better understood as technological units within the complex industrial systems of hardrock mines.

Keywords: animal geographies, mining, evolution, western United States

Sigismund Ayodele Wilson, Michigan State University. Email: wilsonsi@msu.edu; *The New Global Diamond Order and Post Civil-War Sierra Leone: Is the Kimberly Process the panacea?*

Diamonds may be regarded as a mixed blessing for Sierra Leone. In fact, some scholars regard the Sierra Leone diamonds as resource curse. The country has been exporting considerable amount of valuable gemstones since independence, yet official sales plummeted in the 1970s and 1980s due to smuggling. Substantial reduction in diamond revenues, in addition to widespread government corruption, exacerbated poverty and discontent, culminating in the civil war (1991-2002). The ideology of the rebel Revolutionary United Front (RUF), if there was one, was diamond control. The RUF fought for and secured the most diamondiferous area, Kono District. From this secured location, it traded diamonds for arms to sustain its assault on the state. The main objective of this paper is to examine how diamonds are located in ongoing dynamics between the post-civil war state and the 'new' global diamond architecture. The paper reviews (i) as backdrop, the links between the RUF, the state and regional and global diamond agents in particular De Beers; (ii) the new globalization values implied in the concept of 'ethical diamonds'; and (iii) the new globalization dispensation condensed in the notion of the Kimberly Process. The paper uses these narratives to assess the comparative stability of the state under the old and new global diamond world orders.

Keywords: post civil war Sierra Leone; new global diamond world order; De Beers; Kimberly Process

Steven Gregory Wilson, U.S. Bureau of the Census. Email: steven.g.wilson@census.gov; Anika E Juhn, U.S. Bureau of the Census. Email: anika.juhn@census.gov; *Population Dynamics in the Great Plains, 1950-2006*

Trends over the last five decades have seen substantial percentages of population decline in the majority of counties located in the Great Plains region of the United States. Recent population estimates suggest that while the major population centers in the region have stable or growing populations, most other areas in the region?especially predominantly rural counties?are experiencing population decline. In this poster we examine the population dynamics in the Great Plains region in further detail. We begin by examining historical patterns of population, focusing on census-to-census change in the period 1950 to 2000. We then incorporate recent population estimates for the period 2000 to 2006 to look at the demographic components of change: natural increase, domestic migration, and immigration. A series of county-level maps reveals the spatial patterns of the components' relative contributions to population change. Finally, we turn attention to two of the consequences of these demographic trends: an aging population and the consolidation of school districts with declining enrollments. Data are from United States decennial censuses of population and the Census Bureau's Population Estimates Program.

Keywords: Great Plains, Demographic components of change, Age structure

The Global Mapping project is an international effort to develop and integrate 1:1,000,000-scale (1:1M) geospatial data that will facilitate environmental research at spatial scales ranging from continental to global. Hydrologic drainage datasets that include streams, waterbodies, and canals, facilitate environmental research by establishing hydrologic connectivity between regions. The accuracy, detail, and connectivity available in the 1:100,000-scale (1:100K) National Hydrography Dataset (NHD) provides an appropriate and reliable base for the creation of a 1:1M drainage dataset. This poster explores the various methods used in the production of the 1:1M drainage dataset. Methods tested include network hierarchy analysis based on stream name, classification of 1:1M scanned map data and calculation of zonal statistics within buffered streams, generating hydrologic derivatives for 30 and 90-meter resolution digital elevation models, thinning of the network based on the NHD Plus Thinner Code, and downstream trace and attribution based on ancillary data. Distinct inadequacies in each approach suggest that a methodology combining aspects of several methods is most effective. The final methodology uses ancillary data to attribute headwater reaches and a downstream trace algorithm to attribute streams. The downstream trace algorithm makes decisions using the geometric network and attributes stored in the 100K NHD. This method is currently (2006) being used for production of the 1:1M Global Map Hydro datasets.

Robert D. Wilton, McMaster University. Email: wiltonr@mcmaster.ca; Geoffrey DeVerteuil, University of Manitoba. Email: deverteu@cc.umanitoba.ca; *The Politics of Place in Addiction Treatment*

In this paper we examine the location and character of treatment programs for people with drug and alcohol addictions. Using qualitative data collected at treatment programs in three Canadian cities, we draw attention to the complex and inherently political character of treatment programs as social spaces. Our analysis is organized around two related themes. The first concerns the often marginal locations of treatment programs and the extent to which these marginal environments shape the process of addiction treatment in both positive and negative ways. A second theme is concerned with the politics of the program space itself - the way in which the physical and socio-cultural organization of the treatment environment contributes to a reassertion of control over the individual client's behaviour. We argue that the internal and external program environments interrelate in important ways. The external environment ? for example, the character of the neighbourhood ? may shape program regulations with regard to the monitoring of clients' movements to and from the site. At the same time, the organizational ethos of the program ? the daily routines and power relations cultivated in and through the site ? aim to alter the ways in which individual clients relate to the external environment upon their departure.

Dick G. Winchell, FAICP, Eastern Washington University. Email: dwinchell@ewu.edu; Smart Growth for Sustainable Tribal Planning: Schitsu'umsh, The Coeur d'Alene Tribe, Idaho

Smart Growth offers core principles to address the problems of America's cities which come from the negative impacts of designing for cars to produce sprawl, congestion, auto-dependence, and non-sustainable urban futures. Smart Growth seeks to re-establish positive relationships with the natural environment; sustainable energy use and reuse; compact, pedestrian oriented development, and a mix of land uses and housing costs within dense urban centers. These principles do not directly apply to the generally rural development patterns on most American Indian lands, but have been recommended by the Environmental Protection Agency as a new framework to guide development for rural areas and for American Indian reservations. For reservation applications, however, "smart growth" assessment of land use patterns and densities must be tempered with the analysis of traditional settlement patterns and tribal architecture, as well as the generally disjointed historic development of isolated buildings, individual or small clusters of residential areas, and total reliance upon automobiles on most reservations. This paper presents a case study of the application of Smart Growth principles for new tribal development adjoining the City of Plummer, Idaho, by the Coeur d'Alene Tribe. The Schitsu'umsh Coeur d'Alene Tribe Smart Growth Project demonstrates the value of Smart Growth for planning to promote sustainable tribal development. These principles must be tempered by the context of tribal architecture, settlement patterns, and with the intent of correcting uncoordinated land development on reservations within a context of tribal values and sovereignty if it is to become an effective guide for future development.

Antoinette M.G.A. Winkler Prins, Michigan State University. Email: antoinet@msu.edu; Amazonian Dark Earth creation in homegardens: A preliminary assessment of the (pre) historical record.

In recent years there has been increasing attention given to Amazonian Dark Earths (ADE), dark, organic-rich soils found in patches throughout the Amazon Basin. Research has demonstrated that these soils are anthropogenic, formed by people in the past, through their everyday praxis. What is not well understood yet is how deliberate the actions were that contributed to the formation of these soils. Key to ADE formation is the existence of aromatic carbon, the result of a process called 'slash and char.' On-going research in present-day homegardens in Santarém, Pará, Brazil, indicates that a process similar to slash and char, terra quemada, may be a process that leads to the formation of ADE over time. Using text analysis, this paper will investigate classic writings about the Amazon, both ethnographic and historical, to consider descriptive references made about homegardens and soils management strategies such as terra quemada to consider antecedent knowledge systems that sustained knowledge and methods from pre-historical times to the present.

Keywords: Amazonian Dark Earths, Terra Preta, homegardens, historical ecology, soils

Tony Winson, Ph.D, Dept. of Sociology and Anthropology, University of Guelph. Email: twinson@uoguelph.ca; Food Environments, Market Power and the Spatial Colonization of 'Pseudo Foods': Critical Concepts for Understanding the Degradation of Diet and Imperilled Health

The rapidly expanding influence of multinational conglomerate food and beverage firms in shaping diet in developed and developing countries alike has sparked sustained controversy around such key issues as genetically modified foods, food safety, and more recently the issue of the growing incidence of overweight and obesity in society. This paper takes the obesity issue as a point of departure for examining how food can be a valuable lens to bring into focus how the all pervasive influence of corporate capitalism affects life sustaining spheres of human activity such as food production, processing and distribution. It proposes new concepts to understand the nutritional content of food environments in developed countries today and the contemporary transformation of

food environments in the developing world. It concludes by demonstrating how these concepts can be utilized to explore the degradation of the diet in such institutional spheres as supermarkets and schools.

Keywords: food environments, market power, pseudo foods, supermarkets, schools

Jeannine Wintzer, . Email: wintzer@giub.unibe.ch; Jeannine Wintzer, . Email: wintzer@giub.unibe.ch; Residential Segregation of post socialist cities in GDR

Residential Segregation in post-socialist cities The pattern of segregation in socialist cities was caused by national assignment agencies. These agencies were responsible for the regulation and control of housing space between 1967 and 1985. It was the aim to guarantee manpower for the local industries and to control family planning; after all the political system had to be stabilized. However, social segregation did not stop after 1989. New forms of social-spatial segregation arose. Economic prosperity not automatically leads to rising income for everyone, new policies not automatically means better distribution. New social gaps between those employed and those unemployed, rich or poor, educated or less educated occurred. In my presentation I will focus on single mothers living in post-socialist cities and thereby on residential segregation due to income and social status. This group of city dwellers is among others most effected by poverty and constitute the new core of the poor in East Germany. The data of the socio-economic panel (SOEP) shows that there was a significant change on the job market after the collapse of communism in 1989. Above all other people women were affected the most by dismissals and longterm unemployment. The collapse of the well-developed childcare system caused job-finding problems, especially for single women with children. I argue, normative ascriptions became visible after 1989 and are remaining one of the defining factors for gender-specific disadvantages in social institutions until today (e.g. in the job market) and cause poverty and inequality.

Keywords: segregation, single mothers

Erika K. Wise, University of Arizona. Email: ekwise@email.arizona.edu; Hydroclimatic Variability across the U.S. Continental Divide: Integration of Dendroclimatology and Spatial Analysis to Assess Watershed-scale Dynamics

A multitude of activities and livelihoods depend on rivers systems that originate in the mountains of western Wyoming. This area experiences a high degree of hydroclimatic variability due to physiographic, meteorological, and teleconnection influences. The purpose of this study is to improve understanding of the spatial and temporal patterns of hydroclimatic variability in this region, as well as the underlying atmospheric processes controlling those patterns. Analysis of historical climatological and hydrological data were undertaken to provide better understanding of current hydroclimatic connections at the watershed scale. Precipitation and streamflow were modeled using regionalization and synoptic climatology techniques to examine the region's spatial patterns of variability. Tree-ring samples were collected from *Pinus flexilis* and *Pseudotsuga menziesii* trees at nearby sites on opposite sides of the continental divide, allowing for a study of the physical processes that impact two particular water basins on time scales longer than those available from the instrumental record. Tree-ring cores were dated to the calendar year through crossdating, and ring widths were measured. Correlation and response function models were used to establish relationships between climatic variables and tree growth, and a statistical model was created to calibrate and validate the reconstruction. Objectives of this project include helping place recent climatic events in the context of natural climatic variability and allowing better forecasting for water managers attempting to plan for and mitigate future flood and drought impacts.

Suzi Wiseman, Texas State University - San Marcos. Email: swiseman@txstate.edu; An Evaluation of the Spatial Relationship between Stray Pets, Community Ethnicity and Other Socio-Economic Factors

Studies report that free roaming cats and dogs significantly impact wildlife, ranching operations and communities - socially, financially and environmentally. Ferals, strays and outdoors pets are not evenly distributed. This paper explores the degree to which this may be a reflection of social, ethnic, and/or other cultural and economic factors that may tend to generate, tolerate, or exacerbate the situation. Geographic patterns were identified in the distribution of stray cats and dogs collected in Waco in Central Texas. Analysis of the source neighborhoods and of the demographics of those hotspots using GIS and census data permitted correlation of ethnic as well as other socio-demographic factors which may be associated with animals straying.

Keywords: Stray domestic animals, animal control, nature-society relations, cultural ecology, zoogeography

David J. Wishart, University of Nebraska. Email: dwishart1@unl.edu; *The Conjunction of History and Historical Geography*

This paper begins with Louis Mink's revelation that "the past is literally nowhere . . . there's no there for it to be" and moves from there to a conclusion that history and historical geography are joined at the root by the ontological challenge of having no access to their subject matter. It is suggested that any epistemological differences that have been used to distinguish the two subjects, such as period/region and time/space, are insignificant by comparison, and they have largely disappeared in any case. Along the way there is discussion of non-western conceptions of the past, the imputed survival of the past in the present, the possibility of direct experience of the past, problems with idealism as an historical methodology, and the role of historical narrative as a substitute for a past that cannot be regained.

Keywords: Past, History, Historical Geography, Narrative

Ben Wisner, Independent Scholar. Email: bwisner@igc.org; *Danger Money: Working the Political Ecology of Risk*

Drawing from Paul Robbin's notion of political ecology as critical "hatchet" that seeks to understand deeply hidden processes and as "seed" that helps to catalyze practical action, one can review 40 year's work by geographers, anthropologists, and others on natural hazards and other risks. In my own case, I began in the late 1960s to deconstruct the idea of "drought," "hunger" and "famine" in East Africa. Others working in the 1970s in Central America, Southern and West Africa, and parts of Asia did parallel hacking away at comfortable myths of "development" and the idea that such "disasters" were deviations from a Rostowian stage-like progress in economic development. My more recent work, over the past 10-15 years, has been more along the lines of helping NGOs and agency staff discover "seeds" of popular coping and adaptive livelihood management that help to empower neighborhoods and rural localities to assess their own vulnerabilities in the face of hazards and resources to deal better with them. In the course of such work local power relations as well as the complexities of relations between often marginalized groups of people and the nation state play an important role. The future of work in the political ecology of risk lies in a creative balance of top down and bottom up activities of this kind, guided by clear but not cynical understanding of power.

Jonathan Witcoski, University of Tennessee. Email: jwitcosk@utk.edu; *An Analysis of the Spatial Distribution of Chiefdom Settlements: Modeling the Mississippian Culture in the Tennessee and Little Tennessee River Valleys*

Did chiefs during the Mississippian period (900 - 1500 A.D.) situate themselves so as to maximize control of area populations and resources within their chiefdoms? Were trade networks during more volatile time periods better connected than they were during lessened less volatile times when ruling elites undoubtedly probably had greater control over scarce resources? When a differentiated elite class of individuals controls a subservient population and the resources of an area, it is assumed that they would do so in a predictable fashion so as to maximize their control within their limited power base. Central place theory, and its underlying organizing principles, show that, settlement spacing is predictable in such hierarchically based societies. This paper will try to answer these basic questions regarding the political organization of chiefdom society using archaeological data during the Mississippian period in the Upper Tennessee and Little Tennessee River Valleys. The study will develop a location-allocation model that will simulate the decision-making processes responsible for the spatial arrangement of administrative centers. A transportation network among contemporaneous Mississippian period sites geocoded into a GIS will be developed by using the more likely of the two theoretical transportation strategies—riverine and terrestrial. The research should shed light on the controversial issue of the level of complexity of chiefdoms during the Mississippian period.

Keywords: GIS, Archaeology, location-allocation model, Central place theory, Mississippian Culture

Suzanne Davies Withers, University of Washington. Email: swithers@u.washington.edu; William AV Clark, University of California, Los Angeles. Email: wclark@geog.ucla.edu; Tricia Ruiz, University of Washington. Email: tr Ruiz@u.washington.edu; *Demographic Variations in Housing Cost Adjustments in US Migration*

The rapid increase in the cost of housing has recently been identified as a motivation for significant migration flows down the urban hierarchy. However, little empirical work has established the relationship between differential costs of living and migration flows, across demographic groups. In this paper we measure the difference in the cost of living between origin and destination for all migration flows across the United States at the county level from 1995-2000. Particular focus is given to the top 0.1% of population flows (magnitude) to examine the cost-of-living outcomes for these exchanges. We then assess the impact of housing cost differentials on interstate migration specifically. Lastly,

using the 2000 PUMS we assess the cost-of-living adjustments experienced by migrant households. The paper provides convincing evidence that cost of living adjustments are a critical component of understanding recent long distance flows, particularly for at certain stages in the life course.

In a context of contemporary globalization important economic and social relations are increasingly stretching worldwide, thereby transcending national boundaries. One of the contingent processes of this 'global shift' is that these ever-larger flows of people, goods, information, knowledge, money, and cultural practices are no longer harnessed by countries but organized through a network of cities. One such important flow is airline business travel, as it appears to be the fundamental production process in constructing and reproducing the Network Society. The lack of suitable data is however responsible for the apparent academic neglect in understanding the role of airline business travel in the global space economy. In this paper we draw on data from the Association of European Airlines (AEA, 2001-2005) which allows us to map and explore the movements of nearly 100 million first and business travelers in the European city network. The results suggest the existence of various configurations of urban systems and allow for the comparison of intercity connections. We then couple this to interview data to understand the meaning and significance of the patterns detected for professional service industries and the functioning of the global space economy. We use this to propose a more holistic analytical framework for thinking through the role of business travel in global economic activities.

Keywords: mobility, business travel, airline data, AEA

Aaron T. Wolf, Oregon State University. Email: wolfa@geo.orst.edu; *Spiritual Transformation and Lessons for Water Negotiations, or, Conflict, Cooperation, and Kabbalah*

Successful multi-party negotiations require profound transformations in the way participants conceptualize the issues at hand. Those involved can often point to the precise moment when thinking altered dramatically - the "aha!" moment? where emphasis shifted from individuals thinking only in terms of their own agenda to also understanding the needs of the other. Traditional conflict resolution models define these moments in rational terms. Even overlooking the tautological nature of this argument, "rationality" simply often does not hold sway if the conflict involves even a modicum of real emotion. To really understand the process of transformation, and the settings most conducive to inducing these shifts, then, one may do well to look outside of the field of conflict resolution as defined in modern, academic terms. The world of spiritual transformation rises as potentially the most appropriate. Every spiritual tradition in the world, after all, is devoted to precisely this process of transformation: to aid individuals in moving from a focus on their own immediate wants and desires, to addressing more their obligations to society, humanity, and to the divine. Our case study center on the process of transformation in negotiations over international rivers? specifically on the points at which parties move from thinking of themselves as representing countries, to perceiving more broadly the needs of all stakeholders within a basin. This is a critical juncture in these negotiations, where movement from "rights-based" to "needs-based" to "interest-based" negotiations suddenly becomes possible. This negotiation transformation may, however, have a corollary in spiritual transformation.

Eric Bradway Wolf, MS, University of Colorado at Boulder. Email: ebwolf@colorado.edu; Barbara Buttenfield, PhD, University of Colorado at Boulder. Email: babs@colorado.edu; *A Hierarchical Vector Data Model for Distributed Geospatial Processing*

We present a hierarchical data structure to store and manage vector data at multiple resolutions based on a single fine-resolution version. Vector data is typically maintained in separate data files at fixed resolutions (e.g., 1:5,000, 1:24,000, 1:100,000, etc). To analyze a geographic process at the appropriate scale, an entirely new data set may need to be compiled, at significant cost in time and resources. The proposed data structure can support web services involving measurement, modeling and analysis across a range of resolutions. This data structure is constructed using binary decomposition. Convex hulls are developed around each node in the tree to preserve topology. Features are re-constructed at user-specified ground resolution, level of accuracy, or volume of data (number of coordinate pairs) by extracting a cross-section of the tree. Work in progress includes topological checking within feature layers (e.g., networks of

stream tributaries) and between feature layers (e.g., roads and streams). Metadata describing feature geometry is stored at each node and summarized for each row of the tree, and allows for pattern analysis of feature geometry and comparison against other data sets without needing direct access to the finest granularity coordinates. The intent of this data structure is to sustain a highly efficient web-portal infrastructure for storage, transmission and analysis of very large geospatial data sets independent of application.

Christopher J. Woltemade, Shippensburg University. Email: cjwolt@ship.edu; Jinnieth J. Woodward, SUNY - College of Environmental Science and Forestry. Email: JinnieWoodward@aol.com; Hydrology And Nitrate Removal In A Restored Spring-Fed Wetland, Pennsylvania

In 2001 the 1.04-ha Hornbaker wetland in south-central Pennsylvania was restored by blocking an artificial drainage ditch to increase water storage and hydraulic retention time (HRT). A primary goal was to diminish downstream delivery of nitrate that enters the wetland from a limestone spring, its main source of inflow. Wetland inflow and outflow were monitored weekly for two years (2004 - 2006) to assess nitrate flux, water temperature, pH, and specific conductivity. In Year 2 spring discharge was measured weekly to allow calculation of nitrate loads and the hydraulic retention time. Surface runoff was confirmed to be a small fraction of wetland inflow via rainfall-runoff modeling with TR-55. The full data set ($n = 102$) was screened to remove 13 weeks in which spring discharge constituted less than 85% of total inflows due to high precipitation and runoff. Over two years ($n = 89$), mean nitrate-nitrogen concentrations were 7.89 mg/l in inflow and 3.68 mg/l in outflow, with a mean nitrate removal of 4.19 mg/l. During Year 2 ($n = 47$) the wetland removed an average of 2.32 kg N/day, 65% of the load. Univariate analysis shows that nitrate removal was significantly correlated with HRT, water temperature, and the concentration of nitrate in inflow. Nitrate removal was significantly greater during the growing season (5.36 mg/l, 64%) than during the non-growing season (3.23 mg/l, 43%). Multivariate regression analysis shows that about 27% of the variance in nitrate removal is accounted for by HRT and water temperature ($n = 47$).

Kelly Woltman, McMaster University. Email: woltmak@mcmaster.ca; Bruce Newbold, McMaster University. Email: newbold@mcmaster.ca; Variations in Health Care Use among Recent Immigrants in Montreal, Toronto and Vancouver

Montreal, Toronto and Vancouver represent the largest immigrant receiving centres in Canada. As Canada's largest and most diverse cities, there may be more variation in health and health behaviours in these urban environments, than across any other provincial boundaries or health region. Existing literature suggests that recent immigrants, defined as those residing in their host country for less than ten years, typically under-use the health care system. Recent research also suggests that they may be even less likely to participate in preventive health care screening, especially those that are not necessarily considered essential by the individual. Drawing upon a population health approach, this paper will investigate access and utilization of preventive health care among recent immigrant women, as compared to their long-term and Canadian-born counterparts. Specifically, this paper examines the individual and neighbourhood influences on the use of a primary care and preventive cervical cancer screening (Pap testing). The Canadian Community Health Survey (CCHS), cycle 2.1 (2000-2001) Masterfile dataset provides cross-sectional estimates of health determinants, health status and health system utilization across Canada at sub provincial scales of analysis. Along with demographic, social and economic profile information from the Canadian Census Public-use dataset (2001), this research will employ both descriptive and multivariate techniques to examine a growing concern within the public health sector of the potential inequities in health care use amongst immigrants.

Keywords: population and public health; immigrants; preventive cancer screening; women's health

David W Wong, George Mason University. Email: dwong2@gmu.edu; Measuring Spatial Separation - A Distance-Based Approach

Traditional segregation measures have been criticized of their aspatial nature as spatial relationship among population groups has not been taken into account. Spatial measures introduced in the past two decades overcome this shortcoming by incorporating spatial relationship in the forms of adjacency or neighborhood of a given size, while distance is either reduced into a binary (neighbors) variable or not dealt with directly. Some earlier spatial measures used distance explicitly to model spatial relationship, but some of them are computationally intensive and difficult to implement. Another problem with segregation measures is the baselines for comparison. Most measures use the ideal situation (no segregation) as the baseline, but some others use random distribution. These ideas are sometimes limited by the relative sizes of the population groups. Few measures adopt the worst situation as the baseline for comparison. This paper suggests a distance-based spatial measure of segregation. The measure is referenced to the ideal and worst situations empirically possible given the geography and the populations of the study area. The measure is conceptually simple and relatively easy to implement. Though the optimal concept is used, no real optimization routine is needed. The measure is useful to compare segregation level of different regions even with very different geographical settings.

Keywords: segregation measures, distance

Koon Kwai Kenneth Wong, Department of Geography, Hong Kong Baptist University. Email: kenwong@hkbu.edu.hk; The Transformation of Urban Public Spaces in Beijing

Since the 1990s, the cityscape of Beijing has changed radically. In the city center and neighboring districts, large tracts of old city areas are being pulled down to permit more intensive use of land. This paper discusses the new forms of public spaces that have emerged in this traditional Chinese capital city. This rapid transformation of urban public spaces in Beijing is an attempt by the Chinese government to develop the city into a "global metropolis," and gained impetus when Beijing succeeded in the bid to host the 2008 Olympic Games. The Beijing municipal government is keen on showing the world the "new faces" of this traditional capital city of China. Rhetorically, terms like "green," "modern," "high-tech," are now frequently used in the official propaganda apparatus. Undoubtedly, the cityscape of Beijing is changing and will be changing drastically and radically in the years ahead. This paper examines the different forms and styles of urban public spaces that exist in Beijing. Of particular interest to this study are spaces that have a mixture of Western and Chinese influences, and the problems that are associated with the amalgamation of Western ideologies and technologies with Chinese traditions and culture in public space planning and design.

Keywords: Cityscape, Beijing, urban public spaces, global metropolis

Madeleine Wong, Dr., University of Wisconsin-Madison. Email: mwong2@wisc.edu; Globalization, Health Crises and Recruitment: Postcolonial Ghanaian Nurse Immigration to the U.K.

In the age of globalization, the growing health crises engendered by neoliberal reforms have compelled industrialized countries to adopt overseas recruitment to address their nursing shortages. The past decade has witnessed significant 'nurse exodus' from many African countries. Though subsidizing the health care sectors of industrialized countries, this exodus has created severe staff attrition that handicaps the development of health services in African countries. Yet, despite efforts and guidelines issued to curtail the poaching of nurses from African countries, nurse migration continues to increase. This paper focuses on the experiences of Ghanaian nurses in the U.K., which accounts for three-quarters of Ghana's verification request. First, the paper maps out the movement of Ghanaian nurses through their transnational networks and private independent recruitment. Second, based on interviews, the paper analyzes their social and economic realities and challenges in the UK. The analysis demonstrates that Ghanaian nurses experience exclusions and discriminatory practices in the work place within the hierarchical nurse labor structure shaped by recruitment programs. Finally, the paper addresses the transnational strategies and negotiations nurses are pursuing in response to these experiences and recent changing labor policies and immigration rules restricting the exemptions for foreign nurses, and threatening their employment and immigration status.

Email: sslee@cuhk.edu.hk; *Assessment of the Coverage of Substitution Treatment as a Means of Harm Reduction Using GIS Approach*

Heroin addiction is a catalyst of the HIV epidemic through the sharing of contaminated syringe among injection drug users. To prevent and control HIV transmission, harm reduction is one of the effective intervention strategies. This study aims at assessing and planning the coverage of methadone clinics, a harm reduction measure that provides substitution treatment, in various spatial scales with the aid of GIS. Hong Kong is chosen as the study area and existing coverage of methadone clinics, which is the number of heroin users attending a methadone clinic over the total number of reported heroin users by district, is an indicator of the effectiveness in delivering services to drug users. Three modules are included, namely "Assessment", "Projection" and "Decision Making". In "Assessment", spatial distribution of treatment's coverage in heroin users will be evaluated by measuring buffers based on coverage approach and travel distance approach. Projection through 2011 is made by a simple linear regression model. In addition, the spatial "Projection" in finer spatial resolution is made by assigning the 18-district coverage data to around 400 constituency areas according to local population density. The results from "Assessment" and "Projection" are used to support the Decision Making component on different scenarios: 1. No resource limit 2. A targeted coverage of greater than 60%. The system supports the planning of harm reduction programmes for diminishing the risk of HIV infection among injection drug users. Efficiency and coverage of substitution treatment are the key attributes which can be monitored using a GIS approach.

Theresa Wong, Ohio State University. Email: wong.300@osu.edu; *Anti-corporate globalization movements and the local politics of dissent: the spatiality of protesting the IMF/World Bank in Singapore*

The recent trend of International Monetary Fund (IMF)/World Bank (WB) and World Trade Organization (WTO) meetings being held in places known to suppress dissenting voices has been viewed as a worrying move to prevent anti-corporate globalization and civil society groups from engaging with such meetings. The move of WTO ministerials and IMF/WB Annual Meetings to places like Doha (WTO 2001), Dubai (IMF/WB 2003) and Singapore (WTO 1995 and IMF/WB 2006) necessitates an additional level of engagement by anti-corporate globalization activists, as they converge on these spaces, with that of the local politics of protest. These new hurdles that must be negotiated by activists were apparent in the IMF/WB meetings in Singapore in September 2006, where there was a last-minute decision by the Singapore government to ban activists accredited by the World Bank from entering the country for the meetings, for fear of 'local' security concerns. This paper examines representations of anti-corporate globalization activists in the Singapore media in the context of a general depoliticization of the meetings. It shows how these representations of both the IMF/WB and anti-corporate globalization movements inform our understandings of the spatiality of civil society activities conducted over the week of the meetings. The paper argues for a closer study of how local politics of dissent engage with practices of anti-corporate globalization groups as they converge on such meeting sites.

David Woo, California State University East Bay. Email: david.woo@csueastbay.edu; *Immigration and Concentration: Changing Asian Settlements in the San Francisco Bay Area*

In the past decade, Asian population in the San Francisco Bay Area has increased by nearly 400,000, reaching 1.43 million in 2004. With an annual growth rate of 4.3%, Bay Area Asians are growing three-time faster than the rest of the population in the region. Today, one-fifth of Bay Area's residents are Asian. The purpose of this study is to monitor the population momentum of Asians and map their changing settlement patterns in the San Francisco Bay Area. Change detection analysis is carried out using census data together with immigration statistics since over eighty percent of Asian population growth in the Bay Area comes from immigration. The study focuses on the six largest Asian ethnic groups (Chinese, Filipinos, Indians, Vietnamese, Koreans, and Japanese). It explores the major socio-economic factors that transform the ethnic makeup of Asian neighborhoods. The findings show that the epicenter of Asian population settlement has shifted from the San Francisco to the South and East Bay. San Jose has surpassed San Francisco to carry the largest Asian population among Bay Area cities. In the East Bay, Fremont has replaced Oakland to become the new hub of Asian settlement. Such demographic shifts sprout the emergence of new Asian socio-economic centers in the suburbia over the ruins of the classical

Chinatown settlement model.

Keywords: Asian, settlement patterns, immigrants, Bay Area, population, ethnic enclaves

Myungje Woo, Ohio State University. Email: woo.55@osu.edu; Jean-Michel Guldman, Ohio State University. Email: guldman.1@osu.edu; *Analysis of Urban Spatial Structure under the Urban Containment Land Use Policies*

Numerous communities have adopted some form of Urban Containment Policies in their Land Use Policies, which include Urban Growth Boundaries, Urban Service Areas, and Greenbelts, designed to deal with urban sprawl. Also these policies are increasingly chosen as the growth control tool by local governments. However, there is controversy over the negative and positive impacts of Urban Containment Policies. For example, the Urban Containment Policies are known to contribute to the preservation of farmland and the desired density of population and development. Critics of these policies have asserted that they have the negative effects such as increases of housing values and increases of traffic and congestion. Previous studies have focused on the impacts of Urban Containment Policies on housing values and infrastructure costs. However, little is known about the impacts of Urban Containment Policies on changes in urban spatial structure from the nation-wide case studies. This study tries to find out whether Urban Containment Policies are desirable in shaping an urban spatial structure that is beneficial to both the environment and the public. Specifically, Geographically-Weighted Regression is used to examine the spatial variability of population and employment densities for those metropolitan areas that have Urban Containment Policies versus those that do not. The answers to these questions should help assess whether the enforcement of Urban Containment Policies is having desirable results for the future of a metropolitan area, or just generating negative externalities, such as congestion and rising housing prices.

Keywords: urban spatial structure, urban containment policy

Andrew Wood, University of Kentucky. Email: andrew.wood@uky.edu; Gavin Bridge, University of Manchester. Email: gavin.bridge@manchester.ac.uk; Michael J. Bradshaw, University of Leicester. Email: mjb41@le.ac.uk; *When all the easy oil is gone: geographies of knowledge in the upstream oil sector*

Economic geography's understanding of 'knowledge economies' draws primarily on paradigmatic sectors of the 'new economy,' such as financial services, software and biotechnology. Accordingly, work in the field overlooks the way knowledge economies might extend to mature industries more frequently associated with the 'old economy.' Such an a priori discounting of the role of knowledge in mature industries is not warranted: technical and market profiles of these sectors indicate how a round of technological, organizational and geographical restructuring is creating demands for new types of knowledge, and driving significant shifts in the way production is organized. In this paper we present findings from work on the upstream oil and gas sector, the portion of the oil industry dedicated to exploring for and producing oil from conventional hydrocarbon resources. We draw on documentary analysis and interviews with oil producers to develop two claims about geographies of knowledge in this mature industry. First, we argue that an increasing proportion of E&P activity is targeted towards non-traditional, frontier environments. Second, we argue that competitive success in frontier-type environments depends on being able to bring together several distinctive types of knowledge: along with the capacities and expertise required to operate in technically challenging conditions, firms increasingly need to navigate a range of political, social and environmental conditions. We present the case of western oil firms on Sakhalin in the Russian Far East, which vividly illustrates how 'knowledge economies' in the upstream oil and gas sector are being re-worked by the challenges of a non-traditional environment.

Keywords: knowledge, oil, russia

Angie Evans Wood, Ph.D., Blinn College. Email: awood@blinn.edu; *Much Ado About Nothing: A Geographical Analysis of Industrial Clusters*

After it had more or less disappeared in the mid-twentieth century (Cooke, 2002), cluster theory has reemerged as one of the dominant paradigms in the advanced economies of the world. There are many reasons for this, but one of the most important factors in the resurgence of industrial cluster theory has been the explosive growth of globalization in economic and business activity. This author looks at the truth behind industry clusters. Are they a true phenomenon, or just a fortunate product of location? Who benefits from this so-called cluster and why would anyone want to become a part of it? Are industrial clusters fact or farse? This paper draws from available research literature, research fieldwork (with focus on the Texas wine industry and Cuban tourism), and practitioner documentation.

Keywords: clusters; industry; location; wine; tourism

Eileen Wood, University of Minnesota. Email: wood0556@umn.edu; Policing transnational families: Norwegian immigration legislation's management of 'acceptable' kinship structures

This paper focuses on the ways in which the Norwegian state has used immigration regulations to manage and police the kinship structures of 'immigrants.' I examine two areas of immigration law that have been of particular importance in enabling and restraining the transnational lives of non-European immigrants and their descendants in Norway. First, family reunification legislation has most obviously been used to regulate who counts as a 'close family member,' which sorts of visits are considered appropriate, and what kinds of marriage practices are acceptable. Secondly, tourist visas are central in allowing transnational families to maintain their ties, yet Norwegian visa practices are particularly restrictive. Visa granting practices place strict limits on which family ties can form the basis for a tourist visa, as well as the 'acceptable' family structure, class, and age of the visitor. Both the family reunification legislation and the visa granting practices have specific gendered goals, and are based on specific gendered assumptions, which tend to reflect broad notions of non-Western women as victims and of non-Western men as patriarchal villains.

Keywords: Immigration, gender, Norway

Lawrence E. Wood, Ohio University. Email: WoodL@ohio.edu; Taking Account of Context: The Political Articulation of Appalachian Regional Commission Policy

In 1965 the U.S. federal government created the Appalachian Regional Commission (ARC). The ARC was to oversee a regional development program in Appalachia. The ARC's creation marked the first time that the U.S. government had passed legislation designed to address socioeconomic development in a multi-state, lagging region. Prior to 1965 there had never been anything like the ARC in the U.S., and there has not been anything like it since. Understanding the political and social contexts of the U.S. in the 1960s is important to appreciating how the ARC came to be. It is important to understanding ARC policies as well. This paper indicates that ARC policies, which were almost entirely contrived prior to the establishment of the ARC itself, were articulated through entrenched political, economic, and ideological norms. In short, to understand ARC policies one must consider the broader milieu in which such policies were conceived. Influencing ARC policies included issues such as protecting the interests of politicians representing non-Appalachian constituents; the belief that government intervention should primarily come in the form of bricks and mortar style investments and should not directly interfere with private sector matters; and the expectation, based upon the neoclassical economic paradigm, that infrastructure investments could successfully stimulate the movement of both capital and labor in ways that would promote spatial equilibrium. Understanding the political and ideological limitations associated with creating ARC policies may inform expectations regarding regional development policies more generally, including in various contexts.

Email: alibar@eesi.psu.edu; GIS-based assessment of community exposure and sensitivity to tsunami hazards along the Hawaiian coast

As the 2004 Indian Ocean disaster demonstrated, tsunamis are significant threats to many coastal communities. The U.S. coastline is not immune to tsunamis and considerable energy has focused on determining the likelihood of future events and on developing tsunami-detection warning systems. To understand the risks that tsunamis pose to coastal communities, hazard information must be coupled with information on how communities occupy and use the land within tsunami-prone areas. The Tsunami Risk Assessment Project (TRAP) is looking at the variations in land use, demographics, and economic assets in land prone to tsunami hazards in the State of Hawaii. This collaborative project includes representatives from the U.S. Geological Survey, the Pennsylvania State University, the State of Hawaii Civil Defense, the State of Hawaii Department of Business, Economic Development and Tourism, and the Pacific Disaster Center. Current research focuses on the use of geographic information system (GIS) to integrate and analyze hazard, landcover, population, economic, and critical facility data. Results suggest the presence of significant tourist and employee populations in hazard-prone land in many communities. In addition, results indicate that many businesses in high tsunami-hazard zones are the primary employers and economic drivers in coastal communities, suggesting that a major tsunami could drastically affect the regional economy. TRAP results help support disaster preparedness planning efforts of the State of Hawaii Civil Defense and economic planning efforts of the State of Hawaii Department of Business, Economic Development and Tourism, as well as serving as baseline information

for response and recovery operations.

Nathan J. Wood, United States Geological Survey. Email: nwood@usgs.gov; Application of midresolution landcover information to estimate community vulnerability: A case study of tsunami hazards on the Oregon coast

Natural-science studies suggest that a Cascadia subduction-zone earthquake has the potential to generate tsunami waves which would impact more than 1,000 km of coastline on the west coast of the United States and Canada. Although the predictable extent of tsunami inundation is similar for low-lying land throughout the region, human occupation and use of the hazard-prone land varies, thereby creating variations in community vulnerability to regional hazards. To better understand such variations, landcover information derived from midresolution remotely sensed imagery (e.g., 30-m-resolution Landsat Thematic Mapper imagery) was coupled with tsunami-hazard information to describe hazard-prone land in 26 communities along the Oregon coast. Correlation coefficients (r) summarizing the correlative strength between landcover cells classified as developed and various community assets, including residential populations, business locations, and parcel values, are statistically significant ($p < 0.05$), indicating a high correlation between the datasets. The distribution of landcover cells classified as developed indicates that community exposure and sensitivity to tsunami hazards vary considerably within the study area. In the absence of socioeconomic data or local knowledge of how communities have developed, the integration of hazards information and landcover information derived from midresolution remotely sensed imagery may be a useful first step in estimating community vulnerability for regional hazards and in identifying areas for site-specific risk assessments.

Nichola Wood, University of Leeds. Email: n.x.wood@leeds.ac.uk; Passionate Practices: The Role and Significance of Emotion in Geographies of Nation and National Identity

Many works acknowledge the role that emotions play in the power of ideas of nation and national identity, however, little work has been carried out on why or how these concepts gain their emotional power. Whilst many areas of social enquiry have 'traditionally' neglected the emotional aspect of social relations, what is peculiar is the fact that despite the 'emotional turn' in geography and the social sciences more generally, contemporary studies of nation and national identity still do not focus on the role and significance of emotion. Part of the explanation for this neglect may lie in the fact that despite some notable exceptions (including Edensor 2002; Gagen 2004), scholars have tended to largely focus their attention on the tangible 'artefacts' of nationhood (e.g. textual reproductions, symbolic representations and sites of nationalist commemoration). Drawing on work that is grounded in non-representational styles of research, I argue that in order to fully understand the 'nature' and power of nations and national identity, there needs to be a more meaningful engagement with the social practices and processes through which nations are (re)produced, emotional attachments are forged and national identities are performed.

Keywords: nation, national identity, emotional geographies, non-representational styles of research

Patricia K. Wood, York University. Email: pwood@yorku.ca; Neither Here nor There: Exploring Native Youths' Geographies through Mental Maps and Photography

Several youth from the Tsuu T'ina Nation, a First Nation near Calgary, Alberta, worked with the author to explore their personal geographies on the reserve and in the neighbouring city, where some of them attend school. Producing mental maps and working with photography, the Tsuu T'ina youth revealed cartographies and geographies that were neither traditional nor "modern," but an integration of both, and a complicated sense of belonging to both places. The details of the students' maps indicated that they were unfamiliar with "official" maps of either the reserve or the city, and that the Nation continues to privilege oral and experiential knowledge of their land over modern print cartography. Their photographic choices demonstrated the nature and depth of their attachment to both city and reserve, and highlighted aspects of the relationship between the two.

Peter A. Wood, Emeritus Professor, University College London. Email: p.wood@geog.ucl.ac.uk; Dariusz Wójcik, Lecturer, University College London. Email: d.wojcik@ucl.ac.uk; *Urban knowledge-intensive services and regional innovation policies*

The policy models being employed to promote economic innovativeness and international competitiveness in British cities echo national policies by being science, manufacturing and technology-based. And yet the most powerful driver of regional and urban inequality in the UK for the past 15 years has been the economic success of the London region. Innovativeness in London does not arise primarily from technological initiatives, but from the labour intensive, knowledge-based processes characteristic of the city's national and global service functions. This paper explores the nature of competitive innovativeness in such functions, illustrated with examples from recent developments in the financial and business services.

Connie A. Woodhouse, NOAA/ National Climatic Data Center. Email: connie.woodhouse@noaa.gov; *Dendrochronology in Water Resource Management*

In the western US, recent drought conditions coinciding with increased demands for water due to population growth, tribal claims, and environmental needs, have resulted in a growing awareness of the limitations of water supplies. Anticipated regional impacts of climate change in the future are an additional concern. Many water managers are now considering climate variability and change as they develop or refine water resource management strategies and drought plans. Although instrumental records have typically been the basis for planning, some water managers are now using extended records of hydroclimatic variability from tree-ring data to assess the suitability of the instrumental data for long-term planning. A network of moisture-sensitive tree-ring chronologies in Colorado and neighboring regions has provided the foundation for a set of annual streamflow reconstructions for gages key to a number of water management agencies. Generating reconstructions for gages of interest has been a first step, but the real challenge has been working with water managers to determine how best to incorporate this information into decision making. In partnership with our collaborators, we have investigated the application of these data to address a range of management issues. This work continues to evolve and expand to other parts of the western US. Although the climate of the past will not be replicated in the future, dendrochronological records provide a broader range of natural hydrologic variability than the instrumental records. This natural variability is likely to persist into the future, underlying human-induced climate changes, making these data relevant to planning.

Philip Woodhouse, University of Manchester, UK. Email: phil.woodhouse@manchester.ac.uk; *Water Rights in South Africa: Insights from Legislative Reform*

Inequality of access to water resources marks South Africa's history even more profoundly than inequality of access to land. Redistribution of rights to water to redress the results of past discrimination is an explicit purpose of the National Water Act of 1998 (NWA). In other respects the NWA is consistent with 'best practice' embodied in the 1992 Dublin principles. Under the NWA, water management is devolved to 17 Catchment Management Agencies (CMA), each with a governing board that is representative of the water users within the catchment. This paper traces the development and current status of the Inkomati CMA, the first to be approved (in 2004) by the South African government. In the Inkomati catchment water use is dominated by established commercial agriculture and forestry, by important environmental interests, including the Kruger National Park, and by the demands for improved access to water from a black population of around 1.5 million living in ex-bantustan areas. The paper reflects on the experience of the Inkomati CMA and considers the insights it provides, both on universal 'best practice' principles and also on the role of water management as an arena of political struggle, compromise and experimentation in South Africa.

In many countries, rural cultures, landscapes and societies play an important symbolic in national identity. Threats to traditional forms of rural life are consequently frequently represented as threats to core aspects of the national character, and associations of rurality and national identity are mobilised as part of the discursive framing of rural protests. However, whilst previous studies have

focused on allusions to nationalism and national identity in media reports and promotional material for rural protests and political movements, less attention has been paid to significance of national identity as a motivating factor for participants in rural protests. Drawing on research in Wales, this paper examines how individuals negotiate rural identities and national identities in their political activity. Through case studies of protests around agriculture, housing and hunting, the paper reveals disjunctures and tensions within both discourses of national identity and discourses of rural identity. As such it critiques some of the conventional associations between national identity and rural identity, and provides an insight into the contribution of rural identity and rural activism to reproducing individual senses of national identity.

Keith Woodward, University of Exeter. Email: keithw@email.arizona.edu; *The stalemate of dialectics :: Badiou contra Deleuze contra ?i?ek contra?*

For some time in many areas of human geography - and in social theory in general - 'dialectics' has become an increasingly forbidden concept. Yet, after two decades of a massive, deconstructive push to isolate and root out alternatives to its frequently claustrophobic structurings, a number of recent theoretical articulations - such as ?i?ek's new dialectical materialism and Badiou's "expressive dialectics" ? have begun to turn their attention back to the various productivities of a new dialectics. At the center of the current conceptual rejuvenation is the crucial notion of singularity, which new dialecticians suggest offers the possibility of marrying dialectics and difference through a politics that emerges with novel 'moments'. This paper interrogates the politicization of novelty in the new dialectics by reading with and against the singularity that corresponds to the Marxism of Deleuze.

Chih Yuan Woon, National University of Singapore. Email: g0500912@nus.edu.sg; *Caring for tsunami victims by Singaporeans: Generosity, (im)partiality and the moral implications of distance*

The horrific Indian Ocean tsunami of 26th December 2004 was followed by a tidal wave of (dramatic and disturbing) media coverage focusing on the spectacular scale of destruction. Going beyond these immediate reactions to unpick the myriad geographies of the event, context and aftermath, my research agenda in the wake of the tsunami hovers on a(n) (impoverished) social analysis interweaving themes at the interface of ethics, generosity and care. Specifically, I am interested in the multiple ways in which Singaporeans 'care' for people affected by the tsunami. In human geographical terms, affective consequences extend extra-locally through familial, ethnic and media networks, many of which have also been mobilized in efforts to provide assistance from afar. This coincides with recent geographical assertions about the ethical possibilities of caring for distant strangers. Utilising philosophical ideas of Emmanuel Levinas and Jacques Derrida on ethics, generosity and hospitality critically, this interdisciplinary research refuses the framing of distance as an impediment to responsible action and promises a warm, passionate project purporting for a more caring world.

Keywords: Indian Ocean Tsunami; Generosity; Caring practices; Singapore

Taking as a point of departure recent geographic debates surrounding the politics of scale in human geography, this paper explores the theorization of scale in critical development theory and practice. Despite a history of complex debates about scale among critical geographers - who have attempted to theorize scale as relational, and as socially constructed and reproduced - we contend that many critical development scholars continue to perpetuate a hierarchical, disempowering notion of scale - for example, by emphasizing the global-local dichotomy, or by idealizing the local. We argue that, while critical development theory has made significant progress toward problematizing mainstream understandings of development, many critical development theorists have failed to recognize the ways in which a hierarchical concept of scale has been naturalized within development discourse, and the ways in which 'scalar thought' interacts with and reinforces hierarchical relationships in development theory and practice. While some geographers have recently called for a complete methodological rejection of scale, we argue that a theoretical engagement with scalar discourses is important for critical development theory, in order to adequately theorize the complex interplay between the discursive construction of scale and the material practices of development. However, we believe that frameworks for utilizing scale in critiques of development must be expanded, thus allowing us to understand the complexity and contextuality of scalar relationships. We examine recent innovations in development theory - especially research conducted within the modernity/coloniality framework - to examine how this could be done.

Felicity Wray, University of Newcastle Upon Tyne. Email: Felicity.Wray@ncl.ac.uk; Exploring the Spatiality of Financial Knowledge: An Empirical Investigation.

The aim of this paper is to explore how the uneven circulation of financial knowledges amongst networks of venture capitalists can have profound material consequences for entrepreneurs successfully securing finance. While much theory and empirical attention in economic geography has been applied to understanding the movement and appropriation of mainly technical knowledge within industrial districts, clusters or even between spatially dispersed organisations, understandings concerned with the spatiality, and circulation of financial knowledges across and within monetary networks remains undeveloped. It is precisely this empirical hole that this paper intends to fill. By using concepts from relational economic geography, this paper will argue that a relational lens is a useful means to uncover the mechanisms by which financial knowledge is circulated across the space economy resulting in an uneven landscape of financial knowledges amongst venture capital agents. The empirical vehicle for this paper is a comparison of a sample of entrepreneurs seeking finance in the North East and East Midlands plus the community of venture capitalists and finance agents also operating in said regions. The structure of this paper will firstly highlight the asymmetrical and uneven attachments each community of venture capitalists has to the more 'dominant' circuits of capital, knowledge and people. Secondly, it will uncover and compare the actual mechanisms by which financial narratives are moved and circulated across space, if at all. Finally, using empirical data, this paper will demonstrate how the uneven spatiality of financial knowledge embodied by venture capitalists can affect entrepreneurs ability to secure finance.

While significant capacity in the last decade has been built in the field of coastal mapping via web-based atlases, as well as coastal/ocean informatics, little has been done to take stock of the implications of these efforts or to identify best practices in terms of taking lessons learned into consideration (including the effective translation of science to coastal decision-making). This presentation will review a results in progress from two recent NSF-funded workshops: the first, held in Cork, Ireland in the summer of 2006, under the theme of "potentials and limitations of coastal web atlases," and the second, to be held in Oregon under the theme of "building a common approach to managing and disseminating coastal data, maps and information." Both workshops are bringing together key experts from Europe, both coasts of the United States, and Canada in order to examine state-of-the-art developments in web-based coastal mapping and informatics (including the development of controlled vocabularies and ontologies for building a geospatial semantic web among partner atlases), along with future needs in mapping and informatics for the coastal practitioner community. These workshops are intended to advance research in the field by providing recommendations for best practices in coastal web mapping and to develop a cadre of scientists who will play a leadership role in forging international collaborations of value to the participating nations.

Melissa W. Wright, Penn State University. Email: mww11@psu.edu; Urban Geography Plenary Lecture

When Movements Falter: Public Women, Justice, and the Geographic Conundrum of Ciudad Juarez Democratization movements and social protests against neoliberal restructuring are a prominent characteristic of contemporary modernity. In Mexico, the transition to democracy has been accompanied by massive demonstrations against the privatization of public entities, stringent government cutbacks, and growing disparities between the elite and the poor. Anger over neoliberal policies has prompted the creation of civic organizations that, in turn, have taken the lead in forcing the acceptance of democratic reforms and establishment of electoral institutions accountable to the public. Women have emerged as leaders within these civic organizations and have achieved greater presence across the country's political spectrum. Within this context, Ciudad Juarez has gained notoriety as a city with powerful feminist organizations and public figures who have succeed in forcing the issues of domestic violence, violence against women, sexual assault and rape into the political debates at the state and federal levels. Despite obvious gains, however, the social movement generated by these women and their organizations has been troubled by internal debates over who truly represents and has the moral authority to guide the movement. These tensions cause difficulties not only for the local organizations but also for international groups seeking to support the movement. In this paper, I use feminist and Marxist theory to examine how these problems are rooted in the gendering of citizenship and economy within the intertwined processes of neoliberal restructuring and democratic reform within and beyond Mexico.

Paul Wright, University of Wales, Aberystwyth. Email: temp-pww98@hotmail.com; Voysey's generous ideas in architectural things

Charles F. A. Voysey believed that buildings radiated influence to the people inhabiting them and the broader areas around them. Between 1881 and 1913 he designed houses that "palpitated" with an agency that he'd crafted; one that he hoped would produce a specific effect, and one that he based on a broader philosophy about the character of places, the efficiency of nature, and the important role of architecture in harmonising them. In this paper I seek to examine what has become - if anything? of his didactic efforts, and to discuss what this might tell us about the possibility of buildings being able to reflect, and then effect upon, wider geographies of place.

Keywords: Voysey-Charles, architecture, cultural geography, buildings, houses, agency

Sarah Wright, PhD, University of Newcastle, Australia. Email: sarah.wright@newcastle.edu.au; *Extra-territoriality and the politics of intellectual property*

Struggles over intellectual property rights (IPR) on plants, so-called "patents on life", have galvanised social movements the world over and are a key point of contention within the politics of neoliberalism. While much research has been done on the broader politics and economics associated with these struggles, there has been limited detailed empirical work that ties macro-level concerns to lived experience or that reveals the nuances involved. In this paper, I explore the process through which a new law allowing for intellectual property on plants in the Philippines (2002) was drafted with an aim of elucidating the politics of knowledge and territoriality associated with IPR. Intellectual property is a government sanctioned ownership of ideas and thus, in some ways, it increases the power of the Filipino state to control the transfer and use of its genetic resources. Yet the differential influence of states in supranational organisations, the use of unilateral measures and bilateral agreements, and the influence of corporations, US based aid programs and consultants in developing the Filipino law, as well as the widespread and effective involvement of NGOs and social movements, points to a much more complex story. While processes of coercion and exclusion heavily inform the ways multilateral trade agreements play out in a country like the Philippines, it is important to emphasise that farmers, indigenous people, NGOs, social movements, policy makers and politicians not only react to external forces but are actively engaged in bringing knowledge(s) and property relations into being.

Keywords: intellectual property, knowledges, territoriality, globalization

Jenny Wrye, . Email: jjwrye@gmail.com; *Investigating Earthquake and Tsunami Preparedness Organizations in Humboldt County, CA.*

Humboldt County, California is located along a tectonic subduction zone, making it especially vulnerable to large earthquakes and tsunamis. This rural, coastal county is distant from regional urban centers, a situation that underscores the importance of planning for an aftermath of extended isolation in the wake of disaster. Several local organizations are working to plan for these potential disasters and mitigate their aftermaths, including the Humboldt Earthquake Education Center, NOAA's Tsunami Ready Program, Redwood Coast Working Tsunami Group, Humboldt County's Hazard Mitigation Steering Committee, American Red Cross, Americorps Youth Serve and Volunteer Center of the Redwoods. Numerous interviews and participant observation at several emergency preparedness events indicate that a large number of planning and preparedness activities are currently underway in the region. I contend that Humboldt County is a model of tsunami preparedness for similar communities in California. Although Humboldt County is ahead of the game in planning and preparedness for earthquakes and tsunamis, many organizations seek to develop and implement further education outreach campaigns in the community.

Bing Sheng Wu, Texas A&M University. Email: wbs@geog.tamu.edu; Daniel Z. Sui, Texas A&M University. Email: sui@geog.tamu.edu; *Exploring economic activities and population dynamics in Asian urban transition: a case of Taipei metropolis*

Economic activities, primarily secondary sector, and population dynamics are thought to be two important factors leading to Asian urban transition, which is different from Western paradigm. Much literature discusses the influences of these two driving forces on Asian urbanization qualitatively, yet little quantitative work has been done. This empirical study applies statistical approaches to explore the interaction of economic activities as well as population dynamics in Taipei metropolitan region and examine how urban transition is affected by these factors. The results show not only quantitatively how secondary sector plays an important role resulting in population dynamics and resulting in urbanization processes in Taipei metropolis, but also reveal how suburbanization, the phenomenon of Western urbanization process, emerges in Asian urbanization with the increase of tertiary sector.

Keywords: Asian urbanization, Taipei, population dynamics, economic activities

Fulong Wu, Cardiff University. Email: WuF@cardiff.ac.uk; *Property Rights, Citizenship and the Making of the Urban Poor*

Market-oriented reform has remoulded the Chinese citizenship. 'Clarifying property rights', accompanied by enterprise reform, housing reform and the reform of education and healthcare, has led to the re-configuration of the system of entitlements. This paper examines the change in labour market, housing tenure, education and healthcare to provide a microscopic account for the making of the 'new' urban poor at the household level. The paper starts from distinguishing the concepts of citizenship and property rights and moves on to reveal how 'ambiguous' all-inclusive strong entitlements are commodified into

property rights and, for the residual population, are minimised into the minimum living standard support (dibao). The paper also examines complex interaction among low-income groups (laid-off workers, migrants, and marginal urban residents) in poverty neighborhoods and their survival strategies.

Keywords: social geography, China, urban poverty

A wide array of field measurement, remote sensing, and modeling approaches to estimate carbon budget are available for natural and agricultural ecosystems, but relatively few have been developed or tested for urban landscapes. Vegetation is a basic component of urban-suburban environments, and turfgrass is a major vegetation type with significant coverage in U.S. cities. However, the estimation of carbon storage for urban vegetation becomes more difficult because of increased human activities and spatial heterogeneity. Traditional urban land use schemes do not adequately resolve landscapes to include vegetation types. With high-resolution QuickBird satellite images and a step-wise classification scheme, a detailed land cover map, which includes turfgrasses and trees, was generated for the footprint area of a flux tower in Roseville, Minnesota. Shadows in the images were removed by taking advantage of the high radiometric resolution of the QuickBird images. A set of biophysical variables and multispectral reflectance were measured in the field experiments to investigate the dynamics of turf ecosystems. A production efficiency model (PEM) was parameterized to estimate above ground net primary production (ANPP) and carbon storage, which was integrated over the whole growing season to give the annual average. The PEM was validated with field measurements and used to scale turfgrass carbon storage to the entire footprint area based on QuickBird imagery. The results indicated that turfgrass carbon uptake varied with management and that high input turfgrass had a large capacity to assimilate carbon dioxide due to high light use efficiency and fast turnover with high ANPP/biomass ratio.

Lei Wu, . Email: wulei@cuhk.edu.hk; Anrong Dang, . Email: danrong@tsinghua.edu.cn; Hui Lin, . Email: huilin@cuhk.edu.hk; *A Case Study on WebGIS for Public Participation in Urban Planning*

This article focused on the topic of applying WebGIS to public participation in urban planning. A stage-based participation model applying WebGIS in urban planning was proposed since traditional participation methods (such as exhibitions and public conferences) usually are low efficient, lack of interactivity, and of a great consumption of time and money. In this model, corresponding to different stages of planning process, different participation missions were designed. Except visualization and inquiry planning information, the author made an effort to support participant inputting from the client side and analyzing the data collected on-line for a dynamic and interactive participating process. A prototype system was designed and developed to this model and took the Tsinghua University campus plan as a case. The prototype system was implemented on the campus network and opened to the students and staffs for about a month. With the prototype system, participants are able to browse and inquiry information, to generate thematic map of interested area, to make location-based comments, to cast a vote, to make experimental changes to current map, and even to analyze the participating results spatially by themselves. Through analyzing the data collected in the case, it was concluded that with the application model of WebGIS, the public participants would not only understand the plan more vividly, but also communicate more efficiently with the planners and the government, meanwhile understand themselves mutually, and thus participate through the entire planning process at a higher level. Furthermore the remaining issues were stated as the future study.

Li Wu, George Mason University. Email: lily_liwu@yahoo.com; *Deriving Modeling from Regional Land Use Change Analysis*

All kinds of modeling technologies also have been developed in the recent years to seek out the essential principals and rules of land use change. One of the weak parts in land use modeling development nowadays is lack of the thorough study to the analytical solutions, which means model properties are not completely understood. This paper will try to derive a regional land use change model from the original land use analysis outcomes and from the RS / GIS based real world data. Suzhou land cover is fragmented or connected in some way, and expanded and shrank over the years, which displayed spatial complexity. Suzhou case study is to explain whether the trends of land use pattern change can be explained by the agents derived from land use pattern analysis.

Keywords: regional land use model, LUCC

Shengjun WU, . Email: swu1@memphis.edu; Hsiang-te Kung, . Email: hkung@memphis.edu; Xiang Li, . Email: xli1@memphis.edu; *Regionalization Of Flooding Risk In Tennessee*

With the advance of hazards research and the development of economy, hazard analyses from risk view point have become a new research area, which will help decision makers to choose optimal policies to manage disaster and to create disaster reduced strategy. Flooding is one of the most severe natural hazards in the state of Tennessee. The state has climatic extremes, often results in damaging floods. From 1991 to 2003, flooding resulted in 20 Federal Disaster Declarations across the state, with Public Assistance/Mitigation expenditures in excess of \$294 million. Floods had badly threatened and deterred sustainable economic development of the state. In terms of natural hazard risk analysis, the regional difference of flooding is assessed. According to the status of flooding and physical features in Tennessee, a flooding risk index system will be developed by county level. The county is the political unit for regionalization in the state. The index system includes four parameters and they are: precipitation, historic frequency of flooding, topographical features, and river system. These parameters will be standardized, compiled, and analyzed systematically. Combining with the qualitative analysis, the dynamic clustering analysis method will be used to regionalize the flooding risk in the state. The results show that the flooding risk in four categories: severely heavy flooding, heavy flooding, moderate flooding, and minor flooding potentials. Through the spatial analysis and prioritize the flooding risk in the regional level by county, some mitigation strategies are proposed to improve the flooding management.

Keywords: Flooding, Risk Regionalization, Dynamic Clustering Analysis

Shuang-Ye Wu, University of Dayton. Email: shuang-ye.wu@notes.udayton.edu; Lance Greene, University of Dayton. Email: ; *Potential impacts of climate change on flooding in the Great Miami Watershed, Ohio*

After the devastating flood of 1913, the city of Dayton, Ohio, constructed one of the nation's most extensive flood control system on the Great Miami River and its major tributaries. It has effectively protected the city against many flooding events since its completion in 1950s. However, will the system provide sufficient protection with future climate change? This study aims to examine this question by using geo-statistical models to see how climate change will affect the frequency and magnitude of floods in the Great Miami River. In this study, we first downscaled IPCC climate models to estimate the potential change in precipitation in the watershed. The change of precipitation is then translated into variation of stream flow by applying a water-balance model for the whole watershed. Based on the stream flow change, future flood frequency and magnitudes are estimated, and compared to the capacity of the flood control system. Finally, we will also examine the spatial distribution of population to estimate the extent of vulnerability if the system fails.

Shuo-sheng Wu, U.S. Geological Survey. Email: sw1020@txstate.edu; *An Exploratory Analysis of the Resolution Effects on AGNPS Runoff Prediction*

The purpose of this study is to investigate how the spatial pattern of runoff output from AGNPS watershed modeling changes with input data at different resolutions. Spatial statistics were used to examine whether there is an overall clustering pattern of runoff, where the clusters and hotspots are, how clustering levels and cluster/hotspot locations change with model resolutions, and how the geographic center and dispersion degree of the entire watershed runoff change with resolutions. Variograms were used to investigate the distance of spatial autocorrelation between runoff at different locations. The results showed that the runoff had an overall clustering pattern at all resolution models, and the clustering levels decreased with model resolutions. The distance of spatial autocorrelation increased with model resolutions. The overall clustering level reached maximum at the neighborhood distance of 1920m, while the high-runoff clustering level consistently decreased with the neighborhood distance. The results indicated that cluster locations did not change but cluster sizes decreased

with model resolutions. The 210m and 240m resolution models had cluster and hotspot sizes corresponding to visually observed runoff patch sizes and, therefore, were regarded as the most suitable model resolutions for detecting clusters and hotspots among eight tested resolutions. The analyses also revealed that the larger the neighborhood distance, the larger the derived clusters. A neighborhood distance of 960m is considered suitable to identify hotspots through visually comparing with high runoff patches. In addition, the analyses showed that the geographic centers of runoff did not change but the dispersion degree increased with resolutions.

Tony Wu, Lawrence Livermore National Lab. Email: wu26@llnl.gov; *A Multi-period Spatial Hydrogen Facility Deployment Model*

Hydrogen is considered as a possible fuel carrier for transportation vehicles nationally and in the State of California. To evaluate infrastructure transition to serve the potential hydrogen demand, we need to model the hydrogen facility deployment spatially at multi-periods. We developed an applied mathematics optimization model, in order to understand the possibilities for Hydrogen infrastructure deployment. Major components of the model include identifying regions of Hydrogen Demand and Hydrogen Supply. The model's objective function is to minimize total cost under scenarios set by sponsors the State of California and the Department of Energy.

Weiping Wu, Virginia Commonwealth University. Email: www@vcu.edu; *Stepping Out of the Ivory Tower: Managing Industry Linkage in Chinese Universities*

With the rise of the knowledge economy, research-oriented universities are increasingly seen as vehicles for technology transfer and agents for local industrial dynamism. Placed in a comparative framework, this paper explores how select universities in China enhance research commercialization capacity. The primary goal is to understand different institutional mechanisms for promoting effective innovation diffusion and maximizing spillovers from academia. In particular, what university policies and institutions shape the nature and fruitfulness of innovation diffusion? What may be the limits to university engagement in business activities? Under China's reforms, university-industry linkages are built through two broad categories of mechanisms. The first is technology transfer through licensing and other arrangements such as consulting, joint or contract research, and technology services. The second mechanism, almost uniquely Chinese, is through university-affiliated enterprises. It appears that there are divergent institutional arrangements and methods in managing industry linkage as universities explore their new-found autonomy.

Keywords: innovation, university-industry linkage, higher education reform, urban economy, China

Wen-Yu Wu, The University of Sheffield, UK. Email: ggp03www@sheffield.ac.uk; *Moral geographies of gay men's internet intimacy in Taiwan*

From 1990s, intimacy and emotions have become issues of social science and geographical research also began to face this "private turn". At the same time, the popularity of the internet as personal communication made the personal relationships involved into complicated on-line and off-line worlds. Interestingly, gay men played the pioneered role to use this technology for their relationship seeking and building. Because of rapid developing industries of information technology in Taiwan, local gay men joined in on-line relationships soon and early, and moral orders of relationships in the internet were innovated in specific cultural context. This paper will discuss cheatings, which are very common moral conflicts in on-line world, by using in-depth interviews from Taiwanese gay men's experiences of internet relationships. It will show how morality of local internet intimacy is interwoven into Taiwanese historical and geographical complexity.

Keywords: moral geography, sexuality, internet, intimacy, Taiwan

Yi-Hwa Wu, Northwest Missouri State University. Email: ywu@nwmissouri.edu; Ming-Chih Hung, Northwest Missouri State University. Email: mhung@nwmissouri.edu; *Spatial interpolation of soil pH readings from farmland*

A systematic sampling strategy has been used to get pH samples from the R.T. Wright University Farm near the Northwest Missouri State University campus. There are three different sampling grids: 0.27 acre with 110 points, 2.43 acre with 12 points, and 7.5 acre with just 4 points. pH values are sampled and spatially interpolated to generate a surface of the pH value for the entire study area. The study area is not a flat farm. Instead, it is a hilly farm. The interpolated surfaces are quite different from each other depending on methods and

parameters chosen to perform the spatial interpolation and the grid size. Some of the interpolated surfaces will be compared and examined to see the effects of sampling grid size on the resultant surface. The 110 points with 0.27 acre sampling grid size method provides enough sample points for data splitting for evaluating the results. The 110 points are divided into two groups, the control point group for performing the spatial interpolation and the validation point group for evaluating the results. Not surprisingly, the resultant surfaces generated with the control points are different from each other even with different strategies for data splitting.

Keywords: spatial interpolation, systematic sampling, gis

Susan Wurtele, Associate Professor, Department of Geography, Trent University. Email: swurtele@trentu.ca; Jillian Ritchie, Health Promoter, Peterborough County-City Health Unit. Email: jritchier@pcchu.ca; *Transportation Infrastructure Improvements and Children's Mobility: promoting successful transition from bussing to walking and cycling*

This paper builds on the recent work of geographers studying links between children, environment, health and transportation. It presents the results of an ongoing project assessing student travel patterns and the impact of infrastructure improvements in the immediate vicinity of two elementary schools in a mid-sized Canadian city. Since 1999, a coalition of community organizations involved in public health and environmental education has promoted walking and cycling to school. In 2005, the coalition expanded to include representatives from municipal transportation planning and school board transportation services. From this partnership, Active and Safe Routes to School — Peterborough identified that the municipality could improve pedestrian safety, promote active transportation and reduce bussing costs for the local school board by giving priority to sidewalk construction in areas located within the school walking zone where students are bussed only because no sidewalk exists along an arterial road. This paper explores actions taken to address concerns that once the sidewalk is completed and bussing is discontinued children may end up being driven to school. A child-friendly walking map was developed and disseminated to help students make the transition from riding the school bus to walking or cycling to school. Also considered within this paper are reflections on the success of expanding the community coalition to include transportation planners and the impact of acting on an opportunity to intervene to promote a culture of activity around the issue of children's mobility.

Kathryn Wuschke, Simon Fraser University. Email: kwuschke@sfu.ca; Nadine Schuurman, Simon Fraser University. Email: nadine@sfu.ca; *Sentinel Conditions: A Method of Predicting Criminal Activity Based on Socio-Economic Indicators*

Sentinel conditions are a proxy for primary measurement of spatial phenomena. They have been applied across a variety of disciplines to provide estimates where direct analysis of a feature is impractical or problematic. Commonly used within the fields of ecology and biology, sentinel species can assist in pinpointing environmental stressors, and can provide an indirect measurement of habitat degradation. Remote sensing and GAP analysis literature also describe the use of sentinel layers of data. Researchers have been able to efficiently develop a proxy estimation of species diversity by combining satellite imagery with additional data sources. This facilitates an alternative to labour-intensive field studies. By borrowing from these areas of literature, a similar framework is developed for use with crime data. Because crime occurrence data is confidential in nature and can therefore be difficult to obtain, the use of correlated sentinel conditions can provide estimates of relative crime levels without requiring actual address-level data. By pinpointing several socio-economic conditions that correlate with hotspots of residential burglary in a select municipality in B.C., a sentinel crime layer is created, which can be used as an approximation of such crime clusters within the area.

Keywords: gis, sentinel conditions, proxy mapping, spatial patterns, socio-economic status

John Wylie, Dr, University Of Exeter. Email: J.W.Wylie@exeter.ac.uk; *Ghost stories and the nature of place.*

In this paper I want to explore the argument that ghost stories, in particular those narrated through interiors and domestic settings, can tell us something about the nature of place. This argument draws inspiration from Jacques Derrida's noted account of spectrality, and also from contemporary writings on affect and materiality, in order to consider again intertwinings of place, presence and absence. Although much recent geographical work on place has sought to emphasise the relational constitution and performance of places, it is still the case that the term remains closely associated with notions of dwelling, belonging and reliability. In some humanistic and phenomenological readings, for instance, place connotes presence, stability and identity. We could even argue that in its everyday evocation place works so as to harbour and sustain a secure and

consistent sense of self-in-the-world. What I would like to do, by way of contrast, is consider the possibility that haunting, as a dis-placing, could be the paradoxical pre-requisite to our received notions of place and self. Perhaps place only takes place through a spectral event of displacing. Perhaps there is place only if there is dislocation. The paper will pursue this argument via a reading of Mark Danielewski's *House of Leaves*, a meta-text which affords an opportunity to examine how certain spectral spatialities - abysses, darkneses, thresholds - may form the constitutive outside of domestic and quotidian place.

Elvin K. Wyly, University of British Columbia. Email: ewyly@geog.ubc.ca; James DeFilippis, Baruch College, CUNY. Email: James_DeFilippis@baruch.cuny.edu; *Mapping the Neoliberal-Neoconservative City: Landscapes of Assisted Housing in New York City*

Neoliberal and neoconservative urban policy involves calculated tactical shifts in the politics of visibility, particularly in the portrayal of public housing. The projects serve as iconic landscapes of dependency; the choices provided by housing choice vouchers are quietly narrowed by budget cuts, administrative decisions, and the invisible decisions of private landlords; and the national ideology of ownership entitlements helps to hide the largest public housing dependency syndrome of all — the \$100 billion plus annual tax concessions to homeowners and investors. In this paper, we undertake a simple analysis designed to alter the politics of visibility for housing subsidies at the urban scale. We analyze a comprehensive database of housing assistance for New York City, combining public domain information with specialized measures obtained through FOIA requests. In order to map and classify the fine-grained local geographies of federal housing subsidies, we use the familiar technique of multivariate cluster analysis applied to all census tracts in the City. The epistemology of this technique that renders it flawed for evaluating causality suddenly becomes a virtue when the goal is rich empirical description: the n-dimensional space of multivariate taxonomy is literally defined and created by the inherently political nature of variable choice. We seek to measure the full range of housing subsidies benefiting rich and poor, and to analyze the resulting cartography of housing assistance as poor- and working-class residents struggle for affordable homes in an increasingly polarized housing market of neoliberal and neoconservative policy.

Email: grann@usgs.gov; *Urban Growth Assessment using information derived from Multiple Satellite-based*

Urban growth continues in most metropolitan areas within the United States. One major change associated with urban developments is an increase in impervious surface cover. Urban areas are described by a variety of major land use categories, such as transportation corridors, residential, commercial, industrial tracts, and these have been identified with specific ranges of percent impervious surface. Results indicate that urban development density is closely associated with, and can be quantified by, different thresholds of percent sub-pixel impervious surface. Impervious surface has been identified as a key environmental indicator because of its impact on surface water runoff and related drainage systems and because it is recognized as an indicator of the extent and expansion of urban development. To quickly and economically estimate impervious surfaces in many metropolitan areas, remote sensing-derived information is necessary. We used currently available remotely sensed data, including Landsat data, which have been widely used as a primary source for medium resolution land use and land cover characterization. Two other satellite-based remote sensing systems?ASTER and ALI, which have spectral characteristics similar to Landsat, have also been used to extract imperviousness for the Seattle, Las Vegas, and Tampa Bay metropolitan regions. Impervious surfaces mapped from ASTER data have a relatively higher accuracy than those from Landsat and ALI data. The mapped impervious surfaces provide useful information for local and regional planners to assess the impacts of urban growth on ecosystems, storm- water runoff, and urban structures, as well as social and economic changes.

Honglang Xiao, Dr., Chinese Academy of Sciences. Email: xhl@ns.lzb.ac.cn; *Integrated Water Resources Management at the Heihe River, Northwestern China.*

China is one of the 13 countries that have water scarcity problem according to the United Nation. In the inland river basin, which takes up 1/3 of the total area in China, with naturally limited water resources and combined with unreasonable utilization, water-induced problems have become critical issues that effect social economic development and ecological protection. Taking the Heihe

River Basin as an example, this article discusses water, soil, ecological and management problems at the basin scale. It highlights that water use efficiency at basin scale must be increased in order to mitigate basin water resources problems. Four components are discussed for improving water efficiency in irrigation district, which are transformation of irrigation water into soil water, biological utilization of soil water, crop water efficiency and enterprises setting as market demand. Cases such as improving water holding capacity in the upper reaches, constructing water-saving oasis and increasing water efficiency for environment are discussed. In addition, the article analyzes the stages, problems and approaches of social management of water resources, reinforces virtual water strategy at the basin scale and emphasizes that there are great potential to augment integrated benefit of water, ecology and economy.

Keywords: Water Problem, Water Environment, Water Efficiency, Approach, Solution, Heihe River Basin, Inland River Basin in Western China

Honglin Xiao, Elon University. Email: hxiao@elon.edu; High resolution record of climate and human activity from cave stalagmite, China

Detailed petrographic study of a stalagmite from southern China revealed at least 24 detrital layers in the top 4.3cm of the stalagmite. Calcite truncated at detrital layers is commonly capped by pointed euhedral crystal terminations and a sharp boundary between the underlying calcite and overlying detrital material. Above detrital layers, many small (roughly 0.06 mm x 0.20 mm) calcite crystals with diverse orientations typically give way upwards to the columnar calcite making up most of the upper section. Electronic scanning microscopy study indicated that those layers mainly contain Al and clay, indicating the detrital layers recorded flooding events in wetter conditions. The sharp variation on grey scale intensity, $\delta^{18}O$ and $\delta^{13}C$ at one layer dated at around 130 years ago was too great to be explained by the change in climate alone. Close thin section studies with additional field trips to Yangzipo Cave area revealed that the sharp change was at least partially influenced by a layer of wood detritus created by a historical event taken place around the cave at that time.

Keywords: high resolution, stalagmite, human activity

Biomass burning is a major source of black carbon aerosols, which contribute to approximately 70 percent of total aerosols. These aerosols have negative human health impacts and affect the radiation budget and climate, directly and indirectly. Understanding the contribution of biomass burning to the concentration of aerosols is particularly important in Southeast Asia where the slash-and-burn agricultural tradition is still largely associated with the conversion from forest to agricultural land use. While it is clear that the effects of such land-use processes extend into the atmosphere, and that such localized events have regional and global implications for air pollution and climate, the actual dynamics of the local land use - regional aerosol composition relationships remain elusive. Our study draws on observed burning events, associated land-cover changes, and carbonaceous aerosol concentration measurements provided by MODIS and MISR data in mainland Southeast Asia from 2002 to 2005. Using field-based estimates of the amount of carbon released from burning by vegetation type, we will explore the space-time relationship between these local fire events and the regional distribution of carbonaceous aerosols.

Keywords: land-cover/use change, biomass burning, aerosols

Yichun Xie, Eastern Michigan University. Email: yxie@emich.edu; An integrated ANN method to estimate biomass of typical grassland in Xilinhe River Basin, Inner Mongolia, China

Two models, ANN (artificial neural network) and MLR (multiple linear regression), were developed to estimate typical grassland biomass in Xilin River Basin, Inner Mongolia, China. NDVI (Normalized Difference Vegetation Index) and topographic factors (elevation, aspect, and slope) were integrated with the spectral signatures from Landsat ETM+ as the candidate input variables for constructing both models. Seven parameters (NDVI, aspect, and the bands 1, 3, 4, 5 and 7) were selected by the ANN model (implemented in Statistica 6.0 neural network module), while six (elevation, NDVI, and the bands 1, 3, 5 and 7) were picked to fit the MLR function after the correlation analysis between these candidate input parameters and the biomass. Both models achieved acceptable results with the coefficient of determination (R^2) ranging from 0.597 to 0.872. ANN had a better performance ($R^2 = 0.792$ for the trained set and $R^2 = 0.872$ for the tested set) than MLR ($R^2 = 0.655$ for the trained and $R^2 = 0.597$ for the tested). The final biomass maps of the research area were produced based on ANN and MLR models, generating average biomass covers of about 121 and 147 g/m²,

respectively.

Zhixiao Xie, Florida Atlantic University. Email: xie@fau.edu; Charles Roberts, FAU. Email: croberts@fau.edu; Brian Johnson, FAU. Email: bjohns53@fau.edu; Detect invasive plants in Florida coastal areas using an image retrieval approach and remote sensed data

Extensive actions are undergoing to reduce the presence and impacts of invasive non-native plants, a statewide critical stress source of Florida's habitats. To periodically update performance measures of such actions, high resolution remote sensed data is essential. The voluminous data poses a great challenge in terms of cost and efforts, if image classification is used. Moreover, invasive plants may occupy only a small proportion and a full classification is not necessary. Conversely, image retrieval represents a promising and invaluable approach for such a target-search task. This paper presents a novel image retrieval approach to detect invasive plants, specifically Australian Pine, using DOQQ and LIDAR data, in coastal areas of Florida. Image retrieval (IR) is similar to document search on the Web, but intends to retrieve targeted objects from image databases. A robust IR system demands an effective and efficient retrieval framework, mainly comprising of image segmentation, content representation and similarity measurement. We employed an object-oriented approach to first segment images into image objects corresponding to land use/ land cover (LULC) types. The segmentation enables the use of object level information to characterize LULC types, which are superior than pixel based ones. We then integrated spectral, texture and object height information for representing the contents in the image objects. The most similar image objects were retrieved and retrieval performance assessed through visual interpretation and conventional remote sensing ground truthing.

Keywords: Remote sensing, object-based, image retrieval, Invasive Species

Bo Xu, University of Georgia. Email: xubo@uga.edu; Visualization and spatial-temporal prediction of hemorrhagic disease in white-tailed deer in the Southeastern United States

Studies have shown that the occurrence of hemorrhagic disease can be explained by climatic factors and remotely sensed data. This paper presents the application of climatic and remotely sensed data to the prediction of hemorrhagic disease in white-tailed deer in the Southeastern United States. Different geographic visualization techniques are used to display the occurrence of hemorrhagic disease, climatic data, and remotely sensed data. Spatial, temporal and spatial-temporal trends are visually discovered. Time-series statistics are then applied to the hemorrhagic disease data and its affecting factors to statistically predict the spatial-temporal distribution of hemorrhagic disease in the Southeastern United States. The Hemorrhagic disease occurrence data are originally collected on a county basis from 1980 to 2003 throughout the southeastern United States. The data are further processed into presence/absence binary categories. The climatic data include the mean, median, maximum, minimum, and range of annual temperature, rainfall, relative humidity, and those index from June to October annually when the breeding of vectors and Hemorrhagic disease in white-tailed deer prevail. The remotely-sensed data include the mean, median, maximum, minimum, and range of normalized difference vegetation index, surface temperature, Middle infrared radiance during the same period as the climatic data. The results show that the distribution of Hemorrhagic disease is both visually and statistically correlated with the distribution of the explaining factors. The combination of climatic data and remotely sensed data are more predictable than either of them respectively.

Keywords: Hemorrhagic disease, climatic data, remotely-sensed data, visualization, time-series Hemorrhagic disease, climatic data, remotely

Gang Xu, Department of Geography & Planning, Grand Valley State University. Email: xug@gvsu.edu; An Exploratory Study of the Internationalization of Chinese Enterprises

The internationalization of Chinese enterprises is a recent phenomenon. Based on a survey done in Sichuan province/China, this study examines the geographic patterns of international business, entry modes, and information search behavior of a set of homegrown Chinese enterprises. An analysis of the geographic markets of the surveyed firms show that Chinese enterprises tend to trade more frequently with geographically neighboring countries and those countries with large markets. Although most Chinese enterprises are still in the early stages of internationalization, they often use multiple entry modes to establish and expand their businesses in foreign markets. There is evidence that Chinese enterprises tend to trade according to the principle of comparative advantages. Statistical analyses of the information search behavior of the surveyed firms suggest that the amount of information search and the type of information source used are associated with 1) the perceived usefulness of an information source, 2) the degree of perceived uncertainty and competition in

the foreign markets as well as cultural distances between home and foreign markets, 3) organizational traits such as firm size and marketing capabilities, and 4) firm strategy. A statistical association is also found between a firm's information search activity and its export performance.

Keywords: Internationalization, Chinese firm, geographic markets, entry mode, information search

Jiang Xu, Research Assistant Professor, The Centre of Urban Planning & Environmental Management, The University of Hong Kong. Email: hdxugoy@hkucc.hku.hk; *The Politics of Inter-jurisdictional Cooperation in the Pearl River Delta: the Case of Guangzhou-Zhuhai Railway*

The Pearl River Delta (PRD) is consisted of nine municipalities in Guangdong Province in southern China. Like many other polycentric mega city-regions in the world, it is facing problems caused by localism and external competition. There is an urgent need to study how cooperation among cities can be successfully developed so that the region can establish a more cooperative environment. Following successive waves of making local competitive strategies in the PRD cities, concerns now revolve around whether the delta is susceptible to intensified inter-city competition, jurisdictional fragmentation, and thus gradually losing its competitiveness within national and global context. Regional cooperation is much affected by inter-jurisdiction administration and politics amongst the local government in the cities of the region. This study attempts to use a cooperation politics approach to examine how such politics deteriorates administrative fragmentation to affect region-wide infrastructure provision. The politics behind cooperation is explored with reference to the Guangzhou-Zhuhai Railway - an ongoing stop-and-go project. The possible reasons that prevent cities from cooperating in this project are examined. It is argued that, different from the Western experience, the thesis of state governing the market in China has complicated local politics of cooperation. The study will increase our knowledge on what lessons we can learn to turn cooperation rhetoric into practice in China.

Keywords: Inter-jurisdictional cooperation, competition, Pearl River Delta

Lei Xu, California State University Fullerton. Email: lxu@fullerton.edu; Kao-Lee Liaw, McMaster University. Email: ; *Initial Destination Choices of Skilled-worker Immigrants from South Asia to Canada: Assessment of the Relative Importance of Explanatory Factors*

Using a multinomial logit model, this paper explains the initial destination choices of skilled-worker immigrants from four South Asian countries (India, Pakistan, Bangladesh, and Sri Lanka) who landed in Canada in 1992-2001, based on the micro data of Citizenship and Immigration Canada. The most salient feature of these skilled-worker immigrants turned out to be their extremely strong tendency to select Ontario as their initial destination: over 80% of them ended up in Ontario. Our multivariate analysis revealed that the main reason for this extremely strong concentration in Ontario was that they were strongly subject to the attraction of their co-ethnic communities and the positive effect of high income level. The initial destination choices of the immigrants in question also responded to changes in the spatial pattern of employment growth. In addition, we have found that those with French language ability were much more prone to going to Quebec, and that those aged 60 and over were much more likely to choose British Columbia as their destination. The continuing intense concentration of newly arrived South Asian immigrants in Ontario through the 1990s is in stark contrast to the increased dispersal in the destination choices of the newly arrived immigrants (especially low-skilled Hispanic immigrants) in the United States from the late 1980s to the late 1990s. Further research is needed to assess whether the dispersal of immigrants can also occur in Canada in the near future.

Keywords: immigration, Canada, destination choices, South Asia, skilled immigrants

Zengwang Xu, Texas A&M University, Department of Geography. Email: xuzw@geog.tamu.edu; *Spatial dimensions of complex network modeling*

The emergence of the "new science of networks" is characterized by seeking the universal regularities or laws and underlying mechanisms governing them in the increasingly complex networks. The small-world network is one of the highlights and major contributions of the new science of networks. It has been discovered a ubiquitous feature of many real-world networks, and considered a potential model for many real-world complex systems. However, most small-world studies only take into account of topology of networks. In fact, real-world spatial networks are characterized by spatial structure as well as topological structure. This study, with a focus on spatial dimensions of complex networks, investigates the manifestations and applications of the small-world characteristics among networks in three different spaces in attempt to better understanding

the complex networks in geographical study, potentially contribute to GIScience with new models for representing, analyzing, and modeling complexity from a network-centric perspective. Initial results show that spatial clustering, distance effects, and relation between local and global are significant to the spatial dimensions of complex network modeling.

Keywords: Small-world network, Complex network, network modeling

Mariko Yabe, University of California, Los Angeles. Email: mariyabe@ucla.edu; *1945 Map of Tokyo: Representing and Un-representing the Place and the Space for the Last Six Decades*

This paper examines how a representation of a place, the map of Tokyo made in 1945 by the Japanese, has had different meanings and interpretations between 1945 and the present. I present several meanings of the 1945 maps by examining the mapmakers' voices, recorded in 1985 and 2005. I pay special attention to the mapmaker as author, since "history exists by virtue of its authors." I at the same time analyze the institutions, such as governments and map companies, to which the mapmakers belong. I then review the ways in which the map was used in Japanese public spaces over the last six decades. During February and March of 2006, I observed how the Tokyo air raids were presented in various social texts in Japanese, such as news media, published books, TV programs, and museum exhibitions, focusing on the 1945 Tokyo map and other visual texts. I show that the meaning of the map has been changing since 1945, as societal and political circumstances have changed and as public space has expanded.

Haim Yacobi, Ben Gurion University, Israel. Email: yappan@zahav.net.il; yacobih@bgumail.ac.il; *Israel's Social Contract: What the War Revealed*

Most discussions in Israel around the 'Second Lebanon War' are focused on its military success/failure as well as on the critique concerning the decision making of the Israeli military and political leadership. However, one of the significant issues revealed by the war - silenced or ignored by both the media and the politicians — is the deepening polarization of the Israeli society along ethno-class and center-periphery spatial divisions. I would argue that this war has exposed the inherent contradiction of the Israeli society; on one hand it is affected in the last two decades by a rapid process of neo-liberal social and economic policies and the withdrawal of the state, deepening the social gap, while on the other hand the constants state of war demands solidarity which cannot exist in the current social situation.

Keywords: Israel, Lebanon, War, Neoliberalism, Social Contract

Vineet Yadav, Department of Geography, University of Iowa. Email: vineet-yadav@uiowa.edu; *Land Use and Soil Organic Carbon Transformations in Southern Illinois*

Soil organic matter is a biophysical parameter, which is also directly linked to above ground land use and land cover. Magnitude of soil organic matter changes over a parcel of land on the temporal scale of decades is an unambiguous portrayal of human intervened land cover/use modifications. Currently changes in land use and land cover and variation in soil organic matter is studied and modeled separately. However both are conjoined and should be seen as part of a cascading ecosystem framework. This is not only true for soil organic matter but also for other biophysical parameters which in this anthropocenic world are chiefly governed by human activities. In terms of soil organic matter the questions which we should ask is a) what were and will be the impact of land use change on soil organic matter and b) what measures can be invoked to reduce and make up for the loss of soil organic matter induced since human modification of the natural land use and land cover. To address these two questions we studied conjoined transformations of land use and soil organic carbon since the start of settled agriculture from 1850 in Union and Pulaski counties of Southern Illinois. To model soil organic carbon we used Century whereas land use changes in the area were derived by visually classifying old aerial photographs.

Keywords: land Use, Erosion, Soil Organic Carbon

Natalia Yakovleva, Cardiff University. Email: yakovlevan@cardiff.ac.uk; Samarthia Thankappan, Cardiff University. Email: ThankappanS@cf.ac.uk; Global food trade and environmental sustainability - roles of international organisations and corporate sector

Trade liberalization have set in place widespread consolidation in the global food system, led by mergers and acquisitions among transnational firms, now firmly established as major power brokers in every level of the modern food chain. This paper therefore focuses on the global expansion of corporations in the food system, exploring the ways and methods for penetrating international and national markets and seizing control over production and retail. Dominance of corporations in the global food system causes a number of concerns in relation to environmental sustainability of their operations, especially the impact of global food trade on the developing countries. Using a case study of fresh fruit and vegetables, which are widely traded products, the paper aims to demonstrate the roles of food corporations and international organisations in shaping the conditions of the modern trade and how they impact on social, environmental and economic dimensions of the global food system. Specifically, the paper critically assesses how international organisations address sustainability concerns within the global food system.

Keywords: globalisation, sustainability, food system

Ikuho Yamada, University of Utah. Email: ikuho.yamada@geog.utah.edu; Teen Pregnancies and Local Community Environments: A Case Study in Marion County, Indiana

In the United States, teen pregnancy is one of the most serious public health concerns in local communities and the teen pregnancy and teen birth rates in this country are the highest in the fully industrialized western world despite their considerable reductions between 1992 and 2000 (National Campaign to Prevent Teen Pregnancy 2004). Although potential risk of individual teenage girls' becoming pregnant strongly depends on their own behavioral and/or socio-economic characteristics, those of local communities are also considered to have an influence on the risk to some extent. This research therefore aims at identifying environmental risk factors for teen pregnancy while especially focusing on social characteristics of local communities rather than their physical characteristics. Significant local patterns in spatial distribution of teen pregnancies are first searched for and then spatial regression models are developed to explain the detected patterns in relation to community environmental factors. The study region is Marion County, Indiana, for which an extensive GIS-based community information system is available. The information system is named Social Assets and Vulnerabilities Indicators (SAVI) and includes a wide variety of information for the Indianapolis Metropolitan Statistical Area, including census, criminal justice, health, vital statistics, education, and welfare. The information is provided at a range of spatial scales, which allows investigation of appropriate scales to analyze and model the teen pregnancy distribution.

Keywords: teen pregnancy, community information system, spatial regression

Britt T. Yamamoto, University of Washington. Email: byama@u.washington.edu; In Daizu We Trust: Alternative Food Networks and The Soybean Field Trust Movement in Japan

This paper explores how transgenic, Roundup Ready? soybeans have reshaped the production, handling and consumption of soybeans in Japan, with a particular emphasis on the emergence of a decentralized, nationwide social movement called the Soybean Field Trust (SFT), and its umbrella citizen's movement, the No GMO! Campaign. I illustrate how the groups have used the GMO issue to initiate territorial strategies and produce knowledge about rural spaces, Japanese soybeans, and American agriculture that can be seen as an engaged progressive politics of consumption. Yet at the same time, research findings raise questions around defensive localism and the lasting potential of the SFT as a viable alternative to imported soybeans given the current structure of state policies.

Keywords: Alternative Food Networks, GMOs, Consumption, Social Movements, Food Policy, Japan

Akiko Yamane, Department of Geography, CSU Fresno. Email: ayamane@csufresno.edu; Constructing Sri Lanka as a vulnerable party to climate change

Growing concerns over global climate change in recent decades has resulted in a number of studies that attempt to assess its impacts for developing countries. These studies draw on the concepts of hazards and vulnerability used in the assessment reports published by the Intergovernmental Panel for Climate Change (IPCC). In most cases, the studies assume that vulnerability can be objectively measured. They identify a number of social, economic, and geographic indicators and factors that contribute to the vulnerability of particular social groups or regions within countries, and use these to assess the levels of adaptation the countries require. This paper examines how the IPCC's approach to vulnerability

assessment is translated in Sri Lanka. Sri Lankan scientists and policymakers claim that nearly 70 percent of their country will be severely affected by droughts and disasters caused by global climate change, thus requiring Sri Lanka to be recognised as a 'vulnerable party'. The paper explores this assessment of Sri Lanka's vulnerability by focusing on the process of translation. It examines why and how Sri Lankan policymakers and scientists use the IPCC's approach to vulnerability assessment to identify vulnerable regions and social groups, and how various statistics and accounts are used to re-present Sri Lanka as a 'vulnerable party' in the international arenas of climate change science and policy. A research design based on the Actor-Network approach is adopted to analyse the process of translating vulnerability to climate change in Sri Lanka.

Takashi Yamazaki, Osaka City University. Email: yamataka@lit.osaka-cu.ac.jp; Experiences of militarism and the politics of urban redevelopment: three "base towns" in Okinawa, Japan

After the Battle of Okinawa in 1945, the U.S. military forces occupied Okinawa, continued to govern it until 1972, and remain there even today. The tragic Battle, the 27-year foreign governance, and the continuing heavy military presence over the islands have engraved various incidents concerning militarism on Okinawans' experiences and memories. U.S. military bases currently occupy 20% of the land of the main island, which has been only incrementally returned to Okinawa. Experiences of militarism have not only affected Okinawans' perception of the current U.S. military presence, but also influenced the concepts of urban planning in "base towns (kichi no machi)". Some base towns have implemented urban redevelopment plans for the returned land by re-conceptualizing and re-interpreting the experiences of militarism. This paper selected three base towns: Yomitan, Chatan, and Okinawa (formerly Koza). Using the data on urbanization, industrialization, base-related economy, demography, land use, local politics, and urban redevelopment, this paper examines how these towns re-conceptualize, re-interpret, and materialize the experiences of militarism in their urban redevelopment plans. Particular attention will be paid to various ways in which the experiences are utilized as resources to improve local socio-economic conditions.

Keywords: experience, militarism, U.S. bases, urban redevelopment, Okinawa

Jun Yan, Western Kentucky University. Email: junyan@wku.edu; Stuart Foster, Western Kentucky. Email: stuart.foster@wku.edu; On Data Organization and Similarity Measures in Mining Spatio-Temporal Data

The detection of spatio-temporal patterns in time-series data presents a unique challenge since the dimensionality in time is different from that caused by regular thematic attributes. For regular attributes with numeric values, Euclidian Distance is often used to measure the similarity or dissimilarity. However one of the implications by choosing Euclidian Distance is that each attribute in the data vector is independent from each other. However for many time-series data this assumption is basically false in that the data in later times are usually influenced by those of prior times due to the existence of temporal autocorrelation. So often than not special considerations must be given to both data organization and choices of similarity measures. This paper discusses this important issue in mining spatio-temporal data. Findings from two case studies are presented. The first cases study focuses on the changes of U.S. domestic airline markets while the second one examines the drought development process. In both case studies, Self-Organizing Maps (SOM), a special type of competitive artificial neural networks (ANN), is adopted as the data mining tool.

Keywords: Spatio-temporal Data Mining, Time-Series Data, Distance Measure, Self-Organizing Maps (SOM)

Benjamin Yanda, University of Wyoming. Email: benyanda@uwyo.edu; Competing Livelihood Strategies in the Rukwa Valley Landscape

Traditional agricultural residents in the Rukwa Valley of southwestern Tanzania are living side by side with agro-pastoral in-migrants from the North. This paper aims to characterize two cultural land-use systems and the resulting conflict over natural resources. The Wasukuma compete with more traditional residents over access to pasture, agricultural land and water resources. I examine culture persuasions and perceptions of land use and change, spatial organization of the village, access to resources, land tenure, and aspects of local government. Ethnographic methods were employed over 11 months in Tanzania to understand both villager and Wasukuma livelihoods. Distinct differences exist in this rural society that may serve to characterize broader trends in southern Tanzania. Subsistence agriculture, cash crop production, forest products, fishing and pastoral production are examined to tell the story of a changing physical and cultural landscape.

Keywords: Rukwa, Tanzania, livelihoods

Kahlil Yanes, University of Minnesota. Email: yanes007@umn.edu; *An Investigation into the Relationship of Impoverished Urban Women and Water in Lima's Shantytowns: Looking at the Cultural Dimensions of Water*

Many Studies focus on the role of women in water-gathering and their access to safe drinking water; however, these women's abilities to work with what is given them and their ability to re-think projects for subsistence- in an indirect way or in an active political way- is overlooked by local and federal governments as well as NGOs. The fact that these women have low educational attainment and lack of formal skills should not doom them to social programs that consider them hopeless and powerless. I will be looking at public water fountains in a shantytown of Lima, Peru for evidence of how women appropriate a publicly provided service to achieve diverse and imaginative livelihood strategies.

Chaowei Yang, NASA Geosciences Interoperability Office / George Mason University. Email: cyang3@gmu.edu; *Distributed Geospatial Information Processing*

Distributed Geospatial Information Processing refers to the processing of geospatial information on multiple computers distributed across computer network (s). This paper introduces 1) the architecture of DGIP from the early stage of client-server based distributed platform to the flexible service oriented architecture, which is capable of integrating legacy and future components of geospatial information processing through interoperable interfaces based on standards. 2) The performance is introduced as a major concern in design and developing DGIP when multiple computers and computer network (s) involved in building a well performed system. The performance is observed to be improved by traditional computer science algorithms and methodologies and goes beyond to include massive data sources, massive computers involved, and intensive computing needed in the processing, as well as massive simultaneous users involved. Grid-based Cyber infrastructure is introduced as a possible solution to the performance issue. 3) The paper also introduced interoperability-based spatial web portal for the benefit of hybrid information integration through portal technologies. In summary, the paper introduces DGIP in aspects of cyber infrastructure, interoperability, and spatial web portal.

Keywords: GIS, Distributed Processing, CyberInfrastructure, Architecture, Spatial Web Portal

Chun Yang, Department of Geography, The University of Hong Kong, Hong Kong. Email: chyang@hkucc.hku.hk; *From Pearl River Delta to Yangtze River Delta: Transformation of Taiwan Investment in Mainland China*

Through firm-level survey and case studies, this paper aims to examine transformations of industrial clustering of Taiwan investment in Mainland China over the past two decades. As the major geographical concentration of Taiwan investment and the most dynamic regions in China, the Pearl River Delta (PRD) and the Yangtze River Delta (YRD) are chosen as cases. It is argued that distinct firm practices and their interactions with institutions and governments in both host and home regions in the context of global economy have brought about different spatial outcomes in the two areas. So-called 'implicit' and 'explicit' industrial clusters driven by Taiwan investment have emerged with different roles and policies of local governments in the PRD and YRD respectively. Moreover, Taiwan investment-driven industrial clustering has exerted distinctive impacts on the trajectories of regional development in the two economic powerhouses of China.

Keywords: Taiwan investment, industrial cluster, Pearl River Delta, Yangtze River Delta, China

Chun Yang, The University of Hong Kong. Email: chyang@hkucc.hku.hk; Haifeng Liao, The University of Hong Kong. Email: felixhku@hkusua.hku.hk; *Industrial Agglomerations of Hong Kong and Taiwan Investment in Dongguan, China: a Town-level Analysis*

Dongguan, an emerging world-famous manufacturing metropolis in South China has aroused considerable attentions in both academic and policy research over the past decade. Industrial clusters driven by the influx of foreign direct investment in Dongguan have been primarily based on qualitative analysis, while without any differentiations of the sources of foreign investment. Based on the firm-level statistical data, this study attempts to explore the extent and patterns of industrial agglomerations of Hong Kong and Taiwan manufacturing investment in Dongguan quantitatively and comparatively. The paper argues that Hong Kong and Taiwan manufacturing agglomerations in various towns of Dongguan have evolved in different sectoral and spatial patterns during the past two decades. It could be explained by different firm linkages and comparative advantages of the source regions, as well as distinct interactions with the host region in the context of global economy.

Keywords: Hong Kong, Taiwan, Dongguan, China, foreign direct investment, industrial agglomeration, comparative study, quantitative study, town-level analysis

Jiansheng Yang, Ball State University. Email: jyang@bsu.edu; *Vegetation change detection on surface coal mines in Indiana using Landsat*

There is a need for rapid and cost-effective techniques for the evaluation of reclamation success on surface coal mines over the long-term. The objective of this study is to explore the use of remote sensing technology to gain knowledge about vegetation establishment and growth on surface coal mines following reclamation. Active coal mines in southwestern Indiana started in 1990s are selected for this study. Field data including vegetation types and their spectra are collected using a portable spectroradiometer and global positioning system (GPS) unit for calibration and accuracy assessment purposes. Five Landsat Thematic Mapper (TM) images acquired in 1984, 1989, 1995, 2000, and 2006 are used to extract vegetation and change information over time. Radiometric correction is conducted on 1995 scene (base scene) and the radiometric characteristics of the rest images are normalized to this base scene. Both unsupervised and supervised classifications are used to classify the images to vegetation and vegetation change maps in different time periods. The accuracy of classification and change detection are evaluated using field collected data and historical high resolution aerial photographs. The method provides a rapid way to obtain accurate and detailed information of vegetation and its change on surface coal mines following reclamation.

Keywords: Landsat TM, remote sensing, surface coal mines, vegetation change

Meixue Yang, University of Delaware. Email: mxyang@lzb.ac.cn; Frederick E. Nelson, Department of Geography, University of Delaware. Email: ; Nikolay I. Shiklomanov, Department of Geography, University of Delaware. Email: ; Tandong Yao, Institute of Tibetan Plateau Research, Chinese Academy of Sciences. Email: ; *Ground Temperature and Soil Freeze-Thaw Processes on the Tibetan Plateau*

The Qinghai-Xizang (Tibetan) Plateau has been referred to as "the ridge of the world." The energy and water cycles on the Plateau play an important role in the Asian monsoon system. Much of the plateau is underlain by permafrost, and the remainder is subject to seasonal freezing. Soil freeze-thaw processes have a significant effect on interactions between the land surface and atmosphere. Observational data sets of soil moisture and temperature obtained by the GEWEX Asian Monsoon Experiment (GAME)-Tibet, which has been conducted since 1996 (continued as CEOP/CAMP-Tibet after 2000), include soil moisture, soil thermal regime, and freeze-thaw processes. Soil energy-water distribution and freeze-thaw processes are highly variable between different sites in the northern part of the Plateau. The temporal and spatial variations of soil moisture content are more complex than those of temperature. Freeze-thaw processes and the vertical distribution of temperature are strongly influenced by variations in soil moisture content. During the summer monsoon period, soil moisture content at the 10 cm level was relatively high at all sites, but showed a high degree of geographic variation. In general, the shallow layers begin to freeze in October and thaw in April at all sites, with freezing duration of about six months. The seven years of observations also indicate that soil temperature is increasing.

Keywords: permafrost, freeze-thaw, soil temperature, soil freezing, Tibetan Plateau; GAME-Tibet; CEOP/CAMP-Tibet

Xiaojun Yang, Florida State University. Email: xyang@fsu.edu; *Relating Estuarine Landscape Patterns with Biophysical and Socio-Economic Conditions: A Multi-scale Approach*

We present a method to characterize spatio-temporal landscape patterns, identify the correlations between landscape patterns and biophysical and socio-economic variables, and determine the significant natural and human drivers of landscape changes. We applied this method to examine landscape dynamics from 1989 to 2002 in the Pensacola estuarine drainage area, situated at the northern Gulf of Mexico, USA. The study was conducted at three different levels, namely census tract, 11-digit hydrological unit, and hexagon. The primary data were the land use and land cover maps for 1989 and 2002 that were produced by classifying Landsat TM/ETM+ imagery. Several core landscape metrics are identified using multivariate statistical analysis. Two major socio-economic variables, namely total population and per capita income, were considered, which were originally derived from US census datasets but further redistributed according to their natural distributions through dasymetric mapping technique. Other variables were NDVI, Soil Conservation Service Curve Number (CN), and a number of accessibility indexes including terrain slope, total length of road networks and several straight-line distance measures to a location of activities (CBD, cities, regional airport, coastline, and major shopping centers). A stepwise multivariate regression method was applied to determine the relationship between landscape structural metrics and biophysical and socio-economic variables. The results indicate that the natural and human variables can explain most of the variability of landscape spatio-temporal patterns but the drivers identified are somewhat different at each level.

Keywords: landscape dynamics, driving forces, data integration, multivariate statistical modeling, multi-level, estuarine watershed

You-Ren Yang, Dr., National Taiwan University. Email: yyren@ms34.hinet.net; Jinn-yuh Hsu, professor, National Taiwan University. The Divergent Institutional and Spatial Embeddedness in the Development of High-technology Parks in Taiwan*

This paper aims to explore the divergent impacts of different technology park projects draw on local development in Taiwan. Technology parks have been instrumental for propelling regional development and acclaimed as the panacea for curing regional declines since industrial restructuring after 1980s. Three parks, which were allocated in different regions, were constructed by the state under different political and economic circumstances, both domestically and globally. As capitalistic development discloses itself among the divergent institutional embeddedness, structural coherence, geographical organizations, and scalar connections, the interplay between the global production networks and local institutions will shape the divergent patterns of 'siliconization' of regional development in the three high-technology projects.

Zhengwei Yang, Dr., USDA/National Agricultural Statistics Service. Email: zhengwei_yang@nass.usda.gov; Rick Mueller, USDA/NASS/RDD. Email: Rick_Mueller@nass.usda.gov; *Citrus Grove Change Detection Using Heterogeneously Sensed Imagery*

Citrus grove change detection is of great importance to citrus production, inventory monitoring and policy making. Using remotely sensed imagery to detect the land use and land coverage is one of the most widely-used, cost-effective approaches. However, there is little published research on citrus grove change detection using remotely sensed multi-spectral imagery, especially for those acquired by heterogeneous sensors. The biggest challenge for this problem is that the pixel value of the imagery acquired with the heterogeneous sensors in different years is intrinsically dominated by the radiometric reflection characteristics of the specific sensor from which the imagery was acquired. The purpose of this paper is to investigate the effectiveness of the citrus grove change detection using heterogeneously sensed imagery. In this paper, the histogram matching method is used to perform the radiometric transformation on the heterogeneously-sensed imageries to address the problem of the radiometric reflection difference among heterogeneous sensors. It provides the ability to relatively normalize the radiometric response among heterogeneous sensors without knowing any sensor physical parameters. In this paper, the image differencing and the normalized spectral correlation change detection approaches are assessed and tested against the heterogeneously sensed citrus imagery data. Finally, a comparison of citrus grove change detection results between those two approaches as well as the impact of radiometric transformation to the change detection results is presented. The initial study indicates that the radiometric normalization can significantly improve the image differencing based change detection results.

Keywords: Change detection, Spectral Cross-correlation, Citrus, radiometric Correction, Histogram Matching

The "Kyoto virtual time-space" is a GIS with a temporal dimension, based on GIS and Virtual Reality technologies. This allows users to travel virtually over space and time in the Japanese historical city of Kyoto. The original purpose of this project was to provide a platform to handle a broad range of digitized materials of Kyoto. The project resulted in an historical GIS of Kyoto for many different slices of time: for the present day based on commercially available large scale 2 dimensional and 3 dimensional digital maps; for the Meiji/Taisho eras of the late 19th and early 20th centuries based on aerial photos and old topographic maps and the earliest cadastral maps; for the Edo era (ca. 1600-1868) based on hand-drawn maps and paintings; and for Heian era, based on archeological data and historical documents. Also we include a huge GIS database of historical buildings that would have been seen in Kyoto at different times, e.g., Kyo-machiya (traditional merchant/artisan houses), early modern buildings, temples

and shines. For the next phase, we developed new approaches to historical GIS. Analyses in historical GIS were limited to that of a single time slice or a single theme from the past because of the limited availability of digitized historical data. With the use of "Kyoto virtual time-space", it is possible to derive information from the intersections of temporal and spatial data. Thus the next generation of 'historical GIS', as its name connotes, should be both spatial and historical.

Email: ; *Climate Changes in Southern Lower Michigan Over the Last 2000 Years: Differentiating Between "Lake Effect" and Regional Climate Patterns*

A comparative study of the paleoclimate records of two lakes in southern Lower Michigan was conducted to reconstruct regional paleoclimate changes and to test for a localized "lake effect" signal. Multiple proxies (pollen, plant macrofossils, particle size, % organic matter, and % calcium carbonate) were analyzed from sediment cores collected from Miner Lake (42.7°N, 85.8°W), located close to Lake Michigan, and contrasted with those from Duck Lake (42.4°N, 84.8°W), which is situated in the interior of the state. Proxy data from Duck Lake show that this inland lake was responsive to large-scale climate perturbations, including the Medieval Warm Period (MWP, ca. 1200 to 800 cal yr BP) and Little Ice Age (LIA) cooling (ca. 500 to 150 cal yr BP). For example, the pollen record of this site indicates a shift from beech-maple forest to oak-hickory forest during the MWP and the subsequent resurgence of beech-maple forest during the LIA. Spectral analysis of gray scale data for Duck Lake exhibits dominant periodicities of 207 and 96 years for cool/wet events, which may indicate a global climate signal, possibly induced by solar forcing. In contrast, the paleoclimate record of Miner Lake was invariant during the past several millennia, which suggests that a "lake effect" climate induced by Lake Michigan was more dominant than the regional climate pattern for sites located near the shore of this Great Lake.

Xiaobai Yao, University Of Georgia. Email: xyao@uga.edu; *Network Analysis of Multiple Route Systems*

Conventional analysis of a topological network can measure the accessibility and connectivity of a node in a network, by the use of a series of matrix-based analysis such as C matrix, D matrix, and T matrix. This study deals with the insufficiency of these network analysis methods in some real world applications. First of all, the topological network requires a representation of only one link between two adjacent nodes. This makes the conventional network analysis methods inadequate to account for multiple connections between two adjacent nodes, which are commonly seen in reality. A more serious problem is the representation and analysis of multiple route systems in a network. This study aims to provide a solution to the above discussed problems. I use public transit system as a typical example for case study. If a public transit system is not too slim, it is commonly seen that many nodes and direct links are on multiple transit routes. This study proposes a revised C matrix, so called RC matrix, to represent both direct node to node links but also routes in a topological network. Based on this RC matrix, a set of new matrix operations are defined to analyze the connectivity and accessibility of single nodes (e.g. transit stops) in the network. The operation gives results that reveal optimal path between two nodes based on either travel cost or transfer times, or a combination of both.

Keywords: Network analysis, transportation, public transit, route analysis

Zhijun Yao, . Email: zy1001@txstate.edu; Benjamin Zhan, . Email: zhan@txstate.edu; 2D line cluster detection

Most clustering methods so far have concentrated on analyses related to spatial point patterns. We present preliminary results about the development of a procedure for detecting the concentration of the occurrences of a pair of variables among N variables in a set of observations. In each observation in the data set, we assume that a variable may have a real number or a null value. For the N variables in question, we position the variables to locations evenly spaced along the X-axis, use the x coordinate of each of the locations as the x coordinate of variable N_x , and utilize the value of N_x for each observation in the data as the y coordinate of variable N_x . When the values of all observations are plotted, a graph similar to a parallel coordinate plot is generated from the data. However, unlike parallel coordinates, for each observation there is only a line segment linking two variables when the two variables are placed consecutively along the X-axis and when both variables in that observation have values. This procedure can be used to detect the clustering of line segments. These line segments may represent the simultaneous concentration of a pair of variables or events in geographic space.

Keywords: line segment, cluster, parallel coordinate plot

Robert Yarbrough, Georgia Southern University. Email: ryarbrough@georgiasouthern.edu; Securing the Border from Atlanta, GA: Scale, Race, and the Politics of Immigration

In March 2006, while the U.S. Congress debated immigration reform, the state legislature of Georgia passed arguably the most punitive and comprehensive state law intended to curb illegal immigration in recent history. Supporters of the legislation drew upon a popular, national discourse of "border security" in arguing for the implementation of Georgia state bill 529 (SB 529). Through a discourse analysis of coverage of the debates surrounding the bill in Georgia's largest newspaper The Atlanta Journal-Constitution, I argue that proponents of SB 529 were actively engaged in scaling down the issue/problem of illegal immigration and effectively promoting their legislation through an appeal to securing and protecting the state of Georgia. In addition, enforcement of the newly-signed law promotes (perhaps even necessitates) racial profiling of non-whites and non-blacks in Georgia, the majority of whom are Latino/Hispanic. This law, therefore, contributes to the racialization of dark-skinned, Spanish-speaking residents of the state by constructing undocumented immigrant status (illegal and/or alien) as integral to "Latino/Hispanic" identity in Georgia. This analysis demonstrates that the debates surrounding this state law appealed to a national discourse of "border security" and scaled it down to garner popular support, while one result of the law is to perpetuate a racialized discourse that increasingly places illegal status at the center of Latino/Hispanic group identity.

Keywords: Immigration Politics, Scale, Race, Atlanta

Brent Yarnal, Penn State University. Email: alibar@psu.edu; Vulnerability Assessments of the Future? The Case of Hurricane Storm Surge

This paper presents a vision for vulnerability assessments of the future, using vulnerability assessments of hurricane storm surge as a well-understood case study. The paper begins by discussing the typical steps taken in contemporary storm surge vulnerability assessments, including procurement and processing of data, methods applied to these data, and analysis and distribution of the results. It presents examples of the usual decisions made by the assessor and typical products generated by applying standard procedures. It then considers the weaknesses of the data, methods, and analyses. Based on this appraisal, the paper suggests improvements needed in conducting such assessments, including better data, more robust methods, and additional analyses. The paper emphasizes the need to build models that not only facilitate projections and/or scenarios based on the variables assessed today, but also handle many more physical, engineering, and socioeconomic variables. These GIS-based models would enable decision makers to visualize the future consequences of every decision they make today, thereby identifying unrecognized vulnerabilities. The most important conclusion is that coastal-zone vulnerability assessments require local stakeholder participation during every phase of the process.

Keywords: Vulnerability assessment, Hurricane storm surge, Hazard scenarios, Stakeholders

Emily D Yates, Chicago Botanic Garden. Email: emilydrewyates@hotmail.com; Betsy Allen, Chicago Botanic Garden. Email: ballen@chicagobotanic.org; The Millennium Seed Bank Project at the Chicago Botanic Garden: Ex-Situ Conservation of Native Prairie Plant Species

The Chicago Botanic Garden, in collaboration with the Royal Botanic Gardens, Kew, is collecting seed from native, tallgrass prairie species as part of the Millennium Seed Bank Project. The Millennium Seed Bank Project is an international conservation program that aims to collect seed from 10% of the world's flora by 2010 for long-term ex-situ conservation. The Chicago Botanic

Garden is currently collecting seed from 1500 species native to the tallgrass prairie ecosystem, which now occupies only 10% of its original 58 million hectare range in the Midwestern and Great Plains states. For each species, 20,000 seeds from a single population are collected along with herbarium vouchers and associated data. After cleaning, the seeds are dried to 15-20% relative humidity and stored at -20C, thereby greatly increasing their longevity. Half of the collected seed is deposited into long-term storage at Kew Gardens, UK, while the rest remains in-country. Seeds not allocated for long-term storage are made available to the scientific and stewardship communities for seed biology and ecology related research, as well as local, on-the-ground restoration projects. The development of seed banking facilities at Chicago Botanic Garden contributes to providing ex-situ conservation of the Midwest local flora, and supports its mission to promote conservation of plants and the natural world. Chicago Botanic Garden's participation in the Millennium Seed Bank Project highlights the interconnections between plants and people and the importance of conserving the natural systems that support them both.

Keywords: seedbanking, conservation-ex-situ, plants, biogeography

Peter Hunt Yaukey, Ph.D., University of New Orleans. Email: pyaukey@uno.edu; Effects of Hurricane Katrina on Urban Landbirds in New Orleans, Louisiana

Previous comparisons of wildlife populations before and after hurricane landfalls have shown some species to decline, and others not. The effects of the August 2005 landfall of Hurricane Katrina on the suburban and urban landbird community of Greater New Orleans, Louisiana, was assessed starting five weeks after landfall. Compared to numbers recorded on 2.2 km of transects during pre-storm surveys between 1994-2000, the ten most numerous bird species all showed strong declines, as did squirrels. Additional transect surveys at 100 random locations city-wide showed that overall bird numbers on the initial 2.2 km were similar to those in the city overall. Additional surveys conducted in the Lower Ninth Ward, Arabi and the Murphy Oil Spill, revealed that bird abundance was extremely low in these areas of especially severe storm impact. The effects of the oil contamination is hard to assess at present; bird populations in the oil spill area are strikingly low, but not obviously lower than in non-contaminated areas also hit by the storm flooding.

Megan Ybarra, U.C. Berkeley. Email: mybarra@nature.berkeley.edu; Envisioning Guatemala as an "Ownership Society": Reflections on the Land Administration Project in Petén, Guatemala

In the wake of Guatemala's 36 year civil war, peace negotiations left one burning problem unresolved: land. Although the Agreement on Social and Economic Aspects and the Agrarian Situation purported to address the root causes of poverty, including highly concentrated land ownership, it offered only market-based solutions. The centerpiece of these solutions, theorized by World Bank economists and popularized by Hernando de Soto, is a land administration program designed to measure and formalize individual property rights, thereby increasing tenure security, creating "liquid" capital and opening up latent land markets. The pilot program is in the department of Petén, which is a formidable testing ground for fixing property rights in the midst of competing claims by peasants, environmentalists, drug traffickers, and former military generals. Rather than increase equity in economic opportunity, the land administration program has fomented a renewed cycle of violence. Development economists fail to account for displacement and violence that occur as an immediate effect of the project, as well as long-term disparate impacts of the project that may exacerbate existing inequalities. Although the project's stated aims are merely to formalize an existing set of individual landed property rights, this development intervention necessarily changes the property regime, thereby changing underlying relationships that land as property embodies. The new property regime cannot be separated from the violence used to enforce it, which may have important ramifications for this kind of project in weak states with heterogeneous societies.

This study assess the quality of total atmospheric water vapor measured by Atmospheric Infrared Sounder (AIRS) by comparing it with radiosondes and the European Centre for Medium-range Weather Forecasts (ECMWF) operational analysis products during December 2003 and January 2004. We find that PWV from AIRS Level 3 (daily gridded) data is about 9% drier while ECMWF is 14% moister than sondes at the two grid points closest to the Dome C radiosonde site on the Antarctic Plateau at 3233 m elevation. When AIRS Level 3 data are compared with ECMWF over the entire Antarctic continent, AIRS and ECMWF PWV have similar variability (correlation coefficients are predominantly 0.8 or higher), but with AIRS drier over most of the Antarctic by a consistent offset of about 0.1-0.2 mm. Because of this constant difference, the largest percentage differences are found over the highland areas of about 2500 meters and above, where absolute water vapor amounts are smallest. This should be an important consideration in radiative balance calculations for summertime Antarctica.

Keywords: Antarctic; atmospheric water; AIRS; ECMWF

Junjia Ye, The University of British Columbia. Email: junjiaye@interchange.ubc.ca; Multiple Identities At Work: The Case of Singapore's Financial Sector

The flow of diverse peoples into the global workplace is embedded with particular notions of the "ideal" cosmopolitan worker - notions that serve to reproduce inequalities in workplace access. This paper uses the example of Singapore's financial sector to expound on the issue of access to the professional classes in financial work. I argue that the performance of a particular cosmopolitan identity is crucial for accessing the professional financial class both through institutional and daily, mundane processes. I investigate how certain characteristics of gender, ethnicity, race and nationality limit entry into this class of globally connected and well-paid individuals. Referring to Bourdieu, I conceptualize "class" as an on-going symbolic struggle sustained by attributing bodies in the workplace with difference. In the process of creating the "ideal" worker for the financial sector, the notion of "cosmopolitanism" has been used as a powerful filter that limits access to certain performative kinds of work.

Ian Yeboah, Miami University. Email: yeboahie@muohio.edu; Emancipatory Ethnicity and Urban Land Claims: Marginalization and Impoverishment of the Ga and Adangme in Accra, Ghana?

Postcolonial Sub-Saharan Africa has experienced an upsurge of land claims by various ethnic groups whose lands were acquired by both the colonial and the postcolonial state through eminent domain. Often these land claims are about rural lands and ethnicity has been used as the basis of emancipating the group from impoverishment and marginalization. These economic claims to land, however, belie fears of the future that often result in violence and political unrest. An urban example of such a claim made by the GaDangme Council (GDC) in Ghana calls for an emancipation of the Ga and Adangme ethnic groups from their disenfranchisement, advocates changes in land laws and the distribution of benefits from lands acquired by the state. To an extent, a challenge to the traditional system of political organization of the Ga is also made by the GDC's call. This paper argues that the GDC's claim of marginalization and call for emancipation based on nationalism, although perceptual, has brought the issue to the fore of national debate. The paper suggests ways by which such claims can be addressed to forestall a breakdown of socio-ethnic fabric of Ghana. Resolving the Ga and Adangme case provides lessons for other Sub-Saharan African countries.

Keywords: emancipation, ethnicity, nationalism, urban, land claims, impoverishment

Muriel A. Yeboah, West Virginia University. Email: myeboah@mix.wvu.edu; Gender and livelihoods: Mapping the Economic Strategies of Porters in Accra, Ghana

Economic conditions across the African continent have worsened over the past few decades, and as a result there has been unprecedented growth in urban livelihood strategies. Using feminist methodologies this paper examines the linkages between gendered livelihood strategies and vulnerability among porters in the context of wider contemporary socio-economic changes taking place in Ghana. Porters, people who transport goods from one location to another location in and around market areas in cities of Ghana are among urban poor people striving to earn livelihoods in cities of Ghana. The paper discusses economic developmental processes leading to uneven development and high rural-urban migration in the country. It also highlights some of the strategies that porters adopt in engaging their activities as well as gender-related issues in their livelihoods in Accra. In addition, several factors that affect and lead to high vulnerability levels among porters in the city are explored. Findings indicate that men porters adopt simple technology that enables them to earn higher income than women. The analysis shows that clients, susu collectors, thieves, pickpockets and the general public exploit and harass porters. Moreover, poor living conditions, inadequate housing, lack of or inaccessibility to basic amenities, poor working conditions, and the effects of structural adjustment impact on the livelihoods of porters. In conclusion, the paper emphasizes the importance of policy measures that target porters particularly women at their home villages than measures aimed at targeting them in Accra.

Keywords: gender, livelihood; strategies; vulnerability, Accra,

Emily T Yeh, University of Colorado. Email: emily.yeh@colorado.edu; Blazing pelts and burning passions: Environmentalism, nationalism, and sovereignty in Tibet

On February 11, 2006, hundreds of Tibetan nomads in Zorge county, Sichuan, China publicly burned an estimated one million dollars worth of pelts of endangered animal pelts, including tiger, leopard, and otter, most of which were illegally poached from India. Used to decorate Tibetan robes, many of these pelts were purchased with a family's life savings in this economically marginalized area. Despite the magnitude of monetary destruction, more than one participant recalled it as "the happiest day in my life." The burning, only one of many across cultural Tibet, was a response to the Dalai Lama's statements at the Kalachakra Initiation in India in January 2006, that for religious and environmental reasons, Tibetans should not wear such pelts. Furious at the Dalai Lama, and especially over this evidence of his continued religious, political, and moral authority among Tibetans, the government arrested organizers. Those threatened with detention argued that they were only upholding Chinese national environmental law, and thus being patriotic citizens, while the state accused them of attempting to "split the [Chinese] nation." Several months later, the government forced Tibetans to wear pelts of endangered animals at summer horse race festivals. In doing so, the government ignored its own national environmental laws, which uphold CITES. Based on interviews conducted in Tibet, this paper examines this wave of public burnings and their aftermath to analyze the complicated and contradictory role of transnational environmentalism and discourses of environmental stewardship in the conflict of Chinese and Tibetan nationalisms.

Keywords: Tibet, environmentalism, religious authority, nationalism

Brenda Saw Ai Yeoh, Professor, National University of Singapore. Email: geoya@nus.edu.sg; "Gateway Singapore": Immigration Policies, Differential (Non)incorporation and Identity Politics

Globalizing cities such as Singapore are more akin to "transnational revolving doors" than "immigrant gateways". In the case of Singapore, the concept of a "transnational revolving door" has to be further qualified, based on skill level. For transnational unskilled workers, the "revolving door" is a structural condition that regulates their presence in the city. Use-and-discard state measures prevent them from gaining any significant foothold in Singapore society as socio-political subjects. For these workers, the "revolving door" turns systematically and relentlessly. In contrast, for transnational elites with talents and skills which the city-state wishes to root and retain, the state attempts to slow down the "revolving door" as much as possible. Instead, the state is keen to fashion Singapore as an immigrant gateway that is able to attract international talent to supplement its small base of local talent in order to remain globally competitive. Using a case study of skilled PRC transmigrants in Singapore, the paper however indicates that international talent is highly mobile: permanent residency and citizenship will not guarantee their integration into society and ironically may actually confer a higher degree of potential mobility. Immigrant gateways are animated by everyday identity politics dependent on a complex web of identifications with, as well as pragmatic opportunities in, "home" and "host". How comfortably the PRC transnational elite are able to negotiate their identities vis-à-vis similar-and-yet-different Singaporean Chinese in everyday

lived realities will have a significant bearing on whether Singapore becomes "home" or simply part of an unending sojourn.

Keywords: transnational migrants; immigration policy, identity politics; Chinese migrants, Singapore

Christian Yeomans, University of Wales, Aberystwyth. Email: cay02@aber.ac.uk; Post-socialist citizens, 'deep participation' and the sharpening of network governance: Research notes from Berlin.

Recent research on differentiation between multiple spaces of post-socialism has tended to deploy West-centric network governance models as 'complete', coherent, and even original ways of making sense of social change, marginalization and difference in post-socialist spaces. At the same time, new academic directions in network governance are starting to engage notions of a deeper order of citizen participation as an emerging dimension of healthy societal coordination. Employing field-evidence collected as part of a recent project, this paper raises the possibility that everyday patterns of participatory practice among citizens in an eastern district of post-socialist Berlin reveal a startling link between these trends: that the 'new' governance discourses deployed to manage thinking on changing post-socialist spaces are in fact beginning to aspire to and reproduce societal coordination principals that had existed already in advanced forms as pillars of GDR state-socialist societal coordination. The paper goes on to discuss the implications of this for perceptions of 'difference' and for the future of governance interaction and citizen-participation in post-socialist societal spaces. Special attention is afforded to the particular historical, sociopolitical and cultural contexts in which such patterns of governance practice are embedded.

Keywords: Post-socialism, Berlin, governance, citizen participation

Henry Wai-chung Yeung, National University of Singapore. Email: geoywc@nus.edu.sg; Situating Regional Development in the Competitive Dynamics of Global Production Networks: An East Asian Perspective

The debate on the nature and dynamics of regional development in both academic and policy circles has now moved on from the earlier focus on endogenous regional assets to analyzing the complex relationship between globalization and regional change. This paper attempts to engage with this debate through the experience of regional development in East Asia. The East Asian perspective shows that regional development cannot be understood independently of the changing dynamics of global production networks. While the existing literature on East Asia tends to focus on the state as the key driver of economic development at the national and regional levels, I argue that the developmental state is a necessary but not sufficient condition for regional development to take place. Instead, we need to study the complex strategic coupling of those economic actors, particularly large business firms, operating in specific regions in Asia with their lead firm counterparts orchestrating production networks on a global basis. To illustrate these strategic coupling processes and their impact on regional trajectories, I draw upon primary data collected through personal interviews with over 70 leading Asian firms. The paper concludes with some major implications for theorizing regional development and strategic policy options.

Keywords: Regional development, global production networks, strategic coupling, Asia, business firms

Natalia Yevchenko, Rostov CASE. Email: natayevch@yahoo.com; International Strategy of the South Russia Region

The Southern Federal Okrug of the Russian Federation has the largest boundary length in European Russia. Geographical location of the Southern Federal Okrug could be an advantage for effective regional development via international activity. However, over the past decade the Southern Federal Okrug has been growing less attractive for foreign trade and investments. The economic level is low, key production elements (energy, fuel, professional staff) are scarce, whereas political instability in some Caucasian republics keeps growing. Regional Administrations do not pursue any clear-cut economic policy, as they have seen no positive output of international business. The situation in the region has to be changed by developing international policy which would involve both medium- and long-term forecasts. The Russian Duma (Parliament) should adopt in 2006 new legislation on the so-called "boundary-to-boundary cooperation". The bill in question does not take full account of the possible international involvement of municipalities in environmental assessment, especially for large investment projects which could be detrimental to environment. The 660-km long state boundary with Ukraine needs state budget allocation for its immediate and effective protection. Ukraine has been fortifying its boundary since 2004, while Russia, having declared a policy of reliable customs control, has not moved ahead since. The Southern Federal Okrug must be granted federal tax remissions and investment incentives, similar to those offered to foreign investors in natural resources sector. Regional Administrations are to be evaluated by the number of new jobs they have created, the amount of attracted investments, and cuts in

federal budget subsidies.

Ling Yin, Department of Geography, University of Tennessee. Email: lyin@utk.edu; Shih-Lung Shaw, Department of Geography, University of Tennessee. Email: sshaw@utk.edu; Dali Wang, Department of Computer Science, University of Tennessee. Email: wang@tiem.utk.edu; A GIS-based Cellular Automata Model of Fire Spread Simulations

Cellular Automata (CA) has been a popular approach of simulating spatial changes over time. The grid-based partition of space in cellular automata fits well with the fundamental design of raster geographic information systems (GIS). However, implementation of a CA simulation model also requires functions that can represent the transition rules and compute spatial changes over time efficiently. With the open development environment offered by some GIS software vendors, it is feasible to integrate GIS with CA using a tight-coupling approach. This paper first discusses the advantages and the disadvantages of using ArcGIS/ArcObjects for CA simulations in terms of spatial data structures and spatial analysis functions. The paper then presents an efficient spatial data structure and neighborhood search functions for GIS-based CA simulations. Finally, this paper discusses the potential of coupling a GIS-based CA simulation model with a high performance computing environment in order to improve the performance when dealing with complex simulation models and large data sets. The improved data structure, new spatial analysis functions, and high performance computing approach can provide useful extensions to the development of GIS functions for simulating complex real world processes.

Samantha C Ying, Stanford University. Email: sammying@stanford.edu; Benjamin D Kocar, Stanford University. Email: ; Mickey Sampson, Resource Development International-Cambodia. Email: ; Scott Fendorf, Stanford University. Email: ; Christopher A Francis, Stanford University. Email: ; Near Surface Pore Water and Surface Water Cycling of Arsenic and Manganese in the Mekong Delta, Cambodia

In an attempt to circumvent illnesses caused by surface water pathogens, Cambodians recently turned to well water as the main source of drinking water. However, some wells within a well populated region, Kandal Province, have been measured to contain over 100 µg L⁻¹ arsenic, equating to ten times greater than the suggested limit set by the World Health Organization. Near surface pore water cycling of arsenic may contribute a slow input of arsenic into the ground water via vertical transport of arsenic-containing pore water through cracks formed by shrink-swell processes. Arsenic may be released from soil solid-phase during the wet season through reductive dissolution of iron and manganese oxides or arsenate reduction caused by microbial arsenic respiration. Here, we investigate the annual cycling of arsenic, iron, and manganese in seasonal ponds and near surface pore waters at 10, 50, 100, 200, and 400 cm depths and their effects on microbial community composition at multiple sites within the Mekong Delta. High concentrations of manganese oxide nodules can also be found in the surface soils, which may affect arsenic cycling in near surface processes via adsorption of trace amounts of arsenic. Cultivation and characterization of manganese-oxidizing bacteria may lead to greater understanding of how biogenic manganese oxides formed by native soil bacteria can be used to remediate arsenic from groundwater sources.

Keywords: Environmental Science, Arsenic- manganese, Cambodia

Michael S. Yoder, Texas A&M International Univ. Email: myoder@tamiu.edu; Neoliberalism, Federalism, and Transportation Corridors of the U.S. and Mexico: The Case of Three International Bridges of the Rio Grande

Since the mid-1980s, policy makers and the private sector in Mexico and the border states of the U.S. have increasingly defined international trade as a primary, if not the primary, engine of economic growth. Localities compete fiercely for permission and funds to construct international bridges spanning the Rio Grande. To construct these bridges, the cornerstones of inland ports linking Mexico and Texas, the public sector and its private sector allies face significant hurdles that include the issuance of presidential permits by both federal governments, securing sources of funding, and undertaking arduous planning processes. Such planning is both bi-national and inter-governmental in each country. This paper examines three international bridges spanning the Rio Grande in South Texas and northeastern Mexico, and highlights the dramatic differences from locality to locality in terms of bridge finance and revenue disbursement produced by the two countries' respective federal systems and adherence to neoliberal governance. In depth interviews of key public officials and private actors revealed three facets of the bridges that illustrate the differing conditions of bridge development from place to place, and the workings of the post-Fordist state to stake out a place for each locality in the global supply chain. These

themes are the unique planning, financing and revenue distribution arrangement of each bridge; the efforts of each locality to promote the bridges and their corresponding transportation corridors; and the impact of each bridge and its related infrastructure, such as warehousing and connector roads, on the built environment.

Keywords: neoliberalism, inland ports, U.S.-Mexico Border, international bridges

Eun-hye Enki Yoo, Dr., University of Texas at Dallas. Email: enki.yoo@gmail.com; Phaedon Kyriakidis, Dr., University of California, Santa Barbara. Email: phaedon@geog.ucsb.edu; Area-to-point coKriging in spatial hedonic pricing models

Considering the significance of locational attributes as a housing price determinant, we propose area-to-point coKriging with external drift as a means to predict house prices. Similar to existing spatial autoregressive models, the proposed framework explicitly specifies a property's spatial characteristics within the error structure of pricing models. The consideration of such spatially dependent error structure improves the quality of hedonic pricing model predictions, since the presence of spatial dependence in errors leads to biased estimates of the residual variance and inefficient estimate of the regression model coefficients. The unique feature of the proposed framework, however, is in its flexibility which allows incorporating integrated house price values measured over irregularly shaped spatial units, such as census tracts or local housing markets. Incorporating such area-averaged house price data in hedonic models will affect significantly the accuracy and the precision of predictions, in particular, when only a limited number of exogenous variables are available. Furthermore, the proposed geostatistical framework reports uncertainty associated with each individual house price prediction via its associated coKriging variance. In a case study, the application of the proposed geostatistical hedonic regression model is illustrated using apartment sales prices collected in Seoul, Korea during 2003. The performance of coKriging with external drift in the context of hedonic models is evaluated in terms of coherence property of predicted housing prices, i.e., reproduction of areal average when the predicted values are reaggregated, and the precision of predictions compared to a set of true values of a validation set.

Keywords: coKriging, external drift, spatial hedonic model

Hyebin Yoon, Department of Geography Ohio State University. Email: yoon.120@osu.edu; Emerging sectors in film production and the transfer of technology: Artists or programmers?

Advances in digital technology have brought many changes into the production systems of the film industry. The huge success of 3D-animated film in the box office and increasing demand of special effects for live-action film production using digital technology are part of these changes. These emerging sectors, 3D-animated films and special effects, have different requirements of labor and skills compared to other sectors in the film industry. These new sectors have been influenced by many factors such as the state of technology, computer software, and growing market. To understand the characteristics of these new sectors, this paper examines spatial patterns worldwide of the location of firms involved in special effects and 3D-animated film. The paper then reviews the cross-sectoral skills that are used in these two sectors and compares them in order to gain insight into how technology is transferred from one to the other.

Seo Youn Yoon, Department of Geography, University of California, Santa Barbara. Email: yoon@geog.ucsb.edu; Konstadinos Goulias, Department of Geography, University of California, Santa Barbara. Email: goulias@geog.ucsb.edu; Measuring activity spaces as determinants of travel behavior

Activity space is a very important concept in assessing benefits to urban residents, describing their time allocation and travel patterns, and explaining individual and household travel behavior. Several methods have been proposed to calculate activity space from recorded activity locations and to measure the spatial extent of activity space. These include confidential ellipses, kernel density estimation methods and minimal spanning trees. Each of them uses locations of activities in different ways and may capture different aspects of urban quality of service as well as explain different aspects of activity participation and travel behavior. This study incorporates products of each method into Geographic Information System (GIS) and uses GIS to capture spatial characteristics, such as network density or activity opportunities. A comparison is first made among the proposed methods. Then, using statistical analysis each product is correlated with typical travel behavior indicators including trips made, distances traveled, and duration of activity participation. The analysis shows which methods are more appropriate for modeling travel behavior emphasizing within household temporal and spatial interactions. Lessons learned are summarized and the study identifies a new method to build activity space from travel diaries to be

eventually used in forecasting travel demand.

Keywords: activity space, travel behavior

Mami Yoshimura, University of Waterloo. Email: myoshimu@fes.uwaterloo.ca; Geoffrey Wall, University of Waterloo. Email: gwall@fes.uwaterloo.ca; Weaving stories in Taiwan: Japanese colonialism and Atayal culture

This presentation is concerned with Japanese colonialism and Atayal indigenous culture in Taiwan. It highlights findings from ethnographical research undertaken in Taiwan and with Atayal artifacts in Japanese museums. During Japan's occupation of Taiwan from 1895 to 1945, the government of Japan banned Atayal facial tattoos. This ban eventually led to the loss of gender identity among the Atayal because facial tattooing symbolized maturity and availability for marriage. To get facial tattoos, Atayal men had to be accomplished headhunters and women had to be meticulous weavers. Japan's colonialism cut the links between gender identity, facial tattooing and marriage, and further undermined the Atayal's culture by taking their weaving back to Japan where there is a large museum collection of Atayal weaving. The Atayal men's headhunting activity and facial tattoo ritual have not been revived. On the other hand, the Atayal women's weaving has been revitalized as a way to promote their ethnic identity. The reintroduction of weaving required the Atayal weavers to retrace their weaving history and to reconstruct and revive lost skills. The reintroduction of weaving has had multiple effects on the Atayal community. The meaning of weaving has changed from the representation of the Atayal women's gender identity alone to the representation of the Atayal's collective ethnic identity as a whole. It has also become an ethnic symbol and a tourism product. By working with the weavers, insights have been gained into the legacy of Japan's colonialism and the future of Atayal culture.

Chad L. Yost, Graduate Student, Saint Cloud State University. Email: chadyost@hotmail.com; Mikhail Blinnikov, Ph.D., Saint Cloud State University. Email: mblinnikov@stcloudstate.edu; Diagnostic phytolith evidence for the presence and abundance of wild rice (*Zizania sp.*) from central Minnesota lake sediments.

This study develops a novel approach to understanding the paleoecology and paleobiogeography of wild rice (*Zizania sp.*) through the analysis of silica phytoliths from central Minnesota lake sediments. Phytoliths, opal silica microfossils of distinctive forms, are typically .005 to .200 millimeters in size and are preserved in a wide variety of environmental extremes. Wild rice, like many other grasses, is a prolific producer of phytoliths and provides greater taxonomic resolution than that afforded by pollen for the Poaceae family. We established a modern silica phytolith reference collection from 40 aquatic, wetland and upland plant species, with emphasis on the Poaceae, and identified a few highly diagnostic forms that allow unambiguous identification of wild rice in lake sediments. Modern sediments collected along transects from four lakes within the study area show a positive relationship between wild rice abundance and estimates of absolute abundance of wild rice phytoliths. Dominant phytolith morphotypes recovered from lake sediments can be linked to *Phragmites*, *Phalaris* and *Calamagrostis* and indicate phytolith deposition is inclined to be spatially focused in some lakes. We are currently analyzing sub-samples from a 1400 cm core with a basal date of 10,000 years BP that has previously been analyzed for pollen. The degree of correlation between wild rice phytolith abundance and Poaceae pollen abundance will be presented as a part of this paper. Further research will expand this study across a wider spatial and temporal extent with the intent to better understand the entry and speciation of *Zizania* in North America.

Keywords: phytoliths, wild rice, *Zizania*, Minnesota, paleoecology

Craig Young, Dr BSc PHD, Manchester Metropolitan University, UK. Email: c.young@mmu.ac.uk; 'The return of the cosmopolitan. Urban visions, European dreams'

This paper will outline the key strategies of post-socialist urban identity construction across East and Central Europe and analyse how in an attempt to underpin strategies of a 'return to Europe' cities are building identities which hark back to a mythical Golden Age of European, multi-cultural identities. The notion of the cosmopolitan city is frequently mobilized in post-socialist discourses of urban identity formation as a way of signifying a 'return to Europe', but specifically a mythical past is constructed for the city in which the city was a) explicitly European and b) the site of multicultural harmony and of a 'cosmopolitanism' which welcomed all cultures. The paper examines various examples of the operationalisation of this idea of the cosmopolitan city as a means of building post-socialist urban identities in an integrating Europe. It explores the extent to which this notion be sustained in contemporary post-socialist cities and also the implications of such identity building processes for how 'Europe' is imagined. In particular, the paper explores whether the production of new

cosmopolitan visions of the past to support future development inevitably produces a 'non-cosmopolitan' 'Eastern other'.

Keywords: Post-socialism, Europe, urban identity, European integration

Douglas Young, York University. Email: dgyoung@istar.ca; *In-between Growth and Decline: Confronting uneven development in Toronto and Berlin*

Highly uneven urban geographies of growth and decline appear to have become accepted by many in North America and Europe as a universal condition - perhaps even a necessary prerequisite - of global economic competitiveness and neo-liberal urbanism. At the same time, however, the consequent social disadvantage that is concentrated in some urban districts is viewed by policy-makers to be a threat to overall urban economic success and social stability. Such districts are considered as crises to be managed by way of strategic and targeted state intervention that includes new limited spending initiatives. A particular challenge for such state-initiated policies are districts that embody, in their built environments and the social practices of their residents, the social utopianism of the Modern Era during which time they were initially developed. In this paper I explore confrontations between neo-liberal urbanism and the legacies of modernity in attempts to address uneven development in two places: Toronto, a global city of both explosive growth and increasing poverty, and Berlin, a city of national treasures but limited growth. Case studies of two districts - Jane-Finch in Toronto and Marzahn in Berlin - suggest that their modernist legacies provide the potential for area residents to challenge state-imposed concepts of crisis management and to reorient debates about growth and decline in their respective urban regions.

Keywords: growth and decline of cities; Toronto; Berlin; modernity

Jason C. Young, Miami University. Email: youngjc2@muohio.edu; *Public Space and Cultural Power: A Study of the Maijuna*

This paper views the political struggles of the Maijuna, a people of the Peruvian Amazon, through theories of public space. I evaluate whether Western theories on the importance of public space for political action apply to indigenous peoples living in the interior of the rain forest. This evaluation builds upon field observations and interviews performed in the Sucasari village of the Maijuna, found along the Amazon River in Peru. It also draws heavily upon secondary publications about the Maijuna. Using these resources I discuss how the Maijuna lost many of their public spaces during periods of colonization and explain how this loss negatively impacted the transmission of traditional knowledge from one generation to the next. However, the Maijuna are mobilizing to stop these losses, and I examine how public space is important for this regeneration of cultural pride. I conclude that these public spaces are important spaces for political struggle for the Maijuna. In particular, the Maijuna are now using spatial techniques to gain further rights (including rights to more of their traditional lands) for their community. I conclude by analyzing the benefits of these techniques, such as participatory mapping and indigenous political coalitions.

Keywords: indigenous politics, Peru, political geography, public spaces

Jeffrey M. Young, SANZ EarthWhere. Email: jyoung@sanzen.com; *Geospatial Data Collaboration Imperative*

This paper examines geocollaboration underway in .gov, .mil, .com, .edu, .org and .net communities. Geospatial data collaboration initiatives at USGS, USDA, Northern Command, NOAA, BLM, selective state governments and others are compared and contrasted. These organizations employ spatial data provisioning to support collaboration. Spatial data provisioning technologies enhance the value of geospatial holdings through sharing and reuse. Isolated and redundant practices are being dismantled and institutions are embracing collaborative philosophies with the associated accountability. As spatial data holdings increase, the time is right to consider an integrated multi-organization, multi-tier approach to data collection storage and dissemination. Recent catastrophic events have forged some defining moments in the collective geospatial community. With these events has come an expectation of faster and more effective responses to protect lives and property. Some changes are being driven by improvements in how projects are managed in terms of project design, sensors employed, interpretations applied and the conclusions presented. We can expect to see an increased resolution in sensors, increased temporal and spatial availability, improved access to multi-sources, improved time to deliver, increased end user skills, and new and affordable tools. Our citizens expect smooth, seamless distributions of products and results. Ultimately, the drama of events over time and space demands a sharpened collaborative response. Impacts of change on our cultural and physical landscapes are evident. Professional collaborators for managing change should recognize that their contributions do indeed influence daily operations and decisions.

Keywords: geocollaboration, spatial data provisioning, geospatial data

John Young, United States Geological Survey. Email: jyoung@usgs.gov; John Jones, United States Geological Survey. Email: ; Jeffrey Evans, U.S. Forest Service. Email: ; *Using spatial filtering and landform analysis of LiDAR data to reveal forested sinkholes*

We acquired and processed LiDAR data for the watershed surrounding the USGS Leetown Science Center (Leetown, WV) through a partnership with the USDA-Natural Resources Conservation Service. Our goal for this project was to develop fine-scale surface models to delineate sinkholes and other threats to ground water recharge in the local area. LiDAR data were delivered as unprocessed x,y,z (location and surface height) data files, and as "bare earth" models that are processed to remove trees and buildings in order to represent the unvegetated or "bare" ground surface. However, close inspection of these models revealed that numerous vegetation artifacts remained, reducing their effectiveness for modeling fine surface features such as small sinkholes. To address this problem, we employed a progressive curvature filter that effectively removed vegetation artifacts from the LiDAR data. Once a filtered surface model was prepared, we conducted landform analysis to reveal small topographic depressions that might indicate sinkhole development. Field surveys showed that the filtered LiDAR dataset was very effective at locating small surface depressions in forested areas, many of which were obvious sinkholes.

Keywords: LiDAR, spatial filter, sinkhole, landform, Karst

Julie Young, York University. Email: juliey@yorku.ca; *"It Kind Of Gets In The Way Sometimes": Youth Living In Toronto With Uncertain Legal Status*

Immigration policies allow states to select members and to thus perpetuate exclusive social and spatial relations, locating some individuals outside the system without access to services and rights even while they live within state borders. While states determine who is permitted to cross their borders and under what conditions, it is individuals who migrate so it is important to understand how they negotiate the immigration and settlement processes. This paper presents insights from youth living with uncertain legal status in Toronto and highlights the multiple ways in which an individual can be living with precarious status, in terms of both their access to services and their participation. Despite the uncertainty of their status, the youth were able to develop and sustain a network of support persons both within and outside of Canada. School in particular was a space where their status was constantly negotiated: at times going to school offered support while at others it was a reminder of the precariousness of the youth's situations. The project highlights the ways in which legal status is constructed at a number of scales and reveals how these youth participated and strove in their daily lives despite their lack of officially sanctioned status.

Email: mcardozo@mail.utexas.edu; *Drivers of landscape and agricultural change in floodplains of the western Amazon*

Annual floods in the northeastern Amazon of Peru alter landscapes and reset conditions for farmers, structuring their agricultural calendars and facilitating some aspects of their land use practices. Through semi-structured interviews along the Amazon River and tributaries, we evaluated local land-use responses to different hydrological and precipitation regimes related to topography and river size, origin, and connectivity. In addition, we asked about perceptions of and responses to extremes in those regimes, for example during the Amazon dry period of 2005 and due to past high water levels caused by El Niño events. Commonly mentioned concerns for floodplain agriculture were pests, availability of credit and labor, transportation costs and difficulties, and prices paid for products and produce. In addition to household-level strategies for accommodating environmental fluxes and reported concerns, there are additional opportunities and stresses that have implications for development and conservation efforts. These contingencies originate from the urbanizing Amazon (through movements of people and commerce), from the national and regional governments (through regulations and incentives), and from globalization (as mediated through commodities and international influences). Extreme events often require people and communities to gauge land use consequences of landscape dynamism.

Keywords: agriculture, Amazon, extreme climate events, flooding, land use change

Stephen S. Young, Dr., Salem State College. Email: syoung@salemstate.edu; Persistent Changes in NDVI between 1982 and 2003 over India using AVHRR data.

Global vegetation change studies using AVHRR data for the period 1982 to 2003 have shown extensive areas of the world increasing in photosynthesis, as captured by NDVI data. Increasing levels of NDVI in the high latitudes has been attributed to global warming, but what about the other regions of the world. At the global scale, South Asia is one of the major regions of the world in the lower latitudes demonstrating intensive and extensive levels of increasing NDVI during this period. This presentation will show preliminary results of NDVI change studies over India using AVHRR GIMMS data between 1982 and 2003. The three methodologies of: univariate differencing, temporal profiling and anomaly analysis were undertaken in the research. A persistence filter was used to filter out ephemeral changes. The preliminary results indicate positive trends of vegetation change occurred over most parts of the country and these changes appear not to be highly correlated with rainfall data, which indicates that land cover transformations may be the major driving force behind the changes. The potential driving forces of change will be explored.

Keywords: Global Change, India, remote sensing

Stephen Young, University of Washington. Email: sjy2@u.washington.edu; Finance at the frontier: Redlines and Microloans in India

This paper will present some preliminary research on the impacts of the globalization of financial capital in two key sites in India. Firstly, I look at Mumbai, exploring how the city is changing as it is increasingly integrated into global financial markets and subject to the 'gaze' of international investment funds and risk rating agencies. I explore both the imagined geographies that work to simulate the city as a 'big emerging market' and the effects that neoliberal policies are having on the ground, particularly in relation to growing social-economic inequalities. Secondly, I look at how many of the banks based in Mumbai (and other financial centers) are increasingly involved in lending to microfinance schemes that have been expanding in regions which were initially 'redlined' as a consequence of the same neoliberal reforms. This shift towards for-profit microfinance has been accompanied by a growing emphasis on competitive interest rates and entrepreneurial clients, which raises serious questions about microfinance as a panacea to the disinvestment and dispossession of neoliberal change. It also underlines the importance of thinking through the governance of global finance and the governmentality of microfinance in relation to one another.

Keywords: neoliberalism, finance, governance, microfinance, governmentality, India

Tom Young, University of Toronto. Email: youngt@geog.utoronto.ca; Natural Communities; Political Landscapes

The conservation of biodiversity through the identification and protection of natural communities has been a focus of the Nature Conservancy for decades. Yet the existence of natural communities as real entities has been in dispute in the field of ecology since the beginning of the 20th century. How has the Nature Conservancy seized on this controversial construction and represented it as solid conservation science, providing the backbone for successful conservation initiatives on the ground? The concept "natural community" does important political work. Like the broader notion of biodiversity, it recasts the scale at which land attaches to human constituencies. It calls into being a global citizenry as a stakeholder in any land use decision. Yet the concerns of the global citizenry are mediated and interpreted by a specific political construction, the conservation organization, whose interests are never as transparent as it would have us believe. Drawing on material from northern Vermont, this paper will look at the way the discourse of natural communities has provided a justification for considerably more restrictions on land use than could be justified under single-species focused approaches to conservation. As such it represents a powerful discursive tool with which the Nature Conservancy is attempting to reshape the political landscape of conservation.

Keywords: political geography, ecology, Vermont

Don Youngblut, Carleton University. Email: dyoungbl@connect.carleton.ca; Dendrochronological studies in the southern Yukon Territory, Canada: are two species better than one?

A network of annual ring-width chronologies featuring high elevation white spruce (*Picea glauca*) and lower elevation lodgepole pine (*Pinus contorta*) has been developed from the southern Yukon region. The relative close proximity of the thirty-five sample sites affords the opportunity to examine the different dendroecological information these two species may provide, particularly as fire plays an important role in the maintenance and development of these forests. Patterns of ring-width variability between the chronologies across the region suggest species-specific controls on growth supersede those of geographic

location. However, lower frequency patterns of growth variability between the two species have displayed periods of synchronicity during the last several hundred years. Tree growth at the higher elevation spruce sites shows sensitivity to summer growing conditions whereas the lower elevation pine sites show a more mixed sensitivity, generally most consistent with regional records of moisture availability (i.e., streamflow). We discuss the feasibility of combining radial growth patterns from both species to document past climatic conditions and the association between climate variability and fire activity over the last 300-500 years. We also highlight the potential influence of diurnal temperature variability on radial growth at some of these sites.

Keywords: dendrochronology, Yukon, lodgepole pine

Yolonda Youngs, Arizona State University. Email: yyoungs@asu.edu; Battling for the red buttes of Phoenix: Multiple and contested views of Papago Park, Arizona

In 1914, President Woodrow Wilson signed the legislation to create Papago Saguaro National Monument on the edges of the fledgling metropolis of Phoenix, Arizona. This seemingly benign act of preservation to protect the prominent red rock buttes and desert flora set in motion the gears of social, political, and economic contest over ownership and use of this public pleasure ground. Twenty-five years later, Congress revoked Papago Park's national monument status and declared the area a state park. Once declared a "useless wasteland" by Arizona Governor Carl Hayden, Papago Park's red rock buttes evolved into an icon of for local Phoenixians and a contested terrain where battles over city, state, and regional identity were fought between local boosters, recreation enthusiasts, and artistically minded citizens each looking to express their interpretation of this landscape. Combining archival research, interviews, and field observations, this paper explores the emergence the Papago Park's spatial configuration as a material representation of these conflicts of multiple, contested, and negotiated meanings over nature and culture from 1914 to 2006. Papago Park is an example of how conflicting ideas about nature and culture play out public space through time. Through this case study of a protected area in Arizona, this paper explores the flexibility as well as resistance of preservation legislation as federal, state, and national stakeholders engage in debates about the use of public lands. This paper also offers applications for park managers and planners by investigating the importance of local participants in decisions about preservation efforts.

Keywords: national monument, public lands, contested meanings, culture and nature, Arizona

Danlin Yu, Montclair State University. Email: yud@mail.montclair.edu; Spatial interpolation, GWR, would more information make big difference?

Spatial interpolation usually interpolates the unknown values purely depending on the existence of spatial autocorrelation. Geographically weighted regression, although is used primarily in modeling the spatially varying relationships, can also be used to interpolate unknown values. The difference between these two interpolation methods are that the traditional spatial interpolation is a univariate interpolation, whilst the GWR uses multivariate information to interpolate. Using house data from the City of Milwaukee, this study evaluates the interpolation accuracy of the univariate interpolation method represented by IDW and ordinary Kriging and GWR interpolation. It is found that by modeling the spatial varying relationships, GWR interpolation could be more accurate than the univariate interpolation methods. However, misspecification can be a serious problem for GWR interpolation.

Keywords: Spatial interpolation, geographically weighted regression, hedonic models, City of Milwaukee

Hongbo Yu, Oklahoma State University. Email: hongbo.yu@okstate.edu; Shih-Lung Shaw, University of Tennessee. Email: sshaw@utk.edu; A Temporal GIS Design for Exploring Spatio-temporal Patterns of Acquisition Projects

The project concept, which is defined in the time-geographic framework to describe a sequence of activities organized to complete a specific goal, provides a process-oriented representation of human activities. With the wide adoption of information and communication technologies in our daily lives, activities of a project now can be performed in either physical space or virtual space. This phenomenon can lead to profound changes in the spatial and temporal distribution of our activities and therefore is worth of a close study. In this paper, the authors focus on the examination of various spatio-temporal scenarios that an acquisition project can be completed. An acquisition project involves three tasks (i.e., information search, transaction, and delivery) in the process. As each task can be performed in either physical or virtual space, a total of eight scenarios are identified in this study to describe different combinations of activities performed in physical and virtual spaces. For example, a project of purchasing a book at Amazon.com is identified as a V-V-P scenario because the project is done by browsing the book catalog on the web site (information search in virtual space), placing an online order for the book (transaction in virtual space), and having

the book delivered to home (delivery in physical space). A temporal GIS design is developed to support the representation of the eight scenarios of an acquisition project and the exploration of spatio-temporal relationships of activities in a project. Using a hypothetical activity dataset, a prototype system is created to implement the design.

Keywords: virtual space, time geography, project, GIS

Hwa-Lung Yu, San Diego State University. Email: hlyu@mail.sdsu.edu; George Christakos, San Diego State University. Email: gchrista@mail.sdsu.edu; Integrated Spatiotemporal Modelling and Mapping of Natural Systems

This work proposes the integrated spatiotemporal modelling and mapping of natural systems by means of the Spatiotemporal Epistemic Knowledge Synthesis and Graphical User Interface (SEKS-GUI) framework. Based on rigorous theoretical reasoning and sound empirical evidence, the SEKS-GUI involves combinations of teleologic and adaptation knowledge synthesis principles (epistemic ideals of maximum informativeness and statistical induction/stochastic deduction adaptation); expresses the system's space-time dependence structure using a multitude of both ordinary and generalized spatiotemporal covariance models; explores heterogeneous (spatially non-homogeneous and temporally non-stationary) system distributions; integrates core knowledge bases and various uncertainty sources of the system; and generates a meaningful picture of the system using space-time dependent probability functions and associated maps of important natural attributes (physical, cultural etc.). The wide applicability of the proposed framework is demonstrated in terms of real-world case studies.

Keywords: Spatiotemporal Analysis; Environmental Modelling

Email: kssc022@tamuk.edu; Joon-yeoul Oh, Texas A&M University - Kingsville. Email: kfjo000@tamuk.edu; GIS-based flood and storm surge damage assessment of Corpus Christi, TX

Flooding is one of the most influential natural disasters in the United States. Among the top 10 nature disasters ranked by FEMA's relief cost, 8 of them are hurricane or flood related. Inland flooding and storm surge has been reported to be responsible for more than half of the casualties and property damages associated to hurricanes and tropical storms. In terms of number of lives cost and property damage, floods are the number-one natural disaster in the United States. Due its geographic location, Corpus Christi can not be free from flood and storm surge disasters. Corpus Christi is the eighth largest city in Texas with a 2000 metro census of 380,783. There is no reported quantitative damage estimations yet in this area, however, enormous damages are expected if disastrous hurricane hits the city. This study simulates the flood and storm surge area in Geographic Information Science (GIS) environment and provides accurate quantitative damage estimations in terms of life and properties. Raster-based simulation will be used to map the risk area in detail of pixel level 10 m as the water level increases every m. In addition, vector layer of residence and commercial properties provides accurate number of possible life and properties threat with the water level increase. The output will be utilized for damage management plan and possibly reconsideration of evacuation plan.

Keywords: GIS, Damage Assessment, Raster analysis, Life and property damage

Qian Yu, University of Massachusetts-Amherst. Email: qyu@geo.umass.edu; Estimating Riverine and Coastal Chromophoric Dissolved Organic Matter (CDOM) Using In Situ Hyperspectral Data and High Resolution Satellite Image

Chromophoric dissolved organic matter (CDOM) is the part of DOM that is highly colored and absorbs light. Early research reported that the concentration of CDOM can be correlated with the total concentration of dissolved organic carbon (DOC). Because of the correlation between DOC and CDOM, remote sensing method can potentially be used to assess DOC. The CDOM efficiently absorbs short-wave-length solar radiation. Therefore, optical remote sensing potentially provides the means to measure over large geographic regions. Some studies have already proved the feasibility of estimating the amount of CDOM using remote sensing imagery in lakes, estuaries, and bay. Because of the high CDOM absorption and low reflectance, this practice requires sensor measurements of high radiometric sensitivity. In this study, we use both In Situ hyperspectral measurement and satellite image to estimate the CDOM in a riverine and coastal environment. The ratio of multi-bands in visible range is adopted in the estimation to remove the effect of atmosphere (especially aerosol-scattering) and suspended sediments, so as to increase the image contrast for a better regression. Hyperspectral data from intensive field spectroradiometer measurement are useful to develop and calibrate the estimates from imagery. The study result can potentially improve the understanding of carbon cycling from

landscapes to coastal water in large scales.

Keywords: CDOM, Hyperspectral data, high resolution image, remote sensing

Fei Yuan, Minnesota State University, Mankato. Email: fei.yuan@mnsu.edu; Shouraseni Sen Roy, University of Miami. Email: ssr@miami.edu; Analysis of Phenological Change Patterns and Growing Season Trends in Response to Climatic Variables and Urbanization

Vegetation phenology refers to the study of the timing of recurring vegetation circles. It is a well established fact that climatic variables are main factors for vegetation growth. Previous studies have demonstrated that there is an increasing trend of annual sum of NDVI in temperature-dependent regions because of earlier start and later end dates of canopy emergence and senescence, which is associated with increasing trend of air temperature in the past two decades. While monitoring changes of vegetation phenology due to global warming are a significant issue in environmental studies, accurate assessment of phenology change patterns at local level is complicated due to various non-climatic factors such as urbanization, and other disturbances. This study aims to analyze vegetation phenology patterns and growing season trends at local level in Minnesota, as a combined function of variable climatic conditions and urbanization using satellite remote sensing and long term climate data. The results may provide useful information for better agriculture practices and land use management in Minnesota.

Keywords: Vegetation phenology, remote sensing

Brendan T Yuill, Arizona State University. Email: byuill@asu.edu; Mary H Nichols, PhD, USDA ARS Southwest Watershed Research Center, Tucson, AZ. Email: ; Mark W Schmeckle, PhD, Arizona State University. Email: ; Supply, sorting & yield of transported sediments in a semi-arid, ephemeral watershed.

Sediment transport is sampled during eight flow seasons at Lucky Hills, a 4.53 ha subwatershed of the Walnut Gulch Experimental Watershed near Tombstone, Arizona. Depth integrated, total load sediment sample concentrations and particle size distributions are analyzed. Measured concentrations average 1.18 % at the watershed outlet although they are highly variability, occasionally surpassing concentrations of 3.00 % and producing transport rates over 15 kg/m/s. Within runoff events, sediment concentrations do not vary systematically with discharge. However, fine material concentrations (< 0.125 mm) pulse at the beginning of each flow event, with little relation to seasonality or recovery period, and gradually wane through the event duration. The coarse material concentrations (> 0.25 mm) exhibit a much weaker association with time, although the highest values are often collected during the later part of an event. This difference in the character of transported sediment depending on particle size is likely due to the contribution of fine sediment from hillslopes in contrast to more complex sorting processes between coarse material and its supply from the channel bed. Complimentary measurements of bedload transport link values of transport flux with the character of the upstream bed material, arranged in patches of variable particle size distribution and mobility that evolve in response to flow hydraulics and local sediment supply.

Justin Zackey, University of California, Berkeley Center for Chinese Studies. Email: jzackey@berkeley.edu; Peasant Perspectives on Deforestation in Southwest China: Social Discontent and Environmental Mismanagement

This paper examines the causes of deforestation in southwest China by listening to peasants' own descriptions of their role in illegal timber cutting. It finds that a sense of "relative deprivation" amongst China's rural poor has encouraged poor environmental management. Peasants justify illegal tree cutting by pointing to China's rapidly increasing inequalities, their lack of economic opportunity and the absence of economic support from the (corrupt) government. These issues, combined with the continuing institutional problems with forest management after decollectivization, convince peasants that ignoring environmental conservation edicts and cashing in on their trees is a good choice. This article distinguishes itself from other critical studies of environmental degradation in China by identifying relative poverty and social discontent as major factors driving deforestation.

Keywords: China, Deforestation, Environmental Management, Poverty, Social Discontent

Amy Zader, University of Colorado. Email: amy.zader@colorado.edu; "Rice is Life": A Critical Overview of China's GM Rice Debate

The struggle over the use of genetically modified (GM) rice in Chinese agriculture is a critical component to larger debates regarding the production and trade of GMOs. The Chinese government has invested a significant amount of time and money into the research and development of agricultural biotechnology. However, international environmental NGOs are bringing the issues of risk and uncertainty of GMO production to China's growing environmental movement. The approval of GM rice for cultivation has formed a national state political debate. This debate is complicated by scientists directly involved in biotechnology development sitting on the central state's advisory board and by European activists, threatening to halt trade relations if GM rice is approved. This paper explores issues surrounding the GM rice debate in China. Paying particular attention to the role of actors influencing the central state, I argue these scientists and environmental activists send a variety of messages to Chinese farmers, consumers, state officials and international audiences. Thus, the central state's responsibilities are stretched as it waits to make a decision. In the meantime, Greenpeace has released reports of GM rice being sold 'illegally' in Chinese markets. This paper suggests further research needs to be done on how Chinese scientists, farmers and consumers are responding to the introduction of GM rice in fields.

Keywords: China; Agriculture; Biotechnology; GMOs; Environmental activism

Terry Lee Zahniser, Muskegon Community College. Email: travelingyrene@comcast.net; West Michigan - A Region Ripe For Change

The purpose of this poster is to illustrate West Michigan's unique natural and human characteristics, and what must be done for it to advance into the world community and 21st Century. West Michigan is a region undergoing major social, economic and political changes. But, in order for this region to make the necessary 'leap' to the next level of 'smart' development and expansion, it must overcome several challenges to that potential growth and eventual world prominence. West Michigan is situated within major domestic and global transportation corridors that provide the region with easy market access for its agricultural and industrial goods, as well as use of the planet's largest available commodity of freshwater - the Great Lakes and its watershed. This strategic geographic location and abundance of natural and human resources puts West Michigan at the apex of future growth and progress that should make it capable of participating more competitively on a global scale.

Anna Zalik, University of California, Berkeley; York University. Email: zalik@berkeley.edu; Securing the 'License to Operate': Industrial access to oil under state re-regulation

Through a comparison of the activities of Royal Dutch Shell subsidiaries in three sites - Nigeria's Delta Region, the Canadian Tar Sands and Mexico's Gulf States, this paper offers a multi-scalar approach to the study of corporate strategy. The paper theorizes how industrial access is mutually constituted through territorially embedded trajectories of social and agrarian reproduction (notably state policies concerning the use of the sub-soil), and trans-national financial and industrial policies guiding the behavior of private industry (namely transformations in corporate governance procedures across the global North and South). In particular, the comparison explores how industrial approaches for achieving social consent are highly contingent on the region and activity of operation. As such it provides background for an ongoing study of pre-existing possibilities for 'claims-making' available to resident populations in these sites.

Ramin D. Zamanian, Department of Geography and Anthropology, Louisiana State University. Email: rzaman1@lsu.edu; A Material/Conceptual Landscape Analysis of the Virgin of Guadalupe Pilgrimage Site in Mexico City, Mexico

As geographers continue to research the interactions between physical landscapes and conceived or represented landscapes, the Virgin of Guadalupe pilgrimage site, a prominent site for Latin American Catholicism, provided an opportunity for further research in this area of study. Mexico City's rapid expansion drastically changed the material landscape from rural to densely urban, especially since the early 1900s. With indigenous spirituality closely tied to the physical aspects of the landscape, especially those more related to the natural

and rural elements, the onset of urbanity can potentially lead to alienation and consequently a decrease in pilgrimages and participation in worship at the site. How then, do those representing the site adjust to the changes in the landscape in order to maintain a sense of spirituality, and how accurate of a portrayal are the representations? How is spirituality maintained through the interactions of all other elements of the material/conceptual landscape associated with the site? Repeat photography, field observation, and archival research were used to answer these questions. Several dialectical considerations are discussed in order to provide a more in-depth understanding of the site's interactions with its surroundings. Subsequently the introduction of a material/conceptual landscape site analysis model, developed in regards to this pilgrimage site but potentially applicable elsewhere, paves the way for understanding the intricate interactions taking place among different aspects of the material/conceptual landscape.

Keywords: Mexico City, material/conceptual landscape, indigenous spirituality, pilgrimage, geography of religion, cultural geography

Kazimierz J. Zaniewski, University of Wisconsin-Oshkosh. Email: zaniewsk@uwosh.edu; Trends in Population Change in the United States, 2000-2005

The paper examines regional differences in demographic trends in the United States since the 2000 census. Two components of population change, natural increase and net migration, and their relationship to socio-economic conditions, levels of urbanization and relative location are examined at the county level with the use of analysis of variance. Economically depressed areas, particularly many farming and mining dependent areas have recorded population decline. On the other hand, counties with the strong service sector, retirement destination and recreation areas have gained population since 2000. The levels of urbanization and proximity to metro centers have been positively correlated with population growth rates. Implications of this analysis for future research are also briefly discussed.

Keywords: population change, United States

Marc Zarrouati, University of Toulouse (France). Email: marc.zarrouati@toulouse.iufm.fr; Torture: a 'liberal' disciplinary mechanism?

In "The Birth of Biopolitics", Michel Foucault defines political liberalism as an intrinsically restrictive movement which the 'Police State' imposes upon itself. In this type of rationalisation of the 'government of populations' which was beginning to develop in Europe in the mid-18th century, 'Raison d'État', far from disappearing, becomes anchored in the 'power over people's lives' or 'biopower', instead of in the 'discipline of their bodies. In this connection, the legal process of granting civil and political freedoms is a secondary consideration, insofar as it takes over a pre-existing political rationale, which makes it possible. Foucault's thinking on liberalism therefore allows for the genealogy of the concept of 'State of Exception' - as introduced by Giorgio Agamben - as a 'liberal' political expression of the old 'Raison d'État'. We propose to study the genealogy of this concept, starting from an analysis of the power effects of the liberal discursive system legitimising torture as part of the war against terrorism. We will show, in particular, how the effect of such discourses is to relegate alleged terrorists to the fringes of the population of the governed, into a 'liminal' area where the State's administration of aliens is based, paradoxically, on a 'police' approach? rather than a diplomatic or military one, and in which torture emerges as an 'inverted' disciplinary mechanism? in a way that will be further explained.

Keywords: Biopower, Foucault, Torture, Terrorism, State of exception

Jamie Zech, Texas State University. Email: j.zech@txstate.edu; Processes of Exchange and Identity in Gentrifying Neighborhoods

This paper discusses the social and material impress of gentrification on two areas in Austin, Texas and how the processes of gentrification can dislocate or dissolve place identity. Both of the study areas are comprised of historically low-income, minority neighborhoods that are rapidly being transformed by an influx of upper-income Anglos. In addition to examining the dynamics of place identity in gentrifying communities, this study also explores whether and to what extent communities in the process of gentrifying exchange their values, beliefs, and practices (economic, political, social, ethnic, and cultural) - gentrifying with gentrified. How is socio-cultural space negotiated as the value of geographic space changes?

Keywords: gentrification, place identity, neighborhood

Richard Zehner, Great Basin Center for Geothermal Energy. Email: geothermal@mines.unr.edu; Curt Robinson, Geothermal Resources Council. Email: crobison@geothermal.org; Mark Coolbaugh, Great Basin Center for Geothermal Energy. Email: sereno@dim.com; Lisa Shevenell, Great Basin Center for Geothermal Energy. Email: lisaas@unr.edu; *GIS techniques in Locating Geothermal Resources*

Current interest in renewable energy has sparked a resurgence in geothermal power plant development, which utilizes water heated by the Earth to generate electricity. Unlike many other renewables, geothermal power provides reliable baseload (24/7) electricity in areas with favorable geology, such as the Western United States. California and Nevada together produce approximately 2500 MW of geothermal power, or 37% of the total world geothermal energy production of 6833 MW. High temperature geothermal systems suitable for power generation occur in regions where the combination of high heat flow and permeability produce hot water (>150°C) in sufficient volume. Most geothermal power plants around the world utilize the heat of cooling magma at volcanoes or igneous intrusions. However, in Nevada, extensional tectonics create a thinned crust and copious fracturing that produce the same conditions, without the magma. Since favorable conditions for geothermal development occur at the confluence of several geologic factors, Geographic Information Systems (GIS) provide an efficient method for regional geothermal exploration. Gravity gradients, super-accurate GPS/Geodesy, Quaternary fault movements, heat flow from wells, active seismicity, and groundwater geochemistry have all been employed in geothermal exploration and can be depicted as layers in a GIS. Geostatistical techniques such as weights of evidence and logistic regression have been used to quantify the relationship between these layers and high-temperature geothermal systems, resulting in the production of geothermal favorability maps.

Keywords: GIS, geothermal, California, Nevada

Ezra Zeitler, University Of Nebraska-Lincoln. Email: ezeitler@unlserve.unl.edu; *Commemorating Conquest: Native American Iconography in Secondary Schools*

Among the many ways American society symbolizes authority over indigenous peoples is through the appropriation of their culture in the form of the athletic team nickname and mascot. Secondary schools fielding teams with Native American nicknames in America contribute significantly in preserving false representations and stereotypes of those they claim to honor. By examining imagery preserved in high school yearbooks and critiquing photos of current athletic facilities across the country, this essay provides historic and contemporary examples of how disparaging misrepresentations of Native Americans are used by the dominant (White) society to memorialize its conquest over a "savage" foe. In addition, the use of public opinion forums such as letters-to-the-editor and similar online publications provide examples of hegemonic rhetoric that is typical of the dominant society.

Keywords: Native American mascots, cultural hegemony, iconography

Sarah E. Zell, MA, University of Texas at Austin. Email: sarahzell@mail.utexas.edu; Emily Skop, PhD, University of Texas at Austin. Email: eskop@prc.utexas.edu; Wilson Fusco, PhD, Universidade Estadual de Campinas. Email: wfusco@nepo.unicamp.br; *Legality, Ethnicity, and Return Migration: The Importance of Destination State Policy in Brazilian Migration*

In an era of expanding geographies of migration, this paper provides a comparative portrait of two relatively recent Brazilian migration flows. It compares migrant composition in a legally regulated "ethnic-return" guest worker program, from Maringá, Brazil to Japan, with that of a largely unauthorized flow, from Criciúma, Brazil to the United States. The research combines survey data analysis and fieldwork. The survey collected demographic information the migration history of more than 1,500 respondents in each sending city. To elaborate on the survey data, in the summer of 2005 in-depth semi-structured interviews with a sample of return migrants and family members/friends of migrants from each community of origin were conducted, sixteen in Maringá and eighteen in Criciúma. Describing demographic selectivity and social dynamics (i.e., use of networks) over time in the two migration flows, the study ultimately shows that though social networks allow for the diversification of migrant composition over time, destination country policies, as intervening obstacles, play an important part in influencing migrant composition and the migrant experience. Examining variables such as legal status and rate of return migration, these two cases when held in comparison allow for an assessment of the role state policies play in influencing the shape, intensity, and direction of migratory movements. The paper critiques theories on migrant social networks and transnational migration, emphasizing the importance of the state as an actor in organizing and even inducing migration flows.

Over the last decade, dam removal has emerged as an issue debated in numerous communities around the country. During this period, an increasing number of dams considered either safety hazards, too costly, or impediments to rivers restoration efforts were removed. While removal is a viable option for some dams which have become obsolete, the decision-making process surrounding a removal can lead to polarized and entrenched positions within a community. This study examines public attitudes toward the proposed removal of the Homestead Woolen Mills Dam, a small private dam located on the Ashuelot River in southwest New Hampshire. Originally proposed for removal in 1997, implementation was stalled due in large part to concerns and debate within the local community. A survey was conducted to examine residents' knowledge and views towards the fate of this dam. Results of the survey indicated that despite state and local government efforts to inform citizens about the benefits and costs of removing the dam, few felt they were well-informed about key issues. Additionally, a significant majority did not perceive any benefits to be associated with the removal and articulated other completing values, most importantly a historic covered bridge downstream of the dam. When considering removal financing, respondents expressed support for cost sharing among the private owner, the local community and the state and federal government.

Yu Zeng, University of Iowa. Email: yu-zeng@uiowa.edu; George Malanson, University of Iowa. Email: george-malanson@uiowa.edu; *Coupling Climate Change with Complex Alpine Treeline Dynamics*

Use of alpine treelines as a potential indicator of climate change has been suggested by previous research. But the impact of climate change on alpine treelines is still poorly understood. It is not only because of the difficulty to get reliable long time observational data, but also because of the fact that both climate change and alpine treeline exhibit complex behaviors. Therefore, it is important to couple the climate change with a spatially explicit treeline model to investigate the coupled complexity. In this study, we use a spatial simulation model to simulate alpine treeline advance under different climate change scenarios. The results are analyzed to gain insights on how signals of climate change influence alpine treeline dynamics.

Keywords: climate change, alpine treeline dynamics, coupled complexity

Barbara Zennaro, American Samoa Environmental Protection Agency. Email: zennarob@gmail.com; Edna Buchan, Environmental Protection Agency. Email: ebuchan2@yahoo.com; *A GIS approach to water quality stream monitoring in American Samoa*

Stream ecosystems in American Samoa are poorly understood and currently under threat by the Territory's growing human population. Monthly water quality samples were collected at a number of streams stations throughout the territory for the past 4 years to determine the status and trends in stream water quality. A total of 8 streams were selected annually representing different levels of anthropogenic disturbance (pristine, minimal, intermediate and extensive) within island watersheds. Stream data consisted of flow regime, temperature, salinity, conductivity, pH, dissolved oxygen, total nitrogen, total phosphorous, nitrite, nitrate, and enterococci. The data was stored and analyzed into a GIS geodatabase, and geospatial analysis was utilized to locate the source of pollutants. Preliminary results showed that there is a gradient of decreasing habitat scores with increasing level of human disturbance. In particular, one of the main threats to water quality is the waste originated by the numerous piggeries present in the territory. A new program will enforce regulations on piggeries, and this will most probably result in an improvement of water quality, as shown by previous pilot projects. The goal is to create a GIS model to easily identify the source and the fate of pollutants in American Samoa streams to help government agencies to make informed decisions of the managements of the limited island's resources.

Keywords: Water quality, Stream monitoring, GIS, American Samoa

F. Benjamin Zhan, Texas State University-San Marcos. Email: zhan@txstate.edu; Xuwei Chen, Texas State University-San Marcos. Email: xc1001@txstate.edu; Intercity and Urban-Rural Commute Flows in Central Texas

The coordination of different public transportation agencies in a given area requires a better understanding of commute flows between urban-rural areas and commute flows between different cities and counties in the area. This study uses U. S. Census Transportation Planning Package (CTPP) 2000 Part 3 journey-to-work data at the Traffic Analysis Zone (TAZ) level in a five-county area in the Austin-San Antonio area to analyze inter-county and urban-rural commute flows as well as the geographic distribution of these flows to the underlying transportation networks in the area. Preliminary results indicate that: (1) inter-county commute flows account for about 13% of the total commute flows in the area, and (2) commute flows between urban and rural areas account for 20% of the total commute flows in the area.

Keywords: Commute, GIS, Public Transportation, Transit, Network Flows

Chunhua Zhang, Nipissing University. Email: chunhuaz@nipissingu.ca; John M. Kovacs, Nipissing University. Email: johnmk@nipissingu.ca; Examining ENVISAT ASAR imagery for mapping forested wetlands of the Mexican Pacific

Although considered an extremely beneficial coastal resource, mangrove forests world-wide have experienced considerable degradation in the last few decades as the result of numerous anthropogenic causes. Protection of these often remote and extensive coastal wetlands has been hindered by a lack of up-to-date inventorying. Consequently, optical satellite imagery is now being used to map these forests. However, in many tropical regions persistent cloud cover limits these endeavors. The purpose of this investigation is to determine whether C-band satellite synthetic aperture radar imagery, which can penetrate clouds, could be used as an alternative source for mapping mangroves. Focusing on one of the largest mangrove forests of the Pacific coast of the Americas, we examined eight scenes of ENVISAT ASAR imagery to determine whether mangrove forests could be distinguished from other common coastal land covers including cropland, saltpan, palm forest and urban infrastructure. Moreover, we assessed the potential of this sensor for distinguishing various types of mangrove including dead stands, poor condition stands, healthy tall stands and healthy dwarf stands. The results of this study do suggest that the selection of the incident angle and, more importantly, the polarization mode greatly influences the ability to map these forests at acceptable accuracies. Of particular importance is the ability of the depolarized mode for separating the various types of mangrove studied.

Keywords: radar, mangrove, wetland, land-cover, classification, mapping

Haifeng Zhang, University of South Carolina, Binghamton University. Email: czhang@binghamton.edu; Testing Tiebout Hypothesis Using Geographic Analysis Approach

Previous economic and political research has drawn on the Tiebout hypothesis to explain how families choose their residence and neighborhood public services. In the context of education, families often sort themselves into relatively homogenous neighborhoods by income and taste for public education? wealthy families tend to live in neighborhoods with high quality schools and poor families cluster in neighborhoods with poor quality schools. Public school data and spatial statistical methods (i.e., spatial autocorrelation and spatial regression) were employed to test the Tiebout Hypothesis and reveal the phenomena of White flight in South Carolina. Evidence of White flight, suburban public schools experienced substantial increase of enrollments while inner city schools lost students, was disclosed. Significant positive spatial autocorrelation of public school participation among neighborhoods provided evidence for the Tiebout hypothesis.

Wu, Ph.D, Department of Biological System Engineering, Washington State University. Email: jwu@mail.wsu.edu; Effects of DEM Resolution and Source on Soil Erosion Modeling Using the WEPP Model

Digital elevation models (DEMs) vary in resolution and accuracy by the production method. DEMs with different resolutions and accuracies can generate varied topographic and hydrologic features, which can in turn affect predictions in soil erosion models, such as the WEPP (Water Erosion Prediction Project) model. This study investigates the effects of DEMs on deriving topographic and hydrologic attributes, and on predicting watershed erosion using WEPP v2006.201. Six DEMs at three resolutions from three sources were prepared for two small forested watersheds located in northern Idaho, USA. These DEMs were used to calculate topographic and hydrologic parameters that served as inputs to

WEPP. The model results of sediment yields and runoffs were compared with field observations. For both watersheds, DEMs with different resolutions and sources generated varied watershed shapes and structures, which in turn led to different extracted hillslope and channel lengths and gradients, and produced substantially different erosion predictions by WEPP.

Jianting Zhang, LTER Network Office, the University of New Mexico. Email: jzhang@lternet.edu; Deana D Pennington, LTER Network Office, the University of New Mexico. Email: ; Composing and Validating Conceptual Geospatial Models in the Kepler Scientific Workflow System

Motivated by the popularity of ESRI ArcGIS ModelBuilder in modeling executable geospatial processes, we propose to use the Kepler scientific workflow system for conceptual geospatial modeling. We develop ontologies of geospatial data types and operations and build a conceptual geospatial workflow library for composing abstract geospatial workflows. Supported by the Kepler structural and semantic type checking infrastructure, the ontologies and the library are used to annotate semantic types of in-put/output ports of the processing units in composed workflows and perform semantic validations on the workflows. The feasibility of the proposed approach is demonstrated using a real ecological and geospatial analysis example.

Keywords: Conceptual Modeling, Workflow, Semantics, Ontology

Jun Zhang, University of Minnesota. Email: zhan0167@tc.umn.edu; Local Talent, National Politics, and Global Networks: the Rise of Beijing as China's Dominant Urban Internet Clusters

Existing economic geographic studies are largely focused on the development of mature industrial clusters. As some recent literature points out, it is important to trace the origin of firm formation and cluster emergence in order to provide a more adequate explanation of regional economic development. In this paper, I seek to explain why Beijing was able to ascend as the dominant urban cluster in the nascent Internet industry in China. My data are mainly based on my interviews with Internet entrepreneurs during 2002-3, as well as a database on China's Internet industry that I have developed in the past few years. My analytical framework is centered on the interplay between three geographic scales: local, national, and global. I argue that the rise of Internet cluster in Beijing has benefited substantially from the particular post-1989 national political environment in China, Beijing's status as China's national capital and the largest urban talent base, its active local entrepreneurship in the incipient stage of the Internet industry, as well as the entrepreneurs' widespread overseas connections, particularly to Silicon Valley and the Wall Street.

Keqi Zhang, Department of Environmental Studies and International Hurricane Research Center, Florida International University. Email: zhangk@fiu.edu; Processing and Analysis Tools for Airborne LIDAR Data

Airborne LIDAR technology allows accurate and inexpensive measurements of topography, vegetation canopy heights, and buildings over large areas. In order to provide researchers high quality data, NSF has created the National Center for Airborne Laser Mapping (NCALM) to collect, archive, and distribute the LIDAR data. However, the LIDAR systems collect voluminous irregularly-spaced, three-dimensional point measurements of ground and non-ground objects scanned by the laser beneath the aircraft. To advance the use of the technology and data, NCALM is developing public domain algorithms for ground and non-ground measurement classification and tools for data retrieval and transformation. We present preliminary algorithms and tools for processing and analysis of LIDAR data. While Geographic Information Systems (GIS) provide a useful platform for storing, analyzing, and visualizing most spatial data, the sheer volume of raw LIDAR data makes most commercial GIS packages impractical. Instead, we have developed a suite of applications which combine self developed C++ programs with the APIs of commercial remote sensing and GIS software. Tasks performed by these applications include: 1) transforming data into specified horizontal coordinate systems and vertical datums; 2) merging and sorting data into manageable sized tiles, typically 4-km-square in dimension; 3) filtering point data to separate measurements for the ground from those for non-ground objects; 4) interpolating the irregularly spaced elevations onto a regularly spaced grid to allow raster based analysis; and 5) converting the gridded data into standard GIS import formats.

Keywords: LIDAR, NCALM, classification, and data processing

Tao Zhang, . Email: tz05@fsu.edu; Xiaojun Yang, . Email: xyang@fsu.edu; *Quantifying the Land Use - Water Quality Relationship in the Apalachicola River Basin*

Anthropogenic effects from upstream watersheds are degrading the nation's coastal ecosystem health primarily through unloading contaminants and nutrients into downstream estuaries. Understanding the cause of nutrient enrichment is critical for watershed assessment and management. This paper reports a research effort we have made to characterize the relationship between land use pattern and water quality in the Apalachicola River Basin. The study area extends across the States of Alabama, Georgia, and Florida. We assemble land/use data from USGS and water quality data from EPA and USGS. A step-wise multivariate regression method is applied to determine the relationship between land use/cover composition and water quality indicators at sub-watershed level. Our results indicate that land cover/use composition can explain a considerable variability of water quality indicators at the Apalachicola River Basin. Our further research will refine the analytic framework and incorporate a multi-scale perspective.

Keywords: Land use/cover, water quality indicators, Apalachicola, stepwise regression

Email: ; *Comparison of Diversity Characteristics Between Pedological and Biological Taxonomies*

Biologists have not paid much enough attention to the mathematical structures of biological classifications and their interpretations. A few have made such an analysis mainly using statistical distribution models in nonbiological classification, such as Soil Taxonomy. In this paper, we compare the biological classification of a target group of soil borne plant parasitic nematodes (the *Tylenchina* suborder) with a nonbiological one, Chinese Soil Taxonomy as an example, using the same methods and analyze the similarities and differences between them. Results show that both taxonomies are very similar, have the same structure and diversity characteristics, and are both informative systems. Both taxonomies fit well to the same distribution models such as power law and lognormal. Minor differences also exist between both taxonomies. Whereas the *Tylenchina* suborder is a more profuse branching system than Chinese Soil Taxonomy, the latter seems to be a little bit better descriptive as an information system (according to the evenness values). The Willis curves show the Chinese Soil Taxonomy has a more regular structure than the tested biological classification. This feature might be explained by the distinct taxonomical practices in using both disciplines. (Supported by NSFC 40671012)

Yanli Zhang, GeoTREE, University of Northern Iowa. Email: yanlizhang@hotmail.com; Ramanathan Sugumaran, GeoTREE, University of Northern Iowa. Email: sugu@uni.edu; *Development and Validation of a Web-based Watershed Management Spatial Decision Support System*

Watershed is the natural resources unit and its management is always a challenging job because of the broad responsibilities. In order to keep balance between development pressure and environment protection for a sustainable future, efficient tools and techniques are constantly needed by local planners and government agencies. Also, public participation at the beginning of planning process can reduce the number of appeals and can help managers to identify the concerns of local residents at the earliest stage. Based on these two considerations, we developed a web-based watershed management spatial decision support system (WWMSDSS) using the Watershed Management Priority Indices (WMPI) approach. WMPI is a zoning method for watershed management planning and it integrates land use/land cover derived from the remote sensing data, hydrological data, soil, slope, roads, etc. In order to support watershed planning, the land is divided into three categories: Conservation Priority Index (CPI), Restoration Priority Index (RPI), and Storm water Management Priority Index (SMPI). The WWMSDSS was developed with ArcGIS Server®, ASP, Java Script, and Visual Basic .NET®. Several graphical user interfaces have been developed to assist potential users. This presentation describes the development and validation of the WWMSDSS for Dry Run Creek watershed in Cedar Falls, IA. It works as a web-based spatial data analysis application and allows user to interactively run the whole system to evaluate different scenarios.

Feng Zhao, Boston University. Email: zhao26@bu.edu; *Spring flooding mapping for the purpose of restoration in Connecticut River Watershed using Landsat etm plus and digital elevation model*

Spring flooding has been frequent in parts of New England region and, hence brought a great loss to people residing along the Connecticut River watershed. As an essential step to identify the appropriate sites for restoration, mapping the intraseasonal flooding dynamics is necessary before the restoration takes place. In this study, a typical spring flooding was mapped based on the ETM+ data acquired in 2001 and the DEM. A composite image consisting of a water index layers for both April and September, respectively and a hill shade layer, was stacked to better display the flooding area. Then an unsupervised classification was performed, and corresponding flooding extent was extracted. The high overall accuracy indicates that the methodology was both reliable and efficient for spring flood mapping.

Email: kbergen@umich.edu; *Effects of Urban Sprawl on Gross Primary Production (GPP): Sensitivity of Estimation to Land-Cover Data Quality*

Suburban and exurban development occupies a large fraction of the land surface in the United States. Their impacts on ecosystem carbon fluxes and stocks are yet to be fully understood. In our study, we investigated changes in gross primary production (GPP) between 1991 and 1999 in Southeastern Michigan, where low-density residential settlement has occurred at the urban-rural fringe. We also analyzed sensitivity of the estimated changes in GPP to remotely sensed land-cover data and its relations to landscape spatial patterns. Our approaches included: 1) estimating the growing season GPP with Landsat land-cover and AVHRR NDVI data based on the light-use-efficiency theory; 2) sampling four townships representative of different stages and trends of residential development; 3) using Monte Carlo simulation in each of the four townships to generate 50 realizations of the 30-meter land-cover data by introducing classification errors that consider spatial patterns of commission errors; 4) calculating GPP and its changes based on the simulated land-cover data and deriving estimation sensitivities by different stages and trends of residential development; and 5) examining correlation between the estimation uncertainty and patch characteristics of the original and simulated land-cover data. We found divergent responses of GPP to residential development trends. The estimated GPP increased in low-density development areas and decreased with the intensified development. We also found the estimated GPP is less sensitive to land-cover data in urban or rural areas than in suburban or exurban areas, where landscapes are more fragmented.

Hägerstrand's time geography presents an elegant conceptual framework for representation of human activities in a space and time context. Due to the advancements in location-aware technologies and in geographic information systems, there has been a renewed interest in time geographic approach in recent years. The classical time-geographic framework however falls short of providing adequate analysis functions for examining and comparing spatio-temporal patterns of and spatio-temporal relationships among different space-time paths. Although some recent studies have made good progress in expanding the analytical capabilities of time-geographic approach, there is a need to develop exploratory analysis functions to help identify the hidden spatio-temporal patterns and relationships in large activity datasets. This paper presents selected exploratory analysis functions that employ the concepts of data aggregation and cluster analysis. We also will present a pilot study, which is based on travel diary data collected in South Florida and is implemented in a GIS environment, to

discuss the strengths and limitations of the suggested exploratory analysis approach.

Keywords: time geography, space-time path, data aggregation, cluster analysis

Tao Zheng, University of Maryland - College Park. Email: tzheng@glue.umd.edu; Shunlin Liang, University of Maryland. Email: sliang@geog.umd.edu; Mapping Incident Photosynthetically Active Radiation From AVHRR Data

Because Photosynthetically Active Radiation (PAR) controls vegetation's photosynthesis, PAR has become an indispensable driving parameter for many ecosystem models. A number of algorithms have been developed to estimate PAR using remotely sensed data, however, none of the existing algorithms or products taps into the valuable resource of more than 20 years of continuous observations taken by Advanced Very High Resolution Radiometer (AVHRR). Deriving PAR from AVHRR data has its unique merit considering that many ecosystem models require long time data record for initiation, calibration and validation. In this paper, a new method was developed to estimate incident PAR from AVHRR visible band data, which has two components. The first component is to estimate instantaneous PAR with an algorithm that is centered on deriving both surface reflectance and atmospheric properties simultaneously from top of atmosphere radiance values. A series of sequential observations at a same location, along with pre-created lookup tables, enable this simultaneous estimation. The second component is to scale the instantaneous PAR to daily average value using a sinusoidal model. This new method was implemented over the continental United States using one-year AVHRR data of 1999. The accuracy of the estimated instantaneous and daily PAR was assessed by two methods: first, they were compared with PAR values derived from co-located half-hourly Geostationary Operational Environmental Satellite (GOES) data; and second, they were validated against ground measurements taken at five Fluxnet sites.

Keywords: PAR, AVHRR, Lookup Table

Sheng Zhong, The University of British Columbia. Email: mppshengz@yahoo.com; What Makes Shanghai's Suzhou Creek So Attractive? A Preliminary Study on Location Choices of Suzhou Creek Creative Enterprises

Suzhou Creek Area, one of Shanghai's traditional industrial bases, had seen much of its industrial and warehousing space turn derelict in the mid 1990s due to obsolescence and public policy interventions. However, since a Taiwanese architect converted a historic warehouse into a modern design studio in 1997, the area had miraculously been transformed into a magnet for artists and creative enterprises within a few years' time. This paper is an attempt to explore the reasons behind Suzhou Creek Area's post-industrial revival from a demand-side perspective, namely the location choices of artists and their enterprises. A questionnaire survey based on non-probability sampling methods was conducted in May 2006, mainly covering questions in three areas: What are the basic profiles of Suzhou Creek creative enterprises? What are their location preferences? What impacts do urban planning and the surrounding property development have on their location decisions? From the survey, it was found that most of these creative enterprises are small in scale and they value the spaciousness of industrial and warehouse buildings, the cultural meanings of place, good transportation and closeness to clients and other enterprises. While many of them expressed concerns over the proliferating property development nearby, they were generally optimistic of a win-win situation based on policy interventions. Although results from this empirical study are far from conclusive, given the constraints of the sampling methods used, they nevertheless can shed a bit light on the formative mechanisms of emerging creative clusters in Shanghai.

Keywords: Shanghai, Suzhou Creek, location choices, artists, creative enterprises

Bin Zhou, George Mason University. Email: bzhou@gmu.edu; Wenwen Li, . Email: wli6@gmu.edu; Chaowei Yang, . Email: cyang3@gmu.edu; Cyber Infrastructure for Geospatial Applications

Cyber infrastructure offers great computing potential with high reliability and throughput. Through grid, cyber infrastructure provides the capability to break large dataset computing down into many smaller ones, and the capability to divide intensive computation, that would be impossible on a single computer, into parallel computations. Therefore, Grid computing can satisfy the geospatial applications that require large data resource and/or intensive computational capacity. To support such applications, we developed a grid platform using Globus, condor, and condor-G. Via interfaces provided and developed, a Web user can implement geospatial applications in a secure, scalable, and reliable fashion. We'll also extend this platform to the GMU campus as a campus grid, and connect to SURF grid to share resources. Integrating these widely distributed computing resources using grid technology enabled the geospatial applications

that can not be done previously on single machine.

Bo Zhou, University of Missouri-Columbia. Email: bz9n9@mizzou.edu; The application of Hyperspectral Remote Sensing in detecting Sericea in Missouri

When conservationists in Missouri realized that *Sericea Lespedeza* (later in this paper referred to as *Sericea*) is taking its toll in threatening the healthiness of the economic vegetation, they decided to start controlling the invasion of this species. A major challenge encountered is to map its spatial spread. While remote sensing and aerial photography have been available for many years, newer detecting technologies as implemented in hyper-spectral sensors have made it possible to acquire detailed laboratory-like spectrum of *Sericea* patches and surrounding natural grasses in the air. In this study I will discuss one case study of detecting *Sericea* using the AISA image that records the spectra at high spectral (2.9nm bandwidth, visible-infrared) and spatial (~1m) resolution. Ground reference spectra will be acquired using the Analytical Spectral Devices (ASD). The study area includes a public grassland owned by the Mark Twain National Forest and a private pasture land in Missouri. The AISA images will be processed with the spectral feature mapping followed by the supervised classification methods. The results will be validated based on field surveys.

Keywords: Remote Sensing, Hyper-spectral, Weed detection.

Libin Zhou, Florida State University. Email: lz06c@fsu.edu; Xiaojun Yang, Florida State University. Email: xyang@fsu.edu; Neural Networks for Urban Landscape Classification From Satellite Imagery

Accurate landscape mapping is a prerequisite for sustainable urban and landscape planning. This paper reports a research effort we have made to improve landscape mapping from Landsat Enhanced Mapper Plus (ETM+) imagery by parameterizing a feed-forward neural network. The study area is part of the Beijing metropolitan area, which contains a mosaic of complicated landscape types. A multi-layer perceptron network is parameterized with a variety of architectures to classify an ETM+ image into seven major land use/cover types. For comparison purpose, the same training data set for neural network classification is used for a classic parameter-based classifier, namely, Gaussian Maximum Likelihood (GML). The classification maps from the two different approaches are assessed in terms of their accuracy using the same set of reference data derived from field mapping and photographs, topographic maps and SPOT panchromatic image interpretation. We find that neural networks can generate noticeable improvement in classification accuracy when comparing to the GML classifier. However, we find that the performance of neural network classification varies with the architectures parameterized. Our further research will continue to optimize the parameters that control the structure of neural networks so that better landscape classification can be achieved.

Yu Zhou, PhD., Vassar College. Email: yuzhou@vassar.edu; *Synchronizing Export And Import Substitution: Path Of China's High-Tech Industry*

Studies on technological changes in developing countries have emphasized export sectors and state intervention as the proven path for technological upgrade; while virtually ignore the role of domestic market in technology learning. This paper challenges such established theories through case studies in China's information, communication technology (ICT) sectors since the 1990s. It argues that technological development may be more effective if import substitution is jointly practiced with export. In China, it is precisely the synchronization of export upgrade and domestic market growth that have helped to create China's most competitive companies. By analyzing the practices of Chinese firms' in personal computer manufacturing, multimedia semiconductor chip design, and in using and establishing technical standards, the paper shows the on-the-ground deficiency of foreign multinational corporations in responding to the needs of an emerging market. It also argues that the regional division of labor and inter-regional collaboration of firms in China's ICT industry have created possibilities for synergy, and multiple opportunities for local technological learning and innovation.

Keywords: Export, import substitution, China, technology development, ICT sectors, regional collaboration

Email: ; *A Hybrid Model for Modeling Watershed Behaviors and Its Application for Scenario Analysis*

A hybrid model was developed for modeling hydrological behaviors and their impact on soil erosion at landscape level. The model consists of two major parts: the physically-based part and the empirical part. The former is a spatially distributed hydrological model, WetSpa Extension, used to model the hydrological behaviors over space. The latter is a sediment module which in turn consists of two components: soil erosion model based on the empirical relationship between the discharge and sediment yield derived from experimental plots, and a simple sediment delivery ratio describing sediment transport. At each location (such as a raster cell) the hybrid model computes the volume and speed of discharge using WetSpa Extension. The discharge is then used to compute the amount of soil erosion using empirical relationships. The model is capable of operating at very fine space and temporal resolutions (such as daily or hourly discharges and event-based sediment yields at 5 meters or finer pixel resolution). The model has been applied in the small catchments of HeMingGuan watershed, located in JiaLingJiang River basin in central SiChuan Province. Validation of modeling results from these catchments suggests that the model performed successfully in simulating daily discharge and event sediment yields. In addition, the model was used to assess the effects of the water and soil reservation practices over these catchments and it was found that this model can serve as a scenario analysis tool for natural resource managers to contemplate the effects of their managerial practices

Keywords: Environmental Modeling; soil erosion; physically-based models; hydrological models; scenario analysis; WetSpa Extension; China-SiChuan

Haijun Zhu, George Mason Univ.. Email: hzhu1@gmu.edu; *Vector Data Compression Using DPCM and Entropy Coding*

The volume of vector data transmitted via Internet is one of the most critical factors influencing the quality of geospatial information service. A proper compression algorithm (e.g., compression of natural images with JPEG) can significantly reduce the data size. This paper proposed a vector data compression algorithm using Differential Pulse Code Modulation (DPCM) and entropy coding. DPCM, a simplification of predictive coding, is used to reduce the redundancy between adjacent points of vector data. Lossless entropy coding is adopted to further reduce the size of data compressed. The intrinsic complexity of vector data structure is the main obstacle for designing the vector data compression algorithm. To overcome this problem, an entropy coding algorithm is specially designed so that the beginning of each geometry feature can be directly identified from coded bit stream without extra bits added. This approach also makes the proposed algorithm easy to implement.

Tongxin Zhu, University of Minnesota. Email: tzhu@d.umn.edu; Tongxin Zhu, University of Minnesota-Duluth. Email: tzhu@d.umn.edu; *Gullying and Tunneling in the Hilly Loess Region of Northern China*

Gully development has attracted increasing attention recently. The growing interests are driven by the increasing concerns over the off-site impacts caused by soil erosion at the larger spatial scales than plot-scales (Valentin, et al, 2005). Piping/tunnel erosion is closely associated with gully development in many regions of the world. However, detailed studies of the interactions between gully development and piping are scarce. The role of piping/tunneling erosion in initiating and extending gully systems remain important for geomorphological theory. The present study was conducted in a semi-arid watershed in the hilly region of northern China and the objectives of this study are (1) to investigate the role of tunnel erosion in the development of different types of gullies; (2) to examine the tunnel activities at different stages of gully development; and (3) to identify the conditions favoring tunnel and gully development. All gullies were identified in the 9.1 km² watershed. The activity of gullies was assessed in the field by criteria such as sharp-edge, mass wasting, cracks, recent deposited sediments, biological crusts, and vegetation re-growth. It is found that gullies with tunnel development at the gully head are all very active in erosion. However, not all active gullies are associated with tunnel erosion. The development of gullies with/without tunnels is largely controlled by the topographic and lithologic conditions.

Keywords: gully, tunnel erosion, piping, Loess Plateau, China

Yuanda Zhu, Louisiana State University. Email: yzhu2@lsu.edu; Steven L Namikas, Louisiana State University. Email: snamik1@lsu.edu; *Modelling the Spatial and temporal variations of surface moisture content on a micro-tidal, fine-grained beach, Padre Island, TX*

Surface moisture content is one of the most important factors in meteorology, hydrology and ecology. Modeling surficial moisture dynamics is still underdeveloped to date due to its extreme complexity related to saturated and unsaturated water flow underground and energy and mass transfer between earth surface and atmosphere. Surface moisture content can be predicted technically using various hydrophysical models. Traditional hydraulic models involving liquid and vapor water transport usually have no consideration of the evaporation dynamics on the surface. Land surface models which allow variable soil moisture content treat only the bulk soil moisture, and they in many cases have a specified bottom layer in which zero exchange with deeper aquifers is assumed. However, field investigation shows that spatial and temporal variations of beach surface moisture content are closely linked with groundwater table fluctuations and diurnal and inter-diurnal changes of evaporation. A coupled evaporation and groundwater model is therefore needed to be developed to simulate beach surface moisture variations. Based on an eight-day field experiment, groundwater table oscillations, water retention of beach sand, and evaporation process were simulated analytically and numerically to represent the spatiotemporal variability of beach surface moisture content.

Keywords: surface moisture content, beach, modelling, Padre Island

Asim Zia, San Jose State University. Email: asim.zia@sjsu.edu; *Land Use Adaptation to Climate Change: Forecasting the Economic Impact of Hurricanes in the Atlantic and Gulf Coastal Regions of the U.S.*

Global climate change, especially the phenomena of global warming, is expected to increase the intensity of land-falling hurricanes. Societal adaptation is needed to reduce vulnerability from increasingly intense hurricanes. This study quantifies the adaptation effects of potentially policy driven caps on population densities, housing densities and agricultural cover in coastal (and adjacent inland) areas vulnerable to hurricane damages in the Atlantic and Gulf Coastal regions of the U.S. Time series regressions, especially autoregressive moving average (ARMA) models, are estimated to forecast the economic impacts of hurricanes of varying intensity, given that various patterns of land use — population, housing, agriculture — emerge in the Atlantic and Gulf coastal counties of the U.S. The ARMA models use time series data from 1900 to 2005 for inflation adjusted hurricane damages and socio-economic and land-use data in the coastal or inland regions where hurricanes caused those damages. Multiple spatial scales are employed to test the robustness and sensitivity of these results. The results from this study provide evidence that increases in housing density and agricultural cover cause significant rise in the de-trended inflation-adjusted damages. Population density, surprisingly, shows up as negatively correlated with the de-trended damages. As expected, higher intensity hurricanes significantly increase the economic damages. More importantly, hurricane intensity shows up as a variable with the largest standardized effect on hurricane damages. The evidence from this study implies that land use adaptation in the form of capping housing density and agricultural cover can significantly reduce vulnerability from intense hurricanes.

Friederike Ziegler, University of Durham, UK. Email: r.f.ziegler@durham.ac.uk; 'I'm not old' - towards a new theoretical approach to ageing research

'Old age' has been studied by social scientists for some decades. Nonetheless some researchers have argued recently that ageing research lacks in theories which embrace the various aspects of ageing, such as the individual's experience of the ageing process or changes in social structures and generational cultures. Much academic literature and western popular culture consider old people either as a 'problem' for society or as vulnerable to social exclusion. The life course approach is one of the most promising attempts to link the ageing person with his/her past and to study the relationships between biographical and historical events. Despite of this 'ageing' is considered as it relates to 'old age' only, i.e. the later stages of a person's life. On the basis of recent qualitative research with older people in the UK, I am here developing an approach to ageing which considers ageing as a process a person is subject to from the day they are born. Older people do rarely consider themselves as 'old', and I will investigate the significance of this finding. This argument fundamentally questions what it means to live life as a human being. Ageing is integral to what it is to be human and does not begin at a certain age. This approach could provide a theoretical as well as a moral basis for researchers of ageing, in that it will highlight the vital contributions of older people to society, not just in an economic context, but also as vessels for human experience and as vectors of knowledge.

Keywords: ageing- theory- life course

Pulses of tree recruitment at an oak savanna in east central Minnesota coincided with dry periods throughout the past 200 years. Bur oak trees reached coring height (30 cm) as early as 1809, before Europeans settled on the sand plain. Land managers had thought that settlers planted green ash on sandy ridges in the oak savanna, but ash trees established over a wide range of dates beginning in the early twentieth century. Northern pin oak shrubs are increasing in abundance since the introduction of prescribed burns, suggesting that the current management plan might be creating oak woodland rather than an open, park-like savanna.

Kathryn L. Ziewitz, Florida State University. Email: klz06c@fsu.edu; *From the Redneck Riviera to Florida's Great Northwest: Rebranding Florida's Panhandle*

The Florida Panhandle is undergoing a transformation. This largely rural region has experienced a surge in real estate development in recent years, especially along the coast, that has rivaled other better-known markets in peninsular Florida. At the same time, business and government entities in the region have actively engaged in a campaign to change perceptions about the identity of the region. This paper examines the discourse used by the region's dominant landowner in its efforts to "re-brand" the region in order to attract land buyers. This company, the St. Joe Company, owns approximately 800,000 acres in the region and is Florida's largest landowner. In the late 1990s, the company ceased its operations as a pulp and paper manufacturer and began to convert many of its holdings, chiefly timberlands, into an array of real estate developments. For this paper, both printed and visual media will be analyzed, including advertisements, annual corporate reports, press releases, and items from newspapers and magazines, to trace the branding campaign from its inception in 1997 to present. The analysis will include attention to: 1) How the area's natural attributes are being capitalized upon to sell land in similar fashion to other consumer goods; 2) The company's "New Ruralism" campaign, which seeks to transfer the success of the high-end coastal marketing campaign to inland rural properties; and 3) Reactions to the re-branding campaign by both the target audience and existing residents of the region.

Keywords: Florida Panhandle, real estate development, regional identity

Karl S. Zimmerer, University of Wisconsin - Madison. Email: zimmerer@wisc.edu; Karl S. Zimmerer, Dept. Geography and Nelson Institute for Environmental Studies. Email: zimmerer@wisc.edu; *Spatial Externalities in Land Use: Economic Geography and the Political Ecology of Agriculture and Agrobiodiversity*

Spatial externalities contribute to the economic processes that result in the clustering of land use and land cover. Spatial externalities influence the potential for income on adjoining parcels of land and hence exert potentially important influences on land use choice and landscape pattern. Economic theory suggests that where spatial externalities are present on a landscape the private allocation of land will not necessarily maximize economic welfare. Recognizing and evaluating the role of spatial externalities in land use can be used to identify a role for policy to enhance environmental quality and farmer welfare. Statistically quantifying the presence of such externalities from landscape pattern is one of the first steps in informing policy. It is insufficient for policy guidance, however, unless the underlying processes of the externality are identified and determined as positive or negative. This paper discusses the underlying processes of spatial externalities and potential identification strategies associated with quantifying these spatial externalities from observations of landscape change. The paper relates the economic dynamics of spatial externalities to the political ecology of agriculture and agrobiodiversity in particular.

Jeffrey A Zimmerman, PhD, University of Wisconsin Whitewater. Email: zimmermj@uww.edu; *From the "Gray City" to the "Green City": Urban Sustainability, the Provision of Eco-Amenities, and the Making of the New Chicago*

Mayor Richard M. Daley promised in 1999 to re-make Chicago as the "greenest city in the world". His administration has since spearheaded a multi-scalar policy package; one that successfully reworked the city into what Daley now calls a global "eco-superstar". Daley's efforts ranged from the primarily cosmetic to dramatic, even radical, institutional reform. Most visible for the average Chicagoan was the planting of over 400,000 trees across the central neighborhoods. This was accompanied by an aggressive re-landscaping effort which transformed miles of utilitarian thoroughfares into orderly boulevards showcasing hearty prairie perennials. Deeper reform initiatives included the building of two million square feet of "green roofs", the addition of new bike paths, adding green space to the neglected Chicago Riverfront, and adopting the "Chicago standard", which mandates that all public buildings meet LEED certification by the US Green Building Council. This paper evaluates these green city-rebuilding efforts in Chicago. Although there is much to praise in Daley's approach, what remains largely unexamined is the particular geographic distribution of these eco-amenities. A closer inspection of these patterns reveals that green amenities have been enlisted both in the service of gentrification at the local scale, and towards securing Chicago's place as a "progressively unique" place within a broader, more globalized inter-urban competition.

Keywords: urban sustainability, Chicago, green amenities, gentrification

Email: cerestrepo@gmail.com; *Spatial Concentration Of Critical Infrastructure Systems And Resource Allocation For National Security Grants*

The spatial concentration of critical infrastructure systems such as energy production and transportation represents a vulnerability to national security. These systems are critical to the functioning of our society and are often the target of terrorist attacks abroad. In addition, emergency response efforts can be hindered if they are disabled or destroyed during a natural disaster. This paper uses GIS to analyze the spatial concentration of electricity production and consumption, transportation (vehicle-miles traveled, auto and bus registrations, and traffic congestion), and oil and gas pipeline networks (natural transmission and distribution and petroleum product liquid pipelines) at the state and local level and examines how this information can be used as inputs into resource allocation decisions for security grants. The results indicate that there are very important differences in the spatial distribution of infrastructure systems. States such as New York and California have a high concentration of the country's public transit rider-ship and states such as Texas, Louisiana and California have high concentrations of oil and gas pipeline networks. Although data used are primarily at the state level, the methods are transferable to other geographic scales. The data are compared to current resource allocation programs such as the Department of Homeland Security's Urban Area Security Initiative and Urban Area Transit

Security Grant Program.

Friedrich M. Zimmermann, University of Graz - Austria. Email: friedrich.zimmermann@uni-graz.at; *Tourism in Austria - Growing Tourism Centers and Suffering Peripheries*

Austria is well-known for the highest tourism intensity in the world. Despite of the very positive international perspectives for tourism, Austria is facing enormous pressure from international competition. Tour operators dominate the international supply and create images and fashions by using efficient marketing strategies. Additionally international capital is supporting tourism centers and business concentrations, offer efficient organization and price advantages by using economies of scale and low-cost labor. This leads to the domination of some multinational tourism groups which cause enormous pressure on small- and medium-scale tourism offers, esp. in spatially disadvantaged peripheries. Austria's tourism can be characterized by problems like small-scale, family-run enterprises with financial problems, high quality but high prices (high taxes, high labor costs), traditional tourism (infra)structures with image problems and effects of inertia, high ecological standards with high costs and strict development limits and social impacts, like tourism weariness of the local population. The paper is the result of a multivariate study of the competitive capacity of tourism regions in Austria. It refers to the spatial concentration process with a commercialization of supply, esp. in winter resorts and cities; in contrast to this it illustrates the crisis of the traditional Alpine summer destinations, esp. in rural peripheries and the challenges of a sustainable tourism and community development. Initiatives by the European Union to reduce regional disparities by improving the tourism situation in remote areas are discussed, as well as sectoral strategies like life-style oriented product specifications, innovative marketing, high standard specialization, and (cross-border) cooperation.

Alisa S. Zlotoff, Department of Geography, University of Colorado-Boulder. Email: alisa.zlotoff@colorado.edu; *Branding Trust: Producing a Risk-Free 'Economy of Qualities' for Organic Milk*

Callon et al. (2002) utilize the concept of the 'economy of qualities' to analyze values of commodities that are not strictly economic, values that derive from mutually constitutive social relationships between producers and consumers. In order to illuminate the ways in which consumers, marketers, and producers interact to produce value, this paper applies the economy of qualities to a case study of organic milk production and marketing in Colorado. Framing an analysis in this way makes it possible to address the power of consumers to shape, define, and qualify products' values. In addition, this analysis helps to show how actors' broader anxieties regarding food cohere in qualifying organic milk as risk-free. Organic milk's value hinges on this risk-free definition, which is expressed through various marketing narratives that reference the product's safety, trustworthiness, and wholesomeness. Such narratives, moreover, illustrate the connections between perceptions of food's risk and productions of food's value.

Email: Joan.Martinez.Alier@uab.es; *Wind energy conflicts and environmental justice concerns*

Environmental justice is typically studied as a situation of inequitable distribution of costs and benefits from natural resource use, looking at how the growing environmental load of economies is transferred to disfavoured groups while benefits remain with influential ones. However, a new employment of the concept has emerged in the context of conflicts regarding the promotion of wind energy. Wind parks opponents claim that ecosystems where energy is produced bear landscape impacts of 'clean' energy generation while benefits are transported to sustain economic activity in rich and unsustainable areas (e.g. cities) outside the production locality. They argue that this socio-geographically unequal distribution of environmental costs and benefits generates a new sort of environmental injustice legitimised by sustainability claims (need to tackle climate change). To consider the relevance of this argument for environmental justice we explore the political ecology of wind energy generation in rural Catalonia, focusing on a case study of conflict over a massive wind park construction on a landscape of particular historical value (major Spanish Civil War battle site). We examine the institutional framework that promotes wind energy and consider to what extent it generates unequal distributions of environmental burdens and benefits that serve as a source of environmental injustice and ecological distribution conflicts. We also look at the impacts of this framework on the environmental movement which is split up into wind energy

opponents and supporters who emphasise different values (e.g. landscape/ climate) and normative arguments (e.g. environmental justice/ eco-efficiency) regarding the nature of 'green' economic activities.

Edmund J. Zolnik, Ph.D., George Mason University. Email: ezolnik@gmu.edu; *A Biographical-Multilevel Approach to the Study of Travel Behavior*

One of the principal shortcomings of quantitative analyses in human geography is the over reliance on models which can only account for the average outcomes of spatial events. While methodological advancements in the form of multilevel models now allow geographers to account for average outcomes as well as deviations about average outcomes, it is not without question that such models can fully account for the social, cultural and political contexts which affect human behavior. In this paper I argue that mixed-method research that adopts a biographical-multilevel approach to the study of human behavior can address some of the concerns raised by humanist and critical geographers about quantitative analyses in human geography. Using travel behavior in the United States as an example, I will discuss how a multilevel approach can complement qualitative analyses which rely on biographical accounts of travel behavior. Such mixed-method research offers human geographers the opportunity to identify the appropriate role for quantitative methods as well as to explore how context affects behavior.

Keywords: biographical approach, multilevel models, travel behavior

Robert J Zomer, International Water Management Institute (IWMI). Email: r.zomer@cgiar.org; Glenn Hyman, Dr., CIAT - International Center for Tropical Agriculture. Email: g.hyman@cgiar.org; *The CGIAR-CSI GeoNetwork: Advancing Geospatial Science For Sustainable Development, Biodiversity Conservation, And Poverty Alleviation*.

The Consortium for Spatial Information (CGIAR-CSI) is an initiative of the the Consultative Group for International Agriculture Research (CGIAR), linking the efforts of CGIAR scientists, national and international partners, and others working to apply and advance Geospatial Science for International Sustainable Agriculture Development, Natural Resource Management, Biodiversity Conservation, and Poverty Alleviation in Developing Countries. The CGIAR-CSI facilitates collaboration and capacity building for data sharing, data dissemination, and geospatial analysis amongst the fifteen CGIAR centers and their many regional activities; with geospatial laboratories, scientists and researchers throughout the developing countries; and within the broader global research and development communities. The CGIAR-CSI Geonetwork project is a standardized and decentralized spatial information management environment, designed to enable access to geo-referenced databases, cartographic products and related metadata from a variety of sources, enhancing the spatial information exchange and sharing between organizations and their audience, using the capacities of the internet. This approach of geographic information management aims at facilitating a wide community of spatial information users to have easy and timely access to available spatial data and to existing thematic maps that might support informed decision making.

Leo Zonn, University of Texas at Austin. Email: zonn@mail.utexas.edu; Katherine Williams, University of Texas at Austin. Email: K.R.Williams@mail.utexas.edu; *The 'Alamo' on the Road: Mobility and the Cinematic Experience*

Over the last decade the Alamo Drafthouse Cinema of Austin, Texas, has established a unique reputation for its creative programming and for its audience friendly setting, including the serving of food and alcohol in a stadium setting. In 2002 the theater took the audience/film engagement one step further by creating the 'Rolling Roadshow Tour', whereby films were shown in settings that were associated with their cinematic subject matter. The meaning of venue and the nature of the audience participation were therefore uniquely and constantly constructed to fit the character of each film. The focus here is upon this engagement and the mobility that is so important to the program and to the audience itself. We examine this process from two views: firstly, whether it reflects an exercise of creativity that in fact is moving toward hyperreality with the 'absolute fake masquerading as the real'. Secondly, we draw upon Cresswell's theorization of mobility, which proposes that people are able to transgress norms of behavior and experience 'place' in unique and unorthodox ways. We believe that in the case of the 'Roadshow', regardless of how commercial it may have become, the audience exercise is one of ironic engagement and a need for community participation, and that the audience is well aware of the distinction between fantasy and reality which then itself becomes part of the appeal.

Matthew Zook, Ph.D., University of Kentucky. Email: zook@zooknic.com; Mark Graham, University of Kentucky, Geography. Email: immedium@gmail.com; *The Creative Reconstruction of the Internet: Google and the Privatization of Cyberspace and DigiPlace*

The Internet has often been portrayed as the ultimate leveler of information where existing hierarchies of power and privilege are undermined by meritocracy. But in practice some websites and functions are more equal than others and Google has become a key means to construct meaning out of disorder. This ordering, however, is at its heart a subjective and political process as Google's algorithms determines centrality and periphery on the Net. The recent incorporation of spatial elements into the Google indexing (e.g., GoogleEarth) raises fresh and geographically relevant concerns. This paper focuses on the construction, access and use of Google to deploy geo-referenced information in the physical environment and the ways this melding of code and place affects how people interact with place. Using the theoretical concept of DigiPlace this paper analyzes how GoogleEarth is structured and shapes what appears (and what does not) in DigiPlace. Although GoogleEarth has been lauded as a paragon of democratic decentralized difference, allowing a multitude of unfixed and fluid views and viewpoints to coexist, it remains that a certain amount of control is exerted by Google over what is seen. This control takes many forms including the direct manipulation of satellite imagery (often via blurring), the distribution of satellite imagery deemed highly sensitive to state and corporate concerns, the ordering of views and results, and ways in which various spatial elements are, and are not, represented.

James Zoulas, University of California, Los Angeles. Email: jzoulas@ucla.edu; Hongkyo Koo, University of California, Los Angeles. Email: gotiger9@ucla.edu; Antony Orme, University of California, Los Angeles. Email: orme@geog.ucla.edu; *Beach erosion and recovery: Nature versus nurture*

Beach erosion and recovery are natural occurrences on all coasts. Erosion is more or less predictable in response to specific storm events or more prolonged destructive wave series. Recovery occurs during ensuing phases of relative calm and constructive wave series. Some forcing events, such as tsunamis and great storms, have no recognizable frequency but, within a given tidal and eustatic framework, most controlling wave series function within seasonal, annual, and decadal recurrence intervals involving periodic and quasi-periodic cycles. Human disturbance of beach and nearshore systems, for example from sand mining and engineering projects, disrupts the natural system and replaces it with a nurtured system. Spatial disruption is evident from beach gains and losses, but disruption of temporal cycles only becomes obvious when beach changes of both natural and nurtured systems within a coastal cell are monitored over several decades. This paper explores the effects of cyclic and non-cyclic changes in beach geometry in three coastal cells along the southern California coast over the past 80 years, using archival data, repeat field surveys, historical aerial photography, and GIS analysis. Analyzed data support the hypothesis that temporal cycles of beach change, especially those involving artificial nourishment, are significantly shortened on nurtured coasts. This contrasts with temporal cycles on natural coasts, which are most influenced by increased storm activity related to quasi-cyclic El Niño events and warm phases of the Pacific Decadal Oscillation. These differences in long-term beach behavior raise economic, political, and legal issues regarding current practices of beach management.

Christine Zuhlsdorf, Wasserman Scholar, UCLA. Email: czuhlsdorf@gmail.com; *Concentrated Animal Feeding Operations and Their Effects on the Environment*

Vegetation health adjacent to bovine concentrated animal feeding operations was analyzed and compared to historical vegetation data; it was then referenced against the vegetation health surrounding free range beef farms. Feeding operations often contaminate surrounding natural resources by leaching toxins into the water and soil. The vast size of the concentrated feeding operations encompasses so many animals that the proportion of waste is nearly impossible to manage. Subsidies are readily given to these unsustainable operations. Remote sensing of the locations allowed for comparisons over a period of more than two decades. Using the normalized difference vegetation index (NDVI) for measuring spectral reflectance assisted in demonstrating the health of vegetation. In situ measurements provided a visual comparison to the remotely sensed data and the agricultural censuses statistics. The lack of enforcement of regulations contributes to the contamination of local water sources that then disperse the toxins to a greater area. Vegetation loss in surrounding areas continues to be a problem that affects various flora and fauna habitats. Subsidies encourage unsupported growth of the feeding operations. Concentrated animal feeding operations are unsustainable and affect more than their immediate environment. The risk of a large scale contamination increases as practices

continue to go unchecked and exceed the limits of local environmental loads. Continual monitoring of nearby plant communities helps measure the environmental degradation. A move to more sustainable management practices that combine free-range policies with economic gain will help the beef industry to still make a profit while conserving natural resources.

Since the 1970s, certain kinds of upscale restaurants, cafés, and stores have emerged as highly visible signs of gentrification. Taking Harlem and Williamsburg as field sites, we explore through interviews with store owners, data on changing composition of retail and services (1979-2006), and discursive analysis of print media the role of new stores as agents of change. We find that the media, city government, and quasi-public organizations (in the case of Harlem) have valued small upscale retail businesses, along with all forms of entrepreneurial capital, as symbols and agents of revitalization. However, the "boutiquing" of urban areas brings up complex social issues and questions for public policy. These include displacement of local retail and services for longstanding residents and the responsibility of the state for encouraging neighborhood stability and diversity, as well as whether government efforts to preserve affordable housing should also consider the mix of shops.

Keywords: Harlem, Williamsburg, entrepreneurial capital, gentrification, retail, state led revitalization

Michael Zukosky, Department of Geography and Anthropology, Eastern Washington University. Email: mzukosky@ewu.edu; *Settlement, Nature Reserves, and Pastoral Development: Engineering New Minority Localities in Northern Xinjiang*

In northwest China's Xinjiang region, international and domestic financial capital are mobilized in large-scale relocation and settlement policies for minority pastoral groups. Promoted as solutions to the economic and environmental problems of the region, new rural settlements for pastoralists represent an important flow of capital, as prioritized as "infrastructure construction" within the 'Open the West Policy.' At the same time, settlement, referred to as 'ecological migration,' interweaves with the establishment of forest reserves and draws upon other sources of funding through the nationally subsidized Forestry Bureau, enabling local governments to engage a modernist form of social and ecological engineering. Contrasting discourses of 'settlement' within a county level government and forestry bureau with the experiences of several settlement residents, this paper looks at some of the effects of settlement, as financial capital transforms both the social and natural landscape and its government, as new units for the administration of both land and people emerge. Moreover, the experiences of local residents speak to how settlement and its governance reflect critical, local imaginaries of state responsibility and obligation.

Leo Charles Zulu, Dr., Michigan State University. Email: zulu@msu.edu; *Conservation Re-Scaling And Emergence Of Community Forest Management In Malawi*

Predominance of community natural resources management (CNRM) in conservation policies in Africa over the past two decades is perhaps the biggest development since the start of scientific conservation. Broader neoliberal attempts to transform social relations by decentralizing governance to local communities, and widespread failure of centralized, top-down conservation have given currency to CNRM. Proponents tout social and ecological benefits, including more efficient environmental governance, better conservation, sustained provision of ecosystem goods and services, community empowerment, equity and social justice. Critics argue success is rare. CNRM transfers power and benefits from central bureaucracies to village bureaucracies composed of few local elites. Others see tyranny in the way CNRM is promoted, often leaving little room for constructive empirical criticism. This study contributes to this debate by examining the evolution and re-scaling of forest conservation policy over the past century in Malawi from top-down to CNRM introduction in 1996. It looks at substantive policy changes, motivations behind them, and their implications, drawing on historical accounts and contemporary community forest management in southern Malawi. Study findings show that introduction of community forest management policy in Malawi was more about externalizing conservation costs by a cash-strapped government than about community empowerment in

environmental governance. They point to the need for flexibility and balance between strong government leadership that acts as glue to hold CNRM together and rigid village-scale conservation. They highlight the need for CNRM strategies that allow forest conservation at multiple scales simultaneously to meet the needs of various social actors.

Joseph Terzungwe Zume, University Of Oklahoma. Email: jzume@ou.edu; Aondover Tarhule, University of Oklahoma. Email: atarhule@ou.edu; *Modeling The Relation Between Climate Variability And Groundwater Levels In A Shallow Alluvial Aquifer On The U.S. Southern Great Plains*

In arid and semiarid environments, alluvial deposits along streams often constitute shallow productive aquifers that support a variety of human activities. On the United States southern Great Plains for example, alluvial aquifers are some of the most dependable sources of water for irrigation, municipal, agricultural, and industrial uses. These aquifers also are critical to aquatic and wetland ecosystems because they recharge overlying streams during non-flood periods. Unfortunately, the dynamics of alluvial aquifers in these environments have not been fully understood, especially, how they might respond to the combined impacts of climate variability and enhanced anthropogenic water withdrawals. This study uses the U.S. Geological Survey's three-dimensional groundwater flow model, MODFLOW, to simulate the response of an alluvial aquifer in northwestern Oklahoma, to impacts of climate variability and aquifer exploitation. Northwestern Oklahoma is one of the southern Great Plains' areas that are drought-prone and experience episodic water shortages. By simulating several climatic as well as groundwater withdrawal scenarios, this study provides information that is necessary to evaluate and reconcile competing management alternatives for Great Plains' alluvial aquifers.

Keywords: MODFLOW, Southern Great Plains, Northwestern Oklahoma, alluvial aquifers, climate variability

Sandra Zupan, University of Wisconsin-Milwaukee. Email: szupan@uwm.edu; *Assessing Environmental Justice and A Community Empowerment Process: The Case of the 30th Street Industrial Corridor in Milwaukee, Wisconsin*

Brownfields, or contaminated, abandoned sites, overwhelmingly cause environmental and socio-economic burdens. Such burdens are especially significant in inner-city neighborhoods where brownfield sites are often concentrated. Redevelopment of these sites, however, mitigates health risk, adds amenities, and provides an opportunity for direct community participation. It has been suggested that meaningful community participation is the key to achieving environmental justice goals - economic, social and political empowerment of marginalized and poor inner-city communities. According to leading researchers such power changes could reverse the deteriorating conditions of inner-city areas and increase exercise of control over a community's future. Focusing on an area comprised of eleven distressed Milwaukee neighborhoods this case study seeks to reveal how disadvantaged and disempowered communities navigate and negotiate the process of public participation in order to improve and maintain the well-being of their communities. The importance of the proposed study lays in its attempt to advance the limited knowledge of existing power relationships, particularly at the urban, neighborhood level. Environmental justice and brownfields frameworks are merged in this study and placed in the spatial and temporal scalar context in order to creatively address the meaning and sustaining of the empowerment process in a localized context.

Keywords: Environmental justice, brownfields, community empowerment, Milwaukee
