Urban systems have a significant effect on the disposition of energy and water in an environment. While this locally significant climate effect only impacts a small area of the land surface, it has a direct impact on roughly half the human population. By simulations the combined effects of urbanization and larger scale climate changes from land cover change and atmospheric composition, we can now assess for different locations climate impacts on specific human population sectors (e.g. high residence urban or sub-urban populations). This paper will qualitatively assess the effectiveness of an urban canyon type model in the National Center for Atmospheric Research (NCAR) Community Climate System Model (CCSM) to simulate typical urban heat islands over the contiguous US. We test the robustness of the model through sensitivity studies and evaluate the model's ability to simulate urban heat islands in different environments. Findings show that heat storage and sensible heat flux are most

sensitive to uncertainties in the input parameters within the atmospheric and surface conditions considered here. Sensitivity studies suggest that attention should be paid to not only accurately characterizing the structure of the urban area, but also to the input data reflecting the thermal admittance properties of city surfaces. The magnitude and timing of the heat island varies tremendously depending on the prevailing meteorological conditions and the characteristics of surrounding rural environments.

Keywords: urban climate, climate change

Gennady Fedorov, Baltic CASE. Email: fedorov@albertina.ru; Migration Policy in the New Development Strategy of the Russian Exclave, the Kaliningrad Region: Objectives, Opportunities and Conditions for Realization

The Kaliningrad region, the Russian exclave in the Baltic Sea region, is a very interesting object for research on migration. Only 42% of its population was born in the region; most of the inhabitants are migrants. Currently, an increase in the number of the population due to migration is small: 3-4 thousand people per year. The new regional government plans a considerable economic growth in the region, and the new immigration program aimed at attracting 450 thousand migrants to the region during 2007-2015 is being developed. Now, the population of the region is 940 thousand people. The Kaliningrad region is one of the 12 Russian regions identified as priority development territories in the new federal policy on receiving immigrants from the countries of the Near Abroad, i.e. non-Russian countries that were once part of the USSR. It is important to set realistic tasks and examine opportunities offered by this new resource as well as forecast social and economic changes in the region brought about by the new migration program. The paper includes the analysis of opportunities and conditions for the realization of the program, i.e. the migratory potential of other Russian regions, the Baltic States, Kazakhstan and Central Asia, Ukraine and Belarus, the economic, social and institutional conditions of the Kaliningrad region; a specific character of the population of the region; financial resources, etc. Conclusion: the new immigration program in the Kaliningrad region is difficult to implement.

Garry Fehr, University of Guelph. Email: gfehr@uoguelph.ca; Linking 'chains of explanation' with the commodity chains of India's non-timber forest product sector

Classical political ecology literature has followed 'chains of explanation' embedded within political economy meta-narratives in order to more fully understand why marginalized populations continue to degrade the resources their livelihoods depend upon. Researchers use commodity chain methodologies to determine the extent and nature of power differentials in economic transactions. The commodity chain methodology utilized in this paper aims to expand political ecology's use of political economy meta-narratives by exploring the micro and meso-scale interactions embedded within local social, political and economic power relationships. This paper is based on seven months of research in several forest dependent villages of central India and along the commodity chains of the non timber forest product sector. It is situated within the context of India's current liberalization process which has struggled to reform a highly regulated mixed economy and more fully integrate it with the global market economy. Overall the reforms have been implemented in an uneven manner and yielded varied results across India's socially and economically stratified rural population. Although the research examines a classic example of political ecology's marginalization and degradation thesis, the commodity chains approach reveals how multi-scalar implementations of economic and political power produces uneven impacts across regional, social, economic and political space. Practical contributions of the research include recommendations to inform India's forest policy reforms in such a way that more of the economic and social benefits extracted from the forests are retained by local forest collectors and to ensure that harvesting of these forest resources remains sustainable.

Keywords: political ecology, commodity chains, sustainability, livelihoods

Rob Feick, University of Waterloo. Email: rdfeick@fes.uwaterloo.ca; Map-Centred Visualization Of Criteria Weight Sensitivity In GIS-MCA Analyses

The need to develop better means to explore and represent different viewpoints within spatial decision processes has been evident for some time in the participatory GIS and spatial decision support literature. Spatial MCA tools, which couple GIS and multi-criteria analysis (MCA) methods, can be useful in these situations since individuals express the relative importance of selected "facts" through criteria weights. This capability to disaggregate a complex decision issue into quantitative data scores and value-based criteria weights has the potential to improve decision process tractability and participants' understanding of the merits of different strategies or alternatives. However, since criteria weights are subjective and are at initially defined on an a priori basis, they are often subject to considerable uncertainty. A number of approaches to sensitivity analysis have been adapted from the MCA field to allow individuals to

view, in tabular or chart formats, the stability of results in response to criteria weight changes. To date, comparatively little attention has been given to examining or representing the spatial variation in sensitivity. In light of the geographic variability in criteria data values that characterise many spatial decision problems (e.g. environmental protection, urban growth management, etc.), this shortcoming appears particularly problematic. This paper explores some methods for decision participants to visualise how weight sensitivity varies throughout a study area. In an effort to encourage the dissemination of spatial MCA into practice, particular emphasis is given to methods which can be applied in practice by users with little or no prior experience.

Ian Feinhandler, PhD, University of Colorado. Email:

ian.feinhandler@colorado.edu; *The Electoral Geography of the BJP: Hindu Nationalism and Neoliberal Economics in the 2004 Indian Parliamentary Election*

This paper examines the electoral geography of the Hindu nationalist Bharatiya Janata Party (BJP) in India in the 2004 Lok Sabha election. By controlling for various socio-demographic cleavages, the significance of contextual effects within sub-regions of India is determined and explored using ordinary least squares regression. From this analysis, place emerges as a factor that influences voter behavior. In addition, the composition of the vote for the BJP by two key social groups is estimated using Gary King's EzI method of ecological inference; this procedure reveals significant spatial variation in the vote for the BJP. By extending electoral geography to the largest democracy in the world, this paper finds that social cleavages of caste, class, and religion, have replaced the catch-all politics that once dominated the Indian political process, but that these cleavages are mediated by place-specific contextual effects.

Keywords: India, electoral geography, Hindu nationalism, BJP, contextual effects, neoliberal economics

Marshall Feldman, PhD, University Of Rhode Island. Email:

marsh@uri.edu; *Fixing the Spatial Fix*

In 1977, Richard Walker put forward a political economic theory of suburbanization that subsequently was very influential. This paper examines the theory, identifying its major themes. The paper then examines developments in urban political economy during the past thirty years to identify absences, modifications, and potential criticisms of Walker's theory. The paper also discusses the subsequent literature specifically dealing with suburbanization and urban form during the period covered by Walker. Finally, the paper summarizes developments in empirical spatial patterns of suburbanization and urban form in the US since the 1970s. Based on these four components, the paper proposes ways to "fix" the spatial fix in the quadruple sense of modifying and augmenting Walker's original theory, addressing actual developments in urban form over the past thirty years, understanding the current situation, and identifying the real contradictions stemming from the suburban solution as a spatial fix for the contradictions of an earlier period.

Maryann Feldman, University of Georgia. Email: mfeldman@uga.edu;

Ji Woong Yoon, University of Georgia. Email: jiwoongy@uga.edu; *Where Do New Industries Come From? : Evidence From The Biotechnology Industry*

How new industries emerge and what factors contribute to their development has been a question studied from different perspectives since Schumpeter first posed the question. Studies in economics explain the evolution of new industries via the industry life cycle theory, or through a key technology applied through the vertical value chain. Institutional perspectives identify the legitimations necessary to mobilize resources for the new ventures that form the basis of a new industry. Scholars also consider the impact of regional specialization via knowledge spillovers; however, the contribution of place and the geographic limits associated with the diffusion of knowledge is under theorized. There are also few empirical studies that incorporate a geographic component to the study of radical new discoveries. This paper examines the evolutionary process of inventive activity in biotechnology to investigate the origins and genesis of new industries. In particular, we map the technology landscape using Cohen-Boyer's rDNA technique, a seminal discovery that defined the biotechnology industry and consider the geographical distribution of the invention over time. This mapping of technology landscape and geographical distribution allows us to identify the industry clustering patterns and provides an understanding of where and how local resources are used. Also, we examine the geographical composition of the organizations using rDNA technique and the organizational movement of inventors. We suggest that this exercise offers a novel method of studying the emergence of new industries driven by the new technology.

Keywords: Economic geography, technology innovation, regional specialization

Chen-Chieh Feng, Geography, National University of Singapore. Email: geofcc@nus.edu.sg; *Class-Based Definition for Hydrologic Features for GIS Interoperability*

The research is about clarification of meanings of hydrologic features recognized in United States' National Hydrography Dataset. Specifically, the research aims at the development of a theory of these hydrologic features so that the exchange of geospatial data between geographic information systems (GIS) can be achieved at the semantic level. Being able to exchange geospatial data at the semantic level is vital to the modeling of hydrologic phenomena such as flooding, because any misinterpretation of the data in a GIS database can potentially cause erroneous modeling results, lead to the making of improper policies, and thus carry serious consequences. Exchanging geospatial data at the semantic level is typically realized through the use of well-defined classes whose meanings are agreeable to both the data providers and data users. The problem with such an approach is that the classes' definitions are often inconsistent, incomplete, and imprecise. This research proposes the use of instances associated with these classes to handle the problem. Specifically the research will focus on the clarification of various relations, such as parthood and containment, between classes through the examination of the relations between their corresponding instances. A formal ontology will be used to ensure that the resulting meaning is consistent, complete, and precise. A simple test will be conducted to examine if the meanings of these hydrologic features are correctly captured and sufficient to support the exchange of geospatial data at the semantic level.

Qi Feng, Dr., Chinese Academy of Sciences. Email: qifeng@ns.lzb.ac.cn; G.D. Cheng, Academician, Chinese Academy of Sciences. Email: ; *Trends of water resource development and utilization*

The development and use of water resources in most river basins of arid northwest China is still at the surface water development stage. Currently, the extent of surface water resource exploited is 480.07108 m³, accounting for only 56.0% of the total exploitable surface water resources of arid Northwest China. The canal systems provide 42% of the water used, and farmland use is 0.8. When the ground and surface waters of river basins in the region are comprehensively developed in the future, channelized surface water may be increased to 686.17108 m³ and the channelized ground water may reach 248.27108 m³. This would constitute a 95% increase over current levels in surface water resource development. The total use of water resource would account for 55.0% of total channelized water resources. In the future, with scientific and technological advancements the utilization ratio of canal system will reach 0.9 as the utilization rate of farmland water. So the total use waters will reach 756.87108 m³ increasing by 3-4 times than current levels and accounting for 84.8% of the total exploitable water resources in arid Northwest China.

David A. Fennell, Ph.D., Brock University. Email: dfennell@brocku.ca; *Ethics: We're Stuck with it [in Tourism]...Whether We Like it or Not!*

Trivers' (1971) theory of reciprocal altruism, emerging from animal behaviour studies, is premised on the belief that human social behaviour is said to have evolved in relatively small, stable communities where groups of people had opportunities to forge cooperative relationships over time through repeated interaction. The more time we have to engage in altruistic acts?acts that are returned in kind? the better chance for individuals and groups to set up longer term cooperative relationships. Cooperation of this sort can be challenged in tourism because of limited interactions based on restricted periods of time, with

implications at the micro scale (tourist-host interactions) and at the macro scale (collective interactions within the region as a whole). Despite these challenges, ethics and trust have emerged from reciprocal altruism as mechanisms that induce both short-term and long-term cooperative relationships for mutual benefit. Implications of these relationships are discussed in the context of generating ways to improve cooperation for the tourism industry as a whole.

Tovi Fenster, Tel Aviv University. Email: tobiws@post.tau.ac.il; *Belonging Revisited: writing about belonging from within*

In 2004 I published my book *The Global City and the Holy City: Narratives on Planning, Knowledge and Diversity* (Pearson) which focused on everyday experiences of (dis)comfort, (lack of)belonging and (lack of) commitment to various spatial scales (from the home to the city) in Jerusalem and London. I now re-write the book in Hebrew and this process allows me to revisit some of my earlier assumptions, analysis and conclusions regarding constructions of emotions in everyday life as related to identities, power relations and urban citizenship. The paper focuses on these experiences and the process of re-writing them in my own 'spaces of belonging' (language and political, social and gendered context).

Keywords: belonging, scales, urban citizenship

Jill Fenton, Dr, Department of Geography, Queen Mary, University of London. Email: j.fenton@qmul.ac.uk; *Au Bon Endroit: surrealism, creative play and passion*

While walking to the café la Tour Saint-Jacques in the centre of Paris during the spring of 2006, two members of the Paris surrealist group are aghast to notice that the Tour Saint-Jacques, a monument much revered by surrealists, has been shrouded in a white illuminating cover. They contemplate what this veiled construction resembles - a silo, a tower of ice or of icing sugar. Subsequently, they photograph the gleaming white vision and initiate an international surrealist enquiry that raises questions about its origins and purpose. Some respondents, in immediately identifying the construction, are unable to reply enthusiastically to the enquiry; others, like myself, respond in the intensity of the moment and according to an impassioned vision of how life ought to be. This paper explores *Au Bon Endroit*, a surrealist game that reflects creative practice as the opening to a new poetic sense of place that engenders hope, possibility for a meaningful life, and a different society. The paper illustrates how surrealist imaginative play, in summoning *détournement* from a humdrum existence, in the course of everyday life nurtures passions beyond our wildest dreams. Such creative and enthusiastic exploration contributes to cultural geography's engagement with alternative geographical imaginations.

Keywords: Surrealism, passion, hope, creative practice, *détournement*, everyday life, alternative geographical imaginations, cultural geography

Nancy Ferber, Portland State University. Email: nancy.ferber@gmail.com; *Participation and Support of the Literary Arts in Portland, Ore: Gains in social capital, trends in the creative class and establishing identity while creating a sense of place in the urban environment*

The field of literary arts thrives in Portland, Oregon. It is a crucial component in defining Portland's cultural identity. Through extensive opportunities for local participation, Portland has shaped, and been shaped by literary artists. Local writers and non-profit organizations in support of the literary arts are engaging invisible and marginalized populations around the city. This paper argues that Portland's growing literary arts networks are increasing gains in social capital, as well as further developing Portland's creative class. Through examining Portland's unique publications, organizations and cultural events, this paper presents evidence of the creative class becoming a distinctive force in the city. By profiling organizations and establishments around Portland, trends appear which exemplify the growth and efforts of the creative class. The field of literary arts itself is broad; this paper aims to focus on the increasing accessibility of both actual texts and interactions between the field of publishing and literary consumers. The uses of writing and public readings is encouraging individual expressions and community building. The literary arts scene in Portland is allowing individuals to create community by sharing these common experiences. This accessibility within the field is adding to a sense of place and developing social networks in and around the Portland Metropolitan area. Portland is becoming an area with high participation in the literary arts, because its creative class is forming unique ties and networks with trends in the literary arts field and the city itself.

Yaïves Ferland, Defence R&D Canada - Valcartier. Email: yaives.ferland@drdc-rddc.gc.ca; *Geographical factors for establishment of the Canadian Defence R&D Centre in Valcartier (Québec)*

Canadian Armament Research and Development Establishment (CARDE, today DRDC Valcartier) was founded in 1945, 20 miles West from Québec City, as a fusion of five war laboratories. This civilian science and technology facility was placed under the authority of the Defence Research Board created sixty years ago, in 1947. During WWII, those necessary laboratories controlled and improved the production of the Dominion Arsenal on its new plants installed in 1933-38, beside the expeditionary military Camp Valcartier, settled in 1912-14. Creation of the Department of Munitions and Supply, September 1939, opened officially the "scientific front" of this "fourth force", engaged in a new era of active international collaboration with the United Kingdom and Canada Inspection Military Board (UKCIMB), the USA and Australia. At its peak in 1943, the Arsenal was the most important provider of both light and artillery ammunitions within the Commonwealth. By 1945, Government was anxious to preserve this vanguard military-industrial capacity and the scientific expertise in explosive chemistry and ballistics concentrated there. For the third times, the question of the best location for this kind of special defence operations rose again; where else than Valcartier for optimal experimental conditions for new products such as missiles and lasers? A retrospective analytical study considered dozens of factors and location criteria, at many scales, demonstrates that DRDC - Valcartier is still at its best purposive place in the Québec region. It is located on sandy well-drained soil at the edge of the Canadian Shield, in a wooden basin circled by hills.

Sarah H. Fernandez, MA, UCLA. Email: sarhafe@yahoo.com; *Losing the Indigenous Links: An Historical Geography of Coca in Ecuador*

Even though much has been written in the past about coca and its numerous associated topics, scant information on this subject can be found with regard to Ecuador. Ecuador's location between two major coca-producing countries would logically lead one to assume that it has been susceptible to many of the same issues surrounding coca in these other nations, but so far only a handful of individuals and organizations have attempted to examine these issues within the Ecuadorian context. The most likely explanation for this lack of material is the curious absence of coca in modern day Ecuador, which differentiates this country from its Andean counterparts. The first objective of this paper is to analyze the mysterious disappearance of coca in Ecuador. How and why did coca vanish from this country in the first place? This study will address a combination of colonial prohibitions, native demographic collapse, the impact of mining, and competition from other crops as probable factors in the demise of coca in Ecuador.

Keywords: Ecuador, Latin America, historical geography, coca, cultural geography, cultural ecology

Dinali Nelun Fernando, Rutgers University. Email: dnelunf@eden.rutgers.edu; *Assessing climate impacts on water scarcity variations within a river basin in northwestern Sri Lanka*

Water scarcity is an acute problem in many parts of Sri Lanka and often lasts for more than six months each year. Past studies on water scarcity in Sri Lanka have not taken into account the impact of climate variability and change that affects the magnitude and distribution of water scarcity in a given location. This study assesses water scarcity at sub-district scale within a river basin in northwestern Sri Lanka from 1979-2000 and analyzes how climate influences the seasonal distribution of water scarcity within the basin. The operational definition of water scarcity adopted was "when water supply exceeded water demand". Assessments of water scarcity were made at the seasonal timescales of October to December, January to March, April to June and July to September. The distribution of average water scarcity during JFM, AMJ and JAS follows the seasonal distribution of precipitation, and during OND follows the seasonal distribution of rice cultivation. Trends in inter-annual water scarcity during JFM and JAS follow inter-annual precipitation trends during those seasons. OND water scarcity has decreased from 1991-2000 despite a statistically significant decrease in basinwide OND precipitation from 1961-2000, and an increase in the OND water demand for rice from 1980 onwards. A similar decrease in the incidence of water scarcity was observed during AMJ despite a similar decrease in seasonal precipitation. Such counter-intuitive patterns of water scarcity need to be

understood in the context of regional patterns in seasonal precipitation and long-term changes in the extent under seasonal and perennial crops.

Keywords: Water scarcity, climate impacts, sub-district scale, seasonal time scale

Jude L. Fernando, IDCE Clark University. Email: jfernando@clarku.edu; Jude L Fernando, Ph.D, IDCE Clark University. Email: jfernando@clarku.edu; *Humanitarian Interventions in Complex Emergencies and Natural Disasters: Towards Praxis Oriented Scholarship*

This paper examines the dilemmas of praxis centered scholars working on issues pertains to humanitarian interventions, complex emergencies, and natural disasters. It is based on on-going field work in Sri Lanka. Theoretically, the analysis is located in current debates between traditional and new humanitarians. Traditional humanitarians argue that all humanitarian interventions should maintain principles of neutrality, impartiality and human dignity. New humanitarians disagree, on the grounds that such principled-interventions are impossible and counter productive for the wellbeing of those affected by humanitarian crises. The very acts of conducting research and how one write about their findings are not politically neutral. They shape and are shaped by contexts within which they work. The very presence of the researcher in these crisis locations, types of questions they ask of different stakeholders, and their practical activities do contribute to shaping the dynamics of these crises, which in turn affect the 'objectivity' of research. This paper explores the difficulties faced by socially responsible researchers in relation to how they reconcile the tensions between the need to respond to immediate and long term human suffering by working with humanitarian organizations and maintaining 'objectivity' in research projects in highly politically charged environments. It draws from my own field work and working with those affected by the 2004 tsunami and civil war in Sri Lanka.

Keywords: Humanitarian Emergencies, Scholar-Practitioner paradigm, social responsibility, Natural Disasters, complex emergencies

Susanna Ferreira, University of Stellenbosch. Email: slaf@sun.ac.za; Visser Gustav, Dr, University of the Freestate. Email: visserge.sci@mail.uovs.ac.za; *Creating an African Riviera: From local regeneration project to global playground*

The use of leisure and tourism to re-image and redevelop cities has been interpreted as a mechanism for attracting capital and people. In a period of intense inter-urban competition and urban entrepreneurialism whole built environments become centerpieces of urban spectacle and display. Waterfront developments have become emblematic in this regard. Over the past 20 years the redevelopment of the Victoria and Alfred Waterfront in Cape Town has been transformed "port to playground" and is internationally acknowledged as one of the most successful of these developments. This redevelopment has, however, not been uncontroversial. Tensions and conflicts have risen over the use of space, the meaning of place and ownership of space. In 2006 the Waterfront was sold to a Dubai-based and led development consortium. The stated objective of the consortium is to transform the Victoria and Alfred Waterfront into an "African Riviera". Concerns have emerged that these new developments will "plasticize" the Waterfront. The purpose of this paper is firstly, to emphasize the importance of place-identity and place-marketing in the increasing competition among major urban tourist destinations. Secondly, the Waterfront's development is located on a continuum between 'growth machine' and 'growth management' models. Thirdly, drawing on international debates, the paper argues that the engagement of local agencies is critical in formation of the character of heritage spaces, and, finally, we speculate on how the change in ownership will affect the sense of place or identity of Cape Town.

Keywords: regeneration post-modern harbourscape meaning of place

Kristel Fesler, Oregon State University. Email: feslerk@geo.oregonstate.edu; Nathan Eidem, Oregon State University. Email: eidemn@geo.oregonstate.edu; *Cooperation and Conflict over Water in the Western United States*

This paper presents research findings on cooperative and conflictive behavior over fresh water resources in the Upper Colorado River Basin, the Upper Rio Grande River Basin, the State of Oregon, and Internationally. Incidents of cooperation and conflict were collected from major news sources, coded using a standardized classification system, and compiled into event databases. Cooperative incidents outnumbered conflictive ones in all study areas. Quantitative analyses of demographic and physical datasets showed no single parameter greatly explained variability in cooperative or conflictive behavior internationally or in Oregon. Further qualitative analysis showed cooperation and conflict severity depends upon alterations in institutional frameworks. The number and severity of incidents in Oregon were affected by actions at all levels of government: local, state and federal. This analysis emphasizes the importance of institutions, like management plans, and highlights increases in social instability when institutions are altered. This is especially apparent when

stakeholders are faced with protocol changes that subsequently lead to uncertainty. The results of this research support shifting focus from increasing supply to stakeholder mediations and the creation of institutions prepared for future uncertainty of water resource availability.

Russell Fielding, Louisiana State University. Email: rfield2@lsu.edu; *A Comparison of Pilot Whale Drives in Newfoundland and the Faroe Islands*

The long-finned pilot whale (*Globicephala melas*) is a common cetacean species in the North Atlantic Ocean and has been hunted by humans for food and oil for many centuries. A common hunting method used by pilot whalers has been to initiate a "drive" in which the whales are surrounded by boats and driven onto the shore or into the shallow water, then killed. This method uses the natural herding instinct of the pilot whales to the whalers' advantage and entire pods are often taken at once. These pilot whale drives have historically occurred throughout the inhabited regions of both sides of the North Atlantic but by the mid-twentieth century were only occurring in two locations: the Faroe Islands and Newfoundland. Canada's 1972 ban on commercial whaling put an end to the Newfoundland pilot whale drive, leaving the Faroes as the North Atlantic's lone whale-driving society. After introducing both pilot whale drives, this paper compares the Faroese and Newfoundland whaling communities and examines reasons why the whale drive has continued in the Faroes but has been ended in Newfoundland.

Gary Fields, University of California - San Diego. Email: gfields@ucsd.edu; *Enclosures Past and Palestinian*

This paper seeks to generalize the experience of the enclosure process currently taking place in Palestine by comparing it to the British Enclosures of the late 18th and early 19th centuries. It draws on insights from Foucault about power, discipline, and the recasting of space as a fundamental tendency of modernity, and uses this insight to situate the comparison within a theoretical framework of "Mastering Space." The paper uncovers parallel territorial practices of modern power holders ranging from profit-driven English landowners in the 18th century, to nationalist-inspired Zionists of the 20th century in unmaking and remaking land and landscape where subordinate groups live and work. The paper makes an argument about the relationship of enclosure to the two most basic routes to modernity, the development of capitalism and the development of nationalism. By uncovering parallels in the two cases, this study reveals how the exercise of power and the recasting of place is fundamental to both lineages of the modernist project, reinforcing the idea of capitalist development and nation-building as complementary. In emphasizing the common thread of enclosure in both capitalist development and nation-building, this study shows how conflict based on differences of class, and conflict based on differences of nation share a similar territorial logic. The study poses the question of what made the recasting of territory a critical part of modernity, and reveals how the remaking of space conformed to the goals of modern power holders ranging from early modern English landowners to contemporary Israeli Zionists.

Heather L. Fields, California Polytechnic State University, San Luis Obispo. Email: loluma001@gmail.com; David W. Stahle, University of Arkansas, Fayetteville. Email: dstahle@uark.edu; R. Daniel Griffin, University of Arkansas, Fayetteville. Email: dendrodan@gmail.com; *Age Structure, Climate, and Recruitment History of Selected Blue Oak Woodlands in California*

The blue oak (*Quercus douglasii*) woodlands are the largest hardwood ecosystem endemic to California. Blue oak trees were not widely cleared for commercial timber production, and extensive old-growth blue oak forests remain throughout the native ecosystem. However, blue oak regeneration is a significant scientific and management concern. We collected tree-ring samples and observed vegetation characteristics at 36 old-growth sites throughout the ecosystem. Over 2,300 living trees greater than 10cm in diameter and dead logs were sampled at approximately breast height. The samples were cross-dated with dendrochronology, and when possible, the year of recruitment into the canopy was established. Based on 1,280 randomly sampled living trees, we define blue oak age structure and recruitment history at the site, regional, and ecosystem level. Blue oak trees in our random sample average 165 years old, 10% are over 225, and 1% are over 335 years old. Recruitment to the 10cm DBH class appears to have been relatively continuous through time across the ecosystem, with a large pulse of recruitment in the mid- to late-19th century. The precipitation sensitive blue oak tree-ring chronologies indicate that relatively wet conditions may have contributed to this 19th century recruitment pulse. Our 10 cm DBH minimum sampling constraint does not allow description of blue oak recruitment over the most recent 50 years, but we found a very low sapling to tree ratio (0.37). These

new blue oak data may contribute to the conservation of this ecosystem by describing the impressive age and wide distribution of these ancient oak woodlands.

Keywords: dendro-ecology, blue oak, recruitment

Yves J. Figueiredo, PhD, Université Paris-Sorbonne. Email: yves.figueiredo@paris4.sorbonne.fr; From aesthetics to ecology: the long apprenticeship of the Yosemite Commission (1864-1890)

The first white men who saw Yosemite in 1851 described a valley which was "park-like in its lack of underbrush and small tree growth, with its floor clear under the tall trees, carefully preserved by the expert foresting of the Indians." In 1890, the Yosemite Commissioners wrote in their report that "views formerly fine and inspiring are obscured entirely by the dense tree and underbrush growth of the last forty years." During the first decades following the establishment of the Yosemite park, managers systematically fought natural fires and allowed the forest to colonize the valley, thus contributing to the drastic change in the visual appearance of the valley. By 1890 however, the Commission reversed its policy concerning forest fires. This decision was guided by aesthetic motives (open up views of the valley and of the falls for the tourists) as well as a new understanding that systematically suppressing fires was potentially more harmful than allowing them. My paper will show that it was in fact for primarily aesthetic motives that the Yosemite Commission arrived at the first ecologically sound management plan of the valley. Using archival material (including the reports of the Yosemite Commission), I will argue that despite the bitter accusations of mismanagement by John Muir and Robert Underwood Johnson, the Yosemite Commission tried to introduce ecological practices in Yosemite Valley in the 1890s.

Pierre Filion, School of Planning, University of Waterloo. Email: pfilion@fes.uwaterloo.ca; Smart Growth and Affordable Housing: The nature of the Trade Off

Perhaps the most damaging critique that is levelled at Smart Growth policies is that they make housing less affordable. In debates about the impacts of Smart Growth, critiques often invoke a correlation between metropolitan regions that rely on growth management measures and high housing costs. The paper explores the relationship between Smart Growth policies and the cost of housing. First, it observes that metropolitan regions that are most likely to rely on such policies generally experience substantial growth and therefore strong pressures on housing values. Second, the paper demonstrates that it is the cost of land that is most sensitive to growth management policies. It thus follows that the types of housing that consume most land are the ones that will be most affected by these policies. Consequently, the impact on house values will be minimized if Smart Growth measures are accompanied with a shift towards the production of higher density units; otherwise, critiques of Smart Growth will be vindicated. The paper relies on the Toronto experience to explore ways of inserting high-density housing within the existing urban and suburban texture. It identifies the kinds of sectors where such housing is presently being built and relates variations in the cost of these units to types of development and their location.

Michael Finewood, PhD student, University of South Carolina. Email: finewood@gmail.com; The Embodiment of Economic Development in Coastal South Carolina

This paper is about how places can be constructed in such a way that gives meaning to - and privileges - economic development, and how people embody those notions of economic development at different scales. This conceptualization provides a situated understanding of the contradictions of land use in capitalism, and how people perceive those contradictions as natural. Along the coasts of South Carolina, developers and town stakeholders are pursuing strategies of rapid economic development. For example, townships in Southern Beaufort County have committed 90% of all developable land to commercial and neighborhood development. Town managers anticipate being the third largest populated region in South Carolina in the next five to ten years. The material outcomes of development processes are dramatically changing the physical and social landscapes. And although the social and environmental costs are recognizably high, community members remain convinced that economic development is inevitable or necessary. This location provides a unique opportunity to see how economic development is given meaning not just through policies and institutions, but is taken on as personal worldviews.

Chanelle Fingal, BA in Geography, University of the West Indies, Mona Jamaica. Email: chanfing@hotmail.com; "Quality production and a better deal for producers and consumers": Globalisation, Fair Trade and the St. Lucian Banana Industry.

Globalisation and its sister process trade liberalization have resulted in the phasing out of the guaranteed preferential access that bananas from the Windward Islands once had to the British market. This action was a tremendous blow to the banana industry in the Eastern Caribbean and in particular to the small farmers who rely on bananas for their survival. Fairtrade has since emerged as an alternative and has created a new niche market for Windward Island bananas in the United Kingdom. Fairtrade, in its truest form is supposed not to only ensure a market but also other social and environmental benefits for the small farmers. Through the analysis of interviews with fairtrade and other officials as well as a questionnaire survey of a number of small farmers, this paper will illustrate some of the impacts that fairtrade has had on the banana farmers in St. Lucia. The financial and environmental benefits which have been gained through fairtrade shall be presented. In addition, this paper shall express the fact that all of the expected social benefits of fairtrade are yet to reach the St. Lucian banana growers.

Kevin Fingerman, University of California, Berkeley - Energy and Resources Group. Email: kfingerman@berkeley.edu; Understanding the System of Rice Intensification: Lessons from South India

The System of Rice Intensification (SRI) is a low-input method of rice farming that has generated some debate as it has spread rapidly in the 20 years since its development in Madagascar. Proponents claim that not only does the system produce yields that far exceed those from conventional methods, but that SRI can nearly double the efficiency of agricultural water use while vastly reducing or eliminating the necessity for chemical inputs. Opponents, meanwhile, maintain that enthusiasm for the technique is overblown, and that convincing evidence is lacking for the benefits attributed to SRI. This debate is also shaped by the fact that the SRI technique was not developed through the conventional lab-to-land pathway. This paper attempts to shed some light on the debate through analysis of case studies using insights from SRI farmers, researchers and extension practitioners in the Indian state of Andhra Pradesh. Using 15 semi-structured interviews and a survey of 32 farmers conducted in the summer of 2006 we develop a list of factors that contribute to successful application of the SRI technique, both in the Indian context and elsewhere. We recognize that adoption of SRI can be either beneficial or detrimental to farmers depending on context, and hold that the prudent step at this point is to better understand the ecological, geographical and social dynamics that contribute to SRI's success in order to move forward in a considered manner.

Nissa Fink, University of Cincinnati. Email: finkna@uc.edu; Muslim Burials in Mainstream Cemeteries: The Case of Cincinnati

In 2004, land was purchased by the Muslim community in Memphis, TN with the express purpose of establishing an Islamic cemetery. Due to opposition by the local community, that plan was never carried out. Opposition to similar cemetery projects has also surfaced in Charlotte and Atlanta. While the reason for such opposition may be questioned, so may the reason for why a specifically Islamic cemetery is needed. What are the requirements of a Muslim burial? Can these requirements be performed in a mainstream cemetery? What happens in locations where no Islamic cemetery is available? This research examines the burials of Muslims in Southwest Ohio, with the purpose of examining both the locational and cultural attributes of these burials. The location of Muslim burials were obtained through interviews with local Muslim leaders; site surveys were used to examine the location of Muslim burials within the cemetery as well as demographics and cultural attributes of the individual burials. Cultural attributes examined included the existence of a cult of piety, burial markers, inscriptions and grave orientation.

Sarah A. Finkelstein, University of Toronto. Email: finkelstein@geog.utoronto.ca; Konrad Gajewski, University of Ottawa. Email: gajewski@uottawa.ca; Diatom community dynamics in a Fragilarioid-dominated Holocene paleolimnological record from Russell Island in the central Canadian Arctic Archipelago

Many diatom records from Arctic lakes are dominated by a single group of benthic taxa: the Fragilarioids. This group can constitute >90% of valves in fossil diatom assemblages. It is often assumed that diatom records dominated by this group offer little in terms of paleoecological information. We present here a whole-Holocene paleolimnological record from a small lake on Russell Island (Lake PW02), in the central Canadian Arctic Archipelago (74°00' N, 97°50' W, 182 m asl). The record is dominated by Fragilarioid types; we examine separately

each of nine species or morpho-types within this group to test whether individual Fragilarioid taxa responded differently to Holocene climatic changes. The ratio of the two most common types indicates a higher proportion of *Staurosira venter* relative to *Staurosirella pinnata* in the earliest Holocene. By 8300 years ago, *S. pinnata* rises to an abundance of ~20% and *Staurosira construens* appears. *Fragilaria oldenburgiana* declines by 5000 years ago, as two species in the genus *Pseudostaurosira* begin to increase. Recent sediments deposited over the past 200 years contain the highest numbers of individuals of *S. venter* and *S. pinnata* morpho-types with particularly long valves. We conclude that studies done at high taxonomic resolution offer possibilities to extract enhanced paleoecological information from records dominated by Fragilarioid diatoms. The record from Lake PW02, like many others from Arctic lakes with low algal diversity throughout the Holocene, shows pronounced increases in diatom diversity in the most recent sediments.

Mary Finley-Brook, University of Richmond. Email: mbrook@richmond.edu; Karl H. Offen, University of Oklahoma. Email: koffen@ou.edu; *Bounding the Commons: A Political Ecology of Land Demarcation in Northeastern Nicaragua*

The modernist state dream of a perfect cadastral system cataloging individual private land owners in the lowland tropics of Latin America has finally ended. Large chunks of collectively-owned lands will not only remain but be enclosed, mapped, titled, regulated, stabilized, and open for green business. In the process of bounding the tropical commons, ethnic communities, state agencies, multiscale NGOs, and multilateral lenders all struggle to establish the conditions most conducive to their own interests. Funding sources wedded to a one-size-fits-all green neoliberalism push against the weighty inertias of regional resources histories, ethnic politics, discursive imaginaries, divergent agendas, and overlapping national legislation. The relatively new re-territorialization of the lowland tropics in Latin America begs theorization supported by empirical case studies. It remains unclear how ethnic communities form distinctive social and spatialized collectivities, decide upon specific land or territorial claims, negotiate formal boundaries, influence regulatory procedures, interact with regional governments and extractive industries, and interact with the pressures of multilateral and NGO objectives. In the present study we explore these issues in three case studies taken from our research in the North Atlantic North Autonomous Region of Nicaragua (RAAN). We use the tools of political ecology to examine the contested political process of bounding the commons into social-spatial units. An examination of the daily processes within Nicaraguan case studies demonstrates disempowerment and alienation of Miskitu and Mayangna populations and an unwillingness on the part of state representatives and foreign donors to understand or even entertain their territorial claims.

John C. Finn, Arizona State University. Email: FinnJ@asu.edu; *Commodification and Culture in Cuban Music*

After nearly three decades of cultural and economic isolation from the West, and a paralyzing economic crisis in the early 1990s, Cuba is increasingly globally active. The resulting increases in globalization affect all sectors of Cuban society. This is especially true for many of the islands musicians whose careers are deeply imbedded in the international market. In this paper I break with traditional approaches to music geography that focused on musical hearths, diffusion, delimitation, thematic analysis, and cultural mapping, instead exploring the dialectical relationship of music as an expression of cultural and a cultural asset, and at the same time a commodity for sale on the international market. I will present results from qualitative case-study research with Juan de Marcos Gonzalez, the creator of the world-renowned Buena Vista Social Club. Through the lens of this well-known Cuban musician I explore the increasingly contested terrain that cultural producers throughout the global south are forced to negotiate in attempting to preserve cultural authenticity while surviving economically in the increasingly globalized realm of international capitalism.

Park Williams, University of California, Santa Barbara. Email: williams@geog.ucsb.edu; *Biogeographic impacts of California coastal fog and stratus*

Fog has long been recognized as hydrologically important in many ecosystems, including coastal deserts, tropical cloud forests, and montane areas worldwide. Fog drip can be a major water source, particularly during the dry season, and there is evidence in some ecosystems of direct fogwater uptake by foliar absorption. Fog and low clouds can also greatly increase availability of soil

water by reducing evapotranspiration. We have used parallel measurement, modeling and remote sensing approaches to quantify the importance of fogwater inputs and persistent cloud cover to the growth of two of the many conifers endemic to the California coast (*Pinus muricata* and *P. torreyana*). We have modeled drought stress over the last century based on local climate records, calibrated against a dense network of weather stations on a 7km coastal-inland gradient. Water availability varies greatly year to year, with episodic droughts driving widespread tree mortality, as documented with historical photos. Frequent cloud cover near the coast reduces evapotranspiration, thereby delaying and moderating the annual summer drought. Satellite data show significant interannual variability in cloud cover within the coastal "fog belt." Substantial summer fog drip at higher elevations also reduces drought severity. Tree rings show greater growth in foggy years. Stand boundaries appear to be driven by spatial patterns of mortality related to water availability and frequency of severe drought. These results suggest that coastal endemic conifers may be particularly susceptible to climate change, in agreement with palynological evidence of contraction of coastal pines during warm periods over the last 160 kys.

Diana Michelle Fischetti, B.A., Departments of Geography and Environmental Studies, University of Oregon, Eugene. Email: dfischet@uoregon.edu; *Voluntary Simplicity and Ecovillages: The Role of Place in Challenging Consumer Culture*

Voluntary simplicity addresses not only the patterns of material consumption in industrialized nations and their associated environmental, political, social, and cultural impacts, but also the psychological impacts of consumer culture, and the often associated desire for a more fulfilling and meaningful existence. Accepting the assertion that consumption, as structured by capitalism, results in the derivation of consumers' sense of personal identity has led many to question whether personal identity is enhanced, satisfaction gained, or happiness found through consumption. Social scientists have begun to discover that within industrialized consumer culture, people's ability to derive satisfaction from consumption actually decreases with increasing consumption, beyond a certain threshold. The relationship between materialism and well-being is now understood to be an inverse one. In addition to consumption, sense of place also plays a role in the construction of personal identity. Ecovillages, communities whose members strive to live in a socially and environmentally sustainable manner, are often associated with voluntary simplicity. These communities often display specific social and environmental design characteristics. This paper will explore the ways in which the deliberate creation of a place that embodies the rejection of consumer culture and the cultivation of other means of constructing meaning, results in a sense of place that can modify the formation of personal identity. This paper will also explore the ways in which voluntary simplicity and ecovillages link to broader-scale dynamics, processes, and structures.

Diana Fisher, Ph.D., California State University - Los Angeles. Email: Dfisher2@calstatela.edu; *Collective Memory & Cultural Practice in West Hollywood*

The unofficial naming of a large section of West Hollywood as "The Ruskii Rayon" ("The Russian Neighborhood") by Soviet-Russian émigrés can be analyzed through the trope of memory, where the production and consumption of the local cultural landscape reflects the "ongoing dialectics" between real and imagined "pasts" and "presents." Both individual and collective memories play an active role in shaping how émigrés reconfigure space and use West Hollywood, California as an instrument of cultural expression and identity formation. Organized through years of nostalgia, fetishization, ambivalence, and hybridity, West Hollywood has thus become a city marked?in both public places and private spaces?by Soviet-Russian immigrants who draw from remembered homeland habits and rituals as a way of (re) constructing a meaningful and satisfying life in the United States. These collectively recalled habits and rituals materialize in embodied and performative uses of city space within the Ruskii Rayon. These uses are varied and include group street strolling activities, routine jaywalking violations, strategic frequenting of ethnically owned local business establishments, and a constant interaction with the diverse topography of the city. On their own, immigrants in West Hollywood are spirited authors of space; as a collective ensemble, they are a cultural force to be reckoned with in the city.

Joshua T Fitzpatrick, Central Washington University. Email: joshfitz79@hotmail.com; *The Need for Instream Flow Protection in New Mexico: A Comparative Analysis of the Yakima River, Washington with the San Juan River, New Mexico*

Instream flows in a river are an important requirement of successful riverine health. Instream flows are defined as the minimum stream flow needed to protect and preserve instream resources and values, such as fish, wildlife, recreation, Native American treaty guarantees, and the aesthetic values of a free flowing river. The state of New Mexico has very few laws protecting and promoting instream flows, which has subsequently allowed many river flows to be diverted for irrigation and development purposes. This thesis will examine a stretch of Washington's Yakima River downstream of the Sunnyside dam as a case study analog of instream flow protection vis-à-vis water demands to the San Juan River in Northern New Mexico. I will: 1) analyze the legal structure of laws protecting Washington instream flows as a surrogate for New Mexico instream flow protection and; 2) utilize geographic information systems to conduct spatial analyses that map land and water use change over recent history. I expect to expand the array of options to policy makers in New Mexico based on the protection measures implemented on the Yakima River. The significance of this study is important as it can assist in securing a healthy riverine environment as well as safeguard New Mexico from transboundary conflicts between both the Lower Colorado River Watershed and Mexico.

Keywords: Instream flow, New Mexico, policy

Kevin Flaherty, Graduate, Humboldt State University. Email: knfl@sfsu.edu; *Understanding Housing needs in San Francisco*

San Francisco's Housing market has shown an unprecedented rise in value over the past fifteen years and this has not only contributed to a change in the structure of the housing market but also in the demography of the City as well. Though city planners have added provisions to the city plan aimed at providing more affordable housing to the general stock they have consistently approved much more housing termed "Market Rate" than they have "Affordable". The intent of this paper is to present how GIS analysis can be used to graphically depict the relationship between the price of housing and the community that lives in it.

Keywords: Affordability; Affordable Housing

Charles A. Flanagan, Ph.D., State of Louisiana. Email: cflan@cox.net; *Webs of Contingencies: Integrating Scales, Surfaces, and Networks in the Recovery Efforts Following Hurricanes Katrina and Rita*

This paper presents a conceptual framework to explore the complexities of the recovery efforts initiated in south Louisiana in the aftermath of Hurricanes Katrina and Rita. The scope and intricacies of the recovery efforts elude linear representations and create significant challenges for geographic information systems (GIS). I propose a conceptual framework that integrates geographic scales, numerous types of surfaces, and networks of institutions to elucidate contingent characteristics of disaster recovery efforts. Implementations of the recovery programs require the coordination and cooperation of a great number of institutions, both public and private, across local, state, and national scales. The complex interactions of these institutions, viewed as transactions between networks, have direct impact on the material conditions of the built environment in the hurricane impacted areas of the state. The existing material conditions on the ground (e.g., large swaths of destroyed, depopulated neighborhoods) as well the conditions envisioned in recovery plans and programs (e.g. reconstructed, repopulated neighborhoods) are viewed as surfaces. The conditions of these surfaces are discussed as the ongoing project of the transactions between networks across myriad scales. The conceptual framework is illustrated with examples drawn from my experiences of working directly on recovery efforts for over a year. The goal of this discussion is to explore the relationships between scales, surfaces and networks, in order to facilitate better coordination and cooperation among all stakeholders in the recovery efforts and, hopefully, to contribute to an equitable and sustainable recovery in south Louisiana.

Thomas S Flanagan, University of Denver. Email: tflanag4@du.edu; Sharolyn J Anderson, University of Denver. Email: sharolyn.anderson@du.edu; *Mapping Perceived Wilderness to Support Protected Areas Management in the San Juan National Forest, Colorado*

Wilderness can be defined in both political and popular terms. Political wildernesses are areas designated as such by a government and given a resultant protected status. Popular, or perceived wilderness is wilderness as defined in the mind of an individual. This research investigated the potential for maps of perceived wilderness created in a geographic information systems (GIS) environment to be used in the management of political wilderness and other protected areas. Using data gathered through a questionnaire survey of the wilderness preferences of recreational users of Colorado's San Juan National Forest (SJNF), we divided users into four "purism groups" that reflected the level of discrimination demonstrated by the user in personally defining the wilderness setting. For each purism group, we determined specific conditions considered by the group to be undesirable in the wilderness setting. In the GIS environment, we mapped the extent of perceived wilderness in the SJNF for each purism group using a method that excluded areas of the national forest demonstrating conditions considered by the group to be undesirable in the wilderness setting. We assessed the potential for maps of perceived wilderness to be used in the management of political wilderness and other protected areas by comparing the extent of perceived wilderness in the SJNF to the extent of political wilderness, inventoried roadless areas, and recreation opportunity spectrum class groupings in the national forest.

Keywords: geographic information science, wilderness, perceptual mapping, protected areas management

William Flatley, M.S., Texas A&M University. Email: flatley@tamu.edu; Carolyn A. Copenheaver, Ph.D., Virginia Polytechnic Institute and State University. Email: ccopenhe@vt.edu; *Successive Land Surveys as Indicators of Vegetation Change in an Agricultural Landscape*

The objective of this research was to identify the nature and timing of historical vegetation changes in a small agricultural watershed in order to better understand the underlying causes of these changes. A total of 304 land surveys were collected for a small agricultural watershed from early settlement in 1787 through to the present day. Types of witness corners were tallied and tested for shifts in frequency across time periods. Tree species were also classified by silvical characteristics including sprouting capability, shade tolerance, and seed type and these groupings were tested for shifts in frequency across time periods. Results showed significant shifts in white oak (*Quercus alba* L.), chestnut (*Castanea dentata* Marsh. Borkh.), chestnut oak (*Quercus prinus* Wild.), black oak (*Quercus velutina* Lam.), red oak (*Quercus rubra* L.), black locust (*Robinia pseudoacacia* L.), yellow poplar (*Liriodendron tulipifera* L.), and scarlet oak (*Quercus coccinea* Muenchh.). The central change was a steady decline in white oak, probably due to the absence of fire and changes in soil properties. Chestnut replaced white oak as the dominant species, but was removed by chestnut blight in the 1930's. Sprouting capability appeared to be the most important silvical characteristic across all species.

Jonathan Fleming, University of North Alabama. Email: jjpfleming@gmail.com; *Visualizing Yesterday's Maps with Today's Technology*

Topographic cognition is an essential skill for geographers and anyone interested in the outdoors. Contour lines presented on 2-dimensional paper maps are a traditional means for displaying topography. Digital data holds many advantages over paper maps because of the spatial analysis operations available in a GIS (line of sight, aspect, hillshade, etc). There are many instances where topographic data are not available in a digital format. This lack of digital data can eliminate access to spatial analysis operations for both computer aided cartography and GIS applications. There are many ways to preserve non-digital map data in a digital format, including basic scanning. Once this data is preserved digitally, it can be converted and attributed with elevation data which can then be interpolated into a Digital Elevation Model (DEM). DEM's hold an advantage over 2-dimensional contour maps because they can be represented in apparent 3-dimensions which is often easier to visualize and interpret for the untrained. This poster presents a case study involving the preservation and conversion of a pre-digital 1963 contour map. The area in consideration can no longer be surveyed because it has been impounded and is now a reservoir. This research focuses on ways to preserve the non-digital data, convert the non-digital contour lines to digital attributed vector data, and then interpolate the vector data into a Digital Elevation Model in order to improve the cognition of elevation.

Steve Fletcher, Senior Lecturer in Coastal and Marine Affairs, Bournemouth University. Email: sfletcher@bournemouth.ac.uk; Stakeholder involvement in the process of converting science into policy: Perspectives from the European Marine Strategy Directive

Within the EU Marine Strategy Directive, stakeholder involvement is a continuing theme, particularly with regard to the establishment, implementation and updating of national and regional Marine Strategies. The Directive also asserts the requirement for a sound knowledge base to inform and underpin national and regional Marine Strategies. The conversion of science to policy through a stakeholder process is therefore likely to present challenges to member states and competent authorities. The poor management of a stakeholder process risks the formulation of poor policy, not due to scientific inadequacies, but through incomplete stakeholder understanding of, or flawed treatment of, scientific inputs. It is therefore important that the conversion process is managed with regard to the stakeholder profile and the complexity and tractability of the issues under debate. Additional important considerations for those leading the science to policy conversion process include: the recruitment of accountable and genuinely representative stakeholders; the motivation of stakeholders to engage in a learning process; the provision of scientific information to stakeholders that is comprehensive and comprehensible; the operation of a policy-making process that is fair to all participants; and, that all stakeholders have a demonstrable influence on the creation of policy. It is concluded that the manner in which the participatory process is organised and operated can influence policy outcomes; as such participatory processes will require careful and sensitive management to ensure they produce credible, supported, and scientifically grounded policy.

Keywords: Stakeholder, Science, Policy, EU Marine Strategy Directive

Tom Fletcher, Bishop's University. Email: tom.fletcher@ubishops.ca; From Conservation to Reform Environmentalism: Memphremagog Conservation

Memphremagog Conservation, Inc. (MCI) is one of the oldest watershed groups in Quebec. This paper examines its history in the context of North American environmentalism, based on the group's archived files and the author's recent work with them. MCI formed in 1967 in response to problems with algal blooms due to nutrient loadings from two small cities, several villages and extensive farming. Its earliest efforts involved inspections and improvements of septic tanks of waterside cottages and the development of a code of ethics for the lake's users. Upon reaching its 20th year, MCI had recently fought and won a dramatic fight against a U.S. Department of Energy plan to bury nuclear waste on the Vermont side of the watershed. The group's most recent campaign, Operation Healthy Lake, involves water and sediment testing as a tool to inform watershed land-use management decisions, some of which are quite controversial; a recent provincial government plan to approve a condo development in a protected area is one of the more notable examples. This progression of MCI's priorities shares many similarities with the development of North American environmentalism more generally. Moreover, small local and regional groups like MCI are changing as larger environmental groups move from their history of voluntarism to a heavy reliance on paid professionals. The combined effect of these changes is that MCI has transformed from a relatively apolitical conservation group that espoused a kind of Leopold land ethic to a highly political advocate of reform environmentalism.

Sebastien Fleuret, CNRS-France. Email: sebastien.fleuret@univ-angers.fr; Re-engeniering of local health systems : networks and new spaces

This presentation aims to demonstrate that new organizations of care and social services deliveries (especially the development of coordinations and networks) leads to define new spaces. We studied samples of re-engeniering of health system in France and in Quebec. Both are moving towards more integration of delivery of care. In Quebec, 95 territories were created with a leading structure : the center for health and social services. This structure is responsible for bringing all the providers of services into a network and for giving to the population the guarantee of continuity and quality of care. It results in a new geography of health at the local scale. In France, continuity and quality of care are also used as arguments to justify changes in the organization of the system. But since the delivery of services is more compartmentalized (between different administrations and at different scales), it is impossible to create new spaces of health globally like in Quebec. Despite this difficulty, we can observe a similar trend to a redefinition of the geography of care and social services based on specific issues : aging, disabilities, emergency, specific diseases, ? This presentation shows that despite strong local differences, a cross-country study reveals similarities in the creation of new spaces in health.

E. Spencer Fleury, MA, University of South Florida. Email: spencer.fleury@gmail.com; Toward a Framework for Karst-Aware Land Use Regulation

Many jurisdictions in the United States have implemented land use regulations that attempt to mitigate the impacts of development and urbanization on karst. However, the techniques used to do this vary widely from place to place. This is at least partially related to the fact that there are no universally-accepted guidelines for developing land use regulations that explicitly account for the nature of karst terrains. This presentation will describe my efforts toward developing a flexible and effective framework for writing and developing karst-aware land use regulations. The framework is based on surveys of land use professionals in karst-prone areas, analysis of zoning and land use ordinances and of protected area management plans, and on quantitative analysis of the impacts of selected existing karst-related regulations. Ultimately, the goal is to create a land-use regulatory framework that can be effectively applied in virtually any karst region.

Colin Flint, University of Illinois. Email: flint@uiuc.edu; Adolf Hitler and the Construction of Family Values in US Geopolitical Discourse

Michael Walzer's writing on Just War includes a discussion of when it is moral to conduct immoral acts in warfare. Walzer introduces the concept of "emergency ethics" in which the circumstances and consequences are so dire that immoral acts, such as the bombing of civilian targets, are justifiable. Walzer's discussion focuses upon the British bombing campaign against Germany in face of a Nazi invasion. But what of today? The US invasion of Iraq rested upon arguments that were, at best, at the margins of just war theory. And yet there is a geopolitical need to represent the war as just. This paper explores the sense of "emergency ethics" within US geopolitical rhetoric - noting the frequent use of modern day "Hitlers" Hussein and bin Laden ? and connects it to the construction of a threat to an idealized description of the "American family". The use of threats to the family as justifying military action is traced to the Korean War and is contrasted with the frequent references to "domestic" situations in letters from US and British servicemen to their family and loved ones.

Jennifer L. Fluri, Dartmouth College. Email: jennifer.fluri@dartmouth.edu; "We Benefit from Supporters Like You": Addressing Academic Rigor through Activist Research

This paper will explore the role of activism and agency in conducting fieldwork with/on an organization one is both studying and supporting. The political, economic, and social support for an organization can and does at times compromise the researcher's position, ability and/or capacity to examine and analyze the organization both subjectively and objectively. Conversely, providing support to an organization one is researching can also present unique insights to the operational structure of the group and its involvement with (and limits to) individuals outside the nucleus of the organization. By focusing on my case study and fieldwork with The Revolutionary Association of the Women of Afghanistan's (RAWA) and its international supporters "network", I discuss the opportunities, challenges, and pitfalls of engaging in activist support in tandem with academic research. This article will further problematize the politics of activist research and the ethical and methodological issues associated with social, economic, and political support for groups that are also academically analyzed and represented through research publications and teaching.

Keywords: Activism, Academy, Afghanistan, Gender, Feminism, Academic Rigor

Steven Flusty, York University. Email: sflusty@yorku.ca; Bunkers and the Mirrorhouses: The Resurgence of the Imperial Metropole

Nearly a century ago, Patrick Geddes identified world cities as centers of far-reaching political, economic and cultural control. While much research has since elaborated upon this broad introductory definition, it has also tended to neglect Geddes' emphasis upon politics and governance by subordinating it to the logistics and localization of corporate capital. In the process, the imperial context within which the idea of world cities first evolved has been tacitly disappeared, leaving us increasingly well able to locate the market's invisible hand but ill-equipped to similarly place its indispensable iron glove. While the past century has witnessed some spatial disaggregation of the world city's political and financial control functions, world cities of political power, of coercive force, even of imperial domination are not only alive and well but, since the beginning of this century, increasing in prominence. In this presentation, excursions through two cities in particular - Washington D.C. and Brussels ? will serve to reveal the resurgence of the imperial world city. Despite the stark contrasts between Washington, D.C.'s landscape of concrete opacity and the multiply glazed transparency of Brussels' European Quarter, both cities' streetscapes are suffused with expressions of geopolitical triumphalism. These in turn bear heavy implications for everything

from Guyanese spaceports to Soviet-surplus prisons in Eastern European and, in so doing, testify to both cities' capacity for the production and projection of regulatory, diplomatic, ideological and military might.

Keywords: world cities, imperialism, geopolitics, globalization

John J. Flynn, College Of St Catherine. Email: jfflynn@stkate.edu; "Beauty All Around Me": Artistic Impressions of Three Special Places in the Navajo Country

The Navajo Nation, in the American Southwest's Four Corners region, is full of places of meaning to the Dine' or Navajo; mountains, mesas and many other natural features have been invested with sacred status and incorporated into a worldview. Numerous features in the region also have significance and appeal to other people, including to artists and writers. This presentation is a focus on three special, and to some sacred, places: Monument Valley, Canyon de Chelly and Shiprock, as they have been represented in painting, photography, literature and other arts by both Navajo and non-Native people.

Randall Edward Flynn, MA, National Geospatial-Intelligence Agency. Email: Randall.E.Flynn@nga.mil; Political Geography and Cultural Intelligence Analysis at the National Geospatial-Intelligence Agency

The United States and Allied Intelligence and Defense Communities have relied on space-borne and remote sensing assets to produce predictive assessments of adversarial actions. Why should studies of other cultures and societies interest military geographers and intelligence analysts today? This presentation will overview the National Geospatial-Intelligence Agency's (NGA) Political Geography program and mission. It will highlight NGA's work in producing thematic geospatial products, the agency's efforts in maintaining the Geographic Names Data Base, collaborative work with the U.S. Department of State to develop boundary analysis methodologies, and initiatives to collect ethnological data resulting in the ability to combine a technological explication of a region within a cultural geographic context. "Cultural Intelligence" is an underrepresented and underutilized discipline. We define it as the collection, analysis and application of ethnographic data that will yield insight into the thought process and value system of a given group, allowing for prediction of their behavior. The largest consumer of cultural intelligence is the war-fighter, whose mission success depends on familiarity with the society in which they are deployed. Because there is no national resource for cultural intelligence, war-fighters are forced to become collectors, interpreters, analysts and disseminators of this data. Polling users and producers of cultural intelligence in the United States, we identified gaps in the Intelligence Community's approach to this field. The Intelligence Community requires a methodology to prepare geospatial context for analysis of the geography of cultural intelligence. NGA analysts are applying their unique skills in new ways to address these gaps.

William Flynn, Oklahoma State University. Email: william.flynn@okstate.edu; Note Worthy: The Geography of Smooth Jazz

This paper explores the geography of contemporary jazz, a subgenre that coalesced out of a variety of musical influences in 1980s coastal California and has long been associated with this region serving as its core. Much research in music geography to date is based on song lyrics and since smooth jazz is primarily an instrumental form, this paper fulfills two purposes, as it (1) examines different approaches to studying music geography and (2) it covers a musical style that has not yet received scholarly attention. The paper will also highlight the long-running Catalina Island Jazz festival, examine the link between contemporary jazz and viticulture, and discuss how "fusion" has recently turned into diffusion.

Keywords: Music Geography, Jazz

William Flynn, Oklahoma State University. Email: william.flynn@okstate.edu; Allen Finchum, PhD, Oklahoma State University. Email: allen.finchum@okstate.edu; Temporal Comparison of Geography Faculty Migration and Hiring Patterns: 1991 and 2006

This presentation will discuss the results of a continuing study of Geography Faculty migration and hiring patterns based on datasets compiled from the 1990-91 and 2005-06 AAG Guidebooks. Patterns of faculty migration from PhD granting institution to academic job setting are analyzed and discussed to determine if trends in faculty migration exist or are changing as the discipline and the academy moves well into the 21st Century. Also, Hiring trends of institutions based on size and program complexity in relation to the hiring of PhD candidates from various locations are also reviewed. The purpose of the research is to aid in determining if patterns of faculty migration and institutional hiring practices exist within the community of geography faculty and the various types of departments that hire such individuals. It is believed that distinct regional variations exist in such patterns, and the intention of this portion of the research project is to better understand how these patterns might have changed in the past

15 years. This period was chosen as it represents approximately one-half of the normal academic career, and a significant turnover in faculty should be present between the periods selected for review, although some overlap in faculty placement will also be present.

Keywords: Geography Faculty, Migration, Higher Education

Matthew Fockler, University of Nevada. Email: mattfockler@sbcglobal.net; Thicker Than Blood: Water, Irrigation and the Truckee Meadows

In the early 1850s, white settlement of the Truckee Meadows, in what would be known eventually as Nevada, was far from a forgone conclusion. Early settlers, hay-cutters and trading post operators mostly, encountered alkali hills, swamp filled lowlands, and a river that was prone to flood. Early settlers attempted to mediate these conditions by draining off the swamps through ditching. With the boom of the Comstock a market for feed created a rush for irrigable land in the Truckee Meadows. Irrigation became a tool to make the Meadows bloom. The story of who actually dug the first ditch in the Truckee Meadows is lost to history. We do not know the name of the man who first took a shovel full of damp river mud and rock and slung them aside, again and again. What we do know is that, in the early days of the Truckee Meadows, as the Comstock boomed and fortunes were made, men in the Truckee Meadows decided to shape the land in a way that would allow them to provide for themselves. Irrigation in the Truckee Meadows would outlive the Comstock. Today, irrigation ditches spread across the landscape and fuel, not just agriculture, but industry and suburban development. This study looks at the role of irrigation ditches in the cultural and physical development of the Truckee Meadows through five cartographic representations of water, irrigation, and its uses in the Truckee Meadows.

Keywords: historical geography, water, irrigation, cartographic representation, GIS

Niels Fold, Department of Geography, University of Copenhagen. Email: nf@geogr.ku.dk; Getting to grips with pickers, farmers and labourers: Transnational capital in Ghana's perennial export crop sectors

Rural transformation in African economies has been spurred by the removal of state monopolies, including the replacement of pan-seasonal and pan-territorial prices with 'market' prices. Transnational capital now firmly controls access to global markets while local capital is mostly relegated to serve different 'comprador' functions. Export crop production is still dominated by smallholders although some export crops are more suitable for wage labour or - at the other end of the spectrum - simple commodity production based on picking and gathering activities. This traditional set of actors - while not forgetting the changed power relations between them - has been supplemented by NGOs who increasingly act as mediators of money, commodity and information flows. This paper examines differences and similarities in the sectoral practices of transnational capital in Ghana's dominant perennial export crop sectors (cocoa, shea nuts, palm oil, pineapples). It is argued that different transnational practices and functional roles of local capital and NGOs are structured by variations in the 'nature' of the crop (perishability, transportability, pre-shipment processing, etc.), different institutional settings (variations in contractual relations with producers) and distinctive forms of 'civic global governance' (campaigns and consumer preferences in (Northern) markets). Despite notable inter-sectoral differences, the general tendency is an increasing spatial dichotomisation in 'involved' and 'marginalised' rural regions with increasing social differentiation taking place in the former. However, acknowledging the variety in practices and functional roles as constitutive elements of broader rural transformation processes may (potentially) result in more resilient regional and social policies.

Keywords: transnational (agro-food) capital, perennial crops, Ghana

Ronan Foley, NUI Maynooth, Ireland. Email: ronan.foley@nuim.ie; Equitable Access to Carer's Services: Mapping the Geographies of Informal Care in Ireland.

Carers have become important providers of social care in Ireland. Within the developing areas of geographies of care and voluntarism (Milligan & Conradson, 2006), there are ongoing debates about the relative importance of place and locality in the equitable provision of services. Such debates are particularly relevant to informal carers, and this study will examine whether there are any equity issues associated with the provision of services to carers within Ireland (Power, 2005). Census data on informal carers was first collected in Ireland in 2002 and the research initially mapped the distribution of carers in Ireland at a variety of spatial scales. Those distributions were then analysed against relevant census variables to establish whether any causal relationships could be identified. The location of carer's services nationally was also mapped from a national database. The underlying thesis was that there was likely to be spatial inequity between carers and service locations. The results suggested that some spatial inequities exist in Ireland and that rural/urban variations account for

much of the equity gap between need (carer geography) and access/provision (service geography). There was little evidence of clear relationships with a number of expected explanatory variables, i.e. deprivation and family formation at an area level. At a regional scale, clear differences emerged in service provision as measured through 'location quotients'. Surprisingly the expected findings in relation to service-rich urban provision and service-poor rural provision were unclear. Potential explanations were related to historic patterns of provision, income and the underlying demographic distributions of elderly residents.

Keywords: Informal Care, Access, Services, Access

Jadah Folliott, M.A., The University of Western Ontario. Email: jfolliott@uwo.ca; Micha Pazner, Ph.D., The University of Western Ontario. Email: pazner@uwo.ca; *Wildfire Scar Pattern Interpretation*

Since the 1980s large wildfire activity has been increasing. Based on a global warming trend, the impacts of climate change may include more frequent and severe fires, shorter growth periods between fires, and a decrease in the carbon storage of forests. Satellite imagery and GIS have been used in past studies to observe the effects and extents of fire regimes. This study will develop new pattern analysis and visualization methods, custom tailored to wildfire scars. The objective of this study is to become familiar with the data, problems, and study area of our broader research plan. Initial image interpretation of wildfire scar patterns in Canada's Boreal Forest will be undertaken using Landsat GeoCover, topographic maps, and ancillary data (e.g., fire-related and other forest disturbance information). The following research questions will be addressed: 1) How can wildfire scars be distinguished from other forest disturbances? 2) Can these disturbances be used to identify wildfire scars through elimination? 3) Can fresh burns be distinguished from older burns (e.g., scars that are weeks versus months old, or scars from different wildfire seasons)? 4) Can older fires be classified by regeneration stages? 5) Can soil and impervious surfaces be used as indirect indicators in wildfire scar pattern analysis? These questions will be addressed using digital image enhancement and manual image interpretation. It is expected that the results of this study will guide the next stage of our research.

Keywords: Global warming, climate change, wildfires, Boreal Forest, remote sensing

Gail A. Fondahl, Univ Of Northern British Columbia. Email: fondahlg@unbc.ca; *The 'Ecological Path' and the 'Tree of Memory': Challenging Place Annihilation through Landscape Performance in Southeastern Siberia*

Indigenous peoples in Siberia have endured a turbulent post-Soviet period of economic and political reforms that have radically changed the political, economic and social landscapes of their homelands. If legal rights to land have notably improved notably (at least on paper), standards of living have markedly deteriorated, compelling many indigenous families to re-assume the subsistence livelihood strategies of their ancestors. Meanwhile, resource development is reducing the land available for pursuing subsistence activities in many areas, while the inter-generational transmission of knowledge regarding such activities has been disrupted by compulsory schooling and sedentarization. This presentation explores how the indigenous Evenki at the north end of Lake Baikal are resisting place-annihilation caused by both the direct actions of resource development and the indirect effects of the decline of indigenous place-based knowledge, by the production of landscape elements that assert and educate about Evenki place-based identity. Through performing a landscape of an 'Ecological Path' and a 'Tree of Memory,' for both Evenki youth and visitors from afar, Evenki elders manipulate memories of indigenous pasts (pre-Soviet and Soviet), communicate place-based cultural teachings and celebrate Evenki survival and renewal in the face of continued threats of place-annihilation.

Keywords: Indigenous, Siberia, resistance, revival, place-based identity

Mark Alan Fonstad, Texas State University, San Marcos. Email: mfonstad@txstate.edu; *The Three-Dimensional River Environment: Tests of Classical Hydraulic Geometry Predictions using Remote Sensing Approaches along the Brazos River, USA*

Large rivers in semi-arid and mild mid-latitude areas often are wide, shallow, and produce physical habitats of great complexity. Policy and scientific decisions regarding management of these rivers require measurement techniques that can handle the high geodiversity and that are simple, straightforward, and can use existing geographical data. The Brazos River is a 500 km long clearwater river that has its headwaters in the eastern New Mexico and flows across Texas into the Gulf of Mexico. In clearwater rivers such as the Brazos, some light often reaches the riverbed and returns to the surface, providing optical information about different components of the physical habitat structure. The HAB-2 transform allows the estimation of river depth at each image pixel, and separation of the depth effect from the remaining image information. This remaining spectral information can be correlated with suspended sediment concentrations, bottom albedo, and water surface geometry. The widespread

availability of CIR digital orthophotoquads across much of the United States allows the use of HAB approaches to extract three dimensional data for large area riverscapes. In so doing, they allow the testing of classical models of fluvial forms and large-area processes. The classical theory of the downstream hydraulic geometry, for example, postulates power relationships between a rivers upstream drainage area and its width, depth, and velocity. Calibrated high-resolution imagery shows systematic deviations from the classic theory as well as a level of randomness at most scales that support's Phillips's theory of multiple modes of adjustment in fluvial systems.

Keywords: geomorphology, remote sensing, sediment transport, Brazos River

Joseph F Fontanella, COL, USA (Ret.), Deputy Director, USAERDC-TEC, U.S. Army Corps of Engineers, Topographic Engineering Center. Email: joseph.f.fontanella@erdc.usace.army.mil; *Military and Applied Geography at the U.S. Army Topographic Engineering Center*

AAG invited executive speaker and geographer, Colonel Joseph F. Fontanella (USA Retired), Deputy Director of the U.S. Army's Topographic Engineering Center (TEC), helps geographers understand opportunities in military and applied geography across the various geographic specialty domains. Geographers and other geospatial scientists form the core of the intellectual capital found at TEC. The presentation prepares the audience for a follow-on discussions session on opportunities within the center, its partner organizations, and its contractors. The presentation addresses the center's mission, how it fits into the Corps of Engineers and the Army, and how TEC uses it geographers. The presentation concludes with an overview of the geographic problems that TEC faces as an enterprise. The presentation covers information about enterprise settings relevant to those considering employment in either applied or military geography as well as for academics preparing students for applied careers in any geographic workforce found in the knowledge economy.

Keywords: military geography, applied geography, topographic engineering

Kenneth E. Foote, University of Colorado at Boulder. Email: k.foote@colorado.edu; *Time Management for Early Career Faculty*

This paper focuses on the difficult, often conflicting choices early career faculty face in balancing the time they invest in research, teaching, and service. The paper reviews research findings relating to time management, research & teaching productivity, procrastination, and stress and suggests strategies for addressing key concerns often expressed by early career faculty about the stresses they face as they begin their careers. Two activities are included in the chapter for use in professional development seminars or workshops.

Keywords: early-career faculty, EDGE, professional development, time management

Margaret D. Foraker, Salisbury University. Email: mdforaker@salisbury.edu; *Labor and Amenity Migration to the Delmarva Peninsula*

This paper examines the relationship between amenity/destination migration and labor migration to the Delmarva Peninsula. The Delmarva Peninsula is a region undergoing rapid change largely as a result of population growth (net migration) and urban development pressures from megalopolis. In addition to its relative location, Delmarva's rural landscape, environmental amenities, and resort/recreation attractions are fueling amenity and retirement migration. As business, housing, and infrastructural growth boom to meet rising demand, traditional rural industries on the peninsula such as chicken processing are necessarily reacting with a more competitive labor strategy. Within the context of the low wage labor margins of resort/retirement/retail development and chicken processing, Delmarva serves as a prime location for exploring the connections, dependencies, and confusions of supportive migration streams. Analysis of 1990 and 2000 census data is used to establish a context of economic and social re-composition on the peninsula and to explore both linkages and segregation among dual migration streams.

Keywords: Delmarva Peninsula, labor, amenity migration

William Forbes, Stephen F. Austin State University. Email: forbesw@sfasu.edu; *Perceptions of Conservation and Development in Southeastern Peru*

This presentation summarizes a proposal to survey social perceptions of conservation and development issues in southeastern Peru. Renowned conservationist Aldo Leopold featured Peru's Rio Madre de Dios in a 1924 essay about declining global wilderness. Today the region is known for some of the highest biodiversity on the planet. The proposed research would compare western attitudes on conservation, exemplified by Leopold's land ethic, with attitudes of a variety of local groups on nature, poverty alleviation, and economic development. National parks, indigenous groups, and the proposed trans-Amazon

highway are of particular interest.

Keywords: Peru, land ethic, development

James Ford, PhD, Dept. of Geography, McGill University. Email: james.ford@mcgill.ca; Gita Laidler, Dept. of Geography, University of Toronto. Email: gita.laidler@utoronto.ca; Bill Gough, Dept. of Geography, University of Toronto. Email: gough@utsc.utoronto.ca; Theo Ikkummaq, Hamlet of Igloolik. Email: ; *Vulnerability to sea-ice change in Arctic Canada*

This paper characterizes vulnerability to sea-ice change in Igloolik, Nunavut. Using the vulnerability framework of Ford and Smit (2004), we conducted 64 semi-structured interviews between 2004-2005, and focus groups in 2006. These methods were used to: identify the nature of sea ice use among Igloolik Inuit, characterize how risks associated with sea ice use are managed, and analyze those characteristics of the community that enable or constrain this ability. The research demonstrates that Inuit in Igloolik have been highly adaptable in the face of changing sea ice conditions. However, societal change, and more recently climate change, have increased the susceptibility of people to sea ice risks and have resulted in the emergence of vulnerable groups within the community. To assess vulnerability to future sea ice change we used downscaled climate change scenarios and sea ice modeling to estimate directional changes in community-identified sea ice risks. The models predict significant changes in sea ice conditions including later ice freeze-up and earlier break-up, more dynamic ice conditions, and thinner ice in the Igloolik region. We conducted focus groups in fall 2006, and analyzed past experience and response to sea ice variability and extremes, to assess what these projections mean for sea ice use and to identify future adaptation options, constraints, and opportunities. The research indicates continued importance of traditional coping mechanisms in light of climate change. The ability to draw on these coping mechanisms, however, will be unequal: young Inuit and those without access to economic resources, in particular, are vulnerable.

Keywords: Climate change, vulnerability, Inuit, sea-ice, natural hazards

Pip Forer, P.h.d., SGGES, University of Auckland, New Zealand. Email: pipf@clear.net.nz; *Activities, options and spaces in individual lifelines*

This paper is concerned with the dynamics of the contexts in which individuals make decisions about future activities subject to constraints on information, mobility and time. It explores the nature of forward planning and the way in which opportunities may be recognised, adopted or ignored within planning horizons which act at different temporal and spatial scales. Using both urban and regional examples it discusses the links between spatial knowledge, mobile technologies and decision making and identifies ways to represent the ongoing pattern of individual opportunity.

Keywords: time geography, spatial decision making, activity patterns

Patrick Forest, Université Laval. Email: patrick.forest.1@ulaval.ca; Marie-Josée Verreault, Université Laval. Email: marie-josée.verreault.1@ulaval.ca; *Spatial encroachment on public land: Assessing geo-legal strategies in Grands-Jardins National Park, Québec, Canada*

Since the 1980's, the province of Québec has established many national parks in order to protect natural landscapes of interest. One of these parks, Grands-Jardins National Park, is contiguous to public lands under commercial forest management. According to the current law enforcement, lumber companies can log wood on public lands through timber supply and forest management agreements. In this particular forest zone, the recently modified regulation provides that cutting areas are to be dispersed throughout the landscape, while being interspersed of residual forests. To mitigate the impact of this regulation upon the annual cutting allowance, a lumber company was allowed to take into account some parts of the Grands-Jardins National Park territory in the calculation of the residual forest blocks. Relying on the literature in legal geography (Blomley and al. 2001, Holder and Harrison 2003, Manderson 2005), the objective of our empirical research is twofold. Firstly, it aims at acquiring a better understanding of the concepts of encroachment (Blomley 2005), of territoriality (Raffestin 1980, Sack 1986, Johnston 2001), and of territorial jurisdiction (Ford 1999, Vandergeest and Peluso 1995, 2001). Secondly, we want to assess and highlight the use of geo-legal strategies by private lumber companies and governmental departments. We demonstrate that both the interpretation of the law and the territorial dynamics drive these changes.

Keywords: legal geography, territoriality, forest, law interpretation, environment

Philippe Foret, Dr., Swiss Federal Institute of Technology, Zurich (ETHZ). Email: pforet@bluewin.ch; *Chinese borderlands: Mapping race, land and climate at Kara Khoto*

This paper on the historical geography of the Heihe river delta (in Inner Mongolia) will analyze the role that cartography can assume in border studies. Chinese and Japanese geographers have extensively studied Kara Khoto (or Heicheng), a Mongolian Silk Road city that European scholars first surveyed in the 1920s and 1930s. I am interested in the mapping conducted then of the cultural and ecological borders that used to separate pre-modern nomad from peasant societies. I will therefore examine the textual and pictorial records collected by the geologists, geographers, and archaeologists who directed topographical expeditions in the Chinese borderlands. This would feed a discussion on the significance that between the two world wars this marginal region took for the understanding of climate change and the interpretation of long-term interactions between civilization and barbarism.

Keywords: History of geography, history of cartography, Chinese studies, border studies, environmental history

Jennifer Forkes, University of Toronto. Email: j.forkes@utoronto.ca; *Measurements of the foodshed: Size, Shape and Structure.*

Beginning with Getz (1991) and Kloppenburg et al (1996), the concept of the foodshed has encouraged critical thought about where our food comes from and the environmental burden it brings with it. In this paper, I argue that in order to move towards innovative policy and action, a set of indicators is needed to measure the broad array of environmental impacts arising from the current operation of urban food systems. Additionally, I emphasize that a holistic approach to understanding the foodshed must incorporate a consideration of the amount and destination of food wastes, and must advocate for a re-use of embodied nutrients and energy. Using Toronto, Canada as an example, I illustrate four environmental indicators for an urban foodshed: the food-mile (the distance food and food waste travel, a measure of the radius of the foodshed); the food-print (the area required to produce and disposed of food and wastes); the food-emission (the amount of greenhouse gases produced as part of transportation and waste disposal); and the food-cycle (the degree to which food wastes are re-used in food or other urban systems). The indicators are used to link theory to practice through an evaluation of the impact of three municipal food system policies on the environmental sustainability of the urban food system. The paper concludes by highlighting the need for increased data collection and coordination at the scale of the urban foodshed.

Keywords: food systems, nutrient cycling, indicators, organic wastes

David E. Fornander, PhD Candidate, University of Arizona. Email: dfornand@email.arizona.edu; *Fish, Floatboats and Feds: "Directions and disparities in policy surrounding the Endangered Species Act and listed Snake River Chinook salmon on the Sawtooth National Recreation Area."*

Since the mid 1900s and coinciding with the initial damming of the Columbia River watershed, wild salmon and steelhead stocks in the Pacific Northwest have declined at an alarming rate. Current governmental policy and discourse have indirectly placed much of the burden for conserving this regional icon upon local communities, yet how much affect and power they actually have upon salmon recovery is a topic of much debate. Using endangered Snake River Chinook salmon in the Sawtooth National Recreation Area (SNRA) as a case study, this work addresses how current patterns of commercial floatboat use are directed by policy and the role this alternative livelihood strategy may play in the reproductive fitness and long-term survival of the few remaining wild salmon and steelhead in the region. A collaborative project involving individuals at the state, local and federal level, this research critically examines the use of the Endangered Species Act (ESA) of 1973 as a protective tool, and more importantly the potential disparities associated with its enforcement and regulation. By examining management and regulation surrounding shifting land use strategies such as ecotourism, this work will better equip environmental managers and policy makers to provide alternatives strategies for protecting areas of concern for threatened fish and wildlife.

Keywords: Salmon, environmental policy, conservation, land management, and ecotourism.

James Forrest, PhD, Macquarie University. Email: jim.forrest@mq.edu.au; *The Trouble with Segregation Indices: Towards resolving the existing 'state of theoretical and methodological disarray'*

The study of the spatial segregation of ethnic groups in urban areas has long suffered from the plethora of measurement techniques, both spatial and aspatial. The lack of agreement 'about which measure is best to use and under what circumstances' acts to limit our understanding of what is actually happening across urban systems at both the national and international level. This is especially so in increasingly complex, multicultural societies in an age of widespread international migration. The value of threshold analysis as a means of

moving beyond the present impasse is demonstrated in the case of school segregation in a British urban context.

Keywords: segregation indices, threshold analysis, school segregation

Gunnel Forsberg, Stockholm University. Email: gunnel.forsberg@humangeo.su.se; Susanne Stenbacka, Uppsala University. Email: susanne.stenbacka@kultgeog.uu.se; *Creating Gendered Ruralities - Cases from Sweden.*

With the point of departure taken in local studies in three Swedish regions, this paper will critically analyse negotiations of rural gender contracts. These negotiations result in three different strategies concerning the gendering of everyday practices. Adopting as a way of taking part in mainstream restructuring of gender contracts or holding on to traditions while meeting new societal demands. Challenging can be done in public or in private and implies that gendered ruralities are challenged, for example in the labour market or in everyday relations. Re-treating implies a passive strategy with a defensive attitude towards society activities. We attempt to show how the spatial formation of gender is working through peoples' experiences, coloured by representations of the rural. The constructed rurality is built on a collective memory and a common conception of what the rural should be like. The gendered representations are stitched to people according to their given spatial urban or rural label. These labels become parts of a person's identity and affect the practising of masculinities and femininities. Two regions can be characterised as peripheral; one forest based region on the border between Sweden and Norway and one in the sparsely populated Northern/Arctic region on the border between Sweden and Finland, and a third more centrally located metropolitan region. Empirical findings are based on in-depth interviews.

Keywords: gender, ruralities, social geography, Sweden

Richard L. Forstall, Independent Scholar. Email: mzwa85a@erols.com; Richard P. Greene, Northern Illinois University. Email: rgreene@niu.edu; James B. Pick, University of Redlands. Email: James_Pick@redlands.edu; *The World's Largest Cities? Why So Little Consensus?*

Lists of the world's most populous urban areas are surprisingly inconsistent across standard reference sources. These even disagree in identifying the world's largest city. We first review the differences found in lists of the twenty largest areas, according to several unofficial sources and the United Nations. We show that these variations in populations and rankings stem primarily from differences in concepts and definitions, not from bad census counts or lack of basic information about the individual urban areas. As specific examples, maps and statistical data for Tokyo, Mexico City, Los Angeles, and Beijing elucidate the administrative areas and statistical definitions in use for each of these urban areas, and illustrate how the varying definitions yield different totals of population and extent. We conclude by comparing the UN's list of largest urban agglomerations with a list of the largest metropolitan areas defined using consistent criteria so far as possible.

Keywords: metropolitan areas, definition, Tokyo, Mexico City, Los Angeles, Beijing

Elizabeth M Forsyth, UCLA Undergraduate. Email: readehorn@yahoo.com; *Influence of Religion on Midwestern Agriculture*

This paper examines how the Midwest has used religion to help shape the family farm and the influence religion has had on agricultural practices in the region. Population maps and ratios, combined with historical evidence on the foundations and practices of the Midwestern family farm, are used to help determine religious influence on agriculture. The region's Lutheran/Catholic divide serves as a mirror of the greater American religious landscape of Protestant/Catholic divisions. Examining these divisions in agricultural communities can help our understanding of the impact religion can have in everyday life, both within agricultural communities and for urban consumption that agriculture supports. This impact is becoming increasingly relevant as people begin to question the roles industrial agricultural and genetic engineering, increasingly the Midwestern norm, play in communities.

Keywords: midwest, religion, genetic engineering, family farms, industrial agriculture, midwestern agriculture, catholicism, lutherans

Joseph Fortier, Clark University. Email: jfortier@clarku.edu; *A comparison of Machine Learning Algorithms: The Effects of Classification Scheme Detail on Map Accuracy*

Remote sensing research has benefited greatly from the introduction of machine learning algorithms to land-use/ land-cover mapping. However with an increased number of classification algorithms now readily available to remote sensing practitioners, knowing which algorithm is most appropriate for a given project can be difficult because different methods interact with input data in different ways. Previous studies have compared machine learning algorithms to

assess their impact on land-cover map accuracy but little is published about the effect of categorical detail on classification accuracies. In this study Landsat-7 ETM+ and environmental GIS data are combined to compare the maps generated by a Classification Tree Algorithm, Fuzzy ARTMAP, Self Organizing Feature Map, and a Back-Propagation neural network, at multiple levels of aggregation, over a subset of Massachusetts, USA. The results of this study demonstrate that while simple levels of categorical aggregation (e.g., 6-8 land-cover classes) have little impact on algorithm performance, increased categorical detail (e.g., 15-22 land-cover classes) leads to multiple sources of commission and omission error throughout the study area.

Keywords: Massachusetts, land-cover mapping, machine learning algorithms, classification scheme, classifier accuracy

Eugene A Fosnight, SAIC contractor for USGS EROS. Email: fosnight@usgs.gov; Gary N Geller, Jet Propulsion Laboratory, California Institute of Technology. Email: Gary.N.Geller@jpl.nasa.gov; *TerraLook: Satellite Imagery for a Changing World*

Science writers, field scientists, resource managers, educators, students, policy makers, and the general public are all interested in using satellite images of the Earth. However, many are prevented from using these images by arcane data formats, specialized analysis systems, or the expert knowledge needed to use most remote sensing products. With the TerraLook product, we seek to expand and broaden the remote sensing user community by providing user-selectable collections of satellite images, which are distributed as simulated natural color JPEG images that are easy to acquire and use. The TerraLook collection consists of georegistered Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER) images and orthorectified Landsat images from three epochs (circa 1975, 1990, and 2000). TerraLook is a no-cost product available from the USGS Center for Earth Resources Observation & Science (EROS) (<http://eros.usgs.gov/>). TerraLook builds on the success of the NASA Jet Propulsion Laboratory's Protected Area Archive project (<http://asterweb.jpl.nasa.gov/paa.asp>). The TerraLook's simulated natural color JPEG images have many benefits. JPEG images are compressed, which make them quick to download and display. Simulated natural color images are easily grasped by a wide range of users. The algorithm used to process TerraLook images permits the creation of a consistent time series from the earliest Landsat satellite sensor to existing land imaging sensors. The TerraLook product is GIS-ready, but more importantly, TerraLook images can be viewed in any software that can display JPEG images. An easy to use TerraLook viewer is also available to view, compare, and annotate TerraLook images.

Keywords: remote sensing, simulated natural color, time series

Jennifer Foster, York University. Email: jfoster@yorku.ca; *Constructing landscape continuity, producing social order*

Convergence around ecological concepts like landscape continuity suggests certain degrees of consolidation of ecological ideals that extend beyond the science of ecology into postcolonial landscape patterns. As the concepts of ecology are infused with preferences and histories performed through landscapes, they reflect both the coarse and subtle ways that ecologies produce and reproduce social relationships that are spatially inscribed. An important conduit through which these discrete politicizations congeal is environmental aesthetics, or the aesthetics of everyday life. This presentation considers how the specific concept of landscape continuity kindles social exclusions and erasures that correlate ecology, aesthetics and social order.

Keywords: landscape continuity, social order, environmental aesthetics, postcolonialism

Matthew W. Foulkes, University Of Missouri. Email: foulkesm@missouri.edu; *An examination of the relevance of traditional theoretical approaches to studies of the geographic mobility of the rural poor*

Studies of US migration and residential mobility have predominately relied on the neoclassical theoretical framework. While recent studies and internal disciplinary reflection may be loosening the dominance of economic-based theories, the core of migration research remains rooted in approaches stressing economic rationality. Yet it is debatable whether these economic-based theories are applicable to the migration behavior of the poor living in the rural US. The rural poor face greater constraints, follow non-conventional housing careers, have a higher percentage of forced moves, and may conceptualize moving differently than the non-poor. Utilizing evidence from a variety of studies of poverty migration and residential mobility, this paper will explore the relevance of neoclassical and human capital theory to the migration and residential behavior of the rural poor. It will also explore the insights gained from alternative approaches to studying migration and residential mobility, and how current theoretical explorations occurring in population geography might inform our understanding of poverty migration.

Keywords: migration, poverty, migration theory

Email: kjack@pdx.edu; *Glaciers in the American West: Response to climate change during the past century*

We have inventoried 8303 glaciers and permanent snowfields in the American West, exclusive of Alaska. A subset of that inventory, largely restricted to the National Parks have observational histories dating to the beginning of the 20th Century. Results from photographic analysis show that glaciers retreated quickly as the climate was warming from the Little Ice Age. By the 1950's to 1970's the retreat in many, but not all, glacial regions slowed or started to advance. In the northwest, retreat accelerated after the 1975-76 shift in winter atmospheric circulation, which caused thinner winter snow packs. Trends in warmer summer temperatures do not play a role except in Colorado and southern California. The magnitude and rate of retreat between glaciers varies greatly. The variability results from the interaction between local topography and large scale climate forcing. The distribution of area with elevation is a major factor and local topographic factors may enhance or suppress local snow accumulation. Altitude range of a glacier also is an important factor such that enhanced precipitation resulting in snow at higher elevations may compensate for rising freezing levels and less snow at lower elevations. Also, as glaciers shrink they retreat into higher elevations and local climates of favorable energy balance conditions slow the rate of shrinkage. In these environments the glaciers can become insensitive to further climatic change, in our case, reduced winter snow accumulation. We speculate that this unstable state of equilibrium would persist until a climatic threshold is crossed whereby the glacier essentially disappears.

Eric J. Fournier, Samford University. Email: ejfourni@samford.edu; Max Baber, Samford University. Email: rmbaber@samford.edu; *Tear-Downs, Renovation, and Neighborhood Change: A GIS Analysis of Major Home Renovation and Patterns of In-fill Construction in Homewood, Alabama.*

The building of large new houses (or major renovations of existing homes) on small lots in desirable neighborhoods is a relatively new phenomenon. This process has resisted easy labeling, but it is a significant new force in the geography of housing in some U.S. cities. This study explores the housing market of Homewood, Alabama as a means of examining this process. Building permit data are used to show the spatial and temporal patterns of large-scale renovation and new in-fill construction. The use of GIS allows us to examine the diffusion of renovations from a wealthy adjacent suburb towards less affluent areas. In addition we explore the role that barriers (such as highways) play in the diffusion of renovation. Finally we integrate the housing data with census data to create a demographic profile of neighborhoods that have experienced large-scale renovations and attempt to predict areas that will experience this phenomenon in the future. The results of this project will contribute to an ongoing debate in the city about zoning regulations, neighborhood change, and a new version of the city's master plan.

Keywords: Housing, Neighborhood change, Alabama

Christopher Fowler, University of Washington. Email: csfowler@u.washington.edu; *The Complex City: Agent-based models and critical, quantitative, economic geography*

Geographers have rightly criticized the deductive models of economists for oversimplifying the complex processes that drive urban economies. As an alternative, many geographers have turned to qualitative, case study approaches that often do not seek to provide generalizable theory, but instead draw insight from the uniqueness of each urban environment. Agent-based modeling can offer an attractive middle ground between these two approaches. Agent-based models can incorporate path dependence, heterogeneous agents, and indeterminate outcomes within a framework that permits replication of experiments and mathematical analysis of processes and outcomes. In this presentation I will briefly elaborate on these points using two examples; one an internal critique of a deductive model taken from economics, and the other a simple model testing theories of neighborhood segregation.

Keywords: Quantitative Methods, Agent-based Model, Complexity

Rebekah M Fox, Dr, Royal Holloway, University of London. Email: rebekah.fox@rhul.ac.uk; *My Mother, My Self and My Doctor: Regulating the Pregnant, Childbearing and Maternal Body Across Recent Generations*

This paper takes a cross-generational perspective on issues relating to pregnancy, diet and body image by exploring the experiences and understandings of two generations of mothers in Britain. Based upon in-depth interviews with recent mothers and their own mothers, it examines the continuities, changes and conflicts in cultural conceptions of the pregnant and post-natal body during the late twentieth / early twenty-first century. Motherhood is a pivotal time in a

woman's life course (each time it happens) with implications for her identity, quality of life and mental well-being, as well as rapid physical and bodily change. However perceptions and experiences of pregnancy vary across time and space and are subject to both internal embodiment and external social control. Using Foucault's notion of self-surveillance I argue for the increased medicalisation and surveillance of pre-natal care, diet and lifestyle across recent generations and explore the ways in which various forms of 'expert' or 'embodied' knowledge become accepted, rejected or internalized as 'common sense'. Secondly I consider new expectations and concerns surrounding body image in the pre and post-natal periods, in an increasingly consumer and media dominated society exemplified in the cult of the 'celebrity mum'. Overall I argue that pregnant women's bodies have never been entirely their own, subject to external comment and control from a variety of sources, but the forms this takes have varied over time, demonstrated in the everyday experiences of mothers interviewed in this study.

Keywords: Pregnancy, Body Image, Medicalisation, Surveillance, Motherhood

Samuel H. Fox, University of Oregon Geography. Email: sfox1@uoregon.edu; *Somalia's Contested Coast*

The southeastern coast of Somalia marked the spatial intersection of transnational hazardous waste dumping, modern piracy, and concentrated impact areas of the Indian Ocean tsunami in December 2004. The receding tsunami wave exposed large amounts of illegally dumped hazardous waste while reports of piracy along the Somali coast greatly increased in the following months. The attack on the Seaborn Spirit, one of the most luxurious cruise ships in the world, in November 2005 brought international attention to this chain of events. This presentation will situate these events in the unique context of stateless Somalia and propose a theoretical framework for understanding their interconnected and inherently geographic condition. Additionally, it will call for further investigation into the spatial location and socio-economic drivers of modern piracy.

Keywords: Somalia; core; periphery; modern piracy; political ecology; hazardous waste

Andrew Foy, Virginia Tech University. Email: afoy@radford.edu; Laurence W. Carstensen, Virginia Tech University. Email: carstens@vt.edu; *An Application of a Spatial Uncertainty Tool to Automate and Enhance Data Fusion for Points, Lines, and Polygons*

This project was developed in response to a 2005 Broad Agency Announcement research objective from the National Geospatial Intelligence Agency on the topic of research "Next Generation Data Fusion". The process of combining information from multiple sources for a given location to enhance information extracted is data fusion. In Geographic Information Systems data fusion processes and concerns are inherent because multiple layers of spatially defined data, varying in scale, date, acquisition and reliability are used for analysis, most notable in overlay functions. The goal of this research is to improve the state-of-the-art data fusion by developing tools that provide information on the spatial uncertainty. This paper discusses the problems associated with uncertainty, relevant literature, and it explores our newly developed tool. The tool works on points, lines and polygons. It manages and produces data on uncertainty in an analysis environment, using methods associated with Fuzzy Logic and Bayesian statistics. We wanted to allow individual features and individual data types to have specific uncertainty data, producing outputs with a quantitative estimate on the degree of uncertainty. This tool is unique because typical methods of managing uncertainty are raster based and absent in ESRI software. Our ESRI based tool automates large, statistical calculations and presents them in a vector format. Practical applications and potential implications of this tool are also discussed in this paper.

Keywords: Spatial Uncertainty, GIS, Raster Models, Fuzzy Logic, Data Fusion

Mark Fram, B Arch, MA, PhD (abd), University of Toronto. Email: mark.fram@utoronto.ca; *Good Places, Bad Pictures*

This is an examination of the photograph in urban studies and in its multiple relations to urban places: the photograph as document, representation, artwork and commodity, all roles that may both support or impede the photograph's usefulness as a device for the transmission and understanding of knowledge about places, and about their politics. Urban places themselves seldom reveal their significance (their "secrets") without intercession or interpretation. Any given place is not only a place, but is a representation of place (or placeness): that is, a representation of itself. Photographs are frequent props for geographical explanations, yet the geographer's photographs themselves are seldom as effective as the presenter would have them be. Frankly, planners and geographers are often terrible photographers, and terrible abusers of others' images as well. While photographs are endemic in urban studies, their appearance, function and comprehensibility are astonishingly inconsistent, and perhaps most distressingly, undependable. And the use of photographs as instruments to

promote (or oppose) urban projects has received scant attention. Theoretical issues around the subject of place-pictures seem to coalesce around two key issues. One is the matter of memory, primarily shared memory, and the role of historical and contemporary photographs as supports for certain shared values. The other is the matter of objectivity, and the relation of what's visible in a photograph to the real place (and time) it purports to represent. But there is as well a third topic to consider: how these theoretical issues are (and might be) attended to in practice.

Derek France, Dr, University of Chester. Email: d.france@chester.ac.uk; John P Smith, Dr, University Of Wolverhampton. Email: jpsandas@yahoo.co.uk; Faculty Based Field Meetings: An Opportunity to Enhance Fieldwork Practice within Higher Education Geoscience and Geographic Curricula

The paper evaluates the participants response to a faculty based field meeting held in South East Spain. This was designed to share and reflect upon the teaching opportunities offered by a defined field location to practitioners from diverse branches of the Geoscience and Geographic disciplines. In particular, we evaluate whether practitioners positively gained from: a) the field experience and b) interaction and networking with others familiar with the field location. We review the possibilities for change in field practice and whether this regional meeting was an efficient method to reflect upon delivery and organization of an undergraduate or graduate field programme for their own institution. We also evaluate if faculty field practice would be enhanced through the use of future field meetings to different locations and whether this is an effective platform for continued professional development related to their to own field programmes.

Benjamin Franek, A.S., B.S., M.A., University of Connecticut. Email: benjamin.franek@uconn.edu; Impacts of Flow Variability on Reference Reach Selection for Stream Restoration

This research will examine how variations in flow stages of streams affect the spatial distribution of geomorphic/hydrologic habitat types with the aim of understanding how these changes may affect reference reach selection/delineation for river restoration. Included will be development of a conceptual model that depicts how stage changes might influence reference reach description/definition based on river data collected in Connecticut. Testing of the model will be conducted through a case study application to a selected Pennsylvania stream, first via selection of a reference reach using traditional methods, and second, via selection of a reference reach using the conceptual model. A product of the research would be a refined conceptual model that can be utilized to account for river flow stage influences when determining reference reaches for river restoration.

Keywords: Flow Stage, Reference Reach Selection, River Restoration, Hydrogeomorphic Unit

Aliette Frank, University of British Columbia. Email: afrank@ires.ubc.ca; Dreaming Our Places: (Re)Constructing the Land "Out There/In Here" with Aboriginal Dreaming

This paper seeks to explore the ways in which an Aboriginal Dreaming-based ontology of place can theoretically and practically challenge Eurocentric analyses of sustainability. First, this paper examines an Aboriginal Dreaming-based ontology of place via theories of narrativity (hermeneutics and archetypes), phenomenology, and social construction of nature/culture. Second, this paper presents the Medicine Wheel (of Wabanaki tradition) as a narrative lense to map the 'Dreaming'. Case study investigations then suggest how Aboriginal Dreamers transact the mental, physical, emotional and spiritual bodies with the land, to materially co-construct "place". Case studies of place-based struggles that have been revisioned through the use of Dreaming-based ontologies of place include but are not limited to the preservation of sacred sites, reforestation of logging regions, and resolving of political disputes in beachfront property. These studies provide an entry to discuss the ways in which an Aboriginal Dreaming-based ontology of place can practically challenge wider Eurocentric understandings of sustainability. Reflection centers on both place-based struggles in the cultural history of the conceptual evolution of sustainability as well as in contemporary and emerging schools of thought. To conclude, this paper articulates some potential challenges and opportunities for applying an Aboriginal Dreaming-based ontology of place in sustainability planning in both Indigenous and European communities.

Rebecca S. Franklin, University of Arizona. Email: rebecca@lrr.arizona.edu; Roots in the Rocks: an Application of Herbchronology above Treeline at Barney Rock Glacier, Sierra Nevada, California, USA

Herbchronology, a technique adapted from dendrochronology, is the study of the annual growth rings in roots of certain perennial dicotyledonous plants. The presence of annual growth increments in plants in alpine and above-treeline environments is significant as it highlights the importance of herbchronology for climatic and geomorphologic applications in alpine and above-treeline ecology. I am presenting the preliminary results from a herbchronology analysis of the plants colonizing Barney Rock Glacier. This site, at 3200 meters elevation on the northeast side of the valley wall is located below Duck Lake Pass in the eastern Sierra Nevada mountain range. Upon analysis of the secondary root xylem of these plants I discovered the presence of annual growth rings in virtually all species present (especially in members of the Asteraceae, Brassicaceae, Lamiaceae and Polemoniaceae families). Knowledge of the year of establishment of plants on the surface of rock glaciers can give important clues about disturbance on and movement of these rock-ice features. I show the age distribution of plants by species and location on the rock glacier along with climate data covering the span of these age distributions. Comparison can potentially determine whether or not plant establishment and growth in the root rings of these plants is controlled by regional climate, microclimate, position on the rock glacier, rock glacier movement or perhaps other factors. Although herbchronology has been tested and used extensively in Europe, this is the first formal description of the annual rings of a community of non-tree plants in the eastern Sierra.

Keywords: herbchronology, rock glaciers, alpine

James C. Fraser, University Of North Carolina. Email: pavement@unc.edu; Matt Reilly, University of North Carolina. Email: mjreilly@email.unc.edu; Catch Me If You Can: Urban Governance As Open System

A strand of recent treatments of urban governance have focused on state-market-civil society configurations that are guided by neoliberal ideology seeking to privatize social welfare and expand market logic into domains of civil society. An emerging area of interest has been on the ways in which civil society has been hailed by public and private sectors as a way of working towards urban revitalization. This labor to promote place-making simultaneously intensifies the need for civil society to organize, carry out redevelopment tasks, and be recognized as having legitimate 'rights to the city.' This has been framed by some as part of a larger shift in how people access citizenship rights from being a given status to being a performative act. What has been less studied are the potential openings that are created for citizens and non-governmental organizations (NGOs) to insert themselves into processes of city building. This paper theorizes these openings through a case study of the Arts and Business Coalition of Downtown (ABCD) and its role in redeveloping downtown Durham, North Carolina. Started by a small group of citizens that desired to create non-hierarchical and fluid scaffolding for citizens to come together, we find that ABCD has provided a wide range of actors the ability to transcend the putative categories of state-market-civil society that are associated with theorization on neoliberal urban governance.

Oliver W. Frauenfeld, Ph.D., University of Colorado. Email: oliverf@colorado.edu; Tingjun Zhang, Ph.D., National Snow and Ice Data Center. Email: tzhang@nsidc.org; Andrew J. Etringer, M.Sc., National Snow and Ice Data Center. Email: etringer@nsidc.org; Haiyan Teng, Ph.D., National Center for Atmospheric Research. Email: hteng@ucar.edu; 21st Century Projections of the Northern Hemisphere Freezing/Thawing Index

Variations in the ground thermal regime in high-latitude areas have important ramifications for the surface energy and moisture balance, surface and subsurface hydrology, carbon exchange, and ecosystem diversity and productivity. Assessing these variations, however, particularly in light of reported widespread atmospheric and terrestrial changes in recent decades, remains a challenge due to the sparse observing networks in high latitudes. The annual freezing/thawing (F/T) index can be used to predict and map the distribution of permafrost and seasonally frozen ground, active layer and seasonal freeze depths, and has important engineering applications. The F/T index thus provides important information on climate variability in cold regions. While generally defined as the cumulative number of degree-days below/above 0°C for a given time period, we have established that long-term monthly air temperature measurements can be used reliably to approximate the annual F/T index over the last century. Here we employ the model output of surface air temperatures from the Intergovernmental Panel on Climate Change (IPCC) Fourth Assessment Report (AR4) to provide an estimate of 21st century F/T index changes. We first compare the "20th

Century Climate in Coupled Models" (20c3m) output to historical observations for an assessment of the models' reliability. Next, we apply four emission storylines (commit, SRES-A2, SRES-A1B, and SRES-B1) and calculate the 21st century F/T index for these scenarios. These projections can be used to estimate future distributions of frozen ground, as well as active layer and seasonal freeze depths.

Ryan Frazier, Clark University. Email: rfrazier@clarku.edu; Mapping Land Cover On Vancouver Island, Canada Using Machine Learning Algorithms And Generalization

Satellite remote sensing has many strengths, the strongest being the ability to capture data over large areas and remote locations. The nascent interest in large area, fine detail (i.e. 30 meters) land-cover mapping and monitoring is expressed by a variety of national and regional resource monitoring programs (e.g., Earth Observation for Sustainable Development of Forests (EOSD), The California Land Cover Mapping and Monitoring Program (LCMMP), Coastal Change Analysis Program (C-CAP) and others). Despite reported progress, these monitoring programs still face two key challenges: (1) low map accuracy and consistency over large heterogeneous landscapes; and (2) high programmatic costs caused by image processing, field data collection and manual image interpretation by humans. However, we argue that large area monitoring programs can overcome these difficulties by taking advantage of recent advances in remote sensing methods, specifically machine learning (Rogan et al. 2003) and generalization (also known as signature extension) (Woodcock et al. 2001). Thus, the objectives of this study were to apply machine learning classification algorithms to map land cover in British Columbia, Canada using Landsat ETM+ 7 and ancillary data and to determine the impact of these ancillary variables on classification accuracy, across different Landsat scenes using signature extension.

Keywords: Land Cover, Machine Learning, Generalization, Landsat, British Columbia, EOSD

Bettina Natalie Fredrich, Department of Geography, University of Bern. Email: fredrich@giub.unibe.ch; The security discourse in Switzerland from a gendered geographical perspective

In my presentation I focus the security discourse in Switzerland, paying special attention to the gendered dimension of localizing security and danger. Recently a variety of initiatives on different levels have been taken in Switzerland to reconceptualise security in terms of gendered security. With the end of the Cold War and the terrorist attacks against the Western world the security discourse has shifted and broadened in at least two ways: First, the concept of security itself is contested by politicians and scientists. And second, due to political and historical changes an increased number of organizations and experts take part in the discourse. For almost two decades critical geopolitics has asked crucial questions on how 'we' and 'the others' are localized in political discourse and how these processes discursively generate identity and nationality. The gendered character of these processes however has only marginally been negotiated. Based on my first findings, I will emphasize the gendered dimension of localizing 'we' and 'the others' in the security discourse in Switzerland. Referring to Foucault I identify various subject positions in the security discourse. Furthermore I highlight what difference gender makes in the process of localizing 'we' and 'the others' as well as discuss to what extent the discursively constructed 'other' is gendered itself. My findings rely on expert interviews with representatives of governmental and non-governmental organizations in the fields of national defense, foreign policy and peace building ranging from the head of the Swiss army to representatives of feminist peace organizations in Switzerland.

James P. Freeman, PhD, Concordia University. Email: jfreeman@alcor.concordia.ca; Ipanema in the 1960s: Global bohemia in a Latin American metropolis

Ipanema, in Rio de Janeiro, Brazil, is a post 1960s counter-culture neighborhood, comparable to the Haight-Ashbury in San Francisco or Kreuzberg in Berlin. In the 1960s and 1970s, Ipanema was cosmopolitan and represented a little piece of the wider world. Ipanema was also a node in a network of neighborhoods around the world where inhabitants produced and consumed a powerful set of ideas, aesthetics, lifestyles, and cultural products. Through an analysis of accounts of Ipanema during its golden age and ethnographic data on the post counter-culture neighborhood, I identify the generic characteristics of bohemia and 1960s counter-culture neighborhood in Ipanema, and discuss the incredible cultural productivity of the time and place that had everything to do with the interface between global trends and local traditions. I argue that Ipanema was only possible in the context of a modern urban way of life that involved a certain dissolution of social ties, anonymity and heterogeneity, but that this modern urban veneer overlays a fundamentally divided, hierarchical and

personalistic society.

Keywords: Brazil, Rio de Janeiro, bohemia

Lisa M Freeman, PhD Candidate, University of Toronto. Email: lisa.freeman@utoronto.ca; A Criminal Threat? Community Responses to Homelessness and Resistance in the City

Provincial legislation and municipal by-laws that target aggressive panhandling are not the only forms of regulation criminalizing and marginalizing the space of homelessness in Canadian cities. Community responses, most notably Not-In-My-Backyard (NIMBY) sentiments, play a significant role in regulating urban space. Neighbourhood conflict over the construction of homeless shelters and urban squats is by now a phenomenon in Canada, yet it led me to question how community responses to municipal by-laws and squats regulate urban space in the city. If community responses do indeed constitute an informal mode of urban regulation, then this proposed paper, utilizing work of Lefebvre, Soja, Foucault and Agamben will ask: how are informal modes of urban governance constructed and how do they gain power? How do homeless (and marginally housed) persons come to be viewed as criminal and/or a moral threat to notions of community? What type of effect does this form of social control have on the organization of urban space? Exploring community conflict in relations to homelessness in two Canadian cities (Ottawa and Toronto) will further develop an understanding of how different forms of community mobilization and activism create differing yet powerful forms of urban governance that challenge legal spaces in the city.

Keywords: law, geography, resistance, theory, governance, urban, homelessness, by-laws

Sara Fregonese, Newcastle University. Email: sara.fregonese@ncl.ac.uk; Colonial Laboratories, Overlapping Territories: the Lebanese Civil War and the Colonial Past.

Despite tendencies to consider them as timeless, discrete entities, the Lebanese religious sects and their political expressions can be interpreted as products of Lebanon's colonial past. As a result of earlier affiliations between local religious groups and colonial powers in the end of the Ottoman era, the French Mandate's main tool of governmentality on Lebanon was the idea of "religious community" and its territorialisation, through population censuses based on religious belonging, and by officially declaring 17 religious communities as "historic". Sectarianism characterized the electoral system, the division of parliament seats and of the State powers in post-independence Lebanon. Before the Lebanese turbulent political panorama had seen the sectarian polarization of the civil war, public order, electoral and political power were structured around that colonial idea of "historic religious community". I draw mainly from Foucault's conception of power as a dialectic process between hegemony and resistance rather than as complete domination, and from critical geopolitics' vision of geography as militant spatial practice and rhetoric that physically delimits and discursively defines territory. I then analyze how, during the Lebanese civil war, the colonial legacy of governmentality via territorialized religious communities was present in the violent territorialisation of identity - such as ID killings? and in the ways the militias used and represented Beirut's built space through street fight and propaganda. In these spaces of resistance, the colonial and the militia spatial ontologies often overlap.

Observations of continental scale North American snow extent (NA SCE), along with ancillary observations of snow depth, surface climate, atmospheric circulation, and sea ice concentration, are evaluated to test the hypothesis that decadal scale variations of NA SCE can be explained by atmospheric circulation, without need to invoke additional explanatory factors such as anthropogenic climate change. We show that decadal scale NA SCE variations are driven largely by the locations of the polar front and jet stream. A portion of that variability can be explained by dominant modes of Northern Hemisphere atmospheric variability, including the Arctic Oscillation and the Pacific North American pattern; and a portion is attributable to circulation variations not captured by dominant modes. Both modeling and empirical results suggest that decadal, continental-scale NA SCE variations during the last century are of sufficient magnitude to preclude the identification of a climate change signal outside of the

natural variability at this time. Such attribution will require either (a) greater confidence in our ability to attribute circulation modes linked to NA SCE variability to anthropogenic climate change; or (b) more detailed analyses (e.g. at regional scales) that provide sufficient evidence for anthropogenic influence. However, a continental scale NA SCE anthropogenic climate change signal is expected to emerge in the coming decades.

Kenny French, PhD Candidate, University of Nebraska-Lincoln. Email: kfrench@unlnotes.unl.edu; *The Globalization of Rap: From Da South Bronx to Da World*

The globalization of rap music represents the adoption of a popular culture medium to convey societal concerns by marginalized groups. As an expression of oppression, rap provides a voice to those groups who feel isolated from the larger society. This paper will first map and analyze the diffusion of hip hop from the South Bronx in New York City to other inner cities in America. Distinctive rap regions can be constructed in America distinguished by rap styles and local slang usages. Another aspect of this study is to investigate the diffusion and meaning of rap throughout the world. This paper will analyze rap lyrics from around the world for common themes of social awareness. Understood through the processes of reterritorialization and indigenization (Lull, 2000), rap music is an imported cultural element that takes on local features in other countries. Rappers from France, Italy, Germany, and New Zealand illustrate how rap popularly conveys their messages of social injustices. Overall, the globalization of rap across the world is another example of how the global mixes with the local.

Keywords: rap, globalization, cultural geography

Bryan Girard Frenz, University of Wisconsin-Eau Claire. Email: frenzbg@uwec.edu; *Soccer in Milwaukee: A Wave of Immigration*

As much as religion and food is an identifying feature of a culture, ethnicity is also trapped in the world's favorite sport. The emergence of soccer in the United States came only as an influx of European immigrants flooded to major US cities. Soccer is a sport different from any US sport and using sport is a way ethnic immigrant groups tried to remain individuals in a new home and a foreign nation. The names of soccer clubs, also known as football clubs, relate the sport to its ethnicity. The Bavarians, Croatians, Serbians, and Polonia clubs all identify an ethnicity to soccer. Today the attempt to hold onto ethnicity has evolved into community functions for all local residents. Multi-ethnic players are joining the soccer clubs and creating competitive soccer teams which compete in leagues and tournaments gaining recognition for the club. Still rooted in each club is the history of a people but has recently transferred into a business with sponsorships and corporate interests labeled by an ethnic trademark. This study evaluates how the city of Milwaukee established a rich history of soccer through immigrant settlement.

Claire Frew, Queen Mary, University of London. Email: c.frew@qmul.ac.uk; *Direct Payments: What will an increased 'choice' mean for home care workers and service users?*

Issues of consumerism and choice are at the centre of the UK government's public sector reform agenda. Public services in the UK are under increasing pressure to develop and expand their response to the 'customer' and their need for 'choice'. Direct Payments have altered the relationship(s) between social care providers and users, demonstrating the changing nature of the welfare state. Under this system, clients are given money, in proportion to their assessed needs, to directly purchase the care they need. This paper seeks to examine the impact of Direct Payments on workers and service users. Local Authorities, currently the main purchasers of care, will increasingly be required to regulate provision for users, while users will buy their own care. Where Direct Payments are already in use, employer and employee relationships have altered dramatically (Ungerson, 1999). The user becomes the direct employer of the care/personal assistant and through this control, they are argued to have increased rights and independence, which will ultimately empower the individual (Ungerson, 1997). Users also have to 'manage' their own risk, by employing people they already know or someone through recommendation. While research has explored the importance of user

influence on the determination of provision, workers' perspectives and the consequences for employment are often neglected. This paper examines the changing nature of employment in the sector and the consequences carers and personal assistants are experiencing. The paper will draw primarily on empirical research conducted with users and workers in the London Borough of Tower Hamlets.

Keywords: The welfare state, public service reform, choice, Direct Payments, care services and employment.

Laurent Frideres, University of Cambridge. Email: laf25@cam.ac.uk; *The competitive advantages of firms inside and outside industry clusters*

The spatial clustering of firms is seen as having significant benefits for individual firms and regions. Little cluster research has been aimed at evaluating the relative importance of spatial proximity and scale in clusters, in particular with reference to assessing the competitive advantages of firms over space. The spatial scales at which clustering occurs are often only scantily defined and a clear definition of geographical boundaries is generally lacking. This paper focuses on the software industry in a trans-national region covering parts of Belgium, France, Germany and Luxembourg. It makes use of geocoded point-level firm data and spatial cluster detection techniques to explore spatial industrial clustering at different geographical scales. A survey conducted among software companies in the region provides firm-level data on networking and cooperation, which are used as proxy-variables to measure relational proximity and interaction between firms. A combined index of spatial and relational proximity is used to map clusters of software firms in the region and to identify firms located inside and outside those clusters. A comparative analysis of innovation capabilities, knowledge development and performance between firms located inside and those located outside industry clusters is undertaken. This paper puts to the test the common assumption that being located in a cluster enhances knowledge development within and knowledge transfers between firms and thus promotes the innovative capacity and economic performance of firms.

Keywords: Clusters, performance, innovation, spatial data analysis

Roxane Fridirici, California State University, Sacramento. Email: rmf8dfa@inreach.com; *Floods of People: Migration and Opportunity Versus Flood Risk in San Joaquin County, California*

Since the disastrous 1997 Central Valley floods, local San Joaquin County governments have approved 30,800 new houses in flood-prone areas, including land that was underwater in 1997. Some houses are in new subdivisions, tucked behind "super levees", some are in older, expanding subdivisions, some are proposed for Sacramento-San Joaquin Delta islands below sea level. Migration for more affordable housing along the Interstate-5 corridor near Stockton, Lathrop, and Tracy is driven by San Francisco Bay prices. The opportunity is greater than the perceived flood hazard, supported by ignorance of the local environment. In San Joaquin County, odds are greater that a home protected by a levee will flood rather than burn, yet only about 2% of San Joaquin single-family home owners have flood insurance. Comparison of the area flooded in 1997 and the new development which might now be affected is startling. Flooding is a reoccurring part of this region's environment. While well-constructed and maintained levees will probably protect inhabitants within their immediate vicinity, they may create greater problems along less well-protected side-streams and sloughs, causing failures where prior floods were minor. When small levees fail, flooding may do an end-run around or undermine new levees. Finally, raised ground water levels during wet periods may result in unexpected flooding of some recently developed areas. Research suggests new inhabitants require education about flood hazard and disaster preparedness, while local governments must balance costs and problems when the levees break with the opportunity of tax revenues from lucrative developments.

Mark Friedl, Boston University. Email: friedl@bu.edu; Navin Ramankutty, McGill University. Email: navin.ramankutty@mcgill.ca; *Mapping Cropland Over Large Areas by Fusing Remote Sensing and Inventory Data*

In the last 300 years, agricultural ecosystems have transformed vast areas of the Earth's surface. Currently, nearly 40 percent of land areas are used for agriculture. In addition to their obvious importance for food production and security, agricultural ecosystems also have significant impacts on local to global environmental processes. These processes include biogeochemical cycles, water supply and quality, and deforestation and other forms of land cover conversion. However, despite the obvious societal importance and environmental effects of agricultural land use, global information regarding the spatial distribution and dynamics in croplands remains quite poor, especially in developing nations. Here we describe research to improve this information using a combination remote sensing and global inventory data. Specifically, we describe ongoing efforts to map agricultural land use by fusing information from sub-national cropland

inventory data with data from the Moderate Resolution Imaging Spectroradiometer. These efforts include several key activities. First, we are using MODIS data in association with national agricultural inventory data to test the ability of MODIS for mapping both crop areas and crop types over large areas. Second, we are exploring the utility of phenological metrics derived from time series of MODIS to differentiate cropland and crop types. Third, we are using 500-m MODIS data to “downscale” an existing global map at 5-minute spatial resolution, thereby providing more detailed spatial information regarding global croplands.

Keywords: agriculture, remote sensing, inventory data

William H. Friedland, University of California - Santa Cruz. Email: friedla@cats.ucsc.edu; *Mysteries of the Church of Wine: Epiphanies*

Wine, for some consumers, is akin to religion. As with other supernatural thought systems, wine has a number of “mysteries,” phenomena that have little or no rational or scientific explanation. This paper explores the wine epiphany, the “revelation” of a moment. Utilizing examples of epiphanies generally, and wine in particular social and locational factors are seen as critical to the epiphany experience even though, as in the case of wine, it is wine that is subjectively viewed as causal.

Keywords: wine, epiphanies, social factors, locational factors

Wardlow Friesen, Dr., University Of Auckland. Email: w.friesen@auckland.ac.nz; *The layered identities of the Indian diaspora in New Zealand*

Within the “Indian diaspora” there is a great deal of diversity, and issues of belonging and identity vary between different migrant destinations and between different groups. Imperatives towards pan-Indian identity among diasporic groups include nationalistic sentiments arising from the history of the independence struggle, perceived threats from neighbouring countries, and the rising economic and political profile of India on the global stage. Another factor is the globalisation of “Indian” culture through Bollywood, diasporic novels, Indian fusion cuisine, festivals, and other forms. Beneath this pan-Indian layer of identity are the identities of particular cultural and linguistic groups, as well as identities resulting from variables including gender, education and occupation. This paper considers the ways in which issues of identity and belonging have been manifest in a relatively small country with high levels of Indian immigration in recent years. It is based on interviews with leaders of a number of cultural/linguistic Indian communities in New Zealand, and considers their divergent and convergent experiences of identity, belonging, integration and nationality.

Keywords: belonging, identity, Indian, diaspora, New Zealand

Joy A. Fritschle, University of Connecticut. Email: joy.fritschle@uconn.edu; *Identifying representative old-growth for second-growth forest restoration*

Old-growth forests in the American West typically represent fragments of former, more extensive forests that were subjected to nineteenth and twentieth century land-clearing activities, such as logging. These present-day forest fragments are thought to be representative of the former landscape, and thus are capable of serving as living references for restoration of logged-over lands. Yet how do we determine how well existing old-growth stands represent the former forest, especially when little of the vegetation remains after intensive logging activities such as clearcutting? Historic land surveys conducted prior to significant logging can reconstruct the former forest at the stand level, thus allowing an analysis of old-growth patches within the larger historic landscape. This study utilized original Public Land Survey field notes to assess the applicability of old-growth stands in Redwood National Park as reference ecosystems. A GIS and statistical analysis of the nineteenth century forest found that the vegetation communities, woody species composition, and ratios of dominant canopy species in unlogged patches were highly representative of the forests that were logged. The results of this study suggest that the national park should increase efforts to protect old-growth reference ecosystems from further human impacts, and minimize on-going degradation from edge effects by prioritizing restoration of adjoining second-growth forest.

Patricia Frontiera, Ph.D., GISC, UC Berkeley. Email: pattyf@berkeley.edu; Howard Foster, Ph.D., GISC, UC Berkeley. Email: hfooster@gisc.berkeley.edu; *Spatial Approaches to Representation and Ranking for Geographic Information Retrieval*

Geographic information retrieval (GIR) concerns the retrieval of geographically and thematically relevant information resources in response to a query of the form: theme - spatial relationship - location (e.g., wetlands near San Diego). GIR distinguishes itself from traditional IR in that one or more system components are based on spatial methods, where such methods are either placename based, coordinate-based (geometric), or some hybrid of these two. The develop-

ment of online environmental information catalogs and spatial data clearinghouses in the 1990s pioneered GIR research, especially with regards to coordinate-based spatial methods and the development of richer gazetteers to support placename to geographic location disambiguation. More recently with the growth of internet search engines, the desire to find information by geographic location has driven the development of GIR, particularly in terms of placename approaches to retrieving georeferenced web pages. In this presentation we provide an overview of current research on geometric and hybrid placename/geometric methods for GIR. In particular, we focus on geometric methods for representing the geographic content of information resources, matching query and document representations and ranking retrieved results that can improve retrieval performance yet remain simple enough to be applicable to both spatial data libraries and more general geographically-enabled search engines. These topics are discussed in the context of current digital library projects being developed at the UC Berkeley Geographic Information Science Center (GISC).

Keywords: geographic information retrieval, geographic relevance, spatial similarity, spatial indexing, spatial representation, spatial ranking, geographic digital libraries, spatial data clearinghouses

Heather Frost, PhD Candidate University of British Columbia, University of British Columbia. Email: frost_heather@hotmail.com; *Punjabi Youth in Vancouver: Identities of Segregation?*

For the thousands of children born into Canadian immigrant households, the process of identity construction is complicated by family histories and memories of relocation and resettlement, continuing attachments to the ‘homeland,’ questions of religion, race and ethnicity, and their position within and between cultures. Such that in addition to confronting the fundamental question faced by all young people, “Who Am I?,” the sons and daughters of immigrants must also ask “Who am I ethnically?,” “Who am I racially?” Although researchers have convincingly demonstrated that the identities adopted by second generation youth are multifaceted, multiply determined, temporally dynamic, situational and contextual, the nuanced processes by which youth arrive at their self-definitions are still not well understood. In this paper, I discuss the extent to which the social identities of high school aged offspring of Punjabi immigrants residing in Surrey, British Columbia (BC) are articulated out of their everyday spaces and places. Canada’s sizeable Punjabi population is highly concentrated at both the provincial and urban scales. In 2001, close to 45% of Canadians who reported Punjabi as their mother tongue resided in B.C.; and of those individuals, 72% lived in the Vancouver region - almost half of them in the municipality of Surrey. By exploring the relationships between where these young people live and are schooled and their social identities, I will consider in particular the significance of Surrey’s ethno-cultural and racial composition/concentration for identity construction.

Keywords: youth, identity, ethnic concentration

Carolyn Fryberger, University of North Carolina at Asheville. Email: cfryberger@gmail.com; *Measuring Rapid Change: A Cadastral-based Analysis of Land Use Change in the French Broad River Basin, Western North Carolina*

North Carolina is the 6th fastest growing state in the country; Western North Carolina specifically experienced population growth of up to 9% between 2000 and 2005 according to census data. These changes and their spatial effects have previously not been tracked in a consistent manner; there is no readily available data with which to explore year-to-year development trends. The objective of this work is to develop a much-needed baseline of data to quantify and mitigate the effects of rapid development in western North Carolina’s French Broad river basin. The analysis uses readily available, frequently updated, and highly accurate cadastral data to quantify development in the region. Parcel size statistics are used as a proxy for development; smaller parcels are likely to have existing roads and infrastructure, which would facilitate build-out. By nature of their size, small parcels are most productive when built on, whereas larger parcels still have potential for conservation and rural land uses. A GIS-based analysis of the pattern and density of small parcels in the French Broad River basin shows that the region has experienced substantial development, especially between 2004 and 2005. Further Overlay analysis using this change data shows areas of urban sprawl around city centers like Asheville, and the increasing development of sensitive lands such as steep mountain slopes. Such analysis provides crucial but previously neglected information for the land use decision-making process of local governments, and can help conservation-minded groups protect water quality, species habitat and prioritize management areas.

John Dale Frye, Department of Geography, University of Georgia. Email: jdfrye@uga.edu; **Thomas W Hodler, Department of Geography, University of Georgia.** Email: twhodler@uga.edu; *Cartographic Uncertainty in Georgia's Tornado Climatology*

Data collection and cartographic procedures can lead to visualization uncertainty in many fields. Using Georgia as an example, the current research focuses on the uncertainty in data collection procedures and thus climatological records of tornadoes as well as uncertainty in the typically cartographic procedures for visualizing those records. Three components of uncertainty are examined with the tornado climatology of Georgia: 1) percentage of weak tornadoes, 2) compactness of the enumeration unit (in the present research, Georgia counties), and 3) variations in the classification during different commonly used cartographic procedures. Research has shown that there is less accuracy in reports of weaker tornadoes as compared to stronger tornadoes, thus leading to more uncertainty in counties that have only experienced weak tornadoes. The compactness of the counties in Georgia is also investigated for uncertainty (i.e., more compact counties have a lower level of uncertainty). Uncertainty can also be found based on the cartographic procedures used to visualize the data. Tornado reports are typically visualized as raw values or standardized by population or enumeration unit size. However, it was found that these procedures produce maps that have very dissimilar views of the tornado occurrences in Georgia. An uncertainty metric for cartographic procedures was developed to show the locations where these maps vary and thus have a higher level of uncertainty based on the cartographic methods utilized.

Keywords: cartography, uncertainty, tornado, climatology, Georgia

Stephan Fuchs, University of Kansas. Email: stephan2240@yahoo.com; *Migration Routes and Settlement Patterns of 19th-Century German Immigrants: A Case Study of Douglas County, Kansas 1860-1880*

The location of Kansas at the settlement frontier in the 1850s and 1860s and its subsequent demographic development over the following years made it a likely destination for new immigrants and western settlers throughout the second half of the nineteenth century. Using the framework for the entire Midwestern frontier population provided in 1988 by John Hudson I explore Douglas County, Kansas, as a destination and new homeland for German settlers. The goal is reconstruction of the migration routes German families took to Douglas County and then explanation of their settlement patterns and distribution within this territory. My data comes from federal and state censuses, plat atlases, and deed books. This study works on two spatial levels - a national and county scale? and discusses the changes and developments for a period of roughly twenty years. German families predominantly migrated through states of the American Northeast and Midwest to Douglas County. Depending on the local conditions German families both clustered and lived scattered among other groups in the townships and towns of the county.

Kurt Fuellhart, Shippensburg University. Email: kgfuel@ship.edu; **Catherine Ryan, Shippensburg University.** Email: cr4077@ship.edu; **Sharon Sarmiento, UCG Associates.** Email: SSarmiento@ucgassociates.com; *An Analysis of the Air Transport Environment in the Middle Atlantic Region, U.S.A.*

The air travel market is somewhat unique within the Middle-Atlantic region of the United States because a number of airport choices are available to consumers. These airports - including Baltimore, Philadelphia, Washington-Dulles, Washington-National, Harrisburg and others? vary significantly in the degree to which they function as hubs or spokes, volume of traffic, number of airline competitors, availability of non-stop service, and fares, among other things. Examining the market environment in multi-airport regions is critical not only to understand the geographic nature of consumer airport choice, but also to improve airport planning and to shed light on the dynamics of commercial air transportation generally. This paper examines air transport and airport "competition" in the Middle-Atlantic region with a specific focus on airfares, airport market areas and future traffic trends. Airfares to/from the region's airports relative to hundreds of cities around the world are examined using a longitudinal data set collected over eight months. Using this data set and others, as well as a variety of analytical methods, patterns in airfares are illuminated, regional catchment areas are mapped and future trends in airport traffic and market areas are forecast. The paper contributes to the expanding volume of research on the air transportation industry in multi-airport regions, consumer airport choice, and the geographic implications of both.

Keywords: Air Transport, Airport, Airfare

Pablo Fuentenebro, University of California - Los Angeles. Email: pfuentenebro@ucla.edu; *Nationalism at the scale of 1:50,000. Maps, mapping and materiality in Contemporary Catalonia*

Over the last twenty years there has been increasing critical interest in cartography. From pure objects of science and reason to instruments of knowledge and power, maps are now seen as a major tool in the construction of nationhood discourse. But beyond its physical authority, the stories behind a map's making can prove to be as revealing as its existence. In this paper I trace the history of two maps of Catalonia, Spain, and the conflict emerging between the institutions responsible for their making. A judicial ruling opens the door for epistemological interpretations over the meaning and significance of maps in society, adding them to the present debate on agency and materiality in social and cultural geography.

Keywords: mapping, nationalism, Catalonia, Spain, material culture, objects

Bernhard Fuhrer, University of Berne. Email: fuhrer@giub.unibe.ch; *Geographical dimensions of clusters - An evolutionary approach to change agency in technological and institutional transformation*

In economic development policy the cluster 'concept' has established itself as a standard for enhancing growth performance of cities, regions and even nations. Martin and Sunley have argued that the geographical fuzziness disavows any analytical claims of Michael Porter's pseudo-concept and warned economic geographers against following a prescriptive fad (2003). In a more recent contribution the same authors continue to warn us, this time cautioning the insouciant use of evolutionary terminology and concepts. In an attempt at a combined reply to these warnings this paper suggests that only an evolutionary understanding of the cluster phenomenon can finally free the concept of its geographical fuzziness and turn it into a theoretically solid multi scale model. Such a model is construed in a two step procedure. In a first part recent evolutionary theorizing from economic geography and economics is drawn upon to define the conceptual framework for investigating the technological and institutional changes relevant for cluster development. Particular emphasis is given to the question of agency in change. In a second step this new framework is applied to a well known empirical example namely that of biotechnology clusters in the U.S. It is shown that in the evolutionary perspective these high-tech clusters can only be understood as a co-evolution of technological and institutional enabling processes mainly associated with agency on the national level and a concurrent competition of institutional configurations linked to agency on the regional level. In an evolutionary view, therefore, geographical fuzziness disappears and becomes a multi-scalar interpretation of change-agency.

On 12-13 November 2003 an intensifying mid-latitude cyclone tracked across the Midwest and Great Lakes regions. Non-convective high winds up to 76 knots caused \$36 million in damages, eight deaths, and 23 injuries from Iowa to Pennsylvania as well as a major seiche on Lake Erie. The most outstanding destruction from this storm occurred in Lower Michigan where a utility company called it the worst storm since the Edmund Fitzgerald storm in 1975. Despite the extent of the wind damage, there was little consensus among forecasters at the regional National Weather Service offices as to the origin of the high winds or the mechanisms responsible for them. Storm event summaries from offices across the Great Lakes cited the following possibilities: a fast-moving cold front, strong cold air advection, isallobaric winds, and a deep tropopause fold. To help mitigate the hazards associated with non-convective windstorms, it is necessary to develop a comprehensive, multi-scale conceptual model of these events. This presentation provides a detailed account of the synoptic and subsynoptic dynamical features that contributed to the high winds across the Great Lakes region. Using both observational and remote sensing platforms, we focus primarily on the role of the tropopause fold and stratospheric intrusion in the development of high surface winds. Specifically, we present two original hypotheses for the transport of high winds to the surface. These involve the "coupling" of stratospheric air and planetary boundary layer heights and the contribution of Kelvin-Helmholtz instabilities to momentum mix-down.

Keywords: high winds, Great Lakes, case study, synoptic meteorology

Brian Fulfrost, University of California. Email: fulfrost@ucsc.edu; Mapping Food Environments: Using GIS to Identify "Food Deserts" on the Central Coast of California

Research in the United Kingdom and more recently in the United States has found geographic differences in access to affordable, nutritious food. In some cases more limited access has been associated with a higher proportion of residents in ethnic minority groups. Using Geographic Information Systems (GIS), we explored the potential existence of "food deserts" and their relationship with ethnicity in Santa Cruz, Monterey and San Benito Counties. Relative to the region as a whole, there were few clusters of census blocks with less access to retail food outlets with fresh produce (grocery stores, supermarkets and fruitierias) after adjusting for population density. In addition, access to these retail food outlets was not associated with the percentage of the population that was Latino. However, we identified some areas that would benefit from further investigation, and that may be suitable locations for locating new fruit and vegetable markets. Such markets may benefit local residents, as well as new, limited-resource, and minority farmers who often have inadequate access to distribution networks for their produce.

Keywords: Food Deserts, Food Environments, GIS, population density

Boyd Fuller, LKY School of Public Policy, National University of Singapore. Email: boyd.fuller@nus.edu.sg; Reconsidering the "local" in local knowledge: consensus building, joint fact-finding, and water management in California and Florida

Local knowledge has often been defined as knowledge that is practical, collective, and place-centred. Advocates of local knowledge believe that local knowledge is often essential for public policy-making, because it introduces location- and culture-specific questions and data that experts might miss in their more generalized approach. However, experts and sceptics often have concerns about legitimacy and usefulness of local knowledge. This paper looks at this interaction of "local" and "expert" knowledges from another angle, the creation of new, problem- and place-specific facts, frameworks, and analyses in consensus building processes convened to solve water and ecosystem management problems. The question that this paper then asks are: does joint fact-finding provide a useful means for legitimizing and integrating local knowledge in official problem-solving? And can the concept of "local knowledge" be expanded to include the often problem- and location-specific facts and analyses produced by joint fact-finding? To look at this question, the author draws upon two case studies in California and Florida. In both states, stakeholders from conflicting groups met and, to everyone's surprise, develop consensus recommendations which decision-makers incorporated into multi-billion dollars programs for restoring local and regional ecosystems and improving water management. In both cases, the local knowledge of farmers, hunters, and other stakeholders was integrated actively into the science produced. Even more interesting, however, is that place-based stakeholders also agreed upon what counted as "good science," so that "good" was measured not only by the scientific method, but also local norms and values.

Keywords: local knowledge, consensus building, joint fact-finding, water management, ecosystem management

Trevor Fuller, Indiana State University. Email: tfuller4@mymail.indstate.edu; Jay D Gatrell, Indiana State University. Email: jgatrell@indstate.edu; Thomas Steiger, Indiana State University. Email: tsteiger@indstate.edu; Eric W LaFary, University of Auckland. Email: ; "Dumb Farmers": The Case for Agricultural Entrepreneurs as Drivers of Economic Development in Northwest Ohio

For over three years, a team of researchers from Indiana State University, The University of Toledo, Bowling Green State University, and The Ohio State University has been investigating the structure and geography of the Ohio greenhouse industry. Three surveys of industry members provided critical insight into the dynamics of the industry and revealed key policy concerns. In 2005-2006, the research team expanded its investigation to include focus groups composed of survey participants in order to understand their perspectives on key issues and to determine how the "Ohio Greenhouse Project" can be tailored to meet the needs of growers and aid the development of this strategic industrial cluster. Based on results from the focus groups, it is evident that growers are ready to transcend traditional perceptions of their industry, transform traditional production and marketing strategies, and identify areas of collaboration that will improve the overall competitiveness of the industry. The poster will present the 2005-2006 survey findings, examine points of departure from previous findings (as appropriate), and contextualize the results using the 2006 focus group data.

Keywords: greenhouse, economic development, agriculture, Ohio

Henning Füller, Institut für Humangeographie, University of Frankfurt. Email: fueller@em.uni-frankfurt.de; 'Production of space' as a technology of power in the neoliberal city: the current ideals of urban dwelling in Europe compared to the U.S.

Driven by ongoing trends of social polarization, the question of guaranteeing social order in a complex environment is becoming urgent. As has been noted, the search for answers is increasingly taking place at the local level. Especially striking in this regard is the process of exclusion and privatization of public space materialized in so-called Gated Communities. But the fact that this bald form of segregated living is hardly found in a European context surely does not deny the existence of underlying structural similarities. Overarching trends do exist in the current housing market, in planning not only of the building and its surroundings but also of an entire lifestyle and a homogenous community; a trend that can be seen rather openly in the master planned communities in the United States but also in the boarding-house types of condominiums being built in German cities recently. Seen from the viewpoint of power theory, these overarching trends in the housing sector of western societies provide a heuristic device to better understand general tendencies of existing neoliberalism. As we can see here, the production of space currently has the underlying impetus of segregating society, naturalizing social relations and governing through the establishment of effective as well as conforming subjects. Drawing on examples from recently built condominiums in the United States and Europe, the grounding rationalities of space as a power technology are explored in this paper.

Keywords: Space, neoliberalism, governance, power

Sit Victor Funghuen, . Email: hragvis@hkucc.hku.hk; Yanting Zheng, . Email: zhengyt@hkusua.hku.hk; A New Global Region-based Urban Pattern- Formation of Extended Metropolitan Regions in China, 1990-2000

Along with the worldwide rapid increase of urban agglomerations since 1980s, a new territorial type or development pattern, i.e. continuous regional extended development and urbanization, has also emerged in the coastal regions in China. This study investigates economic restructuring and spatial transformation in two urban regions, the Yangzi Delta and the Pearl River Delta, to highlight the specific characteristics of this territorial type which make it distinct from its surrounding neighborhoods and from the traditional urban transformation. Our results suggest that not only the traditional urban areas, but also the towns, even the rural areas within the urban regions have priorities to concentrate population (especially migrants), investment (especially FDI) and various things, so the whole regions show more dramatic economic restructuring and development (especially in the rural areas), and being considered as platforms of global production and marketization. The swift transformation endows those original rural places a juxtaposition of urban and rural features, in terms of activities, land use, ways of life which are distinct from the Western experience. So this new regions of fast economic growth are called Extended Metropolitan Regions (EMRs) after McGee. These processes were owed to the process of rural industrialization, especially the development of TVEs. We argue that the concentrated region-based urban pattern is a response of globalization both by firms and by local governments to take advantage of the state-of-the-art in the major port cities after the bankruptcy and reorganization of TVEs since 1990s.

Keywords: City region, Extended Metropolitan Regions, urbanization, regional development, globalization

Jason Funk, Stanford University. Email: jfunk@stanford.edu; Climate policy as a driver of land-use change in New Zealand: barriers and opportunities for indigenous communities.

New Zealand climate policy allows private landowners to earn tradable carbon credits for establishing and maintaining Kyoto-eligible forests. Some estimates suggest that reforestation could offset nearly half of New Zealand's projected excess emissions for the first Kyoto commitment period. Indigenous Maori landowners are a key group of stakeholders, because in many cases they have been unable to utilize other development opportunities, and they hold a great deal of Kyoto-eligible land now reverting to forest. We focused on the Gisborne District, an area of the country containing nearly one-quarter of all Maori land. Using a spatial biophysical model, we mapped the potential above-ground carbon sequestration in marginal pasture and scrub. We compared the economic benefit of carbon farming to other systems for landowners at the parcel level, under several price scenarios. In conjunction with spatial modeling, we also conducted ethnographic work among landowners in the Gisborne District. Using semi-structured interviews, we collected data on land-use decision processes, institutions, and constraints. We found that profit-seeking strategies varied widely, especially among Maori landowners. These strategies were related to the structures for communal governance of land blocks. We evaluated the implications of these strategies for carbon farming uptake in the region in an agent-based framework, building upon the spatial and economic variation captured in our earlier models. Results provide a means for interpreting uptake levels and locations which differ from the expectations of profit-maximizing

behavior. We discuss the implications for these outcomes, in terms of local land use, economy, and national-scale policy design.

Keywords: carbon sequestration, reforestation, indigenous people, land management

Jayson Funke, Clark University. Email: jfunke@clarku.edu; *The Development of Emerging Markets*

This paper will examine the historical and geographic origins of the so-called "emerging market" investment funds and financial markets by exploring their origins in the International Finance Corporation, the private sector arm of the World Bank, and in the financial services industry. It will also situate these emerging markets within existing economic geography and development studies literature. It will conclude by arguing that emerging markets should be understood as an integral component of neoliberal development strategies and discourse, which function to reshape economic relations between core and peripheral economies.

Keywords: Emerging Markets, Development, Neoliberal, Financial Services

Kathryn Furlong, PhD Candidate, UBC. Email: kathrynf@interchange.ubc.ca; *Coalitions and the status quo: resisting neoliberal water sector reform in Ontario*

Resistance to neoliberalization in the water sector has a rather unique ability to act as an umbrella issue under which otherwise disparate groups coalesce. In Ontario, and across Canada, environmental and labour groups have worked together with churches and other activists groups to fight private sector involvement in municipal water supply. The effect of such coalitions is two-fold: (1) they enable activists to garner a broader range of the public trust, thereby realizing more 'successful' campaigns; and (2) they tend to reinforce the status quo for governance (a municipal department in Canada). Regarding the first, their remarkable monopoly over the public trust is not realized simply through idealized 'speaking truth to power'. Their campaign is nuanced and, at times, strategically misleading, and contradictory. This stems most significantly from a mistrust of government-led management, while being caught in a paradigm that presupposes no alternative to [local] state or market led governance. This speaks to the second point: in bolstering the status quo, the 'green' part of the coalition campaigns for a model of which they themselves are quite critical. In their critique of government-led water governance as well as calls for demand-led management including full-cost unsubsidized water pricing, the coalition demonstrates affinity with common tenets of the neoliberal position. As such, 'successful' campaigns may require taking water sector restructuring as a phenomenon that flows from more than neoliberalization, but also from broader social changes that can have moments of accord - among the many moments of discord - with neoliberalization.

Keywords: water-supply, governance, Canada-Ontario, resistance, neoliberalism

Shelagh Furness, University of Newcastle Upon Tyne, UK. Email: Shelagh.Furness@newcastle.ac.uk; *Conceptualizing the 'new' Europe: a role for territoriality?*

This paper will explore how the formulation of political space is undergoing fundamental change in the EU. It is suggested that in order to realise its aims and objectives, the EU has necessarily had to adopt a territorial strategy, one that is qualitatively different to the familiar and dominant modern formulation of the sovereign, territorial state. This EU territory and territoriality is evident in the constitution, construction and realisation of the Area of Freedom, Security and Justice which encompasses the Single Market and the Area of Freedom of Movement of People, and it overarches, co-exists and operates simultaneously with member states' territory and territoriality. It is understood as an instance of scalar structuration, a novel formulation of political space at a supranational scale that challenges the taken-for-granted, fixed-point perspective of modern political spatial ordering. Consideration of the 'new' Europe in the light of this research invites reflection on the assumptions underlying the very conceptualization of different 'Europes', on the many issues and concerns such as identity and 'othering', security and future trajectories, which are identified as being associated with EU enlargement and particularly with the eastern expansion of the EU. It is suggested that an important initial step for the study of any aspect of the 'new', or indeed 'old' Europe is consideration of the territorial frame of reference to which the study relates; since as empirical evidence from my research is demonstrating, this factor could be of major significance to the outcomes and conclusions of such study.

Keywords: European Union, territoriality, Area of Freedom, Security and Justice

Owen J. Furuse, University of North Carolina - Charlotte. Email: ojfuruse@email.uncc.edu; *Immigration Reception and Incorporation: Challenges Facing Latinos in a Pre-Emerging Immigrant Gateway*

Over the past 15 years, Charlotte, NC has developed as a pre-emerging immigrant gateway. A diversified service economy has fueled economic prosperity and accompanying population growth. During this period, the national and transnational Latino immigration stream has been particularly sizable, earning the city designation as a Hispanic hyper-growth metro. Latinos settling in Charlotte have made myriad contributions to the urban community and are recognized to be a critical labor base, upon which components of the city's success rest. However, as their numbers grow, Latinos have become increasingly economically disadvantaged and socially marginalized, raising significant questions about Latino reception, incorporation, and the adequacy of service provision. This paper draws on the research findings from a community-based needs assessment for new Latino residents in Charlotte. Using a multi-faceted methodology, the research finds a broad consensus about the key challenges and barriers facing these newcomers. Indeed, community leaders and low income Latinos share common visions and assessments of the most pressing needs facing Charlotte's Latinos. In addition to presenting the assessment's findings, the paper offers commentary surrounding the potential policy responses to the issues raised.

Keywords: Latino immigrant incorporation, social service provision, public policy

Caddo Native Americans were the primary inhabitants of the Nacogdoches area when European and other cultures (Spanish, French, American Anglo, African-Americans) first settled here. They relied on bottomland forest sites, home to some of the highest biodiversity in Texas, and clearings in upland pine sites, where they performed sustainable intercropping agriculture for over one thousand years. However, the Caddo population is no longer concentrated in East Texas to provide a regular, primary source of cultural heritage. Caddo Mounds State Historical Park has mounds and exhibits. A Caddo mound site also exists within the Washington Square National Register Historical District in Nacogdoches. More materials and activities are needed to bring this important, ancient, and unique culture to life and sustain it in the minds of local inhabitants. The project links local schools with local cultural and natural heritage through: 1) Development and hosting of activities for schoolchildren at an annual Caddo Days event, including Native American crafts and other hands-on activities; 2) Development and distribution of school teacher kits with materials on local Caddo Native American heritage such as sustainable intercropping agriculture, folklore stories from other local cultures, and surrounding natural heritage such as local pine forest and bottomland hardwood forest - materials will include coloring books, maps, and CDs with slide presentations; 3) Surveys of local state park visitor registers to assess and map the origin of visitors to Caddo Mounds State Historical Park, with subsequent analysis of niche marketing opportunities and estimation of the dollar value of visitors to local communities.

Rita Gaber, UC Berkeley. Email: rgaber@berkeley.edu; *The Biopolitics of Neo-liberal Bodies: Some Reflections on Blood and Knowledge*

In September 2006, Governor Arnold Schwarzenegger signed into law the California Environmental Contaminant Biomonitoring Program, the first state-wide program of its type in the U.S. Authored by several non-profit advocacy and education groups concerned with the links between human and environmental health, the legislation sets in place provisions for gathering biospecimens (e.g., blood, urine, tissue) and therefore data on 'pollution in people' or 'body burdens'. While gathering these data is undoubtedly a welcomed development for those tracing environmental causes of disease, the case of biomonitoring also calls for critical examination of the construction and representation of human bodies as polluted. As such, this paper will outline some implications of framing 'pollution in people' as a problem, the solutions this frame suggests under a neo-liberal order, and some consequences of this form of knowledge for an embodied politics.

Keywords: biomonitoring, health, the body, blood politics

Joan Marie Gabig, . Email: jgabig@iupui.edu; *Geovisualization of Volcanic Islands in the Lesser Antilles, Caribbean*

In recent years, several new geospatial data sources have emerged that enhance potential for visualization of Earth's topography and its relationship to land use and land cover. One such data source is the Shuttle Radar Topography Mission (SRTM) digital elevation model, provided by the National Geospatial-Intelligence Agency (NGA) and the National Aeronautics and Space Administration (NASA). The SRTM project resulted in the most accurate digital elevation data available with near-global coverage. Methods presented in this poster utilize 90m SRTM data available for the Caribbean to develop visualizations of the landscape and terrain for volcanic islands of the Lesser Antilles, including St. Kitts and Nevis. Topographic shading and surface transformations are applied to the SRTM elevation data and integrated with remotely sensed imagery (astronaut photography, Landsat and ASTER imagery) to develop both thematic and pseudo-realistic landscape visualizations in a GIS environment. Using the SRTM data in conjunction with remotely sensed imagery creates an enhanced perspective and understanding of island topography and its effect on land use and land cover patterns.

Keywords: geovisualization, shuttle radar topography mission (SRTM), cartography, remote sensing

Nathaniel Gabriel, Rutgers University. Email: nategabriel@gmail.com; *Non-timber Forest Products, Restoration, and the Urban Forest*

Native species restoration is an increasingly common focus for managers of urban forests. To undertake such projects effectively, engagement of the myriad interests of users of the urban forest is often necessary. Yet, despite this engagement, efforts to restore native landscapes can severely limit how urban people use public land. Even as inclusion of a multiplicity of uses of these spaces increases, non-timber forest products use continues to be overlooked. This paper examines potential effects of restoration on non-timber forest product collectors. It is based on recent research in Philadelphia, in which collectors were engaged in open-ended interviews. Its findings suggest that native species restoration can have a significant negative impact on collectors, who often rely on invasive species for cultural and spiritual fulfillment, recreation, and in rare cases, livelihood. Conversely, the paper also examines ways that non-timber forest product collectors and forest managers can collaborate to achieve mutually beneficial goals.

Keywords: urban forest, non-timber forest products, restoration, political ecology

Mary Gagen, University Of Wales Swansea. Email: m.h.gagen@swansea.ac.uk; Iain Robertson, University of Swansea. Email: I.robertson@swansea.ac.uk; Neil Loader, University of Swansea. Email: n.j.loader@swansea.ac.uk; *Developing high-resolution palaeoclimate records from tropical trees using stable isotope dendroclimatology*

The detection and attribution of anthropogenic climate changes requires fundamental knowledge about the low-frequency variability of tropical climate including large-scale modes such as the El Niño-Southern Oscillation system (ENSO). In the tropics, a lack of instrumental climate records is compounded by a lack of high-resolution terrestrial climate proxies in regions where large populations are vulnerable to climate change. In addition, because the tropics have the energy to influence the entire climate system, extending high-resolution terrestrial proxy records is critical for understanding climate dynamics at a global scale. We combine two pioneering stable isotope dendroclimatology methodologies to develop long palaeoclimatic records using oxygen isotopes in trees, from the Danum Valley, Malaysian Borneo. Rhythmical signals in oxygen isotope records from trees are combined with radiocarbon dating to develop chronological control in non-annual ring forming trees and enable us to extract high-resolution palaeoclimatic information. Distinct atmospheric circulation associated with different precipitation seasons at Danum imprints trees with the necessary information about the climate systems for both chronological control and palaeoenvironmental information.

Keywords: Palaeoclimate, tree rings, Isotopes

Michael Gainor, Los Angeles Unified School District. Email: michael.gainor@lausd.net; *Terrestrial Altitude and Coronary Heart Disease*

Cardiovascular disease is, and has been, the leading cause of mortality in the United States since 1900. While the incidence rate has decreased somewhat since the 1950's and 1960's, and with the development of new medical treatments such as cholesterol lowering drugs and advanced surgical procedures like, diseases of the heart were still the causes of 29.4 percent of all mortality in this country in 2001. The Center for Disease Control and Prevention (CDC) recently released the ranking of 50 states and the District of Columbia on heart disease incidence per 100,000 people over age 35. It was interesting to note that the states of Utah, Colorado, New Mexico, Montana, Idaho, and Wyoming all ranked among the top 10. The expected correlation of heart disease with socioeconomic status

does not seem to correspond to this ranking. This paper will focus on the issue of human health as it relates to the geography of the physical landscape, in particular, the response of the cardiovascular system to increased terrestrial altitude. To seek explanations for this unanticipated spatial distribution of cardiovascular disease incidence, this paper seeks to define the extent to which this correlation between terrestrial elevation and coronary artery disease exists in higher altitude human settlements in the United States and around the world. The paper will also explore possible explanations for this phenomenon, using medical and physiological literature on the subject of cardiovascular disease, with particular emphasis on the effects of decreased oxygen levels and barometric pressure on human metabolism.

Keywords: medical geography, cardiovascular disease, high altitude

Francis A. Galgano, Ph.D., United States Military Academy. Email: bf6360@usma.edu; *The Exploitation of Ungoverned Space in South America's Tri-Zonal Region by Terrorist Organizations*

Instability in failed states is having a debilitating effect on regional security. The new security menace is transnational in nature, characterized by enemies without territory or borders and has adroitly exploited regions of the world where government control is absent or weak. This situation cultivates growing threats to global and regional security, which are being nurtured in the world's ungoverned regions where violent non-state actors (VNSA) seek new havens from which to operate. Territories of Competing Authority are regions in which a sovereign state is unwilling to exercise authority over part of a country. In some cases, a state lacks resources to exert control over a province, thus, the region remains selectively uncontrolled and consequently becomes susceptible to humanitarian disasters and/or exploitation by VNSAs. The rapid exploitation of a lawless area by VNSAs is occurring the tri-border area (TBA) of Brazil, Argentina, and Paraguay. Evidence indicates that this area is being exploited by terror groups with connections to extremist movements in the Middle East. This is an area of competing authority, which includes three cities (Foz do Iguacu, Iguazu, and Ciudad del Este), and a sizable population of about 1 million people. The area is now generating billions of dollars from illicit activities to include money laundering, arms trade, piracy, and drug trafficking. Thus, the TBA presents a terror organization with a near ideal base of operations: a source of finance, a sympathetic population; access to modern weapons; and the infrastructure and communications advantages of three lawless cities.

Keywords: ungoverned space, non-state actors, military geography

Megan Gall, University of Denver. Email: megan.gall@du.edu; *The Relationship Between Panhandling and Crime and a Public Policy Assessment*

The "Broken Windows" idea has been at the forefront of criminological thought and policing strategies since it was articulated by James Wilson and George Kelling in 1982 in *The Atlantic Monthly*. Broken windows is a metaphor for community disorder that states minor disorder left unattended will escalate cyclically. As disorder increases citizens withdraw due to fear which invites a further increase in disorder and more serious crime. The Broken Windows idea translates into a police strategy known as community policing and utilizes the order maintenance approach which is applied as a no tolerance policy for community disorder. These policies have been adopted by a number of major cities, most notably in New York City's Quality of Life Initiative. The city and county of Denver, Colorado is incorporating these practices and ideas in the police department. In January 2006, new ordinances were passed detailing regulations for panhandling, a sign of disorder specifically mentioned in Broken Windows. Research was conducted to investigate the relationship between high panhandling areas and crime, the effectiveness of the strategy in lowering crime, and the potential geographic displacement of crime. Analysis was accomplished using geographic information science (GIS) crime mapping and analysis techniques, the weighted displacement quotient (WDQ), and traditional statistical techniques. Conclusions shed light on the effectiveness of the panhandling strategies and the theoretical relationship between crime and disorder.

Keywords: GIS-crime, Broken Windows, displacement-crime

Melanie Gall, University of South Carolina. Email: melanie.gall@sc.edu; *Social Vulnerability Indices to Natural Hazards*

Over recent years, numerous approaches emerged that attempt to quantify social vulnerability to natural hazards at the nation state level of analysis. Their intended purpose is to provide globally comparable vulnerability assessments, benchmark baseline vulnerability, identify trends and inform policies. The development of an index though, poses many challenges and requires crucial decisions regarding the choice of indicators, normalization procedures, weighting, and aggregation schemes. Since there is no agreed upon set of vulnerability indicators or aggregation methodology, vulnerability indices vary distinctly in their approaches. This raises questions concerning index validity and best practices, i.e. do all of these indices possess the ability to actually capture the phenomenon of social vulnerability or do some perform better than others? This

paper compares selected indices (Predictive Indicators of Vulnerability, Disaster Risk Index, and Environmental Sustainability Index) to assess how comparable they are in determining social vulnerability. This is done by sensitivity analyses, comparisons with proxy measures (e.g. life expectancy), and evaluations of spatial trends in the output measure. The findings suggest that despite their different approaches, the Predictive Indicators of Vulnerability and the Environmental Sustainability Index show strong spatial parallels, whereas the Disaster Risk Index does not.

Keywords: index, social vulnerability, hazards, vulnerability science, ranking

Sarah Irene Gall, Griffith University. Email: s.gall@griffith.edu.au; Exploring Articulations of Everyday Life in Brisbane's Inner-Urban West End: Emerging Spaces of Flexibility

Recent research has revisited the small-scale case-study in order to focus on embodied practices at minute scales (for example within households, neighbourhoods and particular social groupings). These types of 'everyday life' research often consider how different social agents shape space and place, understanding actors as adaptable, flexible and fluid. The approach implies a methodological openness to interactions that occur at multiple and complex scales, exploring the ways everyday actions re-make ecological, discursive, economic, social and power relations. Yet when working in urban contexts, this approach finds itself limited by existing urban research agendas. City residents (or "bodies in space") are often rendered invisible by research which describes the world-historical process of urbanization. The response of many urban 'everyday life' enquiries has been to define peoples' activities as resistances against some sort of prevailing world order, whether this be a hegemonic "capitalism" or even "housing market". What if we were to move away from this idea of everyday resistances to instead consider and explore emerging spaces of flexibility within city landscapes? Drawing on case-study research in Queensland, Australia, this paper considers the ways human (and non-human) agents in the inner-city respond to changed external circumstances, and how these actions are articulated. The paper also considers what themes or lenses help us as researchers to step outside the power/resistance binary to explore a range of flexibilities within urban life. Drawing richly on resident's articulations of their everyday practice, this research seeks to challenge, defamiliarise and rework existing ideas of life in city-spaces.

Keywords: Flexibility, Everyday Life, Diary-Interview, Brisbane, West End, Urban

Lesley-Anne Gallacher, University of Edinburgh. Email: lesley.gallacher@ed.ac.uk; Unruly monsters? Imaginative play in the nursery

Most young children are passionate therianthropes. In 'imaginative' and 'fantasy' play they en-gage in all kinds of shapeshifting, inventing new worlds and creating new possibilities as they do so. Early childhood educators are also keen on fantasy play, but only under very particular circumstances. Preschool educators do not seem to share children's passion for monsters. Monsters are tolerated in the nursery so long as they stay within the story books, contained within allegory. When they are rampaging across the classrooms, however, it is another story altogether (so to speak). Monstrous play is disruptive; it is noisy, difficult to control and sometimes violent. To engage with monstrosity is to invite disorder into the nursery. Of course, potential disorder always lurks within the the nursery order, but actually inviting monsters in seems all too likely to tip the balance. For many educators, then, it seems far easier, and safer, to simply ban monsters outright and get on with 'se-rious' play instead. I do not share this view. I view monstrous play as a creative practice through which children might invent new possibilities, and even new selves. In this paper, I will use video recordings of preschool children at play to think through their passion for becoming-monstrous, and consider what 'we' lose when 'we' eradicate them.

Keywords: monsters, passion, preschool, imagination

John Galloway, Union of Concerned Scientists. Email: ; Renewing California's Electricity: A Status Report on the RPS Program

The California Renewables Portfolio Standard (RPS) is the most aggressive policy of its kind in the U.S., requiring that most of the state's utilities obtain 20% of their electricity from renewable resources by 2010. Utilities now face the enormous challenge of nearly doubling the amount of renewable generation in their portfolios in only four years. The RPS program got off to a slow start in 2002, and while utilities have contracted for substantial new capacity since 2003, policymakers expect some of those projects to be delayed or not materialize, and transmission constraints will hamper the timely delivery of many projects. Less than ten percent of the capacity needed to achieve the RPS has come online. The presentation will report on the state's progress in achieving this goal, and explore the policy and technology complexities and challenges that utilities and regulators must overcome to ensure the program's success. The presentation also provides an update on recent developments at the state's regulatory agencies and legislature, and explains the implications for reaching the 20% renewable

mandate and illustrate the vital role of the RPS in meeting California's recently adopted greenhouse gas reduction targets.

Keywords: RPS, California, Renewable Energy

Ryan E. Galt, Ph.D., Cornell University. Email: reg29@cornell.edu; Structure, Agency, and Agroecology in the Explanation of Agrochemical Use Intensity

Agroecologists and agricultural economists have separately attempted explanations of variation in farmers' pesticide use intensity, yet research in each of these areas typically leaves out key socioeconomic or biophysical relationships, respectively. The econometric analysis presented in this paper merges the concerns brought together by cultural and political ecology?variables related to agency, political economic structure, and agroecology?to explain differences in pesticide use intensity by Costa Rican vegetable farmers. Farmer's personal characteristics?age, education, propensity to seek out information, and knowledge of pesticides?negative effects on others?are very important. Household characteristics?whether the farm is an incorporated business, use of family labor, composition of the spraying team, farm resources, and off-farm income?matter greatly. Political economy is important through tenure arrangements, contract farming, and pesticide residue enforcement. Crop specificities and agroecological relationships?parcel size, fallow periods, years of consecutive vegetable production, fertilizer and foliar nutrient use, use of integrated pest management, and spraying of biopesticides composed of antagonistic fungi?have important effects on pesticide intensity. Environmental advantage also plays a role since farmers' commuting distance, strongly related to farming in agricultural environments better suited to the specific crop in question, is negatively associated with pesticide intensity. Coupled with understandings from qualitative methods employed in fieldwork, the econometric analysis shows the joint importance of agency, structure, and agroecology and the problems of explaining pesticide intensity without considering each of these important facets of human-society fusions.

Keywords: econometrics, cultural and political ecology, agroecology, pesticide intensity

Juan Pablo Galvis, University of Washington. Email: jgalvis@u.washington.edu; The state and the construction of territorial marginality: the case of the 1961 land reform in Colombia

This paper explores the ways in which the 1961 land reform policy in Colombia constructed as marginal particular territories and the landless settlers occupying them, through an analysis of both its discourse and the outcomes of its implementation. I privilege the role of the state as an actor historically producing such marginality. However, while focusing on these discursive constructions by the state, I acknowledge that the production of marginality cannot be understood isolated from the political economic factors creating conditions for the existence of a landless peasantry. Also, I take into account that there are multiple ways in which the state as an actor is itself a field of contestation and struggle, rather than a monolithic structure. Agricultural policy has been seen as an attempt to control and make legible rural territories outside the realm of the state, running the risk of idealizing marginal places as venues of localized resistance. This paper illustrates the other side of the coin of this vision by analyzing how land reform worked to construct marginality and thus render subjects and populations illegible. Contestation and resistance, under this analysis, are located inside the operation of the state rather than in its absence.

Keywords: development, marginality, land reform, Colombia

Julia Andrea Gamas, Ph.D., US EPA. Email: gamas.julia@epa.gov; Evaluation of the Input-Output Framework to Assess Resource Scarcity

Energy models use information about primary energy resource supplies as inputs. However, short term prices in energy markets can mask true scarcity because they depend on expectations about finding and developing future reserves. This issue makes it difficult to construct conventional long term supply curves for energy markets because price estimates may not be meaningful. The goal of this study is to evaluate the input-output modeling framework as a tool to determine whether a resource is becoming more scarce. This information can assist energy modelers in the characterization of the supply of primary energy in their models. If it is determined that a resource is scarce, then the modeler can make a determination about its future supply. This information can complement observed price and quantity information; whether a backstop technology or alternative source of energy will become feasible (such as unconventional sources of oil, or ethanol, for example). Coefficients for different mining industries were analyzed to see if it was possible to observe a trend in the use of inputs to those industries, and whether any changes could be attributed to scarcity alone. A comparison with coefficients with other extractive or mining industries with known scarcities was conducted. Preliminary results together with directions for future research will be discussed at length.

Keywords: energy, input-output, resource, scarcity

Matthew Gandy, Dr, University College London. Email: m.gandy@ucl.ac.uk; *Bio-political contestations in the urban arena*

This paper explores the idea of “bio-politics” in relation to the modern city. The concept of bio-politics is traced through its original Foucauldian formulation to more recent explorations of the relationship between the body and the city. We explore the idea through the emergence of discourses on hygiene, public health and differing conceptions of “urban order”. We find that the bio-political dynamics of urban space encompass both juridical and dispersed sources of power in modern societies. It is concluded that existing conceptions of power in urban space need to take account of those diffuse sources of power that enable the modern city to function in spite of its contradictory dynamics. We also need to contend with those “zones of indistinction” which appear to lie outside of conventional urban discourse yet reveal much about the hidden dimensions of urban modernity.

Keywords: cities landscape modernity bio-politics urban infrastructure

Bharath Ganesh Babu, Valparaiso University. Email: bganeshb@valpo.edu; *Variation in leaf area measurements at multiple spatial scales*

Monitoring the tropical forests of the Brazilian Amazon is ever more reliant on remotely sensed observations. However, remote sensing observations are merely cell based radiation measurements that require extensive processing to extract meaningful information. The accuracy of information relies on a combination factors such as pixel size, spectral resolution, underlying land cover, and information extraction techniques. In order to study the effects of pixel resolution on leaf area measurements in a heterogeneous tropical landscape, a study area in north central Amazon was selected. Multi-spectral satellite data at 4m, 30m, and 250m resolutions were used to extract leaf area indices, and the results were compared. Pronounced distortions occurred in both low and high resolution datasets. A multi scale integrated approach has been explored to improve accuracy of these measurements.

Keywords: Remote sensing, Amazon, Leaf area, Spatial resolution

Auroop R Ganguly, Oak Ridge National Laboratory. Email: gangulyar@ornl.gov; Budhendra Bhaduri, Oak Ridge National Laboratory. Email: bhaduribl@ornl.gov; *A Framework for Geospatial-Temporal Knowledge Discovery*

The ability to discover actionable insights from massive and disparate geographic data has often been highlighted as an important challenge in multiple domains. The research community has responded to the challenge through breakthrough science and technologies in spatial databases and integration of semantic information, spatial statistics and spatial data mining, modeling of spatial processes based on domain knowledge and/or data-dictated insights, as well as geographic information systems for visualization and decision-making. In recent years, remote and/or in-situ sensors, including wireless sensor networks and large-scale sensor infrastructures, as well as RFIDs, satellites and GPS systems, are becoming ubiquitous and useful for high priority applications like disaster management and climate change. In addition, the need for faster and more reliable decisions exists in domains ranging from disaster mitigation to security analysis. These challenges have led to emerging requirements for dynamic knowledge discovery from geospatial-temporal data, and real-time, or near real-time, decisions. We describe recent research within our group in areas like spatio-temporal databases, ontologies and real-time systems, spatio-temporal statistics and data mining, spatio-temporal process modeling, and space-time geographic information systems combined with real-time decision support. One of our emphases is on rare events and abrupt change for domains ranging from security or intelligence analysis to climate change and impacts. We describe non-traditional and novel algorithms, methodologies or technologies which have been developed, or are being utilized, to solve these challenges. We propose a conceptual framework for geospatial-temporal knowledge discovery, which brings together disparate capabilities within an overarching solution for specific application domains.

Keywords: geospatial-temporal knowledge discovery

Sarah Ganley, Macalester College. Email: sganley@macalester.edu; *American Indian Urban Migration and Population Trends: 1950-2000*

According to the United States Census, the American Indian population has increased tenfold in the past fifty years, and the percentage of American Indians living in urban areas has increased from 13 to 64 percent in the same time period. Starting with the federal urban relocation program in the 1950s, the American Indian population has seen large shifts in demographics. Although some of these trends can be attributed to changes in the U.S. Census, other factors, such as changes in ethnic classification and a shifting political and social environment that encourages the expression of Indian identity, have also contributed to the significant increase in population. The data provided by the federal relocation program and the subsequent research done by social scientists

until the 1970s forms a significant body of work that has yet to be paralleled in recent years. This paper examines American Indian urban migration and seeks to explain the population trends of the last decade, with a focus on urban Indian populations and the borders between reservations and cities. Using the state of Minnesota, as it has an Indian population that is distributed in both urban centers and rurally, Census data are used to express the migration and demographic trends both numerically and spatially.

Keywords: American Indian, urban geography

Jin Cheng Gao, Kansas State University. Email: jcgao@ksu.edu; Douglas G Goodin, Kansas State University. Email: dgoodin@ksu.edu; *Canopy Chlorophyll Estimation with Hyperspectral Remote Sensing*

In this research, proximal measurements of hyperspectral reflectance were used to develop models for estimating chlorophyll content in tallgrass prairie at leaf and canopy scales. Models were generated at the leaf scale and then extended to the canopy scale. Three chlorophyll estimation models were developed, one based on reflectance spectra and two derived from derivative transformations of the reflectance spectra. The triangle chlorophyll index (TCI) model was derived from the reflectance spectrum, whereas the first and second derivative indices (FDI and SDI) models were developed from the derivative transformed spectra. In each case, indices were developed from observed features in the reflectance and derivative spectra. The three models were found to be well-correlated with the chlorophyll content measured with solvent extraction. The result indicated that the three models were effective for the leaf scale estimates of chlorophyll content. The three chlorophyll models developed at the leaf scale were further extended to the canopy scale. The three models were found to be conditionally effective for estimating canopy chlorophyll content. The TCI model was more effective in dense vegetation, and the FDI and SDI models were better in sparser vegetation. This research suggests that the extension of chlorophyll models from the leaf scale to canopy scale is complex and affected not only by soil background, but also by canopy structure and components.

Keywords: Hyperspectral, remote sensing, chlorophyll

Karina - Garbesi, Professor, California State University - East Bay. Email: karina.garbesi@csueastbay.edu; *Are Rail-Sited Transit-Oriented Developments in the San Francisco Bay Area Achieving Sustainable Cities Goals?*

Stimulated by a regional Smart Growth strategy that advocates broad environmental and social justice goals, transit oriented developments (TODs) are rapidly multiplying in the San Francisco Bay Area. Using field observations in and around BART-sited TODs, interviews, and existing data, this guided field study conducted by a Cal State East Bay Geography and Environmental Studies class, investigated the extent to which these TODs are facilitating those environmental and social goals, and why. Metrics included green-building and landscape design, density, pedestrian and bike friendliness, community oriented design, architectural diversity, and affordability. In general, these TODs are facilitating only the narrow goals of placing housing near transit and reinvigorating mixed-use development, while ignoring the significant environmental potential of green building design, in particular solar electric, solar hot water, and passive solar design. While there are some exciting examples of architectural diversity and ecological design, most BART-sited TODs follow a relatively mundane pattern: moderate density buildings using a modest palette of repeated design elements in ‘California neutral’ colors with layouts poorly designed for pedestrians and children and common land devoted primarily to automobiles. While some TODs integrate well with their existing communities and enhance their urban environments, others are so poorly integrated they feel isolated and appear destined for problems. Again, with a few notable exceptions, TODs are contributing only modestly to affordable housing in the Bay Area. While having limitations, Berkeley area TODs achieved the highest environmental and social rankings.

Keywords: transit oriented developments, sustainable cities, green buildings, San Francisco Bay Area

Ricardo Alexandrino Garcia, IGC/UFMG/BRAZIL. Email: alexandrinogarcia@gmail.com; Ralf Matos, IGC/UFMG/BRAZIL. Email: ralfmatos@yahoo.com.br; *Geographic Dimensions of the Peripheralization Process in Brazilian Metropolitan Regions*

This study proposes a socio-demographic and economic-geographic characterization of the central and peripheral areas of the main Brazilian metropolitan areas (MA), based on the 1991 and 2000 censuses data and IDH (Human Development Index) indicators. Methodologically, there are three kinds of geographical concentric areas: the first one embodies the central metropolis surface; the second one contains the nearest adjacent periphery; and the third one agglutinates the remaining metropolitan area municipal districts. The municipal districts that do not belong to the metropolitan areas are aggregated, for each state, what allows comparative analysis among the three metropolitan and non-metropolitan areas. The socioeconomic indexes initially focus the

population growth, total fertility rates, life expectation, mean family per capita income, and the IDH indicators. In the final analysis, classifications that contemplate social, demographic and economic differentials, taking into account house location (rural and urban), migration condition, sex, life cycle insertion and schooling are presented.

Keywords: metropolitan process, geographic dimensions, demographic and economic differentials

Juan Carlos Garcia-Ellin, JD, MA, University of California - Los Angeles. Email: jcgarcia@ucla.edu; Educational attainment of domestic Hispanic migrants: the case of California

This paper will deal with particularities of Hispanic domestic migration and the possible effects it is having in the amounts of the skilled population within the state of California. As a major recipient of Hispanic migrants from abroad, California has the largest number of Hispanics residing in the state. According to the US Census Bureau, the domestic migration patterns indicate that California has a negative flow of domestic Hispanic migrants. Does the negative domestic migration patterns are synonym to negative flow of college educated Hispanics? According to this study, it may not be necessarily so. Many have speculated about the lack of college educated people in California and the loss of people from that group on the state's population. This paper will show that Hispanics are not necessarily part of the loss of the college educated population in California. When the statistics are analyzed, the rates of college educated domestic Hispanic in-migrants are higher than the rates of college educated Hispanic out-migrants. California may be losing less educated Hispanics, not college educated ones.

Keywords: population, Hispanics, Latinos, migration, California

Hector Garcia-Escobar, CICIMAR-IPN Becario COFAA-EDI. Email: capitanhge@yahoo.com; Luis Chias-Becerril, UNAM Instituto de Geografía. Email: lchias@yahoo.com; Mexican Sea Ports Of Call For Cruisers

Cruisers' data registered at Mexican Sea Ports of call define a constant increment of passengers flow for last 12 years, this paper analyses main maritime tourist destinations of Cruisers. As a whole, Mexican Sea Ports System, is integrated by 90 sea ports, with different activities, but statistics (from 1993 to 2005) show that there are 25 sea port destinations, but in some of them, tourism is not main activity. In a general analysis, there are six main destinations which covered 84 percent in number of passengers added by each series. Then, there are two groups of sea ports concerning to Cruisers, major (those six) and minor one, analyzed each one. Major group includes Cozumel, Ensenada, Cabo San Lucas, Puerto Vallarta and Acapulco. It is important to say that Cozumel is the greatest port of call which operates 45 percent of all passengers transported by cruisers at Mexican Sea Ports of call. It is to say that other 5 ports are located on Mexican Pacific Riviera. As a result of analysis, it suggests there are two main reasons which explain increasing demand: 1) origin/destination (which includes geographical localization, time consumed, and prices) and 2) infrastructure (berths, commodities, access, and attractions). A comparison between two sea ports of call (Cozumel and Cabo San Lucas) it is evident the reasons of superiority from the first port: closest to main origin, time and prices of cruiser are lower, but better on infrastructure, which includes berths, second coral barrier, archaeological sites, among others.

Keywords: Mexican sea Ports of call, geographical location, Cruisers, attractions, infrastructure

Bradley S Gardener, CUNY The Graduate Center. Email: bgardener@gc.cuny.edu; A Quantitative Analysis of Black populations in Fairfax County, Virginia

Using 2000 Census data, Black populations in Fairfax County are broadly examined. The degree of heterogeneity that exists among the Black population in this area is measured. This project explores the Black population in terms of ethnicity and socio economic status. The spatial patterns of West Indians and other Black ethnic groups are empirically tested against paradigms of Triple Layering and Heterolocalism. These are the general purposes of this research. Furthermore, this project attempts to elucidate the spatiality of Black ethnic groups in hope that more exhaustive research can be conducted at a smaller scale.

Keywords: Triple Layering, Heterolocalism, Census 2000, Black Geographies

Alexander Gardner, Ph.D., Tibetan Buddhist Resouce Center. Email: alex@tbrc.org; Regional Geographic Identity Formation in Nineteenth Century Eastern Tibet

This paper examines the geographical activity of a well-known triad of Tibetan religious leaders active in the Sino-Tibetan border region of Khams the second half of the nineteenth century. I argue that they contributed to a lasting regional identity that has survived the political divisions of the territory. The three lamas - Jamgon Kongtrul, Khyentse Ongpo, and Chogyur Lingpa - each contributed substantially to the sanctification of particular sites across Khams,

primary through the composition of religious gazetteers and the performance of ritual activities at the sites. Both types of activities served to root specific religious traditions and customs in the soil of the region, staking the particularities of the Khams culture firmly to Khams space. Khams had long had an ambiguous geographical identity. Its many polities enjoyed centuries of both de facto and de jure independence from Tibet, China, and from each other. In the nineteenth century the region was a primary theater for the struggle between the Qing Empire and a nascent Tibetan state to establish their relationship and border. Both sides claimed Khams as their own and sought to formally integrate its territory into their own. As a result Khams itself threatened to disappear as a place. In the absence of any nationalist movement that could resist the Tibetans and the Chinese in the political sphere, the geographic activity of the region's religious leaders gave Khams the geographic foundation on which to establish and preserve its identity as a place.

Keywords: religious geography, Tibet

James Gardner, University of Manitoba. Email: gardner@cc.umanitoba.ca; Anthropogenic Factors in Increasing Risk from Natural Hazards in the Indian Himalaya

Natural hazards pose a significant risk to people, property and infrastructure in the Indian Himalaya. There has been speculation and increasing evidence that risks posed by natural hazards have increased over time as a result of biogeophysical changes and changes in social-ecological systems. In this paper, anthropogenic factors in increasing risk are described and discussed using empirical evidence from three areas: the Kullu District in Himachal Pradesh, the Garhwal region in Uttaranchal, and the Darjeeling District of West Bengal. The hazardous processes of significance include floods of all types, debris flows and landslides of all types. The evidence suggests that the single most significant factor in increasing risk results from population growth and increased building in hazard prone areas. A secondary factor, especially at the local level, is disturbance of the existing bio-geophysical system by anthropogenic causes. Of lesser importance but of significance locally are disturbances caused by deforestation and agriculture. Finally, the effects of climate variability and change must be considered but remain speculative at this time. Evidence to date suggests that measures to reduce risk from natural hazards in the Indian Himalaya must, in the first instance, be addressed through appropriate land use planning and management and secondarily through structural and other physical means.

Brian J. Gareau, MS; MA; PhD Candidate, University of California - Santa Cruz. Email: bgareau@ucsc.edu; Methyl Bromide, the Protected Counterpart of the Carbon Economy: Neoliberal Discourse, Nation-State Protectionism, Science, and Civil Society in the Montreal Protocol

Despite the successes of the Montreal Protocol on Substances that Deplete the Ozone Layer, ozone layer destruction is still a serious global environmental issue. Moreover, recent research shows that ozone layer destruction and global climate change are intimately linked. Yet, thousands of tons of ozone-depleting methyl bromide (MeBr) remain in use in the U.S. and in other parts of the world. The continued use of MeBr is largely due to political economic concerns. Here, evidence of U.S. protectionism found in the carbon economy is also found in chemicals that work synergistically with heat-trapping particles to alter myriad ecological processes. Thus, MeBr and remaining chlorofluorocarbons (CFCs) can be considered counterparts of the carbon economy, protected by the U.S. from annihilation. This paper explores how the Montreal Protocol is currently undermined by U.S. political economic positions of protectionism, driven largely by California's agro-industry. Using empirical data gathered at Montreal Protocol meetings from 2003-2006, the paper shows how, through neoliberal discourse, U.S. policy undermines the Montreal Protocol's mandate to phase out MeBr. Building on the literature in critical geography that demonstrates how environmental concerns are undermined by corporate protectionism, and the newer literature on neoliberal governmentality, the case study illustrates how science, nation-state protectionism, and neoliberalism can become articulated uneasily and in sometimes unexpected ways at the global level. Civil society groups have had little success in reversing the Montreal Protocol's leniency toward U.S. claims, due to the fact that their interventions are incompatible with the neoliberal discourse of international environmental regulation.

Keywords: Governmentality; international environmental governance; methyl bromide; Montreal Protocol; neoliberal discourse; neoliberalism

Paul A. Gares, East Carolina University. Email: garesp@ecu.edu; Patrick Pease, Northern Iowa University. Email: patrick.pease@uni.edu; The influence of topography and approach angles on local wind speed in a coastal blowout, Jockey's Ridge State Park, North Carolina, USA

This study examines the wind field and associated sediment transport through a 3-5 m deep blowout at Jockey's Ridge, North Carolina. The blowout has an orientation of 240°. Thirteen wind vane/anemometers were placed 0.5 m

above the surface throughout the blowout. A 4-meter mast, located upwind of the blowout, provided a reference for the blowout sensors. Wind speed records at each sampling location were grouped according to the mast wind direction. Wind direction data were classified into 100 groups ranging from 250 to 310°. Wind speed varied significantly with wind direction. In the blowout, wind speed increased gradually (100-120%) relative to the mast speed as the direction aligned with the blowout axis. However, locations on the blowout floor generally showed a reduction in wind speed relative to the reference. This reduction was greatest (50-80%) for winds approaching the blowout from azimuths of 300° and greater. Significant acceleration (100-150%) relative to the reference was recorded at locations at the landward ends of the blowout. On the dune crest north of the blowout, acceleration was very high and consistent (160%) regardless of direction, whereas on the dune crest to the south, wind speeds were lower than the reference (60-110%) except when wind approach was nearly normal to the crest. Sand transport patterns mimicked the wind speed patterns. The most effective sand transport occurred when wind direction was oriented along the blowout axis. Winds from other angles were largely disrupted by upwind dune features and were more likely to cause deposition.

Gregg Garfin, Climas/University of Arizona. Email: gmgarfin@email.arizona.edu; Preparation, Serendipity, Persistence: Developing and Implementing Arizona's Drought Plan

In spring 2003, following the most severe and pervasive drought impacts in recent memory, Arizona Governor Janet Napolitano enacted Executive Order 2003-12 directing the Arizona Department of Water Resources (ADWR) to convene a Drought Task Force and develop a drought plan - the arid state's first! The Governor's Drought Task Force consisted of heads of state and federal agencies, as well as two state Legislators; however, a small army of agency personnel, academics, and volunteer consultants conducted the real work of researching, drafting, and implementing the drought plan. As the drought plan was being developed, the Climate Assessment for the Southwest project at The University of Arizona (CLIMAS), with its mission to develop usable research products and processes by fostering connections between scientists and stakeholders, was poised to contribute to the effort. CLIMAS played a key role in bridging the gap between researchers and policy makers, including development of drought monitoring protocols, background documents, drought mitigation and response options, and local drought impact groups (LDIGs) — a unique mechanism for citizen stewardship and county-level drought preparedness. At present, CLIMAS, in partnership with Arizona Cooperative Extension and ADWR continues work to implement the LDIGs and to improve Arizona drought monitoring and policy. The success of our drought planning work depends on anticipating decision-maker needs, forging solid long-term relationships with cooperating agencies, playing off project strengths and finding partners to fill-in weaknesses, and inviting adequate public participation. These lessons form the basis for developing and delivering effective regional climate services to decision-makers.

Jeff Garmany, University of Arizona. Email: garmany@email.arizona.edu; Beyond the Right to the City: New understandings of urban democracy and social practice in Fortaleza, Brazil

Within the discipline of geography, numerous scholars concerned with urbanization and its social effects have turned to Lefebvre and his ideas pertaining to the "Right to the City". Mark Purcell notes that while this theoretic may have its drawbacks, he also suggests that perhaps "a more explicit debate on what the right to the city should entail? might contribute to greater urban democracy" (Purcell 2002, 107). Stated differently, if current understandings regarding the right to urban space were centered more around the everyday use of space rather than ownership, then perhaps the politics of space would be more open to the input and needs of all inhabitants. In this paper I take up Purcell's challenge to more critically interrogate Lefebvre's "Right to the City" to see if this notion may indeed potentially "contribute to greater urban democracy," or at least provide better understandings of it. Working from my own fieldwork in the favela community of Pirambu (Fortaleza, Brazil), I question how residents are contesting the use of space in their neighborhood. I ask whether their efforts resemble a push for greater participation in democratic processes, and, if so, are their arguments based in any way upon their own rights to the city. Ultimately, I consider whether residents in Pirambu see the usage of urban space as a stronger claim than exchange value in the right to the city, and how different conceptualizations of space are affecting local issues of democracy, governance, and neighborhood citizenship.

Keywords: Use value, exchange value, urban development, flows

Steven M Garrett, MS, MA, RD, University of Washington. Email: geografood@yahoo.com; A Chain and Network Approach to Identifying Social Justice and Environmental Sustainability Issues in an Urban Food System

The focus of this paper is on the theory and methodology of urban food system assessments and how policy directions in creating new urban forms and policies can be identified using commodity chain and network analysis techniques. Most previous descriptions of food systems focus on commodity chain analysis, which does not provide the deeper understanding of institutional structures and relationships that network analysis can. By combining the two methodological approaches, problems and opportunities for solving them can become more apparent. Examples are drawn from a study of Seattle, Washington's food system, which provided the practical impetus for this epistemological advancement. The food system model developed in this project was especially useful in locating alternatives to the status quo of the industrial food network. It also revealed leverage spots for various food system actors to engage concerns amenable at the local level. The goal of the project was to create a food system that is more socially just and environmentally sustainable. Thus, this model will be of use for academics in urban planning, geography and other disciplines with an interest in the multiple facets of the urban food system and for practitioners who wish to integrate food systems into their community planning work at various scales.

Keywords: urban food systems, alternative food, actor network theory, commodity chain

Dustin Garrick, University of Arizona. Email: dgarrick@email.arizona.edu; Amy McCoy, University of Arizona. Email: amccoy@email.arizona.edu; Flowing Uphill toward Conservation: Property Rights and Water Governance in the Santa Cruz River Valley

Despite a pattern of high public land ownership in the Western US, over 90% of the land along the Upper Santa Cruz River is privately owned. Fragmented and contested property claims have challenged collective efforts to govern the river sustainably. The Santa Cruz River therefore provides an opportunity to analyze water governance and community-based conservation at the intersection of property rights, institutions, and ecohydrological conditions. A proposed community water rights agreement has prompted consideration of environmental water marketing tools to meet river conservation objectives, placing this case within the paradigm shift toward market environmentalism as a mode of natural resource governance. This trend toward market-driven solutions has unfolded against a backdrop of rural economic transition and changing institutional dynamics among communities, the state, and freshwater resources. The paper begins by defining market-based approaches to reallocate water for conservation (instream) purposes by highlighting how the Pacific Northwest model has influenced freshwater protection throughout the West. While the economic aspects of environmental water marketing have been examined in detail, the institutional and ecohydrological dimensions have received limited attention. This case study articulates the obstacles and opportunities of applying transactional tools in differing regulatory and ecological contexts, specifically in the US Southwest and the Upper Santa Cruz River. Following from the work of Karen Bakker and others on neoliberal nature, the debates in the Santa Cruz over private property, water rights and riparian protection illuminate how water's physical geography influences its governance.

Keywords: Property rights, Community-based Conservation, Water Markets, Institutions, Environmental Policy

William L. Garrison, Institute/Transportation Studies. Email: garrison@newton.berkeley.edu; Increasing Flexibility in Legacy Systems

Priority for flexibility is a no-brainer. Flexibility is what we seek when striving to increase or expand economic and social choices, equity, technological innovations, and other desirable things. Flexibility provides the robustness we need to adjust to changes such as those arising from a warmer/colder world, and the actions required when managing threats from and results of social strife, economic downturns, environmental catastrophes, infrastructure disruptions, and war. Flexibility is easy to praise at the level of principle, if we allow that a bit of stability and resistance to change does have merit here and there. However, at the level of practice or operations the concept is most illusive, and explaining what flexibility means, why it is thwarted, and how it might be obtained is a very challenging task. My remarks begin by contrasting views of systems and their behaviors. Alternative explanations for behaviors thwarting flexibility are identified. Consequences of inflexible, locked-in development paths are illustrated using examples from transportation and similar systems. Suggestions for increasing flexibility are made after examining system behaviors in dynamic contexts. Academic, government, and industry experiences inform and color my interpretations.

Keywords: flexibility, research design, systems, behaviors, transportation, applied

Georg Gartner, TU Vienna, Department of Geoinformation and Cartography. Email: georg.gartner@tuwien.ac.at; *Ubiquitous Cartography as new means of supporting wayfinding*

This presentation deals with current efforts at the Technical University of Vienna to analyze methods of wayfinding support for pedestrians in mixed indoor and outdoor environments. It is assumed, that methods of ubiquitous cartography in terms of a combination of active and passive systems with various presentation forms can support the wayfinding process. In this context the term ubiquitous cartography follows the definition of Ota (2004), who stated "ubiquitous mapping is that people can access any map at anywhere and anytime through the information network", incorporating also Morita's perspective (2004): "includes not only map making but also map use and map communication considering the interaction between map, spatial image, and the real world". The main research question include the modelling of the behaviour of pedestrians and the possibility of meeting the needs/behaviour by a combination of active and passive systems. The use case includes therefore the usage of mobile devices in combination with short-range sensors and public displays. The main aim is to make the environment "smart", so that adaptively the "smart" environment delivers customised and location-dependent information for a particular user, instead of trying to permanently track and send information from centralized systems.

Keywords: Ubiquitous Cartography, Wayfinding, Location Based Services

Mike J. Gasher, Concordia University. Email: gashmj8590@yahoo.ca; *Journalism as a Practice of Cartography: Mapping the News Geography of Three U.S. On-line Dailies*

This paper posits journalism as a practice of cartography, arguing that through their daily news coverage, journalists make maps which outline the contours of community, establish that community's borders and membership criteria, identify centers of power, explain the extent and nature of the community's relations to the larger world, in sum, sketch a picture of who and where "we" are. In so doing, journalists put particular events, people, institutions, concerns and solutions on the map, marginalizing, even excluding others. They define the ways in which events are newsworthy - i.e., as things that matter to "us" ? and thereby create categories of inclusion and exclusion, relevant and irrelevant, we and they. Journalists, in other words, produce a news geography, a representational space in which they situate their community and its people. Each news organization draws its own particular map, providing an editorial content package that brings together audiences and advertisers in a shared geographical space, or market. This paper reports on a 2004 news-flow study of the on-line editions of three U.S. daily newspapers — the New York Times, Chicago Tribune and Los Angeles Times ? and draws a detailed portrait of each paper's news geography. The news world these newspapers depict is highly circumscribed, and points to the need to expand the notion of news value beyond conventional criteria and include the criteria by which journalists distinguish between "us" and "them," as well as the commercial value of particular groups of news consumers.

Greg Gaston, PhD, Univ. of North Alabama. Email: gggaston@una.edu; *Investigating Ice-Cored Moraines in the Cascades of Oregon using Electrical Resistance Imaging Equipment and Aerial Photography*

Globally glacial ice in both alpine and continental glaciers is retreating. In addition to the melting ice, supraglacial features such as ice-cored moraines are rapidly retreating (melting). "Ice Cored" moraines are common features of many alpine glaciers. These moraines, both recessional and lateral, are believed to be indicated by slopes steeper than would be expected from the normal angle of repose of unconsolidated glacial debris. The 'ice core' probably takes the form of discontinuous ice lenses that serve as structure holding the otherwise unconsolidated material in an oversteepened state. In recently deglaciated areas in the Cascade Range, hundreds of lakes have formed; at least 30 are dammed by unconsolidated moraines that are susceptible to failure as the ice core of the moraines melts creating unstable unconsolidated debris. Failure of ice cored dams could represent a hazard for areas of the Cascades. Research undertaken in 2006 documented changes in ice surface and ice-cored moraines on two glaciers in the High Cascades of the Pacific Northwest. Electrical Resistance Imaging equipment was used to confirm the presence of subsurface ice lenses in glacial moraines. The presence of what are believed to be discontinuous ice lenses in a lateral moraine is supported by the electrical resistance images. In addition, historical and current aerial photography were examined to identify changes in glacial lakes on the Sisters peaks in the Oregon Cascades.

Email: kuzera@rohan.sdsu.edu; *Combining Topographic Normalization with Spectral Mixture Analysis for Improved Forest Structure Classification*

Forest brightness has been shown to be well correlated to forest structural parameters including stand age. Brightness differences between observed image reflectance and reference spectra, or endmembers, can be caused by shadow, shade, and component brightness. Shade is the result of topographic affects, while shadow is the result of the blocking of direct radiation by an object, including trees, rocks or terrain features. Spectral Mixture Analysis (SMA) is a powerful method for decomposing a reflectance spectrum into the proportion of its component surface materials. The three sources of brightness differences are generally treated collectively as 'shade' in SMA. Many SMA studies have modeled vegetation using green vegetation, non-photosynthetic vegetation, soil, and shade. To estimate forest structural parameters it is advantageous to decouple the brightness effects of shade and shadows. By separating and removing the topographic shade component, we focus our analysis on the relationship between canopy shadow and forest structure. We hypothesize that removal of the topographic shade component will increase the accuracy of forest structure classification. We present a theoretical and an empirical approach to removal of topographic shade, and demonstrate their application to conifer forest structure classification. Furthermore, we test the geographic portability of this approach by applying the same methodology to two distinct ecoregions in the Western US.

Email: jsouthwo@geog.ufl.edu; *Spatio-temporal patterns of land-use/land-cover change: analysis of landscape dynamics in Siem Reap, Cambodia*

This study examines spatial and temporal dynamics of land-cover change in different topographic zones in the Angkor basin (1989-2005). Region-specific land-cover shifts were quantified using multiple change detection methods. Supervised classifications for three Landsat Thematic Mapper (TM) image dates, 2005, 1995, and 1989 were combined to create one multi-temporal, multi-spectral, change-trajectory composite of forest/non-forest change. A principal components analysis (PCA) was conducted on the original Landsat TM three-date stacked image of eighteen bands (TM reflective bands 1-5 and 7 for each year) to highlight spatial and temporal changes within the basin. Normalized Difference Vegetation Index (NDVI) time-series was used to measure the magnitude of vegetation change and these results were compared to the principal components analysis to identify consistent patterns of vegetation change. In addition, fragmentation analysis was performed to characterize different land-cover patterns using selected landscape indices. Observed changes indicate that local vs. regional controls have different influences in different topographic positions in the landscape. More forest to non-forest conversion occurred in mid-elevation areas, which are influenced by local factors, while more complex patterns of vegetation change occurred in the floodplain region, which are influenced by Mekong River hydrology. The large shift in mid-elevation forest areas occurred since 1995 which corresponds to political stabilization and increasing development in Cambodia. Protected upland areas remained mostly forested despite small areas of swidden agriculture. This study emphasizes the importance of understanding effects of landscape position on land-use/land-cover change and the need to further explore underlying processes of change in different elevation zones.

Laura C Gauron, USGS. Email: lgauron@usgs.gov; Ellen A Raabe, USGS. Email: eraabe@usgs.gov; *Suwannee Information Gateway: a Web-based Tool for Management and Research*

Increasing population and escalating pressure on water resources in the Suwannee River watershed pose an environmental threat to resources in the basin and its estuary in the eastern Gulf of Mexico. Available data is held by multiple Federal, State and local authorities, by universities and private concerns in a variety of formats. The Suwannee Information Gateway (SIG) was developed to bridge jurisdictional limitations in developing access and inquiry tools for

modeling natural and anthropogenic changes in the basin. The Gateway is a user-friendly web portal for scientists, government agencies, and the general public. It provides users the ability to view and explore basin-related data from a variety of sources. Users have access to mapping, data inquiry, and visualization tools. Preliminary land use change analysis shows growth of urbanized areas and fragmentation of forest with intensified agricultural activity. Demographic data shows a general increase in population throughout the basin in the last twenty years with the greatest increase in counties along the Lower Apalachee River in Georgia and the Lower Suwannee in Florida. Greatest population change coincided with areas of greatest land use change. An assessment of habitat vulnerability and fragmentation was also developed with the Suwannee Information Gateway. The Suwannee Information Gateway brings together previously un-related data sets, facilitating multi-agency watershed management, protection of natural resources, and identification of research gaps.

Keywords: Suwannee, land use change, demographics, habitat change, web portal

Catherine Gautier, Professor, University of California Santa Barbara. Email: gautier@icess.ucsb.edu; Relationships Between Knowledge, Misconceptions And Attitudes Regarding Climate Change

Undergraduate students come to climate change classes with limited knowledge and usually have a number of misconceptions about the physical processes involved in climate and climate change. To investigate the relationships between knowledge, misconceptions and attitudes, we have studied the evolution of knowledge, misconceptions and attitudes of a group of juniors and seniors as they were progressing through a university course simulating a climate summit. Preliminary results from this investigation will be presented and discussed.

Keywords: Climate change, education, attitudes, misconceptions

Daniel G. Gavin, University of Oregon. Email: dgavin@uoregon.edu; Brian Beckage, University of Vermont. Email: Brian.Beckage@uvm.edu; Severity And Persistence Of Sugar Maple And Red Spruce Decline: The Roles Of Climate, Acid Deposition, And Stand Dynamics

Montane forests in the northeastern United States have experienced episodes of declining growth and increased mortality over the last half-century. Attributing observed declines to specific causes has been problematic because multiple environmental changes have occurred concurrently, including acid deposition ('acid rain'), regional climate change, and natural stand dynamics. We distinguish among these explanations using tree-ring records of red spruce and sugar maple from multiple elevations. We analyzed the tree-ring records using a statistical method that selectively removes the effect of tree age and size, and then minimizes the effect of canopy disturbances by censoring smaller trees. We show that the remaining variation in growth can be explained by climate, but episodic growth declines followed disturbances at certain elevations. In high-elevation spruce, growth declines follow winter thaw-freeze events in a pattern consistent with observed winter foliar injury. In low-elevation sugar maple, growth declines occur as incomplete recovery following insect defoliation events. The persistence of decline episodes have increased since the 1960's, especially for maple, consistent with a progressive impact of acid rain on tree vigor. Spruce and maple co-occurring at the deciduous-conifer ecotone show less severe decline. A recensus of 40-yr old forest plots at the same site shows an upward range shift of maple and an overall decrease of spruce. These results indicate that forest decline is a disturbance-incited process mediated by the predisposing factors of acid rain and climate, resulting in strong elevation gradients in decline symptoms and shifting species distributions.

J. A. Gavinha, Texas A&M University. Email: gavinha@geog.tamu.edu; Spatio-temporal trends in economic globalization - what we can learn from top corporations' sales (1984-2004)

Top corporation lists from Fortune and Forbes have been used as attribute data to discuss existing world city hierarchies. Existing studies tend to use a single annual list, providing us a snapshot from one point in time. Lists of Top 500 corporation sales for the period 1984-2004 were consolidated and analyzed in order to identify major trends by economic sector, and how cities were moving within relative rankings. Data confirmed that globalization is neither a single nor an uniform process, and world cities have diverse and changeable roles over time.

Hugh J. Gayler, Brock University. Email: hjayler@brocku.ca; Canada's emerging wine culture and conflicts in the new countryside

The last 30 years have seen a dramatic shift in the Canadian wine industry from a product that one didn't talk about in polite society, and never admitted to drinking, to an award-winning product in international competition. The key to this success has been the switch from the local *Vitis lambrusca* to the European

Vitis vinifera, the development of smaller estate and boutique wineries, government and business intervention, and the promotion of a wine-drinking public. Meanwhile, measures to protect the small land base from urban sprawl and the farmer from financial exigencies are aimed at securing the long-term future of the industry. The development of over 70 wineries in Niagara, Canada's most important wine region, and a growing agritourism industry are testaments to the new countryside as a place of consumption as well as production. However, behind the bucolic landscapes, media hype and middle-class consumerism lay a troubled industry. This paper will explore the reasons for, and possible solutions to, the many conflict areas involving grape growers, the small wineries, the two large wine corporations, and the various arms of government.

Keywords: Agritourism, wine industry, new countryside, Niagara, Canada

Katherine Geddie, University of Toronto. Email: kate.geddie@utoronto.ca; Shifting subjectivities and labour market boundaries: post-graduation plans of international students in Toronto, Canada

Within the knowledge-based economy, increasing attention is being placed on "talent," or highly skilled and creative individuals, as the key input for local innovation and economic dynamism. As a result, there have been strategic policy changes in the spheres of higher education and immigration as cities and countries seek to attract and retain international students and young researchers. Yet while the policy rhetoric is clear on its intentions to encourage the desired "talent" to remain post-graduation, little is known about the effect of these regulatory and discursive changes from the perspective of the student. Previous research has shown that the reasons students seek an overseas education is culturally embedded, and range from household spatial strategies for social reproduction to the individual desire for cultural or personal experiences, or seeking credentials to launch a transnational career. This paper examines the link between the original intentions to study abroad and their future work and mobility plans upon graduation under the evolving policy context of cities competing for skills. Preliminary findings will be presented from interviews with international students from multiple national backgrounds in Toronto, Canada that explore changes to personal career motivations and imaginations, shifting subjectivities, and perceived geographic labour market boundaries.

Keywords: talent-based economic development, international students, labour mobility

Dawn Gedenberg, Clark University. Email: dgedenberg@clarku.edu; Nagraj Rao, Undergraduate Student, Clark University. Email: nrao@clarku.edu; Exploring Suburban Drought in Metropolitan Boston

An increasing number of metropolitan Boston towns not on the Boston water supply system are experiencing summer water shortages despite abundant precipitation. Residential development patterns and the associated lawn irrigation habits are hypothesized causes of this emergent "suburban drought" phenomenon. Clark University's HERO program has been investigating the links between suburban residential water consumption and land development patterns in suburban areas, controlling for climate. Both qualitative and quantitative data, such as information from in-person interviews and multivariate regressions, can be important for identifying factors contributing to water shortages. Interviews with officials at various levels of authority (town to regional to state) in the areas of development, planning, and water system management suggest that these regular water-use restrictions are not sufficient to restrict or modify development patterns and associated water consumption patterns. Yet new and existing challenges to suburban development, such as the state's per-capita water consumption cap and affordable housing mandate, suggest that this suburban drought phenomenon may be exacerbated in the coming years, rather than mitigated. Future research directions include constructing a spatial regression model to explain water consumption including a ratio of lawn size to lot size independent variable to reflect the potential for water shortages as significantly attributable to lawn irrigation.

Meghan Gemma, . Email: meghan.gemma@umontana.edu; A Biocentric Approach to Sustainable Agriculture and Community Design: Crystal Waters Permaculture Village, Queensland, Australia

In 1986, the world's first permaculture village was established - Crystal Waters Permaculture Village - in Queensland, Australia. Permaculture, a design approach whose practices are based on the imitation of natural processes, is a relatively new and evolving vision of sustainability. In order to understand the significance of this community, my research addressed three questions: 1) What were the social and ecological contexts of the community's historical development?; 2) How has the implementation of permaculture contributed to morphology of the local landscape?; and 3) What is the future significance and potential

for Crystal Waters? To provide a framework for this research, an analysis of the contributions of both utopian thought and intentional communities to society was conducted. This study was based on ethnographic and qualitative research methods. Data was gathered over a one month period at Crystal Waters. I lived with a host family, participated in the WWOOFer program, reviewed archived community documents, and spoke at length with community residents, planners, and visitors. The conclusions of this study are based on my experience at Crystal Waters and on my analysis of utopian thought and intentional communities. Generally, Crystal Waters presents a serious alternative to mainstream culture, whose major role in social betterment is education. Crystal Waters provides amazing examples of ecosystem rehabilitation and self-sufficiency at the community level. Its most significant contribution will likely be its historical legacy; a record of a serious attempt to live responsibly and sustainably - both socially and ecologically.

Keywords: agriculture - sustainable, intentional community

Christopher M. Gentry, Indiana State University. Email: cgentry2@indstate.edu; James H. Speer, Ph.D., Indiana State University. Email: jspeer3@isugw.indstate.edu; *Analysis of the Relationship Between Disturbance and Forest Structure in Southeast Texas, USA*

In 2005, Hurricane Rita destroyed vast amounts of forested areas throughout southeast Texas. Hurricanes are a relatively common occurrence in this area and may be particularly important in maintaining these forests and their diversity. This project will analyze how disturbance has helped to shape the structure of forests within the Big Thicket National Preserve and the surrounding area. Increment cores and cross-sections were taken from all standing and dead trees within three plots in the Neches Bottom Unit (NBU) of the Big Thicket National Preserve and two plots in the Weir Woods Preserve (WWP). Each sample was sanded with progressively finer grit sandpaper until the cellular structure was visible at 10-50X magnification. All tree-rings were then dated to their exact year of formation using standard cross dating techniques. Stand-age structures were developed to determine the effect of disturbance on forest structure. The results of this research will help to examine long-term trends in forest succession and how disturbance changes forest composition through time in these highly diverse forests.

Keywords: dendrochronology, disturbance, succession, hurricane, southeast Texas

Glenn White Gentry, Syracuse University. Email: gwgentry@gmail.com; *Memory Ink*

In New Orleans, talk of memorializing Hurricane Katrina is impossible, or at least grossly premature, because the after affects are still omnipresent. It is not that the memory is too fresh, but rather, the event is not yet over. There has been no return to a (new) normal. Yet some people have marked in time and on skin the transition from event to recovery. Importantly, the iconography used in the tattoos is readable for the individual, the local community and to a larger community, especially those who paid attention to the disaster. When viewed collectively, these tattoos provide a type of memorial previously overlooked by geographers. Utilizing place images, these tattoos mark the trauma permanently on those who participated, those who have returned, those who have left, and those who have just tried to help save lives. Not place bound, but very much place specific, these recognizable tattoos act as memorials to the individual and to society at large. This paper investigates the Katrina tattoo phenomenon and how it acts as a form of memorialization, communicating the trauma, loss, hope, and pride associated with the disaster.

Keywords: Memory, New Orleans, Hurricane Katrina, tattoos

Peter Geoghegan, University of Edinburgh. Email: p.geoghegan@sms.ed.ac.uk; *From Community Relations to Good Relations: the politics and policy of anti-racism and multiculturalism in Northern Ireland.*

While most geographical and sociological engagements with anti-racism have focused on its expression in social movement politics, anti-racism operates at a variety of levels and in a range of discourses and practices (Lloyd, 2002). Based on interviews with civil servants and an analysis of institutional structure, public policy and governmental statements this paper seeks to interrogate the emergent anti-racist and multiculturalist rhetoric within the political institutions of post-Good Friday Northern Ireland. Throughout 'the Troubles' the existence of minority ethnic communities in Northern Ireland was seldom acknowledged (Hainsworth, 1998) and the dominant discourse on identity and multiculturalism, Community Relations, was based solely on Protestant/Catholic difference. Although a consociational agreement between Nationalists and Unionists, the Good Friday Agreement expresses a desire to promote Good Relations between all groups. Since the Good Friday Agreement political institutions charged with addressing race relations and racial equality have been formed and racial equality policy produced in Northern Ireland for the first time. Drawing on an analysis of institutional structure, and specific examples of institutional discourse and

practice, this paper shall argue that the politics and policy of anti-racism and multiculturalism in Northern Ireland is undermined by a fundamental tension between a consociational structure which privileges sectarian identities and anti-racist and multiculturalist rhetoric which stresses equality and difference. In conclusion this discursive shift from Community Relations to Good Relations shall be considered as a facet of the post-conflict discourse of 'normalisation' in Northern Ireland.

Melissa Danielle George, Ph.D., middle school science teacher, Tecumseh Middle School/Purdue University. Email: mgeorge@lsc.k12.in.us; Enrico Nino Manes, GK-12 Graduate Fellow, Purdue University. Email: nino@purdue.edu; Deborah Bennett, Associate Professor, Educational Psychology, Purdue University. Email: bennett@purdue.edu; *Evolution of Earthquake Theories in a Classroom Community*

As part of a GK-12 project (National Science Foundation, 2006), an interdisciplinary team examined the evolution of student ideas about the cause of earthquakes during a unit on plate tectonics. The design and enactment of this teaching and learning unit were shaped by the situated learning model (Harrington & Oliver, 2000) which views science classrooms as scientific communities where "enculturation and personal knowledge construction are intertwined" (Hogan, Nastasi, & Pressley, 2000). The study focused on the evolution of the ideas of 12 students as they engage in discourse with teachers, peers, and members of the GK-12 team. Prior to instruction students engaged in three pre-assessment tasks: 1) open-ended questions regarding knowledge of the cause of earthquakes, 2) concept maps constructed during interviews, and 3) a survey and interview analysis of adults' ideas about earthquake phenomena. Following the initial assessment, students read earthquake myths from several cultures and formulated their own earthquake myth (Thier & Knott, 1998). Students also worked in groups of four and engaged in inquiry-based activities and discussions focusing on the cause and effects of earthquakes. As a culminating project, the small groups created new myths reflecting their reconstructed understandings regarding earthquakes. Final interviews provided a means for student to reflect and reconcile their initial and final understandings. Changes in student concept development as a result of instruction and dynamic assessment activities will be discussed.

Sunita George, Alabama State University. Email: sunigeorge_99@yahoo.com; Raymond R Greene, Western Illinois University. Email: R-Greene@wiu.edu; *Obesity in Alabama's Black Belt: A Geographical Investigation*

According to a recent survey estimating obesity in the U.S., six of the ten most obese states are in the southern region of the country. Alabama has ranked among the five most obese states in the U.S. during the last couple of years. The Behavior Risk Factor Surveillance System (BRFSS) data for 2003 show that the counties in Alabama with highest estimated proportion of obese adults were in the lower third of the state, an area roughly coincident with the so-called "Black Belt". This is a region with a high concentration of African Americans. This paper examines obesity and its correlates in the Black Belt counties of Alabama, and compares them with the other counties in the state. The capital, Montgomery, is also examined with a view to discerning whether food deserts exist and what role they play in determining obesity rates.

Keywords: Obesity, Alabama, African Americans

Hannes Gerhardt, University of Arizona. Email: hannes9.geo@yahoo.com; *Christian Advocacy for Sudan: Ethical-Geographic Imaginaries and Foreign Policy*

This research is a contribution to the moral turn in geography, particularly the issue of caring at a distance, but it combines this growing field with the now somewhat more established field of critical geopolitics. The case that I explore is that of Christian activism regarding the political-humanitarian crises that have plagued the Sudan over the last decade. I consider how mainline and evangelical Protestant churches, NGOs, and Think Tanks have constructed the spaces of the Sudan and the United States in their formulation of responsibility and care as well as their subsequent actions and calls for action. Beyond getting a better sense of how an internal "here" and an external "there" are constructed and intertwined with mappings of belonging and ethical reasoning, I also intend to consider the implications of such imaginaries for the execution of U.S. foreign policy. The mainline and evangelical branches of American Protestantism will here be compared and contrasted to show the various ways that religion, ethics and geography may coalesce to influence the implementation of global politics.

Rhett Mohler, Kansas State University. Email: rlmohler@ksu.edu; *Line in the Sand: Boundary as Variable in Southeast Kansas and Northeast Oklahoma*

Environmental phenomena are continuous data, reflecting no natural variety across a landscape. Yet different human factors, including the history of the people living there, the laws and policy they create, and how they use the land, vary across space and interrupt natural continuity. These differences are most salient at border regions where different people and policy meet, and at times of extreme conditions. We seek to understand and explain the differences between nine counties in southeast Kansas and eleven counties in northeast Oklahoma, split by the 37th parallel, that are made apparent by recent drought in the area. In February 2006, the drought affecting southeast Kansas and northeast Oklahoma ranked as abnormally dry to severe. Certain places within the study area have received less than ten inches of precipitation since September 1, 2005. NOAA predicts that the drought will be ongoing with little improvement throughout the study area. Employing historical, political, and spatial analytic geographic perspectives, our aim is to consider and understand the differential impact of people, policy, and land use on neighboring landscapes affected by the same drought. Historical perspectives consider the settlement and cultural groups of the study area. Political perspectives consider policy differences between both the states and the individual counties. Spatial analytic perspectives consider the existing land cover and the potential differential impact of the drought in the study area. Does the boundary appear in how people, policy, land use, and land cover interact with the drought?

Alexandre Germain, McGill University, Department of Geography. Email: agermain@intercime.qc.ca; *Parks and Politics on the Ungava-Labrador Peninsula, Arctic Canada*

National parks are the most outstanding features of environmental protection. This naturally leads to the idea that environmental protection is the main motivation for park establishment. I will challenge this idea by looking at a specific case of federal versus provincial park establishment in the Canadian Arctic, in Inuit country. Canada's newest national park was recently established on the northern tip of Newfoundland-and-Labrador as a result of the successful Labrador Inuit Land Claims Agreement with Ottawa. Also, the government of Quebec is planning a park that would be contiguous with the federal one. Through an actor-oriented analysis of the parks establishment processes, I interpret the values attributed to both new and future parks, thus suggesting what motivations lead these "conservation" projects in the Canadian north. The analysis suggests that Canada's approach is more sophisticated than Quebec's, while the latter gives, somehow paradoxically, more independence to the Inuit organizations. The analysis also exposes an intricate set of motivations that the federal, Quebec provincial, Nunavut and Nunatsiavut regional, and local governments do not always share with each other. The geopolitical, societal, identity, cultural, and economic values of these parks are interpreted and anticipated in different ways by the various actors. These values, it is argued, are more likely to generate interest for park establishment than the sole ideal of ecological integrity.

Alexander Gershunov, Scripps Institution of Oceanography. Email: sasha@ucsd.edu; *Extensive Summer Heat Waves Under Current and Possible Future Climates*

People should perceive changes in climatic extremes more vividly than changes in mean climate, because individuals and society are directly and adversely impacted by extreme climate events. The spatial scale of a heat wave is an important determinant of its impacts. Extensive summer heat waves are considered over Europe and North America in observations and model projections. Recent trends towards more frequent and extensive hot spells follow global warming trends, but are regionally modulated on decadal timescales. Model projections reflect these influences. Europe, warming continuously, had an early warning in 2003 of conditions projected for the second half of the 21st century. Until summer 2006, North America has not seen the extent of heat consistent with model projections. Regional precipitation anomalies together with global anthropogenic influences can explain the atypical pattern of North American summer warming. Last summer's widespread heat waves were consistent with drier conditions over the Eastern US. People's perception of climate change may be effected by such events depending on whether scientists are able to correctly and clearly explain their occurrence. A key requirement is that Nature should act consistently with climate projections. Projections must be reasonably accurate, or the science should be perceived as inadequate. Drought would seriously exacerbate the recent warming over North America to levels in line with the

warmest projections. Assuming realistic warming scenarios, a long-term anthropogenic increase in the frequency and spatial extent of regional hot spells is projected to be strong and strongly modulated by decadal-scale variability throughout the 21st century.

Meric S. Gertler, University of Toronto. Email: meric.gertler@utoronto.ca; *Buzz Without Being There? Communities of Practice in Context*

A core idea emerging from the recent geographical literature on communities of practice is the insight that geographical proximity should not be confused with relational proximity. This means that the former need not imply the latter. Equally intriguing for economic geographers, it also presents the possibility that relational proximity can be achieved at a distance. While this argument makes sense conceptually, its limits - both theoretical and empirical - have not yet been fully explored. Under what conditions should we expect relational proximity to be achieved effectively at a distance? In this paper, I suggest that the evidence accumulated thus far is still underdeveloped, drawing on a small sample of sectors and empirical settings. It is also somewhat undertheorized, lacking any systematic attempt to identify critical determinants of relational proximity. I then review recent findings from a number of case studies in which distributed teams participating in joint problem-solving projects have attempted to engage in long-distance learning and knowledge translation, with varying degrees of success. Deterrents to effective distanced learning are both logistical and institutional in nature. The frictional effects of distance are shown to depend to some extent on the types of knowledge base supporting innovation in each case. I argue that it is through this kind of analysis that we might begin to develop more compelling answers to questions like: under what circumstances will relational proximity be stronger or weaker? What are the conditions that facilitate long-distance circulation of knowledge, or its joint production by distanced actors?

Dean Gesch, U.S. Geological Survey. Email: gesch@usgs.gov; *An Inventory and Assessment of Significant Topographic Changes in the United States*

Within the collection of studies that have documented the effects of human actions upon the environment, some studies have estimated the total effects of human activity on the landforms and shape of the Earth's surface, but these studies have not emphasized the spatial component of the changes. The primary issue addressed by the research reported here is the need for more comprehensive information on the nature and extent of recent human geomorphic activity. The National Elevation Dataset and the Shuttle Radar Topography Mission dataset form a unique pair of multi-temporal elevation datasets that were used to detect and analyze 20th century topographic surface changes in the United States. The primary types of topographic changes resulting from human geomorphic activity include surface mining, road construction, urban development, dam construction,

and landfills. Notable concentrations of topographic changes are found in the mining areas of central Appalachia, northern Minnesota, eastern Wyoming, and southern Arizona, and in the expanding urban areas in southern California. Summary statistics of the distribution of changes were accumulated and tabulated for states, counties, watersheds, and ecoregions. The environmental effects of topographic changes can be quantified in a number of ways, including hydrologic effects, visual impacts, and comparisons among regions for the effects of mining on topographic relief. Although some unique dataset characteristics and data quality issues presented a challenge to development of reliable topographic change maps, the inventory was successfully completed, and it represents a first ever detailed spatial accounting of topographic change across the United States.

Daniel J Getman, DOE ORNL Geographic Information Science & Technology Group. Email: getmandj@ornl.gov; Aaron Myers, DOE ORNL Geographic Information Science & Technology Group. Email: myersat@ornl.gov; Making Usable Data Available and Available Data Usable: The Application of Geospatial Standards in Near Real-Time Sensor Networks

The benefits associated with the use of geospatial standards in application development, including vendor neutrality and application interoperability, are often gained at the expense of system performance and the integration of existing proprietary applications that users have already invested in and are familiar with. Determining an appropriate balance of these two strategies can be a difficult calculation. Efforts to effectively bring these concepts together within the same system design can be hampered by issues associated with latency, scalability, conflicting software requirements, and demanding processing requirements. A research effort to design near real time sensor networks in which GML based web feature services are utilized along with proprietary GIS software applications is presented. This research culminated in the development of two prototype systems. The process of designing, implementing, and deploying these systems will be described while outlining the issues, balancing the pros and cons, and providing insight into the pitfalls of attempting to combine the two goals of making usable data available and available data usable.

Christy Getz, PhD, UC Berkeley, Department of Environmental Science, Policy and Management. Email: cgetz@nature.berkeley.edu; Sandra Brown, UC Berkeley, Department of Geography. Email: sandybrown@berkeley.edu; Privatizing Farm Worker Justice: Regulating Labor through Voluntary Certification and Labeling

This paper assesses the possibilities and limits of efforts to incorporate social accountability into California agriculture through voluntary certification and labeling in the context of neoliberal governance. Based on participation in two pilot social audits on a California farm, participant observation in sustainable agriculture meetings, and interviews conducted with actors in the social justice in agriculture arena, we explore the contradictory motivations of actors involved in the social certification “movement” in the agricultural arena. Unlike more traditional forms of social justice organizing, which have historically sought to alter power relations between labor, capital, and the state, social certification assumes that production conditions can be regulated through voluntary standards and monitoring. As such, it embraces two key neoliberal principles: 1) the primacy of the market as a mechanism for addressing environmental and social ills and 2) the privatization of regulatory functions previously reserved for the public sphere. Our interviews suggest that the rise of the social certification strategy is at once shaped by the current political possibilities of the neoliberal era, a reaction to the substantive impacts of the neoliberal turn, and a reinforcement of neoliberal ideology. We conclude that certification both reflects and reproduces particular subjectivities, which may create political openings for future resistance to neoliberal rollback but which may also further destabilize collective action efforts and rationalize state withdrawal from regulating farm labor conditions. Significantly, many of the activists suggested that collective bargaining and state regulatory campaigns were “polarizing,” citing a preference for consumption-based approaches to social change.

Lisa L. Gezon, Ph.D., University of West Georgia. Email: lgezon@westga.edu; Khat in Madagascar: Political Ecology and the Culture of Drugs in a Postcolonial State

Khat, a leafy drug with amphetamine-like properties, arrived in Madagascar with Muslim Yemeni dock workers in the early twentieth century. Its growing popularity within Madagascar over the past fifteen years has followed a trend throughout the Indian Ocean, where khat leaves are increasingly chewed along the East coast of Africa and on several Indian Ocean islands. While its popularity in Madagascar has allowed farmers and traders in the northern region to earn

considerable profits (leading some to identify it as the “green gold” of the north), khat falls outside of the purview of the formal political economy and is ignored in official discourse. This paper explores this conundrum, merging critical medical theory with an analysis of postcolonial state politics in an era of global governance. It argues that the popularity of khat and its simultaneous silencing cannot be understood without reference to the global wars on drugs and terror, growing animosity toward Islam, and the conditionalities of Western-financed economic development.

Email: mccreigh@nsidc.org; Detecting and Attributing a Climate Change Signal to the Arctic Sea Ice Extent

The purpose of this study is to analyze the spatial pattern of changes in the Arctic sea ice extent over time, and to attribute those changes to specific causes. Using the satellite record of Arctic sea ice extent based on passive microwave observations, empirical orthogonal function analysis (EOF) is employed to identify the spatial pattern of changes in sea ice for two main seasons (summer and winter). The leading EOF pattern of winter (Jan-Feb-March) sea ice reveals a spatial pattern which suggests a link to the dominant atmospheric teleconnection pattern (AO). The second dominant winter EOF pattern indicates an influence of increasing air temperatures over the Arctic. The leading EOF pattern for summer (July-Aug-Sep) sea ice offers a different spatial pattern which reflects the influence of an atmospheric warming signal. It appears that a signal from arctic-wide increasing temperature over the last two decades may have emerged in the record of sea ice variations.

Keywords: Arctic, Sea ice, Climate Change

Geoff S Ghitler, MS, University of Calgary. Email: gghitter@ucalgary.ca; Sustainable Cities as Complex Adaptive Systems: A returned theory of systems for geography

Systems thinking in geography has always been befuddled by complexity. Inspired, as it has been, by a long descent from Newton and Descartes through Darwin, the Chicago School of Sociology, logical positivism and the quantitative turn, systems thinking in geography has relied on mathematical generalization as a fundamental tool. Complexity, in the form of raw data, is smoothed so that mathematical operations can be performed, models constructed, and predictions made. But this approach had mostly failed and, by the mid 1980s, explicit references to a theory of systems as the underlying logic for geographic research had all but vanished. More than two decades of quantitative research had failed to produce a systems methodology that could be generally applied. Yet the need and desire to understand the world as a system of systems has not disappeared. Thus, although muted with reference to an explicit theory, research in geography continues to rely on representation of systems. This paper tentatively forwards a new way to think about systems in geography that is particularly appropriate for the study of sustainable development. In this formulation sustainability is conceived of as the passage of a system through time in a way that conserves the elements that comprise it. Drawing on new techniques from conservation biology and ecological economics, complexity is managed by shifting the purpose of research from prediction-making to analyzing the consequences of systemic processes (such as path dependency) for the system’s long term viability.

Keywords: sustainability, urban geography, complex adaptive systems

Rina Ghose, Associate Professor, University Of Wisconsin Milwaukee. Email: rghose@uwm.edu; Scalar Politics and Scaled Networks in Collaborative Urban Governance

Urban governance in the western capitalist world is increasingly marked by a shift to a collaborative governance model, strongly shaped by neoliberal ideology, which emphasizes free market capitalism, reduced public funding, the devolution of state’s responsibilities, and the foisting of state-led priorities upon citizen groups. In such a model, the state is actively creating partnerships with not only citizen groups, but also with various private sector actors, foundations and quasi-state organizations in order to create market led economic growth in sites of deindustrialization and disinvestment. As such, the lines separating the state, market and civil society are increasingly blurred. This paper contends that such a collaborative governance is multi-scalar and multi-institutional, involving actors that form associations through networks. Such networks transcend political boundaries and are both territorial and thematic in natures. These networks can contain structural inequities, hierarchical dominance and fluctuating resources. But these networks are also dynamic and flexible, enabling actors to manipulate and modify them. Using the case of Milwaukee’s collaborative governance models, I intend to examine how multi-scalar and multi-institutional urban

governance takes place through alliances between various actors in public and private sector. In trying to control the revitalization agendas and the material resources required for it, these various actors and community organizations try to construct politics of scale. For some community organizations, such scalar politics and creative alliances with critical actors allow them to gain a voice in decision-making activities. But other community organizations lag behind, and are unable to secure their urban space.

Keywords: Politics of Scale, neoliberalism, networks

Debarchana Ghosh, University of Minnesota. Email: ghos0033@umn.edu; Robust Principal Component Analysis and Geographically Weighted Regression: Urbanization in the Twin Cities Metropolitan Area of Minnesota

An emerging challenge in spatial analysis is modeling and understanding land change at fine spatial scales. In this paper, we present a hybrid approach, robust principal component geographically weighted regression (RPCGWR), in examining the problem of land change as a function of both extant urban land use and the effect of social and environmental factors in the Twin Cities Metropolitan Area (TCMA) of Minnesota. We used newly available remotely sensed data to treat urban land use via the proxy of impervious surfaces. We then integrated two different methods to create an innovative approach to modeling urban land use. We first applied robust principal component analysis via the projection pursuit algorithm to a number of explanatory variables in order to reduce their complexity and the influence of outliers. We then used the resultant robust principal components (RPCs) in a geographically weighted regression to capture spatial heterogeneity in the urban landscape. The first three RPCs account for 93 percent of the total variation in the explanatory variables and described three underlying dimensions: cost-distance to cities, market centers and highways; income; and infrastructure factors. The RPCGWR results show significant spatial heterogeneity in the relationships between proportion of impervious surface and these factors in TCMA. We link this heterogeneity to the 'sprawling' nature of land change that has moved outward from the core Twin Cities through to their suburbs and exurbs.

Jayati Ghosh, Dominican University of California. Email: jghosh@dominican.edu; Ezekiel Kalipeni, University of Illinois. Email: kalipeni@uiuc.edu; Vandana Wadhwa, University of Akron. Email: vandanaw@comcast.net; Vulnerability of Next Generation to HIV/AIDS in India: A Research Agenda

In India, 5.7 million people are infected with HIV/AIDS, and women comprise 37% of this population. According to the Center for Reproductive Rights, 0.7% of HIV+ people aged 15 to 24 were females, outnumbering males who made up 0.3%. However, the relatively low HIV prevalence rate (0.98% among 15-49 age group) leads to false perceptions of low levels of risk to the disease, particularly in women and youth. This creates a vulnerability to HIV infection, which in turn provides a conduit for infections to the next generation via MTCT. Moreover, throughout the developing world adolescent reproductive health is often affected by socio-cultural and economic factors. In India, several socioeconomic factors such as feminization of poverty, conformity to tradition and low status in society make women unable to protect themselves against HIV infections. On the other hand young men often begin sexual activity earlier and have more sexual partners than young women. In this paper we argue that there needs to be a greater understanding of the sexual and reproductive health of the youth in an era of escalating HIV/AIDS rates in India. Understanding of Indian youth's own perception of their reproductive and sexual health and rights (RSHR), particularly in reference to their perception of risk for HIV/AIDS, and to their decision-making status in the area of RSHR is critical. In addition, we argue that increased levels of awareness regarding RSHR, and particularly HIV/AIDS among Indian youth will promote a greater sense and level of autonomy regarding RSHR decision-making.

Sutama Ghosh, PhD, Urban Studies, York University. Email: sutama@yorku.ca; Transnational Ties and Intra-Immigrant Group Settlement Experiences: A Case Study of Indian Bengalis and Bangladeshis in Toronto

Transnational theories have established that, after migrating to a new country, migrants often maintain their pre-existing social, economic, and political ties to their home country. The extent to which however, transnational institutional and social connections may affect the residential location and housing experiences of immigrant and refugee groups, and why and how these experiences differ within broadly defined immigrant groups such as the 'South Asians' remains unexplored. Building on transnational theory and previous research on the housing trajectories of new Canadians this paper examines the housing experiences of two recently arrived South Asian subgroups in Toronto—

Indian Bengalis and Bangladeshis. By highlighting important intra-immigrant group differences, the study reveals how diverse transnational ties affect the migrants' neighbourhood choice and the type, tenure, and quality of housing they live in.

Cerian Gibbes, University of Florida. Email: gibbes@gmail.com; Jane Southworth, PhD, University of Florida. Email: jsouthwo@geog.ufl.edu; Turning up the heat

Remote Sensing has become an integral tool to geographers, especially those concerned with land cover change. Land change science research has traditionally emphasized the use land cover classifications, often with the creation of discrete maps of land cover change. While some other sub-areas, such as landscape ecology and more ecologically based studies have used more continuous representations of the landscapes, such as NDVI and other vegetation indices, even these are limited in terms of applications. The use of such continuous variables contrasts with more traditional classification schemes, and in general, the incorporation of both spatial and spectral information into land-cover change analyses greatly improves the amount of information that is obtained. Satellite based thermal data measures the emission of energy from the Earth's surface and thus can be linked to land cover types. The use of surface temperatures as a source of data for land cover change analyses provides a continuous dataset that is a physical manifestation of energy transfers and can be compared to discrete classifications of land cover. While other research areas within the discipline (e.g. urban studies, climatology), have embraced the use of satellite based thermal analyses (e.g. surface temperatures), the land change science community has not maximized the use of thermal data. This paper will highlight the advantages, limitations and additional information to be extracted when using thermal data to examine land cover change, incorporating specific examples from a complex transitional zone, savanna landscape in Botswana.

Ann E. Gibbs, U.S. Geological Survey. Email: agibbs@usgs.gov; Susan A. Cochran, U.S. Geological Survey. Email: scochran@usgs.gov; Seafloor Habitat Mapping in Hawaiian National Parks

The U.S. Geological Survey, in cooperation with the National Park Service, has completed high-resolution maps and habitat characterization of selected coral reefs in Hawai'i. The detailed benthic habitat maps document the underwater geological and biological resources in and adjacent to three National Parks located along the Kona coast of the island of Hawai'i. The maps were developed using a combination of aerial photography (ranging from ~0.2 to 1.0 m/pixel resolution), SHOALS bathymetric lidar data (~4.0 m/pixel resolution), georeferenced ship-towed video, and SCUBA. The classification scheme used for the maps is based on one established by NOAA's biogeography program in 2002, and subsequently revised in 2004. A minimum mapping unit (MMU) of 100 square meters was used, yet smaller features were mapped if they contained significant habitat. Each of the three parks has a unique offshore environment, ranging from well-defined spur and grooves, platforms, sea cliffs, and pinnacles. Integration of the aerial imagery, SHOALS bathymetry data, and field observations made it possible to create detailed benthic habitat maps from the shoreline to depths of 40 m, which is deeper than can be mapped with aerial multispectral, or hyperspectral imagery alone. The resulting habitat maps are of higher-resolution than currently available through other sources. The use of SHOALS bathymetric data allows for 3D visualization of the maps, assisting in both habitat interpretation and management decision-making. These maps can be used as stand-alone products or in a GIS, and provide useful baseline information to scientists, managers and the general public.

Email: peter.holmgren@fao.org; Tracking the Fate of Deforested Land in the Tropics: Critical New Inputs for Ecosystem Service Evaluation

Tracking the fate of cleared land in the tropics is critical to reducing the uncertainty in estimates of deforestation rates and to fully evaluating ecosystem services such as carbon storage, biodiversity, and disease regulation. Land use following deforestation is highly dynamic and often rapidly cycles between classes following deforestation, allowing secondary forests to regrow for varying periods of time. We have tracked the changing fate of deforested land across the tropics using ~600 manually-classified Landsat scenes from the FAO and TREES projects. The land use following deforestation varies across the seven major

tropical regions and through time. We have identified statistically significant changes in the fate of deforested land between the 1980s and 1990s. Preliminary analysis indicates patterns of agricultural intensification in South America are reducing forest regrowth and fallow while simultaneously increasing the amount of mature forest cleared for permanent agriculture.

Email: chrisbh@uow.edu.au; Jim Walmsley, University of New England, Australia. Email: dwalmsle@pobox.une.edu.au; Mapping vernacular creativity: the extent and diversity of rural festivals in Australia

Although creativity is now taken more seriously by governments, it is often 'folded into' normative ideas of market-led place competition, with biases towards commodifiable creativity (producing copyright/content) and urban, middle class neighbourhoods and aesthetics. In reaction to this, our central research concerns are: 1. to expose such biases as embodied practices of knowledge-construction; 2. trace the manner in which such knowledges about creativity are produced and circulate; and 3. to problematise 'normative creativity' by exploring 'everyday' creative expressions in suburban, rural and remote settings where boundaries between 'amateur' and 'professional' creativity may be porous. This paper draws on a project which seeks to map the extent and diversity of festivals held in rural parts of three Australian states (Tasmania, New South Wales, Victoria). A database of 2,000 rural festivals has been compiled, evidence itself of the creativity embodied in staging festivals, from small community events celebrating migrant heritage, to quirky, specialist offerings (scarecrow festivals, pumpkin bakes, goanna-pulling contests, 'ute musters' and chocolate fairs). We discuss results of work with festival organisers, and briefly draw on ethnographic research conducted in two case studies (an Elvis Presley impersonator festival and the nation's largest rural gay and lesbian festival). Such events are rarely taken seriously by governments and development promoters, who instead favour 'traditional' industries (agriculture, mining); they are also often ignored by urban-based creative industries proponents. This paper accordingly seeks to show that rural creativity is widespread, and intimately connected to discourses about community sustainability and vitality.

Kristina Gibson, University Of Colorado at Boulder. Email: Kristina.gibson@colorado.edu; Freedom of movement or the right to mobility?

Homeless youth are a highly mobile segment of the overall homeless population in the United States. Recently, the diffusion of anti-homelessness laws and order maintenance policing in most major metropolitan areas is rewarding a kind of hyper-mobility amongst street kids. Homeless youth that stay moving provoke less attention from authorities than those who stay put and accumulate fewer tickets for loitering, illegal camping and panhandling. Highly mobile street youth have difficulty maintaining contact with social services, gaining government benefits, and forming strong networks of supportive individuals. Mobility may be interfering with less harmful ways of surviving on the streets, driving youth into progressively more dangerous occupations in less visible locales. Yet street kids discuss their mobility as a lifestyle of choice and as a right to be defended. How is mobility a right that is both enabling and disabling for street youth?

Vinay K. Gidwani, University of Minnesota. Email: vgidwani@geog.umn.edu; The Afterlives of 'Waste': Eviscerating Urbanism in Post-Development India

The neologism 'eviscerating urbanism' describes three overlapping forces that are transforming Indian metropolises: first, a parasitic urbanism that is colonizing the land and ecology of the surrounding countryside at accelerated rates; second, a speculative urbanism that is relentlessly deploying resources and violence to convert spaces of waste into spaces of value; and third a techno-ecological urbanism that is producing two different urban ecologies and sets of populations - one, the ecology-set of an urban bourgeoisie actively tied into global circuits of capital, whose lives are considered worthy of caring by the state; the other, the ecology-set of an urban underclass living off the commodity detritus of these global circuits, whose lives are of utter indifference to the state. I ask how the figure of 'waste' introduced into political and economic discourse by John Locke more than three centuries ago provides intellectual alibi to 'eviscerating urbanism'. Finally, I argue that contemporary urban India is emerging as a post-development social formation. How so? Because as the paradigmatic form of biopolitical power, 'development' has always presupposed nominal engagement with the subjects whose lives it seeks to manage and cultivate. But this is no longer a tenable assumption. Today, neither the apparatuses of the state nor an increasingly anti-poor urban bourgeoisie seek this

ethical engagement. The breach requires a combining of forces by the 'anti-bodies' of capital to lay claim to urban flows and spaces: in short, a subaltern cosmopolitanism.

Jen Gieseke, CUNY - Graduate Center. Email: jgieseking@gc.cuny.edu; Mental/Cognitive Mapping Revisited: The Geographical Imagination in Methodology & Pedagogy

The work of Tolman (1948) defined cognitive mapping as the spatial representation of complex, selective, and generalized mental representations of personal and social spatial experiences. 'Mental maps' artistically represent the geographical imaginations of an individual or groups' 'long history,' the experience of a place over time, both real and imagined. The concept of the geographical imagination (Harvey 1973) argues that no geography is isolated from the social, political, and economic histories within its landscape. I argue that mental mapping offers cartographers and researchers the geographical imagination's "spatial consciousness" which can be used to peel away layers of social injustice towards geographies of justice through both academic research and teaching. I will first present a classroom exercise at a highly selective college where students created mental maps of their college and the surrounding area. These maps were then analyzed with faculty to demonstrate the various social (in)justice histories locked within their geography of the campus and their own identities. I then analyze the mental maps created during a research study regarding the same campus by students and alumnae to describe their experiences and identity development in the campus, and how these maps simultaneously depict efforts toward and identities based upon social justice and injustice.

Mark Giesken, University of Oklahoma. Email: chsmgl@yahoo.com; Using IMPLAN and JEDI modeling to analyze the economic benefit of wind power in Oklahoma.

The economic impact on local communities is a major driving force in the rapid expansion of the wind industry across the United States. Oklahoma has substantial amounts of wind resources available; the state is able to harness this resource. Wind farms can have many different effects on a local economy. They provide both short-term and long-term employment during different phases of development. This economic benefit, however, is not only limited to employment and tax payments. Depending on the local economy, the wind farm can provide long term ripple effects. IMPLAN (Impact Analysis and Planning) is an economic impact assessment modeling system. It is used by any number of different industries. IMPLAN allows the user to develop an analysis and actual economic impact assessment to look at economic changes from a broad geographic distinction like a state, down to the county level and even to a small specific governmental unit like a community. The JEDI model uses actual default data of wind plant construction costs, along with allowing the user to input project specific data to fully analysis what economic impacts may have occurred on a geographic area; such as a county, state, or even a regional area. The models were used in this study to show the significant impact thus far from Oklahoma's operating wind farms in the economic sectors of employment, tax base, and overall impact on the local communities.

Emily Gilbert, University Of Toronto. Email: emily.gilbert@utoronto.ca; Eye to Eye: Biometrics, the Observer, the Observed and the Body Politic

Biometrics have held out the promise of authenticating identity absolutely in a world beset by risk and violence. A number of body parts can be used, but retina and iris scans are said to be the most accurate, and are now used by the military, large corporations, airports, and by some ATMs. In what ways are social and disciplinary power exerted on and through the bodies subjected to biometric analysis? What are the implications of these techniques of observation on the constitution of the subject, particularly in light of increased modes of surveillance from CCTV to border watchtowers? In other words, how are the relations between observer and observed reconfigured when they see "eye to eye," so to speak? This paper addresses these questions and considers the implications of the reconstitution of vision, embodiment and subjectivity for rethinking territory and the body politic.

Liette Gilbert, PhD, Faculty of Environmental Studies, York University. Email: gilbertl@yorku.ca; Sanctuary and vigilante cities: "borderless" pro- and anti-migration discourse

My presentation examines the role of municipal governments in immigration policy by examining pro- or anti-migration urban policies. Although immigration is primarily a federal responsibility, some local governments have adopted sanctuary policies that prohibit city personnel from reporting immigra-

tion violations, and resist cooperation with abusive Immigration and Customs Enforcement crackdowns. Others have passed restrictionist (vigilante) policies that give local police force access to federal databases, prohibit renting to undocumented migrants, revoke license of businesses hiring undocumented workers, shut down day laborer centers and sites, and declare English the official language. In this increasingly polarized debate, what are the rationale, development, implementation, representativity, and constitutionality challenges of such urban policies. To better understand these municipal ordinances, the research will also examine key elements of the larger legislative and popular discourses of immigration politics in the US. Finally, the research examines how the pro- and anti-migration debate in the US is influencing immigration politics and activism in Canadian cities through transnational networks for migrant rights and the expansion of punitive "national security" regimes for immigrants.

Melissa R. Gilbert, Temple University. Email: mgilbert@temple.edu; Place, Space, and Power: A Framework for Examining the Intersection of Digital Divides and Urban Inequalities

Research on the digital divide in the US has documented statistical disparities in access to and rates of use of information and communication technologies (ICTs) by race/ethnicity, socio-economic status, gender, and geographic location. A large-scale study recently found that "place effects" (i.e., high poverty urban census tracts) rather than "race" per se best explained African-Americans lack of access to and use of ICTs. Because this type of analysis rests on essentialist conceptualizations of "race" and place, it can contribute to the further racialization of inner-city neighborhoods by ignoring the intertwined nature of the processes creating digital divides and urban inequalities. In this paper, I present a framework for conceptualizing the intersection of digital divides and urban inequalities that requires analyses of 1. wider social, political and economic processes occurring at multiple scales (e.g., economic restructuring, occupational segregation), 2. the interconnections among multiple relations of power and inequality in particular place/context (e.g., labor market segmentation, residential segregation, state and non-profit policies) and 3. the embeddedness of ICTs in people's daily lives in particular places. This framework leads to a research agenda that explores how processes of gender, "race" and class shape the nature and acquisition of technological capital across multiple spaces/arenas (e.g., workplace, domestic, community). Furthermore, we need ask how technological capital shapes the nature and acquisition of knowledge related to jobs, education, public services, consumer spending, and political participation.

Keywords: digital divide, urban inequality, race/ethnicity, racism, US

Susan J. Gilbert, Ph.D., Montana State University-Billings. Email: sgilbertz@msubillings.edu; Yellowstone River Cultural Inventory—2006

As a provider, as a symbol of progress, as a shared resource, as a management challenge, and as a symbol of our American heritage, the Yellowstone River is important. Native Americans depended on its valley for hunting grounds. William Clark explored much of the river in the spring of 1806 and found it teaming with beaver. By 1906 the US Bureau of Reclamation was sponsoring diversion projects as a source of irrigation waters. The river enabled "twentieth-century progress," and today it supports many nearby agricultural, recreational and industrial activities, as well as many activities on the Missouri River. Management of the shared resources of the Yellowstone River is complicated work. Federal and State interests compete with one another, and they compete with local and private endeavors. Legal rights to the water are sometimes in conflict with newly-defined needs, and by State law the public is guaranteed access to the river even though eighty-four percent of the riverbank is privately owned. In spite of the many services it provides, the Yellowstone River in 2006 remains relatively free-flowing and seems to link contemporary life to the unspoiled landscapes of the Great American West. The Yellowstone River Cultural Inventory?2006 documents the variety and intensity of different perspectives and values held by people who share the Yellowstone River. Attention has been paid to the ways in which over 300 residents from diverse geographical settings and diverse interest groups view river management and uses. Implications for linking cultural investigations with management schemes are discussed.

Audrey R. Giles, Ph.D., University of Ottawa. Email: agiles@uottawa.ca; Heather Castleden, Ph.D. Candidate, University of Alberta. Email: heather.castleden@ualberta.ca; Swim at your own risk: Examining Aquatics Risk Communication in the North from a Postcolonial Perspective

The Northwest Territories (NWT) Aquatics Program, originally created to facilitate leadership development but later expanded to include drowning prevention, began in 1967. At its height, this program operated in 41 NWT (and now Nunavut) communities. Though drowning rates have decreased in recent years, the NWT still reports a drowning rate that varies between 5-10 times the

national drowning rate (Government of the NWT, 2004), Indigenous Northerners drown at a rate far greater than non-Indigenous Northerners, and drowning is one of the leading causes of accidental death (Government of the NWT, 2004). Certainly, these figures support the finding that the NWT is a risky place to maintain an active lifestyle (Helwig, 2000). This begs the question: Why does aquatics risk communication in northern communities continue to be particularly problematic? Exploring colonial/postcolonial factors may lead to not only a better understanding of northern/Indigenous risk perspectives, but also to the development of successful risk communication strategies. We thus argue that risk communication in the North can be improved by examining water safety from a postcolonial framework to better understand Indigenous risk perspectives. While various organizations have produced literature and programs in an attempt to educate all Canadians about water safety, these educational efforts are firmly rooted in non-Indigenous perceptions of risk. As a result, we argue that it is not so much a lack of education that is inhibiting drowning prevention strategies, but rather the failure to create regionally and culturally sensitive materials that engage with Indigenous and Northern understandings of risk.

Debbie A. Giles, University of California, Davis. Email: dagiles@ucdavis.edu; Potential Impacts of Vessel Characteristics and Traffic on the Behavior of Southern Resident Killer Whales (*Orcinus orca*)

This study addresses the hypothesis that the presence and/or activities of whale-watching vessels affect the behavior of the federally listed endangered Southern Resident killer whales (*Orcinus orca*) in their summer range between northwest Washington state and southern Vancouver Island, Canada. US and Canadian governmental agencies have identified vessel effects as a factor influencing the survivability of these genetically isolated whales yet we do not understand the extent to which vessels disturb them. Current voluntary distance guidelines of 100-yards/meters between whales and vessels may not provide the whales with enough buffer to engage in life sustaining behaviors such as communicating, hunting, traveling, and socializing. New technology allows for the collection of geographical, spatial, and behavioral data throughout the summer range. A global positioning system with built-in data recorder for collecting attribute data, a laser rangefinder for distance, and a compass for bearing were physically/electronically connected to generate geo-referenced offset latitude/longitude points for focal whales and vessels. This remote sensing equipment allows for data collection at distances greater than the guidelines suggest, and farther than whale-watching and private boaters. Therefore, research vessel effects are minimized and the quantity and quality of data are maximized, lessening the chances of affecting the natural habitat and/or behavior of the whales and vessels being recorded. Analyses using Geographic Information Systems software will determine if vessels are affecting whale behavior and evaluate vessel compliance with voluntary guideline. Results will inform managers charged with drafting and implementing the endangered species recovery plan.

Daniel A. Gilewitch, Ph.D., United States Military Academy, West Point, NY. Email: daniel.gilewitch@usma.edu; Graham Stullenbarger, Natural Environments Test Office, Yuma Proving Grounds, AZ. Email: graham.stullenbarger@yuma.army.mil; Transforming Army Equipment Testing to the Realities of the Post 9-11 World

Since the end of World War II through the mid 1990s, the US Army was trained, organized and equipped to defeat Soviet forces in a large scale conflict in Europe. This focus drove the Army's equipment acquisition, testing, and operational concepts. Today while engaged in the Global War on Terror, the Army is transforming from a heavy force to a more rapidly deployable organization that can fight successfully in any environment on short notice. This force is also quickly modernizing and this process requires incorporation of the latest technologies and high fidelity environmental data. However, the Army's materiel acquisition process, especially the guidelines for environmental testing of new equipment, reflects a Cold War focus. Equipment destined for combat is currently tested using outdated climatic categories that divide the entire world into 'basic' (temperate) or 'extreme' environments. Environmental testing is discouraged except in 'basic' environments. This paper argues that Army Transformation requires embracing a fundamental change in the Army Testing community. This change should take advantage of ever more complex, scientifically derived environmental data that reflect the complexity of the world well beyond 'basic' and 'extreme' environments. This change requires a rewrite of the fundamental Army Regulation that governs equipment testing.

Jacquelyn L. Gill, UW Madison Geography. Email: jlgill@wisc.edu; Investigating biotic drivers of Quaternary vegetation change: Late Glacial no-analog communities & the North American megafaunal extinction in northern Indiana

In Eastern North America, late Pleistocene and early Holocene lake sediments often yield pollen assemblages that lack a modern analog (so-called “no-analog vegetation communities”). This study investigates the impact that megaherbivores (i.e. mammoths and mastodons) may have had on vegetation, by creating herbivory regimes that are not present on the modern landscape. An 11.7m gap-overlapped sediment core was taken from Appleman Lake in LaGrange County, Indiana, and pollen and charcoal records were reconstructed across the Pleistocene-Holocene transition. Loss-on-ignition and magnetic susceptibility records have also been generated, and sediment stratigraphy consists of gyttja with increasing silt content down-core, shifting to silty clay at around 8m; the clays are punctuated with layers of fine sands and gravels. An AMS radiocarbon date from 8.2m yielded a calibrated mean age of 13,460 BP, placing the record within deglaciation, the Younger Dryas, and the period of peak vegetation dissimilarity. The regional disappearance of the no-analog vegetation coincides with the fossil-inferred timing of the megafaunal decline, but fossil scarcity limits the ability to time extinctions locally. This study uses the fossil spores of the dung fungus *Sporormiella*, and the timing of local megafaunal decline is compared with the vegetation record to assess the impact of Pleistocene herbivores on paleo-landscapes. Initial findings indicate that *Sporormiella* abundances declined and eventually disappeared at a time coincident with the previously reported interval of megafaunal extinction. Local megafaunal disappearance also corresponds with a decline in grasses and a shift to an oak-beech-elm complex.

Nicholas Gill, University of Wollongong, NSW. Email: ngill@uow.edu.au; Peter Klepeis, Colgate University. Email: pklepeis@mail.colgate.edu; Laurie Chisholm, University of Wollongong. Email: lauriec@uow.edu.au; Cultivating Obsession: Exurbanization, Land Subdivision, and Invasive Weeds in Rural Australia

A case study from New South Wales (NSW), Australia, explores the impact of the subdivision of fine wool sheep ranches on the management of the invasive alien species, serrated tussock (*Nassella trichotoma*). The perennial grass covers over 1.1 million ha in southeastern Australia, and the country counts it as one of its 20 worst weeds due to its invasiveness, potential to spread, and negative economic and environmental impacts. In Windellama, NSW, interviews with property owners, government officials, and members of the community-based conservation group, Landcare, expose cultural, institutional, and economic barriers to the control of the invasive grass. Results show that the intensification of the serrated tussock problem is exacerbating the effect of other human-environment conditions on the decline of the ranching sector. As the subdivision process leads to smaller properties and higher population densities it holds the potential to improve management of serrated tussock. However, roughly 65 % of the interviewees are part-time residents and absenteeism tends to result in weak efforts to manage noxious weeds. In addition, regardless of their full-time/part-time status, many of the new landholders embrace land uses that inhibit effective management of serrated tussock. In addition to information for landowners and the need for coordinated state and private efforts, a much greater appreciation for the diversity of perspectives about nature held by the new landholders is required. Given the dynamic change in rural Australia, however, the case shows measured cohabitation with invasives a likely and pragmatic necessity.

Sukhjit (Lisa) K Gill, The Pennsylvania State University. Email: skg146@psu.edu; Alan H Taylor, The Pennsylvania State University. Email: aht1@psu.edu; Spatial and temporal variation in fire regimes along a ponderosa pine-mixed conifer forest gradient in the northern Sierra Nevada's, California, U.S.A

Fire is an ecologically significant process in the fire-prone ponderosa pine and mixed conifer forests in the northern Sierra Nevada's. Spatiotemporal variations in fire regimes are controlled by processes that operate over a range of scales and these can be broadly grouped as bottom-up (e.g. topography) or top-down (e.g. climate and human land use patterns) controls. We quantified spatial and temporal variability in fire regimes in ponderosa pine and mixed conifer forests in northeastern California to identify the relative influence of bottom-up versus top-down controls in this region. Dendroecological methods were used to quantify pre-suppression era fire regimes (i.e. frequency, return interval, season, and extent) from samples (n = 214) of fire scarred trees. Top-down controls, specifically interannual climate variability and human land use patterns, strongly influence fire regimes. Synchronization of fire across the landscape, and fire-free

years, were associated with interannual climate variability. Large-scale cessation of fire beginning in the mid 19th century and continuing through present was seen following Euro-American settlement and implementation of the 1905 U.S. fire exclusion policy. Fire regimes were also influenced by bottom-up controls, specifically elevation and forest composition. Fires return intervals were shorter and fire burned earlier in the season on pine-dominated low elevation forests than on high elevation fir-dominated mixed conifer forests.

Keywords: dendroecology, interannual climate variability, ponderosa pine, mixed conifer forests, fire exclusion

Jamie Gillen, University Of Colorado. Email: Michael.Gillen@colorado.edu; A Socialist city with an entrepreneurial spirit: Business practices among non-governmental actors in Ho Chi Minh City, Vietnam

The entrepreneurial city model of urban governance's currency lies in its ability to explain recent changes to urban cultural economies, where urban government financial speculation is primarily used as a means to promote place. The model and its many case studies conceptualize a progressive and risk-ridden urban political body that acts in coordination with a passive, all-willing private sector. In this paper I offer the Ho Chi Minh City, Vietnam (HCMC), government as a political body that has long been both a public regulatory body and a private, financially speculative enterprise. This presupposition blurs the lines between the public and private spheres in the city, thus rendering them inadequate conceptual tools to employ in this context. Under these conditions non-governmental companies continually explore ways to resist financial partnership with the HCMC government and its subsidiaries. These suggestions lead to the argument that HCMC's urban entrepreneurialism should best be scrutinized from the perspective of the non-governmental cultural sector, such as the tourism industry, for it creates the conditions by which new policies are discursively indoctrinated by the local government. Non-governmental companies also construct webs of informal networks to enhance their prospects for business opportunities outside of official bureaucratic oversight, mirroring some of the practices of urban government officials in entrepreneurial cities around the world. The argument carries implications for shifting business practices as Vietnam ascends into the World Trade Organization, and what it means to be an entrepreneurial actor in a rapidly developing, politically socialist city.

Keywords: entrepreneurialism, business practices, urban politics, Ho Chi Minh City

Thomas W Gillespie, Associate Professor, University of California, Los Angeles. Email: tg@geog.ucla.edu; Quantifying Species Richness and Structure of Tropical Forests from Space

Tropical forests are experiencing high rates of deforestation and there is a growing interest in quantifying and predicting plant species richness and structure in intact and degraded forest fragments and forest landscapes. This research uses remote sensing indices from passive (ASTER, Landsat ETM+) and active (AIRSAR, SRTM) sensors to quantify stand and patch level tree species richness and forest structure in tropical forests of South Florida, Venezuela, Panama, and Oceania. In dry forests of South Florida and Venezuela, NDVI from Landsat ETM+ was significantly associated with stand and patch species richness. NDVI was also significantly correlated with stand density, basal area, and mean tree height, while estimates of tree height from SRTM were correlated with maximum tree height. Remote sensing indices from ASTER and AIRSAR were significantly correlated with tree species richness and forest structure within a 50 ha plot on Barro Colorado, Panama. However, when examining 1 ha plots spread thought out the Panama Canal Zone, the predictive value of these remote sensing indices significantly improved. Results from this research support the species-energy theory at the level of a forest stand, patch, and landscape and suggest that a first order approximation of woody plant species richness and structure is possible in biodiversity hotspots.

Jason A Gilliland, PhD, University Of Western Ontario. Email: jgillila@uwo.ca; Kathy Tang, MSc, University of Western Ontario. Email: ktang28@uwo.ca; Neighbourhood Characteristics Associated with the Clustering of Junk Food Outlets around Schools

The increasing prevalence of obesity among poor children in developed countries may be partly due to environmental factors; socio-economically disadvantaged populations may be more likely to live in areas that promote ‘junk food’ consumption. In this paper we examine the concentration of junk food sites around elementary schools to characterize local food environments for children in London, Canada. Databases of every fast food restaurant, convenience store and elementary school were compiled, geocoded and mapped to assess distributions of junk food opportunities in school neighbourhoods of varying SES (median household income). Traditional (planar) and network K-function statistics were used to quantify the degree of clustering of junk food

outlets around schools. The median (network) distance from any school to the nearest junk food outlet was 0.3 km, the distance a typical child can walk in 3-4 minutes. Nearly three-quarters (73%) of schools in low-income neighbourhoods have at least one junk food site within 500m (a five-minute walk), compared to only one-quarter (24%) of schools in high-income areas. Results based on the more precise network K-function method indicate a significant clustering of junk food sites around schools in low-income neighbourhoods, but not around schools in mid- and high-income neighbourhoods. The findings indicate that the most socio-economically vulnerable children are also the most highly exposed (captive) to poor quality food environments in their school neighbourhoods. The discussion focuses on methodological problems of the traditional K-function, as well as potential policy implications of our findings and avenues for future research.

Mary Gilmartin, University College Dublin. Email: mary.gilmartin@ucd.ie; Spaces of belonging: Ireland and migration

Ideas of belonging are central to discourses of space and place. The meaning of belonging changes with migration, both for migrants and for the places they move to and from. This paper focuses on Ireland, a country currently experiencing net immigration for the first time in recent history. Drawing on recent empirical work on both immigration to and emigration from Ireland, the paper theorises the relationship between migration and belonging. It argues that new and changing spaces of belonging need to be understood in the context of Ireland's postcolonial experience(s).

Keywords: Ireland, migration, postcolonial theory

Benjamin Gilmer, West Virginia University. Email: ben.gilmer@mail.wvu.edu; Jennifer Miller, West Virginia University. Email: jennifer.miller@mail.wvu.edu; Predictive vegetation models: A comparison of model combination approaches

The distribution of plants and animals in space and time has long been a focus of many biogeographical and ecological studies. The various approaches for modeling species distributions are rooted in the quantification of the species-environment relationship, where biophysical variables are used to explain the distribution of species and communities. As a result, predictive modeling of species distribution has become a widespread tool in the areas of conservation biology, climate change research, and biodiversity estimates. Although there is now a wide range of statistical models available to quantify the vegetation-environment relationship, previous model comparison studies have found little difference in prediction accuracy when predictive vegetation models were compared using the same data. Therefore, there is a need to explore ways to maximize prediction accuracy with multiple models since comparison studies have not found any one "best" model. One alternative for increasing predictive accuracy among modeling techniques has been through combining models (also known in other literature as consensus modeling, composite models, forecast aggregation, forecast synthesis or forecast combination). We compare different model combination techniques of four different types of parametric and non-parametric statistical models: classification trees, generalized linear models, neural networks, and multivariate adaptive regression splines. The dataset we use consists of presence/absence data of four vegetation alliances from the Mojave Desert, CA, whose prevalence range from being extremely rare (0.006 proportion in sample) to fairly common (0.47 proportion in the sample), and twelve environmental predictor variables. Each model combination's classification accuracy is assessed by using receiver-operating characteristic (ROC) plots.

Kevin Gilmore, University Of Denver. Email: kegilmor@du.edu; Donald G. Sullivan, University of Denver. Email: dsulliva@du.edu; High Resolution Records of Holocene Climate Change from Pocket Fens on the High Plains of Colorado: Implications for Prehistoric Culture Change.

Understanding paleoenvironments of the western High Plains is critical to understanding prehistoric human adaptations to past climates and to predict the magnitude and consequences of current climate change in this semi-arid region. Analyses of sediment cores from small fens (groundwater fed peatlands) on the High Plains indicate they contain high resolution (sub-decadal) paleoenvironmental records that extend into the middle Holocene (ca. 7800 BP). These "pocket fens" are small peatlands (25-2500 m²) sustained by springs fed by perched water tables. Fluctuations in the relative humification and organic content of peat from these features provide proxies for effective moisture and temperature, respectively. Due to the heterogeneity of the sediments contained within pocket fens, new methods of data analysis and display have been developed to compensate for sediment differences within and between fens. Data from pocket fens suggest that they contain sensitive records of relatively low magnitude climate fluctuations such as the Little Ice Age and earlier Neo-glacial events, the Medieval Warm Episode, and anthropogenic climate warming of the past 150 years. A previously unidentified period of drought dated 50 BC-AD 375 is designated here the "Terminal Archaic Drought." This event correlates with a hypothesized increase in prehistoric population that occurred at the transition between the Archaic and Formative periods both east and west of the Continental Divide. Drought, in addition to increasing population, may have provided a forcing mechanism that resulted in the cultural innovations and technologies that define the beginning of the Formative Period.

Franklin Ginn, BA (Cambridge), MA (Canterbury NZ), Kings College London. Email: franklin.ginn@kcl.ac.uk; '100% Pure?' Post-colonial nature and ecological restoration in Aotearoa New Zealand

New Zealand's 'natural' heritage - its forests, mountains, native bird and marine life - is increasingly seen as the foundation for a unique national identity. This eco-nationalist discourse folds both Maori ways of seeing (and being in) the world and the unpredictable agency of non-humans into an historically and geographically 'fixed' essence called nature. Focusing on the material and discursive ecological restoration of a small native forest reserve in Christchurch, on New Zealand's South Island, this paper uses actor-network theory (ANT) to problematise such a post-colonial vision of nature. The ecological restoration process employed techniques and technologies to remove exotic 'pests' from the forest reserve, whilst at the same time nurturing appropriate 'native' plant re-growth. Attention to these small- and micro-scale human/non-human interactions in the forest reserve tells a story of the tentative, relational and on-going work required to fix nature in time and space. Riccarton Bush forest needs to be understood not as a timeless fragment of prehistoric New Zealand, but as an articulated collective of human and non-human actors. The paper concludes that ANT, whilst helpful for critical re-description, is insufficient to get to grips with the complex questions of ethics and valuing the non-human evoked by post-colonial constructions of nature.

Keywords: Nature, post-colonial, New Zealand, agency

Richard N. Gioioso, Florida International University. Email: richard.gioioso@fiu.edu; East Little Havana, Miami: A Case of Mistaken Identity in an Ethnic Enclave Neighborhood?

In this presentation I problematize 'ethnic enclave neighborhood' as an analytical concept. This term is defined by both concentrated immigrant entrepreneurship and an identifiable culture reminiscent of that in the home country. East Little Havana, Miami, is an example of a neighborhood that has been classified as a Latino ethnic enclave. Data from surveys and interviews in 2005 and 2006 conducted with Latin American immigrants who currently reside in the neighborhood show how this classification is problematic. Firstly, the term 'Latino' confounds the many distinct national and regional identities and cultures that co-exist in the neighborhood. Secondly, while some residents remark on characteristics that make the neighborhood seem 'Latino', many others draw attention to important aspects of neighborhood life in East Little Havana that are absent when compared to neighborhood life in their home countries in Latin America. These findings lead me to conclude that both the generalized 'Latino' identity for residents of East Little Havana, as well as for the neighborhood itself, do not accurately reflect what the 'Latino' residents of this 'Latino' ethnic enclave neighborhood perceive. As such, researchers are challenged to re-think the usefulness of such terms in describing and explaining both people and neighborhoods.

Keywords: Miami, neighborhood, Latino, ethnic enclave

Alberto Giordano, Texas State University. Email: a.giordano@txstate.edu; Sharolyn Anderson, University of Denver. Email: sharolyn.anderson@du.edu; How Does Living Near a Hazardous Facility Affect People's Perceptions of Risk? Results of an Experiment

This paper examines to what extent living near a hazardous facility contributes to explaining people's reactions to an emergency or their perception of risk. The site of the study was the Emergency Planning Zone (EPZ) of the Nine Mile Point (NMP) nuclear plant in New York State. In the experiment, a sample of residents of the EPZ was asked to estimate driving and straight line distances from the nuclear facility to their place of residence. Estimates were then compared to actual measures using GIS. Additionally, respondents were asked to estimate their perceived distance to the facility using a Likert scale ranging from "Very Near" to "Not Near." Estimates, actual, and perceived distances were then used to predict the respondents' perception of nuclear risk and their reaction to a possible accident at the plant. Respondents were better at estimating driving distance than straight line distance, but in both cases those living near the plant tended to underestimate distance to the facility whereas those who lived farther away tend to overestimate it. Significant differences in risk perception were found after about 2 miles, then again at 5 miles and 8 miles. The most important variables in determining people's reactions were: a) perceived distance to NMP up to about 2 miles; b) actual straight line distance to NMP at about 5 miles; c) estimated street distance to NMP at about 8 miles.

Keywords: GIS, emergency management, risk perception, distance

Ana Paula Giorgi, Department of Geography, University of California Los Angeles - UCLA. Email: agiorgi@ucla.edu; Thomas Gillespie, Department of Geography - UCLA. Email: ; Ecological niche modeling using remote sensing data in the Atlantic Forest of Brazil.

The Brazilian Atlantic Forest, a major global biodiversity hotspot, is one of the most endangered ecosystems in the world, with only 7% of the original forest left. The majority of conservation activities on the region are concentrated in preserving forest patches. However, increasing the restoration efforts and developing larger contiguous forests may help to sustain natural habitats and biodiversity. Using a combination of ecological niche modeling, and data from remote sensing, climate data layers and endemic species, we evaluate the importance of selected forest fragments in conservation efforts. Occurrence data for three endemic species; two birds (*Carpornis cucullata*, *C. melanocephalus*) and one monkey (*Alouatta fusca*), were applied to Maximum Entropy Algorithm, in order to study their spatial distribution in the region. Remote sensing data from various optical and microwave sensors were used to develop either direct spectral metrics, or derived products (e.g. LAI, NDVI) to represent the vegetation and landscape characteristics. The model was run for three different forcing schemes: remote sensing data only, climate data only, and remote sensing and climate data combined, to map the geographical range of the investigated species. Model results indicate that remote sensing data alone can characterize the species range accurately, and that combined remote sensing and climate improves the result. We discuss the implication of these results for the Atlantic Forest conservation and restoration.

Mario A Giraldo, PhD Candidate, University of Georgia. Email: mgiraldo@uga.edu; David Bosch, USDA-ARS tifton GA. Email: ; Lynn Usery, USGS, Rolla Missouri. Email: ; Craig Kvien, Coastal Plain Experiment Station UGA, Tifton GA. Email: ; Soil moisture point readings in small fields and different landuses for remote sensing applications in a complex landscape in south Georgia US.

Accurate long term study of the environmental cycles and the calibration of remote sensing data using the in situ network of reading devices operated by the USDA-ARS near Tifton Georgia rely on understanding the relationships between the point readings and the surrounding landscape. We investigate the relationships of the soil moisture (SM) in eight stations of the in situ network with the spatial and temporal variations of SM in eight 30m by 30m homogeneous fields adjacent to the sites and in five transects in the land uses: grass, orchard, peanuts, cotton and bare-soil. On eight occasions throughout 2005 and January 2006 we established observations and comparisons at two different scales over a 45 km transect along the watershed. Consistently through time, analysis of variance (ANOVA) showed high variation in the SM behavior between the small fields and high homogeneity in the SM behavior within the fields. Temporal stability geostatistical analysis showed that SM presents high temporal stability in the fields, while t statistic analysis showed that the field mean does not necessarily correlate in all the sites with the point reading of the in situ site. We found statistic differences in the SM between the different land uses and also statistic differences between them and the in situ site. These results confirms the hypothesis that the in situ network will serve better in remote sensing studies in which sensors with high spatial resolution are evaluated.

Guy Girard, UFR des Arts Plastiques et Sciences de l'Art, University Paris 1 UFR04 Sorbonne. Email: j.fenton@qmul.ac.uk; Passionate series and poetry made by all

What animates passions, if not the movements of life itself, stretched towards the open fields of the possible? Here are the passions that are the strength of imagination, the passions that animate utopias, because they are irreconcilable enemies for a reasonable life. The heart and the spirit that set on fire, know that every feeling, every thought are at first moved by desire. One of the greatest thinkers of revolutionary romanticism, Charles Fourier, asserted that 12 passions rule human destiny: five sensitive, four affective, and three distributive, the ignorance and repression of which lead to the disasters of our civilisation. On the contrary, their free use through "passionate series" that recasts the social exchange should lead to Harmony. André Breton saluted Fourier as surrealism's forerunner, because of the surprising poetry of his analogical way of thinking, and his proposal for an ethic of desire that introduces the triumph of Eros to the surrealist project of re-enchantment of the daily life. Love, Freedom, Poetry are the surrealist passions: poetry is the language of love, the necessity of its strength recasting the cause of freedom. Only passionate attitudes, as considered by surrealists hysteria, open for them the fields of the possible. In the centre of this utopian space, still burns Ducasse's watchword of "poetry made by all": let us imagine it will be made by the free playing of the "passionate series".

Frederic Giraut, Université Joseph Fourier UMR PACTE/Territoires. Email: fgiraut@wanadoo.fr; Territorial dynamics and spatial planning trends in developing countries

A comparative study on spatial planning and regional development, and territorial restructuring in developing countries shows few general trends mixed in different patterns. Amongst them those on territorial dynamics constitute the focus of this paper. Territorial authorities, institutions, projects, local, governments and initiatives were positioned with their areas, jurisdictions and zones on a set of figures. The figures are used to differentiate territorial objects and stakeholders by levels (from international to local), tier and scales and by nature, origins and functions. Using a model of the relationship and financial links, three spheres of territorial powers are distinguished, each with its own set of dynamics: the sphere of state territories emanating from the central state apparatus and from devolution (local government); the sphere of operational territories driven by private or public sector; and the sphere of emergent territories with area based development projects, ranging from community based to interregional cooperation. Five main tendencies characterize developing countries in the era of globalization: devolution, participation, concession, regionalization and autonomization. Those trends are not always represented and are combined in different national configurations. This paper traces these for Morocco and South Africa, two African emergent countries with different backgrounds and approaches to spatial planning and territorial management. In the present context of devolution and promotion of stakeholders and spaces for civil society and the private sector, these countries present contrasting patterns with some common trends

Mangrove forests, distributed circumtropically in the inter-tidal region between sea and land in tropical and sub-tropical latitudes, provide important ecosystem goods and services. The continued destruction and degradation of many mangrove forests during the past thirty years has decreased the protective capacity of mangrove forest ecosystems, and impaired their ability to rebound from natural disasters such as tsunamis and hurricanes. We interpreted 2005 Landsat data and estimate that approximately 1,670,000 ha of mangrove forests (~10% of the world's total) remain in the tsunami-affected areas of south and southeast Asia. The analysis of time-series Landsat data revealed that the region lost 12% of its mangrove forests from 1973 to 2005. The rate of change varied through space and time. The annual rate of deforestation was highest in Burma (~1%) and lowest in Sri Lanka (~0.1%). In contrast, mangrove forests in India and Bangladesh remained unchanged or gained slightly. At the local level, the intensity of deforestation varied, with localized hotspots of deforestation and

forest re-growth. In terms of temporal variation, net deforestation showed a peak of 137,000 ha (approximately 1% per year) during 1990-2000, increasing from 97,000 ha (0.2% per year) during 1970-1990, and declining to 14,000 ha (0.06% per year) during 2000-2005. Major factors responsible for deforestation were agricultural expansion (67%), shrimp farming (10%), urban development (2%), erosion/inundation (5%), and other factors (16%), such as over-exploitation, salt pan development, and infrastructure development

Elena Givental, University of California, Davis. Email: egivental@ucdavis.edu; *The Post-Soviet Life of the Old Industrial Urals*

In almost three hundred years the Urals has seen prosperity, stagnation and decline. Its rise as one of the world's first industrial regions in the 1730s due to the abundance of natural resources empowered Russia. Decline in the end of the 19th century is linked to the Urals' remoteness, poor transportation, lack of innovation, and shortage of fuel resources. The region's second boom occurred during the Soviet industrialization of the 1930s and the subsequent WWII, capitalizing on the existing industrial base and its remoteness from the war theater. The Urals fits a model of old industrial regions with its predominance of heavy industry, mineral resource depletion and industrial decline, severe environmental pollution and a vast scope of social problems. Only state subsidies for Cold War militarization mitigated a sharp decline in the 1960s. It shrank in the 1970s and 1980s with the Soviet policy of economic shift to the East. After the collapse of the Soviet Union, the Urals has chosen a path different from most of the old industrial regions. Absent any national recovery programs or new subsidies, the Urals surprisingly continued producing metals and machinery, retooled some plants, and used imported Ukrainian iron and Kazakhstan's copper ores. Intensified ore prospecting in the Northern and Polar Urals promises a continued heavy industry future. The Urals, although still an area of environmental disaster, today has positive net migration and maintains its leading status, producing 42% of Russia's ferrous metals and 35% of its machinery.

Keywords: the Urals, old industrial regions, resource depletion, metal and machinery production

Alex Gjerovski, Ohio State University. Email: gjerovski.1@osu.edu; *Community Organizations Coping With Neoliberalism: The Case of the Michigan Cool Cities Initiative*

Michigan's Cool Cities Initiative, launched in 2003, epitomizes the mentality of Richard Florida's "creative class" and challenges community organizations that embrace significantly different goals. However, community organizations have had difficulty tying together their interests in serving the poor and dispossessed with the aims of the Cool Cities Initiative. Those community organizations not aligning their efforts with the goals of the initiative risk losing state support. Additionally, residents of these communities face challenges shaping their neighborhood into the new urbanist mold, and then subsequently trying to survive in it. This paper analyzes the efforts of several community organizations and moves past received notions of neoliberalism's effects on community organizations. Instead, it posits that community organizations have the ability to manipulate neoliberal policies to their advantage.

Keywords: Community Organizing, Neoliberalism, Detroit, Michigan, Cool Cities

Amy Glasmeier, Pennsylvania State University. Email: akgl1@ems.psu.edu; *What happened to the poor?*

Since 1990, US cities have experienced a significant reduction in concentrations of poor people. Why poverty has deconcentrated is the subject of debate. Some argue welfare reform pushed people off welfare rolls and into jobs, raising incomes and reducing income-based poverty. Others suggest that gentrification pushed the poor out of dilapidated but desirable parts of cities. Still others suggest that new mixed income housing programs such as the Hope VI program resulted in a reduction in the concentration of the poor. Using census data and a variety of spatial analytic techniques, I explore hypotheses about the location of the poor in American cities.

Keywords: poverty poor welfare housing gentrification

Jim Glassman, University Of British Columbia. Email: glassman@geog.ubc.ca; *Democracy with Thai Characteristics? Social Movements, Nationalism, and the Coup of 2006*

Thailand has a rich history of social movement struggles that have contributed to uneven democratization over the course of the 20th century. Ultimately, successive waves of such struggles have encountered obstacles to the processes of social transformation they seek, resulting in repeated lapses into military rule and a general prevalence of what some have called "low quality democracy." Various factors contribute to these outcomes. This paper interrogates one such factor: the inability of Thai social movements to effectively

challenge royalist-nationalist hegemony and to build regional and international connections that would create more leverage for transforming the Thai state. While internationalization of social struggle is no guaranteed formula for success, and might even have some costs, the repeated folding of Thai social movements into royalist and nationalist projects? sometimes through the active co-optation of such movements by groups within the Thai state? has weakened these movements in important ways. The royalist-nationalist hegemony that social movement weaknesses have indirectly abetted, this paper will argue, played a direct role in enabling the coup of September 19, 2006. Moreover, even the forms of social movement internationalism that have been present in Thailand, working through fairly high profile NGO-networks, have failed to counter this royalist-nationalist hegemony and have sometimes contributed to it. This suggests that more than simply internationalism, Thai social movements need international allies that not beholden to forces in the Thai state, as are some national and international NGOs.

Keywords: social movements, globalization, state power, nationalism, Thailand

Sonya M Glavac, Arizona State University. Email: Sonya.Glavac@asu.edu; Kristen D Howze, Arizona State University. Email: ; Andrew Kirby, Arizona State University. Email: ; *Neighborhoods in Metropolitan Phoenix: Public Versus Private Neighborhoods*

It is often argued that suburban sprawl and low density development is unraveling the social fabric of the traditional neighborhood and cited as a source for much of the fracturing of societal norms. However, the above reality is up for dispute. This paper reports on initial results from an empirical study undertaken in Phoenix, AZ on neighborliness in different neighborhoods. The goal of the work has been to assess whether there are social differences between private neighborhoods managed via a Home Owner Association (HOA), and more traditional neighborhoods based on voluntary associations. Contrary to assertions in much of the literature, we have yet to find significant differences between these neighborhoods in terms of the ways in which households relate to, and interact with, their neighbors, and that HOAs seem to have no deterrent effect in this regard. Moreover, we determined that despite rapid growth, widespread suburbanization, high residential mobility, and low tenure rates that residents form significant social ties and widely engage in neighboring activities. We also explored the sociometry of neighboring, examining the reciprocity of neighboring links between residents. Here, differences between the neighborhoods were found.

Keywords: neighborliness, community, urban land use

David A Glenn, Mr., University of South Carolina. Email: Glenna2@mailbox.sc.edu; *Hurricane-Induced Flooding Across the Southeastern United States: A Case Study of Two Landfalling Hurricanes in July, 1916*

Precipitation from tropical cyclones has reduced the effects of drought and has caused extensive flooding over large areas. In July 1916, two hurricanes traversed the Southeast. The first storm made landfall near the Mississippi/Alabama border on the 5th, while the second struck near Charleston, South Carolina, on the 14th. The first hurricane meandered across the Southeast for five days and instrumental records indicate maximum precipitation values exceeding twelve inches. The second hurricane moved more rapidly and produced precipitation amounts exceeding eleven inches, although the system lasted only two days across South and North Carolina. The resulting Great Flood of 1916 is well documented in historical newspapers, instrumental weather records, and personal diaries. Daily-reconstructed precipitation maps were created from all available instrumental records (COOP) and analyzed utilizing the most recent hurricane tracks, ensuring correct storm location and classification (i.e. barotropic or baroclinic) for both hurricanes. This paper will explore the historical documentary evidence of the significant flooding associated with each hurricane, as well as the combined flooding effects. Multiple hurricane strikes within a short time period are extremely rare and are nearly impossible to predict, yet it is essential for those involved in flood and resource management operations to understanding heavy precipitation and flooding associated with tropical cyclones.

Jonathan Glick, University Of Washington. Email: glick@u.washington.edu; *Gentrification and the Racialized Geography of Home Equity*

This paper provides theoretical and empirical justification for the claim that gentrification is having significant effects on the distribution of home equity wealth. I argue that research on gentrification should consider racialization not just as a further disadvantage for poor renters, but also in its unique intersection with the home equity building process among homeowners. I analyze large-scale

gentrification (affecting zones of 100,000 population) occurring in seven metropolitan areas, Denver, Miami, New Orleans, Oklahoma City, Phoenix, Portland, and Seattle. Within the areas, the effects of gentrification on racial inequality vary considerably. Most, but not all, gentrifying areas have concentrations of African American or Latino homeowners at the onset. Levels of home equity for the median African American or Latino homeowner generally increase as home values increase relative to mortgage debt. However, gentrifying neighborhoods represent a declining share of African American and Latino homeownership over time, which suggests overall change to the racialized geography of home equity building across MSA may be negative.

Keywords: gentrification, homeownership, race, equity, land value

Johannes Glückler, Catholic University of Eichstaett-Ingolstadt. Email: johannes.glueckler@ku-eichstaett.de; Global corporate knowledge transfer: a social network analysis of an international technology service firm

Knowledge is now seen as the primary source of value-added and competitiveness. In the context of global business operation and high knowledge-intensity, firms are most severely confronted with the problem of making existing localized knowledge available at other places rather than only supporting the generation of new knowledge. The knowledge management literature, so far, has concentrated almost exclusively on the transfer of codified knowledge via modern information and communication technologies. Yet these systems regularly fail to mobilize contextualized forms of knowledge, which are the real assets for highly value-added services. This is where many international firms stand today and seek alternative organizational solutions to attain an effective transfer of individual expertise. This paper discusses the challenges and pitfalls of interpersonal knowledge transfer under conditions of globally distributed knowledge and presents the results of an empirical case study in a medium sized technology service firm operating in four continents of the world. By using the methodology of social network analysis, this study conveys deep insight into the real architecture of knowledge flow behind the organizational chart. The paper reveals and discusses the structure of the knowledge network and its mechanisms, barriers and implications for the organization of intra-corporate knowledge transfer in the global economy.

Keywords: knowledge, knowledge transfer, transnational corporation, social network analysis

Brian J. Godfrey, Vassar College. Email: godfrey@vassar.edu; Politics of Preservation: Institutional Brokers of Heritage Sites in Brazilian Cities

Brazil, long preoccupied with issues of modernization and development, has become transfixed by historic preservation. Although this contemporary valorization of the past is widely perceived as a significant change in what has long been called the "land of the future," this paper argues that it is not entirely new, nor does it fundamentally reject certain tenets of modernism that have long guided the country's urban planning. Case studies focus on Ouro Preto, Minas Gerais, the country's first National Landmark and also the first UNESCO World Heritage Site; Rio de Janeiro's "Cultural Corridor," a city-sponsored heritage program downtown; and Belém do Pará's state-sponsored "Feliz Lusitânia" historic district in the Old City. These cases illuminate the roles of institutional symbolic brokers at the local, state, national, and global levels?in defining heritage and appropriating the cultural capital of national historic centers. The paper's analysis of the politics of historic preservation emphasizes the political articulation of these symbolic brokers, their roles in creating official narratives of the past, and the resulting cultural landscapes of heritage in Brazilian historic centers.

Abhineety Goel, Texas A&M University. Email: abhineety@neo.tamu.edu; Human Impact and Local Knowledge on Biodiversity in Rajaji National Park, India

Rajaji National Park lies in the western Uttarakhand in India, spread over the junction of Dehradun, Haridwar and Pauri Garhwal districts. It is a complex ecosystem rich in wildlife. The forest is home to approximately 23 species of mammals, 315 species of birds and different types of human settlement. This study examines the pressures on, and dependencies, of the communities living there, namely, Gujjars, Taungyas, Gothias, and Tehri dam oustees amongst others, on the biodiversity. According to the Rajaji Park office records, there are 105 villages in and around the park. Intensive forestry operations, colonization of land for various developmental projects, forest fires during summers, and poaching are some of the most significant limiting forces. The location of Gujjar deras (settlements) at the perennial water holes on hill slopes or at seepage springs prevent wild animals from using them. The peripheral villages face constant threat from the wild animals from the park, and chronic employment throughout the year. A significant proportion of people are landless labour or subsistence cultivators working on marginal lands. This paper reports on a bio-

resource inventory of the park, the crucial driving forces resulting in biodiversity loss, and management of bio-resources using the local knowledge of the different communities.

Keywords: Local Knowledge, Biodiversity Conservation, Land Use, India

Andrew R. Goetz, University Of Denver. Email: agoetz@du.edu; Timothy M Vowles, University of North Florida. Email: t.vowles@unf.edu; Sean Tierney, University of Denver. Email: stierney@du.edu; Bridging the Qualitative/Quantitative Divide in Transport Geography

At the 2006 AAG meeting in Chicago, panel sessions were held on the topic, "Transport Geography: Reflections on a Subdiscipline and Identifying Future Research Trajectories." Several of the presentations touched upon the issue of insularity in transport geography and the need to bridge the divide between the largely positivist/quantitative research in transport geography and the post-positivist/qualitative research prevalent in urban, economic, and several other related subfields of human geography. Transport geography has been criticized by some for being a quiet corner of our discipline that has lost its centrality largely because it remains within the analytical framework of the 1960s. This paper explores these sentiments by re-examining recent transport-oriented research in geography to assess the degree to which the qualitative/quantitative divide exists between transport and other subfields in geography, as well as issues of productivity and centrality of transport-oriented research in geography. Results indicate that geographical research involving transport topics is much more prevalent and reflects a wider range of analytical approaches than is frequently assumed. Nevertheless, there is still a considerable divide between "mainstream" transport geography and other human geographical research that necessitates much more interaction between transport and other subfields, and greater incorporation of alternative research approaches within the mainstream of transport geography.

Keywords: transport geography, centrality, qualitative/quantitative divide

Banu Gokariksel, University of North Carolina, Chapel Hill. Email: banug@email.unc.edu; Neoliberalism, Islam and gender: the constitution of the neoliberal Muslim subject and veiling fashions in Istanbul

Recent work on neoliberalism has underlined the contextuality of neoliberalism in the way this ideology articulates with existing social, economic and political structures, institutions and regulatory frameworks to produce a multiplicity of "actually-existing neoliberalism"s. Also, there is a growing interest in examining neoliberalism not only as it relates to the market and the economy, but also as it shapes state-citizen relations and the formation of subjectivities. This paper aims to contribute to these recent developments in the study of neoliberalism by underlining the significance of religion in addition to other factors, in influencing the form neoliberalism takes and by examining the construction of neoliberal religious citizens and subjects. In particular, my focus will be on the relationship between neoliberalism, Islam and gender through an examination of the new women's Islamic fashion industry in the context of the post-1980 Turkey. I will analyze qualitative data consisting of interviews with (male) businessowners and (female) salespeople/consumers of veiling fashions in this paper. My main argument is that neoliberal policies have helped the rise of a veiling fashion industry whose producers and consumers in their different ways partake in a combination of what can be called an 'Islamic neoliberalism'. This Islamic neoliberalism is defined by these groups' contentious relation to the secular state (although going through a transformation under the current 'Muslim democrat' AK Party) and the secular establishment. Neoliberal forms of consumer-citizenship provide interesting possibilities for critically engaging with the secular state for these subjects.

Keywords: neoliberalism, Islam, gender, fashion

Mahmut Gokmen, University of Oklahoma. Email: mgokmen@ou.edu; Tyler Haas, University of Oklahoma. Email: tyler.haas@gmail.com; Modern mapping of Orientalism onto the Arab World: National Geographic Magazine, 1990-2006

This paper focuses on National Geographic Magazine's discourses in Orientalism and journal's textual and visual representations of the Arab World. The timeframe the paper addresses is from January, 1990 to November 2006, and it provides an analysis of the journal's discourses regarding Arab culture using textual and visual construction of Arab men and women in an Orientalist frame. In this paper, we employ post-structural and post-colonial approaches in order to emphasize the exertion of power, language, text and discourse in the construction of the "othering" of the Arab World as an "imaginative geography" of the Orient. This paper demonstrates that the act of representing "others" involves compulsive misrepresentation, exaggeration of cultural differences, framing cultural differences as the peculiarities of "others", and naturalizing American culture. This paper also searches for the potential changes in the Orientalist frame of the journal (throughout the given timeframe) due to important watershed events in the recent history of the Arab World, such as the collapse of the former Soviet Union, both Gulf Wars, and the events of September 11. Our

use of the term “Arab World” in this paper should be understood to refer to Arabic-speaking people and/or people tracing their heritage to an Arabic nation in the Middle East or North Africa.

Keywords: National Geographic Magazine, Orientalism, Othering, Arab World, geographies of representation, post-structuralism, post-colonialism

Arnon Golan, University Of Haifa. Email: agolan@geo.haifa.ac.il; *Jewish Immigrants, Arab residents, and municipal elections in Tel Aviv in the 1950s*

Following the 1948 war and the establishment of the State of Israel the Jewish population of the Tel Aviv-Jaffa urban region rose from 220,000 in 1948 to 380,000 in 1961. Rise of population resulted mainly from the wave of mass Jewish immigration to Israel. Most Arabs that lived in this area were forced to leave their homes during wartime and their number decreased respectively from 85,000 to 6,000. The Israeli government decided upon the formal unification of Tel Aviv and Jaffa municipalities in April 1950. Rapid demographic transformation and municipal boundary re-demarcation were followed by a transfer of power from right wing General Zionist to left wing Labor party. Although most immigrants arrived as early as 1950 this transfer of political power occurred only in 1959, following two municipal election campaigns, in 1950 and 1955, in which the right managed to remain in power. The State of Israel afforded since its establishment general franchise for all citizens, including Arabs and newly arrived Jewish immigrants. It is common knowledge that in national elections most members of these population groups supported left wing parties. Nevertheless the slow transfer of power in Tel Aviv municipality may suggest that they were more reluctant to support the left on the municipal level.

Jennifer Gold, University of Cambridge. Email: jmg81@cam.ac.uk; *In the service of empire: the Imperial Forestry Institute, British Colonial Officer training and the historical geographies of scientific knowledge, 1935-1965*

This paper seeks to extend recent geographic interest in imperial biographies to the understanding of the geographies of science. It examines the Imperial Forestry Institute at Oxford University as a specific site conditioning the production and reception of scientific knowledge. In 1935, the unification of the Colonial Forest Service brought forestry officers from the myriad of distinct and entirely separate forest departments across the British empire into a single service with standardised recruitment and training procedures. The Imperial Forestry Institute was designated the central school for the training of colonial forest officers with new recruits required to take a one year Colonial Probationer Course. This paper, which draws on oral history and archival research, argues that a focus on the personal geographies of Institute staff - the vast majority of whom were retired colonial officers - provides an alternative perspective for understanding the historic and spatial contingency of scientific knowledge. Moreover, it is argued that the colonial careers of Institute staff, and in particular the predominance amongst them of postings to the Indian sub-continent, conditioned the scientific training received by colonial probationers.

Keywords: empire, forestry, geographies of science, imperial biographies

Margaret M. Gold, London Metropolitan University. Email: m.gold@londonmet.ac.uk; *The shock of the old: proto-conservation agencies and changing representations of urban heritage in the 1960s*

The 1960s were a decade that saw a significant shift in attitude towards the built environment culminating in a reassessment of what the familiar urban environment had to offer. Despite the prevailing consensus favouring inculcation of progress through comprehensive redevelopment of the urban environment, a number of newly formed organisations, including the Civic Trust (1957) and the Victorian Society (1958), worked to raise awareness of the continuing value of the past through their campaigns to save what they considered to be iconic structures and buildings from destruction. Their early years saw campaigns end in several spectacular failures, notably in relation to London's Euston Arch 1961 and the Coal Exchange 1962. Nevertheless, by the end of the decade, attitudes were changing, partly through disillusionment with existing approaches but also through the growth of conservation measures at the end of the 1960s which created a fertile climate for the reappraisal of Victorian architecture. Using primary data and contemporary reportage relating to these groups, this paper analyses the discourse of early conservation work in London and provincial cities, identifying the recurrent metaphors employed in justifying and sustaining what at first seemed a forlorn cause. It charts the gradual presentation of arguments that went beyond isolated preservation projects to re-conceive conservation within a wider urban context.

Daniel W. Goldberg, University of Southern California. Email: dwgoldbe@usc.edu; *A Mediator-Based Method for Iterative Bottom-Up Gazetteer Generation*

A gazetteer provides the foundation for numerous critical services in a variety of academic research fields, most commonly through “indirect georeferencing”. This is but a single capability that can be exploited, yet has led to a paradigm of gazetteer generation, termed the “top-down approach”, which produces end results of limited scope and usefulness outside of the target application due to fundamental limitations in the process (e.g. the satisficing condition). In contrast, this paper defines a new generation paradigm, termed the “bottom-up approach”, which focuses foremost on completeness and accuracy, and is not bound by the same limitations. It releases the constraint of explicitly defining what constitutes a valid geographic feature suitable for inclusion into a gazetteer, thereby allowing each individual creator to determine what is suitable and what is not. To test the feasibility such an approach, this paper employs and extends existing geospatial information mediator architectures to define a generalized framework of the gazetteer creation process, focusing primarily on the ability to easily define and include data sources and operations to be incorporated into the process. To evaluate, an experiment comparing the results of different gazetteers created by employing the same geospatial mediator-based method with different data sources and operations for a small section of downtown Los Angeles, California is performed. The results demonstrate that the iterative nature of gradually improving the contents of the gazetteer through the automatic incorporation of higher quality data sources and operations dramatically improve the overall quality of a gazetteer.

David Goldblum, Northern Illinois University. Email: dgoldblum@niu.edu; *Sensitivity of corn and soybean yield in Illinois to air temperature, precipitation, and climate change*

The potential impact of climate change on agricultural production has frequently been evaluated at national and regional scales. This study considers the potential county-scale impact of climate change on corn and soybean yield in Illinois, USA. By identifying specific monthly climate variables (mean daily temperature and precipitation) to which corn and soybean yield is sensitive, this study compares monthly General Circulation Model (GCM) predictions with the monthly climate variables to which corn and soybean yield is sensitive to predict crop yield under future climate. Corn yield is negatively correlated with July and August temperature in much of the state, and positively correlated with precipitation from the previous September (in the central portion of the state) and July and August precipitation in most of northern and southern Illinois respectively. Soybean yield is negatively correlated with mean monthly temperature in the central and southern Illinois, and positively correlated with July and August precipitation in the same regions. Given the GCM predictions for increased summer temperatures and summer drought, both corn and soybean yield will likely decrease under future climate conditions. This is likely to be most pronounced in the central and southern portions of Illinois.

Keywords: climate change, corn, soybeans, agriculture, Illinois, GCM, Midwest

Mara Jill Goldman, Ph.D., International Livestock Research Institute (ILRI), Nairobi. Email: marajgoldman@gmail.com; *Constructed Landscapes, Contested Histories in Northern Tanzanian Rangelands*

Wildlife conservation in northern Tanzanian rangelands has long relied on the construction of such landscapes as wild, open, natural lands, free from human disturbance. Acknowledging the historical impacts of pastoral land use and the political and ecological necessity of working with communities to protect wildlife outside of national parks has done much to disturb these constructed histories. Yet there is little inclusion of local knowledge of historical ecological change in new conservation projects throughout the region. Recognizing the contested nature of land use histories and the alternative historical accounts of ecological change is essential for building politically agreeable and ecologically sound land use futures. In this paper, I present alternative histories and contested future visions of a new conservation area in northern Tanzania, the Manyara Ranch, as presented by local Maasai resource users and the mandating conservation organization. The Ranch is presented in conservation literature as an important ‘natural’ link or wildlife ‘corridor’ between two national Parks. Manyara Ranch is, however, also a cattle ranch, as well as a dry season grazing reserve for neighboring communities. The land trust model for the Ranch promotes multiple land use and community involvement. However, the continued promotion of a particular kind of landscape with an imagined pristine history impedes recognition of the historical use, transformation, and continued use of this area by local people, livestock, and wildlife. By understanding the history of the area from a local Maasai perspective, Maasai visions of the future of the Ranch come into view.

Kirk P Goldsberry, UCSB Geography. Email: kirk@geog.ucsb.edu; *A New Real-Time Traffic Map for Los Angeles, California*

According to the 2005 Urban Mobility Report (Shrank and Lomax, 2006) Los Angeles, California has the worst traffic in the United States. One problem is that drivers have insufficient resources for congestion avoidance. In cities like Los Angeles, drivers in pre-trip or en route situations need access to timely traffic information. Traditionally, this information has been relegated to radio and television reports. However, recent developments in computing, in-car navigation-systems, and location-based-services present newfound channels for real-time communication. How can cartographers utilize these channels to enhance the delivery of real-time traffic information in map form? This paper presents a new online traffic map designed specifically for contemporary media including the internet, and mobile devices. The design is guided by two main influences: an empirical assessment of human-map interaction, and recently established design principles for small-screen displays. The research examines human-subjects' responses to several different design variables including: classification decisions, color schemes, and generalization. The methods involve empirical measurements of human subjects' map task performances, and a subsequent system design stage that is informed by the human subjects assessment. Similarly, there are two sets of contributions. The results from the human subjects assessment offer new insight into how people interpret and respond to real-time traffic maps. Secondly, from a technological standpoint, the research suggests an alternative architecture for the construction of web-based real-time map systems.

Harvey Goldstein, University of North Carolina at Chapel Hill. Email: hgold@email.unc.edu; *The University's Role in Regional Development: Some Implications of the Entrepreneurial Turn*

The presentation will report on a national study of the attitudes of faculty towards the role of universities in promoting and assisting local and regional economic development. Implications of the 'entrepreneurial turn' among institutions of higher education, including potential conflicts of interest, the traditional functions and norms of the academy in society, and regional governance issues will be discussed.

Keywords: Academic entrepreneurship, regional development, conflicts of interest

Noah Goldstein, Lawrence Livermore National Laboratory. Email: goldstein8@llnl.gov; *Current GeoSpatial Energy Supply and Demand Modeling - Challenges and Opportunities*

Calculating current and forecasted future energy supply and demands for States and Nations involves models of economics, demography and environmental science. These models have been developed over the past 30 years for specific applications such as policy analysis and demand forecasting. A subset of these models is used for policy testing and research and development (R&D) testing. These models, including those run by federal agencies have been called to model other issues, beyond the model's original domain, such as Climate Change, Renewable Energy and Alternative Transportation Fuel Research. However rich with respect to economic sectors, many of these models suffer from Geographic challenges, namely regional incongruence and coarse generalizing of potentially fine resolution data, including environmental and demographic components. I present the current state of Energy Supply and Demand Models and potential challenges to improving these models. Additionally, I present quantitative examples that show the importance of incorporating regional variation in modeling residential demand and supply from renewable resources.

Keywords: Energy Modeling, Renewable Energy, Policy Modeling

Email: marstonj@geog.ucsb.edu; *Wayfinding Without Sight: The Haptic Pointer Interface*

In this presentation, we report on recent facets of our ongoing research on a wayfinding device for visually impaired or blind travelers. We summarize previous efforts using virtual (spatialized) sound, spatial language, and several direction/distance giving information processes. Based on our experiences with Remote Infrared Auditory Signage (RIAS), a haptic device was developed to

provide directional guidance. Experiments were undertaken to explore the relative effectiveness of spatialized sound (tones), verbal prompts, and vibratory stimuli as guidance techniques. A more detailed discussion of the vibratory device is then provided together with suggested ways of testing the effectiveness of each interface.

Elyse Golob, Dr., University of Arizona. Email: egolob@email.arizona.edu; *La Universidad y La Frontera: The University's Role in Border Security*

The university's role as a pivotal agent of regional economic development is the topic of intense debate. Institutional involvement arises, at times, as a response to extraordinary events. Following the tragedy of 9/11, the U.S. has faced the challenge of achieving equilibrium between border security, safety and trade flow. The Ports of Entry confront these complexities daily as the gateways of goods, people and information between two countries. As a border state with Mexico, Arizona is a locus for these economic, political and social interactions. The development and implementation of requisite technologies, management systems and governmental policies, however, have not kept pace with escalating and shifting demands. The University of Arizona, a major research institute located 60 miles north of Mexico, is spearheading efforts to create the CyberPort Technology Commercialization Center. Situated in Nogales, AZ between two major Ports of Entry, the CyberPort Center will provide a live test bed to test, evaluate and commercialize border-related technologies. The realization of these efforts requires partnership among a diverse range of stakeholders including the private sector; federal and state governments; and the local community encompassing politicians, civic leaders and property owners. This study will explore the university's role as a facilitator of this initiative and the anticipated benefits to the region.

Keywords: university, border security, economic development, regional economy

Gang Gong, Sam Houston State University. Email: ggong@shsu.edu; *Analysis of Air Travel Propensity Using Logistic Regression*

The National Household Travel Survey (NHTS) conducted by U.S. Department of Transportation collects data on both long-distance and local travel by the American public. It gathers trip-related data such as mode of transportation, duration, distance and purpose of trip. It also gathers demographic, geographic, and economic data for analysis purposes. This research focuses on the analysis of U.S. domestic travelers' behavior in travel by air. Specifically, using a logistic regression technique, this paper is intended to test the impact from travelers' various socio-economic characteristics on their propensity to fly. Regional difference will also be explored.

Keywords: air transportation, logistic regression

Mario Gonzales, New Mexico Highlands. Email: mjgonzales@nmhu.edu; *Border Security as a Labor Issue*

Few researchers study both Palestine and Mexico, yet with respect to land and labour, the two have much in common. Each had its land taken to create an economically larger neighbour. Each has a forced border that creates a "step" economy (Josiah Heyman's term). And the people of each are hence reliant on returning to what was once their land, to work for an economy and state from which they are forcibly excluded - except as wage labourers. This presentation briefly documents the recent history of each situation, and centres on both the structural impediments and sense of agency related to workers in Palestine and Mexico.

Milagros J. González, University of Puerto Rico, Río Piedras. Email: g_milagros@yahoo.com; Mariano Solórzano, International Institute for Tropical Forestry, Río Piedras, Puerto Rico. Email: msolorzano@fs.fed.us; William A. Gould, International Institute for Tropical Forestry, Río Piedras, Puerto Rico. Email: wgould@fs.fed.us; *Migratory Bird Predicted Habitat Maps*

The geographic distribution of a selected number of migratory birds in Puerto Rico will be mapped using the GAP Analysis Program methodology. In addition, predicted habitat maps for these species will be modeled using the landcover developed by the Puerto Rico GAP Analysis Project. A GAP analysis will be carried out to assess the conservation protection of these migratory birds. For this purpose a land stewardship of Puerto Rico will be used in order to calculate the percent of the species habitats that is under some level of protection. The results could help pinpoint the areas that are of importance for the species survival and that need to stay free of human development or urban areas. The Puerto Rico GAP Analysis Project (PRGAP) started as an effort to map vertebrate biodiversity in Puerto Rico and to quantify the amount of protection

that is being given to this biodiversity through land stewardship conservation. As part of the National GAP Analysis Program the PRGAP is sponsored by the Biological Resources Division of the United States Geological Survey (USGS-BRD) whose mission is to carry out regional assessments of the conservation status of native terrestrial vertebrate species and natural land cover types. Other PRGAP sponsoring organizations and collaborators include the International Institute of Tropical Forestry (IITF), US Fish and Wildlife Service (USFWS), and the Department of Natural and Environmental Resources (DNER).

David Goodman, Professor, UC Santa Cruz. Email: hatters@ucsc.edu; *Lively commodity geographies: reflections on the literature.*

This paper reviews the burgeoning literature on the geographical lives of commodities from commodity chains, filieres and commodity systems analysis to circuits and other metaphors. Empirical examples are drawn from recent case studies in the agro-food studies literature.

Keywords: commodity geographies

Gregory B Goodrich, PhD, Western Kentucky University. Email: gregory.goodrich@wku.edu; Andrew W Ellis, PhD, Arizona State University. Email: andrew.w.ellis@asu.edu; *Climatic controls and hydrologic impacts of a recent Extreme Seasonal Precipitation Reversal in Arizona*

The winter (December - February) of 2005-06 ranked as the driest in the instrumental record (since 1895) for nearly all regions of Arizona. The city of Phoenix recorded no precipitation during this time period, which was part of a record dry streak of 143 days without measurable precipitation. More importantly, the Salt and Verde watersheds, which supply the greater Phoenix area with approximately 53 percent of its water supply, received less than 3 percent of normal precipitation. Remarkably, this historically dry winter was preceded by the second wettest winter on record in 2004-05, a winter that filled reservoirs statewide and ameliorated a drought that has persisted since 1996 in some parts of the state. This study begins with a brief overview of the historical context of such reversals of extreme seasonal precipitation in Arizona. We then examine the synoptic and teleconnective conditions that led to back-to-back historically anomalous winters. Finally, we will discuss the impact of this extreme reversal on important watersheds in Arizona. We find that while an extreme reversal such as this has only happened once before in Arizona (1904-05 and 1905-06), there is a trend for increasing variability in winter precipitation from one year to the next in Arizona, especially since the 1960s.

Keywords: extreme, precipitation, Arizona, winter-season, climate, teleconnection

Conrad M. Goodwin, Ph.D., Independent Scholar. Email: macgoodwin@comcast.net; *Wines of Slovenia: Small Country Production in a Globalizing World*

People having been growing grapes and making wine in what is now Slovenia for about 2400 years. Today, there are about 24,000 hectares under vine cultivation and cover about 1.2% of Slovenia's total land area. About 100 million liters of wine are produced annually. Slovenians consume most of the wine, and only about 5% is exported. The country has 3 wine producing regions. Posavje in the south and southeast is best known for Cvček, a light, fresh red wine that normally finds its way to the table along with homemade cheeses and sausages when you visit friends or family. Podravje is in the northeast and is best known for white wines, especially Laski Rizling and late harvest wines. Primorska is in the west, bordering the Adriatic and Italy, and produces some outstanding wines, both whites and reds. Slovene wines, several of which have won medals in international competitions, are not well known in the United States due to limited production and local consumption, hence little for export. EU membership has presented further challenges to Slovene winemakers by limiting wine production areas and by opening the Slovene domestic market to increased foreign competition. In response, some winemakers formed cooperatives to better enable export of their wines. Other wineries concentrate on improving and producing high quality wines, while many still focus on production for personal consumption.

Keywords: Slovenia, wine, EU, agriculture

Mark Goodwin, University of Exeter. Email: M.Goodwin@exeter.ac.uk; Stewart Barr, University of Exeter. Email: s.w.barr@exeter.ac.uk; *The Politics of Scale in Climate Change Research: Enquiry, Policy and Activism*

The politics of scale are critically important for those grappling with climate change research. At present the scaling of enquiry, policy and activism represents three fundamental points of tension within the climate change community - both within and beyond academia. We will examine each in turn. First, the scale of enquiry and scientific representation means that most models of long-term climate change focus on changes in global mean temperature which ignore or distort more local variation. In contrast, social science research is often

framed at the local or even individual scale. We ask whether these two scales can be reconciled. Second, those concerned with the governance of climate change are working with a set of programmes and strategies that stretch from the local to the global and which represent a negotiation of different political and institutional scales. We will explore how such policies might be integrated. Third, the scaling of activism will have a critical impact on our ability to tackle climate change, where the global tends to be too large a scale to mobilise action, whilst the local may provide a restrictive scale for effective action. Each of these elements of course influences, and is influenced by, the others. In short we feel that the 'rupture' of scale cuts across these issues and presents serious challenges to those seeking to confront the full implications of climate change. We will explore these dilemmas using case study material drawn from our own research on the politics of climate change.

Keywords: scale, climate change, scientific enquiry, governance, activism

Jamie Michelle Goodwin-White, University of Southampton. Email: J.Goodwin-White@soton.ac.uk; *Comparative contexts of immigrant and 1.5 generation occupational structure: how do changing ethnic divisions of labor matter for the second generation?*

In this paper, I explore the ways in which geographic context matters for the second generation adult children of immigrants. Specifically, I consider the ways in which five different metropolitan area labor markets have extraordinarily different 1) ethnic divisions of labor, 2) economic fortunes over the past decade, and 3) experiences with newcomers in terms of immigration, internal migration, and the demographic shifts that result from these patterns. As such, the occupational distribution and the rewards that accrue to different bodies in different jobs provide geographically contingent contexts for the important national question of second generation fortunes. How are the 1.5 generation located occupationally relative to immigrant and US-born co-ethnics? How does this differ between places, what remains similar, and why does it matter? Although I focus on the economic and population shifts in the labor force in these cities, as well as on the resulting intergenerational immigrant occupational and wage shifts, I also discuss the interactions of other scales of context - specifically with regard to regional population dimensions and internal migration, as well as state-level policies.

Keywords: immigrants, inequality, economic geography, local labor markets, population geography

Kanishka Goonewardena, University Of Toronto. Email: kanishka.goonewardena@utoronto.ca; *Negative Dialectics, or, The Actuality of Philosophy in the Age of Empire*

This essay explores the contemporary relevance of Frankfurt School philosopher Theodor Adorno's contribution to critical theory in the Hegelian-Marxist tradition, especially in his dialectical meditations on the concepts of 'totalization' and 'identity', which both prophetically anticipate the postmodern motifs of deconstruction and proleptically surpass the late capitalist politics of difference. (Key references: Theodor Adorno, *Negative Dialectics*; Susan Buck-Morss, *The Origin of Negative Dialectics*; Fredric Jameson, *Late Marxism*; Brian O' Connor, *Adorno's Negative Dialectics*.)

Pierre Goovaerts, BioMedware. Email: goovaerts@biomedware.com; *Space-time Visualization and Detection of Health Disparities using Geostatistics and a Space-Time Information System: The case of prostate and cervix cancer mortality in the United States, 1970-1994.*

Geographic Information Systems (GIS) facilitate digital cartography, and Atlases of health outcomes are now published by national and state health agencies. These have proven useful for quantifying patterns in health outcomes, for documenting access to health care, providing tools for risk communication and for assessing disparities in cancer burdens in underserved populations. Notwithstanding these benefits, there are substantial limitations that arise from using conventional GIS technology, in particular for the visualization and detection of health disparities in cancer mortality. First, the smaller size of minority populations leads to rates that can be very unreliable and need to be stabilized prior to any analysis. Second, the interpretation of choropleth maps suffers from the common biased visual perception that larger areas are of greater importance. Third, the temporal nature of the data is not properly accounted for in most GIS, which hampers the visualization of temporal trends that can pinpoint locations where disparities greatly increased over time and health policies need to be changed. This paper presents recent developments in the field of space-time information system and geostatistical analysis of cancer rate data. A methodology is presented to create isopleth maps of cancer mortality risk from observed rates and to propagate the uncertainty attached to the risk estimates through the detection of significant health disparities. The approach is applied to the detection of disparities in cervix and prostate cancer mortality between black and white populations, using data recorded over all US State

Economic Areas for five time periods of 5 years each.

Keywords: geostatistics, time changes, cancer

Suchi Gopal, Dr., Boston University. Email: suchi@bu.edu; Mark Vanelli, MD, MBA, Harvard Medical School. Email: m.vanelli@comcast.net; *Spatial Analysis and Visualization of Patterns of Co-occurrence of Addiction and Serious Mental Illness*

Alcoholism and drug addiction are recognized as progressive, long-term, relapsing disorders, which affect an estimated 15 million people in the US (SAMSHA). Prior medical research has demonstrated that the prevalence of substance abuse disorders in patients with severe mental illness (SMI) is higher than in the general population with co-occurrence rates ranging from 29% to over 50%. The abuse of drugs and alcohol has profound personal, community and social consequences. In this paper, we examine the spatial patterns of co-occurrence of addiction and SMI in the US and more particularly in New England state. Co-occurrence rates vary by geographical area and localized 'pockets' of high or low rates exist throughout the region. High and low rates are estimated using spatial autocorrelation statistics. These patterns are explained to some degree with underlying census geography and location of health services. Health services are classified into three types - major teaching hospitals and medical centers, psychiatrists, and other allied mental services such as methadone clinics, and group facilities such as Alcohol Anonymous Association (AAA) meeting places. Accessibility and distance measures aid in further analysis of regional patterns of delivery of mental health services. Using prescription data relating to an atypical antipsychotic, we further demonstrate the utility of spatial analysis in healthcare delivery. Spatial analysis presented in this paper would be helpful to physicians and health care providers to better manage the condition of co-occurrence. Theoretical issues relating to integration of heterogeneous data, including MAUP, are also discussed.

Keywords: Addiction, SMI, Spatial analysis, Co-occurrence, Healthcare

Andrew Gordon, San Diego State University. Email: gordon@rohan.sdsu.edu; *Accommodating Hypsometrically Tinted Maps for the Color-Vision Impaired*

This study examines the relationship between red-green color-vision impairment and the ability to extract information from maps that use color to display elevation values by area. Red-green color-vision impairment (commonly referred to as color blindness) is a vision disorder that limits a person's ability to distinguish between certain colors. Previous research has shown that those with color-vision impairments have difficulty reading certain statistical maps where color is used to represent value. The combinations of colors commonly used to represent elevation may also lead to confusion. This research attempts to determine what level of difficulty (if any) in map reading exists for color-vision impaired readers for hypsometrically tinted maps, and if these difficulties can be overcome through the creation of accommodated color schemes. Two sets of maps were created using a perceptual color model. One set uses a standard sequence of colors to represent elevation while the other uses a scheme specially accommodated for impaired color-vision. Two groups, one composed of red-green color-vision impaired subjects, the other without impairment, were given a computer-based map reading test on both sets of maps. The number of correct responses (accuracy) and response time for correct answers were used to measure map reading performance. Initial results of the analysis of variance of the group means showed that on the standard maps, impaired subjects were less accurate and took longer to correctly respond than unimpaired subjects. Impaired subjects performed as accurately as unimpaired subjects on the accommodated maps, but took longer to respond correctly.

Keywords: cartography-color, color-vision, relief presentation

Ian R Gordon, London School of Economics. Email: i.r.gordon@lse.ac.uk; *Spatial Mismatch, Race/Class Factors and Inner City Unemployment: translating between the US and UK/Europe*

The spatial mismatch hypothesis, explaining inner city concentrations of unemployment in terms of a more rapid decentralisation of (working class) jobs than of (working class) residents was framed in specific context of post-WW2 US cities where there was both a high degree of sprawl and great concern over high unemployment among black urban residents. A very similar argument - 'trades leave but people stay' - had been made by Charles Booth 70 years earlier in relation to the situation of a London underclass. And contemporary urban policy-makers often talk as if this were the basis of continuing concentrations of underemployment in such inner city areas. But academic researchers in the UK have mostly been sceptical of this line of argument, focusing rather on the role of personal characteristics in disadvantaging the employment prospects of various groups whose limited purchasing power keeps them in inner city housing. In continental Europe, where patterns of intra-urban residential segregation are typically rather different, the argument has also seemed less relevant. In neither case, however, have there been many attempts at direct translation of the

methodology of US research to see whether similar evidence of the significance of spatial mismatch can be found, and what this implies in relation to rival race/class types of explanation. This paper firstly explores the trans-Atlantic comparison in relation to patterns, evidence and methodology, and then uses evidence on the pattern of transportation connectivity in the London metropolitan region to test the premises of the spatial mismatch hypothesis.

Keywords: urban, unemployment, race, spatial mismatch

Jeffrey J. Gordon, Bowling Green State University. Email: jeffg@bgsu.edu; Esther Beckmann, Bowling Green State University. Email: ; *Family Bonding in Mid-Twentieth Century America: Geography and the View-Master*

In mid-twentieth century America, focus upon family-centered, in-home activities flourished. Such activities typically encompassed playing board and card games, listening to the family radio, and watching the newly introduced television. However, another popular medium, the View-Master, offered not only entertainment, but a unique venue for family bonding. Debuting in 1939, one forerunner of contemporary virtual reality technology, the View-Master used 3-D color reels inserted and rotated manually. Popular reel categories included science, sports, movies, cartoons, religion, and famous people. One comprehensive category, geography, consisted of travelogues and scenic subjects such as landmarks, national parks, states, and countries. This geographical category was the subject of a preliminary study. It was hypothesized that not only was the geographical subject matter viewed more as a family activity, but it facilitated communication and bonding. A sample of mid-life males and females familiar with the View-Master from childhood was surveyed. The intent was to examine subjects' perceptions including feelings recalled through familial interaction centered around these virtual travelogues. All subjects indicated memory of the geographical category, the majority relating exclusive use of travelogues and scenic reels as a family activity. Several referred to these viewings as "family vacations." Most subjects recalled this activity as favorable, a time of enhanced communication and inclusion. Some indicated feelings of excitement, learning about extended family, and anticipating new reels at the next family gathering. Results indicated that using geographical content increased familial sharing and bonding.

Keywords: popular culture, View-Master, family bonding

Steven J. Gordon, United States Air Force Academy. Email: steve.gordon@usafa.af.mil; *Case studies using a Rock Art Stability Index*

The Rock Art Stability Index (RASI) is a tool developed to catalog rock art and assess the degree and nature of deterioration and further potential for deterioration. Other researchers detail the need for, and generation of, RASI as a tool for bridging the disciplines of archaeology, anthropology, history, geography, and rock weathering to aid in cultural resource management. This research outlines the practical use of RASI in the field as an assessment tool, and provides results of field implementation of RASI. RASI was implemented in two arid regions: the Tinajas Altas Mountains, Barry Goldwater Range, Luke AFB, Arizona, and in the Waikoloa region of the Big Island of Hawaii. The selection of locations not only allows comparison of arid regions, but also allows RASI to be applied to pictographs (Arizona) and petroglyphs (Hawaii), and granodiorite substrates (Arizona) versus basalt (Hawaii). In both instances, RASI was implemented by more than one individual, to include both people well-versed in weathering and those whose specialty lies outside of weathering studies. The results of this research underscore the ability of RASI to identify multiple weathering threats to cultural resources, especially the presence of vegetation (fire hazard), and water drainage/ runoff, and human activity (rock climbing, graffiti, foot traffic).

Keywords: weathering, rock art, geomorphology

Matthew Gore, Concordia University. Email: matthewgore@gmail.com; *Strip club border crossings: migrant male sex workers and the economies of desire*

As most formal and informal economy jobs in Montreal offer immigrants few opportunities to earn a living wage, a number of immigrants, particularly young males from Latin America, have left traditional low-skilled employment in the manufacturing, agricultural, and commercial cleaning industries, to work in the city's sex industry. The anonymity of the sex industry welcomes migrant labour without requiring work visas or language proficiency. Migrant sex workers face significant challenges upon arriving in a new country. However, as they come to develop working relationships with their customers, migrant sex workers can turn to their customers for reasons other than money, often to access their networks of social capital. While customers may become resources for other employment opportunity, immigration, or access to processional services, they invariably remain in positions of power. I argue that although these relationships appear to be beneficial mutualisms that offer opportunities for social mobility, they ultimately reproduce themselves, with very few sex workers ever crossing

many borders.

Keywords: Montreal, sex work

Contributing to work on gay/lesbian ruralities, this paper explores the contradictory nature of gay/lesbian belonging in Daylesford, Victoria, a country town which hosts ChillOut, Australia's largest annual rural gay/lesbian festival. Now in its tenth year, ChillOut attracts 16000 visitors, and crucially underpins Daylesford's wider reputation as an accepting, gay-friendly country town. In this context, we investigate the role of ChillOut in the lives of local gay men and lesbians resident in both Daylesford and surrounding areas of country Victoria. We utilise qualitative data gathered at and around the 2006 ChillOut Festival specifically, including visitors' surveys, interviews with festival organisers and local residents, and local newspaper commentaries. We initially argue that ChillOut is important for generating a sense of belonging for local gay men and lesbians. Survey and interview responses showed that ChillOut is a focal event for gay men and lesbians in country Victoria, and provides a means of establishing ongoing dialogue with and acceptance by the wider rural community. But we further argue that ChillOut simultaneously reveals the boundaries of gay/lesbian inclusion/exclusion in Daylesford. This was most powerfully demonstrated by the local council's refusal to fly the gay-identified rainbow flag from the town hall during the 2006 Festival, and its subsequent banning of the display of all festival flags from that key public building. The vociferous debate which ensued in the local newspaper revealed the underlying antagonism towards both ChillOut and local gay men and lesbians, demonstrating the contested nature of gay/lesbian belonging in an ostensibly gay-friendly country town.

Keywords: gay men/lesbians, belonging, rural communities/spaces, ChillOut, Daylesford, Australia

Anton Gosar, Faculty of Humanities Koper, University of Primorska. Email: anton.gosar@guest.arnes.si; *Managing EU's Southern Border: The Slovenia-Croatia Dispute*

The paper will focus on the border dispute between Slovenia and Croatia after the disintegration of Yugoslavia and in the light of European Union's expansion in 2004. The discussion of the border region in regard to the historic, economic and cultural situation will be presented. Results of recent field works done in north-eastern and south-western Slovenia will be presented. The relatively favorable situation, which allowed ownership and employment regardless of (Yugoslavian provincial) border, has gone from worse to bad prior to Slovenia's inclusion into the European Union and have become a burden as the s. c. Schengen border crossing regime is becoming increasingly tighter. As Croatia is seeking EU membership as well, disagreements in regard to the actual border delimitation are flaring up - despite the fact that Slovenia strongly supports Croatia's intentions. The Mura River and Pirano Bay case will be analyzed.

Sunday Goshit, University of Iowa. Email: sunday-goshit@uiowa.edu; George P Malanson, University of Iowa. Email: george-malanson@uiowa.edu; David L McGinnis, Montana State University - Billings. Email: dmcginnis@msubillings.edu; *Patterns of Winter Precipitation Variability in Western Montana*

Winter precipitation is the major source of Snowfall for western Montana. We investigate the spatio-temporal variability of winter (DJF) precipitation in western Montana over the second half of the 20th Century. Monthly winter (DJF) precipitation records for a period of 50 years are compiled for 109 Climate data from the US High resolution Coop station database operated by the National Climate Data Center NCDC of the National Oceanic and Atmospheric Administration. Principal component analysis (PCA), a multivariate statistical technique is used to identify spatial patterns of regional winter precipitation variability by defining homogenous spatial groups. We use wavelet analysis to analyze temporal variability by looking at the time-frequency signal of the winter precipitation over the period. The results explain spatial and temporal patterns of winter precipitation variability in this region. Local effects of topography and relief are shown using the dense network of stations selected for this study. We discuss the relevance of understanding winter precipitation variability to the Snowpack in the region over the period

Keywords: precipitation variability, principal component analysis, wavelet analysis

Hannah Gosnell, Oregon State University. Email: gosnellh@geo.oregonstate.edu; *When Ranching is for the Birds (and Fish): New and Emerging Natural Resource Management Institutions on Agricultural Landscapes in the U.S. West*

Due to a number of push and pull factors, agricultural landowners in many parts of the U.S. West are increasingly oriented towards managing for environmental amenities (e.g., world class birding in the Klamath Basin, world class trout fishing in the Greater Yellowstone Ecoregion) and ecological services (e.g., regulation of water quality, soil stability, nutrient cycling). Many of these landowners are engaging in restoration activities due to a combination of environmental laws, changing preferences and priorities, the growing popularity of rights-based market mechanisms designed to encourage reallocation of resources, and government-sponsored conservation incentive/payment programs. The result is an increasingly "multifunctional" landscape: where irrigated agriculture once reigned supreme, landowners are experimenting with dryland grazing, engaging in riparian restoration activities, restoring wetlands, and reducing their hay yields and cattle numbers. In many ways ecological conditions are improving. But are these "strong" multifunctional landscapes? What kinds of communities are emerging on these landscapes? This research aims to identify environmental governance structures that work to promote and sustain resilience in social as well as ecological systems dominated by agricultural land use. Results from interviews and data collection in transitioning agricultural landscapes in Southwest Montana and in the Klamath Basin, Oregon, are presented.

Keywords: environmental governance, multifunctionality, post-productivism, U.S. West, amenity migration

Alison Goss, Purdue University. Email: agoss@purdue.edu; Laura Bowling, Purdue University. Email: bowling@purdue.edu; Jon Harbor, University of Colorado at Denver. Email: Clas.dean@cudenver.edu; *Assessing the Historical Impacts of Landscape Transformation on Water Fluxes, Muskegon River Watershed, MI*

The hydrologic impact of land use change has been addressed through numerous studies. Yet, these investigations are limited in their spatial as well as temporal scales because of the lack of high-quality remotely sensed land cover data and streamflow records. Also, this lack of data prevents the complete examination of how water fluxes respond to land use change over decadal and century timescales. Land use/cover change in the Muskegon River Watershed, MI, was reconstructed at ten year timesteps for the past 100 years. These decadal land cover "backcasts" served as inputs to a macroscale hydrologic model, Variable Infiltration Capacity (VIC). Impacts to water fluxes, streamflow, and soil moisture patterns across the watershed will be presented. These results are counter to watershed studies in smaller geographic areas over shorter time periods. This unique type of long-term hydrologic impact assessment, which coincides with periods of widespread industrialization and land use/cover change in a large watershed, enables the creation of mitigation strategies to reduce the negative impacts of development on critical water resources and informs assertions of how land use/cover change may impact water resources in the future.

Keywords: land use change; water fluxes; Variable Infiltration Capacity (VIC)

Mark A Gossard, Missouri State University. Email: Gossard927@missouristate.edu; *Sediment budget approach to evaluate urban-related instability in an Ozark Stream.*

Sediment load variations can cause channel instability in gravel bed rivers. Accelerated gravel sediment inputs due to land use-related disturbances have been shown to cause channel and bank instability in Ozarks streams. Ward Branch is a heavily urbanized watershed in Springfield, Missouri for which restoration measures are planned. This study aims to use a sediment budget approach to understand the sources and transport patterns of bed load in a particularly

unstable 300 meter long “disturbance” reach along Ward Branch where bank erosion and channel incision is releasing excess gravel to the stream. Urbanization has increased the 2-year flood peak by more than three times the pre-settlement condition. Channel form and erosion/deposition were monitored over a 12 month period. The methods used in this study are (i) repeated cross-section and longitudinal surveys of the channel, (ii) scour chains and bank erosion pins, (iii) pebble counts and sieving of both the bank and bed materials, and (iv) painted tracers to monitor bedload movement. Rainfall records and flood peaks are also being monitored. Results of the tracer experiments showed that during three bankfull floods and one larger event, the D25 moved 25 meters, D40 moved 15 meters, D50 moved 20 meters, D84 moved 16 meters, D90 moved 12 meters, and the D95 moved 7 meters on average with an overall recovery rate of 34%. Results from this study will be used to plan bed and bank stabilization measures and understand channel storage and mobility dynamics of Ward Branch.

John Gossom, The Ohio State University. Email: evereye3@rocketmail.com; *A Solution to the Solution?*

Richard Walker identified the decentralization of the American city as a “suburban solution” to the problem of over accumulation, the dynamics of class struggle that obtain in the growth/stagnation cycles inherent to the capitalist framework, and the externalities of urban industrial activity. In an earlier article, he and David Large related the fixity of capital in the built-environment of the suburbs to a growth at all costs political economic climate that cripples any attempt to rein in energy extravagance. The trends that Walker delineated nearly thirty years ago have greatly impacted the shape of the contemporary metropolitan area and have continued relevance, but many of the circumstances that made moving to the suburbs attractive to city dwellers have changed or are in decline. Furthermore, high oil prices and the coming challenge of climate change have brought back calls for conservation and directed concern about energy extravagance at the consumptive, suburban lifestyle. Taking Walker’s early works as a point of departure, my intention is to assess the continued viability of the suburban solution to the current economic situation and suburban/exurban development. Drawing on my research comparing and contrasting a US and post-communist example of a sprawling metropolitan area with an information based economy, (Columbus, Ohio and Prague, Czech Republic), the relevance of Walker’s work in sorting out the trajectory and momentum of investment into a city’s built-environment as capital’s response to the contemporary problems posed by urban and suburban living will be explored.

Theodore L. Goudge, Dr., Northwest Missouri State. Email: tgoudge@mail.nwmissouri.edu; *Hardwood, Hard Knocks: The Geography of Men’s Major College Basketball 2006-2007*

March Madness results in a nationwide fascination with the American invention of basketball. Just how national is the scope of player production for the college game? Earlier work was conducted in the field of sport geography regarding recruitment of high school basketball players in the 1970’s and 1980’s. This work by Rooney focused on high school origin data derived from college team rosters. Subsequent works by Goudge have brought an updated analysis of the geography of player origins and team success as recent as the 2003 season. What’s happened since that time? A database was developed that includes the hometowns and/or high schools of the players who make up the rosters of NCAA Division I college basketball teams. In addition, an attempt to quantify the success of each major college team was undergone to analyze the geography of success. The resulting maps and data tables present a spatial distribution indicating distinct regions of high and low player production and program success exists. This distribution was compared with identified regions in Rooney’s seminal work and subsequent works by Goudge to determine the extent of the changes that have occurred.

Katherine Gough, Department of Geography, University of Copenhagen. Email: kg@geogr.ku.dk; *Influencing Youth? The impact of a pressure group on youth employment in Ghana*

During the 1990s, pineapples became one of the most important agricultural export crops in Ghana. In the Akwapim Range, located just north of Accra, farmers rapidly expanded their production in response to the rising demand. Young people who had left the area in search of employment in the city returned and others dropped out of school to work in the pineapple fields. Subsequently, a pressure group FAWE (Forum for African Women Educationalists) ran a campaign to get the young people back into school. A poster campaign targeted the youth with the slogan ‘School first! Work can wait’. The pineapple producers were also targeted and agreements drawn up to only employ young people during the school holidays or out of school hours. In this paper, I explore the nature and consequences of the campaign run by FAWE: Why was the campaign established

and what were FAWE’s aims? Who was consulted in the setting up and running of the programme? I focus in particular on young people’s involvement in and opinions of the campaign: Were the youth aware of FAWE’s campaign and what were their views on it? Has the FAWE campaign influenced their involvement in pineapple growing? Through this case, I am able to explore the nature of the power relations between young people and campaigners for social justice in an economy increasingly being tied to the global market.

Kevin A. Gould, University Of British Columbia. Email: kgould6505@yahoo.com; *travelling technocrats and the formation of neoliberal land policy in Guatemala*

Neoliberalism is conventionally imagined as an abstract force that moves from Global North to South, imposing market discipline and painfully reorganizing populations and environments. But we can also think of neoliberalism as a particular set of practices, agents, materials, and imaginaries arranged into diverse, sometimes fragile networks. This perspective opens the possibility to study neoliberalism by tracing the activities of its technicians, known as technocrats. In this paper I take this approach to examine the formation of Guatemala’s current neoliberal land policy. First, I describe how technocrats assembled the materials and information to construct a policy as they shuttled between San Jose (Costa Rica), Guatemala City, and Washington, DC in the early 1990s. Second, I identify ways that they solidified their proposal, forming and transforming organizations as they went. I pay special attention to how technocrats inserted a blueprint of their policy into the Guatemalan Peace Agreements, which officially ended the civil war in that country in 1996. Third, I show how the Agreements became the basis for more institutions and for loans which funded land registration and titling projects in parts of rural Guatemala. This history reveals national and international elites collaborating in the formation of a neoliberal policy and that a valuable resource of the Guatemalan left, the Peace Agreements, was designed partially by neoliberal technocrats. I conclude by discussing how the analysis both unsettles and conforms to conventional depictions of neoliberalism in the Americas and by asking what this approach offers for social justice struggles in Guatemala and elsewhere.

Keywords: land, neoliberal, World Bank, Guatemala, technocrat, Land Administration

Konstadinos G. Goulias, University of California Santa Barbara. Email: goulias@geog.ucsb.edu; *Progress in the Evolving Paradigm of Travel Demand Forecasting*

In this paper, an evolving paradigm for modeling and simulation is described. It is emerging from a need to address travel behavior and develop procedures in facets that emerge from three sources: a) dynamic planning practice; b) sustainable and green visions, and c) new research and technology. The typical aspects of data collection, modeling, and simulation considered for transportation policy analysis and planning are in this way examined from perspectives that raise many questions about our ability to make programmatic assessments. In the paper presentation, a brief review of the policy analysis motivation for contemporary travel demand forecasting is offered first. This is followed by an overview of activity-based microsimulation models and tour-based models and the need to study behavioral dynamics not only as a one-way spatio-temporal process but also as a process with many feedbacks. This review also addresses data requirements, data availability, data used in practice and research and institutional and policy barriers for new data acquisition. The opportunities for geography research are then examined in terms of innovations in data collection, modeling and simulation for integrating dynamic activity-based models with land use microsimulation as well as the necessary steps to validate models when they span a variety of scales. The presentation also addresses the need for curricula that support research in this area and they also create a new professional cadre that combines skills required in modeling with a deeper understanding of human nature.

Sharmila Govender-Van Wyk, Department of Land Affairs, Republic of South Africa. Email: SGovendervanWyk@dla.gov.za; GDH (Deon) Wilson, Prof, Department of Tourism Management, University of Pretoria. Email: dwilson@orion.up.ac.za; *Sustainable tourism on commonages as an alternative to traditional agricultural-based land reform in Namaqualand, South Africa*

This paper investigates the impact of livestock farming on redistributed commonage land on rural livelihoods in Namaqualand since 1994. The paper contends that farming had been on the decline for decades, and its contribution to the Gross Domestic Product declined from 10% in the 1970s to about 3.5% in 2005, resulting in the loss of up to 400 000 jobs in the sector. In order to make a case for sustainable tourism, the study investigated a tourism venture in the Richtersveld, Namaqualand. The study found that the venture has provided both

economic advantages (job opportunities, infrastructure development and increased spending by tourists in the area) and social spin offs (reduced unemployment, reduced alcoholism, increased capacity and skills, and the youth engaged in meaningful employment creation). The findings suggest that commonage users are barely able to sustain themselves from cash earnings gained from livestock farming and that there have been no visible improvements in terms of their quality of life. The findings further illustrate that, while livestock farming is the only known and practiced means of livelihood available to most people in Namaqualand because of the arid climate and poor crop farming conditions, commonage users are receptive to alternatives to traditional farming such as tourism. In view of the findings from the commonage case studies and the Richtersveld sustainable tourism venture, the study proposes that South Africa's land reform strategy should offer other sustainable development options, such as tourism, as an alternative means of ensuring a livelihood for rural people.

Landsat Record

Forest disturbance and regrowth are assumed to be significant forces modulating North American carbon balance. Quantifying the carbon fluxes of forest changes requires the changes be assessed with appropriate spatial and temporal details. The Landsat imagery archive accumulated since 1972 provides a unique data source for carrying out this work over the last 30+ years. With funding from NASA, this team is developing methods to look at continental patterns of forest dynamics during this time period. Cumulative data records from the NASA Geocover decadal products are providing insights into the continental patterns of disturbance. For a statistical sample of 30 WRS (world reference system) locations, time series Landsat "data cubes" are being compiled to look at biennial trends in disturbance and regrowth. In both cases, automated techniques to address orthorectification and geo-registration, radiometric calibration and atmospheric adjustments have been employed to normalize these data prior to change detection. Validation of the results is being carried out by comparison to the US Forest Service Forest Inventory and Analysis (FIA) field measurements.

jgower@justice.com; Partnering with the Hermit Kingdom: The Kaesong
Industrial Complex SEZ of North Korea

The Democratic People's Republic of Korea ("North Korea") teeters on insolvency after a ruinous experiment with its isolationist "juche" economic philosophy. As North Korea is essentially a failed state, it has little competitive industry and no ability to raise capital in the international financial markets to close its import-export gap. To bring economic activity into its borders, North Korea developed several Special Economic Zones (SEZs) that allow foreign firms, primarily from the Republic of Korea ("South Korea") and China, to locate within its borders and utilize its low-cost workforce. Since 2005, over 450 foreign firms have opened manufacturing facilities in North Korean SEZs. The majority of these factories are located in the Kaesong Industrial Complex (KIC). Foreign firms currently employ 70,000 North Koreans in the KIC SEZ alone. Foreign firms receive the benefit of North Korean labor at a 30% less cost than can be sourced in China, or roughly the same wage rate sourced in Vietnam. However, North Korean political instability has led to an ever-changing set of informal operating rules. This paper looks at the potential impact that SEZs may have in the economic and political future of the two Koreas, primarily concerning potential Korean reunification, knowledge transfers, and the South Korea-U.S. Free Trade Agreement (KORUS FTA) in negotiation.

whatchawhatcha@yahoo.com; Fertility Correlates in Peten Guatemala

The purpose of this paper is to examine the determinants of the extremely high total fertility rate (TFR) in a remote and rarely studied pocket of northern Guatemala. Guatemala is divided into two ethnic groups, the Ladino (mixed European ancestry) and the Indigenous. Ladinos belong to every social class in

the country while the vast majority of the Indigenous population remains extremely impoverished and marginalized. Additionally, the country is characterized by a high crime rate and a history of violent internal strife which has been particularly devastating and isolating to Indigenous groups. Currently "less than three-quarters (73.8%) of the relevant age group attend school" with only half of these ever entering the 5th grade. Health care access is also of concern since it is almost exclusively available to urban dwellers. Based on these alarming conditions it follows that Guatemala would have an extremely TFR. In fact, in rural areas of Guatemala, the TFR exceeds 6 births per woman while in rural regions of the Petén, the Guatemalan frontier and the geographic focus of this paper, fertility rates are close to 8 births per woman. Combining classic fertility correlates with environmental and migration data from the 1998-99 Demographic and Health Survey data collected by the Guatemalan Instituto Nacional de Estadística and Measure/DHS+, Macro international we will perform a hierarchical regression analysis to determine the impact and role of these factors. This research will apply innovative statistical techniques not traditionally applied in fertility research which incorporate concepts of interacting and continuous space.

Accommodating Green?: Overcoming Barriers to Sustainability in China's
Tourism Industry.

Over the last several years, the environmental impacts of the tourism industry and more specifically the accommodation industry have come to the forefront of global issues. Environmental degradation has impacted most tourist destinations so the need to implement more sustainable practices is strong. Sustainability considerations have been mainly conceptual to date however and have not translated into industry wide practice. This has been the case in China, where tourism demands are far exceeding the coping ability of the tourism destinations and little, if any environmental management techniques have been implemented. What is needed now is a way to assist the Chinese tourism industry in ensuring that its tourism resources are not degraded beyond repair, and to understand what the barriers are to sustainable tourism. This paper provides an in-depth analysis of the barriers to implementing environmental management initiatives in the Chinese tourist accommodation industry. It explores the interrelated and independent factors that impede the sustainability of tourist destinations. Strategies and incentives to overcome the identified barriers are also explored. A study to identify the impeding factors and related strategies was conducted in Sanya, Hainan, China in 2004 - 2005. The study involved a sample of one hundred accommodation facilities of varying size, star rating and ownership which were analysed using a quantitative survey technique. Key informant interviews with local, provincial and central government agencies, certification bodies and trade associations were also conducted as well as stakeholder workshops to discuss barriers and partnership development.

ijr2105@msu.edu; Neighborhood Effects on Birth Outcomes and Mediating
Medical Risk Pathways by Race in New York City

This study measures the direct and indirect effects of local residential segregation, i.e., black isolation, on low birthweight for African-American and White women in New York City, controlling for individual-level risk factors and neighborhood poverty. This race specific, cross-sectional multilevel study found that as black isolation increased in neighborhoods the risk of adverse birth outcomes also increased for African-American and White women living in these areas. Medical conditions identified as mediators included chronic hypertension and pregnancy-related hypertension for African-American women and chronic hypertension and lung disease for White women. Although this study was limited by the quality of the birth certificate data it does provide exploratory pathways by which medical risks and their sequelae are linked to neighborhood environments and reproductive vulnerability.

Olivier Graefe, University of Bayreuth. Email: Olivier.Graefe@uni-
bayreuth.de; The dialectics of the domestication of water in Islamic rural
society

The domestication of water in the sense of taming and controlling the supply of drinking water on the one hand and making water available at the domicile on the other hand, represents progress to many rural Moroccan households. Especially women do benefit of the new facilities by saving them many efforts of fetching water outside the village. But this undeniable technical improvement for rural areas can also be analyzed in the light of the re-Islamization of society and profound social change as a means for men to reify

their domination in a context of threatened masculinity. This paper will show, following Bourdieu's and Baudrillard's early works, the political and symbolic logics and meanings which are lying underneath the modernization of rural water supply emphasizing the dialectical relationship between evolving waterscapes and dynamic gender relations.

Marie Graf, McGill University. Email: marie.graf@mail.mcgill.ca; Gail L. Chmura, McGill University. Email: gail.chmura@mcgill.ca; Using Pollen Modern Analogues To Locate A Buried Dikeland Soil In A Restored Upper Bay Of Fundy Salt Marsh

The upper Bay of Fundy's Cumberland Basin is home to an estimated 16,500 hectares of salt marsh, nearly all of which have been diked and converted to agricultural lands since the arrival of the Acadians in the late 17th century. John Lusby Marsh is a 600 ha salt marsh that was diked and farmed for approximately 250 years, until dikes breached in the late 1940s and the marsh was restored to tidal conditions. Since dike breach, the reclamation surface has been buried beneath approximately 1 m of tidally-imported sediments. We developed modern pollen analogues for three different grassland land uses common in the upper Bay of Fundy: salt marsh, actively farmed dikeland and fallow dikeland. These modern analogues were used to locate the reclamation surface and reconstruct a sequence of historic land uses. Fifty surface samples were collected: 17 salt marsh, 22 farmed dikeland and 11 fallow dikeland. Using discriminant analysis we discriminated the three land use types based on their pollen spectra. We further discriminated agricultural practices involving cattle grazing or manuring from those that did not, by including coprophilous fungal spore counts in the analysis. A sediment core containing the reclamation surface was extracted in John Lusby Marsh, and a set of eight fossil pollen spectra was compared to the modern analogues. Discriminant analysis classified the fossil samples into a sequence of historic land uses which included phases when the marsh was diked and farmed.

Keywords: salt marsh, Bay of Fundy, pollen, fungal spores, modern analogues

Rosana Grafals, graduate student, Rutgers University. Email: rgrafals@eden.rutgers.edu; The effect of external and remnant sand fences on vegetation cover density and richness of developed shores

The main purpose of sand fences at developed shores is to facilitate the process of dune formation by trapping sediment transported by the wind and accelerating sediment deposition. During this process, rapid deposition often inhibits vegetation growth through excessive burial. However, this is only true for external fences that have approximately 50% porosity and 1.2m height. Little is known about the effects of weathered, buried fences with higher porosity and lower height on vegetation burial. Therefore, the main objective of this study is to compare the effect of these two types of fences on sediment transport and deposition and, consequently, on dune vegetation growth. The methods used are based on field measurements of sand accumulation and analysis of vegetation cover and richness gathered at Ocean City, New Jersey where external fences and multiple rows of remnant fences are found at different zones of the dune gradient. Transects perpendicular to the shore are recorded along the dune field to measure topography. On each transect, quadrants and stakes are located landward and seaward of every sand fence to measure vegetation density and species type, and sediment accumulation. It is expected that remnant fences cause slower deposition rates that stimulate vegetation growth. Therefore, developed shores with remnant fences should have denser and richer vegetation cover than those with external fences.

Daniel A Graham, ABD, University of California, Berkeley. Email: intibucano@gmail.com; The Accumulation of "Primitives": Neoliberal Multiculturalism and the Production of Lenca Space in Southwestern Honduras

This paper settles on the uneven terrain of southwestern Honduras, where critical forms of indigenous identity politics within and among Lenca communities have been undercut by neoliberal cultural rescue initiatives and economic development projects. The paper considers two interrelated moments of neoliberal-multicultural engagement in the Lenca highlands and theorizes their role in securing the conditions for capital accumulation in the region. The Nuestras Raíces program and the Ruta Lenca project offer two instances of public-private collaboration in the promulgation and enforcement of market-friendly articulations of Lenca identity and territoriality. By undertaking to privilege and commoditize authenticity and difference, these interventions have worked to decenter groups' social memory of struggle as a basis and idiom of cultural-political action, with deleterious consequences for those who fail to meet litmus tests for alterity. At the same time, the commoditizing move has effected the gradual displacement of identity-based claim-making from the political arena to the marketplace. However, and as this paper will attempt to show, these developments have galvanized renewed resistance to them and have helped to

reify an imagined Lenca territory that lends additional coherence to a region-wide social movement capable of linking community struggles for control over both land-based and cultural resources.

Charcoal fragments preserved in lake sediment cores provide valuable evidence of past fire history. We investigated macroscopic charcoal in a lake sediment core from Laguna Martínez in northwestern Costa Rica as a complement to prior analyses of pollen and microscopic charcoal. Laguna Martínez (10.642 N, 85.197 W, 340 m elevation) is located within an area of seasonally dry tropical forests on the lower slope of Miravalles volcano. This lake and a number of others in the area formed ca. 8000 years ago in conjunction with pyroclastic flows from Miravalles volcano. Our 5 m sediment core has a basal date of 7610 ± 50 14C yr BP. Pollen analysis of the core revealed evidence of maize agriculture at the site beginning at 4760 ± 40 yr BP — the earliest date for maize agriculture anywhere in Costa Rica. Our macroscopic charcoal study involves sampling the entire core at contiguous 1 cm intervals, disaggregating the samples in cosmetic-grade hydrogen peroxide, and sieving them through screens with mesh sizes of 250 and 500 micrometers. Macroscopic charcoal is present throughout the record, prior to as well as during and after the interval of maize cultivation. However, charcoal concentrations vary between samples by over two orders of magnitude.

Matthew W Graham, Masters Candidate, University of Florida. Email: mwgraham@ufl.edu; Matthew W Graham, Masters Candidate, University of Florida. Email: mwgraham@ufl.edu; Post-Fire Burn Severity Analysis of Sandhill Pine Ecosystem Using Landsat ETM+ Imagery

This is a project to evaluate the ecosystem level impacts of fire on the landscape of North Central Florida. A two pronged approach using field based measurements and remote sensing indices developed for post-fire burn severity will be used. Indices will be evaluated against both each other and the field measurements. A wildfire near Waldo Florida in 1998, termed the Race Track Fire will constitute the wildfire site. A host of controlled burns during the upcoming 2006/2007 winter at the Ordway-Swisher Biological Research Station will constitute the study site for the prescribed fires. Landsat TM/ETM+ images will be used in the evaluation of the Race Track Fire. ASTER will be tasked for anticipated prescribe burn dates in the spring 2007. Both platforms will be used in identical fashion to produce comparison data. The evaluation algorithms will be made up from a selection of indices derived from the literature. All results will be ranked in terms of effectiveness. Florida Division of Forestry records for the Waldo fire will be reviewed to ascertain the extent and various types of effects that occurred as a result of the Waldo fire. Highly spatially correlated data will be used to train the remote sensing analysis. The prescribed fire component will involve fieldwork conducted prior to the fire, during the fire, and at intervals post fire. The project will be completed by spring 2007.

Keywords: Remote Sensing, Natural Hazards, Fire, Severity

Alan Grainger, School of Geography, University of Leeds, Leeds LS2 9JT.. Email: A.Grainger@leeds.ac.uk; Alternative Simulations of Whiteness - A Case Study of Sierra Leone.

The limitations of the prevailing discourse of multiculturalism have become increasingly apparent in recent years. Not least among them is the simplistic treatment of inter- and intra-community communication, and the neglect of such phenomena as the simulation of 'the other', which can both promote social cohesion and generate violent reactions. This paper contributes to the develop-

ment of a more nuanced discourse by demonstrating how a reflexive approach with a more detailed analysis of communication processes can offer insights into contested constructions of citizenship, place and belonging, and enhance our understanding of space-time relations in transnational geographies. Grounded in a reading of the political history of Sierra Leone, it applies Baudrillardian theory to explore the simulation of whiteness in different communities and trace the repercussions of this for communication and solidarity both within and between countries. It pays particular attention to displacement and replacement, the suborning of place for ideological reasons, and how simulations are used as national and international political instruments. It concludes that both the character of simulations and the ability to interpret them are inherently path-dependent, and that simulations of whiteness can offer profoundly subversive challenges to 'white' cosmopolitan constructions.

Dennis Grammenos, Northeastern Illinois University. Email: D-Grammenos@neiu.edu; *Café con Leche: Critical Geographies of Latino Racialization in Chicago*

The emergence of Latinos as an increasingly visible minority in major U.S. cities like Chicago has disturbed the binary white/black racial categories that dominated much of the twentieth century. Latinos are now the largest ethnic minority population in the Chicago metropolitan area and in the city's erstwhile "vanilla" suburbs, while they are well poised to surpass the African-American population within the city itself in a matter of a few years. This paper examines the sociospatial dynamics of the racialization of Latinos in the Chicago metropolitan area. In particular it focuses on the self-ascribed "whitening" of nearly half of the metropolis' Latinos and the implications that such racial transformations carry for the future.

Keywords: Latinos, race, ethnicity, Chicago

Liza Grandia, Ph.D., Yale University, Postdoc Fellow in Agrarian Studies. Email: liza.grandia@yale.edu; *How Frontier Ranchers become Globalized Capitalists: Cattle Enclosures in the Northern Maya Lowlands*

Much of the scholarship on primitive accumulation rightly focuses on the fate of marginalized peoples who have been dispossessed of their subsistence commons and thrown onto the labor market (a.k.a. "proletarianized"). Yet, enclosure alone is insufficient for laying the foundation for industrial capitalism. It also requires the parallel development new labor relations so that investors can "reproduce" their capital. Hence, this paper tells the story of a new wave of enclosures in Petén, Guatemala, from "the other side"-that is, from the perspective of cattle ranchers who are driving the transition from peasant homesteading to large-scale agribusiness. I first describe the coercive mechanisms by which cattle ranchers acquire land from frontier homesteaders and the acceleration of this dispossession by a misconceived land-titling program financed by the World Bank. Will this land plunder turn to profit and "economic development"? How? And, for whom? Borrowing David Harvey's terminology, is this "accumulation by dispossession" or simply "dispossession"? To understand what new economic and labor structures may emerge from this rapid re-concentration of land by cattle ranchers, I analyze transformations in the regional cattle economy due to the impact of neoliberal trade and infrastructure projects organized under the Puebla to Panama Plan and the Central American Free Trade Agreement. I find that external subsidies are essential for the transformation of largely unproductive cattle ranches into other more profitable, transnational enterprises such as African palm plantations, carbon trading, and eco-tourism, as well as the illicit trafficking of drugs and migrant labor.

Keywords: enclosures, cattle, political ecology, Guatemala, primitive accumulation

Carla Chenault Grandy, UC Santa Cruz. Email: chenaultc@yahoo.com; *Understanding Long-Term Beach Width Change at Oceanside City Beach, San Diego, California*

Beaches are vital to the culture and economy of California and the health of California's beaches is affected by both natural and anthropogenic processes. Sediment delivery to the beaches and climatic fluctuations are the primary agents driving beach width change and during the history of development of Southern California, damming of coastal streams, development of harbors, armoring of seacliffs, and artificial beach nourishment have altered the sediment budget as have the effects of El Niño and La Niña events. Oceanside City Beach is located in Northern San Diego County and has received a great deal of attention due to both its proximity to Oceanside Harbor and the fluctuations in beach width witnessed here since the harbor construction in the 1940s. This beach, which in the late 19th Century was a popular tourism destination with beaches reportedly measuring up to 100 meters in width, is today entirely protected by shore protection structures and the focus of several beach nourishment efforts. We are measuring beach width change at Oceanside City Beach using aerial photographs taken between 1947 and 2003. Shoreline and back beach features are digitized to

measure a beach width for each set of photographs. Beach widths are then compared to changes in the sediment budget and climate cycles to help us understand the factors affecting beach width change. Thus far the analysis suggests that beach width at this location has been most affected by beach nourishment and fluvial sediment supply for upstream rivers.

Keywords: Oceanside, beach width, aerial photographs, sediment budget

Richard J Grant, University Of Miami. Email: rgrant@miami.edu; *The Work of Slums*

Slums as sites of work and production are a neglected spatiality in urban and economic geography. To date, most of the research effort has been on understanding slums as places of residences as opposed to places of work. The conventional economic liberal assumption that slums represent an economic category of dysfunctional exclusion is an unsatisfactory explanation and fails to account for any economic activities within slums. Instead, recent scholarly and media evidence points to production taking place in slums. My paper reviews the findings from a number of literatures about the types of work that is taking place in slums. First, there are ethnographic accounts and general works that consider the general phenomenon of "a planet of slums." Second, research on informal economies offer some insights into the relationships between work in slums and the wider space economy. Third, research on local economic development has shed light on local policy terrains as well as some of the entrepreneurial efforts of slum dwellers. Fourth, business school researchers offer particular case studies of products and the links between firms and slum economies. I also review two research traditions that have not yet examined the work of slums and consider their potential contributions. First, global value chain research and second, locational analysis and spatial agglomeration theory, modified to fit the particular context of slums, can both offer promising research avenues to explore and understand the spatiality of slums as place of work.

Zane Austin Grant, M.A., University of Arizona. Email: zag@email.arizona.edu; *Autonomous Force and State Power in Bogotá, Colombia*

Cartucho, a neighborhood four blocks from Bogotá, D.C., Colombia's capitol plaza, was deemed ungovernable from the 1948 riots until 2003 when it was leveled to be replaced by a park and clothing mall. In this paper, I will advocate the use of a Guattarian influenced, urban semiotic theoretical framework to flatten geopolitical state and urban scales towards a better understanding of how state/subject relationships shape the city. After establishing how such a study may be performed, I will present a case from my summer 2006 research of how geopolitical forces in a predominantly rural, civil war have political economic implications in reshaping the city's landscape through population displacement and coercive state management of space.

Keywords: Colombia, geopolitics, state theory, urban theory, autonomy, Guattari, political

Angela M. Gray, The University of Kansas. Email: ang@pionet.net; *Spaces of Refuge: Cultural Landscapes of Refugee-hosting and Resettlement in Ukwimi Zambia*

My paper seeks to understand the long-term impacts of refugee-hosting and resettlement by examining refugee and host community interactions in and around the former refugee camp in Ukwimi, Zambia. The project understands the dynamics of refugee-hosting to include a wide variety of relationships - between and among refugee relief organizations, development initiatives, host communities, and refugee populations ? operating at a variety of spatial scales. Framed around these relationships, my dissertation will assess the political climate concerning refugee settlement, identify Zambian perceptions of and attitudes towards refugee populations, and investigate the strategies by which, as well as the degree to which, self-settled refugees have integrated into the host community. In doing so, I will analyze how refugee and host community relationships operate, and shift, within particular political, gendered, and historical contexts, thereby creating distinct landscapes of refugee-hosting and resettlement.

Keywords: Africa, Refugees, Development, Gender

Clark Gray, University of North Carolina at Chapel Hill. Email: cgray@email.unc.edu; *Out-Migration and Rural Livelihoods in the Southern Ecuadorian Andes*

Recent research in migration and development studies has emphasized the connections between individual out-migration decisions and broader household livelihood strategies and contexts, and in particular has revealed the effects of land ownership and rural employment opportunities on out-migration. Nonetheless, few studies of out-migration have incorporated the full spectrum of livelihood assets and opportunities likely to have important effects on migration, including the environmental context which plays a key role in rural communities. Drawing on original household and community survey data from the southern

Ecuadorian Andes, I test the effects of household livelihood assets and environmental context on rural out-migration to international and internal destinations using a multinomial discrete-time event history model. Key independent variables include household access to owned, rented and loaned agricultural lands, land quality, and survey measures of exposure to soil erosion and nutrient depletion.

Keywords: migration, rural livelihoods, environmental refugees, Ecuador, Andes

Mia Gray, Dr., University of Cambridge. Email: pmg27@cam.ac.uk; *Social Networks and Social Capital in Labour Markets: exploring network relationships*

This paper critiques the expanding use of the term social capital as a shorthand for social networks in the labour market. Social capital has most often been presented as a macro-level indicator of social connectedness of a community and has, more recently, been unproblematically used as a substitute for social networks. By substituting social capital for social networks, scholars lose previously gained insights about how social networks function not only to connect and include but also to exclude and to reinforce job segmentation in the labour market. We present a more nuanced approach towards social networks which looks at the relationships between gender, ethnicity and power in the workplace. We also argue that social capital in the labour market has important intra-regional and interregional dimensions which are lost if social networks are only analysed in the at work. Moreover, we argue that social networks not only has to be differentiated by gender, age, and ethnicity, but that these social structures produce different spatial barriers and opportunities. By tracing the career paths of non-ethnic and ethnic minority, female and male, ICT professionals via a life-history approach, we investigate how social capital functions, for individuals and the firm, in elite segments of the labour market.

Keywords: Social networks, social capital, labour markets, gender, ethnicity

Noella Gray, Duke University. Email: njg3@duke.edu; *Local NGOs and the Co-Management of Marine Protected Areas in Belize*

Marine protected areas (MPAs) are rapidly transforming the international seascape, promoted as essential tools in the effort to conserve and manage marine resources. However, in spite of their increasing prevalence and popularity, there is still much debate over how MPAs should be designed and managed. The 'expert knowledge' advocates argue that unless MPAs are designed according to scientific criteria, they cannot possibly meet their objectives, whereas the 'local participation' advocates argue that citizen participation in MPA designation and management is critical to their success. This debate occurs in the abstract, among an international network of scientists and conservation professionals, as well as in relation to particular places and MPAs. In Belize, home to the world renowned Meso-American barrier reef system, fourteen MPAs have been established. Eight of these MPAs are co-managed, meaning that the Belizean government shares management authority with local non-governmental organizations (NGOs). These local NGOs ostensibly facilitate local participation in resource management, while remaining accountable to the national government and responsive to the interests (and funding) of international NGOs and scientists. Drawing on the political ecology literature and six months of fieldwork (including interviews and participant observation), this paper will explore the role of one local NGO in MPA co-management in southern Belize. It will focus on how the NGO negotiates the influence of actors across multiple scales in the implementation of MPA policies, rather than exemplifying the either/or of the abstract 'expert knowledge' vs. 'local participation' debate.

Keywords: NGO; co-management; marine protected area; political ecology

Stephen Gray, University of Wyoming. Email: sgray8@uwyo.edu; Gregory Pederson, Montana State University. Email: gpederson@montana.edu; Andrew Bunn, Western Washington University. Email: andy.bunn@wwu.edu; *Millennial-scale Reconstructions of Regional Hydrology from the Upper Colorado River Basin, USA*

Recent advances in statistical dendroclimatology have dramatically improved our ability to examine past multidecadal to centennial-scale temperature trends. However, these techniques have rarely been applied to millennial-length reconstructions of regional hydrology. Here we employ a set of seven new 1000+ yr tree-ring records to explore the use of regional curve standardization (RCS) and wavelet decomposition (WD) in generating an extended reconstruction of Colorado River flow. These results demonstrate that lower treeline sites in the Upper Colorado Basin share strong regional growth-curves, and that remnant wood of unknown cambial age can be incorporated into a composite regional chronology. Regional chronologies are also relatively insensitive to standardization procedures (e.g. ratio vs. residual weighting). The resulting seven-site RCS chronology explained over 70% of the variation in observed flows (total water year) at Lees Ferry, Arizona, and served as the basis for an 1100-yr proxy reconstruction. The extended record was then filtered using a WD approach that allows simultaneous examination of the time/frequency domains and facilitates

comparisons between events in the gauged (1906 to present) and pre-gauge periods. The wavelet analysis again confirms the relative wetness of the 20th century (especially the 1920s), and for the first time shows a series of persistent (20-40 yr), extreme low-flow events that spanned 900 to 1400 AD. These techniques allow direct comparisons of the magnitude, intensity and duration of low/high flow events across a >1000 yr record, and provide an invaluable baseline for water management in the western United States.

Jessica K. Graybill, Colgate University. Email: jgraybill@mail.colgate.edu; *Creating "sustainable Sakhalin:" trajectories and subversions*

Sustainability rhetoric is important to hydrocarbon development on Sakhalin Island. The "world is watching" this offshore hydrocarbon development funded by massive foreign direct investment and operated by multinational actors in post-Soviet Russia. "Sustainable Sakhalin" is most vocalized by multinational corporations (Sakhalin Energy, BP-Rosneft) developing the offshore hydrocarbon blocks to promote socially and environmentally responsible development. However, 'sustainability' has caught the attention of other actors, namely environmental non-governmental organizations, who utilize it in local-global campaigns promoting human-natural environmental protection. What does sustainability mean "on the ground" among multiple actors [local and indigenous peoples, different generations of environmental specialists, ENGOs, government and business leaders, expatriates] who affect - and are affected by - contemporary development? Through cognitive mapping research, I find that visions of 'sustainable Sakhalin' are neither unified nor shared among actors, leading to multiple emergent movements towards sustainability. Recognizing that local actors promote and develop sustainable development, this paper focuses on how sustainability is understood by people impacting/impacted by hydrocarbon development. This paper investigates the varied understandings of sustainability in sites of hydrocarbon development (Yuzhno-Sakhalinsk, Nogliki, Okha), revealing a contested landscape onto which this concept is attempting to be mapped. It also reveals a regional character to sustainability - important for understanding the situatedness of different arguments for better human and environmental futures. Only by revealing and appreciating the differences among different actors' visions of better futures can we understand sustainability movement(s) in this region, potentially useful for understanding movements in other regions of the FSU.

Keywords: sustainability, Sakhalin Island, Russia, hydrocarbon development, cognitive mapping

Anne E. Green, IER, University of Warwick. Email: A.E.Green@warwick.ac.uk; *Interactions between skills mismatch and spatial mismatch: insights from disadvantaged local areas in the UK*

In recent years factors underlying the geographical distribution of employment and non-employment at the micro area level have come under increasing scrutiny from academics and policy makers. Notions of 'skills mismatch' and 'spatial mismatch' have been used in attempts to 'explain' the geography of non-employment. However, the extent to which these notions are separable in practice is debatable. This paper draws on case study work with young people in three disadvantaged neighbourhoods in England. It explores their aspirations, perceptions and awareness of contemporary labour market opportunities as they begin to negotiate the transitions from compulsory education to training and work. It highlights the positive and negative role of family and friends in shaping perceptions and opportunities. It also draws on stakeholder perspectives on the factors underlying labour market disadvantage and considers the success and failure of policies to widen horizons. Both commonalities and differences across the three local contexts are highlighted, and results are compared with related research from Northern Ireland. On the basis of the evidence presented, the paper highlights how notions of 'skills mismatch' and 'spatial mismatch' are interlinked and contingent upon the characteristics of the local economy and of jobs, employers, job seekers. It also introduces a 'temporal' dimension, considering geographical access to job opportunities at different times of day and the extent to which some neighbourhoods may be caught in a mid 20th century 'time warp'. Finally, the role of area regeneration policies in overcoming and exacerbating problems of concentrated worklessness is considered.

Keywords: skills mismatch, spatial mismatch, wages, deprived areas, perceptions

Arthur G Green, PhD Student, McGill University. Email: arthur.green@mcgill.ca; Kai Bucher, International Food & Agricultural Trade Policy Council. Email: k.c.bucher-alumni@lse.ac.uk; Linking Complex Systems: Cotton Production in Sub-Saharan Africa

Recent changes in international policy towards cotton trade indicate that African producers may soon benefit from increased market access. Although these changes are considered positive developments, complex human-environment systems make assessing the impacts of macroeconomic policy on cotton production difficult. Some problems with current approaches to measuring cotton production potential in Africa include (1) failure to integrate complex systems into predictive or descriptive models; (2) over-reliance on coarse-scale analyses; and (3) that expert opinion, used to overcome problems of integration and scalability, lacks objectivity and explicit parameters. An integrative model may provide a useful tool for understanding how policy changes relate to cotton production potential. This study applies a geospatial analytic approach to modeling the human-environment system surrounding cotton production in Mali, Benin, and Burkina Faso. The study integrates georeferenced parameters bridging the agent/structure dichotomy. Parameters and their relationships are drawn from theories of social capital, ecological modeling scenarios, geographic considerations, and contextuality of human-environment systems. The model is composed in a geographic information system that can be manipulated to represent different theoretical linkages and production scenarios. Statistical analyses observe collinearity between parameters and reduce the number of parameters (Principal Component Analysis). Ground truthing of the model takes place in Mali.

Chris Green, University of Missouri-Kansas City. Email: cmgvw9@umkc.edu; GIS Applications for Ozone Biomonitoring in Kansas City

Ground-level ozone is formed from the byproduct gases of vehicular traffic and industry. In Kansas City, MO, these precursor gases are produced by commuter traffic traveling along multiple major interstates that intersect in the urban core and by numerous small factories. Ground-level ozone is toxic to life. Not only does tropospheric ozone increase hospital admissions for respiratory problems, but also it physically affects plants. The USDA Forest Service monitors the effects of tropospheric ozone on plants by using highly sensitive native plant species. These bioindicators show visible signs of ozone induced stress in the presence of high concentrations of anthropogenic ground-level ozone. The purpose of this study was to examine the connections of ozone precursor sources and the locations of surveyed ozone injured vegetation. Site selection was based on USDA - Forest Service site recommendations. Fifteen similar sites in the Kansas City metropolitan area were surveyed for Common Milkweed, a native bioindicator used by the Forest Service. These sites were geocoded into a GIS. The number and severity of ozone induced stress were included in the shapefile attribute data. Buffers of specific distances were then applied to point and mobile sources of ozone precursors in the study area. The spatial relationships of highly stressed sites and precursor sources were examined. Of the seven sites that showed signs of ozone stress, most were in close proximity to a major road.

Donna Green, CSIRO. Email: donna.green@csiro.au; Terra Nullius all over again? climate impacts in Australia

The Torres Strait Islands are frequently 'left off the map' in research on biophysical change in Australia. There are few observational data sets from which modelling work or inundation studies can be performed?even though these communities may be facing imminent threats to their existence. Some of these islands are only a metre or two above local mean sea level; and in the last two years several have suffered major inundation incidents. Most of these islands have inadequate infrastructure, health services and employment opportunities. This social context is highly significant in terms of these communities' resilience to climate hazards because social and economic disadvantage reduces their ability to cope and their capacity to adapt to rapid environmental change. This concern is compounded by a cultural issue not normally considered by natural scientists working on identifying climate impacts in human settlements. Many Islanders connect the health of their land and sea country to their mental and physical wellbeing and, more broadly, their cultural integrity. In the near term, projected changes could affect subsistence hunting as well as commercial fishery operations with significant nutritional, economic and cultural ramifications. Similarly, change in rainfall could exacerbate existing pressures on potable water supplies unless significant anticipatory planning is initiated to reduce this climate related risk. In the longer term, the very existence of Ailan Kastom (Island Custom) may be threatened if projected sea level rise in combination with extreme weather events increases the frequency and/or severity of inundation incidents and necessitates relocation from the islands.

Mark D. Green, Ph.D., Indiana State University. Email: M-Green@indstate.edu; The Capture and Storage of Natural Watershed Runoff to Support Permanent Settlement at Mudaybi' Along the Desert Fringe in Ancient West-Central Jordan

Mudaybi' a 65x90 meter fortified site adjacent to the Syrian and Arabian desert in west-central Jordan was constructed by Iron 2ab (925-539 BCE) Moabites. The site continued to be used throughout antiquity with the last phase of intensive occupation occurring during the Nabataean period (300 BCE to 106 CE). Located on the eastern border of the Moabite Kingdom, the site was strategically located along the major transportation corridor linking the region with its neighbors to the south and east. The location of the site afforded a view of the adjacent region out to a radius of 10 km, which suggests that it may have been part of a deliberate signaling network. Mudaybi' was one of seven Iron 2ab fortified sites located in sight of each other within the visibility radius. Though the site offered considerable strategic benefits, the nearest perennial water source was over 12 kilometers from the site. Permanent occupation at the site would have required the harvest and storage of rainwater from winter storm events. There is a small reservoir of unknown age immediately north of the site that currently captures runoff from an adjacent watershed. Using a DEM, GIS, and runoff models, the runoff and discharge potential of the watershed into the current reservoir are estimated. Calculations based on the runoff potential and the amount of accumulated water stored in the current reservoir during the summer of 2001 suggest that harvested and stored runoff would have provided sufficient water to support permanent settlement at the site.

David F Greene, Concordia. Email: greene@alcor.concordia.ca; Quesada Mauricio, Institute of Ecology, Morelia, Mexico, UNAM. Email: mquesada@oikos.unam.mx; The relationship between horizontal wind speed and the probability of seed abscission in mid-latitude and tropical species dispersed by wind.

We examined seed abscission of two mid-latitude and five tropical species at short averaging times (10 seconds in all but one case; 15 minutes in the remaining case), hypothesizing that (1) the probability of abscission should be proportional to Drag and therefore to the square of the horizontal wind speed; there should be a threshold wind speed for abscission that is greater than 0. We found that the exponent of power-law regressions of abscission probability on horizontal speed had exponents that tended to be somewhat higher than the expected value of 2.0. We assume this enhancement is due to the correlation of horizontal and vertical speeds. A threshold speed of about 0.25 m/sec was typical. The exception to both generalizations was the tropical vine *Matelea* because it has the capacity to abscise seeds without wind because of the drying mechanism of the diaspore fibers. We conclude by discussing the consequences of this work for the modeling of seed dispersal.

Richard P. Greene, Northern Illinois University. Email: rgreene@niu.edu; Amenities as drivers of growth: Intra-urban and Inter-urban scales

Generations of Minnesota geographers were exposed to metropolitan analysis (intra-urban) by way of John Adams and metropolitan regions (inter-urban) by way of John Borchert. These courses/approaches were set within a broader collective geographic education that Minnesota graduate-students were exposed to, which included both topical and regional approaches as well as physical and human dimensions. The common denominator in the approaches by John Adams and John Borchert was amenities (both physical and cultural) as drivers of urban growth. Consider the recent works by John Adams, clearly influenced by Homer Hoyt, where he demonstrates that sector/wedge patterns remain the dominant spatial pattern of the contemporary American city. Explanation was a constant theme by Adams in both his research and teaching and amenities at the intra-urban scale was one of the explanatory variables that rose to highest significance. Borchert used amenities to explain variation across the urban system in terms of growth and development. In this paper, I review the recent literature on amenities and analyze new data to suggest that amenities continue to drive growth at both the intra-urban and inter-urban spatial scales.

Charles Greer, Indiana University. Email: greerc@indiana.edu; Shanon Donnelly, Indiana University. Email: sdonnell@indiana.edu; James J. Hayes, Indiana University. Email: jamehayes@indiana.edu; Jillian M. Rickly, Indiana University. Email: jrlickly@indiana.edu; An Ecosystem Energy Model of Landscape Form and Function

While landscape study in Geography through recent decades has produced important work with focus on how selected aspects of culture influence selected features or groups of features, study of the composite landscape has suffered commensurate neglect. Defined as the totality of features at the surface of the

earth, the composite landscape is the physical evidence of human-environment interaction, a better understanding of which is necessary for any progress in theoretical and practical approaches to sustainability. Pursuing the goal of 'keeping humans and nature in the same analytical framework,' and based on energy relationships being the common denominator of human and non-human systems, ecosystem characteristics provide the starting point for the current project to develop a comprehensive qualitative model of landscape relationships. We use the fundamental matter-energy-information relationship to explain the construction and maintenance of features, as well as how they accomplish work of all kinds in the landscape system. Applied to a forty square mile landscape in Monroe County, Indiana, the model identifies twelve feature types delineated into 250 constituent features based on how each processes inputs of matter, energy and information, and how each links to other feature types. Among the outcomes, the model shows that higher levels of information relative to matter and energy are an indicator of greater symbolic power in a landscape feature type. Implications and limitations of the energy-based model for landscape studies and beyond are then discussed.

Ian N. Gregory, Lancaster University. Email: i.gregory@lancaster.ac.uk; *Spatial analysis of long-term change using vector data: Examples from British demography.*

The Great Britain Historical GIS contains the boundaries of the major administrative units of England & Wales as they changed from the mid-nineteenth century to the present. In doing this it locates a wealth of census and vital registration (birth, marriage and death) data in space and time. This would appear to make it an excellent platform for analysing long-term demographic change. The situation is complicated by the difficulties that boundary changes cause to analysing change over time. This paper describes a variety of approaches that have been developed to resolve this problem. One of the most sophisticated is the use of areal interpolation techniques to standardise all of the data using a single set of administrative units. This enable us to explore long-term spatio-temporal change in using an unprecedented level of detail however it has the problem that it inevitably introduces a certain amount of error into the resulting data. This paper explores a variety of approaches to the issues of changing boundaries and areal interpolation and the error that results from it.

William J Gribb, University Of Wyoming. Email: planning@uwyo.edu; *Location, Habitat and Management Strategies for Castor canadensis in the Grand Teton National Park: Implications for the Greater Yellowstone Ecosystem*

The location and distribution of *Castor canadensis* (beavers) had not been examined in Grand Teton National Park (GTNP) since the mid-1970s. This research was conducted over the period 2002-2006 utilizing field and aerial surveys of GTNP to locate and record habitat characteristics of active beaver lodges and dens. Approximately 370km of stream reaches and lake shores were field inventoried for beaver activity and habitat characteristics. Overall, 43 active lodges dens were cataloged, this represents a decline of more than 50% in active locations since the last survey in the mid-1970s. Habitat characteristics have changed from a dominance of activity in cottonwood (*Populus angustifolia*) associated communities to a predominance of activity in willow (*Salix* spp.) dominate areas. This shift in vegetation communities has increased competition for browse with elk (*Cervus elaphus nelsoni*). Compounding the habitat changes has been a subsequent change in water flow along the Snake River and its tributaries. Drawdown patterns of Jackson Lake with subsequent flow changes on the Snake River have created seasonal fluctuations varying from 659 to 18,150 cfs.. Over the last nine years, drought conditions in the region have reduced flows in major tributaries to the Snake River, specifically Pacific Creek and Buffalo Forks, by as much as 50%. Thus, habitat, waterflow along major rivers, and decrease in back-channel waters have possibly contributed to the declining beaver population in Grand Teton National Park. Management strategies should be designed to sustain existing beaver habitats and, where possible, expand beaver locations to increase core populations.

Carl J Griffin, Dr, Queen's University. Email: Carl.Griffin@qub.ac.uk; *Affecting Violence: Language, Gesture and Performance in Eighteenth and Early Nineteenth-Century English Popular Protest*

Historians of English popular protest have long noted the essentially orderly nature of most contentious gatherings. 'To carry weapons, to bandy ferocious threats, and to destroy machinery was one thing', reckoned Hobsbawm and Rudé, 'to shed blood was quite another' (1969). But as E.P. Thompson noted in his hugely influential 'The Moral Economy', whilst protesting 'crowds' may well have been disciplined the form of collective bargaining by riot in which they engaged could only be successful if the leverage of the fear of disorder and

violence could be brought to bear (1971). Or to quote Wells, 'the moral economy was implemented in the context of threatened or actual violence' (1988). Whilst Thompson never suggested that discipline was always maintained, outbreaks of physical violence were relatively rare. We know remarkably little though about the tools and practices deployed in English protests through which a psychosomatic fear was engendered, practices which were clearly successful in affecting violence and more than occasionally winning concessions. Through an archival analysis of a series of different forms of English popular protest, both 'overt' and 'covert', this paper both clearly demonstrates both the usefulness of adopting 'performative' concepts in understanding the complexity of past protest and the centrality of psychological and bodily manipulation in the toolbox of English protestors. Violence did not have to involve flesh (or weapon) upon flesh to achieve its goals, rather through language, gesture and the performing of (dis-embodied) pain, bodies could be made to feel something equally visceral and just as anguishing.

Duane A. Griffin, Ph.D., Bucknell University. Email: dgriffin@bucknell.edu; *Fine-scale geomorphic pattern and biodiversity*

Ecological diversity at patch, landscape, and regional scales reflects interactions between individual organisms and abiotic constraints. Biogeographers and ecologists have long recognized the key role geomorphology plays in these interactions through their effects on microclimate, moisture and nutrients supplies, disturbance regimes, and migration and dispersal. Less-well appreciated are the implications of fine-scale (

Keywords: biodiversity, geomorphology, biogeography, simulation model

Gareth Griffin, University of Louisiana-Lafayette. Email: gareth@louisiana.edu; *The (Hetero)Sexual Citizen and the Evolving Landscape of Sexual Citizenship*

Over the past twenty years, the rhetoric of the lesbian and gay movement has evolved from a discourse of liberation (focused on issues like repealing sodomy laws) to one of citizenship (focusing on questions of marriage equality and other rights). One unexpected result of this shift has been that lesbians and gays are no longer uniquely sexualized when it comes to questions of citizenship. This paper argues that citizenship rhetoric has forced heterosexuals—and more specifically heterosexual opponents to homosexuality—to become sexual citizens themselves. By examining *Bowers v. Hardwick* and *Lawrence v. Texas*, this paper demonstrates a change in how opponents of homosexuality defend the legal and moral "superiority" of heterosexuality. In the wake of these decisions, opponents of homosexuality can no longer dismiss homosexual claims for equal rights simply because of the illegality of homosexuality; they now must define explicitly why their sexual practices are innately "better" or "moral" in comparison. This change in discourse has consequently politicized the question of sexuality itself and its relationship to citizenship.

Keywords: sexual citizenship, homosexuality

The Salinas River Valley in California is known as America's salad bowl and is home to a \$3.5 billion crop industry based largely on groundwater irrigation. Saltwater intrusion associated with long-term aquifer overdraft has ruined thousands of hectares of productive agricultural lands and threatens major municipal wells. Recharge to these alluvial aquifers originates primarily as precipitation and subsequent infiltration from the Salinas and its tributaries. A 60-year record of monthly flow is available at Paso Robles in the upper basin, above more human interference than any other gauge on the Salinas. This record exhibits dramatic inter-annual to decadal variability, including the epic drought of 1976-1977. Old growth blue oak (*Quercus douglasii*) woodlands are widely distributed in and near the drainage basin of the Salinas River and the radial growth of this species is remarkably sensitive to annual precipitation. We have recently developed a new network of 300- to 700-year long blue oak tree-ring chronologies, and these exceptional proxy time series are highly correlated with Salinas flow records at Paso Robles and other gauging stations along the river. A 595-year reconstruction of annual mean flow at Paso Robles explains 70% of the variance during the instrumental period. The reconstruction indicates many zero flow years equal to the drought of 1976-1977 and extreme decade-long droughts more severe than any measured during the instrumental period from 1940 to present. This high-quality reconstruction offers long term perspective on hydrologic variability in the Salinas basin.

Daniel A. Griffith, University of Texas - Dallas. Email: dagriffith@utdallas.edu; Manfred M. Fischer, Vienna University of Economics and Business Administration. Email: Manfred.Fischer@wu-wien.ac.at; Modeling Spatial Autocorrelation in Spatial Interaction Data: A Comparison of Spatial Econometric and Spatial Filtering Specifications

Spatial interaction models of the gravity type are widely used to model origin-destination flows. They draw attention to three types of variables to explain variation in spatial interactions across geographic space: variables that characterise an origin region of a flow, variables that characterise a destination region of a flow, and finally variables that measure the separation between origin and destination regions. These models are said to be misspecified if their residuals are spatially autocorrelated, violating the independence assumption. This paper outlines and compares two approaches, the spatial econometric and the eigenfunction-based spatial filtering approach, to deal with the issue of spatial autocorrelation among flow residuals. An example using patent citation data that capture knowledge flows across 112 European regions serves to illustrate the application and the comparison of the two approaches.

John R. Grimes, Eastern Kentucky University. Email: john.grimes@eku.edu; Don Yow, Eastern Kentucky University. Email: Don.yow@eku.edu; Contesting Globalization by Reconstructing Markets: Florida's "Wild & Wonderful Shrimp" Program

This paper examines how globalization is impacting Florida shrimpers and the State of Florida's "Wild and Wonderful Shrimp" program as a strategy to contest and reshape globalization's outcomes. The geography of shrimp imports is described as well as the recent history of its growth. The U.S. market for shrimp can be described as mostly consisting of a "mass market" that is met by farm-raised, frozen imports and a much smaller "specialty market" met by fresh wild-caught shrimp. The interaction of these two very differently characterized segments of the shrimp market are discussed as well as Florida's strategy to increase demand of their shrimp by the use of a shrimp marketing campaign. The examination of this program shows a state that is attempting to confront the challenges of globalization while acknowledging its own policy limitations because of interdependencies that globalization creates.

Sara Grineski, PhD, University of Texas at El Paso. Email: segrineski@utep.edu; "This house is not good for asthma." Housing and environmental justice

Environmental justice research involves the study of the unequal exposure of poor and minority residents to environmental hazards. In this analysis, I consider indoor environmental exposures as another facet of environmental injustice. I take the perspective that the home is a product of unequal power relations, like ambient conditions. Many research studies have linked housing conditions, such as mold, dust and roaches, to asthma. In this paper, I investigate the experiences of parents managing children's asthma in the central city and in the suburbs of Phoenix, Arizona, where the housing stocks are different. I interviewed 41 low-income African-American and Hispanic parents living in the central city and 12 affluent Anglo parents from a suburban area. I find that wealthy suburban parents are more likely to own their homes, making it easier to conduct asthma-related modifications (e.g., remove carpets). When they do not make modifications, it is because of aesthetic preferences, not a lack of resources or knowledge. Poor central city parents face multiple challenges in controlling indoor exposures. Renters are constrained in making changes to their homes, and are forced to spend their own limited resources to repair rental units. Undocumented immigrants tend to suffer serve landlord abuses and live in marginal housing stock, complicating asthma management. Low-income parents report frequent moves within the central city, trying to access a better environment within a zone of environmental degradation. These parents and their children with asthma face a double jeopardy, whereby their unsafe indoor environments are located in hazardous outdoor environments.

Email: tombell@utk.edu; Earth, Wind, and Fire: The Role of Newspaper Accounts in Public Perception of Suicide Rates After the 1906 San Francisco Earthquake, Hurricane Katrina, and the Great Chicago Fire

Print media reports hype the fear, angst, and chaos following major catastrophes. This was just as true of reportage in the Chicago Tribune following the Great Fire in Chicago in 1871, and the San Francisco earthquake of 1906, as it was in New Orleans regarding the death and destruction in the aftermath of Hurricane Katrina in 2005. And, based on anecdotal evidence and journalistic

sensationalism, media reports seem especially drawn to the "epidemic" of suicides in the wake of such catastrophes. In contrast to media reports, public health statistics indicate that suicide rates do not necessarily increase from the norm immediately following major disasters. Public perception and anticipation of a dramatic increase in suicides as a reaction to major earthquakes, hurricanes, and fires, does, however, persist.

Janet H. Gritzner, South Dakota State University. Email: janet.gritzner@sdstate.edu; Modeling Wetland Basins in the Prairie Pothole Region

The Prairie Pothole Region (PPR) of the US and Canada is characterized by thousands of shallow, water-filled depressions with sizes ranging from a fraction of a hectare to several square kilometers. The purpose of this work is to apply GIS hydrologic modeling techniques to further understanding of surface-flow characteristics in glacially disturbed landscapes. High resolution bare-ground LIDAR DEMs are used as raw elevation data. Over 83 percent of the wetlands in PPR are smaller than 0.8 ha and are generally not resolved by Level II USGS DEMs, remaining depressions are filled during standard conditioning procedures in hydrologic modeling that create a depressionless DEM. Given these statistics, the accuracy of any hydrologic modeling in the PPR using normal methods is doubtful and new approaches required. The study area is a 78 square mile basin located within the larger Devils Lake Basin, ND. To maintain wetland depressions, a mask that identifies the location and extent of real depressions is first generated and, from it, a seed grid is derived. The sink mask was fully attributed with data on maximum depth, average depth, volume, and surface area for each sink as well as code, count, and surface area information from National Wetland Inventory (NWI) datasets. Some 30,324 depressional features were initially identified in the LIDAR DEM. Some 6,016 sinks were possibly wetland features. The mask was applied using various criteria, including depression depth and size, class, and water regime of NWI wetlands. Derived catchments were evaluated. Isolated and linked wetland features were categorized.

David Grondin, University of Ottawa. Email: dgrondin@uottawa.ca; Astropolitik as Global Dominance in the War on Terror: Securing "Freedom of Space" to Achieve Space Control

From World War II onwards, US national security elites have thought US state identity through the prism of national security, whilst the US state has had but one global strategy, a neoliberal geopolitics of global dominance. September 11 was constructed by US governmentality as a nationalist and sovereigntist opportunity to reaffirm state power, thus reactivating unquestionably the violence of the national security state. This paper aims to address how the frontiers of the US homeland are remapped by the War on Terror as it relates to the US Astropolitical dominant discourse. Astropolitics has indeed emerged as a genuine geopolitical discourse on Outer Space. Adopting a critical geopolitics framework, this paper focuses on the US strategic discourse promoted by US defense and statecraft intellectuals and national security elites as it participates in the securitization and reterritorialization project of Outer Space as an American space. The pioneer work of Everett Dolman on Astropolitik - an astropolitical discourse featuring Space weaponization as inevitable and a call for the US to seize the strategic opportunity of achieving Space control ? is here used as a starting point of discussion, especially for its linkage with the Bush administration new National Space Policy (NSP). As Space warfare takes place in the context of general military operations of "full-spectrum dominance", it takes into account the transformed nature of war in the 21st century that rests, for US statecraft, upon a rewriting of the global space through a strategy of neoliberal dominance where force is spatially projected.

Keywords: statecraft, geopolitics, geostrategy, US global strategy, Outer Space

Theodore Grossardt, University of Kentucky. Email: thgros00@uky.edu; Fantasy and Identity in Public Infrastructure: When State and Advocacy Groups Agree They Exist

Frequently new groups constitute themselves around a shared opposition to some new public sector project, either on local or global 'grounds' (eg. The I-66 Interstate Highway project has fostered 'Kick 66'). The existence of, and claim to membership in, such groups is fostered by more than just the members themselves, and in fact may be used by political and technical project sponsors as an excuse for limiting public participation in public infrastructure planning. The perceived or claimed 'threat' to the process may set off or legitimate a cascading series of countervailing public sector strategic moves that further formalizes and limits true dialogic exchange. Ironically, when the "existence" of an advocacy group is acknowledged by the public sector, as evidenced by changes in public involvement strategies, then that is an act granting additional power to the

advocacy group and ironically taking it away from the 'non-aligned' public. The advocacy group will be better able to continue to make its voice heard than non-members, once the public sector begins attempting to tamp down the form and depth of public involvement. Thus the ultimate 'debate' will elide the ordinary public, and grant all negotiation power to the state and the jointly-constituted opposition group(s). The author contends that such outcomes are undesirable from the point of view of citizens.

Keywords: public infrastructure planning, advocacy group, state planning, identity

Chad G. Grossenburg, Montana State University. Email: chadgrossenburg@yahoo.com; *Campsite Impacts and the Limits of Acceptable Change Planning Process: A Case Study of the Jedediah Smith Wilderness Area*

The Limits of Acceptable Change planning process is a means by which managers attempt to preserve natural conditions while facilitating public use in federally designated wilderness areas. The biophysical condition of campsites is often used as one indicator of naturalness. Despite progress using scientific methods to inventory and monitor campsites, little progress has been made formulating standards of campsite condition in the Limits of Acceptable Change planning process. Wilderness planners also require an understanding of the relationship between nearby population growth and its influence on campsite conditions. The population of Teton County, Idaho, adjacent to the Jedediah Smith Wilderness, has doubled in the last twenty years. Other Western places have witnessed similar patterns as many counties next to wilderness areas have recently outgrown other counties. Campsites, in the Jedediah Smith Wilderness of the Teton Range in northwestern Wyoming, were analyzed for changes in biophysical condition and spatial distribution over the last five years. The origin of wilderness users were recorded to determine the impact of new migrants on campsite conditions. Existing campsite conditions were found to have significantly improved, but the number of campsites have increased. These data show that indicators of campsite conditions in the Limits of Acceptable Change planning process need to focus not only the condition of campsites, but also on the spatial aspects of campsite proliferation and recovery. The number of overnight users from Teton County, Idaho were found to be relatively low. Despite recent population growth these recent migrants have little influence on campsite conditions.

Email: zaiki@ccsis.u-tokyo.ac.jp; Rebecca Johnson, Department of Geography SIUE. Email: ; *Annual Maximum Floods and Typhoons in the Kanto, Kyushu, and Hokkaido Regions of Japan in the 20th Century*

This paper examines records of annual maximum floods on eleven major rivers in the Kanto, Kyushu and Hokkaido regions of Japan between 1960 and 2002. Analysis indicates that the study period can be divided into two sub-periods. Period 1 (1960 to the late 1970's early 1980's) was a period of smaller average floods and fewer large floods and Period 2 (the late 1970's early 1980's to 2002) was a period of larger average floods and more frequent large floods. Annual maximum floods in these regions of Japan can be attributed to typhoons, periods of heavy rain during the summer rainy season, and spring snowmelt (in Hokkaido). Of these three causes, typhoons are usually responsible for the largest magnitude floods. Based on this link between typhoons and larger magnitude annual maximum floods, we hypothesize that the differences between Periods 1 and 2 can be attributed to an increase in the number of strong typhoons reaching Japan during Period 2. Analysis of the record of typhoon tracks and daily precipitation (3-day totals associated with the typhoons responsible for the annual maximum flood) support this hypothesis. Further, to investigate causal mechanisms for the observed shift in the number and strength of typhoons affecting Japan, we examine the hypothesis that differences between Periods 1 and 2 can be linked to shifts in global atmospheric circulation patterns such as ENSO and the PDO.

Email: parkeral@evergreen.edu; Edward Whitesell, Ph.D., The Evergreen State College. Email: whiteset@evergreen.edu; *Climate Change and the Pacific Rim Indigenous Nations Treaty*

In October 2006, the Northwest Indian Applied Research Institute published "Climate Change and Pacific Rim Indigenous Nations," as a report to tribal government leadership. The report explores existing effects of climate change on Indigenous peoples and their homelands in Pacific Rim countries, the present

responses of Indigenous nations at both a local and international scale, and potential future paths for Indigenous nation governments to deepen and expand their powers to influence the global discussion and regulatory process around climate change, and to mitigate or adapt to its inevitable impacts. The project is part of a larger proposal to initiate an Indigenous nation-to-nation treaty agreement among Native governments in the Pacific Rim. The United League of Indigenous Nations treaty will serve as a structure to address major issues and challenges that are common to the nations including, most particularly impacts of climate change on Indigenous homelands and the future survival of Native peoples including Maori in Aotearoa (New Zealand), Native Hawai'ians, Alaskan Natives, First Nations in Western Canada, and Native American nations in the Pacific Basin states. The report reviewed evidence of drastic changes now affecting Indigenous hunting and fishing, economic infrastructure, water and housing availability, forest and agricultural resources, and the survival of tribal members and their cultural practices. The report concluded that "Indigenous peoples are the 'miner's canary' of global climate change for the rest of humanity," and issued recommendations to Indigenous nation leadership on possible strategies to confront, mitigate or adapt to the impacts of climate change.

In a 1998 speech before the California Science Center in Los Angeles, then US Vice-President Al Gore called for a global undertaking to build a multi-faceted computing system for education and research, which he termed "Digital Earth." The Digital Earth vision is that of a computing system providing access (via response to queries and exploratory tools) to what is known about the planet and its inhabitants' activities, now and at any time in history. Furthermore, it would accommodate modeling extensions for predicting future conditions with what skill their algorithms might achieve. As such, in its most complete form Digital Earth is a "mirror world," conceivably even passing a Turing-like test. Although such completeness is not a realistic possibility, a digital earth system capable of organizing all such knowledge may be, and is the subject of this research. Together, geographic information systems (GIS), digital geolibraries and knowledge organization systems (KOS) provide many of the conceptual and technical elements required for a comprehensive digital earth system. However, an approach to data modeling that is fundamentally different from a typical GIS is required. It must be semantic and ontology-based; that is, structured to allow feature and event attributes to represent meaning in class rules and relationships. Attribute changes over time must be trackable, to permit visualizations of dynamic processes. Furthermore, the model must enable integration of object and field data sources. We review recent related research and chart a course through the remaining issues, towards an achievable digital earth system.

Kevin Grove, Ohio State University. Email: grove.80@osu.edu; *What, Me Worry? Market Democracy, Global Warming, and the Privatization of Insecurity*

Global warming calls forth a decidedly non-modern mode of being-in-the-world, one in which the precariousness of existence is unavoidable: as the trailer to An Inconvenient Truth proclaims, global warming is about life. This implication of life - or, more precisely, the environmental transformations that make modern life possible - in the negation of existence introduces a new form of ontological insecurity, one in which the modernist dream of benign technology mastering nature for universal benefit is laid to waste. However, the relation between environmental transformation and precariousness as a general ontological condition has yet to be given extended critical consideration. Indeed, the non-human is commonly written out of analyses of precarity that take insecurity as the founding moment of sociality and, therefore, being. But the emergence of a popular form of environmentalism founded on the insecurity of existence as totality of the human and non-human calls for critical examination of this relationship. How radical are the alternatives put forth by this new environmentalism? This paper argues that the turn to green technologies such as energy-efficient light bulbs and individualized carbon offsets advocated by environmentalist discourses feeds on this insecurity to further embed neoliberal fantasies of the market and technology as stabilizing mechanisms. Precarity clears fertile grounds for the development of new biopolitical practices that deepen capitalist oppression through the technologization and privatization of ontological insecurity. These processes also draw our attention to the ways in which space is produced as an emergent and contingent condition.

Morgan Grove, USDA Forest Service. Email: jmgrove@gmail.com; *An Ecology of Prestige: Linking Household and Vegetation Dynamics in Urban Ecosystems*

The dynamics of urban ecosystems can be enhanced by linking the multi-dimensional, social characteristics of households to variations in land cover and land management practices. The goal of this presentation is to compare the relative significance of three social theories of household structure?population, social stratification, and lifestyle behavior?to vegetation dynamics?cover, structure, function, and succession in Baltimore, Maryland. Our ability to examine the relative significance of these theories depends upon fine scale social and biophysical data. Using object-oriented image classification software to combine household level social data, parcel boundaries, high resolution, multi-spectral imagery and LIDAR data, we compare the relative significance of these theories to explain variations in vegetation cover, structure, and function. Emerging from this analysis is what we call an "ecology of prestige," which emphasizes the importance of vegetation to the social identity and status of distinct social groups at a neighborhood level. Ultimately, by linking these household processes to land cover and land management practices, a more complete, robust, and synthetic understanding of urban ecological dynamics is possible at a fine scale and over the long term.

Long after the Kashmir earthquake of October 2005, the destructive aftermath is still visible. Hillsides show signs of weakening through fissuring and small-scale sliding. These unpredictable landslides pose a potential threat to existing infrastructure, villages, and populations. Two main methodologies were utilized in developing a Landslide Hazard Zonation GIS: (1) field based observations (geomorphologic mapping; description of stratigraphies; repeat photography; etc.) and data collection; (2) remote sensing and geographical information system (GIS) analyses. The multitemporal approach includes pre- and post-earthquake data. The latter includes data from November 2005 directly after the earthquake, and data from May 2006 after the snowmelt season. In 2005, a series of >200 landslide locations were incorporated into a GIS database holding GPS locations that correspond to a series of pictures of the landscape. The 2006 field campaign repeated all photographs for those GPS locations and documents that further sliding occurred in the six month period since the first database was created. Aftershocks and snowmelt- and rainwater infiltrating into the ground especially along the fissuring were/are responsible for ongoing landsliding in the region. Results from unsupervised and supervised classifications of satellite imagery (ASTER, Landsat, Quickbird) support the landslide mapping. Criteria for defining a hazard zonation system are based on existing literature and include parameters such as topography, geology, lithology, climate, vegetation, settlements, roads, etc. The Landslide Hazard Zonation GIS for the Kashmir earthquake area of Northern Pakistan is an important acquisition to plan rapid and secure mitigation procedures and future strategic planning.

Tony H. Grubestic, Indiana University. Email: tgrubesi@indiana.edu; *A Spatiotemporal View of Broadband Regions: Tracking Competition and Availability*

Variations in the supply and demand of telecommunications infrastructure in the United States are well documented. However, amidst waning concerns of a digital divide, particularly with respect to its demographic characteristics, the geographic aspects of broadband availability continue to be intriguing. Of note, is the significant locational diversity in broadband competition throughout the U.S. While some areas benefit from a robust selection of broadband providers, choices for consumers in other regions are often limited. These disparities in competition are effectively creating a broadband core and periphery framework in the United States. The purpose of this paper is to explore the spatially unbalanced levels of broadband competition in the U.S. by providing a spatiotemporal analysis of broadband regions and their development from 1999 - 2004. Broadband core and periphery regions are identified through the use of spatial statistical techniques and a geographic information system. A broadband competition index for ranking metropolitan and micropolitan areas is also introduced.

Pyr Gruffudd, University of Wales Swansea. Email: r.p.gruffudd@swansea.ac.uk; *On the prowl with the possum posse: nature and nation in Aotearoa/New Zealand*

This paper addresses complex geographies created by the brush-tailed possum in New Zealand. Introduced from Australia in 1837 to stimulate a colonial fur-trade the possum 'jumped the fence' and became a massively effective pest. With abundant food and no natural predators an estimated 70 million possums now colonise over 90% of the nation. They 'target' the iconic native forests, compete with native fauna for food and shelter, and are also accused of eating the eggs of kiwi and kokako. They have an economic impact on pasture plants and on farm animals, as well as being a 'nuisance to amenity' in suburban areas. These impacts are understood within an extremely well-developed and disseminated discourse of biodiversity and biosecurity. This, crucially, is informed by - arguably built upon - a Maori holistic worldview that claims humans share a common whakapapa (ancestry) with other animals and plants and have a highly-developed sense of responsibility to protect and enhance them. As an 'alien' species, the possum has been the subject of a diverse and energetic eradication programme, ranging from the official creation of Edenic 'mainland islands' to grass-roots and entrepreneurial businesses involved in fields ranging from leisure (such as the Possum Posse) to high fashion. This paper analyses some of these interventions in terms of their claims to embodied knowledge of nature and nation, their appeals to gendered identities (and especially versions of white - pakeha - masculinity), and their presumed reintegration of the wild and the native into postcolonial versions of identity.

Adrienne Gruver, Pennsylvania State University. Email: abg152@psu.edu; *Epidemiological Data Analysis Tasks in a Geovisualization Environment*

Geovisualization tools are increasingly used for exploratory analysis in a variety of disciplines. In an effort to systematically assess how well these tools support the analytical needs of users, it is critical to conduct research from the perspective of users. In this presentation, I will describe my research on the assessment of the Exploratory Spatio-Temporal Analysis Toolkit (ESTAT) as it is experimentally used by professionals in the health research community. ESTAT is a geovisualization application developed by the GeoVISTA Center for the National Cancer Institute. It links established exploratory data analysis methods with a bivariate map and is intended to foster the investigation of multivariate relationships visually and geographically. In order to analyze how geovisualization can support health research, the focus of my study is to identify specific data analysis tasks health professionals seek to carry out in a geovisualization environment. My research methods include a short series of semi-structured interviews with health professionals using ESTAT. The user feedback from this study will be used to improve and expand the ESTAT application, as well as establish the end-user needs that geovisualization for health research should fill.

Songgang Gu, Texas A&M University. Email: gsg@geog.tamu.edu; Hongxing Liu, Texas A&M University. Email: liu@geog.tamu.edu; *Derivation of shallow-water bathymetry using remotely sensed imagery*

Remote sensing is an effective way for shallow-water bathymetry due to the relationship between the water depth and reflected radiance observed by the sensor. Several studies have demonstrated that the logarithm band-ratio is a better choice for bathymetric mapping based on the assumption that this ratio is relatively insensitive to bottom-type variation and water-quality change. However, in most situations, this ratio changes with bottom types and water quality and that assumption is invalid for bathymetric mapping within the entire scene. Moreover, attenuation coefficient of the water varies with the changing water depth in reality. We proposed a new method to effectively derive water depth by removing the effects of different bottom types, water quality and depth.

Qingfeng Guan, University of California, Santa Barbara. Email: guan@geog.ucsb.edu; *PGCAL: A general-purpose Parallel Geographic Cellular Automata programming library*

Most Geographic Cellular Automata (Geo-CA) models involve a set of parameters indicating multiple geospatial and non-geospatial factors, and calibration processes are needed to determine the appropriate values of these parameters to produce realistic simulation results. However, due to the very large number of combinations of parameter values and the ever-increasing amount of high-resolution geospatial data, the calibration process is usually extremely computationally intensive. To reduce the computing time without making any simplifying assumptions, parallel computing technology was considered as a solution in this study. A general-purpose Parallel Geographic Cellular Automata (PGCAL) programming library was developed for users to easily develop and

customize their own high-performance Geo-CA models without being aware of the underlying technical details of parallel computing. Several distinguishing characteristics of Geo-CA models were considered during the development of PGCAL. First, a spatially adaptive decomposition method, i.e., the quad-tree-based domain decomposition, was implemented to reduce the workload inequality among processors, which is mainly introduced by the heterogeneous spatial distribution of geographic objects over the space. Second, an “update on change” approach was used to reduce the communication overhead among processors. Third, both dynamic and static load-balancing methods were provided in PGCAL for users to choose the most efficient method according to the characteristics of the their own Geo-CA models. The PGCAL was developed in C++ based on the Message Passing Interface (MPI) library, and can be used on most of current parallel computing systems.

Consuelo Guayara, University of Iowa. Email: consuelo-guayara@uiowa.edu; *Environmental Policies, Place, Class, Ethnicity, Gender, and Institutional Embeddedness*

I argue in this paper that researchers’ political views on environmental interventions about Amazonia are interlinked with their working and living experiences of place and the politics Amazonia as multiplicity of places play. In addition, researchers’ political views are also inextricably connected to social processes unfold in these places, and researchers’ institutional embeddedness. Amazonian images are institutionally produced by units of knowledge production with different technical relations to foreign capital and labor, with different relations of and in production that struggle to stay competitive in the production of knowledge in a twenty first century capitalism. In that sense, foreign financial assistance crucially contributes to shape the image of research about Amazonia impinging upon already uneven regional economical, social, and scientific institutional structures within countries like Colombia and Brazil. Moreover, foreign assistance creates distortions of environmental policies and practices about the Amazon. My research is based on the analysis of my data gathered during fourteen months of field work that provided the ethnographic and archival work to analyze two sets of researchers, in two different government institutions in two countries whose research work focused on Amazonia. Key terms: class, gender, sense of place, social identifications, environmental policies, institutional embeddedness, conservation

Keywords: Key terms: class, gender, sense of place, social identifications, environmental policies, institutional embeddedness, conservation, Amazonia, environmental interventions

Jeanne Kay Guelke, University of Waterloo. Email: jkg@fes.uwaterloo.ca; *Katrina and caritas: faith-based organizations’ urban visions and disaster relief efforts*

The Salvation Army and Society of St. Vincent de Paul attribute their visible first-responder status during the Hurricane Katrina disaster in New Orleans to the fact that “we were already there.” The two faith-based organizations’ disaster relief activities are examined in light of their sense of urban mission and their concepts of urban space. The massive effort by faith-based organizations (FBOs) to assist Katrina victims reactivated an ongoing public debate over the interface between church and state in the provision of emergency relief. Government funding of FBOs and their theology of mitigating human suffering suggest that FBOs will not capitulate to government’s prerogatives to safeguard its citizens; and their social justice agenda could encompass environmental restoration and sound land-use planning.

David Guerrero, Inrets. Email: guerrero@inrets.fr; *Modelling French Hinterlands: measuring deviations*

This paper explains how transport changes in the last decade have modified the relationship between ports and hinterlands in France. Data was drawn of cargo flows between French “departments” and ports, based on Customs data between 1995 and 2005. A spatial interaction model was developed to provide a set of expected results, and these were compared with the actual flows. The structure of port-hinterland cargo flows is found to be highly consistent with the spatial interaction model: most of the variation of hinterland size can be explained only by port traffic and inland distance. However, important exceptions appear when we consider different types of cargo or forelands. These “exceptional” flows are mostly those that are containerized which are found to be less “inland distance sensitive” and they contribute to distort spatial relationships of ports.

Andres Guhl, Universidad De Los Andes. Email: aguhl@uniandes.edu.co; *From degraded landscape to tourism heaven: history, environment and development in Villa de Leyva, Colombia*

The current state of a landscape represents how certain resources have been used in the past, and it also indicates some of the opportunities a society has for its future. The region near the municipality of Villa de Leyva is a good example of how this interaction between society and nature has taken place since pre-Columbian times. This paper will explore and how socioeconomic and political forces such as Spanish colonization and Independence among others shaped the landscape of this region by transforming its agriculture and land tenure regime, becoming a man-made desert. Landscape evolution continues to this day, but the driving forces of change are not related to agriculture but to tourism and development aid. The presentation will emphasize the last thirty years, when development aid transformed this man-made desert into a landscape suitable for intensive agriculture, that now has become a tourist destination.

Keywords: Development, Environmental degradation, History

Odeibler Santo Guidugli, University Of State Of Sao Paulo. Email: odeibler@rc.unesp.br; *Administrations and Local Spaces in The Context of Demographic Aging*

Local spaces and their administrations themes have assumed more significance. It is precisely, in the local spaces, that the exercise of power on local scale and the relations between this power and the different “local nations” become more evident. In these relations multiple dimensions need to be considered: economic, social, political, spatial and demographic. The last dimension is presented multifaceted in terms of children and adolescents, adults and the elderly. The research developed contemplated the issue of demographic aging in the municipalities of the state of São Paulo with population inferior to ten thousand inhabitants in the period considered between 1970 and 2005. In 1970 the total of the municipalities in this category was 275 and, in 2005 of 310. These values put in evidence the significance of this category of municipalities in the studies that try to Local Administrations and demographic dynamics considering the process of aging as a component of these administrations. It was used a stratified sample of 20% of the total of the municipalities contemplating variables that characterize aging and Local Administration. The results have shown challenging situations if it is considered the accelerated process of aging in these localities due to the distance and even lack of knowledge, of these changes which affects the exercise of power in terms of efficiencies and efficacies in the life of the elderly.

Steven Guilbert, University of Wales, Aberystwyth. Email: stg@aber.ac.uk; Suzie Watkin, Univeristy of Wales, Aberystwyth. Email: ; Michael Woods, University of Wales, Aberystwyth. Email: ; Jon Anderson, Cardiff University. Email: ; *Rural Protests and Local Interests: Scales of Belonging in Rural Political Activism*

The emergence of a broad-based rural protest movement in Britain over the course of the past decade has been premised on the notion of the countryside as a scale of belonging and a focal point for collective action. Appeals to rural identity and rural solidarity have been used to build alliances between activists concerned with different rural issues (farming, hunting, rural services, housing development, etc), and in different parts of the countryside. For individual participants in rural protest activities, however, the motivations for involvement are often rooted in the immediate experiences and challenges of the rural communities in which they live, producing a dynamic relationship between the rural and the local as scales of belonging. This paper draws on empirical research conducted in several rural communities in Britain to examine how individuals understand and negotiate the local and the rural as scales of belonging, how challenges confronting the countryside are interpreted through the local, and how changes experienced within localities are interpreted through the lens of the ‘rural’. The discursive interconnection of these scales, it is argued, both facilitates and potentially limits the disposition of rural residents towards

political mobilization.

Inci Guneralp, University of Illinois at Urbana-Champaign. Email:
iguneralp@uiuc.edu; Bruce L. Rhoads, University of Illinois at Urbana-
Champaign. Email: brhoads@uiuc.edu; Uncovering the Cumulative Effect of
Upstream Curvature on Planform Migration of Meandering Rivers

Current theoretical mechanistic models aimed at predicting planform migration of meandering rivers relate the meander-migration rates to local and upstream planform curvature where the influence of upstream curvature on migration rate decays exponentially with distance upstream. However, this migration-curvature relationship is based on a theoretical assumption about how curvature should affect near-bank flow velocity in a bend, rather than on extensive empirical studies. Furthermore, although the theoretical models based on exponential-weighting of upstream curvature effect yield fairly realistic predictions of bend asymmetry and translation, they are incapable of reproducing complex forms of bend evolution, such as compound looping - quite common features along meandering rivers. This paper investigates empirically the spatial relationship between planform migration and curvature along a variety of meandering rivers, some including compound loops. For this purpose, the weighting distribution of the upstream curvature effect on local migration rates are analyzed using two time-series models: (1) distributed lag model and (2) transfer function model. Then, the results from both methods are compared to verify the robustness of the distribution. Accurate and detailed planform geometry and curvature data necessary for such extensive analyses are obtained using parametric cubic spline interpolation, and then, arc-length parameterization of the planform data. The results indicate that the weighting distribution of the upstream curvature effect on migration rate may be more complex than currently is assumed. Thus, the study improves our understanding of the spatial relationship between upstream curvature and planform migration of meandering rivers, specifically those with compound loops.

Regionalization with Spatially Constrained Multivariate Clustering: Methodolo-
gies and Applications

Region-building has been one of the commonest problems encountered in spatial analysis (Haggett et al. 1977; Openshaw and Rao 1995; Assuncao et al., 2006). Given a set of spatial objects with univariate or multivariate values, regionalization is to aggregate the objects into a given number of spatially contiguous regions while optimizing an objective function, which is normally a measure of the attribute similarity in each region. Regionalization has been an important and challenging problem for a large spectrum of research and application domains, for example, climatic zoning, ecoregion analysis, hazards and disasters management, map generalization, location optimization, census reengineering, and health-related mapping and analysis. The research reported here proposes, implements, and evaluates a family of clustering-based regionalization methods. Two of the proposed methods significantly outperform existing regionalization methods across a set of quality measures. The proposed algorithms are fast and can find the solution in $O(n^2 \log(n))$ time.

Patterns and Parallel Urban Hierarchies: The Effects of Xinjiang Production and
Construction Corps in China's Colonization of Xinjiang

An important consequence of Chinese colonization in Xinjiang, its Central Asian frontier, is the rapid urban growth characterized by two parallel urban hierarchies. One is based on traditional urban centers and provincial economic development, the other has emerged in land reclamation areas developed by Xinjiang Production and Construction Corps (XPCC), China's apparatus for frontier development in Xinjiang. This paper attempts to demonstrate that such parallel urban hierarchies are due to the unique Chinese colonization process in Xinjiang, i.e., large-scale Han Chinese settlement insulated from the indigenous groups and independent of the provincial government. As a result, two parallel urban hierarchies evolved. Since the end of the Cold War, XPCC has accelerated the development of its own urban network as an effort of retaining Han Chinese settlers through provision of urban economic opportunities and services. This trend may lead to strengthening new regional urban centers at the expense of traditional ones, and further divide Xinjiang into two segregated socioeconomic system, one of Xinjiang Uigur Autonomous Region and one XPCC. There is need to examine how such parallel developments would affect China's design for Xinjiang's economic integration and cultural assimilation.

Anuradha Gupta, M.S., University of Hawaii at Manoa. Email:
agupta@hawaii.edu; Birds as Indicators for Terrestrial Conservation in Palau

The island nation of Palau has many endemic and endangered terrestrial species, however, knowledge of which terrestrial areas to protect has been limited. In 2003 we implemented a program to identify areas of high or unique terrestrial biodiversity using birds as indicators. Methods and criteria followed those developed by BirdLife International to identify Important Bird Areas (IBA). The IBA process identifies areas of global biodiversity importance based thresholds of threatened or regionally-restricted birds and congregations of shore and seabirds. Fieldwork was conducted in two phases. One phase consisted of presence/absence bird surveys using community volunteers and the second phase consisted of forest bird surveys using the more rigorous Variable Circular Plot method. Data was pooled and extrapolated to form recommendations for eight proposed terrestrial conservation areas. The resulting network of proposed areas included known populations of all of Palau's threatened and regionally-restricted terrestrial bird species and all of Palau's other IUCN-listed critically endangered, endangered, and vulnerable terrestrial plants and animals. The network also captured at least one representative area from all of Palau's major habitat types and many other known populations of endemic plants and animals.

Planning, University of British Columbia. Email:
gurstein@interchange.ubc.ca; Laura Tate, PhD Student, University of
British Columbia. Email: ; Virtual Spaces, Real Lives and Places: Case
Studies to and From Canada

As companies continue to use technology to segment and redistribute work processes which were once more spatially-rooted, they also impact the lives and experiences of workers and their home communities. The changes affecting workers are not straightforward; nor are they simply one-way. And such changes are often launched from within what might be termed virtual spaces, or what Menzies (2005) calls immersive environments, wherein the essential task of re-integrating segmented work occurs. Truly understanding the relationship between virtual space and real lives and communities requires in-depth and contextually-grounded case study research. The EMERGENCE Canada research project has responded by examining thirteen case studies of outsourcing through telemediated channels, involving Canada as either the source or destination of this work, and such diverse activities as: data processing; systems and software development and maintenance; accounting and financial management; telesales; customer service; training and staff development; and editorial and design functions. This paper examines the interrelationship between the virtual spaces created by outsourcing, and real communities where impacted workers live, and proposes possible implications for evolving theories of space and place. We argue that the complex geographies of virtual spaces are a mediating factor through which workers' identities, and in turn, their relationship to their communities, are reshaped. The presentation will be augmented by video clips for a documentary in production, "Global Work, Local Lives."

Stephen P. Gushue, M.S. Candidate, University of Nevada, Reno. Email: gushue9@hotmail.com; *Everyday Moapa: A Graphic Discourse on the Vernacular Landscape of Nevada's Moapa Valley.*

Situated 60 miles northeast of Las Vegas, Nevada, the Moapa Valley has a storied history of occupation, settlement, and prosperity. Sizable springs have continually renewed the Muddy River, making this valley a verdant icon within the otherwise torrid and inhospitable Mojave Desert. These anomalous waters have invited succeeding populations into the Valley allowing for varied cultural landscapes to be implanted and supplanted, especially over the past hundred years. However, if the Moapa Valley is an example of constant landscape change due to long term occupation, its younger sibling, the metropolitan area of Las Vegas, waves the emblem of overkill. With Las Vegas' booming development, a centrifugal force is spinning out of the neon valley and into the surrounding rural regions. Through the inception of the Coyote Springs subdivision along U.S. 95, the Moapa Valley is the next great bedroom community of Sin City. This will, eventually, create two types of landscapes within the valley: The vernacular one exhibiting elements of the agricultural history of Moapa, and the established landscape of those seeking a home within the megalopolis of Las Vegas. By utilizing photography, cartography, archival and field research a perception and spatial location of the vernacular landscape can be determined and represented in contrast to the oncoming development.

Julie Guthman, Univ of California Santa Cruz. Email: jguthman@ucsc.edu; *Race, Subjectivity, and the Politics of Conversion in Alternative Food Movements*

In response to stinging critiques of the insularity and whiteness of the contemporary US alternative food movement, interest is swelling in making the movement more inclusive in the interest of furthering a social justice agenda. A less white movement is undoubtedly a necessary if not sufficient condition to re-imagining how the social inequalities (including health-related) and environmental problems associated with the current food system might be addressed. Nevertheless, much of the on-the-ground work remains focused on food provision, premised not only on the assumption that certain food is inherently good, but that if such food is made more accessible and affordable to people in the "inner city" they should and will obtain and eat it. This paper speculates on a possible explanation for the apparent lack of engagement among low income African Americans in these food projects. The hypothesis it entertains is that it is mainly white subjectivities that are being enacted in these alternative spaces of food provision. Specifically, it suggests that a particular set of idioms have been produced in movement spaces that are not only insensitive to raced histories but in their claims to universalisms interpellate white subjects to participate in these spaces. The pervasiveness of white bodies, white imaginaries, and white subjectivities crowds the space for other sorts of political projects and subjectivities to emerge. Therefore, the character of these efforts says much more about the subjectivities of the white advocates of these projects than those who are the objects of their conversion and enrolment projects.

Robert N. Gwynne, University of Birmingham. Email: r.n.gwynne@bham.ac.uk; *Upstream and downstream strategies of wine firms and local development impacts in Chile's Colchagua valley.*

This paper explores the theme of governance as it relates to the evolution of global commodity chains in agro-industry and their incorporation of wine firms in Chile's Colchagua Valley. The paper specifically examines the upstream and downstream relationships of key wine firms in a valley in which vineyard planting and wine production has grown rapidly over the past fifteen years in order to supply export markets. The paper assesses how this growth of wine exports has impacted upon local development and, in particular, local supply relationships and the behaviour of land and labour markets.

Hoe Hun Ha, SUNY - Buffalo. Email: hoeha@buffalo.edu; Jean-Claude Thill, The University of North Carolina at Charlotte. Email: jfthill@unc.edu; *Analyzing Pedestrian Accidents with Spatial Regression and DecisionTree Induction: A Study in Buffalo, NY*

Traffic safety studies have underscored the hazardous conditions of pedestrians in this country. Pedestrian fatalities exceed ten percent of all traffic-related fatalities, while injuries incurred by pedestrian during a crash are often highly debilitating. This situation calls for increased public awareness of the pedestrian safety issue and better knowledge of the main factors contributing to traffic hazard for pedestrians. In this paper, we present machine learning and spatial regression approaches to model pedestrian accident rates. First, regression diagnostics are carried out to test for spatial dependency in the data; spatial regression models are estimated. Next, a decision tree is induced on the basis of various environmental and socio-economic conditions. The case study presented is in Buffalo, NY.

Barry N. Haack, George Mason University. Email: bhaack@gmu.edu; Ann Rafner, AMEC. Email: ann.rafter@amec.com; *Double Sampling with Remote Sensing: a Review and Case Study*

With the relatively recent availability of operational fine-spatial resolution imagery from satellites, there is more opportunity to conduct spatial sampling with combinations of spatial resolution data. This method is generally called double sampling with regression but has also been referred to as ratio estimation. It is also a variation or related to stratified sampling, multilevel sampling and nested sampling employed by USDA for agricultural statistics and by others for different applications. Double sampling consists of first using a coarser spatial resolution sensor to delineate a feature or features of interest such as open water bodies for waterfowl, forests, wetlands or a specific crop. For selected samples within the full study area, a second delineation is done with a finer spatial resolution system which is presumed to be more accurate. A statistical comparison of the two estimates for the selected sample areas is made and if a suitable relationship exists, a correction factor can be determined and applied to the full study area. Double sampling was fairly common in the early periods of space borne remote sensing but is less frequent recently. This presentation will review the process of double sampling and provide a case study. The case study is using the technique for determining the extent of the winter rice crop in Bangladesh with Landsat data and statistics provided for local administrative units by agricultural agents. That study provided excellent correlation between the two data sets.

Rebecca Haacker-Santos, M.S., SOARS-UCAR. Email: rhaacker@ucar.edu; Rajul Pandya, PhD, SOARS-UCAR. Email: pandya@ucar.edu; Annaliese Calhoun, B.A., SOARS-UCAR. Email: acalhoun@ucar.edu; *Geography and Geoscience: Working together to build a diverse scientific workforce*

Understanding and responding to the full spectrum of societal issues resulting from our increasing interaction with the planet requires developing a geoscience workforce that draws from the full diversity of the US population. Not only will this make the science stronger by engaging multiple perspectives, it will ensure the relevance of the science to all communities. In the geosciences, as in geography, participation by members of underrepresented groups is low. In order to better recruit and retain students from diverse backgrounds, we seek to form partnerships with the geographic community around the successful geoscience mentoring program, Significant Opportunities in Atmospheric Research and Science (SOARS®). The mission of SOARS is to broaden participation in the geosciences, especially atmospheric sciences. SOARS is a multiyear undergraduate-to-graduate bridge program that includes a supportive learning community, multidimensional mentoring, and a structured summer research internship. This combination of elements has proven successful; in its 11 year history, 81 of the 104 SOARS students have completed or are enrolled in graduate school. SOARS seeks to build on its current efforts to recruit geography students by offering them relevant and unique opportunities for research at the National Center for Atmospheric Research (NCAR). The presentation will describe SOARS' strategies in more detail, and will discuss research opportunities at our laboratories for students with a geography background. We also wish to explore opportunities for long-term collaborations to broaden participation in both geography and geosciences.

Bethany Haalboom, M.A.; B.A., Duke University. Email: bjh14@duke.edu; **Lisa M. Campbell, Ph.D, Duke University. Email:** lcampbe@duke.edu; *Still using without losing: the Ostional sea turtle egg harvest ten years later*

In 1994-95, (Campbell 1998) assessed a legalized, commercial harvest of olive ridley sea turtle eggs in Ostional, Costa Rica, and the extent to which it exemplified two contemporary themes in wildlife conservation: 'sustainable use' and 'community-based conservation'. She found that the socio-economic benefits from egg harvesting were substantial and widely recognized by community members, and that legal and administrative structures ensured community participation in, and control of, resource use. Benefits combined with participation to gain local support for conservation of nesting sea turtles and their eggs. In 2004, Trow repeated Campbell's original survey, to assess the extent to which the benefits and perceptions of the egg harvest have changed. While perceptions of impacts have remained the same, however, some explanations for rankings have changed. Of particular note is the greater emphasis on the importance of conservation, where conservation awareness has increased and it can now be considered an important incentive for participation in the project. Applying Agrawal's (2005) theory of environmental subjectivities, this study highlights how community members may have come to view these sea turtles and their unique nesting behaviour differently by participating in a long term community based conservation project. However, while local subjectivities may be changing, and this may be linked to participation in governance of the resource, other potential motivations have to be considered. In addition, in the approximately ten year interim between surveys, a variety of social, political, and economic changes have occurred, and these changes help contextualize results.

Johanna Haas, J.D., A.B.D., Illinois State University. Email: jmhaas2@ilstu.edu; *Promised Land: The cult of private property as represented in early Appalachian religious practices*

Over the last century, a strong societal belief in private property has dominated the culture and economy of Appalachia. While many social forces worked together in creating this set of beliefs, the Protestant church had a predominant role in disseminating and solidifying these beliefs. A survey of sermons, hymns, and other historic sources of the mountain churches shows a dual construction of private property conceptions. First, an emphasis on a morality of traditionalism and self-reliance lead to a passive acceptance of place in the world, both treasuring ones own property rights and respecting those of others. Second, these religious documents show a literalist, fundamentalist construction leading to a strong belief in a tangible heaven where a better home literally will be granted. These religious beliefs enabled the pattern of primitive accumulation of coal lands away from the Appalachian mountaineers and into the hands of the coal companies. A promised land therefore became a literal concept, both in the here and the hereafter.

Lee Hachadoorian, CUNY Graduate Center / Hunter College. Email: leehach@geo.hunter.cuny.edu; *Homogeneity Tests of Tiebout Sorting - A Case Study at the Interface of City and Suburb*

The Tiebout Hypothesis has stimulated 50 years of research into the relationship between residential location and local taxes and services. One thread in the literature attempts to corroborate Tiebout by explaining population homogeneity (an indicator of sorting) as an outcome of increased consumer choice associated with a larger number of local jurisdictions to choose from. This literature has treated an MSA's large central city as just another jurisdiction on par with small suburban municipalities. The proposed explanation is confounded by (a) sorting for reasons (such as ethnicity) having nothing to do with local taxes and services; (b) sorting based on service differentials within the central city; and (c) statistical sorting, the tendency for smaller subpopulations to be more homogeneous than the population from which they are drawn. Recent attempts to correct for this statistical artifact have failed to take into account the spatial dependence of population characteristics. Using the neighboring New York counties of Queens (a jurisdictionally unified city county) and Nassau (a jurisdictionally fragmented suburban county) as a case study, we quantify the dissimilarity between populations occupying contiguous census tracts and look to see whether sharp differences in population characteristics are more likely to be found across jurisdictional borders. We also ask how these patterns differ between city and suburban landscapes.

Keywords: Tiebout Hypothesis, residential location

Jason Hackworth, University of Toronto. Email: jason.hackworth@utoronto.ca; *Neoliberalism, neoconservatism, and the spread of faith-based social welfare in the US*

The Bush Administration has been keen to extend and create faith-based social welfare as an eventual replacement to centralized government administration of housing, welfare, and health care for the poor. On the one hand, the set of initiatives is very much in line with the politics of the Right in the US?focused on devolved governance, "family values", etc, but on the other, this has created an interesting tension between the neoconservative and neoliberal factions of his constituency. The former are wildly supportive of the measures, but the latter are skeptical because the programs do not lead to lower expenditures. As Jennifer Zeigler of the famously-neoliberal CATO institute argues, "Faith-based organizations are crucial members of civil society that need to replace the federal welfare system, not be dependent on it". This paper critically examines the tension created by this program and speculates on what it tells us about the (in)compatibility of neoconservative and neoliberal social policy.

Keywords: neoliberalism, neoconservatism, welfare

Brandon Harley Haddock, Missouri State University. Email: Haddock75@MissouriState.edu; *"Gay Camp": Analysis of Outdoor Recreation in Gay, Lesbian, Bisexual, and Transgender Culture and the Economic Impacts in the Ozarks.*

Douglas County, MO is one of the most impoverished counties in Missouri. However, the opportunities for tourism and outdoor activities in the county provide for potential economic growth to the area. Specifically, the Cactus Canyon Campground has become a national and international attraction to the Gay, Lesbian, Bisexual and Transgender (GLBT) community. Each year brings increased global acceptance of this community through the legalization of rights and dismissal of laws against the GLBT. This acceptance is tied to an increase in the visibility and specific services aimed at the inclusion and acceptance of the GLBT community. The 'power of the pink dollar', or spending power of the GLBT community, has become an important area of study in many different disciplines. This study examines the geospatial patterns of incoming Cactus Canyon Campground users and focuses on three main objectives: (1) the economic strength of GLBT tourism in the Ozarks, (2) a survey of where campground users come from, and (3) an evaluation of the economic patterns of campground users. A survey has been designed to allow comparison of travel dollar spending in the Ozarks with other travel spending by the participants. Geospatial patterns of campground users will be evaluated through thematic mapping, interpolation of actual frequency, and forecasted needs for tourism capabilities. The results of this research will be used to highlight the positive economic impact of the GLBT community on outdoor recreational activities that can increase awareness of the community and activities in the Ozarks region.

Gregory Haddock, Northwest Missouri State University. Email: haddock@nwmissouri.edu; **Mark Corson, Northwest Missouri State University. Email:** mcorson@nwmissouri.edu; **Jeffrey Bradley, Northwest Missouri State University. Email:** jbradle@nwmissouri.edu; *The New Old Yellowed Notes - Exploring the rate of change in digital lecture tools*

This research attempts to quantify the nature of change within various teaching styles and methodologies. New digital pedagogy tools such as online courses, online course components, presentation software, and multimedia animations take resources and time to develop. Once developed, resistance to immediate change is inevitable. Due to the dynamic nature of the discipline, resistance to change is not appropriate for geography courses, whether in human, physical, or geospatial techniques. The focus of this research is on geography faculty who have and have not developed various digital elements to their courses. The rate of development and rate of change of these items will be measured and explained.

Keywords: teaching methods, geography pedagogy

Brian Hagan, NGA. Email: haganb@nga.mil; *Geographic Names Transactional Gazetteer*

The geographic regions of Western Asia and the Middle-East are linguistically complex. The place-names by which villages, hills and rivers are called vary greatly depending on the tribe and dialect of the person speaking or writing the name. In order to accurately portray names of places and features in these areas, NGA must leverage as much knowledge from as many sources as possible. The purpose of this paper and demonstration is to show results of an NGA effort to use the power of technology and the internet, via a wikipedia-style transactional gazetteer, to collect and provide geographic name information to customers, in critical areas of the world. This on-line, transactional gazetteer will allow all internet users/customers to contribute geographic names and related information

for Afghanistan, Pakistan and Iraq. NGA's Geographic Names Data Base (GNDB) will serve as the foundation of names, with the community providing input and variations in categories such as: 1) Names and locations of geographic features not found in the NGA database 2) Variations of spellings of existing names 3) Alias names for features and places 4) Updates on geographic information for places and features 5) Source(s) of new name or information 6) More accurate geographic coordinates for names/places The paper will give a summary of the data that has been collected to-date, as well as a demonstration of the capabilities of the gazetteer.

Keywords: gazetteer, GIS, geographic names

Chris Hagerman, Portland State University. Email: hagerman@pdx.edu; Constructing a sustainable central city neighborhood in Portland, Oregon

Many cultural geographers have been critical of the ways in which powerful interests have disciplined central city spaces through redevelopment. In Portland, Oregon, a city with a history of progressive, normative environmental and urban visions, the question becomes whether to consider planning for sustainability and new livable neighborhoods in a similar light. The River District, a historic waterfront and warehousing district, has undergone extensive public planning and recent redevelopment and this research investigates the politics of care, scale and memory articulated through transformations of this material and discursive landscape. A recently opened theater, a platinum LEED certified conversion of a historic armory building, simultaneously projects ties to the city's past, sustainable design, and new forms of community. However, issues of social justice have been overshadowed as this project and the surrounding area has been recast as a new urban livable community. The armory demonstrates a spatial strategy of shifting emphasis from segregating the urban poor to redeveloping declining industrial areas within a symbolic economy that draws on appeals to sustainability, theories of the creative class, and justifications of the deconcentration of poverty thesis.

Keywords: Portland, planning, sustainability, historic preservation, social justice

Patrick D Hagge, Oak Ridge National Laboratory. Email: haggpe@ornl.gov; Marie L Minner, Oak Ridge National Laboratory. Email: minnerml@ornl.gov; Nagendra Singh, Oak Ridge National Laboratory. Email: singhn@ornl.gov; Human Interventions in Semi-Automated Approaches to Spatial Data Fusion Error Detection

LandScan USA is a high-resolution population distribution model of the United States developed by Oak Ridge National Laboratory. LandScan USA benefits from incorporating disparate datasets; however, this data fusion exposes major qualitative limitations in the input data, which, if not corrected, can result in errors in the model output. Errors in datasets include spatial errors, attribute errors, temporal errors, and functional errors. Semi-automated tools are useful for finding large errors through reconciliation of multiple data attributes against a constructed model (for example, locating all highly populated census blocks with high agricultural land cover). However, such tools are limited to identifying mathematical anomalies and have no utility in assessing the extents to which the errors need to be corrected. Human interventions are necessary to correct inaccuracies by employing qualitative judgment through recognizing the currency and lineage of certain data sets, understanding settlement patterns, and employing a healthy skepticism of attributes associated with pre-existing datasets. This paper discusses the nature of the error encountered in the data fusion process and the importance of human interventions as part of a semi-automated approach to detect, evaluate, and minimize such errors.

Keywords: GIS, error detection, data fusion

Julia Haggerty, University of Otago. Email: julia.haggerty@stonebow.otago.ac.nz; Hybrid Environmentalities and Freshwater in Aotearoa New Zealand: An exploration of multi-cultural narratives of social participation in river management

Based on the recent stewardship history of one of Aotearoa New Zealand's most celebrated rivers, the South Island's Maitai River, this paper considers the interplay between experiences in freshwater governance and subjectivities, with special attention to the influence of water's particular socio-ecological complexities. Due to the complex ways in which they are constructed and function as (natural) resources, freshwater rivers offer an opportunity to probe the boundaries and dimensions of the concept of environmentality (Agrawal, 2005) as an analytical tool. Drawing on archival materials and oral history narratives of river stewardship gathered from Maori and Pakeha communities in Murihiku/Southeast, the analysis documents encounters between socio-ecological dynamics, governance institutions, and the world views and practical experiences of river users. Evidence presented in this analysis affirms scholarship that points out the potential for nurturing environmental subjectivities through the devolution of resource control to robust local institutions. The paper also argues that environmental and political dynamics have created opportunities for synergistic

exchanges between Maori and European as well as expert and lay perspectives about freshwater ecosystems. However, this case study also emphasizes the transformative and often destructive powers of neoliberal economic ideologies, colonial histories and the biophysical qualities of river systems in mediating the outcomes of environmental governance for both subjectivities and ecologies.

Euan Hague, DePaul University. Email: ehague@depaul.edu; Edward H Sebesta, Independent Researcher. Email: ; Locating the Confederate nation: The United Daughters of the Confederacy and the Jefferson Davis Highway, 1913-1944

The United Daughters of the Confederacy (UDC) has long been engaged in a nationalist project to reposition Jefferson Davis, the leader of the slave-holding Confederate States of America (C.S.A.) during the 1861-1865 Civil War, as a hero for all Americans. Placing plaques and monuments to Davis throughout the United States, one of the major UDC efforts occurred between 1913 and 1944 when this women's organization for descendants of Confederate servicemen unilaterally named a transcontinental highway in honor of Davis. Mileposts and marker plinths were cemented along roadsides from Alexandria, Virginia to San Diego, California and from the U.S. border with Mexico to that with Canada. Claiming the Jefferson Davis Highway (JDH) as a four thousand mile long memorial to 'the great American soldier and statesman' the UDC produced booklets and maps describing the JDH and members wrote poetry extolling its path across the American landscape. This UDC attempt to relocate Confederate nationalist commemoration beyond the boundaries of the 19th century C.S.A. came at a time when white authority was being written into the cultural landscape of the United States. The UDC's efforts, therefore, comprised a nationalist project to ensure that the Confederate nation was honored throughout the United States.

Tina Haisch, . Email: tinahaisch@gmx.de; Christof Kloepper, . Email: christof.kloepper@unibas.ch; Tolerance and the creative class. A sympathetic critique

Tolerance is a crucial concept in Florida's theory on the creative class. Florida claims that urban regions with a high degree of tolerance are well endowed with creative class, which, in turns, boosts urban development. The objectives of the paper are the following. Firstly, we present empirical results of the conceived impact of tolerance on the creative class in 8 European countries. Secondly, our paper puts some critical remarks concerning the conceptualisation and empirical measurement of tolerance at the regional level by Florida. One issue that will be addressed is the multi-dimensional nature of tolerance. We will also show that tolerance has a different meaning in different spatial contexts. Thirdly, we will present a more in-depth analysis of Switzerland that is based on unique data of public direct votes on topic with relevance to tolerance. These data indicate that the significance of tolerance can not be easily assessed by an analysis of only one kind, and that the factor tolerance is closely linked to other factors such as long term political traditions. In addition, evidence is provided that, even though tolerance is highly correlated to creative class distribution, it does not allow to forecast spatial mobility of the creative class.

Keywords: creative class, tolerance, TTT

Jouni Häkli, University of Tampere. Email: jouni.hakli@uta.fi; Biometric identities as symbolic violence

The technologies of biometric passport control have been introduced as a security measure in the context of the War on Terror. For example, the US Visitor and Immigrant Status Indicator Technology system performs a risk calculus on passengers on the basis of database information about travellers' behaviour, financial situation, health, previous destinations, etc. Passengers are then categorized as trustworthy, questionable and dangerous. Coupled with the idea of travellers' infallible identification based on their bodily features, this calculus, and the identities it confers on a person, come to enjoy an aura of

legitimacy and objectivity. This paper argues that biometric identities created for risk profiling represent symbolic violence in the form of arbitrary defamation imposed upon various forms of otherness ranging from ethnic and religious difference to subcultural behaviour. In the aftermath of 9/11 we all have become potential suspects with our identities subject to suspicion. The institutional authority to inflict symbolic violence in the name of a heightened sense of security has gradually turned exception into a norm: we can be stopped anywhere, be interrogated on our identities, and ultimately have them replaced by ones that fit in with the narratives rooted in attempts to control risk, ambiguity and uncertainty.

Keywords: biometrics, security, mobility, body, identity, symbolic violence

Daniel M Hale, University of Leeds. Email: geodmh@leeds.ac.uk; "Their pound of flesh": job satisfaction and work-life balance beyond the family

The emergence of work-life balance as the latest manifestation of the workplace-based feminist project has focused theory and policy on those with child- and increasingly elder-care responsibilities. Contemporary policy and academic debates have reflected this to the extent that work-life balance is now shorthand for the attempt to combine work pressures and family responsibilities. Reconciling these spheres of activity constitutes an increasing problem in advanced producer economies. I argue that this conception of work-life balance, however, is structurally myopic. The oversimplification of work-life balance discourses render workers with no family or care responsibilities invisible. The paper seeks to augment the feminist 'ethic of care' which forms the foundation of the work-life balance discourse, and in doing so to pay attention to those without care responsibilities, but with competing claims on their work-life balance: younger workers. This paper uses an expanded notion of job satisfaction, one which acknowledges the importance of local family, community, and other non-work contexts in its establishment to understand the ways in which work-life balance is contested and achieved. Drawing on a series of in-depth interviews based in the legal sector in the north and south of England, this paper examines and theorises ways in which younger workers encounter and sometimes overcome discursive and structural barriers to establish work-life balance.

Keywords: Work-life balance, job satisfaction, law, neoliberalism

Beth L Hall, Desert Research Institute. Email: Beth.Hall@dri.edu; Timothy J. Brown, Desert Research Institute. Email: tbrown@dri.edu; The relationship between drought and wildfire in the US

There is an intuitive assumption that the more extreme the drought, the greater the potential for an active wildfire season. The 2006 fire season in Texas and Oklahoma is a recent good example of this, where extreme fire activity was attributed to extreme drought. This study is motivated in part to better understand the relationship of drought and fire business. Also, it is of interest to provide fire management with an indication of precipitation thresholds related to fire business. While there have been other studies relating precipitation and drought indices to fire activity, this study is further motivated to examine how effectively a newly developed dataset of high-spatial resolution standardized precipitation indices (SPI) can be related to fire business. A recent project at the Climate, Ecosystem and Fire Applications (CEFA) at the Desert Research Institute (DRI) produced an 1895-2003 dataset of SPI indices for 1-, 3-, 6-, 12-, 24-, 36-, 48-, 60-, and 72-month cumulative time frames based on approximate 4km resolution PRISM precipitation data. This dataset is related to over 200,000 wildfire ignitions, area burned and prescribed burning across the US to assess quantitative thresholds of drought related to fire for the period 1985-2003. Because of varying fuel types and seasonality, it is relevant to examine subsets of fire data and SPI values for varying times of the year, ignition causes, and geographic regions. This presentation provides results of this study and discusses the relevance of this information for decision-support in fire management.

Keywords: drought, fire, SPI

Davin Hall, University of Cincinnati. Email: halldi@email.uc.edu; Cops and Robbers in the Changing City: Examining the relationship between police presence and crime rates among gentrification

This study seeks to examine and explain variation in the relationship between crime and police presence in urban subdivisions while gentrification practices are underway. A ratio of arrests to crimes will be created and mapped in order to analyze police presence (arrests) as compared to crimes (reports). Reports of crime and police arrest reports were collected from a 44 month period (January, 2003 to August, 2006) and mapped across U.S. Census delineated neighborhood boundaries in the city of Cincinnati. Police activity, particularly as concerned with race, has been an important topic in Cincinnati for several years, and this study hopes to answer whether police are disproportionately targeting poorer neighborhoods with higher concentrations of racial minorities, and relaxing their presence in more affluent neighborhoods. Further, crime data will be analyzed to determine if changes in arrest rates or crime rates have an effect on one another, and what kind of effect this is. Gentrification practices in

Cincinnati will then be examined to determine if police are heightening their presence in areas targeted for revitalization, and if these areas affect crime rates.

Keywords: Crime mapping, policing

Heather M Hall, University of Waterloo, Ontario, Canada. Email: hmall@fes.uwaterloo.ca; Being Realistic about Planning in No Growth Communities: Challenges, Opportunities and Foundations for a New Agenda

Regional disparities, most notably of the 'heartland-periphery' pattern, have been a distinctive feature of Canadian urban geography throughout the industrial era. New regimes of economic prosperity, recessions, and restructuring in the post-industrial era coupled with demographic fluctuations have added new and accentuated divisions and disparities creating an increased gap between cities that are growing and not growing. Under these conditions, it seems realistic to expect that no-growth cities might begin to develop distinctive planning strategies centered on a theme of decline or no growth scenarios. However, this has not been the case. The City of Greater Sudbury is located in North-eastern Ontario and is best known across Canada for its original resource-based 'boom', its unsustainable mining practices and subsequent decline. The 21st-Century City of Sudbury has since evolved into a more balanced regional centre. Nonetheless, the population of the City has been fluctuating over the last 30 years, experiencing decline, slow growth, and no growth scenarios. This research determines why decline is occurring and investigates the opinions of those involved in the planning and economic development process through key informant interviews with planners, economic developers, consultants, and politicians regarding planning. The research findings document the contradictory perceptions that surround planning in no growth locales. The paper further explores the challenges and opportunities for no growth urban areas and concludes with a discussion of what might constitute alternative criteria for a New Agenda capable of generating more realistic economic and planning policy and strategy considerations for no growth urban areas.

Jaclyn M Hall, University of Florida. Email: jhall@geog.ufl.edu; Seeing the Forest for the Trees: Change beneath the canopy in East African Rain Forests

For many East African rain forests, viewing the 55 m tall canopy from an opposing ridge gives the impression of healthy and intact forest, yet underneath are found farms, numerous stumps, sawpits and other evidence of human activities. This study investigates variations in composition and structure within the area that would be classified as rain forest, and develops methods to determine 'within land cover' change. Humid forests are some of Earth's most biodiverse and ecologically sensitive ecosystems, therefore, new satellite analysis methods must be developed in order to maximize our understanding of the spatial dimensions anthropogenic disturbance on humid forest condition. In order to understand species-level organization at the landscape level this study investigates spectral signatures of various forest conditions to integrate three spatial scales. Fine-scale species-level data from detailed field surveys are used to understand stand canopy characteristics at a meso-scale in order to generate an understanding of ecological patterns and change processes at the landscape scale. Regression and ordination are used to create indices of biological parameters of humid forest, including numerous canopy structural characteristics. The regression results also give new understanding to the spectral signature of various forest structures, which will help integrate data from multiple sensors into landscape change analyses. Index maps from images of different dates are used to characterize change within the forest land cover. The statistical methods developed by this project can be replicated to continuously map biophysical characteristics of other terrestrial ecosystems.

Peter V. Hall, Dr, Simon Fraser University. Email: pyhall@sfu.ca; Disconnecting: are seaports compatible with urban sustainability?

This paper considers the technological, economic and institutional transformations that have changed the relationship between coastal cities and their seaports. During the last thirty years, the function of many urban seaports shifted from serving as gateways to their respective regions and associated hinterland, into logistics hubs that facilitate widely dispersed global trade flows. Containerization and the "just-in-time" logistics revolution in freight transportation has brought a significant redistribution of costs and benefits among port workers, neighbouring communities, local industry and global manufacturers and distributors of goods located across the globe. The resulting disconnection of seaports from host localities presents new challenges to the search for urban sustainability. Lessons from the transformed relationship between coastal cities and their sea port can illuminate the dynamics of urban paradigm shift.

Keywords: Seaports, port cities, containerization, logistics, urban sustainability

Peter Hall, University College London. Email: p.hall@ucl.ac.uk; Forward from Polynet: Anatomy of an Urban System

The POLYNET project importantly found that physical or geographical polycentricity was not the same as functional polycentricity: a region like South East England, which at first sight appeared to be dominated by London, was in fact achieving a degree of functional polycentricity because London's very success as a global city was leading it to "export" specialised functions to at least some of the fifty other city regions that constitute this particular Mega-City region. Financed by the Balzan International Prize, a follow-up study will now try to trace the evolution of the entire urban system of England and Wales since 1961, relating it to earlier historical roots. The basic hypothesis is that England and Wales contain other major polycentric Mega-City regions - West Midlands, North West England, Yorkshire, North East England, South Wales - but that they have historically evolved in ways quite different from the recent experience of South East England, and that their future prospects for similar evolution are distinctly less favourable.

Keywords: POLYNET, Urban System, Mega-City Region

Sarah Hall, Dr, Loughborough University. Email: s.j.e.hall@lboro.ac.uk; Practical theory and theorising practice: exploring the economic geographies of 'the case method'.

Following calls to acknowledge the increasingly theoretical basis of contemporary economic life (Thrift 1997), this paper explores the role of MBA programmes as intermediaries between economic theory and contemporary financial services practice. I combine fieldwork conducted in US and UK business schools and university economic departments with research on financial practitioners working in London's financial district, to explore the economic geographies of theory and practice at the heart of 'the case method'. This approach to teaching in business schools was pioneered in Harvard in the 1920s but is now widely used in MBA programmes around the world. 'The case method' involves business school faculty preparing a case study firm or scenario that students work through, typically in groups, learning economic theories and principles through their practical application, rather than through more traditional, lecture based approaches. I use this empirical material to argue that the popularity of 'the case method' is symptomatic of the changing nature of theory itself within contemporary financial service practice as more practical based theories are increasingly prioritised and rewarded. Drawing on literature from actor network inspired social studies of science, particularly MacKenzie (2006), I document the co-production of 'the case method' by both 'economists in the wild' (financial services practitioners) and 'confined economists' (economics and business school faculty). I suggest this points to the rise of a more geographically and culturally situated type of practical theory within financial services in addition to the abstract theories of financial economics more typically associated with the industry.

Keywords: Practical financial theory, 'the case method', London's financial district

Jessica Wynne Hallenbeck, University of British Columbia. Email: JessicaHallenbeck@gmail.com; The Urban Creative Food Economy; Spaces of Cultural Production and Reflexive Consumption in Vancouver

Cities are sites of consumption, but importantly, are also places where consumption is closely aligned with notions of community and history. The urban creative food economy plays an integral role in the formation of new spaces of production and consumption within urban areas. This economy emerges alongside other neo-artisanal industries to form places of visible reflexive consumption, contributing to the cultural capital of cities. This paper is particularly concerned with exploring the relationship between equity, food retailing, and neo-artisanal industries in Vancouver. The main body of this paper examines the question: What are the spatial, social, and cultural consequences of the formation of the urban creative food economy? This research question links economic and social geography theory to empirical fieldwork conducted in downtown Vancouver. The rhetoric of Vancouver as a "livable city" is often incompatible with ideas of social equity, and these tensions play out at the intersection of consumption based placemaking and gentrification processes. As the abstraction of cultural value into market value has tremendous social consequences, it is important to critically assess how the negative impacts of the urban creative food economy can be mitigated through urban planning and policy responses. Vancouver, boasting the highest amount of restaurants per capita in Canada, provides an excellent lens through which to examine the effects of the urban creative food economy.

Kerry Q Halligan, UC Santa Barbara. Email: halligan@geog.ucsb.edu; Dar A Roberts, Ph.D., UC Santa Barbara. Email: dar@geog.ucsb.edu; Integrating Hyperspectral and Lidar Data for Fine-Scale Characterization of Wildland Fuels in Yellowstone National Park

Fire is a locally and globally important terrestrial process impacting vegetation dynamics and the global carbon cycle and posing human safety and property risks. High quality maps of wildland fuels are a critical component to successful fire modeling efforts for fire suppression, long-term fire planning and carbon modeling purposes. Advances in remote sensing provide for unprecedented analysis and mapping of wildland fuels. Hyperspectral data provide biochemical information on vegetation that can be used to map fuel type and condition. Lidar data provide detailed vegetation structure information which allows for estimation of critical fire parameters such as fuel loads and canopy height. In this research we evaluate the strengths of these data types and their integration for producing enhanced maps of fine-scale fuel patterns in Yellowstone National Park. New methods and tools are demonstrated for retrieving critical fuel parameters from lidar and hyperspectral datasets. Fine-scale maps of critical fuel parameters are generated for eventual inclusion into existing fire models.

Keywords: fire, fuel, remote sensing, hyperspectral, lidar, forest, conifer

David L. Halsing, M.S., U.S. Geological Survey - Western Geographic Science Center. Email: dhalsing@usgs.gov; System Modeling as a Decision Support Tool for Managing Water Resource Vulnerability in a Southern California Watershed

The Water Replenishment District of Southern California manages water resources in two hydrologic basins, the West Coast and Central Basins in southern Los Angeles County. Management activities include ground-water withdrawal, precipitation-based ground-water recharge, water importation, water distribution amongst municipal and industrial uses, artificial ground-water recharge, desalination, and water injection into aquifers to reduce saltwater intrusion. We constructed a system-dynamics model to represent the physical, informational, and economic stocks and the flows between them. Stocks include sources and sinks of surface water and ground water, human population, commercial and industrial facilities, demand for water, and economic and financial costs of water supply, replenishment, imports, and other programs like desalination or conservation. Flows between these stocks represent changes over time in the physical movement of water, number of people or firms, accumulation or reduction of water demand, and cumulative spending. Once we established the proper baseline values for these stocks, flows, and the mathematics of interactions between them, we constructed a user interface that presents water managers with a variety of inputs they may use to assess system response. These inputs may include policy options (conservation programs, increased purchase of external water supplies), demographic changes (increased migration or birth/death rates), and natural hazards (a large earthquake that disrupts water import, storage, or delivery systems). Users can modify these input parameters and calculate changes in ground-water supplies, water budget deficits, or economic impacts resulting from these perturbations. The model should thus provide a useful decision support tool for water management.

Christopher W Halvorsen, University of Arizona. Email: cwhalvor@email.arizona.edu; Constructing ungovernability: Popular insurgency in Oaxaca, Mexico

Recent events in Oaxaca, Mexico demonstrate the continued relevance of the spatiality of resistance for understanding social movement activism and alternative political projects. In this case, the creation of autonomous spaces is not an end to itself, but a means of transforming society. Through a strategy of spatial reterritorialization, social movement actors are able to construct alternative forms of political organization and to have more power in their relationships with the federal and state governments. We come to see the need for social movements to engage with the state as a heterogeneous sphere, which leads to a complex politics of legitimacy for both the state and social movements. This fluid movement between a politics of demand, in which social movement actors force changes in the state apparatus, and a politics of the act, in which movements construct new forms of social relations in their own sites of activism, represents the dual nature of much activism that attempts to alter spaces of resistance while at the same time negotiating with broader social structures. The broad-based popular movement in Oaxaca that has occupied the state's capital city presents an example of the possibilities of social movement projects that recognize the spatiality of politics and the need to move beyond mere resistance to form creative alternatives.

Sarah J. Halvorson, Ph.D., University of Montana. Email: sarah.halvorson@umontana.edu; "Lurking Evils" and "Native Offensives": Gender, Waterborne Disease and Sanitary Science in the British Raj

In the nineteenth century, the medical advisors of the British Raj pursued various tactics and strategies in an attempt to guard the health of the sons of the empire from what they perceived as a potent and disease-filled landscape of "lurking evils," "choleric attacks," and "native" offensives. This paper expands upon this history in relation to the emergence of a European-oriented sanitary science and policy as it was adopted in the cities of the Indian frontier. Drawing upon an analysis of the British Army Medical Department's Statistical, Sanitary, and Medical Reports of the 1860s, the paper charts the gendered logic underlying the project of mapping waterborne disease and environmental risk that was undertaken by the Royal Commission of the Sanitary State of the Army in India. Looking through the lens of water and sanitation policy, the paper draws attention to a racialized and gendered scientific discourse and sheds light on the interconnections among imperialism, disease, impurity and morality in the constructions of gendered constitutions of waterscape and colonial subject.

Hillary B. Hamann, PhD, University of Colorado at Colorado Springs. Email: hhamann@uccs.edu; Nel Caine, PhD, University of Colorado at Boulder, INSTAAR. Email: cainen@colorado.edu; Mark W. Williams, PhD, University of Colorado at Boulder, INSTAAR. Email: markw@snoobear.colorado.edu; Ken Hill, University of Colorado at Boulder, INSTAAR. Email: kenneth.hill@colorado.edu; Diurnal variations in isotopic and solute concentrations of two alpine headwater streams during snowmelt runoff

Although an ionic pulse from snowmelt has been recognized in early stream runoff from snow-covered catchments, most chemical samples are taken as grab samples on a daily, weekly, or coarser time scale. In order to identify diurnal signals during the period when the ionic pulse may be most pronounced, we collected samples every 4 hours from two alpine, headwater streams in the Colorado Front Range during the first month of three snowmelt seasons. Data from the Martinelli and Saddle catchments demonstrate that an ionic pulse from snowmelt is transmitted to streamwaters, and that diurnal variations in solute concentrations are present. Although magnitudes varied, anions of strong acids showed the largest and most rapid diurnal changes with nitrate increasing by a factor of 4.2 (13.6 $\mu\text{EQ/L}$ to 57.1 $\mu\text{EQ/L}$) and sulfate increasing by a factor of 4.5 (6.7 $\mu\text{EQ/L}$ to 29.9 $\mu\text{EQ/L}$) during a 24 hour period at the onset of melt. DOC and d18O values also demonstrated a diurnal pattern. The magnitude of these, and of most ion concentration changes, decreased rapidly during the first 7 to 10 days of streamflow as discharge increased on the rising limb of the hydrograph. The spatial and inter-annual differences in diurnal solute signals may be explained by annual snowpack and basin accumulation patterns. Our results suggest that grab samples collected early during snowmelt may be subject to larger errors than later in the season, and that pooled samples or more frequent sampling may be necessary for biogeochemical investigations.

Jennifer Hamilton, University of Montana. Email: jennifer.hamilton@umontana.edu; Rebuilding in the Midst of Disaster: An Assessment of the Response to the 2005 Kashmir Earthquake

The October 8, 2005 earthquake in the disputed territory of Kashmir was of an unimaginable scale. Many complex forces, both societal and physical, were interwoven to create a devastating situation and humanitarian crisis. The purpose of this research is to assess the damage in the valleys most proximate to the epicenter of the 7.6 magnitude earthquake. The project specifically addresses the scale and scope of damage to critical structures and infrastructure and implications for community response and reconstruction. The guiding questions of this study are: 1. What have been the impacts on the local communities and 2. How do people perceive the process of rebuilding and reconstruction? Two field campaigns were conducted over the course of seven weeks in November 2005 and May/June 2006. The valleys of study were the Kaghan, Jhelum and Neelum. This study relied upon three methodological approaches; repeat photography, interviews and field observations. Repeat photography was used in order to determine structural change (i.e., in the form of further aftershock and landslide-induced destruction or in the form of rebuilding) over the six month period between the two field seasons. Semi-structured short answer interviews were conducted during the second field expedition. Forty individuals (26 men and 14 women) were interviewed in the three study valleys. The interviews focused on the perceived impacts of the earthquake, priorities for rebuilding and perceptions of the rebuilding process.

Paula Hamilton, PhD Student, Department of Geography, Queen Mary, University of London. Email: p.w.hamilton@qmul.ac.uk; Transport Unions in the era of networked capitalism - commonalities and challenges to organising third party logistics companies in the USA, UK and Hong Kong

This paper focuses upon trade unions' responses to the contracting out of logistics functions and the growth of third party logistics providers. It examines common issues and challenges third party logistics providers pose for traditional trade union organisation across multiple scales. A number of embryonic trade union organising initiatives which are both indirectly and directly linked to the third party logistics service sector are also explored. The paper draws upon data analysis from interviews and participant observation with transport and distribution-related trade unions in the USA, UK and Hong Kong and with several global union federations during the period November 2005 to October 2006. It argues that, in the main, trade unions have been slow to comprehend and respond to the current and potential scale and scope of logistics contracting out across all sectors of the economy. It concludes that trade unions continue to struggle to adapt to the challenges posed by the evolving economic paradigm of networked capitalism.

Keywords: trade unions; networked capitalism; logistics service providers; United States, United Kingdom; Hong Kong; transnational corporations; global union federations; labour geography; globalisation

Stuart E. Hamilton, University of West Florida. Email: shamilton@uwf.edu; Christopher Houser, PhD, University of West Florida. Email: chouser@uwf.edu; Natahn McKinney, University of West Florida. Email: nlm5@students.uwf.edu; Quantifying volumetric and morphological changes in barrier islands using an automated comparison of event-paired LiDAR datasets

Topographic data are rarely available in the immediate aftermath of coastal storms. Traditional post-storm analyses consist of manual surveys or aerial photography. Traditional rod-and-laser topographic surveys can take many hundreds of hours to complete and lack the required spatial resolution as area increases. Aerial photography has the temporal facet required by researchers but lends itself to a descriptive analysis rather than providing quantifiable results. Lidar data is increasingly available from a number of differing sources as a base-level dataset for mapping coastal environments. Lidar has the spatial, temporal, and quantifiable qualities that allow for rapid analyses of coastal environments in the immediate aftermath of storms. This paper explores the potential of Lidar datasets and GIS in quantifying volumetric and morphological changes on northwest Florida's barrier islands before and after Hurricanes Ivan (2004) and Dennis (2005). An automated model operating in a GIS environment was developed that allows for rapid analysis of beach erosion, overwash, breaching, dune erosion, structural damage, and overall volume change on barrier islands. Lidar data from before Hurricane Ivan, after Hurricane Ivan, and after Hurricane Dennis are automatically processed and analyzed using cartographic modeling techniques. Results presented include volumetric calculations of sand loss/gain in the nearshore environment following a storm event, a profile analysis of dune structures, and measurements of washover deposits.

Keywords: gis, lidar, hurricane, coastal storms, model, impacts, dune structure, washover

Trina Hamilton, SUNY - Buffalo. Email: trinaham@buffalo.edu; Analytical Generosity and New Political Models: How a Number-Cruncher Conquered Critical Bias

There has been a wellspring of recent writing about new forms of politics, whether they be informal, networked, boomerang, and/or marketplace models. The increasing significance of these forms of politics has generated much speculation about how they measure up against (often romanticized) traditional state-centered politics. While it is clear that these alternate models do not possess the inherent capacities of territorially-organized states in providing public goods, it also seems clear that the current global economy requires more flexible and transnational governance mechanisms. In this paper I will use the example of corporate campaigns (the direct targeting of multinational corporations to "regulate" their social or environmental performance) to explore how quantitative analysis can help overcome critical bias when evaluating these new political models. After my presentation at the last AAG meetings, one of the session attendees commented on what he described as an "analytical generosity" in the number-crunching I presented, contrasting it specifically to the critical urge to either dismiss or herald new forms of politics without much analysis of their actual outcomes. While my research project makes use of both quantitative and qualitative methods, it was critical to my evaluation of the possibilities and limitations of this form of politics to start with the numbers. I will explain how crunching the numbers on a large database of campaigns resulted in more than simply a coarse description of campaign success rates, but also a better theoretical understanding of the informal regulation process.

Daniel J. Hammel, University of Toledo. Email:

Dan.Hammel@UToledo.edu; *The Great American Money Machine: The New Face of Old Tactics in Predatory Lending*

Land contracts were a standard way of purchasing houses in urban areas for many years before the enactment of a series of Federal Housing Acts in the 1930s reduced the prevalence of usurious lending practices. However, it was not until the housing finance reforms of the late 1960s that poor and minority buyers were able to gain any access to mainstream mortgage capital, and only the regulatory actions of the 1980s and the new markets initiatives 1990s finally opened up mortgage markets to many who had previously been excluded. Since the early 1990s, however there has been a growing concern with subprime and predatory forms of mortgage lending focused upon those groups who composed the "new markets". Toledo, Ohio, with its sluggish economy and segregated housing market, has seen more than its share of mortgage lending problems, including the resurgence of the use of land contracts. In this study I use a large sample of land contracts issued by the now locally notorious Westhaven Group to analyze the spatial pattern of land contract activity. I provide estimates on the amount of capital that Westhaven extracted from Toledo's low and moderate income neighborhoods and follow a brief trail of money and bribes that leads to surprising places. Finally, I examine the policy moral that the story of rise and fall of the Westhaven Group provides to those who fell victim to their aggressive and usurious lending tactics.

From Neighborhood Destruction to the Formation of a Global Entity: An Exploration of the Kendall Square Urban Renewal Program

In response to President Kennedy's mandate for man to reach the moon by the end of the decade, NASA announced in 1962 that they would build their Electronics Research Center in Cambridge, Massachusetts. This decision was a triumph for the Cambridge Redevelopment Authority, which had been attempting to rehabilitate the Kendall Square region since the end of World War II. Former tenement buildings and factories were razed to make way for NASA's complex, as well as for laboratories and offices for science and engineering companies, which had been attracted to the region because of its proximity to M.I.T. and Harvard. The project became embroiled in national politics, with figures such as Ted Kennedy and Donald Rumsfeld challenging each other over the necessity of the center which ultimately led to the abandonment of the complex and its six completed buildings. The NASA structures, along with the Technology Square developments, were conceived with Corbusian ideals in mind, designed to foster uniformity in the form of tall high rises, isolated from the heart of city and its population. What was initially designed to revitalize the district ultimately destroyed the fabric of the community, displacing residents and creating an office-park mentality in what was once a vibrant neighborhood. This work addresses the events that precipitated Kendall Square's redevelopment and the strategies that were implemented to allow it to become the Biotechnology and information technology center that it is today.

Jan Hamrin, Center for Resource Solutions. Email: ; *Renewable Energy Certificates and Greenhouse Gas Offsets*

The market for renewable energy certificates has been growing rapidly for several years due to a strong interest on the part of commercial, industrial and institutional buyers. This market has been driven primarily by the buyers' interest in reducing their greenhouse gas footprint and showing their constituents they are being responsible environmental citizens. Now we see the market moving from renewable energy claims to more direct carbon claims. What is the relationship between renewables and greenhouse gas reduction? What are the issues and how can renewable energy certificates play a positive role in both voluntary and compliance markets for reducing greenhouse gases?

Keywords: renewable energy credits, carbon credits, carbon offsets

Daikwon Han, Morehead State University, Institute for Regional Analysis & Public Policy. Email: d.han@moreheadstate.edu; *Spatial analysis of breast cancer and health care accessibility in Kentucky*

Breast cancer, the most commonly diagnosed cancer and the second leading cause of death among women, disproportionately affects certain areas of the United States, including many areas within Kentucky. However, these variations are not well understood, and the factors responsible for these geographic variations have not been completely identified. To generate ecological hypotheses of the etiology of breast cancer, we will utilize methods of spatial statistical analysis and GIS to examine the patterns and causes of regional variability of breast cancer rates in Kentucky. We will evaluate the contribution of established

risk factors, environmental risk factors, and screening practices to the regional variability of breast cancer rates. In particular, the association between geographic variations in breast cancer rates and health care accessibility will be further examined, especially for those areas that warrant further detailed analysis of the possible causes of spatial and spatio-temporal variations in breast cancer rates. These regional variations may provide important clues about the etiology of breast cancer, thus leading to more effective prevention and control policy.

Ju Hui Judy Han, University of California - Berkeley. Email:

hanj@berkeley.edu; *Missionary Imaginations, Capitalist Deliverance: Korean/American Evangelical Missions in Tanzania and Uganda*

South Korea has recently been catapulted into the status of the second-largest sender of Protestant missions in the world, with nearly 20,000 long-term, resident missionaries in over 160 countries throughout the world. In addition, every year, thousands of South Korean and Korean American evangelicals participate in short-term transnational collaborations that often take the form of relief and economic development projects in the Third World. Based on an ethnography of short-term Korean/American missions in Tanzania and Uganda, this paper examines how the missionaries draw upon South Korea's post-war history of rapid modernization, producing unexpected affinities across geographical differences. The missionaries employ a far-reaching Korean Christian worldview?a global imaginary?in which Korea figures as a privileged actor on the world stage, instrumental in transforming their missionary destinations. Through musical concerts, prayer rallies, economic development seminars, meetings with Christian government officials, and "Christian motherhood" workshops, they actively produce connections between post-war Korea and present-day Africa. I argue that the production of the space of world evangelization is fueled not only by religious convictions but very much by the Korean/American missionaries' faith in the inevitable connection between Christianity and capitalist development, and that geographical imaginations of both the places of missionary departure and the places of missionary arrival inform and shape each other.

Keywords: Korea, religion, evangelical Christian mission, capitalist development, geographical imagination

Luoheng Han, Univ of Alabama. Email: lhan@bama.ua.edu; *Applications of Remote Sensing and GIS in Water Quality Monitoring*

The purpose of this study was to develop a transferable model that can be used to monitor water quality and model the nutrients dynamics using remote sensing and geographic information systems (GIS). The study area is Tallapoosa Watershed, which is located in eastern Alabama and western Georgia. Remote sensing techniques used include close-range hyperspectral sensing and Landsat TM data application. All data collections were conducted during the growing season over a two-year period. The models of estimating major water quality parameters, such as chlorophyll a and Total Suspended Solids (TSS), using spectral reflectance were established. Chlorophyll a maps were derived from the Landsat TM imagery. To model the nutrient loading in the watershed, the Soil and Water Assessment Tool (SWAT) model was adopted. The model computed major nutrients output for each of the sub watershed based on the land use and land cover, digital elevation, soil, and precipitation. The results from this research demonstrated effectiveness of remote sensing and GIS and how these techniques can be used in water quality studies.

Keywords: remote sensing, GIS, water quality, watershed

Songguang HAN, B. Soc. Sci (Hons), National University of Singapore. Email: hansongguang@nus.edu.sg; *A Geographical Analysis of Air Hubs in Southeast Asia*

This paper explores and examines the formation, development and the current role of airport hubs for civil aviation within the context of Southeast Asia. I explain why certain airlines and airports are more successful than others, and how hubbing is used to increase network coverage and reach. The intricate linkages between airlines that use the 6th Freedom rights and airports which situate themselves as hubs will be discussed by looking at the extent to which flag carriers contribute to airport hub formation. I also examine the operations of selected airlines and airports and the pattern of air services through an analysis of spatial networks, establishing the degree of "hubness" of the airports examined. This is achieved firstly by providing a critical understanding to the concept and definition of "hubbing", and subsequently through a network analysis of air hubs using various graph-theoretic measures and other empirical forms of analysis. This paper uses the case study of the Australia-Europe air route (also commonly known as the Kangaroo Route) to illustrate the varying importance and significance of air hubs in Southeast Asia. Finally, the findings are situated within the wider context of regionalization and globalization in Southeast Asia and various policy implications and future scenarios for civil aviation in the region are presented.

Keywords: civil aviation, airport hubs, Southeast Asia, network analysis

Ellen Hanak, Public Policy Institute of California. Email: hanak@ppic.org; *Where the Grass Is Greener: The Value of Lawn Premiums in the American West*

As rapid population growth in the western sun-belt region puts pressure on water resources, conservation is gaining prominence in water policy discussions. Residential water use in the West is high by national standards, given high evapotranspiration rates for landscape watering during the hot, dry summer months. Restrictions on landscaping options in new homes are becoming increasingly prevalent. For existing lots, some utilities are also paying homeowners to replace grass with low-water landscapes. The literature on the capitalization of housing amenities leads us to expect that if westerners value their green lawns, turf restrictions should be reflected in home prices. Using hedonic housing price regressions, this paper explores the amenity value of lawns in the greater Phoenix area, which has experienced considerable variation in turf restrictions. Landscape policies do appear to matter. Yard space in regulated lots is sold at a significant discount in the initial years after the restrictions are introduced. However, this negative effect diminishes over time, as homes subject to regulation form a greater portion of the housing stock. These findings suggest that landscape regulations may be contributing to a shift in homeowner preferences toward low-water landscapes. Such a shift is also implied by the 2003 Phoenix Area Social Survey, which found that preferences for low-water landscapes were higher in newer neighborhoods, where such landscapes were more prevalent. With a diminishing "lawn premium," the attractiveness of turf buy-back programs depends on whether the payment adequately compensates the explicit costs of landscape conversion, not the loss in amenities.

Keywords: landscaping preferences, housing market, water policy

Carol L. Hanchette, Ph.D., University of Louisville. Email: carol.hanchette@louisville.edu; Jong-Hyung Lee, University of Louisville. Email: popopo17@gmail.com; *Asthma, Air Quality and Environmental Justice in Louisville, Kentucky*

The prevalence of asthma in the U.S. has increased steadily during the past two decades. From 1997-2004, the highest prevalence rates were among children 5-17 years of age, with higher rates among females and African Americans. In 2003, the estimated prevalence of childhood asthma in the U.S. was approximately 8.8%. Kentucky's prevalence was 10.2%. We examined inpatient and outpatient pediatric asthma admissions in Louisville, Kentucky for the years 2001-2004 and analyzed their relationship with poverty, housing, and air pollution. We found that there are strong spatial and seasonal patterns to pediatric asthma admissions in Louisville. Spatial patterns coincide with poverty, poor housing conditions and African American race. Seasonal patterns are characterized by a summer trough, followed by a fall peak. We found a positive association between asthma hospitalizations and particulate matter (PM_{2.5}). Poverty, air pollution and African American populations are concentrated in western Louisville, which is close to Louisville's largest industrial complex, Rubbertown. We discuss our findings in the context of environmental justice and examine the question, "which came first, the air pollution or minority and poor communities?"

Keywords: asthma, GIS, air pollution, environmental justice, Kentucky

Max Handler, University of Minnesota - Minneapolis. Email: hand0106@umn.edu; *Political Ghosts? The Lives and Afterlives of Fishing Nets*

When fishing nets are abandoned at sea, they do not simply disperse or disappear. Rather, they can drift through the ocean and continue to fish for many years. These "ghost nets" collect at oceanic convergence zones, ensnaring each other, brushing up against other kinds of plastic debris, and attracting a wide range of foraging marine organisms. Many of those organisms - seals, seabirds, turtles, fish, jellies, and even zooplankton - are harmed when they ingest plastic objects or become entangled in plastic netting. Ghost nets thereby suggest a strange redrawing of the pelagic food web, one in which specific plastic objects take their place alongside biological organisms. The nets are the focal point around which new, plastic ecologies emerge. This melding of technology with biology is made explicit by current ghost net research, which models ghost nets as dynamic natural populations. This paper uses examples from the Arafura Sea and the North Pacific subtropical gyre to ask how politics might engage with such technical-ecological objects. It argues that current political solutions for the ghost net problem are flawed, since they rely on faulty conceptions of fishers as economically rational individuals. A wider and more productive political spectrum is opened up by taking a relational approach to fishing technology, in which agency is dispersed and the materiality of fishing nets themselves comes to the fore.

Keywords: Fishing, technology, ghost nets, marine debris, political ecology

Jim Handley, M.S., University of Wisconsin - La Crosse. Email: handley.jame@uwlax.edu; *Fair Trade Cooperatives and Guatemalan Community Development: Challenges and Sustainability*

Because of Guatemala's altitude and rich, fertile soil, it produces some of the highest quality coffee beans in the world. Its export revenue is Guatemala's primary income source and the coffee industry serves as the country's leading employer. The coffee market has traditionally been characterized by very unequal trading relationships. Small-scale family farms produce over 70% of the world's coffee. However, over 60% of the coffee market is controlled by only four multinational corporations. The Fair Trade movement challenges the fundamental inequities within international market relations, seeking producer empowerment and poverty alleviation. Fair Trade networks are comprised of four general components: producer cooperatives, importers, Fair Trade certifiers, and the retailers that engage in the Fair Trade market. The cooperatives have the potential to positively impact community development in producer communities. They also have significant challenges to overcome in the dynamic and evolving context of the Fair Trade movement. This study explores the role of Fair Trade cooperatives in community development in producer communities in Guatemala and the challenges faced by them.

Keywords: Guatemala, Coffee, Fair Trade

Don L. Hankins, Ph.D., Dept. of Geography and Planning, CSU Chico. Email: dhankins@csuchico.edu; *Prescribed Fire in Riparian Ecosystems: A Fine Scale Process*

Fire has been used for millennia by indigenous peoples of California to maintain and conserve patches of riparian ecosystems. Based on applied research utilizing seasonally prescribed fires, I have studied the effects of prescribed fires on riparian vegetation and small mammal and reptiles within the riparian corridor. The implementation of seasonally-timed prescribed burns allows for creation of a mosaic of burned and unburned vegetation. Within this mosaic I have observed an increase in cover by native vegetation. Additionally, the seasonal application of prescribed fire in the late fall yielded no significant effects to small mammal or reptile use of the burned sites. The implementation of such burning practices can be used to manage and conserve biodiversity within California's riparian ecosystems.

Keywords: Prescribed fire, Conservation, Indigenous land management

Katherine B. Hankins, Georgia State University. Email: khankins@gsu.edu; Emily Powers, University Of Georgia. Email: empowers@uga.edu; *Creating a "livable" city without evidence of the state*

Situated on the 138-acre site of the former Atlantic Steel Mill in midtown Atlanta, Atlantic Station is an example of a new urbanist, mixed-use development. When all phases of development are complete, the 'Live, Work, Play' design of Atlantic Station will host over fifteen million square feet of retail, residential, and office space, and it will include eleven acres of green space. The developers are explicitly drawing on livability discourse in their advertisement of Atlantic Station, but questions remain about what constitutes livable space in a new, privately-managed development. In particular, we ask what the relationship is between public space and livability. Through qualitative investigation including interviews with Atlantic Station residents, consumers, and employees in addition to participant observation, this research reveals the degree to which Atlantic Station provides highly regulated spaces that emphasize walkability and shopping convenience, which are celebrated by residents and consumers alike. Indeed, the "livability" of the development includes a kind of public space where people happily gather among the shops and condominiums under the gaze of private security guards. It is a public space that, by all appearances, has been severed from the state. In this paper, we explore the implications of livable spaces that render the state invisible.

Keywords: livability, new urbanism, the state

James A. Hanlon, Bowling Green State University. Email: hanlonj@bgsu.edu; *Selling the Projects: The Beginning of the End of Public Housing in the U.S.*

In this paper I examine recent trends in the design, management, occupancy, and ownership of revitalized public housing sites in the United States. Since the early 1990s, more than 200 housing projects have been slated for redeveloped into "mixed-income" communities through HUD's HOPE VI program. The replacement housing in these communities includes not only public housing but also a mix of partially subsidized and market-rate units offered for both rental and owner occupancy, the provision of which necessitates the participation of private and non-profit entities. This has entailed "selling the projects" in two closely interrelated respects. First, long-stigmatized public housing sites must be effectively marketed to both prospective (and, crucially, more affluent) residents and to a diverse array of stakeholders including local and state governments, but more importantly, investors and developers beyond the public sector?willing to bear the financial risks of participating in such endeavors.

Second, substantial portions of former public housing sites have been privatized, in that homeowners now inhabit space previously devoted to public housing, and non-public entities now play a central role in housing provision. The emergent trend of “selling” public housing raises important questions about the diminished role of the public sector in maintaining a housing “safety net” and the ability of non-public entities to take on such responsibilities. Preliminary findings suggest that not only does low-income housing provision remain a secondary priority, but also that the imperative to provide such housing is further compromised precisely by the very efforts to revitalize it.

Matthew G. Hannah, University Of Vermont. Email: matthew.hannah@uvm.edu; *The under-scrutinized as a race: biopolitical dividing practices in the age of digital security*

Digital information technologies have opened up new possibilities for the division of social groups into biopolitically distinct categories. Especially since 11 September, 2001, an overriding concern with security has led governments and other entities to place a premium on detailed information regarding the identities, characteristics, locations and movements of human individuals. Those people about whom less information is available thus become a focus of particular concern and, I argue, come to be treated in much the same way that ‘dangerous races’ have been treated over the last 200 years. Constructions of the under-scrutinized in governmental and media discourses often overlap with more traditional characterizations of racial ‘others’, and involve a tangle of cultural, economic and political themes. The controversies over the federal census in West Germany during the 1980s illustrate some of the ways in which the under-scrutinized can be racialized through digital dividing practices, and how this new form of racialization differs from more familiar ones.

Cassandra Hansen, University of Nevada. Email: cassie.hansen@gmail.com; *“They Just Don’t Make Storms like This One Anymore”: Analysis of the Anomalous Record Snowfall of February 1959*

Abstract: This study examines the anomalous synoptic scale circulation during February 1959. During this month of irregular weather, a slow-moving low pressure system over Northern California produced a total of 189 inches of snowfall at Mount Shasta, CA over a six day period (13-19 Feb). This unique slow-moving, moisture-loaded storm event is infrequent, and no storm of this magnitude has been recorded on Mount Shasta since 1959. In order to better understand this anomalous weather pattern, upper atmospheric data, from NOAA, along with local snow depths were used to analyze the unique atmospheric components that were responsible for this exceptional storm. Results showed the mixture of cut-off lows and a stationary amplifying high pressure blocks which contributed to the duration and magnitude of this storm event. The surface sea level pressure was recorded as 964mb, a considerable low, along with a coupled jet streak that amplified the entire storm event. These key elements all contributed to the extreme nature of the snowfall of 1959 at Mount Shasta, perfect combination of ingredients to create a record setting storm.

Keywords: Keywords: Synoptic, Cut-off lows, High-over-lows and Jet Streak

Devon A. Hansen, Department of Geography, University of North Dakota. Email: devon_hansen@und.nodak.edu; *Women-Owned Businesses in North Dakota: The Determinants of Small Business Success*

The number of women-owned businesses in the United States has grown remarkably over the past decade. According to the Survey of Business Owners, Women-Owned Firms: 2002, women-owned businesses grew by nearly twice the national average for all firms. This national trend in business ownership is evident in North Dakota. Between 1997 and 2002, women-owned businesses grew 6.3 percent, twice the growth for all firms statewide. The growing entrepreneurial activity of women is a boost to North Dakota’s economy because of the job and income opportunities it creates. Archival data and field survey questionnaires of female entrepreneurs in rural and urban communities are utilized to examine the issues surrounding women’s business ownership in North Dakota. Survey respondents were asked about personal traits, such as education and work experience, and about firm characteristics, such as sources of financing, economic sector of firm, number of employees, and location. Preliminary results indicate that geographic location significantly influences the success of entrepreneurial activities of women. This study concludes with a discussion of the policy implications of these findings.

Keywords: Women-owned businesses, North Dakota

Ellen R. Hansen, Ph.D., Emporia State University. Email: ehansen@emporia.edu; *Practicing Feminism*

I am a feminist geographer and have made activism part of my personal mission. For the past seven years I have held a position at a small state university, in a socially conservative region, in an institution that does not offer a degree in Geography or Women’s Studies. Lack of a major has required me to expand my perspective on what it means to actively practice feminism. I am not only a feminist geographer encouraging other budding (undergraduate) feminist scholars as a mentor, but also a feminist academic with a responsibility to engage in and encourage practices that de-marginalize feminism and feminists on campus. As I see it, these practices include the ongoing work of supporting academic and women-focused programs, and exposing all my students to feminist perspectives that they would otherwise not encounter. I also am committed to work as an activist involved in political issues and other activities that might seem to be unrelated to either politics or feminism. This paper considers how academic activism may tie all these efforts together to provide an outlet for feminist practice and academic activism.

Keywords: feminist practice, academic activism

Høgni Kalso Hansen, Lund University. Email: hogni.kalso_hansen@keg.lu.se; Bjørn Terje Asheim, Lund University. Email: bjorn.asheim@keg.lu.se; *The changing composition of the creative class: the impact on regional policy of sectoral, spatial and temporal variations*

Research in the geography of the creative class has disclosed diversity in its composition. The creative class, as defined by Florida, represents a large and heterogeneous group (between 30-40% of the workforce) and is, consequently, employed in industries drawing on different knowledge bases (synthetic, analytical, symbolic). These groups of talents will have different preferences and trade-offs between firms, occupations, life-styles and places. The composition of the creative class, thus, demonstrates sectoral variations. Furthermore, most sectors display a spatially uneven distribution, which imply regional and national variations in the composition of the creative class. Differences in political-institutional frameworks add to the territorial variations in a variety of capitalism perspective. Finally, both sectoral and spatial variations will change over time due to different paths of economic development in regions and nations. Seen on the background of the sectoral, spatial and temporal variations in the composition of the creative class, the aim of the paper is to analyse which impact this has on the relationship between people vs. business climate in a regional policy context. The paper argues that regional policy must reflect the particularities of requirements of industries when promoting the business climate of regions as well as recognising the varying preferences of the workforce when improving the people climate.

Keywords: Creative class, knowledge base

Matthew C. Hansen, South Dakota State University. Email: matthew.hansen@sdstate.edu; Jiyul Chang, South Dakota State University. Email: Jiyul.Chang@sdstate.edu; Kyle Pittman, South Dakota State University. Email: Kyle.Pittman@sdstate.edu; *Monitoring global and regional croplands using MODIS data*

Monitoring croplands over large areas is a challenge. Variations in seasonality, spatial scale and intensification all limit the accuracy of global, regional and even national scale crop cover mapping. A primary limitation to cropland monitoring using remotely sensed data sets is the lack of frequent repeat coverage at appropriate spatial scales. Data from the MODerate Resolution Imaging Spectroradiometer (MODIS) sensor on board NASA’s Terra spacecraft improve capabilities for monitoring croplands. These data feature daily acquisitions at spatial resolutions of 250 and 500 meters for 7 land bands. By compositing MODIS time-series data to depict the salient, generic features of crop cover phenologies, a mapping method for annual monitoring is being developed. As a prototyping activity, a global cropland mask has been generated using 6 years of MODIS inputs. Current research focuses on specific, key global crop types, such as soybeans. Using available ancillary data sets, soy crop phenologies are being characterized and incorporated into annual global soy cover map generation. Initial results for the United States show that the MODIS data correspond well with National Agricultural Statistics Service census and high-spatial resolution map data sets. Results of the global cropland and soy cover maps will be presented.

Keywords: global, land cover, croplands, MODIS

James Hansom, co-author, University of Glasgow. Email: jim.hansom@ges.gla.ac.uk; Impact of extreme storm waves in the British Isles: modelling the processes of cliff-top erosion and deposition

During major storms in the North Atlantic, wave heights of in excess of 20m are common and have been increasing over the last 30 years. However, in spite of increasing damage to offshore installations, the impact of such extreme waves on coasts is unknown. We suggest that several types of cliff-top feature, such as individual boulder fields and organised boulder ridges, sitting atop 15-20m high cliffs along the North East Atlantic and Northern North Sea coasts of the British Isles are related to the previously unrecorded impact of extreme waves. We calculate that extreme waves from offshore arrive virtually un-attenuated at some coasts with enough energy to be capable of substantial erosional damage. We propose mechanisms to account for both the removal of rock from the cliff face under extreme wave impact at altitudes well in excess of those normally found and for the subsequent transport of boulders inland. We show major storm activity in the historic past to be responsible for the emplacement of the features but that substantial reworking occurs during modern storms in an important coastal process that has been previously overlooked on such coasts.

Keywords: Extreme Storms, waves, cliff-top erosion, model, periodicity

Brian Hanson, University of Delaware. Email: hanson@udel.edu; Roger LeB Hooke, University of Maine. Email: ; Effect of sea level lowering on ELA depression during the LGM

In paleoclimatic studies, decreases in equilibrium line altitude (ELA) suggest a change in climatic temperature. An open question has been whether one should include a correction for the lowered sea level or, alternatively, take the ELA depression at face value. During the peak of the last glaciation, studies of moraines and cirque elevations suggest that equilibrium lines were roughly 900 m lower than at present, implying a 5-6 degree cooling relative to temperatures today. Some have reduced the effective lowering of ELA by noting that sea level dropped on order of 120 m, so ELAs are only 780 m lower relative to sea level. A recent counterargument is that the troposphere would not have undergone such an overall downward shift because water taken out of the oceans would have been stacked up on land as ice. Lacking from this discussion is any attempt at a rigorous analysis of the effect of sea level lowering and ice build up on atmospheric pressure and temperature. Our goal herein has been to make such an analysis. We show that the atmospheric displacement of air by ice partly reduces the correction for sea level drop, it does not completely eliminate it. However, these corrections remain small compared to the errors in estimating paleo ELAs.

Keywords: paleoclimate, sea level, glaciers

Holly M. Hapke, Ph.D., East Carolina University. Email: HapkeH@ecu.edu; "Now is the time of rich people": State-led Development, Social Relations, and the Commercialization of Fish Markets in South India

Over the past five decades, the fisheries sector of Kerala State (India) has undergone a dramatic transformation, in part as the result of state-led development efforts to increase export earnings. This transformation has affected both production processes as well as markets networks and systems for distribution. Fish trading, once an occupation of the very poor, has become big business. This shift has been accompanied by spatial processes creating new and reworking existing structures of inequality. While it may be tempting to view these inequalities as the result of state intervention, a longer term historical perspective reveals 1) that commercialization and market formation pre-date state intervention, and 2) that individual actions and local agency have played an integral role in the particular formation of market relations in this region and sector. Fish markets are not merely sites for the exchange of commodities. Rather they are embedded in social relationships structured by ideologies such as gender, caste, and native place. These ideologies inform individual fish traders' experiences and agency in coping with economic transformation and change. Through a historical analysis of commercialization and the development of fish marketing networks in Trivandrum, Kerala, I will illustrate how state interventions, market forces, and local practices and ideologies intersect one another to produce particular outcomes of economic transformation for particular groups of individuals. In doing so, I will argue that theorizations of state-market interactions are enriched by inclusion of local agency and practices in our analyses.

Jonathan M. Harbor, Purdue University and UCDHSC. Email: jharbor@cudenver.edu; Melissa Dark, Purdue University. Email: ; Deborah Bennett, Purdue University. Email: ; Carrie Davis Todd, Purdue University. Email: ; Interdisciplinary GK-12 teams working with middle school science and math in rural Indiana

The Indiana Interdisciplinary GK-12 combines the interdisciplinary research focus of Purdue University with the rural and small town learning context of three Indiana school corporations. The project aims to improve middle school

science education while dramatically enhancing STEM graduate students' experience and understanding of learning and teaching. Using an interdisciplinary team approach that is central to much current scientific research, and in direct response to needs expressed by a teacher focus group, this project emphasizes authentic problem solving in interdisciplinary themes as a way to engage student interest and develop effective teaching of STEM in middle schools. Our approach is to involve graduate fellows in science, mathematics, engineering and technology, working collaboratively in teams with middle school science and math teachers. Fellows and teachers work together in a summer professional development workshop and then modify/create, test, and implement curricular theme units using a constructivist, inquiry-based approach focused on authentic interdisciplinary problem-solving. Assessment data, examples of activities and excerpts from journal entries by fellows illustrate both the impact of the fellows on classrooms and students, and the ways in which fellows have been challenged by the realities of middle school environments.

Email: saskia@utk.edu; Ann Tillet, Carpenters Middle School. Email: ; Victoria Headrick, Carpenters Middle School. Email: ; NSF GK-12 Research Collaboration Between University of Tennessee and Carpenters Middle School in Blount County, Tennessee

Two University of Tennessee graduate NSF GK-12 fellows have collaborated with two Carpenters Middle School teachers during the 2005-2006 year, with middle school students participating in ongoing research projects led by the graduate fellows and science teachers. This poster highlights four research projects developed and conducted with middle school students. First, Carpenters Middle School students are inventorying herbaceous biodiversity within the campus wetland and natural area, collecting, identifying, and preserving specimens for inclusion within a school herbarium. This project has introduced the students to plant identification and herbarium collection skills and has resulted in a herbarium at the school. Second, students have been analyzing the radial growth of trees to document forest stand age and recruitment patterns, and to quantify the disturbance regime of Ijams Nature Reserve. Students are also comparing radial growth changes with temperature and precipitation records for the area over the past century. Third, we have begun an erosion study at several locations on the school property. Students use erosion pins to observe and quantify erosion-caused changes in the landscape, and they develop hypotheses about differences in erosion rates between the testing locations. Fourth, students are conducting water quality research using field test kits on samples collected from a local stream. Students test the water samples and maintain data in an ongoing spreadsheet. The projects have introduced students to basic lab equipment and practices and to procedures for acquiring and maintaining data sets for future analysis.

Keywords: education-graduate, education-K-12, environmental history

Lucas Hardy, Muskegon Community College. Email: hurlaky43@cs.com; West Michigan's Big Lake Influence

The purpose of this poster is to showcase the physical attributes of West Michigan and how it impacts the way people in this area live and make their livelihood. The Big Lake, that is, Lake Michigan is the main reason this area is so wonderful. A primary theme of this poster illustrates that unlike the rest of the Midwest, West Michigan has a less continental and more marine climate. This is characterized by a mild summer and a winter maximum for the precipitation. The common factor for our wet winters is locally known as lake effect. Lake breezes provide a cool respite from summer temperatures. This entices tourists to vacation on West Michigan beaches. Lake Michigan provides just the right mixture of mild temperatures and clear skies to promote a literal cornucopia of produce, from cherries in the north, to blueberries in the middle, to grapes in the south, and apples throughout the west. It should be noted that West Michigan is a delight for anyone who loves the outdoors. That applies for all seasons, because here, they have the best of each one. There is fishing and hunting for various game available year round, a tulip festival in the spring, hundreds of miles of sandy beaches both on the big lake and inland lakes to enjoy in the summer, beautiful trees and apple cider in the fall, and in the winter people can go snowmobiling, ice fishing, Nordic skiing and even luge.

Grant Logan Harley, University of South Florida. Email: glharley@gmail.com; Philip Reeder, PhD, University of South Florida. Email: preeder@cas.usf.edu; *An Analysis of Cave Sediments from Jennings Cave, Marion County, Florida: Geomorphic Implications*

Since it is known that cave sediments can be used as indicators of geomorphologic changes that occur during karst landscape evolution, an analysis of these sediments can provide primary geomorphic information about transportation mechanisms, depositional history, and landscape and cave formation. This project attempts to provide insight on certain topics regarding Jennings Cave, Marion County, Florida. Before 1,870 years ago, the sediment that was being transported to the collection site, some 100 meters from the entrance, consisted mostly of fine-size to medium-size clay and silt deposits. However, around 1,870 years before present, certain climatic events caused the sediment input to the collection site to change. Unfortunately, little research has been completed on the landscape of west-central Florida, with past research focusing on the Dames Caves area, Citrus County, Florida, and Briar Cave, Marion County, Florida. In-depth research on Jennings Cave and the surrounding environment is necessary in the attempt to understand the evolution of the west-central Florida's karst landscape.

John Harner, University of Colorado. Email: jharner@uccs.edu; Edith Jimenez, Universidad de Guadalajara. Email: edith.ejimenez@gmail.com; Heriberto Cruz Solis, Universidad de Guadalajara. Email: hpk99@hotmail.com; *Contradictions in the Ownership Society: Housing and Urban Growth in Guadalajara, Mexico*

State funding programs and a deregulated market in Mexico have greatly increased the number of "popular" houses in the formal market. Yet in spite of these increases, illegal settlements continue to be a major path to home ownership. In this paper, we measure the land area, number of tracts developed, and population in four categories that depict dominant housing development processes and different incomes targeted in Guadalajara, Mexico. We next analyze the contemporary housing landscape. The production of urban space and the resultant urban landscape have changed most dramatically with the implementation of the neoliberal discourse that shifts housing from a public service to an investment commodity. The private housing sector is driving development of increasingly exclusive and segregated enclaves for the wealthy, yet contradictions between these privatized worlds and other forms of housing lessen the ability of the state to consolidate the neoliberal development discourse. The contemporary housing landscape brings to question the ability of these policies to service low income residents and build a sustainable urban environment.

Keywords: Mexico, housing, Guadalajara, neoliberalism

James W. Harrington, Professor, University of Washington. Email: jwh@u.washington.edu; *Skill-Development Pathways*

The objective of the research project is to compare the sources (by type and location) of software professionals' training, across regions, industrial sectors, and personal characteristics. This research takes an institutional approach to the individual's gaining and using occupation-specific skills, and to the local availability of occupation-specific labor (through training and through

migration). The current paper relies on secondary research and a survey of software professionals to determine regional variations in the sources and support of these highly skilled workers.

Andrew J Harris, University College London. Email: andrew.harris@ucl.ac.uk; *From London to Mumbai and back again: gentrification and public policy in comparative perspective*

This paper uses a comparative survey of two similar sized, centrally located and previously predominately industrial areas, Bankside in London and Lower Parel in Mumbai, to explore the role of public policy in a globalised 'third-wave' of gentrification. It firstly traces how the gentrification of Bankside since the mid-1990s has been accelerated by major inputs of public money and the explicit support of national and local government. Similar, it outlines how Lower Parel's rapid transformation over the last five years has been instigated by corporate-governmental alliances and the fashioning of new neoliberal planning agendas often directly modelled on London precedents. However, the paper also highlights the comparable lack of a frame of historical reference for gentrification in Mumbai beyond colonial antecedents, and an accompanying important role for Lower Parel's gentrification in a dramatic fracturing of Mumbai's political and economic landscape. The paper argues that the endemic financial irregularities, violent negotiations and severe dislocation of social reproduction that have characterised Lower Parel's recent gentrification offer salutary lessons for policy-makers - and researchers ? in cities such as London.

Keywords: India, London, gentrification, neoliberalism, postcolonial urbanism

Dylan Reed Harris, University of Richmond. Email: Dylan.harris@richmond.edu; *Examining the Urban-rural interface in South Florida using Landsat imagery*

The population of the greater Miami-Dade region of Florida has risen dramatically in the latter part of the twentieth century. This population boom has increased pressure on the available land in the region, both on resources and available living space. This study examines changes in land use/land cover (LULC) in the southern part of Miami-Dade County between 1986 and 2002. A time series analysis is performed using multi-year Landsat data. Using the Erdas Imagine software suite, LULC classifications are performed on each of six different images acquired between 1986 and 2002, using a combination of supervised and unsupervised classification techniques combined with vegetation indices derived from the remotely sensed imagery. Changes in landscape structure illustrate how increased land utilization can be linked to increased population pressures from the surrounding urban environment.

Keywords: South Florida, remote sensing, GIS, Landsat, urban-rural interface

Glenna C Harris, University of Toronto. Email: glenna.harris@utoronto.ca; *Citizens at school: Ontario teachers' perspectives*

The past decade has witnessed an increased interest in character and values education in public schools, promoted as a solution to classroom challenges faced by teachers and has been framed as education for citizenship. Other school boards often employ similar extra-curricular activities to encourage responsible behaviour development and academic success among their students. Through such programs, character traits such as responsibility and fairness are integrated into school programming in addition to the mandated public school curriculum. In Ontario, many school boards have independently taken up character education as well as similar programs, and in 2006 the Ontario Ministry of Education announced a plan to integrate character education programming in schools across the Province as a method of guaranteeing student success and 'value-added' education in Ontario. As children's citizenship continues to gather interest among educators, such initiatives provide a worthy investigative focus for understanding the school as a space where citizenship is learned. Drawing on qualitative interviews conducted with teachers in 3 different Ontario school boards in 2006, this presentation will examine how citizenship is articulated through curricular and extra-curricular programming in the school, including character education. These experiences lead us to understand how the school functions as a site of learned citizenship, often in tension with Provincially-scaled programming mandates and children's private experiences outside the school and at home.

Kimberly Marie Harris, University of Missouri-Columbia. Email: kmb3bd@mizzou.edu; *National Identity and Nationalism in speeches given by Al-Qaeda leaders*

National identity and nationalism have long been utilized by political leaders to control state territory. Stateless terrorist groups such as Al-Qaeda also draw upon notions of national identity to make claims to territory. This study explores how Al-Qaeda leaders Osama bin Laden and Ayman al Zawahiri invoke

images of national identity and nationalism in speeches to further their base and gain more control of territory. We utilize content analysis of transcripts of Al-Qaeda speeches to uncover defined themes of territory and national identity. The findings have implications for our understanding of terrorist goals and the relationship between terrorist leaders and followers.

Keywords: national identity, Al-Qaeda, speeches, qualitative content analysis

Leila M Harris, University Of Wisconsin, Madison. Email: lharris@geography.wisc.edu; Gender and Emergent Water Governance Regimes: Comparative Overview of Gender Dimensions of Privatization, Devolution, and Marketization

This paper provides an overview of themes and approaches based on a comparative reading of the literature on gender dimensions of emergent water governance regimes, specifically those related to privatization and marketization of water resources, and devolution and participatory management regimes. Part of the analysis will involve discussion of institutional issues and approaches, for instances, ways that different governments have responded to directives of international bodies and agreements, such as the Dublin Water Principles, or mandates of the International Monetary Fund. The conclusion will reflect on the body of research on these themes, issues of importance that are revealed by comparative analysis of issues and implementation across contexts, and implications of work for geographic approaches to neoliberalism and nature, and participatory environmental governance more generally.

Keywords: water, neoliberalism, privatization, gender, environmental governance

Philip M Harris, U.S. Bureau Of the Census. Email: philip.m.harris@census.gov; Renuka Bhaskar, U.S. Bureau of the Census. Email: renuka.bhaskar@census.gov; Detailed Place of Birth Reporting Among the Foreign-Born Population of the United States in the 2006 American Community Survey Content Test

What can detailed place of birth tell us about the foreign-born population in the United States? While some attention has been paid to subnational differences in source country characteristics and the selectivity of immigrants, most demographic, quantitative studies of international migration usually focus on country as the unit of analysis. In the United States, much of this country-focused immigration research proceeds with limited information about the socioeconomic characteristics of persons living within those foreign borders. However, because of the social, economic, and demographic diversity within source countries, and as the number of people from a particular country grows, the usefulness of only knowing their country of birth diminishes. Therefore, detailed analysis of foreign place of birth may help to refine assumptions and methods that currently use only foreign country of birth as a component as well as chart migration streams. This paper will analyze responses to the section of the place of birth item that asks for city, town, or village of birth. The analysis will use spatial mapping of respondents' places of birth for Mexico, the Philippines, China, India, and Canada. Data will be used from the 2006 National Content Test of the American Community Survey. We expect the results of this analysis to show disproportionate migration from particular places as well as differences in individual characteristics by detailed place of birth.

Trevor M. Harris, West Virginia University. Email: trevor.harris@mail.wvu.edu; L. Jesse Rouse, West Virginia University. Email: jesse.rouse@mail.wvu.edu; Susan J. Bergeron, West Virginia University. Email: sue.bergeron@mail.wvu.edu; Humanities GIS and the Geospatial Semantic Web: toward a convergence of Digital Humanities and Geospatial Technologies

Humanities Geographic Information Science (Humanities GIS) represents a broad range of activities primarily focused on how best to integrate the humanities with geospatial technologies. The significance of location and spatial relationships in the humanities underpins the linkage to a geospatial approach. With the evolution of the Internet built on an emerging Service Oriented Architecture (SOA), Web Services are at the heart of much of the new Web 2.0 growth and it is apposite that humanities computing should be ready to take advantage of the these new technologies. Through the linkage of geo-spatial and web services the potential exists to do more than transition digital humanities along an incremental pathway but to leapfrog into a convergence of Humanities Computing, Digital Humanities, and Humanities GIS. This paper discusses the design and implementation of a server-based Humanities GIS that will integrate and synthesize humanities and spatial data. We propose combining the spatial functionality of GIS with the emerging technologies of the Semantic Web and Humanities GIS utilizing a Geospatial Semantic Web as a platform for integrating and synthesizing the wealth of humanities and spatial data available through the WWW. The platform will serve to integrate, display, and analyze humanities data in a spatially-enabled format and for querying and serving data through a

semantically-linked web interface. Our goal is to allow humanities researchers to leverage semantically-enabled web services from a variety of disparate sources, to integrate these sources within the GIS client, conduct analyses, and display and disseminate the results via Web Services.

Jill Harrison, University of Wisconsin-Madison. Email: harrison@drs.wisc.edu; Apolitical Food Politics?: By Turning a Blind Eye to Farm Labor, Alternative Food System Advocacy and Popular Food Literature Risk Missing the Mark on Justice

The recent growth of alternative agrofood system advocacy and the current flood of popular food writing both have undoubtedly brought long-overdue awareness to critical problems in the current food system. One common underlying assumption of authors and advocates is that justice can be found through making the right personal food choices. While alternative food markets clearly help to address some key economic and ecological problems, they fail to confront what is arguably the point of greatest injustice in the food system: the conditions of farm labor. By turning a blind eye to the problematic social relations that form the foundation of most conventional (and many alternative) forms of food production, the recent burst of alternative food system advocacy and popular food literature risk missing the mark on justice in a most troubling way: namely, by promoting an individualized form of politics that absolves the state of its responsibility to ensure the conditions of social justice. Drawing on historical analyses of domestic farm labor markets and my own current research on the construction of farm labor difference and disadvantage, I argue that the reliance on consumption politics and the propensity to sideline labor issues are particularly dangerous within the current anti-immigrant climate - unwittingly reinforcing the nativist and marginalizing work of anti-immigrant activism. The path to justice will surely extend far beyond our food purchasing choices - indeed, beyond the borders of the food system itself.

Keywords: agriculture, food systems, farm labor, social justice, immigration, environmental justice

John Harrison, University of Loughborough. Email: j.harrison4@lboro.ac.uk; Stating the Production of Scales - Centrally Orchestrated Regionalism, Regionally Orchestrated Centralism

Esposued in the language of the new regionalist literature, our conceptual understandings of decentralisation to subnational tiers of governance has been dominated by the dual metaphors of 'hollowing out' (the nation-state) and 'filling in' (at the regional scale). In this paper, I argue that despite the important role that these metaphors have played in providing conceptual understandings of local and regional economic development, their capacity has not been extend beyond a linear and one-dimensional scalar understanding of regionalisation. Drawing upon empirical research that sought to develop a multiscalar analysis of regional institutionalisation, this paper forwards two new scalar notions - centrally orchestrated regionalism and regionally orchestrated centralism. In the first instance, centrally orchestrated regionalism reflects our conventional conceptual understandings of local and regional economic development through the exploration of the relationship between the central state and regions in processes of regional economic development. This paper illustrates how through centrally orchestrated regionalism, the state can promote local and regional economic development while simultaneously preventing it from flourishing. Taking this idea forward, this paper then makes the argument that these same processes of centralisation that characterise centrally orchestrated regionalism are actually present regionally with regional agencies actively centralising competencies from subregional/local partners. Critically then, regionally orchestrated centralism is seen to actively reverse the trend of devolution in order to institutionalise a regional tier of economic governance by reducing the capacity for local decision-making and for locally responsive implementation of policy initiatives.

Keywords: Regional geography, scale, centrally orchestrated regionalism, regionally orchestrated centralism

Michael Harrison, Ph.D., University Of Richmond. Email: mharriso@richmond.edu; The Role of ENSO in the Development of the Precipitation Regime of Easter Island (Rapa Nui)

Easter Island (Rapa Nui in the native tongue) is an extremely isolated island on the easternmost fringe of Polynesia, approximately 3000 km west of the South American continent. Believed to have been settled approximately 1000-1200 years ago, the inhabitants of the island evolved from the seafaring Polynesian island inhabitants further to the west. It is well known that the El Niño-Southern Oscillation (ENSO) affects the circulation patterns over the Pacific Ocean, and it has been further speculated that ENSO-based alterations in the surface winds could have altered the migration patterns of seafaring peoples on the Pacific. In addition, changes in surface winds might be linked to precipitation changes over a given region, which in turn can impact the development

patterns of isolated islands whose primary source of potable water is directly tied to precipitation. This study examines the extent to which ENSO impacts the precipitation patterns of Easter Island. Monthly rainfall data is correlated to several well understood ENSO indices, such as the Southern Oscillation Index (SOI), central Pacific sea surface temperature anomaly data, and the composite Multivariate ENSO Index (MEI). Multiple sets of lag correlations (+/- 36 months) are created for each index. The results show that there are no significant ENSO correlations present in the Easter Island precipitation data, contrary to what might otherwise be assumed given the location of the island within the greater Pacific context. This forces a reevaluation of the role of ENSO in the colonization of the trans-Polynesian region.

Carol J Hochstetler, M.S., Dalton Local Schools. Email:
mchochstetler@earthlink.net; Engage, Interact, And Inspire: A Two-Week Journey Into The Hydrologic Cycle Through Inquiry

Water is a precious commodity, and there is a limited amount of groundwater and surface water available for human consumption. Therefore, it is essential for students to understand the hydrologic cycle and conservation of water at an early age. However, traditional methods of graphical illustration may not be adequate to convey the message of the hydrologic cycle to students. This curriculum unit engages students through authentic activities such as discussions, analyses of real data, laboratory activities, model development, and debates of current environmental issues. Such activities accommodate diverse learning styles and encourage student interaction with materials and peer collaboration. Content includes precipitation, evaporation, condensation, sublimation, water transport and storage, and water conservation; learning occurs through students' critical evaluation of activities and results. Through this process, students become more responsive to the subject and begin to ask more critical questions concerning the world around them. Through the implementation of inquiry-based techniques, students become more engaged in learning by obtaining quantitative and qualitative data, than through rote memorization of textbook facts. When previously presented in a seventh grade classroom, the lessons proved successful by providing tactile, visual, and graphic representations that increased student familiarity with subject matter and enhanced environmental awareness. Such education is of particular interest because it aids in the development of integral cognitive skills and empowers students to become environmentally conscious members of society.

Rudi Hartmann, University of Colorado at Denver. Email:
rudi.hartmann@cudenver.edu; The Issue and Problems Based Approach to Teaching Regional Geography

One of the oldest traditions in geography, the regional studies tradition, offers a great potential for the introduction of a fairly new approach to teaching geography: the issue and problems based approach. Over the years I have used this approach in many instances, for the one-time introduction of a selected 'problems' theme to a complete course designed for a whole semester, for instance, as an advanced "World Regional Problems" class. What kinds of themes are appropriate for the introduction into the geography classroom, in particular, when regional studies are the main focus? It can be a local/home area studies problem, for instance, employee housing needs in an upscale Colorado mountain resort, or a problem that has importance for humanity as a whole. In many classes, in World Regional Geography as well as in the Geography of Europe, I have introduced the issue of managing memorial sites of atrocities, for instance, of singular massacres and/or forms of genocide of the past in contemporary society. I have devised ways of introducing such 'places of horror' in the geography classroom. Future mega events in a given country, such as the Summer Olympics in Beijing 2008, may be addressed in regional geography classes as well. Finally, issues and problems can be also discussed on a comparative regional level, such as the development of ecotourism in Eastern Africa, Central America and/or Antarctica.

Joel Hartter, University of Florida. Email: jhartter@ufl.edu; Household and Landscape Level Impacts of Protected Area Establishment: The Case of Kibale National Park

The establishment of protected areas can have long term impacts on the landscape and livelihoods of people living near them. Outside Kibale National Park in western Uganda, rapid population growth, high population density, and heavy reliance on agriculture for income characterize the landscape. Although the park itself is completely surrounded by agricultural land, a network of forest patches, papyrus swamps and other wetland areas is scattered throughout the agricultural landscape that serve as important resource bases. The natural resource dependent livelihoods of these communities are complex and difficult to describe within a single methodological and theoretical construct. Household demographics, local culture, resource availability, and other factors must be considered at multiple scales in order to accurately describe changes in land use and land cover over time. To do this, a more integrated, mixed-methodology approach is necessary. This paper discusses the application of social science and landscape ecology concepts to understand the impacts of park establishment on the surrounding landscape. It further discusses the development of a geographic approach useful in agricultural landscapes to examine both household and landscape level scales.

Estimating Urban Microclimate Variability at a Neighborhood Scale

Estimations of neighborhood scale air temperatures based upon measurements taken at widely spaced weather stations do not adequately register microscale neighborhood variability. This study shows how the use of remote sensing classification techniques with hand-held infrared thermography and satellite (ASTER) images can produce better estimates of this variability. Data used are from Phoenix, Arizona, an arid city that has experienced explosive growth during the past 50 years. The metropolitan area with a population of over 3.5 million also has a significant urban heat island (UHI) of upwards of 6°C. The city's complex, heterogeneous urban fabric also produces considerable air temperature variability at a neighborhood scale, where temperatures can vary upwards of 3°C in short distances. This combination of techniques show promise in estimating microclimate temperature variability at the neighborhood scale.

C. Mimi Harvey, Denison University. Email: harveyc@denison.edu;
Yeong-Hyun Kim, Ohio University. Email: kimy1@ohio.edu; Keeping the Gateway Shut: Global City-ness and Indonesian Migrant Workers in Seoul

This research examines the absence of immigration in the global city formation of Seoul, the capital city of South Korea. Seoul has been considered an emerging economic powerhouse in the Asian Pacific, owing greatly to the Korean government's mega urban projects to boost the city's international status. However, Seoul in ethnic terms is a strongly Korean city rather than a cosmopolitan one. Almost all residents of Seoul are native-born Koreans, while foreigners make up a mere one percent of the population. We argue that Seoul's lack of ethnic diversity and multiculturalism is an intended outcome of the Korean government's restrictive policies on labor migration and immigration. The Korean government's role in keeping the gateway shut to immigration is examined through a case study of Indonesian migrant workers in Seoul. Since the mid 1990s, an estimated total of 30,000 Indonesian workers have migrated to Seoul, meeting a growing demand for low-skilled, low-wage jobs. They have encountered unmistakable political reluctance to allow migrant workers to settle there. The research draws on a series of in-depth interviews with the Indonesian migrant workers, many of which have become illegal under the strict guest-worker measures, including the Industrial Training System and Employment Permit System. Given a sharp shortage in the domestic labor market, it is very doubtful that Seoul could remain closed to migrant workers in the future. Indeed, migrant communities, including Indonesian one, have begun to emerge in the

outskirts of Seoul.

Keywords: global city-ness, cosmopolitanism, Seoul, Indonesian workers

daina cheyenne harvey, Rutgers University. Email: dharvey@rutgers.edu; daina cheyenne harvey, Rutgers University. Email: dharvey@rutgers.edu; Remembering the Forgetting of New Orleans

The urban trauma inflicted upon New Orleans has unambiguously reminded us that certain spaces in the city are more vulnerable than others, not only physically but also discursively. Climatic events like Katrina push marginalized spaces into the view of the larger society. They force us to try and understand spaces and places that we have been socialized to not attend to or have long ago forgotten. Every urban area has these types of spaces. New Orleans, because of its unique topography, seems to have more of these types of spaces than other American cities. The devastation of these spaces reveals a facet of urbanism that has long been ignored: the crisis of urban memory. While not oblivious to other discussions regarding the rebuilding of New Orleans that center on poverty, race, the shortcomings of various administrators, or the possibility that many of the New Orleans diaspora will not, or perhaps should not return, this paper takes as its starting point the idea that urban analysis needs to be recast and that New Orleans and Hurricane Katrina offer an appropriate framework.

Keywords: space, Hurricane Katrina, urban trauma, urban memory

Francis Harvey, University of Minnesota - Minneapolis. Email: fharvey@umn.edu; Nowhere is everywhere? Towards post-modernist ubiquitous computing-based geographic communication

"There's no there there" quipped Gertrude Stein when she was unable to find her childhood home in Oakland, CA while on lecture tour in the United States. This quote has since evolved to be understood as an indicator of the characterlessness of urban and suburban areas in United States—a vast nowhere resplendent in mediocrity, cheap food, and strip malls. Google Earth enters this scene and fulfills a deeply rooted desire to elevate any strip mall, any shopping center, any 5000 place car park onto a ethereal plane of virtuality within the reach of all networked citizens—erasing geographical difference and turning experience into the process of scale, rotate, click, and zoom through. Google Earth entices localities that aim to be as virtual as any other image of geography on Google Earth and transcend their place-bound constraints. This paper suggests that the allure of Google Earth is significant in changing the political economy of local government self-presentation, but may turn out to have the same staying power of many past innovative technologies used to represent local government in the US, for example, electronic voting and interactive local government television, neighborhood C-Span. However, the commercial orientation of Google Earth products suggests that it may achieve lasting staying power. By making the virtual world of online geographic visualization affordable and attractive, Google Earth affords nowheres everywhere a future place on the screen. Getting beyond the screen and becoming a 'place' remains the challenge for for computationally based communication.

William Harvey, University of Cambridge. Email: wh234@cam.ac.uk; British and Indian social networks: the story of Boston's biopharmaceutical industry

This paper emanates from some extensive micro level empirical research conducted on highly skilled immigrants. The paper analyses the professional networks of British and Indian scientists working in biopharmaceutical firms around Boston. The findings are a result of over two hundred structured interviews carried out in 2006. Despite the global origins of these scientists, their closest professional networks are with people who live locally around the Boston area. Indian scientists network more actively on a local level than British scientists when looking for new job or business information. They also show a greater tendency to network globally, for example they communicate significantly more with people from their home country than British scientists. This is surprising given that biopharmaceutical companies around Boston have many more collaborations with the UK than with India. In addition, British scientists travel to the UK more regularly than Indian scientists. Surprisingly, although British and Indian scientific associations exist within the regional economy, they are not well supported and are relatively insubstantial in size and scope. In spite of the large number of British and Indian scientists working in the Boston area, both sets of people tend to avoid networking within their immigrant groups. This is the opposite of what is taking place in other high technology regions such as Silicon Valley (cf. Saxenian, 2006). This paper provides some detailed explanations of why there are distinct similarities and differences both within and between the British and Indian scientific communities in terms of their professional networking patterns.

Katie Haselwood, University of Nebraska-Lincoln. Email: khaselw1@bigred.unl.edu; Childbirth in Homesteading Communities of the Great Plains: Women's Health and Responses

In the early part of the twentieth century the Children's Bureau sent field agents to rural areas of the United States to report on child health as well as maternal care. The reports on some areas of the Great Plains, especially in the case of Montana, showed that many women had very little access to healthcare facilities and in some cases were giving birth with only their husbands in attendance if not on their own. This paper seeks to examine how childbirth practices differed in the Great Plains from areas through out the nation and how childbirth was handled in homesteading communities as well as more established communities. This study hopes to shed light on women's thoughts about childbirth at this time and how they responded if they resided in a region without adequate health care.

Keywords: Great Plains, Childbirth, Homesteading

John Hasse, Ph.D., Rowan University. Email: hasse@rowan.edu; Evaluating Alternate Commuter Rail Corridors in Southern New Jersey

This analysis examines the geographic characteristics of four proposed commuter transit alternatives for Southern New Jersey. Utilizing Geographic Information Systems (GIS), the study measured the road network distance of each proposed rail line station to individual residences countywide as well as to selected destinations including: schools, restaurants, libraries among others. The results demonstrate that the various routes have substantially different geographic accessibility characteristics and thus different transportation service potentials. The best performing configuration for residential accessibility was NJ-3b with 10% of Gloucester County's population within ½ mile of the proposed stations. The 2nd, 3rd, and 4th configurations were NJ-3, NJ-1 and NJ-2 respectively with 7%, 2% and 1% of Gloucester County's population within ½ mile. Accessibility to destinations also favored NJ-3b with 369 destinations within ½ mile followed by NJ-3, NJ-2, and NJ-1 with 145, 16 and 9 destinations respectively within the half mile distance. Furthermore, the NJ-3 & NJ-3b system would better serve the established town-centers of the county fostering economic revitalization while providing a substantial and viable option for non-auto travel to within-county destinations.

Jason M. Hatch, Oregon State. Email: hatchj@geo.oregonstate.edu; Kelley Thomas, . Email: kelley@kbrt.org; Engaging Rural Youth in a Geographic Evaluation of the Impacts of Dam Removal on Sustainability in the Upper Klamath Basin, Oregon

The Chiloquin Dam, built in 1914 by the Bureau of Indian Affairs on the Sprague River in the Upper Klamath Basin to supply the Modoc Irrigation District with water, will be removed in 2008 to improve fish passage. The dam is located in the town of Chiloquin, with a population of 716 people, 30 percent of whom are poor, and more than 50 percent of whom are Native American. Dam removal will have both positive and negative impacts on "the triple bottom line" - ecological, social, and economic sustainability. Is the removal of the Chiloquin Dam an example of sustainable development? This project aims to strengthen the capacity of rural youth in Chiloquin, Oregon to help guide the future of their community and to excite students about the field of geography. Chiloquin High School students will be introduced to a variety of tools for geographic analysis (GPS, GIS, demographic data analysis and interviewing techniques) and will explore the concepts of sustainability and traditional environmental knowledge (TEK) in an assessment of the social and ecological impacts of dam removal on their community. To facilitate this project, a racially diverse (Native American, biracial Black and White, and White) team from Oregon State University comprised of faculty, extension agents and two graduate students will collaborate with teachers to engage students (a third of whom are Native American) in a consideration of sustainable development. Students will present findings to

Chiloquin community members, tribal administrators, and other local officials.

Keywords: sustainable development, water resources, dam removal

Gerhard Hatz, Ass. Prof. Mag. Dr., Department of Geography and Regional Research, Universität Wien. Email:

gerhard.hatz@univie.ac.at; *Growth and Decline in the City of Vienna*

Questions of recycling inner city brownfields and urban renewal have become important issues of urban planning in Vienna that will be discussed and evaluated. The analysis focuses on cycles of growth and decline observed within the last two decades and the instruments and efforts of urban planning and urban governance directed at areas that have to cope with considerable shrinkage. However, the cycles have also created new areas of growth, leaving less attractive locations behind. The "recycling" of abandoned sections of the inner city has required the massive application of instruments of urban planning as well as granting substantial amounts of financial assistance. To countervail the spiral of decline in the inner city residential areas in Vienna, a specific model of "gentle" urban renewal has been developed. Gentle urban renewal focuses on sustainable renovation that directly involves the tenants into the renewal process. The analysis of spatial patterns as well as new concepts for redeveloped brownfield areas are supported by a set of theories, like the application of the spatial product cycle theory or evolutionary economics. The evaluation of fragmented urban planning in Vienna will consider the post-modern paradigm of creating poly-nucleated compact cities. The analysis of cycles of growth and decline reveals the strong linkage of urban planning in shrinking areas to these cycles and the lack of concepts in cycles of decline. Besides, the contradiction between planning efforts of renewal in inner city areas and the demands of the global economy has become a reason for decline itself.

To what degree do individuals' attitudes shape their behavior, and to what degree are attitudes formed in a specific geographical context - in place? The starting point for this research is a theoretical discussion of the importance of attitudes and related concepts as well as of place for how people choose to act in different situations. These issues are then applied in a case study of the national Swedish sickness insurance system. Since the late 1990's, the sickness insurance system has been the subject of an intense public debate sparked by a rapid increase in public expenses for the system. The possible illegitimate "over-usage" of the system by individuals has been a distinct undercurrent throughout the debate, and one proposed reason for this potential problem is differences in attitudes within the "client population" - a matter which has, however been largely empirically unknown. This issue is also closely related to observed regional differences within Sweden in the use of the sickness insurance. This research empirically explores the importance of attitudes for the usage of the sickness insurance system in the form of a case study based on a major questionnaire study conducted in 2005 by order of the Swedish Social Insurance Agency. The data is analyzed using statistical techniques (ordinary linear regression and logistical regression). The results show that the usage of the sickness insurance system is in fact related to variations in attitudes, and that attitudes are subject to regional variations.

A chronosequence with a terminal moraine dating to the mid 18th century is found at the Norwegian glacier Styggedalsbreen. Patches of patterned ground with varying degrees of activity occur along the chronosequence, with activity decreasing with distance from the ice margin. Soil development was studied along the chronosequence in three differently aged terrain units: 1) recently deglaciated (~ 20-30 years); 2) deglaciated ca AD 1930; and 3) deglaciated between AD 1836 and 1867. Within each similarly aged terrain unit, pedogenesis was investigated in regards to three different categories of disturbance: 1) patterned ground centers; 2) patterned ground borders; and 3) relatively stable non-patterned ground. Physical soil properties along with the use of a soil development index (i.e. PDI) show significant ($P < 0.5$) differences in pedogenic development among the three different categories of disturbance within similarly aged terrain units. The

relatively stable non-patterned ground soils have an advanced degree of development (i.e. thicker horizons and higher PDI values) over that of soils within patterned ground. Soil comparisons along the chronosequence also show that soils within patterned ground to be a developmental stage behind that of relatively stable non-patterned ground. Findings therefore suggest that cryogenic disturbance leads to pedogenic diversity and heterogeneity across the landscape, where patterned ground soils are a successional stage behind that of non-patterned ground soils.

Keywords: Pedogenesis; patterned ground; geomorphology; fine-scale; disturbance; chronosequence; Jotunheimen; PDI

Peggy Hauselt, UC Davis. Email: mmhauselt@ucdavis.edu; Richard Plant, UC Davis. Email: replant@ucdavis.edu; *Cultural Water Use in California Rice Production*

Careful water management is critical to successful rice cultivation. Besides meeting the basic evapotranspiration requirements of the rice plant, California rice farmers apply water for many cultural uses such as in seeding, temperature regulation, pesticide applications, salinity management, post-harvest straw decomposition, and waterfowl habitat. While much research has been done on water quality in rice fields less information is known concerning the quantities of water used in California rice cultivation. Most of the cultural practices had not been evaluated with respect to water requirements in California rice. This paper presents the preliminary results of a spatial model of these cultural water uses in California rice production.

Heidi Hausermann, University of Arizona. Email:

hhauserm@email.arizona.edu; Heidi E Hausermann, University of Arizona. Email: hhauserm@email.arizona.edu; *Social organization, Livelihoods and the Environment in Veracruz's Coffee Industry*

In the institutional vacuum caused by State withdrawal and price declines during the early 1990s, Veracruz coffee producers organized in unique ways to negotiate new livelihood opportunities. Based on ethnographic data collected during preliminary dissertation research, this paper discusses the implications of these new modes of social organization for livelihoods and the environment. Moreover, as the State has re-emerged to implement development projects in the coffee sector, government agencies that previously operated in a more top-down manner now must take these new social relationships into account. This paper thus concludes that the social organizations and environmental practices formed in the wake of the coffee commodity crisis are now more directly influencing the State's mode of planning. These findings contribute to recent scholarship from Latin America that demonstrates that agriculturalists are not merely 'victims' of global economic change, but rather are organizing in ways which allow them to claim rights to natural resources and improved livelihoods, while at the same time contesting the more egregious effects of economic and institutional re-structuring.

ehavice@nature.berkeley.edu; *Accessing Domestic Development: Distant Water Fishing and Tuna Industrial Development in the Western Central Pacific Ocean*

By investigating the nature and conditions of foreign access to the world's most valuable tuna fishery, this paper offers an analysis of the economic and environmental opportunities and constraints that shape the Western Central Pacific Ocean (WCPO) tuna industry and tuna related development opportunities in Pacific island countries (PICs). Specifically, it addresses how access to tuna

resources is secured as a function of three main factors that, when taken as a sum, guide the nature of the industry: 1) intergovernmental and state-corporate relations, 2) resource scarcity, and 3) place specific economic development objectives. Building from these factors, it theorizes how the transnational nature of both the tuna industry and the resource itself create real challenges for resource governance that have the capacity to splinter, rather than unite, Pacific island counties' regional management and development efforts. The paper concludes that despite the global and decentralized nature of the tuna harvest sector, 'access' under conditions of resource scarcity remains the lynchpin of global tuna harvest which dictates the international, regional and national economic and environmental management structures of the tuna harvest sector as a whole.

Timothy W Hawkins, Shippensburg University. Email: twhawk@ship.edu; Andrew W. Ellis, Arizona State University. Email: dellis@asu.edu; *Assessing the Importance of Antecedent Soil Moisture Conditions for Predicting Reservoir Inflows on the Colorado River Basin*

Soil moisture content across the Colorado River Basin (CRB) was simulated in an effort to assess the importance of antecedent soil moisture on stream flow. A simple gridded climatic water budget model was applied across the CRB on a monthly time step for 111 years. Soil moisture data for were used to calculate soil moisture indices for the Salt, Verde, Upper Colorado, and Lower Colorado sub basins. These indices, in conjunction with numerous hydrologic parameters generated from the model, were used to develop statistical relationships with stream flow for both the Salt and Verde basins. Of these relationships, the strongest relationship with stream flow included soil moisture, seasonal dummy variables, and the cumulative effect of snow melt, rain fall, and evaporation as independent variables. These relationships were then used to examine the potential for developing a stream flow forecast based on these independent variables.

Dawn Hawley, Ph.D, Northern Arizona University. Email: d.hawley@nau.edu; Samantha Arundel, Ph.D, Northern Arizona University. Email: sam.arundel@nau.edu; *Tablet PC use in Enhanced Communication and Field Skills*

The Tablet PC is emerging as a tool that can enhance diverse disciplinary goals and skills, both in classrooms and on field sites. The Tablet PC presents an opportunity to enhance both communication skills and field data collection using mobile technology while advancing student knowledge in emerging technologies. Examples are first presented in the use of this technology in a public participation course in which no student had used a Tablet PC previously. During the course, students were introduced to various tablet programs. Students then used Tablet PCs to enhance workshop skills using Google Earth images, create community image surveys, and screen peer reviewing to advance visual editing ability and interactivity between groups. Another realm of potential Tablet PC use is in teaching physical/environmental geographies. The Tablet PC is leading to the conceptualized redesign of courses studying the physical environment, particularly in collecting field data to be used with geospatial technologies. Redesign possibilities on the use of this tool in an intermediate GIS course are also presented. Students can utilize the tablets to collect spatial data of their choosing in the field, add attribute data real-time, then prepare the data for web sharing by performing quality control on a peer's dataset, and adding metadata to the files for official use. In this instance, Tablet PCs provide a tool that can increase the interactivity and creativity of course projects, aid in real-time collection of field data that may be useful to various agencies, and aid in students' technological preparation.

Having access to preventive health care services is essential to maintaining an individual's overall health. With this being the case, it is important to calculate measures of accessibility to preventive health services, including measures that consider factors that influence an individual's decision to obtain these services. Traditional measures of geographic accessibility to health care services typically use population to provider ratios, straight line Euclidean

distances or travel times. While these methods are all useful for explaining potential accessibility, they often fail to consider other factors such as an individual's perceptions to accessibility and (un)willingness to access care, which may limit access to preventive health services. Thus, measures which fail to account for individual perceptions to care may report measures of accessibility that differ significantly from revealed accessibility measures. This study utilizes data obtained from a sample of Appalachian Ohio residents to understand social, demographic, neighborhood and individual variables that might help explain why some women choose (and do not choose) to enroll in smoking cessation programs. This research compares traditional measures of accessibility to facilities that offer smoking cessation programs with measures that consider other individual perceptions and variables that might limit accessibility to such programs. This presentation makes conceptual contributions to the health GIS and accessibility literatures by measuring revealed accessibility of individuals based upon their perceptions and (un)willingness to utilize preventive health services. The research also highlights the important differences between estimated and revealed measures of accessibility.

Keywords: accessibility, health GIS, revealed accessibility, perceived accessibility, smoking cessation, Appalachian Ohio

James J. Hayes, Indiana University. Email: jamehay@indiana.edu; *Assessing Change in a Post-fire Ponderosa Pine Landscape of North-central New Mexico: Comparing Simple and Complex Measures of Landscape Configuration*

Fire regimes in ponderosa pine forests have been shown to vary from frequent, low-severity fires to rare, stand-destroying fires across the geographic range of ponderosa pine. Theory in landscape ecology and its methods for describing landscape spatial patterns are well suited to help better understand how this variability is related to spatial configuration of forest landscapes. This paper examines the links between simpler measures of landscape pattern and relatively more complex landscape metrics. Classified Landsat ETM+ data are used to compare the proportion of the landscape in landcover classes, observed and expected transition probabilities, and focal analysis of diversity and evenness before and after a wildfire in the Cason National Forest, New Mexico. Landscape metrics including patch density, patch extent, shape index, and interspersed and juxtaposition index are calculated for the same areas. The results of the two analysis approaches are compared. The theoretical links between metrics for describing landscape pattern and the ecological meaning of those metrics are still not well developed. Many metrics covary, have poorly understood statistical distributions, and are consequently problematic for interpretation. Comparing the "simple" analysis of landscape pattern and relationships with commonly used and appropriate landscape metrics can indicate when landscape metrics become necessary and when they only complicate interpretation of results. Better understanding of the relationship between simple and complex measures of landscape pattern will improve theory in landscape ecology and its power to guide choices of pattern measurement tools.

John T. Hayes, Ph.D., Salem State College. Email: jhayes@salemstate.edu; *Community Climate Action Plans: A Comparative Study of Selected U.S. Cities and Towns*

Climate change activism by cities and towns at the grassroots level is occurring across the U.S. Local governments are adopting resolutions to become a "City for Climate Protection". CCP is a worldwide campaign of the environmental NGO, ICLEI, which attempts to work with city and county governments across the United States to reduce their energy use and greenhouse gas (GHG) emissions. CCP communities use ICLEI software to conduct audits of energy use and GHG emissions produced by their municipal operations. City governments make numerous decisions every year that affect their energy use: renovating and retrofitting old buildings, purchasing 'green' power, adopting energy efficiency standards, traffic idling ordinances, and hybrid vehicle purchase guidelines, promoting bicycling, mass transit, and walking. All of the efforts cited above are being encapsulated into Climate Action Plans, which guide efforts to plan and implement energy efficiencies and reduction of GHG emissions. CAP's represent a focused approach to reduce a city's "ecological footprint". This paper will survey CAP's from selected cities and towns across the U.S. A range of CAP's were chosen to explore differences regarding energy use planning for the municipal, commercial, industrial and residential sectors. I will compare and contrast the various approaches used in this environmental and global climate impact planning that is occurring at the local level.

Allison N Hayes-Conroy, Clark University. Email: ahayesconroy@clarku.edu; **Jessica Hayes-Conroy, Pennsylvania State University. Email:** jsh285@psu.edu; *Taking Back Taste: Feminism, Food Choice, and Visceral Politics*

Appreciation of the political significance of food choice needs to be strengthened. Food choice lacks adequate understanding in three ways; first, food choice tends to be framed as an individual matter, belying ways in which social structures shape decisions made about food. Second, powerful politics are at play at every step of the conventional food system but this multi-scaled politics of food usually remains hidden from the everyday consumer and the everyday academic. Third, adequate understanding of the political importance of food choice may be hindered by an inability to specify the link between the materiality of food choice and the ideology of decision-making in regard to food. This paper addresses this third obstacle to strengthening appreciation of the politics of food choice, and specifically examines the utility of recent work within non-representational theory and feminist urban geography. This is done in order to attempt a more complete disclosure of the play of power in contemporary food systems. Specifically, the work of Foucault is used, modified by feminist urban geography in anticipation of a "breaking open" of the concept of body so that internal body processes may be considered. Examples of eating behaviors are used to specify the role of internal bodily process in food politics and strategically surpass mind-body dualistic thinking.

David J Hayward, University of Auckland. Email: d.hayward@auckland.ac.nz; **Nicolas Lewis, University of Auckland. Email:** n.lewis@auckland.ac.nz; *'Regional Dynamics in the Globalising Wine Industry: The Case of Marlborough, New Zealand'*

The rapid expansion of the New Zealand wine industry has rested largely on a specific wine commodity form, Marlborough Sauvignon Blanc. Global demand has provided the impetus for substantial development at the regional level, an increasingly complex industry structure, and for the intrusion of international capital. This paper explores the contests and relations within the industry through commodity chains analysis, wherein recent developments are mapped onto specific nodes in the production sequence. As a result the contemporary situation may be explained through overlapping organizational and geographic framings of these relations: producer versus buyer-driven dynamics; regional-national and global interests; and inter- and intra-corporate strategies. The commercial contest for control of the region-varietal commodity reveals some paradoxical outcomes in which the region is reaffirmed as a site of investment in an evidently globalised industry, and the significance of who controls what fraction of the value chain is reasserted.

Peter Hayward, U. of Connecticut. Email: steelershayward@hotmail.com; *Applying the Maximal Covering Location Problem to HIV/AIDS Testing & Treatment Centers in Hartford, CT*

The location and allocation of HIV/AIDS resources can effect the testing and treatment of at-risk populations. Centers which offer HIV/AIDS tests, as well as those which provide treatments to individuals already afflicted with HIV or AIDS, have a specific geography which may or may not reflect the underlying population characteristics in distinct areas. Therefore, determining the possible coverage of these centers and linking this to the optimal coverage is research that is not only valid, it is needed. The maximal covering location problem (MCLP) is a technique applied to public facility location analysis which determines the maximum population that can be covered within a specific distance and a limited number of facilities. The purpose of this research is to apply the MCLP to the location of HIV/AIDS testing and treatment centers in reference to the total non-white population in Hartford, CT. Results provide an indication of the optimal spatial arrangement of HIV/AIDS resources.

Keywords: HIV/AIDS, Maximal Covering Location Problem

Francisco Hazera, University Of Richmond. Email: frankie.hazera@richmond.edu; *Monitoring Stream Flow In Southern Florida Using Remote Sensing*

As population density increases in southern Florida there have been studies that show an increase in water utilization in the Everglades. Using a GIS-based analysis of the area a time series is created to identify whether a significant change in the discharge from Lake Okeechobee into the downstream wetland regions of the Everglades has occurred. The analysis was prepared using Erdas Imagine and ArcGIS. Landsat imagery was used to derive indices and perform an unsupervised classification to identify the differences in vegetation between 1985 and 2000. It is hypothesized that over time Lake Okeechobee will increase in size and that the vegetation of areas downstream of Okeechobee will decrease. This supports the idea that the water from the Everglades is being increasingly utilized by the growing population in the adjacent urban areas and intensification

of agricultural concerns in the region.

Julianne Hazlewood, University of California Davis. Email: jahaze@gmail.com; *The Effects of Postcolonial Property and Governance Legislation as Viewed through Aerial Spraying in Southeast Alaska*

This paper uses aerial spraying in Southeast Alaska as a lens to examine how Alaska Native interests are contested and legitimized within postcolonial and state-reinforced tribal-corporate dichotomies. In March 2006, the State of Alaska's Department of Environmental Conservation (DEC) granted Klukwan, Incorporated? a Tlingit Native Corporation established with the Alaska Native Claims Settlement Act (ANCSA) of 1971? a permit to aerial spray herbicides to control for red alder and salmonberry in "their" second growth rainforests on Long Island. In September 2006, the city of Hydaburg, two regional environmental organizations, and three Tlingit and Haida Tribal organizations? established with the 1936 Alaska Indian Reorganization Act? filed suit against the state's DEC because Long Island is Haida traditional subsistence territory. They claim that the DEC ignored the 99 percent of 1,298 public comments opposing aerial spraying because of potential environmental and health hazards associated with the "chemical cocktail". This aerial spraying quandary is inextricably linked to postcolonial re-presentations of property and governance, established through legislation which reaffirms Western notions of property, indigenous territory, and "proper management", and outlines the boundaries of public versus private spheres. In addition, state policies in Alaska Native territories have influenced a political transformation: from the region's indigenous peoples fighting against colonial state governments to ANCSA Native Corporations and IRA Tribal governments sometimes working against each other. Southeast Alaska Tribal governments continue to stand up for Alaska Native sovereignty, a struggle that has existed since the 1880s, and they will not allow their subsistence-based priorities to be undermined.

Canfei He, Peking University. Email: hecanfei@urban.pku.edu.cn; *Industrial Distribution of Foreign Manufacturing Investment In Beijing: The Role Of Industrial Agglomeration And Industrial Linkage*

Theories argue that oligopolistic advantages embedded in multinational corporations and locational advantages in the host economies determine the industrial distribution of foreign direct investment. Most empirical works stress the significance of typical industrial characteristics in influencing the industrial selection of foreign investors, such as industrial concentration, research & development, industrial policies, product differentiation, and scale economies. This paper is to investigate the systematic forces that determine the industrial distribution of foreign manufacturing investment, with a particular interest on the importance of industrial agglomeration and industrial linkage in attracting foreign investment to local industries. Industrial agglomeration and local linkage is presumably assumed to generate significant cost-savings because of sharing markets, easy flowing of information and knowledge and better matching of suppliers and customers. Foreign investment is particularly stimulated to take advantage of the geographical proximity of related enterprises since foreign investors suffer from the disadvantages of alien status. Using a panel dataset of two-digit manufacturing industries in Beijing during the period 1999-2004, this study found that geographically agglomerated industries with strong intra-industrial linkages attract much foreign investment. Previous foreign investments have demonstration effects, information spillover effects and linkage effects, leading to industrial concentration of foreign investment. Investors also highly favor capital and technology intensive industries and are drawn to the most profitable and exporting industries, but avoid industries with high effective wage rates and high entry barriers. The results suggest that the existence of industrial clusters certainly heightens a city's attractiveness to foreign investment.

Keywords: Industrial Agglomeration; Industrial Linkage; Foreign Direct Investment

Chansheng He, Dr., Western Michigan University. Email: he@wmich.edu; **Thomas E. Croley, Dr., NOAA Great Lakes Environmental Research Laboratory. Email:** Tom.Croley@noaa.gov; *Understanding of Water Movement among Glacial, Oasis, and Desert in the inland Black River Watershed, Northwestern China*

The Black River (or Heihe in Chinese) is the second largest inland river in China, located in Northwestern China with a drainage area of 128,000 km². From its headwater to the middle, and lower reaches, glacial, agricultural oasis, and desert make up 21.9, 43.6, and 34.5 percent of the watershed respectively. Annual precipitation ranges from 250 - 500 mm in the glacial and mountain areas to 55 - 200 mm in the oasis of middle reaches and eventually to 40 mm in the lower reaches. While the glacial melts contribute about 10 percent of the surface runoff in the basin, agricultural irrigation water supply in the oasis comes mainly from groundwater withdrawals. In recent years, increasing agricultural

irrigation has been depleting groundwater supplies and shrinking sizes of several lakes in the middle and lower reaches. To address this water shortage problem, we are collaborating with The Chinese Academy of Sciences Cold and Arid Regions Environmental and Engineering Research Institute researchers to understand the water movement mechanism among the glacial, oasis, and desert in the Black River Watershed through field inventory and modeling approach. This paper describes the preliminary work of adapting the Distributed Large Basin Runoff Model (DLBRM) for understanding of water transfer between glacial melts, precipitation, groundwater, streamflow, and evapotranspiration in this large inland river watershed as well as challenges encountered in the project.

Keywords: hydrologic modeling; DLBRM; Black River in Northwestern China; and water shortage

Xueqin (Elaine) He, Texas State University - San Marcos. Email: xh1003@txstate.edu; Samson Eric, Texas State University-San Marcos. Email: es58830@txstate.edu; John Tiefenbacher, Texas State University-San Marcos. Email: jt04@txstate.edu; International Student Risk Perception and Avoidance

This research considers the vulnerability of international students to hurricane hazard, risk, threat, impact and aftermath in the Houston, Texas area. International students at four-year post-secondary institutions in the Houston metropolitan area were solicited to self-report personal information and their perceptions and experiences with hurricane evacuation. A voluntary response instrument was distributed via e-mail to international students through university administrations with an incentive offered for reply. Variables such as English proficiency, duration in the Houston area, age, sex, socio-economic status, parenthood, previous hurricane/cyclone/typhoon experience, and access to media are analyzed to correlate and predict vulnerabilities of this sample of convenience to hurricane scenarios such as watch, warning, and voluntary and mandatory evacuation. Respondents were also asked about perceptions in response to warning events leading up to Hurricane Rita on 14 September 2005 and how the warning event for what turned out to be a false alarm may affect future behavior and vulnerability. The hypothesis that international students are more vulnerable to the hurricane agent than U.S. residents newly arrived in the Houston area and Houston residents in general is analyzed, tested, and reported. Models to mitigate international student vulnerability to hurricanes are abstracted from the data.

Yuanqing He, Dr., Chinese Academy of Sciences. Email: yqhe@ns.lzb.ac.cn; Wenxiong Jia, Chinese Academy of Sciences. Email: ; Climatic and Glacial-Hydrological Features of the upper part of Heihe River Basin, Mts. Qilian

The upper part of Heihe River basin refers to the area between the head of the river to Yingluo Gorge near Qilian County, which is located in a broad valley between Mt. Tuolai and Mt. South Zoulang in Mts. Qilian, with a total area of about 10,240 km². Since 1950's, the temperature has risen to form annual mean values of 0.54° in 1950's to 2.32° in 1990's. The rising amplitude of temperature is higher in high elevation area than that of low elevation area. There are 186 glaciers in the up-part of Heihe River basin, with a total area of 259.35 km². The upper limit of glaciers is 5103 m and the lowest glacier ends at 3560 m. Glaciers mainly distribute in Southern slope of Mt. Zoulang and Northern Slope of Mt. tuolai. The equilibrium lines of glaciers vary from 4350 to 4500 m. The mass balance of glacier Qiyi near the head area of Heihe River was positive in 1970s, with an annual mean value equal to 360 mm water equivalent but the balance in 1980s was equal to 4 mm water equivalent approaching to zero. After then, the annual mass balance were negative during the 2001/2002 and 2002/2003 balance years (-810mm and -316mm respectively), indicating the glacier's response to climate warming.

Keywords: Glacial melts; Climate Change; Inland River; Heihe, Northwestern China.

Richard G Healey, Professor, University of Portsmouth. Email: richard.healey@port.ac.uk; Railroads and 19th Century Regional Economic Growth : Issues for Historical GIS

Based on extensive experience with the development of the N.E. USA Historical GIS, in which railroad-related datasets play a prominent part, this paper examines a number of questions about how historical GIS methods can contribute to an improved understanding of the role of railroads in processes of 19th century economic growth at a detailed regional scale. A first group of questions concerns operational problems associated with the collection and structuring of complex spatio-temporal datasets, and the dissemination of the resulting data resources via both printed and electronic means. A second group of questions relates to the linking of GIS-based research to other topics in the historical geography of transportation, such as the rise of railroads as corporate organisations; the role of interlocking directorates both within and beyond the

railroad sector; local, regional and national sources of financing; and inter-regional forward/backward linkage effects, building on Fishlow's classic work in this area. A concluding section aims to suggest both near-term and long-term areas of potential focus that may form the basis for a research agenda in this area of quantitative historical geography.

Keywords: railroads, historical GIS, regional economic development

Stephen Healy, PhD, Miami University. Email: stephen.healy@gmail.com; "Sexuating the Economy of Care: Towards an ethics of surplus and a geography of Sufficiency"

This paper explores the methodological dimensions of Lacanian sexualization in the context of qualitative research on the U.S. Health Care Reform Debate (HCRD). While Lacanian sexualization is a formal typology of the symbolic order it also has broad applicability to both textual analysis and ethnographic research—it allows for a different approach to both reading and listening. From a psycho-analytic perspective, the arguments for “free market reform advocates” and the “right to care” both rely on masculine sexualized logic. Masculine logic establishes a symbolic order in relation to a constitutive exception that is above the Law. While health care, like other elements of “social reproduction,” is subject to the law of scarcity, productive capital's claim upon social wealth is, of necessity, unfettered. “Capitalism's” need for capital is absolute and, as a consequence, the demand for care must always be constrained and take shape in a discourse that seeks to “optimize” care delivery. Adopting the diverse and community economy framework, developed by J.K. Gibson-Graham, this paper also illustrates the ways in which a care economy is composed of paid and unpaid actors, formal and informal sites, capitalist and non-capitalist class processes. Specifically, I show how stories of paid and unpaid caregivers in the course of my qualitative research accord with feminine sexualized logic wherein the constitutive exception gives way to subjection that is universal and partial. My informants saw at once the finite and particular needs of patients and the range of resources that might be brought to bear in satisfying them.

Keywords: health care, economic geography, community economy, psycho-analysis

Nathan J Heard, MSc, U.S. Department Of State. Email: HeardNJ@state.gov; The New Geography of Treatment, a Response to Global HIV/AIDS

There was no treatment for HIV/AIDS when geographers first joined the international response to the epidemic. Three areas of research emerged where spatial analysis was especially useful: subnational surveillance of HIV prevalence, the identification of optimal location of programs, and the evaluation of programs and policy. With the advent of effective antiretroviral therapies and a large international effort to fund both prevention and treatment, the importance of geographic tools in the global response to HIV/AIDS has only increased. The role of geographers has grown to include program implementation, which requires the coordination of multiple unilateral and multilateral organizations delivering a wide spectrum of services over large areas through community and fixed health facility-based programs. This paper documents the historical realization of the potential role of geography in the global response to the epidemic and points towards additional functions of spatial-analytic information management for USG interagency collaboration and international cooperation.

The NTC at Fort Irwin, California, has expanded its base and available training area into USFWS desert tortoise critical habitat. The desert tortoise is a threatened species. Of all the mitigation measures proposed to offset expansion, the most challenging to implement was the translocation of desert tortoises from portions of the expansion area, and the selection of areas where this would be feasible. We developed a spatially explicit decision support system that was objective, open, and scientifically defensible and produced a range of alternative translocation scenarios. These scenarios were designed to identify the best areas to translocate tortoises in light of the immediate threat of expansion and given the magnitude of the conservation and management challenges within the Western Mojave Recovery Unit. We worked closely with a committee mandated by Congress and designated by the Secretaries of Army and Interior to implement this system. Ten criteria were identified for consideration of translocation suitability and seven alternative translocation scenarios were developed. Ultimately a single translocation model was agreed upon and six potential translocation areas were identified. In addition, as a result of the alternative scenarios, areas not previously scheduled for tortoise proof fencing are now scheduled to be fenced. The use of spatially explicit decision support systems are

beginning to play an ever increasing role in natural resource and conservation management. However, in order for these systems to be successful they must tackle real-world management problems with input from both the scientific and management communities, as well as interested stakeholders.

Alfred Hecht, Wilfrid Laurier Univ. Email: ahecht@wlu.ca; Canadian Regional Growth and Economic Well-Being

Canada has, in part because of its large land mass, substantial variation in economic well being over space. Most data clearly shows that economic well being is low in the eastern part of the country, rises as one moves to the Centre, Ontario, then declines again in the eastern prairies only to increase again in the far western two provinces. This general picture tends to be true if one looks at population growth, income sources, labour participation indicators, unemployment rates as well as other socio-economic indicators. These differences are of long standing. Some can be contributed to the resource sector in various regions of Canada but most to the old manufacturing sector and the new high tech and business sectors. In this paper these regional differences will be summarized and multiple regression models will be presented using 2001 Canadian census Data, to capture the regional positive growth forces.

Keywords: Regional wellbeing, Population growth, multiple regression model, 2001 Canadian Census

Barry Hecht, Balance Hydrologics, Inc.. Email: bhecht@balancehydro.com; Quantitative Analysis of Sediment-Rating Curves in Assessing Changes in Sediment Yield

Analysis of carefully-developed suspended- and bedload-sediment rating curves can allow changes in the sediment yield to be quantified both rapidly and regionally. Curves from 30 San Francisco Bay Area streams developed by Balance Hydrologics staff are used to demonstrate application of these curves in evaluating: (a) pre- and post-project changes in sediment delivery, (b) differences between incising and non-incising streams draining paired watershed, (c) effects of geology and soils on sediment yields, and (d) changes in sediment yields before and after episodic events. Use of bedload rating curves developed with the Helley-Smith bedload sampler over the past 30 years in Northern California streams strengthens validity of these curves in quantifying changes over time and within or between watersheds. Useful analysis rests upon sediment-transport data collected rigorously and over a wide range of flows, possibly supplemented from independent lines of evidence such as reservoir sedimentation or channel dredging records. Electronic data collection and telemetry make it easier to reliably collect sufficient data over periods of (typically) several years to quantitatively address the questions about sediment transport and yield increasingly asked by geographers and professionals in cognate fields.

Wikipedia, the world's largest collaboratively-edited body of encyclopedic knowledge, has been studied very little through the lens of Geography. Accordingly, not much is known about the geographic opportunities presented by such a freely available and massive source of information. It is in this context that we present Minotour, a proof-of-concept, location-aware tour application for mobile devices that frees the content of Wikipedia from existing physical and organizational restrictions by generating narratives relevant to a user's current geography. As such, Minotour is one of the first attempts to place Wikipedia data in real-life, spatial contexts. In order to deliver its unique, spatially-rooted stories, Minotour draws upon interdisciplinary research in GIScience, data mining, human computer interaction, location-based services, and new media narratives. We will discuss the algorithms and data mining techniques used in narrative development and analyze these narratives in the context of new media theory. We will also present the cartographic issues involved in the tour delivery and experience, as well as the effects of Minotour and its Wikipedia-derived content on relationships between space and place.

David William Hedding, North West University. Email: heddingd@uniwest.ac.za; A First Inventory of Periglacial Features in Western Dronning Maud Land, Antarctica

Due the remoteness of Southern Circumpolar Region, particularly Antarctica, and the perceived absence of ice-free areas on the Antarctic continent, it has received significantly less attention from the scientific community with regard to periglacial studies when compared to the Northern Hemisphere. Few data have, thus, been published on periglacial features in the Southern Circumpolar Region, specifically continental Antarctica, even though substantial ice-free areas exist (~280,000 km²), which are all underlain by permafrost. A need, therefore, exists to create an inventory of the periglacial features of Western Dronning Maud Land, Antarctica. This paper documents periglacial geomorphology found on the Robertskollen, Vesleskarvet, Valterkulen and some nunatiks in the Borge Mountains. Detailed measurements describing the characteristics of patterned ground, depth of sorting, and the existence of permafrost are presented.

Keywords: Antarctica, periglacial, patterned ground, permafrost

Cheryl Ann Hedgman, MS, NGA. Email: Cheryl.A.Hedgman@nga.mil; Modeling boundaries and terrain for improved border management

International boundary management will be more effective when all parties involved have a clear understanding of where the boundary is on the ground and where it is located relative to other local features. It is easy enough to have high-level discussions regarding "notional" boundaries, however, in order to effectively manage people, goods and natural resources in border regions, you must be able to evaluate, analyze and discuss issues with the relevant parties. Using GIS and legal treaty materials, trained analysts can create a border/terrain model or common view for policy makers. While creating the terrain model and interpreting the legal boundary material can be time consuming, once this work is completed, decision makers will have a tool for rapidly viewing various sections of the boundary. Proposed boundary changes can be evaluated with other local data to determine possible negative/positive impacts resulting from those proposed changes. A model of digital boundary data and local terrain can be a critical tool for supplying decision makers with better information.

Mara Hedrich, University of North Texas. Email: mnh0014@unt.edu; The Geography of Viral Hepatitis C in Texas, 1992-1999

This study examines the relationship between viral hepatitis C (HCV), race, gender, and population density in Texas counties. Previous studies related HCV rates to residence in urban areas, race, and gender as common risk markers. HCV morbidity rates in Texas counties from 1992 to 1999 were obtained from the Department of State Health Services (DSHS). Race, gender, and population density data were extracted from the 2000 U.S. Census. Simple linear regression, Pearson's rank correlation, and Friedman's test were used for the analysis. The results indicated that population density was not a significant indicator of HCV rates, but race and gender were significant. African Americans have a much higher risk than Caucasians and Hispanics, and males have higher rates than females. Thus, HCV rates in Texas counties seem to be influenced not by urbanization, but by ethnicity and gender. Previously considered as having low risk for HCV, rural counties in Texas appear to have an equal risk compared to urban counties. Yet, the latter have been the main focus of previous intervention efforts. New intervention efforts in Texas must focus especially on minorities in rural areas.

Keywords: Geography, Viral Hepatitis C, Texas

Michael Heffernan, University of Nottingham. Email: mike.heffernan@nottingham.ac.uk; A Geographical Happening: South Kensington (London) in July 1964

This paper focuses on a precise location (South Kensington in London), a particular time (late July 1964), and a specific event (the 20th International Geographical Congress). The congress was attended by over 2,000 delegates from 65 countries and involved the usual range of lectures and presentations in the network of museums and scientific institutions dotted around South Kensington, as well excursions within and beyond London, exhibitions of maps and photography, and even a 'geographical' film festival. These events provide a revealing snap-shot of a discipline on the cusp of a significant intellectual and technical revolution, but also point to much wider debates, characteristic of the period, about the potential of regional planning and urban reconstruction; the tensions generated by decolonisation and immigration; and the fears created by the geopolitics of the Cold War. These larger debates, which were also rehearsed in media reaction to the congress, had acquired a peculiar intensity in the west London streets in the immediate vicinity of South Kensington where intensifying

social and cultural divisions had generated new and complex geographies of exclusion, anxiety and transgression.

Keywords: London, 1964

Christian Patrick Heidkamp, University of Connecticut. Email: Christian.Heidkamp@uconn.edu; *Credence Attributes and Land Use: Eco-labeled Coffee*

The paper aims to contribute a spatial analytic perspective based on normative economic principles to the recent discussion on an environmental economic geography. It does so via an example aimed at analyzing the land use implications of the emergence of credence attributes in the coffee market. The example of shade grown versus commodity coffee is used to assess how increases in demand for eco-labeled coffee are reflected in the landscape. The research presented extends basic land use theory to incorporate the externality effects implied by consumer demand for credence attributes. The approach taken will be based on two basic and interrelated principles: relative scarcity of suitable land, or 'Ricardian' scarcity and spatial proximity. The research is focused on a coffee producing region in Guatemala.

Tanya Heikkila, Columbia University. Email: th2063@columbia.edu; Edella Schlager, University of Arizona. Email: bluff2u@aol.com; Meghan Maloney, University of Arizona. Email: maloney.ml@gmail.com; *Transboundary water conflicts and conflict resolution mechanisms in the American West*

In transboundary river basins, conflicts frequently arise across jurisdictions and between water users about how much water can be used, as well as for what purposes and by whom. These conflicts are frequently about problems associated with the interpretation of resource boundaries. This paper seeks to classify the types of boundary conflicts that arise in transboundary river basins and then identify the institutional mechanisms that support the resolution of the different types of conflicts. To better understand the nature of conflicts and how they can be resolved in transboundary river basins, we analyze data from a study of conflicts arising in 15 interstate river basins in the western U.S. that are governed by interstate river compacts. The compacts themselves provide multiple mechanisms for resolving disputes, ranging from compact commissions, to meetings of states water directors, to mediation and arbitration. A variety of other institutional arrangements also exist in these river basins for addressing conflicts - including legislative processes, state courts, the U.S. Supreme Court, and informal discussions. We argue that the type of institutional arrangement selected and whether the actors resolve the conflict is a function of the type of conflict the actors face. This paper will test these assumptions, which improve both our understanding of conflicts in transboundary settings.

Michael K. Heiman, Dickinson College. Email: heiman@dickinson.edu; *Hydrogen-Based Transportation: Infrastructure, Net Energy, and Greenhouse Gas Concerns*

In his 2003 State of the Union Address, President Bush announced funding for a major collaborative public-private effort to develop a hydrogen "FreedomCar." Designed to ensure freedom from foreign petroleum dependence, the fuel cell vehicle would enable Americans to "drive where they want, when they want, and in the vehicle of their choice." Anticipating concern with greenhouse gas emissions, the Administration suggested that hydrogen produced through nation's abundant coal reserves would be "emissions-free" through carbon sequestration. Drawing upon recent US and European data and using a "well-to-wheels" analysis, this paper challenges these lofty goals and questions whether production of hydrogen from conventional fossil fuel sources offers any significant net energy or emissions advantage. Moreover, carbon sequestration is an expensive energy-intensive process that is not yet commercially viable, with routine escape anticipated and sudden catastrophic release a distinct possibility. If a reduction in greenhouse gas emissions is a primary goal, renewable energy would be better used to displace carbon-based electricity directly in the grid, rather than through electrolysis be converted to hydrogen via a complex and thermodynamically loosing transformation for use in a fuel cell vehicle. Furthermore, plug-in hybrid electric vehicles offer an economically, energy, and environmentally efficient alternative. The paper concludes that the Bush hydrogen agenda appears to be a backdoor attempt to support the coal and nuclear industries through which a majority of the hydrogen would be produced.

ftheitmu@usgs.gov; *Controls on Channel Adjustment of the Llano River, Central Texas: Geologic Transitions and Large Floods*

The Llano River system in Central Texas is characterized by sharp geologic transitions and extreme floods. Upper cobble- and gravel-bed reaches incise the Edwards Plateau, a Cretaceous carbonate upland, and lower sand-bed reaches bisect the Llano Uplift, noted for Paleozoic sedimentary and Precambrian igneous rocks. As a result of the sedimentary and hydraulic controls, channel morphology and other alluvial features are markedly different between the upper and lower reaches. Upper meandering reaches have steep banks and greater alluvial development, including active floodplains, terraces, and abandoned channels. Proceeding downstream, the channel straightens, banks are more gently sloped, alluvial features are less pronounced, and bedrock controls are more numerous. Total-station surveys, aerial photographic mapping, flood-frequency analyses, and sediment sampling and laboratory analyses were used to quantify channel morphology and the associated controls. Interpretations of channel morphology include: (1) the downstream increase in sand load results in less cohesive and gently sloping banks, (2) the downstream increase in bedrock exposures results in a relatively straight channel whose direction is controlled by linear faults and joints, (3) frequent extreme floods have produced a 'trough-like' morphology, especially in the lower reaches, and (4) the highly variable flow regime produces a dual-channel morphology.

Nina Held, Institute for Women's Studies, Lancaster University (UK). Email: n.held@lancaster.ac.uk; *Whiteness in lesbian spaces*

This paper aims to illustrate ways in which whiteness and its performances work as normative in the creation and use of 'lesbian' spaces. It will present findings of ethnographic research carried out in two 'lesbian' bars located in the North West of England. As early as the 1970s black feminists showed some of the ways that whiteness works as the silent and unmarked norm, though it has only recently been explored in the relatively new field of whiteness studies. The workings of whiteness as the unspoken norm are also apparent in studies in the field of lesbian and gay geography. Work in this field tends to neglect the ways in which 'race' and processes of racialisation play out in and are constitutive of sexualised space. White subjects are invariably the focus of analysis, though they are rarely identified as such. In contrast this paper focuses on how in spaces marked as 'lesbian' white bodies represent the somatic norm, whilst other bodies are rendered out of place, invisible and/or exotic, and thus desirable. It argues that these particularised readings of bodies contribute substantially to the racialisation of commercial lesbian spaces. This paper will illustrate how those and other performances construct lesbian spaces as white.

Keywords: whiteness, sexualised space, processes of racialisation

Susanna Heldt Cassel, Dalarna University, Sweden. Email: shc@du.se; *Trying to be attractive. Image building and identity formation in small Swedish industrial municipalities*

Efforts of creating and communicating positive images constitute a considerable part of contemporary regional development strategies. The use of place marketing has become a popular way to promote attractiveness for tourists, business and in-migrants in growth regions as well as in peripheral and economically vulnerable regions across Europe. In this article I explore the employment of place marketing as a development tool in specific local contexts. The study aims at understanding the role of place marketing in municipalities with experiences of negative development. The empirical material used consists of a case study with six small industrial municipalities in the Swedish Bergslagen region. Strategies of image building and place marketing are described and analysed by using a conceptual model of different cultural economy approaches to development. The case study indicates that place marketing should not only be looked upon as a matter of selling the municipality to outsiders such as tourists and potential in-migrants. In some types of municipalities, place marketing is rather a matter of building new images and selling itself to 'insiders' by creating a discourse of attractiveness.

Timothy Edmund Heleniak, University of Maryland. Email: heleniak@umd.edu; *Migration in the Russian Far North during the 1990s*

Russia's transition away from centrally planning towards a market economy has impacted the economic geography of Siberia and the Russian Far North, which in turn has impacted the migration patterns in the region and between the Russian North and the rest of the country. The focus of this paper will be to document the migration patterns of the past decade and a half and to determine whether they are what was expected according to standard migration theories given the economic and social changes that have impacted the region. Peculiarities in migration patterns in the Russian North during this period include a large

element of state involvement including push factors such as the closure of many northern settlements and pull factors such as migration assistance programs. Much of the paper will be devoted to comparing changes to the population of Siberia and the North between the last Soviet census of 1989 and the first Russian census conducted in 2002. Among the characteristics to be examined will be changes in total population by region, ethnic group and language, age and sex, occupation, level of education, place of birth and length of residency, and city and settlement size. Flow data on migration during the inter-census period will also be examined. A final section will examine population trends of the Russian North in the future.

Keywords: Russia, migration, north, Arctic

Robert Hellstrom, Bridgewater State College. Email: rhellstrom@bridgew.edu; Annual Hydrometeorological Variability Within a Tropical Alpine Valley: Implications for Evapotranspiration

Conditions of glacier recession in the seasonally dry tropical Peruvian Andes motivate research to better constrain the hydrological balance in alpine valleys. Studies suggest that glacial mass balance in the outer tropics of the Andes is particularly sensitive to variations between the dry and wet season humidity flux. In this context, we introduce a novel embedded network of low-cost, discrete temperature microloggers and an automatic weather station installed in the Llanganuco valley of the Cordillera Blanca. This paper presents data for distinct dry and wet periods sampled from a full annual cycle (2004-2005) and reports on modeled estimations of evapotranspiration (ET). The transect of temperature sensors ranging from about 3500 to 4700 m revealed seasonally characteristic diurnal fluctuations in up-valley lapse rates that promote up-slope warm air convection that will affect the energy balance of the glacier tongue. Nocturnal rainfall dominated the wet season. Strong solar forcing dominated during both dry and wet periods, but extreme seasonal variations in soil water content and cooler wet season near-surface air temperature suggests the importance of considering the process of ET. Estimates of potential ET using six widely accepted models suggest nearly twice as much for the dry period, and we attribute this primarily to the five times higher dry period vapor pressure deficit. We ran a process-based water balance model, BROOK90, to estimate actual ET, which was nearly 100 times greater for the wet season. These results reinforce the importance of diurnal cloud cover variability in regulating ET in the Peruvian Andes.

Christopher Warren Helm, National Snow and Ice Data Center, University of Colorado, Boulder. Email: chelm@nsidc.org; Ice Divide Migrations in Franz Josef Land

Migrations of ice divides within complex glacier systems are sensitive to changes in individual glacier regimes (i.e., glacier geometries, shapes, or balances). Ice divides, or boundaries of divergent ice flow, as well as glacier extents for several glaciers in the Franz Josef Land archipelago were mapped using historic topographic maps and satellite imagery over the past three decades. Observed movements in the position of the ice divides are thought to be influenced by changes in the external boundaries of the glaciers. Such changes in the position of ice divides in return influence changes in glacier geometries by altering the direction of ice flow. This study examines the dynamics between ice surface topography, glacier extent, and ice divide location in Franz Josef Land. Results depict the relationship between ice divides and glacier extents as well as the sensitivity of ice divide migration to changes in the ice surface topography.

Keywords: GIS, Glaciers, Remote Sensing

Joel W. Helmer, Oklahoma State University. Email: joel.helmer@okstate.edu; Walk Right In: The Origin and Diffusion of State Funded Private Land Access Programs in the United States

Two of the most pressing concerns for state wildlife agencies and the sport hunting community in the United States are declining hunter participation and recruitment. The United State Fish and Wildlife Service's 2001 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation revealed that the number of all hunters declined by 7% from 1991 to 2001, to approximately 13 million. Numerous reasons are cited for the decline in hunting; urbanization, more single-parent families, less connection to rural areas and lifestyles, increasing cost of equipment and licensing, less leisure time, leasing of private land, and changing attitudes towards wildlife. Research also reveals that lack of access to land inhibits hunter recruitment and retention. Since state wildlife agencies rely on license sales for funding and local communities benefit economically from hunting, many states, especially in the Great Plains region, are currently leasing millions of acres of private land for public access. Often referred to as Walk-In Hunting Areas (WHA), landowners voluntarily enroll property and receive a monetary payment and other benefits. Instead of privatization, this is the "publicization" of land to attract hunters, increase hunting license sales, while supporting rural economies. This paper examines the genesis, diffusion, spatial distribution, and

current status of state funded WHA programs.

Gina R Henderson, University of Delaware. Email: ginah@udel.edu; Daniel J Leathers, PhD, University of Delaware. Email: leathers@udel.edu; Atmospheric Processes Associated with Snow Cover Ablation Events and their Effect on the Flood Hydroclimatology of the Chesapeake Bay

The Chesapeake Bay is the largest estuary in the United States and is home to more than 2,700 species of plants and animals. It is a highly productive natural system maintained through a constant influx of nutrients draining from six separate states, and through tidal mixing. The ablation of snow cover is an important element of the hydrologic system for this drainage basin, as variability in the rate or magnitude of snow melt runoff can have major implications on the hydrology of the region. Large flooding events for this basin are considered over a fifty year period based on its primary tributaries, the Susquehanna, the Potomac and the James Rivers. Research utilizing synoptic weather-typing techniques, a physically based snow pack model (SNTherm), and a unique gridded snow cover data set will explore relationships between weather events, rapid ablation and flooding in the Chesapeake Bay watershed. The synoptic-scale patterns responsible for the largest ablation events are identified, and the near surface energy fluxes associated with the synoptic patterns are determined. Sensible and latent heat fluxes are generally the most important fluxes involved in the ablation process during the most extensive hydrologic events. Other fluxes (i.e. net radiation, down-welling shortwave radiation, precipitation etc.) may dominate the energy input to the ablating pack under other specific synoptic types. The importance of snow pack characteristics prior to the ablation episode is also examined.

Jason Henderson, San Francisco State University. Email: jhenderson@sfsu.edu; The New Orleans Rebuild Debate: Informing the Urban Future in America

Recent scholarly research on urban disaster recovery suggest that substantial devastation has not led to visionary new city plans or radical changes in urban form and public policy. Rather, recovery planning often inherits pre-disaster planning practices and institutional structures. In recovery, a planning inertia sets in whereby a rush to return to normalcy means urban patterns are not easily altered. As a result, government policies accommodate previously impacted development by shoring up defenses such as raising levees, improving drainage, fire suppression, importing beach sands, or requiring hazard-resistant building codes. As Burby (2006) argues, a "safety development paradox" emerges, whereby unsafe, inherently vulnerable areas are made safe for development in the short-term, yet are also made exposed to catastrophic disaster in the long term. This research asks why visionary new urban plans and radical transformations of urban form and public policy are difficult to implement after disasters, even if physical geography and ecology suggest that inherently unsafe areas should be left undeveloped. The paper explores a case study of New Orleans, Louisiana to consider how to inform future deliberative process about how cities should grow in a way that limits or minimizes future safety development paradoxes. Specifically, the paper examines how political economy, ideology about urban space, and race and class conflict fuse to complicate a forthright discussion about how to rebuild (or not rebuild) parts of New Orleans.

Keith G. Henderson, Villanova University. Email: keith.henderson@villanova.edu; The Impact of Synoptic Weather Events on Autumn Foliage Patterns

Autumn foliage patterns have significant implications both economically and ecologically. The foliage season represents a key period of tourism in the northeastern United States. Patterns of leaf change and leaf drop also act as indicators of the end of the growing season with ramifications on energy and moisture use. Previous research has shown that, while on average the foliage season begins in early October and lasts approximately six weeks, considerable interannual variability exists. Both the timing and duration of the season may differ by as much as three weeks across the Northeast. Temporal variations are generally linked to monthly climate variations. Warm Septembers and wet Octobers tend to both delay and extend foliage changes. However, rapid changes in the state of both leaf change and leaf drop may be associated with individual weather events. For example, Autumn 2006 began as an average foliage season. A series of strong cold fronts in October though, led to rapid transition of leaf color and large levels of leaf drop heralding to an early and abrupt end to the season. In this paper the effects of individual weather events on foliage patterns are addressed by characterizing the frequency and intensity of synoptic events in the Northeast and relating them to large-scale patterns of foliage change and leaf drop.

Victoria Leigh Henderson, BAH (SLAS), MA Candidate, Queen's University. Email: 2dvtvh@qmlink.queensu.ca; *Sounds Like Resistance: Indigenous Community Radio in Guatemala*

This paper focuses on the sociopolitical impact of indigenous community radio in Guatemala. Exploring tensions both within and between landscape and soundscape, I consider the ways in which community radio articulates indigenous resistance to domestic and international hegemonies. My research is limited to not-for-profit community stations that (1) broadcast in whole or in part in Maya languages, and (2) subscribe to a project of concientización, or consciousness-raising, among indigenous peoples. While community radio is a burgeoning phenomenon across the globe, it has particular resonance in Guatemala: first, because widespread poverty, monolingualism, and illiteracy problematize the utilization of Spanish-language media among Maya peoples, who account for approximately half of Guatemala's population; second, because Guatemala is one of only four countries in the world to have fully privatized its radio spectrum, replacing standard frequency licensing with usufructory rights that allow for frequencies to be leased, sold, subdivided, and consolidated in much the same fashion as private property. Drawing on the critical but decidedly under-theorized interstices between geography and mass communications, I investigate the extent to which structural inequities traditionally associated with access to land-based resources in Guatemala are reproduced and/or renegotiated in soundspace. Further, I consider how the privileging of orality through community radio affects indigenous cultural and linguistic autonomy, and I question what the emergence of new media information flows may mean for Maya peoples in terms of local, national, and international power relations.

Michael D. Hendricks, United States Military Academy. Email: michael.hendricks@usma.edu; Joseph F. Harrison, Topographic Engineering Center. Email: ; *Developing a Geospatial Infrastructure to Support Teaching and Research at the United States Military Academy*

This paper describes efforts at the United States Military Academy to improve the geospatial infrastructure and better support students, faculty, and staff. A robust geospatial infrastructure is required for organizations to fully leverage geospatial capabilities. The software component of this infrastructure is addressed through an enterprise site license for ESRI's ArcGIS product line maintained by the Geospatial Information Science program. The academy's Director of Housing and Public Works (DHPW) currently maintains an enterprise GIS covering the installation's geographic data. To fully support the academy, however, geospatial data must also be available in easy to use formats at multiple scales over the entire globe. In addition, to support historical analysis, such as military history and geography, multi-temporal datasets are required. As a result of these requirements, efforts are underway to extend the Academy's current capability beyond the installation by building a multi-scale geodatabase with a global extent that supports unclassified visualizations and analysis. The database at West Point is designed to mirror the Army's Theater Geospatial Database (TGD) and over time, test extensions to the data model. The database provides geospatial information to personnel at West point and at the same time provides a data model testing mechanism to the military.

Keywords: GIS, Database

David Hendrickson, PhD Candidate, Simon Fraser University. Email: david_hendrickson@sfu.ca; *Assessing Consumption: Three Approaches to our Measurement*

Recently, there has been increasing interest in addressing issues related to consumption within sustainability discourse and community indicator frameworks. Consumption refers to human material provisioning that draws on ecosystem services. The central aim of this paper is to evaluate how consumption is measured at the local level through analyzing three diverse community indicator frameworks including: an integrated public engagement process in the Regional Vancouver Urban Observatory, The Natural Step systems framework in Whistler, B.C. and a municipal performance indicator framework in Santa Monica, CA. Objectives of this paper are threefold: 1) to interpret how material consumption levels within these diverse indicator projects are defined and addressed; 2) to assess the use of various indicators for raising awareness about consumption and building capacity to address overconsumption; 3) to identify leverage points to link indicators to policy implementation. Three case sites will contrast commonalities and differences concerning approaches, outcomes and impacts through reviewing the literature, conducting telephone interviews with key informants in each locale and analyzing pertinent policy and planning documents. Governments do not take actions on problems before identifying how to measure them and are often able to ignore matters when demands for change are unfocused. Perhaps this is no more evident than within the role of consump-

tion. This research study attempts to shed light on how three reputed leading sustainability projects are measuring and addressing consumption related issues. Based on an analysis of these three sites, I suggest why consumption needs to be more fully incorporated into sustainability indicator projects.

Keywords: indicators, sustainable consumption, urban sustainability

Reinhard Henkel, University Of Heidelberg. Email: reinhard.henkel@urz.uni-heidelberg.de; *In the shadow of the duopoly: Free churches in Germany*

In the shadow of the duopoly: Free churches in Germany Since the Reformation and the subsequent religious wars, the Roman Catholic and the Protestant Church have dominated the religious landscape in Germany. Their present spatial distribution can still be traced back to the "cuius regio, eius religio" principle of 1555. Until World War I, both were established state churches. In the Weimar Constitution of 1919, state churches were abolished. But the two churches still benefit from special relationships with the state. Apart from the Mennonites whose origin goes back to the radical, "Anabaptist" wing of the Reformation, most of the Protestant free churches came into being in Germany in the nineteenth century. Being subdued and sometimes persecuted, their growth was slow. With about 330.000 adherents, today they form only 0.4 % of the total population of Germany (82 mio.). The biggest free churches are the Baptists, Methodists, Pentecostals, Adventists, the (Congregational) Free Evangelical Church and the Christian Brethren. Due to their history, they display distinct spatial distributions. Some of the free churches are organized as corporations under public law while others are registered under private law. Since 1990, a considerable number of "Russian Germans" (German origin immigrants from the former Soviet Union) came to Germany. Many of them are Baptists and Mennonites, but they usually do not integrate into the German churches because of cultural differences. In addition, many charismatic or evangelical congregations have come into existence in the last decades which are independent and do not join a denominational organization.

Keywords: Geography of religion, Germany, Free churches

Logan A. Hennessy, Ph.D, UC Berkeley, Environmental Science, Policy, and Management. Email: logan@nature.berkeley.edu; *The Contradictions of Global Reforms, Access, and Sustainability in the Mining Sector*

Since the World Bank completed its Extractive Industries Review process in 2003, a number of private, state, and multilateral policy adaptations have emerged in the mining sector. These include the Mining, Minerals, and Sustainable Development project (MMSD), the Bank's Communities and Small Scale Mining initiative (CASM), and various examples of multinational companies adopting social and environmental guidelines for producing their products. At the same time, the resurgence of mineral markets continues to expand the sector and create problems for affected communities. As the capital-intensive attempts at reforming and legitimating the mining sector unfold, it is more important than ever to critically analyze these efforts of self-regulation and understand if and how they are changing the practice of extracting minerals. This paper discusses these approaches to reform in terms of sustaining 'access' to resources and raises the question of whether such developments can be environmentally and socially sustainable.

Kevin Henry, New Jersey Department of Health, Cancer Epidemiology. Email: kevin.henry@doh.state.nj.us; *Use of the spatial scan statistic to identify geographic variation in survival time of colorectal cancer patients in New Jersey (1996-2002)*

In epidemiology and medical geography the spatial scan statistic (SatScan) has become a popular surveillance method to identify geographic variation in health events and disease incidence. In this study we illustrate an application using the most recent spatial scan statistic method designed for survival time data. The study included 42,693 patients diagnosed with colorectal cancer between 1996-2002 who were reported to the New Jersey State Cancer Registry (NJSCR) and who were followed through the end of 2004. We developed an exponential survival model and used the age-adjusted cause-specific survival times to detect areas of short-survival time for patients diagnosed at the regional stage (lymph node), and distant stage. Our results revealed one statistically significant area with shorter than expected survival time for cases diagnosed at regional stage. We also found the cases in this area to have lower SES measures and survival probabilities when compared to the rest of the State. Our results demonstrate the utility of spatial survival analysis as a surveillance method to better assess disease survival patterns which could be the result of community differences in medical treatment, diagnosis accuracy or insurance coverage. Applying the spatial scan statistic every few years could provide a means to assess changes in regional and community level health outcomes.

Mary C. Henry, Miami University. Email: henrymc@muohio.edu; *The Impact of Fire on Spatial Patterns in Two Pine Ecosystems*

Ponderosa pine forests of the Arizona Sky Islands and longleaf pine forests of central Florida are both fire prone landscapes. Historic fire regimes of frequent, low intensity fire were similar in these ecosystems despite their distinct locations, climate, and topography. Both forest types are also intermixed with species adapted to stand-replacing fire. In this study, remote sensing-based techniques were used to compare spatial patterns between locations and assess the impact of fire on each landscape. Landsat Thematic Mapper (TM) and Enhanced Thematic Mapper Plus (ETM+) data were obtained for Saguaro National Park (Arizona) and Ocala National Forest (Florida). Spectral vegetation indices were calculated as an indicator of green biomass at each location. Resulting enhanced images were used to calculate Moran's I, and to compare pre- and post-fire spatial heterogeneity. Forest managers could benefit from this information, since forest spatial patterns impact fuel load distribution and the behavior of future fires.

Keywords: fire, Landsat, Arizona, Florida, Moran's I

Email: leticia@lanl.gov; *The Relationship between Population and Land Use for Application in Homeland Security Modeling*

Homeland security applications aim at developing scenarios of events, consequences, and strategies to minimize the impacts of consequences. This, however, requires that we also account for limited resources. Los Alamos National Laboratory has been modeling "population mobility" for use in epidemiological and telecommunication models of terrorist attacks and natural disasters, utilizing TRANSIMS, a transportation software package developed to simulate the movements of individuals between parcel-level locations. At the core the models are "synthetic schedules", which are created based on time-use, activity, and travel surveys. Because it is very time consuming and expensive to collect and prepare surveys for modeling, it has become critical that national sources of survey data be utilized to model the travel patterns of persons at local levels. A new methodology is in the process of being developed that will allow a person's activity patterns to be "transferred" to another person living in a different geographic location. In this paper, the connection between travel behavior and land use, land form, and accessibility are explored to determine what relationships exist that allow for reasonable transferability in space and time. We will identify a select group of land use variables that are essential to define activity and travel patterns for people along with socioeconomic characteristics normally utilized in travel behavior research. Then, it will be possible to design a process to generate synthetic travel patterns by transferring a national travel survey to a local level employing statistical methods. This paper will discuss work in progress and discuss research findings.

Ranya Henson, University of Hawaii at Manoa. Email: ranya@hawaii.edu; *Genetic Structure in the Hawaiian Intertidal Zone: Space, Scale and Disturbance*

Issues of scale and disturbance intensity have been poorly examined in most population genetic analyses of marine organisms. To address this problem I investigated patterns of spatial genetic structure in the intertidal echinoderm *Colobocentrotus atratus* in the Hawaiian Islands. I hypothesized that sampling grain would affect measures of population differentiation. Additionally, I expected that high levels of natural disturbance would cause higher rates of local population extinction and recolonization, leading to genetic patchiness, while low levels of disturbance may allow for significant genetic autocorrelation over both local and broad scales. Nuclear and mitochondrial DNA variation were used to assess how the genetic divergence among populations varied across spatial scales and to determine whether the amount or pattern of divergence differed between high and low wave disturbance shorelines. Populations were sampled from three islands in the Northwestern Hawaiian Islands, Necker, Nihoa and French Frigate Shoals, and three islands in the main Hawaiian Islands, Hawai'i, O'ahu and Kaua'i. The main Hawaiian Islands were further stratified into high and low wave disturbance shorelines, and, to examine divergence at the finest spatial scales, the high and low disturbance shorelines of O'ahu were divided into multiple sections. Early analyses indicate that while isolation-by-distance is present at broad spatial scales, chaotic genetic patchiness predominates at more local scales. Furthermore, genetic patchiness occurs at broader scales on the shorelines with the highest level of wave disturbance.

John Heppen, University Of Wisconsin River Falls. Email: john.heppen@uwrf.edu; *Core and Periphery Electoral Changes in the United States 1932 to 2008.*

Core and periphery regional analysis of the United States at the state-level is an useful tool for researching changing regional dynamics in migration, income, and politics. Building upon previous research which analyzes the US into core and periphery regions, this paper regionalized the United States decennially based on per capita income from 1929 to 2000. The country was regionalized as core, near-core, middle, semi-periphery, and periphery regions. The electoral votes or voting power of each region were analyzed to determine the relative strength or power of each region. The analysis revealed that through time the semi-periphery and periphery have gained electoral strength while the core and middle have declined in strength. In presidential elections since 1980, this trend has tended to mean that Republican candidates are candidates of the semi-periphery and periphery while Democratic candidates tend to be candidates of the core and near-core. This constituted a reversal from previous patterns.

Alison Heppenstall, University of Leeds. Email: a.j.heppenstall@leeds.ac.uk; *Application of Recurrence Plots for Visualising Structures in Complex Geographical Systems*

Recurrence plots (RPs) are a relatively new technique for the analysis of time series data that allows both visualisation and quantification of structures hidden within data. They are particularly useful for graphically detecting hidden patterns and structural changes in data as well as examining similarities in patterns across a time series data set (where there are multiple readings at one point). RPs can be also used to study the nonstationarity of a time series as well as to indicate its degree of aperiodicity. These features make RPs a very valuable technique for characterising complex dynamics in the time domain, a factor reflected in the variety of applications that RPs can now found in ranging from climate variation, music to heart rate variability. To date, little work has been undertaken on developing this methodology for visualising complex spatial systems. This paper will (i) outline the use of RPs for time-series data and (ii) discuss spatial RPs. Work using this methodology will be presented and the applicability discussed.

Inscribing Conquest: Guam and the War in the Pacific National Historical Park

History is written by the victors, and victory is inscribed in the landscape. After four thousand years of independence, the Northern Mariana Islands were conquered by the Spanish in the late 17th century, becoming the first European colonial outpost in the Pacific. Guam, the largest of these islands, became a U.S. possession in 1898 with the Spanish-American War. A half-century of American benign neglect ended with the capture of Guam by Japan in 1941 and the subsequent re-conquest of Guam by American forces in 1944. These events gave Guam a unique place in the American colonial sphere. Unlike the Philippines and Hawai'i, Guam remains a U.S. colony. And with the War, Guam's position on the doorstep of Asia was seen with much greater importance than before. Guam remains an unincorporated U.S. Territory. In 1965, a National Park Service team arrived to determine whether "sites of National significance" existed on the Island. The resulting park focuses on the "War in the Pacific" as a whole, with particular emphasis on the "capture and liberation" of Guam as a United States territory. The Park thus equates "national" with "American," and creates a series of landscapes that inscribe U.S. ownership. But this position is not uncontested by the indigenous Chamorro inhabitants, and the loss of Chamorro land to U.S. military bases remains a contentious issue. This study provides a reading of the Park within the context of American colonialism on Guam, and its role in positioning the island within its uneasy colonial status.

Clare Herrick, UCL. Email: c.herrick@ucl.ac.uk; To the West and East of I-35: Constructing and Preventing Los Dos Obesidades in Austin, Texas

With half the US Latino population residing in Texas and California, Hispanic health is a major public health concern for those states. Consequently, obesity and Type-II diabetes have gained importance as health disparity indicators. Despite being a "critical tool in the working of the state apparatus" (Suarez-Orozco and Paez, 2002: 4), the category of race is one that is not often discussed with reference to obesity prevention policy and programmes. This is a significant omission given that obesity prevention programmes in the US are often targeted at racially-defined as well as behaviourally-defined risk groups. This paper contends that obesity as a 'problem' in Austin is a product of the existing socioeconomic, cultural, linguistic and educational divide in the city, both real and imagined. Austin west of I-35 is felt to be a space of wealth and privilege where people know that they should be active and eat healthily and provision is made for this. The East Side is marked out as a space of difference where the informed consumer is rendered impossible by structural and cultural barriers to prioritising healthy behaviours. The population-scale frame of reference favoured by public health means that when health statistics are presented they often draw upon race as a variable controlling for risk, justifying classifying intervention areas by minority composition. This work uses empirical evidence to support the claim that obesity prevention efforts can legitimately fashion both places and people, perpetuating health disparities and marking out difference in their creation of los dos obesidades.

Melinda Herrold-Menzies, Pitzer College. Email: mmenzies@pitzer.edu; Boating on the Sea of Grass: Western Development, Tourism, Resistance, and Local Empowerment

The development of railway and road infrastructure in Weining County, Guizhou Province, through the Western Development Project has led to a dramatic increase in domestic tourism to the local nature reserve, Caohai, the Sea of Grass. Tourists visit the reserve primarily to enjoy leisurely boat rides to admire the scenery of water and mountains in the summer or to view rare black-necked cranes during the winter. This increase in tourism has offered numerous opportunities for the tourism bureau to extend its power, misappropriate funds, and monopolize tourism revenues. One local community of boat punters, however, has resisted tourism bureau monopolization of tourism activities by pooling its own resources to create its own tourist "port." In this case the Western Development Project has enabled this community to take advantage of local infrastructure development to promote economic development initiatives in spite of opposition from a more powerful, but locally distrusted, government bureau.

Carly Lynn Hertz, M.A., University of North Carolina at Greensboro-Doctoral Student. Email: chertz81@yahoo.com; The Role of Geographic Information Systems in Epidemiology and Public Health

The purpose of this presentation is to demonstrate the use of Geographic Information Systems (GIS) for conducting rapid needs assessments (RNA). RNA is recognized as an essential and important component of any disaster relief operation, and robust GIS applications have great potential for increasing the efficiency and accuracy of this process. This past March, the Public Health

Regional Surveillance Team-5 of North Carolina (PHRST-5), conducted an after-action plan assessment in the counties of Hancock and Harrison Mississippi, which were ground zero regions ravaged by Hurricane Katrina. This assessment determined the perceived effectiveness of the Mississippi Department of Public Health's response to the hurricane by using GIS and other technology. This presentation uses this study as an example of how GIS and a cluster sampling method adopted by the Centers for Disease Control (CDC) can be used conjointly to facilitate the RNA process. The cluster sampling method is a statistical technique for incorporating the size of the population as an important variable into the selection process of locations. Traditionally, public health officials have used this statistical technique with paper maps and questionnaires for determining sampling locations and gathering data in the field. This approach, however, has proven to be time consuming, inaccurate, and cumbersome. Improvements in future RNA can be realized through recent advancements in technology such as GIS, Global Positioning Systems (GPS), and handheld wireless devices.

Patrick A. Hesp, Dr, Louisiana State University. Email: pahesp@lsu.edu; Graziela Miot da Silva, Dr, Louisiana State University. Email: gdsilva@lsu.edu; Winds, Coastline Orientation And Barrier And Dunefield Development, Southern Brazil

This paper examines the spatial variation in barrier and dune development along Moçambique beach, a headland bay beach in southern Brazil, and embayments to the south of Santa Catarina Island. Moçambique extends through 600 of curvature, and displays a significant south to north increase in littoral sediment supply, in exposure to prevailing winds and waves, and changes in beach/surfzone morphodynamic type from low energy dissipative, through moderate-high energy intermediate, to high energy intermediate-dissipative. The barrier system extends from a small foredune-blowout complex (protected southern end), to a blowout/parabolic dune complex, to a narrow transgressive dunefield (mid-embayment), to a large-scale transgressive dunefield in the exposed northern end. The system behaves according to the wave-beach-dune model (Short and Hesp, 1982) where the largest dunes are found in the northern, most exposed, dissipative section. Sediment supply is at a maximum here also, but the dune systems do not correspond with Psuty's scheme (2004). The southern beaches display the same northwards wave, surfzone and littoral drift trends, but opposite trends in prevailing winds and dune development. Neither model above applies. We show that regional prevailing wind direction is critical in determining barrier and dunefield development, but tuned very much by coastline orientation, since the degree of exposure to winds and waves also controls dunefield development.

Paul M Hess, University of Toronto. Email: hess@geog.utoronto.ca; Toronto's Towering Suburbs: Planning for Suburban Highrise Housing, 1950-1970

Critical work on the post-World War Two suburban apartment is poorly developed compared to work on planning the US and Canadian suburbs as low density landscapes of single-family houses. This study helps fill this gap. It examines the planning and development of large clusters of high-rise apartments in the post-World War Two suburbs surrounding the City of Toronto in Ontario, Canada during the period between 1950 and 1970. The study interprets the first generation municipal plans and zoning codes produced in these suburbs after the war, city council minutes, government technical reports, popular media sources, and federal housing policies to understand how apartments were conceptualized in terms of their social role and how planning processes shaped where apartments were located and how they were designed. Findings suggest there were conflicts between apartment development and neighborhood planning policies that emphasized creating protected areas of single family houses. Local municipalities sought apartment development, however, because of federal policy incentives, the role apartments played in financing needed infrastructure such as roads, sewer, and utilities, and because of the influence of profitable development concerns. Modernist design and planning ideas helped municipalities justify and create large zones of apartments that were poorly integrated with other residential areas.

Keywords: suburbs, planning history, apartments, modernism

Markus Hesse, Freie Universität Berlin. Email: mhesse@zedat.fu-berlin.de; Shrinking cities, demographic change, and the politics of urbanization. A discourse analysis

Demographic changes and the associated processes of urban (population, economic) decline appear to be dominant in German urban discourse since the end of the 1990s. Within a relatively short period of time, the urban issue has been shifting from how to organize urban expansion towards how to deal best with the consequences of "shrinking". Accompanied by the de-industrialization of major parts of Eastern Germany or regions, such as the Ruhr Area, a somehow

catastrophic perception of urban development has become popular. In this context, a new urban politics has emerged, putting the current attention for “Stadumbau” (urban re-generation) forward to a particular re-definition of the subject. At the same time, a rising housing occupation is being observed in major city-regions and shaping selected inner-city areas, and a “new urbanism of talent and tolerance” (R. Florida etc.) is gaining considerable momentum. These observations are interpreted as signs of a general urban renaissance. Yet they stand in remarkable contrast to the aforementioned theories and assumptions of urban decline. Against this background, the paper aims at critically discussing the process of agenda-setting in urban planning and politics discourse. The perception of cities as both threatened and reviv-ing entities is considered prototypical for short-term interpretation of single phenomena. It appears mainly metaphoric rather than evidence-based. Instead, a reflected investigation of urban development in a broader context is necessary. In order to conceptualize such approach, the theoretical sketch of urban cycles is preferred, compared to the popular mantra of the “shrinking city”.

Keywords: Urban growth and decline, shrinking cities, urban theory, discourse theory

Amy Hessler, West Virginia University. Email: Amy.Hessler@mail.wvu.edu; Richard Stockton Maxwell, West Virginia University. Email: rmaxwell@mix.wvu.edu; Ed Cook, Lamont-Doherty Earth Observatory, Columbia University. Email: drdendro@ldeo.columbia.edu; Brendan Buckley, Lamont-Doherty Earth Observatory, Columbia University. Email: bmb@ldeo.columbia.edu; Eastern Red Cedar (*Juniperus virginiana*): Millennial Length Tree Ring Records of the Mid-Atlantic Region?

Unlike the western and central United States, the mid-Atlantic region has limited tree-ring records suitable for millennial length reconstructions of climate. A new source of climate history for the region may be derived from isolated stands of eastern red cedar growing in the headwaters of the Potomac River. Stands dominated by eastern red cedar populate the steep slopes of limestone “knobs” on the east side of the ridge and valley province of West Virginia. These are some of the driest locations in the region, receiving less than 90cm of precipitation per year, suggesting that these trees may be sensitive to drought. In this paper, we describe a set of sites that contain live and dead wood with tree-rings that extend back to 500 AD. More than 80 trees were sampled with increment cores (live trees) and cross sections (snags and logs) in an effort to build a long record of annually resolved drought information for the mid-Atlantic region. Results indicate a reasonable relationship with drought that may be suitable for identifying the frequency and duration of extreme drought events in the past. Additional sites containing these long-lived and well-preserved trees may exist in the area potentially allowing for a future network of tree ring sites suitable for climate reconstruction. Results may be especially relevant for the Washington DC metro area, located approximately 150 km east of the study area. The area’s population exceeded 5.9 million in 2005 and gets the majority of its water from the Potomac River.

Keywords: drought, tree rings, mid-Atlantic

Richard Heyman, University of Texas at Austin. Email: heyman@utexas.edu; The White Mississippi

This paper looks at the exploration and discovery of the source of the Mississippi River in the nineteenth century. Through an examination of the geographic and ethnographic work of Jacob V. Brower, who produced the “definitive” study of the source of the river at Lake Itasca in Minnesota, the paper argues that the search for the origin of the river constituted a series of attempts to fix the river as a “natural” object within European ways of knowing, to make it intelligible in ways that made both the river and knowledge of it autonomous from indigenous forms of knowledge, to cleanse it of native presence, to make it white. However, Brower’s work, which is significant because it lead directly to the founding of Itasca State Park in Minnesota as the “headwaters of the Mississippi”, was structured by the irreducible contradiction that “scientific” knowledge of the river is haunted by native presence: knowledge of the river as a unified object was a social construction dating back to prehistory, not a “hydrological fact”. Brower, who had been a young soldier in the 1863 US Army campaign against the Lakota, “solved” this dilemma by embracing arcane theories that the “original” people who settled the region (and who Brower claims were “geographers of no mean ability”) were not “Indians” but whites who were displaced by the Ojibwa and Lakota. Brower’s career as a geographer and ethnologist was an attempt to create an entirely white Mississippi, a natural object purged of native presence.

Nik Heynen, University of Georgia. Email: nheyne@uga.edu; Don Mitchell, Syracuse University. Email: dmmitc01@maxwell.syr.edu; Cooking up Civil Disobedience for the Hungry: ‘Food Not Bombs’ and the Resurgence of Radical Anti-hunger Politics

For over 150 years, civil disobedience has been at the heart of revolutionary struggles to facilitate emancipatory societal change. Non-violent civil disobedience began with Thoreau’s abolitionist efforts in mid-19th Century Massachusetts, but has also been at the center of numerous other transformative moments in radical history, including Gandhi’s anti-colonial efforts for India, King and Carmichael’s efforts for US civil rights, Tutu and Biko’s anti-apartheid struggles and Walesa’s Solidarity movement in Poland. More recently, one of the world’s fastest growing anarchist social movement’s, Food Not Bombs (FNB), has engaged in civil disobedience for the sake of reigniting radical urban politics that among others objectives, shares free food that would have otherwise been trashed with hungry people in public spaces in 100s of cities throughout the world. As revanchist government agenda’s continue to proliferate throughout these same cities, members of FNB have begun to come under increased surveillance and go to jail for feeding the hungry. This paper will discuss the spatial potential for politics based in civil disobedience to contribute toward ending hunger and poverty by feeding the hungry in public spaces and bring greater attention, social protest and grassroots mobilization against the uneven development and extreme material inequality produced under neoliberal capitalism. After discussing the theoretical and political potential of civil disobedience for renewing radical anti-hunger/anti-poverty politics, we will focus on the growing sense of panic toward radical/grassroots political action and how it has contributed to the increased surveillance and persecution of several chapters of FNB within North America.

Keywords: civil disobedience, public space, radical anti-hunger politics

Abby Hickcox, University of Colorado - Boulder. Email: abby.hickcox@colorado.edu; Watershed Protection Services in Mexico: The Production and Consumption of a Water Market

This paper utilizes a political ecology framework to analyze a characteristically neoliberal payment for watershed services program in Colima, Mexico, also located in the Sierra de Manantlán biosphere reserve. Using a case study of one Mexican ejido, I analyze the commodification of ecosystem services in the creation of a market for watershed protection services. A local-level analysis shows the arbitrary nature of such natural resource commodification, and a study of the processes of commodification reveals the complicated relationship between the legal and extra-legal realities of natural resource regulation. A central question the ejido members and biosphere reserve staff attempt to answer is: Who possesses the rights to this new benefit stream? This question is one of property rights, and an attempt to answer it brings the ejido members to an ambiguous space between their recently titled individual parcels and an invocation of the global, national, watershed, and ejido level commons.

Michael P Hickey, Tulare County RMA/GIS. Email: mhipkey@co.tulare.ca.us; Calibrating UPLAN (Urban Simulation Model) with GIS Time Series of Land Cover Data

All the counties in California’s San Joaquin Valley are implementing the GIS-based UPLAN urban simulation model in order to estimate the likely impacts of population growth to the year 2050. Tulare County has developed a consistent set of land cover maps, spanning the period 1986 to the present (created by blending GIS data from various sources), and the county is using that data to calculate the various control variables needed by UPLAN. In simple terms, an urban simulation model predicts two things: the AREA OF LAND that will be developed at some future data -and- the SPATIAL DISTRIBUTION of that development. By simulating urban growth in Tulare County from 1986 to 2006, the UPLAN model can easily be calibrated to exactly replicate the quantity of growth. The challenge is to manipulate the control variable in order that the spatial distribution of urban growth duplicates the actual pattern of growth in Tulare County. By measuring the differences between the actual development pattern and the pattern predicted by a specified combination of control factors, it becomes possible to know if a modification of a specific variable improves or degrades the prediction. Thus, through a process of trial and error, it is possible to improve the performance of the UPLAN model on historic data. This process should also provide valuable insights for using UPLAN to simulate future urban growth.

Clare Hickman, BSc, MSc, PhD, Research Fellow on the Historic Gardens & Landscapes of England Project, University of Bristol, UK. Email: clare.hickman@bristol.ac.uk; For "the Morals as Well as ? the Health in the Towns": An Exploration of the Relationship Between Ideas of Health and Disease, and the Origins of Parks in England

This paper will explore the connections between notions of health and disease, and the origins and design of open spaces in England in the early nineteenth century. In addition to a description of the relationship between the creation of parks and ideas concerning physical health, it will also explore notions about mental health and the concept that designed landscapes could materially affect the mind. The main focus of the paper will be the early nineteenth-century concept that environmental design could help create healthy bodies and minds. The inclusion of gardens and wider landscapes in hospital and asylum design and their use as part of the therapeutic regime provide evidence for the influence of medical ideas on environmental design. Similar arguments appear to have been used in relation to open spaces as these were perceived to be beneficial in the prevention of disease. The research presented will be interdisciplinary in scope, primarily concerning the fields of medical and landscape history, as well as elements of cultural, social and geographical history. Texts discussed in the paper will include work by leading nineteenth-century campaigners for the provision of open spaces, such as John Claudius Loudon, public health treatises such as Edwin Chadwick's 1842 'Report on the Sanitary Condition of the Labouring Population of Great Britain', articles in relevant nineteenth century-journals such as 'The Builder' and archival sources relating to specific open spaces created during this period.

Keywords: parks, England, medical geography, social history

Matt Hidek, Syracuse University. Email: mahidek@maxwell.syr.edu; Military Doctrine and Integrated Intelligence in the City

Since 11 September 2001, nation states have focused on further developing defensive strategies to protect cities from the threat of political violence. Now commonly known in the United States as "homeland security," these new governmental initiatives have altered the physical terrain of the city through a wide range of defensive strategies rooted in military doctrine. Through an analysis of the National Geospatial Intelligence Agency's 133 Cities Project and the expansion of New York's Compstat program for antiterrorism planning, this paper presents evidence of new forms of integrated police intelligence operations within the city, and their implication for urban governance and community development.

Keywords: urban, security, intelligence, governance

Nancy A. Hiemstra, Syracuse University. Email: nahiemst@syr.edu; Territorialized spaces, tiered citizenship, and Latino immigrants in small town Colorado

Inherent to neoliberalization is the contradiction between increasing economic dependence on immigrant labor and the concurrent social and political rejection of immigrant bodies. The paper argues that this contradiction profoundly influences enactments of citizenship, and explores the ways in which it plays out at the local scale. An ethnographic analysis of social spaces in Leadville, Colorado, where Latino immigration has increased rapidly in the last fifteen years, revealed that particular places are deeply territorialized - hierarchically divided between Latino immigrants and white residents - by constant reinforcement of race, class, and legal difference. The concept of "el rechazo" (rejection) is developed as a means to explore the impacts of this territorialization on immigrants' participation and community engagement. The case study suggests that neoliberal policies are effectively "tiering" local-scale understandings and practices of citizenship in new sites of immigration. The paper concludes by considering ways in which the solidification of social, political, and economic divisions in such sites is reflected in the production of national identity.

Email: ; Phil Klein, University of Northern Colorado. Email: phil.klein@unco.edu; Michael Solem, Association of American Geographers. Email: ; Sue Vajoczki, McMaster University. Email: ; Developing and Enhancing International Collaborative Learning

This paper reviews international collaboration in geography in higher education. Focusing on partnerships between institutions and on collaborative learning courses, we examine collaboration within the context of internationalizing geography curricula. Examples of international collaborations reveal that communication technologies are both enablers and impediments. Most of the examples depend on the connectivity of institutions in the Anglo-American realm. Many logistical concerns confront establishment of initiatives, including a need for faculty mentoring. Key issues for managing collaborations include

dealing with intercultural differences, varied expectations and engagement among students; agreements on outcomes and assessment; and evaluating performance of initiatives. Ongoing financial support may depend on demonstrating educational benefits added by collaboration, yet identifying and measuring benefits to learners is a critical challenge. The subject of geography should be an important part of citizenship and sustainability education. The examples identified in this paper show that geographers are involved in collaborative learning initiatives in many contexts. But does geography itself make a difference? Is its subject matter particularly suited to collaboration and does the location of collaborators influence its likely success? Collaborations are locally situated as manifestations of different place identities, affecting how geographers plan collaborative learning outcomes. Innovations in communication technologies and institutional or personal desires for internationalizing curricula will no doubt lead to further collaborations. In pursuing these targets, the benefits to the learner may be taken for granted. More explicit attention is needed to evaluate the impact of international collaborations on its student participants, in terms of both content knowledge and interpersonal skills.

Robert J. Hijmans, PhD, International Rice Research Institute. Email: r.hijmans@gmail.com; A cross-country comparison of poverty in SE Asia

A number of recently completed poverty maps for South East Asian countries was compiled. They all had a relatively high level of spatial desegregation. The maps showed clear differences in the characteristics of the geographic distribution of poverty between countries and also illustrate the potentially large effect of aggregation on these data. We tested a number of variables for association with poverty (e.g., road access, soil quality, population density and climate). While some factors are frequently significant (isolated mountain areas are poorer than more densely populated plains), the explanatory power of other variables varied among countries. It remains to be seen whether these differences are due to variation in policy or to other factors not included in this study.

Andy Hilburn, University of Kansas. Email: amhilburn@yahoo.com; What a Road Might Bring: Settlement Dynamics in Ayutla, Oaxaca, Mexico, 1950-2005

Ayutla is located in the rugged Sierra Norte in Oaxaca, Mexico. Prior to the latter half of the 20th century, the village of Ayutla was primarily a market, festival, and administrative center for its respective municipio. Residence within the village for most residents was typically ephemeral and as a result, Ayutla had a relatively low permanent population. In 2005, the townscape of Ayutla appeared much more permanent, reflecting economic, social, and cultural changes seen in other parts of indigenous Mexico. This study utilizes a combination of qualitative and quantitative analyses to illustrate the changes in settlement in Ayutla. Field observation, repeat photography, and interviews comprise the qualitative component. Mexican census (INEGI) data from 1950-2000 were analyzed via combined statistical and GIS procedures according to population, economic activity, household amenities, and indigenous language use to illustrate socio-economic changes. Land cover change detection is investigated as a response to shifting livelihoods and GPS mapping of village land use is helps to describe the current characteristics of Ayutla in regard to historical descriptions and maps.

Darlene Hilburn, Syracuse University. Email: drhilbur@maxwell.syr.edu; Racial discourses and racialization: Liberian refugees and race

In this paper, I examine how racial categories are created and policed through a case study of Liberian refugees in Syracuse, New York. As newcomers to Syracuse from a state formed by US former slaves, Liberian refugees encounter US racial categories with a unique perspective, and at the same time their bodies are immediately racialized by others who view them as "black" or "African." I am interested in how discourses form around race and labels, but also the material and social consequences of these discourses. In examining racialization and racial labeling in its discursive, political, and material relations, I will highlight how these processes and outcomes are spatialized in particular places in the city. Changing geographies of "who is where and why" influence and are influenced by the racial order imposed by city residents and government officials as well as memories of home that migrants bring with them. Therefore, not only the scale of the city matters, but also the scales of home, body, neighborhood, and nation.

Kenneth W. Hilker, Western Michigan University. Email: k4hilker@wmich.edu; Kathleen M. Baker, PhD, Western Michigan University. Email: kathleen.baker@wmich.edu; Dave Lemberg, PhD, Western Michigan University. Email: david.lemberg@wmich.edu; Urban street tree diversity and ash tree replacement

Biodiversity is of increasing concern in urban systems because of its impacts on sustainability of the environment and perceptions of aesthetics within a community. Similar to the epidemics of chestnut blight and Dutch elm disease in the 20th century, emerald ash borer is currently causing the widespread removal of a common tree species from the urban forest. Both green ash (*Fraxinus pennsylvanica*) and white ash (*F. americana*) have been popular street trees in cities throughout the U.S. Removal of these species and decisions regarding replacement planting will have implications with regards to urban biodiversity and regional susceptibility to further epidemics. In this study, we examine species diversity within an urban street tree dataset using various biodiversity metrics. We calculate the impact of potential loss of ash trees to the emerald ash borer infestation on the spatial patterns of biodiversity in the region. This analysis is in preparation for the creation of a spatially explicit model to recommend replacement tree species to maximize the biodiversity of urban forest.

Jennifer L. Hill, University of the West of England. Email: Jennifer.Hill@uwe.ac.uk; Conserving tropical rainforest: a role for ecological education?

There has been much rhetoric that interpretation is an important element in the promotion of environmental conservation and sustainable tourism, largely by educating visitors and by prompting more responsible tourist behaviour. This has rarely been tested empirically and there has been less evaluation of tourist understanding of biodiversity. Research presented here applied inferential statistics to questionnaire and quiz responses in order to evaluate whether

educating visitors about biological diversity during a visit to tropical forest in Australia increased their levels of satisfaction and knowledge above those achieved from the experiential encounter alone and whether this encouraged more positive attitudes towards ecosystem conservation and/or more sustainable behavioural intentions. Results indicated that interpretation had little impact on the emotive encounter of visitors with nature, but those visitors who received biodiversity information rated their perceived learning significantly higher than those who did not receive information. There was a significant difference in actual learning between the two groups of respondents. Visitors who received biodiversity information gained significantly higher results in a biodiversity quiz compared to visitors without biodiversity information and this was largely new learning that took place on site. There was no support that on-site interpretation of biological diversity, including pertinent threats and conservation issues, altered visitor attitudes towards ecosystem conservation and sustainable tourism, but it did seem to reinforce visitors' already favourable conservation attitudes and behavioural intentions. The results should aid site managers in their quest to provide both a satisfying tourist experience and one that supports ecosystem conservation.

Troy D. Hill, Yale University. Email: Hill.Troy@gmail.com; Colin Polsky, Clark University Graduate School of Geography, HERO program. Email: cpolsky@clarku.edu; Development and Drought in Suburbia: A Mixed Methods Rapid Assessment of Vulnerability to Drought in Rainy Massachusetts

This study presents evidence that towns in suburban eastern Massachusetts are routinely restricting water use in years with plentiful rainfall. It then assesses the relationship between these suburban droughts and residential development. Focusing on the suburbs of Boston, seven towns were selected based on their degree of sprawl-style growth. Multivariate regression models demonstrate that water restrictions are increasing in duration, controlling for climate. Qualitative interviews suggest that residential development is playing a central role in increasing sensitivity to suburban drought, though other factors are also important. Long-term planning and integration of land use and water management emerged as two key paths for attenuating development's impacts.

Ken J Hillis, University Of North Carolina - Chapel Hill. Email: khillis@email.unc.edu; Dark Visions, Sunny Spaces: Enlightenment Spatial Strategies and the L.A. Film Noir

Los Angeles manifests key ideals first cultivated within the European Enlightenment public sphere, and a number of "Los Angeles" films depict the spatial practices that flow from implementing these "visionary" ideals in this desert city's built form. Such films noir as *He Walked By Night*, *In A Lonely Place*, and *Kiss Me Deadly*, depict how the city's vastness and reliance on communication technologies are unanticipated monuments to a reworking of Enlightenment theories that extend subjectivity and space yet also promote their mutual division and everyday lived isolation. Los Angeles is the formal outcome of an ideology equating space with the visible. In 1912, railroad magnate Henry Huntington proclaimed it would become the most important American, if not world, city because, like infinitely extensible Cartesian space, it could extend in any direction "as far as you like." The consequent sprawl of bungalows and roadways and the city's reliance on communication technologies promoted adopting surveillant communication technologies that earlier L.A. spatial practices, equating privacy with salvation, were intended to avoid. Extending Habermas' public sphere theory, I trace L.A.'s reliance on transportation and communication technologies in its production of "a place in the sun" organized according to an idea of nature as real estate. I rely on films noir as evidence that Los Angeles, the first fully modern city, embodies empiricist concepts of space and reality as independent, divisible and ordered, and I analyze these films as ironic visual monuments to a place founded on the ideal of the conceptually disembodied masculine eye.

Keywords: Los Angeles, film noir, Enlightenment space

Matthew Himley, Syracuse University. Email: mhimley@maxwell.syr.edu; Mining, Mobilization, and Resource Governance in the Peruvian Andes

Literature on neoliberal forms of natural resource governance has drawn attention to the increased participation of social movements and other non-state actors in the governance of extractive industries. This paper presents findings from preliminary research on the role of grassroots social mobilization in the governance of mineral resources in the Peruvian Andes. Following the adoption of neoliberal reforms in the 1990s, which liberalized both investment and property rights regimes, the region has witnessed a spike in mining investment, the expansion of the mining frontier, and the construction of the numerous

'mega' mines. This surge in mineral development has, however, been highly contested, particularly by residents of agrarian communities whose livelihoods are directly impacted by mining activities. Throughout the Andean region such communities have mobilized to demand greater participation in decisions about mining and a more equitable distribution of the costs and benefits - both economic and environmental ? of extraction. Using as a case study the Pierina Project, a large-scale open pit gold mine in the department of Ancash, this research investigates the interrelations between (1) the impacts of mining on local farming communities; (2) how these communities have mobilized to exercise control over mining activities; and (3) the influence of this mobilization on the formal and informal 'rules of operation' governing extraction. Based on initial findings, I suggest that community mobilization has achieved limited success in influencing mining activities; however, these efforts remain circumscribed by extremely asymmetrical relations of power and property.

Ellen Hines, Assistant Professor, San Francisco State University. Email: ehines@sfsu.edu; Kanjana Adulyanukosol, Phuket Marine Biological Center. Email: ; Mickmin Charuchinda, Eastern Marine and Coastal Resources Center. Email: ; *Conservation Of The Dugong (Dugong Dugon) And Irrawaddy Dolphin (Orcaella Brevirostris) On The Eastern Coast Of The Gulf Of Thailand*

The dugong (Dugong dugon) is a marine mammal whose survival is critically endangered by the proximity of its habitat to nearshore human settlements. Outside of Australia, the with the largest estimated dugong population, dugongs only survive in fragmented population groups in the Eastern hemisphere. Neither the number of dugongs remaining in these groups nor the range of its habitat is known outside of incidental sightings and the reports of fishers. This project was conducted in 2003-2004 to locate dugongs and assess their numbers and the location of population groups along the eastern Gulf of Thailand in Thailand. We carried out aerial surveys, concentrating our efforts in Rayong, Chanthaburi, and Trat provinces. In Thailand two interview teams were formed that included the principal investigators as well as personnel from Phuket Marine Biological Center in Phuket, and the Eastern Marine and Coastal Resources Center in Rayong. In 2003 and 2004, these teams conducted 250 interviews with local villagers on their observations of the way of life of the dugong and its role in the lives and history of local people. While numbers of dugong sightings were not high, we saw Irrawaddy dolphins in groups of up to 30, with a minimum of 16 animals seen in one day to a maximum of 71. In Trat especially, we recommend immediate consideration of coastal management strategies to protect what we believe to be a hot-spot of coastal bio-diversity.

Keywords: dugongs, dolphins, Thailand, endangered species conservation, community interviews

J. Dwight Hines, UCSB. Email: jdlines@anth.ucsb.edu; *Permanent Tourism: Whiteness, Rural Gentrification, and the Postindustrial Pursuit of Experience*

Rural gentrification is dramatically affecting much of the Rocky Mountain West; rapidly infusing white, middle-class patterns of thought/practice into previously industrial/working-class areas. The hastening of rural postindustrialization that this process inspires highlights the contrasts between the newcomers' visions of the Rockies as a landscape of consumption/recreation and the natives' attempts to maintain access to public-lands as sites of production. In this paper, based on over two years of ethnographic fieldwork, I explore rural gentrification as essentially a white, middle-class phenomenon that bears striking similarities to the "white flight" from the inner cities of the 1950s and 60s that inspired the US's rapid and dramatic suburbanization; both of these styles of migration contain pronounced racial undertones. Rural gentrification, however, I propose must also be seen in light of what Dean MacCannell has described as the rising priority of experience (over commodities) written into the process of the postindustrialization of US society. In pursuing novel experiences as criteria of self-worth and social status rural gentrifiers increasingly practice life as previous generations engaged in tourism. In so doing, they seek to reserve the places in which they live from the ravages of industrial production and preserve

them for aesthetic and recreational practices. The advent of this form of permanent tourism, in turn, prompts profound political contests over local, state, and national land-use policy, in which concepts of local heritage (as an important marker of difference and as a saleable commodity), the environmental consequences of development, and "sustainability" are common themes.

Keywords: whiteness, rural gentrification, postindustrial

Sally Hines, University of Newcastle. Email: sally.hines@ncl.ac.uk; *Tran(s)sexualities: Beyond the Binaries of Homo/Hetero Normativity*

This paper explores how transgender narratives of sexual identity, desire and practice trouble the categories of homo/hetero sexuality at both a conceptual and a substantive level. Whilst a heteronormative model of transgender assumes that, post gender transition, trans people will identify and practice as heterosexual - the MtF will assume a female heterosexual identity and the FtM will practice as a heterosexual male - analyses of transgender within many stands of lesbian and gay studies assume homo relationality by positioning transgender women and men as gay men or lesbians. This paper will argue that both these theoretical frameworks neglect the distinct specialities of transgender men and women. Drawing on a recent ESRC funded research project on transgender practices of identity and intimacy, the paper will explore the ways in which transgender narratives of sexuality signpost movement across, between and beyond the spaces of homo/hetero sexuality. The paper will suggest that, rather than representing a dominant hetero or homo sexuality, tran(s)sexualities often bring fluidity to the interplay of gender and sexuality so that notions of gender expression and sexual identity are far from straight-forwardly performed. The paper concludes by reading the potential for varied and contingent sexual identities and practices through gender transition as a marker of post homo and hetero normativity; indicating how contemporary sexualities may transgress these binary understandings.

Beck, Department of Geography, University of Cincinnati, Cincinnati, OH 45221-0131. Email: beckrd@ucmail.uc.edu; *Assessing Thaw Lake Drainage Processes in Northern Alaska*

Thousands of lakes are found on the Arctic Coastal Plain of northern Alaska. Developed in continuous permafrost, these thaw lakes and associated drained thaw lake basins are the dominant landscape features and cover 46% of the 34,570 km² western Arctic Coastal Plain. Lakes episodically drain by a variety of processes including coastal erosion, bank overtopping, stream meandering and headward erosion, and lake coalescence. Comparison of Landsat MSS imagery from circa 1975 to Landsat-7 ETM+ imagery from around 2000 demonstrates that 50 lakes partially or completely drained over the 25 year period, suggesting landscape stability. The lake-specific drainage process can be inferred in some cases, and is partially controlled by geographic settings conducive to active erosion such as coastal or riparian zones. In many cases, however, the cause of drainage is unknown. High-resolution aerial photographs for the Barrow Peninsula extend the record back to around 1950, and mapping spatial time series illustrates the dynamic nature of lake expansion, coalescence and drainage. These historical images demonstrate that humans have inadvertently or intentionally triggered lake drainage near Barrow village. Efforts to understand landscape processes and identify drainage events have been enhanced by interviewing Iñupiaq elders and other practitioners of traditional subsistence lifestyles. Individuals can often identify the year and process by which individual lakes drained, allowing greater dating precision and accuracy in assessing the causal mechanism. Indigenous knowledge has also provided insights into events, landforms and processes not previously considered or identified.

Sarah E. Hinman, Louisiana State University. Email: shinma1@lsu.edu; Andrew Curtis, Louisiana State University. Email: acurti1@lsu.edu; *Creating a Geographic Information System of Consecutive Typhoid Fever Seasons in Washington, D.C., 1906-1909*

Following the completion of infrastructure improvements in 1905, typhoid fever rates in Washington, D.C. unexpectedly increased. For mitigations purposes, the United States Public Health and Marine-Hospital Service conducted four investigations between 1906 and 1909 to better understand the origins of typhoid in the city. These studies included dot maps of typhoid case locations at

two-week intervals for 1906, 1907, and 1908 and monthly intervals for 1909. These point locations were used to construct a geographic information system (GIS) displaying the spatial distribution of individual typhoid cases. The creation of this typhoid GIS allows for the investigation of urban typhoid at a localized geographic scale. This paper will describe the creation of this GIS from project inception to the results of the spatial analysis which provided insight into the geography of typhoid in an urban setting, and the utility of certain types of spatial analysis. Additionally, this GIS allows visual comparisons to be made between typhoid and other common infectious disease, like diphtheria and scarlet fever, that were mapped at the same scale in the early twentieth century. Studies of this type makes use of GIS tools unavailable when the original data were collected to investigate potential patterns of typhoid fever that were invisible a century ago in order to better understand the geography of urban typhoid in general.

Keywords: GIS; medical geography; typhoid fever; historical geography; Washington, D.C.

Sarah A. Hinton, San Diego State University. Email: shinton@rohan.sdsu.edu; *A Spatial Analysis of Fertility in Accra, Ghana Using the K-Function*

Demographers generally expect fertility decline to originate in cities and diffuse to rural areas. However, intra-urban fertility variation has recently been demonstrated. This disputes a simple urban vs. rural dichotomy, and suggests fertility may exhibit significant clustering or dispersal patterns within cities, which may be related to the distribution of specific human and social capital variables. This paper explores the existence and distribution of spatial variability in fertility and ethnicity in Accra, by applying the K-function statistic to fertility rates calculated at the neighborhood level. The aim is to evaluate K-function as a tool for investigation of spatial distributions of demographic variables. Demographic data sets available for Accra include the 2000 national census, Ghana Demographic and Health Surveys from 1998 and 2003, and the 2003 Women's Health Survey of Accra. The geographic information consists of a digitized ArcGIS boundary shapefile of Enumeration Areas. The statistic assesses whether the distribution of points at a given distance from a known point is clustered or dispersed, as compared to a random distribution, without regard for the point value. In this research the statistic is adapted by aggregating the individual level fertility data to Enumeration Areas as the proportion of women having a birth in the last year. The top and bottom quartiles of the fertility data are extracted, and their patterns investigated with K-function. The paper concludes with a comparison of results from K-function, and other global and local clustering statistics.

John Hintz, Bloomsburg University of Pennsylvania. Email: jhintz@bloomu.edu; *Endorsing Nature: A Pragmatist Alternative to Discourse Analysis*

In this paper, I present environmental pragmatism as both a pragmatic (or practical) and pragmatist (theoretically defensible) basis for an analysis of environmental problems. I begin my formulation of environmental pragmatism by revisiting Kate Soper's distinction between "nature-endorsing" and "nature-skeptical" perspectives. Following this, I present a brief overview of the existing environmental pragmatism literature (including its cursory treatment within the geographic literature). Finally, I make the case that environmental pragmatism can serve as a theoretically defensibly middle ground between the poles of uncritically boosterist positions such as (some) conservation biology and self-styled "critical" approaches such as discourse analysis that too often leave geographers unable to find an assertive stance from which to speak about and even for the protection of nature.

Keywords: environmental pragmatism; nature-society geography; discourse analysis

Vanita M. Hipskind, University of Cincinnati. Email: hipskiv@email.uc.edu; *Land Use Pressures in the Midwestern United States: Implications of Urban Development on Historic Cemeteries*

This preliminary research asks to what extent land use pressures for urban development force the isolation, obstruction, and disinterment of early cemeteries now isolated in built up areas. Cities within a one hundred mile radius of Cincinnati, Ohio, that are experiencing either rapid growth or urban renewal, are the focus of fieldwork conducted in 2006 and 2007. Specific issues involved in transferring sacred space to secular uses include: legal frameworks (including wills and power of eminent domain), disposition of remains, historic preservation, cemetery ownership, date of last interment, degree to which a cemetery is being properly maintained, financial status, and surrounding land use.

Email: agrogis@yahoo.com; Magsar Erdenetuya, National Remote Sensing Center of Mongolia. Email: m_erdenetuya@yahoo.com; *Establishment of a Baseline for Future Grassland Monitoring in Mongolia*

Despite the fact that grassland forms the basis of much of Mongolia's economy, no good understanding of its long-term dynamics has been established up to now. Satellite image data, particularly well-calibrated ones, have potential for evaluating vegetation trend at regional to continental scale. The purpose of this study is to examine the recent vegetation trend in order to establish a baseline for current and future grassland monitoring in Mongolia. We used Global Inventory Modeling and Mapping Studies (GIMMS) normalized difference vegetation index (NDVI) dataset to depict spatial distribution of positive and negative vegetation trends. The dataset was well corrected for calibration, view geometry, volcanic aerosols, and other effects not related to actual vegetation change. We computed vegetation trend at each pixel location for the period from 1981 to 2003 using 23 annual maximum NDVI values. Results showed that trend was not uniform over the country. Clusters of negative trend were found in the northern mountain areas, near border with China, around big cities, and around abandoned agricultural lands. They were speculated to be due to the recent wildfire and logging for building constructions, new developments around road networks, rural-to-urban land use conversion and overgrazing, land degradation caused by haphazard cultivation under then Soviet control, respectively. We carried out ground survey with real-time GPS tracking and verified much of the abovementioned assessments to be reasonable. We concluded that a strip of positive trend found along 45-47 degree North latitude is related to large scale climatic changes associated with global warming.

Keywords: mongolia, grassland, vegetation trends, normalized difference vegetation index

Email: bryan.norton@pubpolicy.gatech.edu; *Spatial Bounding in Action: Choosing Sub-state Boundaries for Water Planning and Management in Georgia*

Environmental problems, the interesting and troublesome ones at least, encompass multiple spatial scales and multiple social perspectives. Managing socio-spatial complexity typically involves defining, developing, and reifying spatial "bounds" that serve to impose conceptual and institutional structure on what might otherwise be an unruly mess. Far from being a merely technical consideration, spatial bounding entails the discursive construction of linkages between technical explanations, normative evaluations, and policy solutions. This study follows the deliberations about spatial bounding through the 2006-2007 state-wide water planning process in Georgia, a process that will inform the demarcation of new sub-state boundaries that will guide future water policy and planning in Georgia. The Georgia process provides a unique opportunity to study "spatial bounding in action." This paper will discuss the initial phase of multi-stage research, which involves the identification and characterization of a finite number of "bounding rationalities" that inform and infuse ongoing deliberations about the appropriate spatial boundaries for managing Georgia's water issues.

Philip Hirsch, Associate Professor, University of Sydney. Email: p.hirsch@geosci.usyd.edu.au; *Revisiting frontiers as transitional spaces in Thailand*

This paper explores the notion of frontiers as "in-between" spaces that define particular transitions. Three contexts of frontier and their rapidly changing nature form the basis of the analysis. Agricultural frontiers (typically between farmland and forest) are defined by new relations of production and interplays between conservation, shifting modes of agriculture and natural resource use and management. Peri-urban frontiers (between countryside and city) are taken beyond their desakota/chaan-meuang locations to a more generic interplay between urbanity and rurality in defining livelihood and identity. National frontiers (between nation states with sharply different political and economic conditions) are transcended from above in the form of new regionalisms, and from below in migrations and other transboundary influences and flows. The paper proposes the frontier as both a spatial and temporal heuristic for understanding societal transitions in Thailand.

Keywords: frontier, agrarian transition, periurban, Thailand

Rachel A. Hirsch, Ph.D. Candidate, University of Western Ontario. Email: rhirsch@uwo.ca; Jamie Baxter, Ph.D., University Of Western Ontario. Email: jamie.baxter@uwo.ca; Christine Brown, M.A., University of Western Ontario. Email: christine.brown01@sympatico.ca; Municipal pesticide policy change, science knowledge, and advocacy coalitions in Calgary and Halifax

Concerns over the safety of pesticides have led to federal pesticide policy evolution in Canada; however, the last decade has also seen widespread municipal-level changes in the form of bylaws restricting cosmetic pesticide use. Different pesticide reduction policies have been adopted by various Canadian cities, all with the goal of protecting public health. At the extremes are, for example, voluntary reductions in chemical pesticide use in Calgary, Alberta; as opposed to, a cosmetic pesticide ban in Halifax, Nova Scotia. The processes underlying such divergent pesticide reduction policies remain unclear. Our main objective is to better understand Canadian pesticide policy evolution by applying an 'advocacy coalition approach' and to explore the use of 'science knowledge' as an agenda-setting tool. Our parallel case studies consist of qualitative interview data from the policy makers themselves, collected from pesticide advisory committees in Calgary and Halifax, and a content analysis of local newspaper articles. Findings indicate that both national events and grassroots activism have helped solidify opposing anti-pesticide and pesticide industry coalitions. Scientific uncertainty is used to legitimize opposing 'protectionary' and 'precautionary' policy narratives of the chemical industry in Calgary and the anti-pesticide coalitions in Halifax respectively. As well, policy brokers (e.g., the media) are both necessary and influential players who help negotiate opposing viewpoints leading to more tractable policy outcomes and ultimately policy change. A contextual understanding of competing advocacy coalitions proves to be a useful framework for understanding how divergent policies have emerged in Calgary and Halifax over time.

Keywords: hazard geography, policy-change, pesticides, advocacy coalitions, media, Halifax, Canada

Sonia Hirt, Virginia Tech. Email: shirt@vt.edu; The Compact vs. The Dispersed City: History of Planning Ideas on Sofia's Urban Form

This paper explores stability and change in the evolution of significant urban planning ideas over the 125-year-long history of the City of Sofia as Bulgarian capital. It argues that two fundamental and closely intertwined planning dilemmas—how to reconnect the city with nature and how to define the city's role in the metropolitan region—have provided the framework within which planning debates on Sofia's form have evolved over time. Both dilemmas are, of course, well known from the history of planning in Western contexts. And while the strategies to solve them have shifted over time, the dilemmas have proven to be remarkably persistent. In response to these dilemmas, different visions, shaped by both local conditions and dominant foreign theories, were proposed in Sofia at different times. Some promoted a compact city, while others advocated a dispersed form. The case of Sofia demonstrates the significance of the city-nature and the city-region relationships in the evolution of planning thought. It also points to the difficulties which arise when local ideas of how to organize these relationships are inspired by international models made for cities with different historic experiences. The paper relies on primary and secondary sources. These include the series of Sofia's master plans; scholarly, archival and media accounts of Sofia's planning; and related meetings protocols, published interviews, books and articles by the chief actors in the planning processes. It also uses several drafts of the latest plan, Sofia 2020, and nearly two dozen in-person interviews with planners involved in its writing.

Russell Hitchings, University of Hull. Email: r.hitchings@hull.ac.uk; Urban outdoor practice and the professional office worker

When people spend time outdoors, we know that several social benefits can often follow. Yet western societies now collectively spend over ninety percent of their time within buildings. It is with this contradiction in mind that it may be timely to reconsider how easily personal wellbeing and environmental experiences are able to combine within the actual lifestyles of particular groups today. This is especially the case when the right combinations of these elements are increasingly recognised as central to the promotion of both sustainable societies and liveable cities. This paper is interested in the routine embodied practices of professional office workers in terms of how they handle the changing outdoor conditions presented by the cities in which they work. Such an examination has the potential to make a number of useful impacts. Firstly, by analysing the experiences of an expanding social group that spends long periods indoors, it may be possible to reconsider the potential unfamiliarity associated with routine outdoor encounter and the means by which we may promote a healthier urban experience. Secondly, by starting with daily routines, instead of specific spaces, this approach usefully recasts urban nature debate in both research and policy terms by highlighting the crucial importance of local climatic conditions and how

people handle the embodied issues that come along with them. Thirdly, by underlining the contextual nature of patterns of practice, it illustrates how gradually evolving cultures of personal environmental adaptation could suggest some interesting new means of fostering better urban futures.

Elise Ho, University of Toronto. Email: elise.ho@utoronto.ca; Children's Environmental Perceptions and Perceptions of Climate Change

This paper presents the results of a doctoral study on children's perceptions of environment, environmental risk, and climate change. Open ended interviews and children's illustrations were used to understand the perceptions of children aged 11-12, living in urban, suburban, and rural regions of Ontario. Adults' perceptions of environment and environmental risks have been studied with a variety of applied and academic goals, which include refining public education efforts, understanding risk-taking behaviours, and quantifying willingness-to-pay. Studies specific to climate change have revealed a variety of misconceptions related to pre-existing cultural models and environmental beliefs. In addition, climate change is communicated to the public through a variety of informed and misinformed media, governments, scientists, and popular culture. Misconceptions can be detrimental to effective mitigation and adaptation. Children's risk perceptions are often disregarded, as they are not part of the voting public. However, if we are to look towards the future and aim for a sustainable environment, we ought to also look to the next generation for their ideas, and concerns. This paper concludes that children tend to use cultural models similar to those used by adults, which result in common misconceptions of climate change and environmental issues. The children exhibited a concern for the environment, but also either a lack of knowledge of environmental issues and climate change, or confusion regarding causes and effects.

Keywords: Environmental education, children, perceptions, risk, climate change

Kong Chong Ho, National University of Singapore. Email: sochokc@nus.edu.sg; Keeping the State and Capital Away from Civic Spaces?

If civic spaces are sites for the associational life of the community, there is an assumption that such sites should exist independently from state and capital, as in the case for civil society. But is this really possible when civic spaces are physical sites where intrusions are frequent in everyday spatial practices? And is it desirable in reality to make such clear distinctions between the three types of agents? In this paper, I explore a number of physical sites around cities in Pacific Asia where there are conflicts between community vis a vis the state and capital. But these antagonisms represent a base point or threshold, for my paper also raises the possibility of the potential for collaboration between capital and community for a collective good and the conditions under which such collaborative projects survive. Collaborative examples may be understood as intersections between capitalist and civic spaces, with the overlapping of the activities and people embedded in the two spaces. I want to understand these intersections as an evolutionary process whereby certain features of community seep into capitalist spaces and how capitalist initiated efforts may possibly find root in civic spaces.

Yujeung Ho, University of Pittsburgh. Email: yujeung@yahoo.com; The contribution of the high-technology industry to the regional economic growth at different positions in the distribution of region's size

This study investigates how the high-technology industry affects to the regional economy growth at different positions in the distribution of region's overall size using the county level data. Under the economic base theory, the high-technology industry is an important export sector, in the sense that this industry tends to respond the broader external demand and generate the higher multiplier effects than local sector. This theory implies that this industry could account for the growth in whole regional economy. Among several possible variations associated with the contributions of the high-technology industry, this study focuses on the local market size and the degree of diversity on the grounds that the formation of multiplier effects can depend on the scope and scale of a region. Indeed, this study also examines the possible different effects between the manufacturing sector and service sector. Therefore, this study explains the regional economic growth with the linkage of the specialization of high-technology industry and local market size. In this sense, this study complements to previous studies and extends the understandings for how the high-technology industry leads to regional economic growth.

Keywords: the high-technology industry, regional economic growth, the economic base theory

Bruce W. Hoagland, University Of Oklahoma. Email: bhoagland@ou.edu; A Public Land Survey map of Oklahoma, circa 1870

In 1870, U.S. deputy surveyor Ehud Darling left Fort Arbuckle to establish the Initial Point for the Public Land Survey of present-day Oklahoma. Southeast of the Fort he erected a sand stone monument measuring 54'x18'x18' and commenced a survey that continued into 1871. The 1870 survey did not include all of the state, but only the Chickasaw Nation, western Oklahoma, and lands held by smaller tribes in the northeast. The plats and survey notes produced by the General Land Office surveyors are a rich source of information for modern scholars on vegetation, settlement, and transportation networks in the 19th century. This paper reports the results of a project that digitized the 1,264 plats compiled during the 1870-1871 survey. All features present on the plats were assigned to categories (e.g., vegetation, hydrology, settlement, transportation) and digitized using ArcGIS. This database serves as an important baseline for studies of landcover change and settlement.

Jay S. Hobgood, Ohio State University. Email: hobgood.1@osu.edu; Factors Leading to the Quiet 2006 Atlantic Hurricane Season

There were 27 named tropical cyclones over the Atlantic basin in 2005, which made it the most active hurricane season in the historical record. A combination of above normal sea surface temperatures, a favorable large-scale pattern and little vertical wind shear contributed to the extremely active season. Although the sea surface temperatures were cooler in 2006, they were still above normal. The large-scale pattern also shifted between 2005 and 2006, but most indicators at the start of the hurricane season seemed to point to another active year in 2006. However, persistent upper level troughs created very high wind speeds over the primary development region and the resulting wind shear prevented the development of most tropical disturbances. As a result only nine named tropical storms formed over the Atlantic in 2006 and the season would be classified as slightly below normal. Warming sea surface temperatures in the central and eastern equatorial North Pacific may be the precursor to an El Niño. This study attempts to determine the factors that produced the much less active hurricane season. El Niño indices from several regions of the Pacific Ocean were examined and the position and strength of large-scale atmospheric features were investigated. The results show that a complex interaction of factors led to the unexpected decrease in activity over the Atlantic basin in 2006.

Shawn C Hoch, Indiana University. Email: shoch@indiana.edu; Gilbert C Liu, MD, MS, Indiana University. Email: gcliu@iupui.edu; Jeffrey S Wilson, PhD, Indiana University. Email: jeswilso@iupui.edu; Comparing Spatial Measures of the Built Environment

Background: Research on the association between physical activity, health, and the built environment often employs a delineation of relevant space surrounding a location (e.g., a person's home). Approaches for defining relevant space include Euclidean and network buffers, census geographies, grids, and nearest location comparisons. Analytical comparison of these different methods is lacking. Methods: This presentation compares five spatial measures of the built environment surrounding residential points including: (1) an 805m x 805m grid, (2) 1-kilometer Euclidean buffers, (3) 1-kilometer street network buffers, (4) distance to nearest network location, and (5) sums of distances to nearest three network locations. Built environment variables surrounding residential locations of 3,901 children in Indianapolis, Indiana are assessed in support of an ongoing study on childhood obesity. The first three methods of spatial delineation are used to assess variation in net residential density, street connectivity, the distribution of food sources (i.e. supermarkets & fast food restaurants), and measures of greenness (NDVI). Methods four and five are also used to assess proximity to food sources. Mean values for each measure are compared using t-tests across the socio-demographic variables of African-American / white and privately / publicly funded health insurance. Expected findings: We hypothesize that significant differences exist across the five approaches depending on variable construction. For example, street network buffers should capture restrictions of automobile travel, while Euclidean buffers may more accurately reflect the less restricted pedestrian movement of children. Moreover, results should differ systematically across the four socio-demographic groups.

Michael E. Hodgson, University of South Carolina. Email: hodgsonm@sc.edu; How Many People Live Near the 'Coast'? as a Measure of Risk

It is estimated and often cited that more than half of the U.S. population lives "near the coast." What is the implication of this to hazards? Many assume the population residing near the coast must be at risk to hurricane force winds and flooding. Is half of the U.S. population really at such risk? This research explored the hypothesis that population "near the coast" are at risk. Specifically,

in this study definitions of "the coast" and "near" are examined across a range of spatial scales (e.g. block, block group, etc.) of analysis. The locations of population were then compared to historic measures of hurricane and flooding occurrences to more formally determine the population at risk.

Michael Hodson, SURF Centre. Email: M.Hodson@Salford.ac.uk; Simon Marvin, SURF Centre. Email: S.Marvin@salford.ac.uk; Urban Transitions to Low Carbon Futures: Cities and Corporates Building New Political 'Spaces' for 'National By-Pass'

This paper addresses an issue of increasing contemporary salience: the role of large cities in addressing climate change. Cities perform a central role in the production of greenhouse gas emissions, are highly vulnerable to the consequences of climate change and can potentially provide a key context for addressing climate change. Yet there has been limited critical and thematic reflection on the emerging and active role of cities in undertaking socio-technical transitions to low carbon futures. Consequently we argue that large cities are sites for the reactive interpretation of international climate change initiatives and are actively seeking to cultivate systemic transitions within the socio-technologies of the city to low carbon futures. But central to this shift is a need to more critically understand how large cities are actively engaged in creating new political spaces to fulfil their aspirations. We therefore analyse the "Large Cities Climate Leadership Group" and the "Clinton Climate Change Initiative" to highlight the ways in which large cities are seeking to 'co-operate' with each other and with corporate interests to translate their aspirations into actuality and the tensions and trade-offs this exposes. We highlight three themes: (1) the building of partnerships of large cities and their underpinnings; (2) the negotiated and collective aspirations emerging from these partnerships; and (3) an explicit strategy of national-level 'by-pass' in building (horizontal) relationships (with other cities and corporate capital) in generating the necessary resources to translate the aspirations of cities into actuality.

Keywords: cities, low carbon futures, new political spaces, systemic transitions

Paddington Hodza, National Geospatial Development Center, WVU. Email: Paddington.Hodza@mail.wvu.edu; Trevor Harris, West Virginia University. Email: Trevor.Harris@mail.wvu.edu; Collaborative soil boundary mapping in an immersive GIS environment

Soil scientists have traditionally used analogue imagery, topographic maps, and reports to conceptualize the soil-landscape relationship model, and interpret and manually draw soil boundaries onto 2D maps. This time-consuming, labor intensive, and expensive process necessarily impacts the completion rate of the national soil survey and the implementation of soil map updates. In this paper we propose an innovative approach that brings the logical and cognitive semantic worlds closer together to enhance and advance the soil mapping process. A loosely-coupled GIS-supported immersive visualization (GIS-IV) system is used to provide a stereoscopically-enabled 3D CAVE environment in which multiple soil scientists may be collaboratively 'immersed' in the collection, interpretation, and the digital delineation and attribution of soil boundaries. The results of this intuitive mapping process are discussed in terms of verifiable outcomes including collaborative advantages, mapping cost, time and labor savings, soil map accuracy, and GIS-IV system usability.

Keywords: Immersive GIS, Digital Soil Mapping, Geovisualization

Paul D Hoeffler, The Ohio State University. Email: hoeffler.2@osu.edu; Darla K Munroe, The Ohio State University. Email: munroe.9@osu.edu; Overcoming data constraints for utilizing GIS as a component of multi-method research in data-poor regions

Although myriad spatial data are available to support research in specific areas?particularly in the global North?there remain many regions for which GIS-accessible data are absent or of low quality. In such cases, researchers must generate digital data in order to describe, for example, the physical environment or population characteristics. This presentation reviews some of the technical procedures required to produce accurate information under data-poor conditions, as demonstrated by a case-study describing a remote location in eastern Honduras. The methods and considerations outlined may be of interest to those working with indigenous peoples, those using participatory GIS more generally, or who otherwise work in data-poor areas. Issues include preparing and processing hard-copy materials, software considerations, geo-referencing, digitization, quality assurance, and assessing error propagation. Cost-surface networks will be employed and evaluated as a method for situating individual actors within a landscape. From these surfaces an environment in which both past and future activities may be spatially modeled is produced. Our methodology is markedly different from the common practice of investigating the relationships between people and resources primarily through remotely-sensed geospatial data. This approach will allow the dynamic activities of individuals to be incorporated with

traditionally static data sets, keeping primary focus on the human component of nature-society inquiries. Use of these techniques will allow researchers focused primarily on process-based aspects of geography to expand the tools available for both analysis and product generation (e.g. maps, illustrations, and animations) as computational capacity increases and innovation continues.

Keywords: data generation, geo-referencing, digitization, GIS, data-poor sites, cost-surface networks, behavioral geography

Steven Hoelscher, University Of Texas at Austin. Email: hoelscher@mail.utexas.edu; *Photography, Urban Space, and the Historical Memory of Atrocity*

This paper explores the relationship between historical memory, urban space, and photography, by way of a case study. Specifically, I examine the public art of the Guatemalan photographer and human rights activist, Daniel Hernandez-Salazar. As one of a growing number of Latin American artists committed to combating the "institutionalized forgetfulness" of human rights violations throughout the hemisphere, Hernandez-Salazar uses a place-specific public art to help his society remember its difficult past. The way forward, in post-war Guatemala as in so many other places around the world ravaged by atrocity and institutionalized violence, must first wend its way through the minefields of the past. The obstacles to such a project are great, and here is where photography becomes essential: camera images of atrocity?of practices so horrific that they challenge standards of decent and civilized behavior?are often called upon to represent the unrepresentable. Photographs of the calamitous and reprehensible bear witness to a past that, to most people, seems unreal. The authority of Hernandez-Salazar's photographs to bear witness to war-torn Guatemala's past is aided immeasurably by their insertion into urban space. Beginning in April 1999, one year after the assassination of the country's leading human rights advocate, Hernandez-Salazar annually inserts dozens of poster-size photographs throughout the capital city. The installations, famously known as the Angel Series, are like ghosts haunting graves of the murdered, fortresses of the powerful, bastions of the complicit. In every case, photography and urban space mingle to produce effects that are striking, and memorable.

Lawrence A. Hoffman, University Wisconsin Eau Claire. Email: hoffmala@uwec.edu; *The Changing Face of Wisconsin Dairy: Culture Change & Local Livelihoods in Western Wisconsin*

As Wisconsin's traditional family farms are challenged by an increasingly competitive national market, area dairy farmers are being forced to consider global realities. Increasingly, dairy farmers are tapping foreign labor resources in the face of disappearing local labor. As a result, Western Wisconsin's dairy sector is becoming increasingly dependent upon a growing Latino work force. Realization of this dependency has led to the exploration and creation of innovative approaches, including novel cultural and social programs aimed at facilitating relationships between Latino labor, dairy farmers, and local communities. As immigration debates rage, evidence suggests that, on a local scale, acknowledging the importance of migrant labor to the regional economy and building local/Latino relationships improves the viability of Western Wisconsin dairy farms and their communities as well as the working conditions and livelihood prospects of Latino dairy workers. Questions remain as to what changes to the traditional family farm and languishing state-wide milk production mean to the identity of Wisconsin as "Dairyland."

Changing land use in Miami-Dade County, Florida affects the hydrology, ecology, and recreational attributes of Biscayne and Everglades National Parks. Local decision makers must reconcile the need to protect park ecological health in an atmosphere of increased pressure to develop adjacent lands. In an effort to better inform the land use decision making process, the U.S. Geological Survey is developing the Ecosystem Portfolio Model (EPM) as a Geographic Information System-based tool that integrates natural science with economic information. This presentation will focus on the development of an ecological index for use within the EPM decision support framework. This index is designed to help resource managers communicate the ecological function and value of land in south Florida, and to support their ability to evaluate and comment on the environmental consequences of specific development proposals in the watersheds

of the National Parks. It is a multi-criteria index that combines available scientific data with expert judgment, and is developed in communication with National Park Service staff and their stakeholders. The index-based EPM is being used to evaluate the southern coastal wetland areas between Everglades and Biscayne Parks, the ecological function expected from the preferred scenario of the Miami-Dade Watershed Study, and the restoration versus development plans in the Bird Drive Basin area. These analyses are expected to provide an improved understanding of the implications of protecting ecosystem functions for Federal stewardship interests in south Florida.

Andrew Holden, Buckinghamshire Chilterns University College. Email: andrew.holden@bcuc.ac.uk; *The relevance or irrelevance of environmental ethics? Do they matter in tourism*

Tourism relies upon a variety of natural resources (NRs) to provide its attractions and for its development. These include the atmosphere, mountains, forests, wildlife and water. Whilst tourism can be used as an agent of NRs, its negative impacts have been copiously observed and recorded. Yet to sustain tourism and for tourism to act as a sustainable medium for human development it is essential that resources be conserved. This paper examines the threats that tourism can pose to NRs. It is suggested that owing to the diversity of user-groups of NRs connected with tourism, the spatial spread and the difficulty of disaggregating the negative impacts of tourism from other anthropogenic sources, coercive measures to control stakeholder behaviour are difficult to always implement. Given the complexity of the tourism system, which juxtaposes the humans and nature together in various situations, technical solutions based on technocentric approaches to resource management are also unlikely to be universally successful. Consequently, the ethics that govern human interaction with nature and the extent to which behaviour manifests itself as being resource-conserving behaviour (RCB) or resource-destructive behaviour (RDB) will be critical in determining the impacts on NRs in the context of tourism. Based upon aspects of government and corporate policy, and consumer behaviour, this paper considers the role of environmental ethics in tourism. This analysis is based upon a theoretical framework developed from the literature within the field of environmental ethics.

Keywords: environmental ethics; natural resources; tourism

Meg Holden, PhD, Simon Fraser University. Email: mholden@sfu.ca; *Indicator Projects as Social Technology in Urban Communities*

This paper frames community indicator projects as social technology projects, meaning that they have social, political and cultural roles that go well beyond their instrumental roles in the generation and display of quantitative data. As social technology, community indicator projects influence and are influenced by relationships of power, cultural difference, public value, and within and between professional communities. These relationships must be better understood in order to improve the impact of community indicator projects and other indicator and performance measurement systems as these grow in popularity in cities around the world. Case data from a public participation process for the development of a new set of regional sustainability indicators are qualitatively examined for evidence of the use of the indicator development process as social technology. This evidence, drawn from the public study group process conducted as part of the pilot work of the Regional Vancouver Urban Observatory from October 2005 - April 2006, suggests lessons for other local practices as well as for the scholarship of the role of knowledge in public policy as a whole.

Keywords: urban indicators, sustainable development, Vancouver, public participation

Curtis D. Holder, University Of Colorado at Colorado Springs. Email: cholder@uccs.edu; *Geographic variability of leaf water repellency in Guatemala and Colorado*

Fog persistency and high precipitation totals contribute to the unique ecohydrology of tropical montane cloud forests. The persistence of water droplets on leaf surfaces in cloud forests inhibits photosynthetic carbon exchange because carbon dioxide diffuses slower in water than air. Adaptations that reduce water retention on leaf surfaces may increase photosynthetic capacity of cloud forests. The objective of the study was to determine if 12 cloud forest species from the Sierra de las Minas, Guatemala have a higher degree of leaf water

repellency than 12 species from tropical dry forests in Chiquimula, Guatemala and 12 species from foothills-grassland vegetation in Colorado (USA). Leaf water repellency was measured as the contact angle between the leaf surface and the line tangent to the water droplet passing through the point of contact between the droplet and the leaf surface. Leaf water repellency was significantly different between the three study areas; however, leaf water repellency of 12 species in the Sierra de las Minas was lower than 12 species in Chiquimula and 12 species in Colorado. Leaf water repellency of abaxial surfaces of all species in the cloud forest was greater than leaf water repellency of adaxial surfaces. The low values of leaf water repellency in cloud forest species may be influenced by presence of epiphylls or the loss of epicuticular wax on the leaf surfaces because of high precipitation totals and longer leaf life-span. High leaf water repellency in dry climates may be an adaptation to increase hydrological inputs underneath the canopy.

Keywords: cloud forest, Colorado, Guatemala, leaf surface, leaf water repellency, leaf wettability

Clare Holdsworth, University of Liverpool. Email: clare.holdsworth@liv.ac.uk; *Young's peoples spatial and social mobilities: transitions in the transition to higher education*

One of the most anticipated and regretted outcome of the recent expansion of higher education in England is the concomitant shift towards local recruitment of students, as opposed to the 'traditional' pattern of mass migration and leaving home to go to university. Observers fear that this will create a two-tier education system, distinguishing between those students who can afford to move away and those 'forced' to stay local. What is apparent in this discourse is the importance placed on the spatial practices of young people's transitions to adulthood, and how the ideal of going away to university offers an opportunity for these to be realised. In contrast widening participation policies have promoted the importance of accessibility of local institutions and outreach teaching programmes, to take the university to the people rather than vice versa. This paper will consider the implications of these two opposing discourses, in the light of recent policy changes in HE in England and will explore the perceived and actual relationships between students' spatial and social mobility.

Keywords: student, mobilities, higher education, widening participation

Harmful algal blooms (HABs) are comprised of phytoplankton accumulating at biomass levels that negatively affect co-occurring organisms and the food web. Some HAB species produce toxins while others create anoxic or other environmentally stressful conditions. To date, eight toxin-producing HAB species have been detected in coastal waters of the northern Gulf of Mexico. These include the diatoms *Pseudo-nitzschia* spp. and the dinoflagellates *Karenia brevis*, *K. mikimotoi*, and five members of the genus *Prorocentrum*. This study investigates the use of satellite remote sensing (MODIS Aqua sensor) to detect and predict environmental conditions leading to the formation of HABs in the turbid coastal waters along the Mississippi and Alabama shores. Phytoplankton populations and water quality were monitored at three to six week intervals at 17 locations in Mobile Bay and the Mississippi Sound beginning in July, 2005 and continuing through June, 2006. In situ and satellite-derived water properties included surface temperature, salinity, concentrations of chlorophyll-a (Chla), colored dissolved organic matter (CDOM), total suspended solids (TSS), and nutrient levels. Simple curvilinear regressions determined relationships between phytoplankton cell count and water properties (both measured and satellite-derived). In general, counts of dinoflagellates, chlorophytes, and cryptophytes correlated positively with temperature (r -squared = 0.37 to 0.92) and Chla, TSS and CDOM (r -squared = 0.42 to 0.63) while diatoms exhibited inverse relationships with salinity, temperature, and Chla. These preliminary results are being used to develop a prediction model for HABs in coastal waters of the northern Gulf of Mexico based on daily to weekly satellite observations.

Ryan Holifield, University of Minnesota. Email: holi0023@umn.edu; *Traditional Tribal Lifeways, Human Health Risk Assessment, and the Composition of Common Worlds: Environmental Justice in and beyond Indian Country*

Recent work by Bruno Latour, Isabelle Stengers, and other science studies scholars invites us to rethink politics as the progressive composition of common worlds. Drawing on an empirical study of human health risk assessment at a hazardous waste site on the Leech Lake Reservation in northern Minnesota, this paper asks how such a reconceptualization of politics suggests new directions for

critical approaches to environmental justice. The Leech Lake Band of Ojibwe seeks a risk assessment and remediation that will honor the Band's treaty rights to ensure that all land within reservation boundaries which may in the future revert to the Band is clean enough to support traditional cultural activities and practices of hunting, fishing, ricing, and gathering. On one level, the Band's appeal for an approach to risk that protects traditional tribal lifeways may appear to have little significance beyond the lands known legally as Indian Country. However, I argue that the Band's efforts also point toward a politics of environmental justice dedicated to the production of "common environments," capable of existing outside the dominant socio-ecological projects of neoliberal capitalism. From this perspective, the Band's seemingly particularistic struggle hints at a more widely applicable conception of environmental justice as the "just composition of common environments."

Keywords: environmental justice, American Indian reservation, actor-network theory, risk assessment, United States

Edward C. Holland, University of Colorado at Boulder. Email: hollande@colorado.edu; *Geography and Nationalism in Dagestan*

This paper will present and interpret findings from survey work carried out in the Russian republic of Dagestan in 2005, focusing specifically on manifestations of nationalism among the territory's five largest populations. In apposition to the wider literature on nationalism and national identity in geography, which has primarily focused on the position of minority nationalist movements within the context of majority-controlled states, this work will investigate nationalism in a multi-ethnic territory, where complex ethnic intermixing or porous ethnic identities are present. In such polities a variety of nationalist movements can coalesce, depending on, among other factors, the degree of autonomy sought, the methods used to achieve such political control, and the interplay between the different ethnic groups and their political agendas. One such area that has the potential for such a range of nationalist outcomes is Dagestan. Home to thirty-four nationalities, Dagestan is the most ethnically diverse of Russia's twenty-one ethnic republics. Incursions by Chechen rebels, a corrupt, clan-based regional government, and poverty have all recently destabilized the republic. In light of this situation, Dagestan would appear to be susceptible to nationalist organization in its potential plurality of forms. Yet currently no significant nationalist movement has developed there. To address this situation, the paper will survey the preexisting literature on nationalism within the republic in order to test a set of preliminary hypotheses regarding the topic.

Conservationists and social scientists are concerned with the relationships between protected areas and human welfare. This presentation provides findings for these relationships in Costa Rica, examining whether protected areas provide a net social benefit to those living in the "area of park influence" - defined as communities within or adjacent to parks. Social benefit is defined holistically, in both quantitative and qualitative terms, and measured through observations of quantitative change in human welfare (estimated through the construction of a poverty index), access to services (health, education), and access to markets. This analysis focuses on using deforestation, land use conversion, and fragmentation as proxies for the effectiveness of Costa Rican protected areas in conserving biodiversity. We perform a change detection analysis on all Costa Rican forested protected areas and 10-km buffer areas around each park using Landsat TM and ETM+ imagery, from the 1980s through 2005. The optimal change detection method is selected through testing three different algorithms. Each protected area and buffer is scored according to its level of effectiveness in mitigating forest loss and fragmentation, and this park score is incorporated into a statistical comparison of park effectiveness alongside change in poverty, (as measured by a composite human welfare index). Poverty is assessed at the census segment level for both proximate and resident communities. A main objective of this analysis is to present the relationship between the observable life-cycles of land use/cover change in and around protected areas and the changes in community-level poverty over time.

Framing the Commons: Commercial Water Bottling and Local Empowerment

Mark Giordano has observed that geographers have rarely applied their methods towards an explanation of the commons. This claim although valid is disturbing in that issues of the commons or common pool resources are intricately linked to ideas of resource use, human environmental interactions and spatial relations; concepts well grounded in geographic thought. This paper aims to bridge the gap between commons research and geographic thought by examining how residents in a North Florida community, when faced with the commercialization of the commons (groundwater in this case) by way of bottling frame issues of the commons and how these collective action frames are then implicated in a politics of scale.

Keywords: water bottling, politics of scale, commons, Florida, resource geography

Globalizing groves: Spanish olive oil and protected designations of origin

This paper focuses on the Mediterranean olive oil commodity chain to look at the interplay among regulations at the global, supranational, national and regional levels. We do so through a case study of one of the olive producing regions in Spain. We analyze the changes undergone by a particular form of food labeling?origin?as a response to the pressures exerted by the globalization of the agrofood system. While historically certain kinds of foods and places were intimately interlinked, neoliberal reforms have created the conditions for a formalization of linkages. Protected Designation of Origin (PDO) is designed to commodify previously existing geographical imaginaries as well as newly created ones, associating products with the values attributed to a region. We consider the historical, cultural and political economic factors that help to explain why Spanish olive producers are employing PDO labeling at this time. Finally, we contrast the place-based imagery invoked by these labels with recent transformations in the geography of production, finding that there are marketing synergies that extend beyond the food system to other modes of "consuming" the landscape in the environs of Jaen, Andalusia.

The Promise & Peril of Collaborative Multi-Method Research

Collaborative cross-disciplinary multi-method research holds great promise for the future of critically meaningful quantitative research. Establishing and nurturing the linkages necessary for this type of research is demanding of time and energy, however, and there are inherent risks associated with such ventures. I offer here a tentative heuristic model that centers on iterative and collectively reflexive application of multiple research methods. This approach can help individual scholars to break out of the boxes that too often characterize our work. The approach also foregrounds the epistemological and ontological tensions that necessarily accompany multi-method research by seeking to maximize the chance that productive and creative responses can be forged. To illustrate both the promise and peril of this style of research, I report on an ongoing longitudinal research project with which I have been involved for the last several years. Based on my experiences, I offer a cautionary yet optimistic status report. I conclude by offering a set of general pragmatic suggestions for creative, engaged and meaningful research that involves quantitative research as part of collaborative multi-method approach.

Self-Employment in Services: A Geographical Assessment

Recent analyses of productivity, employment growth, and economic dynamism have focused on the role of small businesses in the U.S. economy. Small businesses are the source of much innovation and job generation. An overlooked, but increasingly important, contributor to economic growth is the self-employed segment, which consisted of over 19 million establishments in 2004 with recorded sales or receipts of US \$887 billion. The self-employed consist of individual proprietorships, partnerships and corporations, which tend to have low entry and operating costs, and are less capital intensive than their employer counterparts. They rely on technology and acquired skills for successful operation but vary considerably in their productivity. This paper examines the sectoral composition, growth, and geographical distribution of the self-employed from 1997 to 2004, with particular emphasis on services. A regional shift share-analysis and regression models are used to estimate regional levels and change in the self-employed. Results show that individual entrepreneurial activity varies

widely within the US and is linked to differences in industrial composition, human capital, unemployment, and regional endowments.

Journalistic Cartography on the Web: A Comparison of Print and Online Maps

This article compares the use of maps in seven major U.S. newspapers in print and online formats during a two-month sampling period. Recent advances in interactive, multimedia, and web-based cartography offer new possibilities for integrating maps with news stories. This article asks how these new technologies are being used and how maps in online and print editions differ. The research found that interactive and multimedia maps are not widely used in online editions and, indeed, online maps are not always well integrated with stories. Furthermore, the disparity in size and resolution between print and online editions leads to a range of compromises involving the absolute and relative sizes of maps, placement on the page, and position with respect to text. Interviews with newspaper staff indicated that lack of staff and time and the separation of production between print and online editions often prevented better integration and use.

Destabilizing Homonormativity and the Public/Private Dichotomy in "Lesbian Domestic Violence" Educational Discourses

Community-based educational materials and workshops are a common feminist approach to addressing violence in lesbian relationships. This paper explores the racialized exclusions in the public/private dichotomy in community-based educational discourses about "lesbian domestic violence". I examine how the public/private dichotomy in these discourses masks how the construction of each space, and the violences within them depend on one another. I investigate how a universal lesbian is constructed, normalizing certain identities and knowledges while subordinating others. An examination of community-based educational materials and interviews with queer educators illustrates how the public/private dichotomy produces exclusions and makes certain forms of violence enacted on certain bodies unthinkable and unintelligible. I argue that an exclusive focus on violence in the private sphere breaks down around race and conceals the relationship with public violences. While these discourses challenge heteronormative constructions of violence, they have relied on a simple conceptual framework that has had the effect of promoting a dominant narrative or regime of truth privileging white, middle-class lesbian experiences. My research highlights the need to destabilize this homonormative construction of lesbian relationship violence by re-conceptualizing violence in same-gender relationships from an anti-colonial framework and seeking new narratives that reflect an interlocking social analysis. This paper argues for a spatial analysis of violence in lesbian relationships that pays attention to the violence enacted on bodies at different sites and from multiple sources. Attention to the socio-historical construction of spaces, bodies, identities and violence is needed in future research and education about same-gender relationship abuse.

Power Asymmetries within Industrial Clusters: Case Studies from the Industrial Mould Industry in Canada and Portugal

Research on industrial clusters has emphasized the embedded nature of networked production systems, scale, and the wider institutional context within which clusters develop. However, there is a growing recognition that the role of entrepreneurial innovation in cluster formation is not fully understood and simply cannot be 'read off' from policies or institutions. Indeed, entrepreneurs may well be the active creators of such institutions. This paper examines the role of entrepreneurs and institutions in the development of industrial clusters. In particular, we focus on the challenges posed by the asymmetric power relationships that can arise due to the development of larger firms within the cluster, relationships with external customers, and the cluster's integration into the 'knowledge pipelines' of transnational corporations. The analysis draws on recently completed interview-based research into the formation and evolution of two internationally-important clusters in the industrial tooling industry: the automotive tool, die and mould industry in Windsor, Ontario and the more diversified industrial mould making cluster in Marinha Grande, Portugal. In each cluster, interviews were conducted with tool makers and representatives of institutions that support the industry. Both clusters have similar histories of

skilled tradesmen who established dense networks of small but highly innovative firms and in the process became successful entrepreneurs. Today, both clusters are faced with tensions and challenges resulting from the asymmetric power relationships that have developed subsequently: between different sized firms within the Marinha Grande region; and, in Windsor, between the mould makers and their large transnational customers in the automotive industry.

Ashley Holt, UC Berkeley, Environmental Science, Policy & Management. Email: ashleyh@nature.berkeley.edu; *Plague in California, 1900 - Present: Exploring the intersection between pathogen, animal, and human geographies*

Current scholarship maintains that the plague bacillus, *Yersinia pestis*, was first imported to the United States in the early part of the 20th century, when infected rats were inadvertently transported from Asia by ships docking in San Francisco. Since 1900, 446 human cases of plague have been recorded in California. While the first plague outbreaks in California were concentrated around the port towns of San Francisco and Los Angeles, during subsequent decades the disease spread across the western United States, and human plague cases were recorded in coastal, inland, and mountain counties. In this study, we map the spread of human cases across California, as well as the geographic distribution of both carnivore and rodent hosts, in order to understand spatial patterns of disease incidence.

Email: sui@geog.tamu.edu; *A Geographic Analysis of Religious Affiliation and Alcohol Consumption in the U.S.*

Excessive alcohol consumption claims approximately 75,000 lives annually and is the third-leading preventable cause of death in the U.S. This study explored state-level correlations between current or binge drinking and religious adherence among US adults using data obtained from the Behavioral Risk Factor Surveillance System and the American Religion Data Archive. There was no significant correlation between overall religious adherence rates and current or binge drinking rates in the general population, and states with higher adherence rates were significantly more likely to have high proportions of binge drinking among current drinkers. However, there was a strong inverse correlation between the adherence rate and both binge and current drinking in the Southeast, and a strong positive correlation between the adherence rate and both current and binge drinking in the Midwest and Northeast. These regional differences were largely explained after stratifying by major religious denominational groupings. States with high Catholic adherence rates tended to have higher rates of current and binge drinking, while states with high Evangelical Protestant adherence rates tended to have lower rates of current drinking and binge drinking. The ratio of binge drinkers among current drinkers was similar in Catholic- and Evangelical-predominant states. These findings suggest that the relationship between religion and alcohol may be denomination-specific, and challenge the lay perception that religious adherence per se is associated with less alcohol consumption and less excessive drinking among those who drink. This analysis underscores the need for individual-level data to more fully examine the relationship between religion and alcohol consumption.

Keywords: alcohol drinking, binge drinking, religion

Louise Holt, University of Reading. Email: L.Holt@Reading.ac.uk; *Young People with Socio-Emotional Differences: Theorising Disability and Destabilising Emotional Norms*

This paper explores the implications of an empirical study of the experiences of young people with a range of mind-body-emotional differences to theorising disability. In particular, it is contended that young people with emotional differences are frequently the most disabled via normalised expectations of development. The experiences of these young people, who often are not labelled with specific diagnoses, destabilises accepted social models of disability, by questioning the necessity of impairment to disability. I contend that challenging the residual biologism of social models, which cast impairment as integral to disability, facilitates examination of a broader range of mind-body-emotional differences. Further, illuminating the experience of people (dis)abled via norms of emotional and social expectations, enhances debates about emotions and affect; illuminating and denaturalising norms of emotional comportment within specific socio-spatial moments within broader social relations. This denaturalisation can highlight how such norms are gendered, classed and

racialised, and simultaneously suggests the potential for contestation and transformation.

Keywords: disability, emotional differences, emotional geographies, young people

Eric Holthaus, Columbia University. Email: emh2134@columbia.edu; *The Social Justice of Weather: Hurricane Risk Management for Development in Latin America and the Caribbean*

With an active Atlantic hurricane era upon us, the risk of hurricane-related losses in Latin America and the Caribbean is enhanced (Emanuel, 2005). This study introduces the Hurricane Vulnerability Index (HVI), a simple model of socioeconomic and meteorological vulnerability designed to quantify hurricane mortality risk. Following previous examples (Kaly et al, 2004; Dilley et al, 2005), an assessment of hurricane mortality risk is made for each country in the region by comparing indicators of vulnerability to observed mortality rates in recent hurricane events. Statistical analysis of the HVI shows that social factors (like literacy rate and life expectancy) influence hurricane mortality more than hurricane frequency or intensity, with social factors explaining 41% of the variance in observed hurricane-related deaths per storm compared to 29% for storm strength and intensity alone. In fact, an exponential relationship is shown between vulnerability and hurricane mortality. Based on this analysis, recommendations are given for hurricane risk management to reduce deaths in the most vulnerable countries, primarily by increasing attention given to hurricane-related social vulnerability, as other recent studies have also recommended (Shultz et al, 2005; Cutter and Emrich, 2006). Although previous studies (Cutter et al, 2003; Pielke et al, 2003) have compiled similar multidisciplinary vulnerability indices, this is the first study to produce an index examining both social and physical vulnerability in Latin America and the Caribbean that focuses on mortality risk from hurricanes.

Carlos Andres Holz, (c)PhD, Biogeography Lab, University of Colorado - Boulder. Email: holzc@colorado.edu; *Fire History of *Pilgerodendron uviferum* (*Guaitecas* Cypress) in the Temperate Rainforests of southern South America*

The temperate rainforests of western southern South America (south of 42° S) have experienced widespread wildfires in recent times. However, we are uninformed as to the natural role and scale of the modern fire history in the region. Here, one of the dominant tree species is *Pilgerodendron uviferum*, an endemic, slow growing, and long-lived species, and the southernmost conifer worldwide. Due to a history of massive burning, *P. uviferum* is listed on the International Union for the Conservation of Nature and on the Convention on International Trade in Endangered Species. The goal of this ongoing research is to examine the role of fire, the influence of climatic and human activities on fire regimes, and the vegetation response to fire in *Pilgerodendron uviferum* temperate rainforests of southern South America (south of 42° S). To address these questions, I use a multi-scale research design that seeks both top-down and bottom-up explanations of fire history, climatic and human influences, and stand dynamics in these forests. At regional and meso scales, I examine the historical role of fires (i.e. frequency, severity, extent) prior to, during, and post-establishment of Euro-settlers across the region, and the influence of interannual and interdecadal climate variability on these fires. At a meso- and stand-scales, I investigate the vegetation responses the most recent fires episodes. Finally, at a stand scale, I am developing new habitat-specific models of the post-fire stand development patterns and regeneration dynamics of these forests.

The National Land Cover Database (NLCD 2001) is a Landsat-based set of data layers created for the United States by the Multi-Resolution Land Characteristics Consortium (MRLC), let by the U.S. Geological Survey. The recent completion of NLCD 2001 at 30 m resolution for the conterminous United States (Alaska, Hawaii and Puerto Rico are in progress) provides several independent data layers that can be directed at a wide variety of applications. Completed data layers include: (1) normalized Landsat Thematic Mapper ? and Enhanced Thematic Mapper Plus (ETM+) imagery for three time periods per path/row; (2) elevation, slope, aspect, slope position, and other ancillary data; (3) per-pixel estimates of percent urban imperviousness and percent tree canopy; (4) a land cover product with 16 land cover classes and (5) a product that identifies land-cover change between 1992 and 2001. NLCD 2001 provides a comprehensive land characteristics database for the Nation, designed to support

many potential applications. All NLCD 2001 data layers are available for free download from the Internet.

With the development and integration of the Internet and mobile communication, we are entering a new era of mobile information. When users utilize GIS in motion, this GIS is called a mobile geographic information system or Mobile GIS. Global Position System (GPS) based vehicle tracking is an important application of mobile GIS. The application has generated many new problems challenging current GIS researchers. One of the problems is system inefficiency and poor reliability, caused by massive and frequent interruptions of communication, limited resources and poor schedule. This problem is the bottleneck that impedes Mobile GIS systems' performance. This paper discusses how to avoid the bottleneck by making a single server efficiently support multi-user communication. First we introduce the architecture and function of our mobile platform and analyze some bottlenecks then, we present detailed strategies and methods for how to use Microsoft's I/O Completion Port (IOCP) model to implement the Winsock 2 communication server program. We prove that this server program can improve the efficiency, flexibility and robustness of the single communication server, especially for large-scale communication. Finally, this paper summarizes the results of some application experiments and other results using this platform.

Eirin Hongslo, University of Life Sciences, Norway. Email: eirin.hongslo@umb.no; Why can't we become rich, like the white man is? Marginalisation and resistance to stock limitations in Namaqualand, South Africa

Carrying capacity planning has been an influential tool in rangeland management in South Africa and has remained important during recent land reforms. As part of a land tenure reform process in 2000-2002, the management plan in Concordia, one of the former coloured rural reserves, was rewritten. Although serious effort was put into changing the plan, and a series of consultative meetings in the communities was arranged, the new plan ended up looking astonishingly similar to the old one, particularly concerning livestock limitations. In interviews with Concordia, farmers argue that this is far from enough to achieve a decent livelihood from farming. The continued application of stocking limitations can be understood in several ways. This paper investigates why carrying capacity, as a management tool, maintain such a lot of discursive influence decades after betterment planning was abandoned and why alternatives were not explored. It asks whether it represents a form of continued technocratic and political marginalisation. The arguments posed by some farmers mainly refer to livelihoods and economic development. Although a limit on stock numbers is maintained to secure grazing for the poorest of the poor, the fixed stock reiterates the divide between commercial and communal farmers, a divide that most other policies seek to overcome. The author of this paper recognises the need for planned management of communal resources. However, there are a number of reasons for rethinking carrying capacity as the main management tool and in particular how it is applied in more community-based planning.

Catherine A. Hooley, Ph.D., Pittsburg State University. Email: chooley@pittstate.edu; Timothy J. Bailey, Ph.D., Pittsburg State University. Email: tbailey@pittstate.edu; Wasteland or Wonderland? Abandoned Mine Land and Economic Development Potential in Southeast Kansas

This paper examines the diversification of economic development opportunities following the natural revegetation of abandoned mine land in two counties of southeast Kansas. The legacy of coal mining has left a distinct landscape in the counties of Cherokee and Crawford. For decades, the barren terrain was considered waste land unsuitable for agriculture and served as a

deterrent for economic development. More recently, however, natural revegetation processes have altered the physical appearance of the land, and in so doing, created more desirable settings. As a result, economic opportunities have begun to present themselves in the form of recreational and residential developments rather than primary and secondary activities. Changing attitudes toward the relics of the mined land features have affected change and growth. Results indicate that the mined landscape continues to impact the economy of the region.

Dawn Hoogeveen. Email: dhoogeve@sfu.ca; Bling Bling: Diamonds and Canada's North

A key contribution geographers have made to the study of diamonds is 'resource war' literature that concentrates exclusively on diamonds in Africa. 'Conflict' or 'blood' diamonds have been criticized for their relationship to the fueling of civil wars. Canadian diamonds on the contrary are marketed as 'pure as ice' and 'conflict free'. Diamonds currently play a vital role in the Northwest Territories economy. The increasing amounts of staking and prospecting taking place across Canada's north lead to questions regarding the adequacy and follow up of legislation that monitors diamond mining practices. This paper examines different ways of looking at Canadian diamonds in the light of these issues.

Barbara Hooper, Dr., Radboud University Nijmegen. Email: b.hooper@fm.ru.nl; Space Matters but is it Matter or Space?

A dominant feature of Soja's work has been his call for a radical restructuring of western ontologies in which space assumes, with being and time, a central position and the essential connection between spatiality and being is given ontological priority. The goal of this paper is to problematize Soja's restructuring efforts through an interrogation of his undeveloped assertions that time and space represent the objective form of matter and that time, space, and matter are inextricably connected. My particular focus is upon the consequences of dropping matter, and more significantly the agency of matter, out of his analysis. Working speculatively, I suggest that Soja does not analyze space but matters which have been spaced/timed into being, and that had this been recognized a very different idea of being and being-in-the-world would have emerged. This alternative, matter-centered ontology would disturb all ideas of self-contained beings and becomings and would work towards a general reconsideration of space and time as socially produced spatializing/temporalizing techniques for mastering the immanent agency of matter? i.e. patternings, quantification, organization, standardization, and so forth which isolate, fix, and pacify matters that are interactive, complex, emergent, irregular, unruly. This more permeable way of conceptualizing being has political as well as theoretical consequences: once it is accepted that the spaces and times produced between matters are foundational ontological fantasies and that matters of all sorts (including rocks) act upon human matters, then ideas of human agency and intentionality and thus human politics require radical revision.

Frank Hopf, Texas A&M University. Email: fhpf@neo.tamu.edu; Bernard O Bauer, University of British Columbia Okanagan. Email: bernard.bauer@ubc.ca; Mark Lorang, University of Montana. Email: mark.lorang@umontana.edu; Douglas J. Sherman, Texas A&M University. Email: sherman@geog.tamu.edu; The history, present and projected future of the mid-channel islands in the Sacramento River Delta.

The Sacramento River Delta of California has undergone significant development and changes during the Holocene. The rate of change increased greatly with the human population explosion that started with the nearby discovery of gold in 1849. Large sections of the delta were converted to agricultural use by the augmenting the height of the natural levees. As a result, the periodic inundations by flood waters and flood sediments were restrained. The islands behind the augmented levees subsided to elevations below normal low water levees forcing landowners to slowly convert the levees into dams. Also during the last century, the channels have been modified and new ones created to facilitate moving about 20% of the total fresh water south to the southern California water supply system rather than west to San Francisco Bay and the ocean. This channel and levee building effort left behind, or in some case may have created, numerous small mid-channel islands. These small islands remain responsive to the modified fluvial and tidal forces processes while the bulk of the delta has been largely isolated or protected from those processes. They also represent some of the last riverine aquatic habitat in the delta and are therefore extremely valuable. This study looks at the historic record largely through maps and remote imagery and studies the active fluvial processes by analyzing up to eight years of quarterly erosion measurements to illuminate the past, understand the present, and project the potential future of these critical remains of the natural delta.

Peter E Hopkins, Lancaster University. Email: p.hopkins@lancaster.ac.uk; *Global politics, national identities, local life: the perspectives of a young Scottish Muslim man*

Through engaging with the lived experiences of a young person whose voice is usually silenced, often unheard and frequently distorted, this paper investigates how youth transitions and masculinities are mediated by the geographies of racism and religion. I do this by exploring the life and times of Kabir, a young Muslim man living in post-devolution urban Scotland. This paper considers how scale is constructed, struggled over and used to mark out Kabir's life - to assign him to categories, to shape his identities ? in different times and places. Engaging with a range of issues framed as global, national and local in character, I consider how this framing shapes Kabir's experiences of neighbourhood, home and personhood. One of the main arguments of this paper is that, whilst Kabir might resist, struggle and connect with scales beyond the local, his personal identity and political future is rooted in his lived and material cultures that are positioned close by; his sense of self and community is critically shaped by the scales 'closest in'; the markings on his body; the placing of his home; and the character of the street. So, through exploring his understandings of, and responses to, September 11th 2001 and July 7th 2005 (global), his opinions about devolution, racist politics and national identities (national), and the significance of home and mosque (local), I analyse how Kabir shapes, creates and resists aspects of his cultural identity, and responds to wider geopolitical transformations and spatial changes.

Corina Höppner, Swiss Federal Research Institute WSL. Email: corina.hoeppner@wsl.ch; Jacqueline Frick, Swiss Federal Research Institute WSL. Email: jacqueline.frick@wsl.ch; Matthias Buchecker, Swiss Federal Research Institute WSL. Email: matthias.buchecker@wsl.ch; *Social impacts of participatory landscape development in Switzerland*

Participation has become an important issue in Swiss landscape development. As an alternative to the conventional top-down approach in landscape planning, new planning instruments such as the Landscape Development Concept (LDC) have emerged. An increasing number of municipalities start to elaborate such concepts, and in the course of it they apply different participatory techniques such as workshops, round tables and information events in order to involve stakeholders and a wider public. While ecological effects of these innovative planning processes have been studied largely, we still do not know about their social effects such as trust and commitment building. Thus, the aim of our study is to assess these effects on persons and groups involved. The examination of social - and often called "intangible" ? effects is methodologically challenging and ideally requires a mixed-method design. In order to assess changes of participants' trust-related beliefs and their intention to participate, we sent a questionnaire to participants of a municipal LDC (n = 35) before and after the planning phase (i.e., repeated measurement) and conducted semi-structured interviews (n = 11) with participants. We found that different participatory techniques have different effects on participants' trust in other participants and their confidence in the planning process itself. In our presentation we first discuss methodological considerations and then highlight possible pitfalls in interpreting the results of quantitative trust measurements, specifically regarding the concurrence of positive and negative effects. Finally, we show, why long-term participation strategies are essential for landscape planning processes.

André Horn, Dr, University of Pretoria. Email: andre.horn@up.ac.za; *From Segregation to Fragmentation: the Changing Racial and Income Structure of the Post-apartheid City*

The apartheid city was highly segregated in terms of racial and income distribution. There was also a strong correlation between race and income. Since the early 1990s, the population and income structure showed significant changes as a result of regional migration and black economic empowerment. 'Integration' and 'development' also became key elements of urban planning policy. To what extent has the aim of urban social integration been achieved? Are new socio-economic spatial patterns emerging? These questions are analysed in the City of Tshwane metropolitan municipality in South Africa. Various types of segregation, desegregation, integration and re-segregation are identified. The emergence of a black elite as well as a black middle class is also visible alongside growing white poverty. It is nevertheless argued that despite significant socio-economic changes urban segregation was merely replaced by urban fragmentation. In conclusion, the 'fragmented city' is explained in local and global context.

Many of the beaches on the UK coast that constitute the main defence against erosion and flooding are composed of highly permeable sediments, usually a mixture of sand and gravel. This paper reports on the results of a research project on the effect of permeability on the performance of nourished mixed sand and gravel beaches. Laboratory experiments showed that under the same wave conditions, mixed beaches have reduced volumetric changes, less onshore transport, and more offshore transport than gravel beaches. This is because the presence of sand in a mixed beach significantly reduces the permeability of the beach, impairing the water flow within the sediment media. Numerical modelling and laboratory experiments showed that the hydraulic conductivity of the sediment and the groundwater level both have significant effects on the evolution of the beach surface. A lower groundwater level leads to increased onshore transport and a higher groundwater level to increased offshore transport for both accretionary and erosional conditions. A series of analytical equations relating the porosity, hydraulic conductivity and bulk density of a bimodal sediment mix to the percentage of sand were validated by laboratory tests which showed that cliffing is most likely to occur when the mixture contains 30-36% or more sand. The case studies identified two particularly problematic performance issues: loss of crest height and width, generally due to the transport of sediment from the upper beach to the lower beach, and cliffing, particularly in newly recharged material.

Far too commonly, science is presented in elementary and secondary classrooms as a body of arcane knowledge handed down by inaccessible, distant authorities known as scientists, rather than as a process of investigation and discovery that is fun and exciting and that makes a scientist of anyone who participates. Funded by NSF, the University of Tennessee GK-12 Earth Project focuses on bringing the excitement of research and discovery to rural middle school science classes in east Tennessee. Ten graduate students from the Geography Department and the Earth and Planetary Sciences Department serve as GK-12 Fellows in seven schools spread across four school districts. Each Fellow is paired with a Teacher-Partner selected from highly committed participants in past summer workshops in the natural sciences. The project has a strong focus on the science of climate and environmental history, and most of the Fellows are engaged in graduate research on natural archives of environmental history, including tree rings, sediments, soils, fossils of various kinds, and stable isotopes. GK-12 Earth Fellows work closely with their Teacher-Partners to develop and carry out hands-on science activities that expose rural middle school students to the Fellows' own unfolding research, to other research at the University of Tennessee, and to broader initiatives such as the Integrated Ocean Drilling Program.

Mark W. Horner, Florida State University. Email: mhorner@fsu.edu; Joni Downs, Florida State University. Email: jad05m@fsu.edu; *Examining the sensitivity of hurricane disaster relief plans to population demand assumptions*

Hurricane disaster planning involves the staging of relief goods at accessible locations in urban areas that are to be distributed to people following an event. Accessible locations for staging relief goods are determined based on assumptions about the spatial distribution of populations in need. For example, some people evacuate their residences while others remain behind. Additionally large grocery stores or shopping centers may remain open during a storm, providing goods to nearby populations, while more distant populations may require delivery of relief supplies. In this research, we examine how assumptions about these and other demand considerations impact modeling hurricane disaster relief goods provision. Specifically, we explore how alternative techniques for estimating relief goods

demand impact the placement of distribution facilities. To accomplish this task, we formulate a multi-commodity goods distribution model that optimally sites relief staging facilities. Then we explore how spatial variation in population demand impacts relief facility locations.

Howard Horowitz, Ramapo College. Email: hhorowit@ramapo.edu; Wordmaps

Although the tradition of visual poetry goes back to ancient history, the explicit linkage of poetry and cartography is relatively recent. Adel Haft describes examples from around the world published since the 1960s. Over the last two decades, I have created such integrations and call them "wordmaps". Each wordmap has its own fusion of text and image. Some are "literal": the names of locations are positioned in the text corresponding to their map locations. "Manhattan", first visualized in a vivid dream and then fitted into place with the precision of cartographic production, is an example of an explicit wordmap. "The Oregon Coast" incorporates geography, history, and poetry of place into a recognizable map, produced with the assistance of skilled cartographers. Earlier wordmaps were more abstract in their geographic representation. "Redwood Creek" flows across the page but does not attempt to represent the Northern California watershed literally; "Idaho" has the shape of the state, but the internal text does not function as a map. "The Wallkill Watershed" flows north from the bottom to the top of the page, and tributary texts flow into the main text as streams flow together on the land. Other wordmaps are organized around geological features ("The Reading Prong" and "Dune").

Leah S. Horowitz, Ph.D., University of Leeds. Email: leah@env.leeds.ac.uk; "It's Up to the Clan to Protect": Cultural Heritage and the (Micro)political Ecology of Conservation in New Caledonia.

Political ecology is a new and promising field, yet proponents have inadequately explored its potential for application to real-world problems. I argue that academics have a duty to use their analytical skills to contribute to government and non-government organizations' understandings of the political, economic and socio-cultural contexts of environmental issues. Reciprocally, data gathered through such analysis can enrich theoretical frameworks. This paper will explore these ideas through the case study of community-initiated conservation in New Caledonia. Local community members independently initiated discussions about creating protected areas. The provincial government asked me to determine the degree to which these initiatives could be supported by formal institutions. I found that most community members supported the proposed conservation projects for the economic development benefits they expected. However, they also saw these projects as an opportunity to strengthen their cultural identity through respect for, or reinforcement of, customary authority structures. Meanwhile, this desire led to intracommunity tensions as people argued over who within the community held the positions of customary authority. I argue that community members may harness conservation projects to their own political or cultural agendas - on a national and/or very local scale. Therefore, people may be more interested in supporting conservation projects that they perceive as furthering their political, cultural or micropolitical goals. In attempting to empower local people through natural resource management projects, conservationists should be aware of the importance of considering precisely who within the community will be empowered, who will be disadvantaged, and what conflicts this may cause.

Kathrin Horschelmann, University of Durham, U.K.. Email: K.Horschelmann@durham.ac.uk; Youth and the geopolitics of risk after 11th September 2001

What constitutes 'the political' has been conceived primarily in terms of the actions of the state in international relations theory and geopolitics. This is despite recognising the often severe effects of geopolitical events, such as interstate war, on civilians and children. In the cases that form the basis of this paper, neglecting the voices of those seemingly on the sidelines of international conflict reinforces a sense of political disenfranchisement. The paper focuses on perceptions of risk after the WTC attacks of 11/09/2001 by British Muslim students aged 16 to 18. For students with hybrid locations in diasporic communities, attachment to people and places in different parts of the world has meant that the effects of these events have been felt strongly in both a direct and mediated way. The research presented here shows that young people's fears about increased racism and potential terrorist attacks were secondary to their concerns about the effects of terrorism and of military conflict on others in distant places. Their interpretations of political responses to 11th September 2001 also show an ability to critique and subvert political discourses rarely recognised in debates on

youth political agency and even in research on popular geopolitics.

Keywords: Critical geopolitics, youth, political agency, risk

Gareth C. Hoskins, University Of Wales, Aberystwy. Email: tgh@aber.ac.uk; Joanne Francis Maddern, Dr, University of Dundee. Email: J.F.Maddern@dundee.ac.uk; Regulation and Commemoration in the production of mobility at two US Immigration Stations

This paper discusses two sites that played a crucial role in the production of mobilities in the United States. Ellis Island, New York and Angel Island, San Francisco functioned as federal immigration stations and worked as strategic locations regulating the movement of people journeying to the East and West coasts during peak immigration years. Today these locations have been historicized as national heritage with million dollar budgets and thousands of visitors annually. More importantly, they have acquired symbolic status in the portrayal of the peopling of America. These two immigration stations and the processes surrounding their objectification as "history" have immense significance for contemporary epistemologies of mobility not least because they play host to a series of reconciliations about movement as a simultaneously alienating and legitimating condition.

Peter Hossler, University of Georgia. Email: phossler@uga.edu; The Abandonment of the City: The Erosion of the Health Care "Safety-net" in Milwaukee

I will remember that I remain a member of society, with special obligations to all my fellow human beings, those sound of mind and body as well as the infirm (Lasagna, 1984, modern Hippocratic Oath). The Hippocratic Oath, has served as the foundational paradigm for the medical profession in the United States. While the institutions and technologies of medicine have changed greatly since Hippocrates, the guiding framework for physicians he developed has remained. This is exhibited in the practice of reciting the oath during medical school graduation ceremonies. However, the onset of modern capitalism commodified the human body, while creating assembly lines of health in the form of hospitals, clinics, and Academic Medical Centers (AMC). This process has, like all other processes of commodification, created two classes of bodies; those with the financial capital to achieve health and those without. AMC's have historically helped narrow this gap by caring for the poor and uninsured. This paper examines the increasingly precarious role of AMC's as they face mounting pressure to collaborate with private entities in order to educate medical students and provide services to the community. I will use a case study from Milwaukee to investigate these contradictions. In Milwaukee a public/private partnership within the Milwaukee Clinical Campus (MCC) has resulted in a contraction of the MCC's role as community resource serving underserved neighborhoods. It has also marginalized activists voices opposing the inequality created by the capitalized U.S. health care system.

Ellen Hostetter, University of Kentucky. Email: ellenhostetter@hotmail.com; Representations of a Racialized Landscape: Public Housing and the HOPE VI Program

This paper analyzes representations of racialized landscapes in discourses of public housing that helped shape HOPE VI, a 1992 HUD program dedicated to transforming public housing into neighborhoods that blend with mainstream America. Analysis of newspaper articles and the Congressional Record, as well as interviews with government officials involved in the creation of HOPE VI, shows a reluctance to directly address issues of race and public housing. Instead, the discourse surrounding public housing focuses on the landscape's aesthetic qualities and evokes the emotions of disgust and fear. I argue that public perceptions of race and poverty, underpinned by disgust and fear, are projected onto landscape. Emotive descriptions of landscape become a vehicle for addressing issues of race

and are, therefore, an important part of racialization. This process has material implications for the creation of national housing policy: emotive descriptions of landscape are used as a justification for the transformation of public housing developments and the lives of public housing residents.

Keywords: public housing, HOPE VI, landscape, emotion

Jacqueline A. Housel, SUNY at Buffalo. Email: jhousel@buffalo.edu; *The Role of Regulation and Social Practice in the Production of Racialized Place*

This paper explores the connections between perceptions of racialized spaces and how individuals (as members of groups) negotiate urban spaces. Initially, this problem was investigated through a series of neighborhood discussion groups that relied on structured dialogue to discuss racial profiling in highly segregated Buffalo, New York. Based upon observations of the study circles, I identified two population groups known to have suffered indignities in their dealing with police, but were marked very differently. One research focus was Black men and how they negotiate space (particularly with regard to white suburbs and police profiling). The second focus was elderly whites living in 'their' neighborhoods that are now almost all Black to see how their daily activity spaces are shaped by their experiences with police and their perceptions of their neighborhood. To capture the interrelationships between regulation of space and movement in/through/around space, I employed multiple research methods/tools, including, participant observation, focus groups, surveys (included cognitive mapping), and solicited travel diaries (supplemented with interviews). These methods, along with an intricate theoretical framework built from interdisciplinary work on race and space, provide context-rich understandings of the construction and maintenance of not just residential segregation seen on 'color line' maps, but also the everyday shaping of embodied, experienced, racialized places.

Chris Houser, University of West Florida. Email: chouser@uwf.edu; *Linking Dune Morphology on a Barrier Island to Transverse Bars on the Inner Shelf*

The morphological response of a barrier island to the elevated water levels and storm waves of a hurricane partly depends on the height and extent of the foredune, and the presence of secondary dunes. Prior to Hurricane Ivan, the height of the dunes along Santa Rosa Island in Northwest Florida exhibited considerable variability alongshore. Empirical orthogonal function (EOF) analysis was used to reduce pre-storm LiDAR data into characteristic cross-island profiles. Cross-correlation analysis between the eigenmodes of the pre-storm morphology and the island width revealed a statistically significant but lagged correlation. The largest dunes tended to be found at and just east of the backbarrier cusped headlands, while the smallest dunes were found at the narrowest sections of the island. The pre-hurricane height of the foredunes was also found to be correlated with the offshore bathymetry. The largest dunes tended to be associated with a dissipative profile, while the smallest foredunes (and the absence of secondary dunes) tended to be associated with a reflective profile. The variation in offshore bathymetry is shown to be associated with transverse bars on the inner shelf and it is argued that the resulting bathymetric highs and lows create alongshore variation in storm energy. Areas with a reflective profile are prone to breaching, which lowers the elevation of the island to the watertable and leaves a heavy shell lag. This creates a supply-limited environment and slows the rate of post-hurricane dune recovery compared to sections of the island with a dissipative profile.

Donald Houston, Dr, Dundee University Library. Email: d.s.houston@dundee.ac.uk; *Reconceptualising the Spatial Mismatch Hypothesis*

The spatial mismatch hypothesis postulates that employment deconcentration within US metropolitan areas goes some way toward explaining higher unemployment and lower wages among ethnic minority groups, since these groups are more likely to reside in central city areas. However, little consensus has emerged on the importance of spatial mismatch in explaining disadvantage in the labor market. This paper argues that this conflicting evidence is the result of the variety of methods used to test the spatial mismatch hypothesis. More pertinently, attention is drawn to a number of hitherto uncovered flaws with some of these methods. Furthermore, it is argued that these flaws introduce systematic biases against finding evidence in support of the spatial mismatch hypothesis. In light of this, favored methods for future research are highlighted. Drawing on evidence from British conurbations that display similar spatial inequalities to US metropolitan areas despite much smaller ethnic minority populations, it is argued that race does not lie at the heart of the spatial mismatch problem. Three areas where the spatial mismatch hypothesis should be re-conceptualized are identified: first, its emphasis should be on spatial not racial

inequalities; second, it needs to differentiate between residential immobility and residential segregation which are in fact quite different; third, it needs to recognize that the extent and the effect of spatial mismatch are distinct and should be measured separately.

Serin D. Houston, Syracuse University. Email: sdhousto@maxwell.syr.edu; *The Absence and Presence of Race: Color-consciousness in Tacoma, WA*

Mixed-race partners are often called the "canaries" or barometers of race relations in the United States (cf. Chito Childs, 2005) because of the presumed emphasis on race in mixed households. If mixed-race couples possess a deepened awareness of race or signal the status of race relations in society then examining their perceptions and experiences is both useful and necessary. With this in mind, this paper analyzes the ways that mixed-race households in Tacoma, Washington, a city where the percentage of mixed-race marriages exceeds twice the national average, both amplify and silence the buzz of race within their lives. Specifically, I explore the ubiquitous color-consciousness evident in the interviews to demonstrate that the visibility and presence of race is context-specific and relational. In other words, conversations centered race when a clearly defined 'other' defied or compounded the racial order. For instance, spaces of whiteness and blackness, perceived opportunities for non-whites, and the parenting of multiracial children exemplified how particular relationships and contexts made race intensely visible. In contrast to these more personal and intimate experiences, race was noticeably absent from the conversations when interviewees spoke of love, equality, and normativity. Juxtaposing the simultaneous absence and presence, and related visibility and invisibility, of race enables me to unpack how mixed-race households in Tacoma, Washington negotiate race within a deeply racialized society.

Keywords: social geography, races-mixed, household, color-consciousness, Washington - Tacoma

Alice J. Hovorka, Associate Professor, University Of Guelph. Email: ahovorka@uoguelph.ca; Peter A. Wolf, University of Guelph. Email: pwolf@uoguelph.ca; *Active Field / Passive Classroom? Reconceptualizing Geography's Pedagogical Spaces*

Much geographical scholarship on teaching and learning details the intellectual, technical, and personal benefits stemming from residential field course offerings. With the sustainability of these offerings in question given logistical and political issues, there is greater demand for changes in field course delivery and structure. This paper seeks to expand the range of pedagogical tools, contexts, and ways in which geographical field experience can take place. It does so by reconceptualizing 'the field' based on the idea of 'everyday life' as a meaningful entry point within a classroom context, and reflexivity as a vehicle for student learning within that field. An empirical investigation of student learning experiences explores the possibility of recreating the benefits of residential field course offerings in a classroom-based field course.

David John Howard, Dr, University of Edinburgh. Email: david.howard@ed.ac.uk; Jan Penrose, Dr, University of Edinburgh. Email: jmp@geo.ed.ac.uk; *'Multiple Streams of Humanity Flowing Together in Harmony': Mela Festivals and Scottish Identity*

This paper looks through the rhetoric of multiculturalism and anti-racism to explore just what policies that are framed around these concepts might mean in practice for Scottish society and its composite groups. Based on a series of surveys and interviews with organisers and attendees at two main urban festivals in Scotland, the research explores two popular understandings of multiculturalism and their relevance to the aims of these events. The first invites minorities to become as Scottish as possible, to integrate into an established culture and identity, while the second invites minorities to integrate their traditions and experiences into an evolving Scottish identity. These understandings of multiculturalism and the processes by which they are advanced and contested are examined through the cultural events of the annual South Asian Mela festivals in Edinburgh and Glasgow. The increasing popularity of these festivals; their proposed integration with wider celebrations of the 'new Scotland' and the physical location of each event form important components for analysis.

Dustin Howard, Center for Spatial Analysis. University of Oklahoma. Email: dustin.howard@ou.edu; *Spatio-Temporal Analysis of the Foreign Military Sales in the Middle East (FY92-FY01)*

In 1995, the Clinton Administration laid out five major guidelines for the Foreign Military Sales program. These included the following elements: Assist and promote interoperability with allies and friends; maintain technological advantage; promote regional stability; promote peaceful conflict resolution, arms

control, human rights, democratization, and other U.S. foreign policy objectives; and safeguard the health of the U.S. defense industry. The purpose of this work is to investigate the motivations for Foreign Military Sales between the United States and Middle Eastern and North African states. This research uses GIS to apply spatial analysis techniques to the Foreign Military Sales agreements from Fiscal Year 1992 to Fiscal Year 2001. The temporal pattern revealed from the results of this spatial analysis highlights the motivations of alliance building to promote regional stability as the major factor for Foreign Military Sales in the Middle East and North Africa.

Thomas F. Howard, Associate Professor, Armstrong Atlantic State University. Email: howardth@mail.armstrong.edu; *Windmills or Mountain Top Removal: Futures for the Cumberland Mountains*

The Tennessee Valley Authority has embarked on wind power generation by constructing 18 wind turbines on Windrock Mountain in Anderson County, TN. This is the largest wind project in the southeast, and part of TVA's renewable energy development program. Yet the agency also plans to increase its consumption of coal from the Cumberland Mountains, which means a new lease on life for strip mining and threatens to introduce mountain top removal for the first time to this part of the Appalachians. The contradictions in TVA's position are even more stark: large tracts of land near the wind power site are in conflicting dual ownership, with surface rights held by the Tennessee Wildlife Resource Agency while mineral rights are owned by TVA or coal companies that sell to TVA. This raises interesting questions about long-range planning for the optimal use of this neglected but highly scenic part of the southern mountains.

Keywords: Tennessee, strip mining, wind power, conservation, land use planning, TVA

Jeff Howarth, UC Santa Barbara. Email: jthinsb@yahoo.com; *Processes Of Land Use Change From Historical Texts*

This paper discusses a methodology to study land use change from natural language texts and presents results from a case study application. Land use is conceptualized as a collection of spaces adapted by human activity to serve one or more goals. Spatial changes in land use are linked to functional changes of either the elements associated with activities or the goals of the activities. The former may constrain (though deterioration) or facilitate (through innovation) the purpose of an adapted space. The latter reflects the loss of purpose (obsolescence) or the appearance of a new purpose (succession). These aspects of land use change are identified through textual analysis of a historical collection of letters written by the managers of a ranching and agricultural operation on Santa Cruz Island, California between 1916-1920. Corpus analysis identifies recurring patterns of activities frequently associated with place names and geographic objects, in addition to changes in these activities, elements, and places over time. Further analysis identifies relationships between functional changes at different levels of spatial granularity. This includes the innovation of barbed wire following the deterioration of pastures, and the succession of vineyards to hayfields following the disappearance of wine-making activities and the obsolescence of vineyards. This study shows how historical descriptions of everyday activities can complement more traditional evidence of land transformations by revealing functional processes of geographic change.

Nicolas Howe, University of California - Los Angeles. Email: nhowe@ucla.edu; *Between heritage and hate speech: The cultural pragmatics of displaying the Decalogue*

Since the early 1990s, cities and towns across the United States have been embroiled in a series of increasingly contentious lawsuits over displays of the Ten Commandments on government land. Part of a broader wave of litigation over religious iconography in public places, these cases have come to represent a moral confrontation between conservative Christians and their liberal opponents over the regulation of religious speech. In court, one side argues that the displays merely acknowledge the nation's "Judeo-Christian heritage," the other that they stigmatize non-Christians and thus exclude them from public life. On both sides, efforts to explain how places "speak" and more important, to describe the psychological effects of such speech have focused on the affective modalities of "observation." How, courts ask, should a "reasonable observer" respond to religious symbols in the public square? And what, if anything, is the political significance of his or her "feelings"? This paper argues that this legal inquiry is best understood as a form of agonistic cultural performance, the outcome of which depends on the actors' skill at dramatizing social memory.

Peter D Howe, Arizona State University. Email: peterhowe12@gmail.com; *The New Water Brokers? Knowledge production about the Gila River Indian Community and the Arizona Water Rights Settlement Act*

The 2004 Arizona Water Settlements Act could represent a massive shift in the fortunes of Arizona's Gila River Indian Community. By granting the community rights to nearly half the water from the Central Arizona Project, enough for a city of nearly three million people, the Act makes it a powerful player in the political landscape of the rapidly growing Phoenix area, a region where control of water rights means the difference between prosperity and stagnation. Through analyses of public discourse, this study examines the social construction of the Act, and more broadly, the water dynamic between the community and other political actors (the state of Arizona, cities, and the federal government). Using elements of quantitative content analysis and qualitative discourse analysis, I identify the characteristics and scale of discourses by popular media and political actors up to and following the Settlements Act.

Keywords: Arizona, water rights, discourse analysis

Sara J Howe, BA Environmental Geography, University of Utah, University of Utah. Email: abioticgrl@aol.com; *Coal Power vs. Geothermalism in West-Central Utah*

This study is a geographic inquiry concerning the development and construction of a 270-megawatt steam turbine coal burning power plant in Sevier County Utah. The study area encompasses Sevier County, located in the West-Central Utah. The Marysvale Volcanic Field and geothermal activity are also located within the study area. Social, political and economic reasons for the development of traditional fossil fuel based utilities over that of geothermal resources are examined within this study, utilizing primary and secondary literary sources and a random population survey of residents. Current development of coal generated electric utilities for the projected growth within Nevada and California fuel local community debate but endorsement for an environmentally impactful industry. Political and market pressures compelling a move away from petroleum based power production. The true environmental impacts of the NevCo coal based power plant in rural central Utah, will be felt by residents of Florida, Vermont, Maine, the Carolinas and other parts of New England through mercury contamination, through the poorly understood process of Methylation, the conversion of elemental mercury to the toxic methyl mercury. The conditions for methylation exist in only certain parts of America. Resource management and conservation principles such as inter-generational equity are integrated into study conclusions. Physical and population geographic criteria such as area carrying capacity and current transportation infrastructure favor the facilities location and raw industrial inputs such as coal. Water resources are limited in the area and may present a challenge to plant development and operation.

Philip Howell, Dr, University of Cambridge. Email: philip.howell@geog.cam.ac.uk; *Race, Suicide and Colonial Governmentality: British Colonialism and the Social Regulation of Self Harm*

The phenomenon of suicide has a long history in the understanding of modern society. It is an equally critical problem in political and ethical theory - particularly for the analysis of liberalism. This paper attempts to extend these considerations to the historical geographical analysis of the British colonies, placing the thematic of race at its heart. Some useful pointers exist in the examination of liberal rule in terms of biopolitics and governmentality, which rightly recover the regulation of suicide as a practice of freedom. However, the extension of this thinking to colonial governmentality is at a very preliminary stage. Some recent work suggests that the colonial governmentalisation of suicide ? such as its incorporation into social statistics ? acted simply as a bulwark of colonial regimes. This is too precipitate however: the encounter with alternative cultural practices of suicide regulation, the incommensurate treatment of European colonial and indigenous suicides, the incorporation of racial and climatic theories, all indicate modes of regulation that acted, in and through the discourse of race, to differentiate colonial subjects. This paper suggests some future avenues of research, and concludes with a nod to the figure of the suicide bomber as an icon of regimes of insecurity in the colonial present.

Michael Hoyler, Loughborough University. Email: M.Hoyler@lboro.ac.uk; Tim Freytag, University of Heidelberg. Email: ; Christoph Mager, University of Heidelberg. Email: ; *Connecting Rhine-Main: The production of multi-scalar polycentricities through knowledge-intensive business services*

In many of the current policy discourses on cities in globalization, city-regions rather than individual cities are being identified as the key arenas for the generation of economic growth. New concepts like 'global city-region' or 'mega-city region' suggest a complex interrelationship between the role of major city-regions as nodes in the global economy and their polycentric, multi-clustered spatial form. However, most of the literature on polycentric urban regions has so far focused on the analysis of internal regional structures rather than external interregional and transnational linkages. At the same time, a growing body of research has analysed the external relations of cities to sketch out the contours of a 'world city network', but has focused on the globally most important core cities without explicitly addressing their city-regional context. This paper aims to bring the two perspectives together. Drawing on an interlocking network model, initially specified to investigate inter-city linkages on a global scale, the paper presents a first analysis of multi-scalar inter-city connectivities within a specific city-regional and national context. At the centre of the analysis is the question how knowledge-intensive business service firms in Rhine-Main connect this morphologically and functionally multi-nodal metropolitan region to other cities in Germany and beyond. The result is a detailed mapping of the external business connectivities of a major European city-region.

Brian J. Hracs, MA, University of Toronto. Email: brian.hracs@utoronto.ca; Working in the Creative Economy: the spatial dynamics of employment risk for musicians in Toronto

Despite the prevalence of literature concerning creativity, Florida's 'creative class' and culturally driven strategies for economic development, most of the research has been conducted at the national or city-region scale. Moreover, there is a lack of research which studies the nature of employment within specific cultural industries. Several critics, including Markusen and King (2003) and Lloyd (2006), have highlighted the need to examine the micro-geographies and employment experiences of the individuals who constitute the creative class. This paper addresses these gaps by providing an analysis of the working lives of musicians in Toronto. It examines the employment risks faced by musicians, the reasons why musicians endure immense personal and economic hardships to express their creativity and the coping strategies musicians employ to mediate risks. This paper also explores the ways in which neighborhood spaces, including music stores, coffee shops and educational institutions, are used by musicians as sites of networking and creative inspiration. Finally, this paper offers a gendered perspective on employment within the creative field as it demonstrates how female musicians experience employment and risk differently from their male counterparts and how gender influences the effectiveness of coping strategies such as networking and accessibility to public spaces.

Li Ming Hsia, Taitung University. Email: att50@nttu.edu.tw; Wang Chun Han, Institute of Regional Policy and Development, Taitung University. Email: ; Ethan Yorgason, Brigham Young University Hawaii. Email: yorgasoe@byuh.edu; Out of Globalizing Taipei: Cultural Imagination, Local Identity, and the Case of The Festival of Austronesian Cultures in Taitung

The processes and altered relationships generally known as globalization do not present the same challenges to every local place. The geographical differentiation of globalization has become almost a truism within geography, yet this differentiation creates the need to understand differences across localities. Many "marginal" places have attempted to create a special festival, one that can shape the local cultural imagination, bolster or contract local identification, and market the local tourist industry. We explore this strategy toward globalization through Eastern Taiwan's Festival of Austronesian Cultures, held annually in Taitung. Hopes surrounding this festival have been important in Eastern Taiwan, as it represents a potential boost to region's economic and cultural development, and as it is seen by some as a means to value and empower Taiwan's aboriginal cultures. Based on detailed study, we assess the festival's successes and challenges in meeting these aims, concluding, among other things, that it has been more successful at raising the visibility of Eastern Taiwan and in promoting a sense of local identity than it has been at either empowering Taiwan's indigenous peoples or in fostering regional economic development. The festival was supported by the government in order to promote the image of "maritime Taiwan," an image that highlights Taiwan as the possible place of origin of the Austronesian people. Yet in the process, Taiwan's indigenous cultures were stereotyped and commercialized, and the planning and arrangements for the festival lacked participation of indigenous peoples. Taiwan's indigenous peoples operated more as objects than

subjects.

You-tien Hsing, Ph.D, Department of Geography, University Of California at Berkeley. Email: yhsing@berkeley.edu; Possibility of Civic Space: Urban Protests in Inner City Beijing

State land tenure, an assumed defining feature of state socialism, was, in fact, never formally legalized during the Mao era. The stipulation that "all urban land belongs to the state" did not enter China's Constitution until 1982 at the outset of the country's market reforms. With the establishment of the land-lease market in 1988, the state's land tenure was further reinforced through its monopolistic authority over land acquisition and land circulation. The combination of state land tenure and a state-controlled land market gave rise to a land-dependent and local state-centered mode of accumulation in late socialist Chinese cities. The land-dependent local accumulation project has generated two legitimization dilemmas for urban governments. The first dilemma stems from the ambiguity of state land tenure amid China's market transition. The other arises through the process of land acquisition, one defined by massive destruction and the absence of social protection at the moment of destruction. The twin legitimization dilemmas have generated highly contentious landed politics in inner city areas. In this paper I will delineate two types of urban protests found in inner city Beijing, from the late 1990s to date, and compare their formation, strategies, and possible impact. I argue that despite the dominant view that social organization in China today is often programmed by the state, one still detects society's creative energy, and the possibility of a civic space created from within, but not necessarily constraint by the state.

Jinn-yuh Hsu, National Taiwan University. Email: jinnyuh@ntu.edu.tw; Lexin Lin, . Email: ; The Contradictory Dynamics of Flexibility in the Transformation of Rural Industrialization in the Taiwanese Hosiery Industrial District

Small size and flexibility have been regarded as the significant features of the post-war economic miracle in Taiwan. Within the miracle, a wide array of industrial entities of various sizes, including household-workshop, single assemble line, and factory, concentrated in the rural areas after the 1970s. Geographical concentration saved the industrial firms tremendous costs in delivery and transactions. It also enhanced the diffusion of business information and even technical skill by the work of local labor market. In other words, flexibility, both quantitative and functional, facilitated the economies of scales and scopes for the industrial networks. However, industrial restructuring transformed the dynamics dramatically in the late-1980s. While a number of industrial entities mobilized functional flexibility to reposition itself in advantageous way to upgrade technically in the industrial networks, others were locked in quantity plasticity and led to the impasse of self-exploitation. Taking the hosiery industrial network in Shetou district, Taiwan, this paper will examine the divergent strategies of flexibility in shaping the social reproduction of different bodies and household, the divergent social embeddedness of the industrial networks, the contradictory developmental trajectories of each industrial entities, and finally the multiscale spatial ordering and configuration of the industrial concentration in the restructuring of rural industrialization.

Keywords: flexibility, rural industrialization, industrial district, hosiery industry, Taiwan

Jungchung Hsu. Email: richard@tmue.edu.tw; The Emigration Considerations and Residential Choices of Taiwanese Immigrants in Canada

The purpose of this research is to explore the location decisions of Canadian Taiwanese immigrants under the factors of "needs" and "capital" considerations. A variety of research methods has been used in this study. Following an extensive review of 2001 Canadian census and library materials, papers and previous studies, a survey of 264 households in Vancouver and Toronto, a Delphi technique method that includes 6 professionals and a nominal group meeting of 12 Taiwanese who live in Vancouver and Toronto has been used. The study is supplemented by in-depth interviews of thirty Taiwanese to investigate the details of the location decision process of settlement in Vancouver and Toronto. The main reasons for choosing Vancouver was good climate, living environment and Vancouver, Burnaby and Richmond areas were preferred. Those who chose Toronto went for favorable business and educational opportunities, family and relatives and Toronto, Mississauga, Markham and Richmond Hill areas were preferred. In general, choice of residence was based mainly on their "needs" which include environmental and housing conditions and their "capital" which include social, and economic considerations, as well as family attitudes. Over time, the reasons for residential choice have changed, reflecting individual preferences and experiences, life cycles, and fluctuating housing prices. Some comparisons with the writer's former studies of Australian

Taiwanese immigrants have also been made in this research. Keywords: Canada, Taiwanese immigrants, residential choice, location decision

Keywords: Canada, Taiwanese immigrants, residential choice, location decision

Tzu-Yen Hsu, Email: myhanoitower@gmail.com; Chen Che-Ming, . Email: jeremy@ntnu.edu.tw; A Mobile Learning System for High School Fieldwork

Fieldwork is always mentioned as an important means in geographical education. However, there are obstacles to high school fieldwork execution, such as coherent time management, exceeded student amount, lack of assistance manpower and many others. This study develops a mobile learning system trying to improve the above difficulties using two main supporting tools. One is a virtual fieldtrip website functioned as a platform to prepare students for fieldwork, share field logs, and display student works. The other is a PDA (Personal Digital Assistant) program to guide students throughout fieldwork without teachers' presence. To make students become active learners, the overall system is designed with the inquiry-guided pedagogy. Students with the mobile device can answer questions and collect data according to location-based message prompts. We utilized local irrigation channel issues as the fieldwork contents to implement the mobile learning system. Evaluation methods including pretest-posttest comparison, questionnaire investigation, interviews, learning assessment, and participant observation are used to know if this pedagogical approach is suitable and how the system works. We gathered initial results based on 6 teachers and 8 students from a local high school. They agreed that this kind of mobile learning fieldwork is more interesting than the traditional lecture-based fieldwork. They found themselves like treasure hunters with much fun during the fieldtrip.

Email: JJSmith@po-box.esu.edu; Study on Environmental Controlling Factors for Spread of Invasive Riparian Plants in the Paradise Watershed, PA

Paradise Watershed, a small northeastern Pennsylvania system with an area of 44.5 square miles, is experiencing the spread of invasive plants in the river corridor. This change in the riparian vegetation is displacing indigenous species and has the potential to impair biodiversity. For effective management of the invasive plants, knowledge about the general patterns and controlling factors of spread in the riparian corridor is needed. Using GPS and hand-held GIS units, an inventory of invasive species, including Japanese knotweed (*Polygonum cuspidatum*), stilt grass (*Microstegium vimineum*), Japanese barberry (*Berberis thunbergii*) and multiflora rose (*Rosa multiflora*), has been built through field investigation. Major environmental factors for the spread of invasive plants have been identified with the Geostatistical Analyst extension in ARC GIS and SPSS software. A statistical relationship between the distribution of invasive plants and the controlling factors has been established to examine the relative contribution of each factor. The preliminary results show that the distance to roads, flood plain, light, temperature, soil nutrients, bridge existences and high stream flow are major controlling factors for the hot spots of invasive plants in the river corridors. These factors account for about 75% of the distribution and abundance pattern in invasive riparian plants.

Yan Hu, Zhongshan University. Email: eeshy@zsu.edu.cn; The New Urban District Development in Guangzhou, China since 1990s: A Governance Perspective

The development of new urban districts in Guangzhou since 1990s is surprising. Some of these large projects include the development of the Pearl River New Town, college town, Nansha new town. This study applies the urban governance concept to research on this phenomenon, with a view to understand the dynamics of the local government, market and the civil society during the development process. It first reviews urban governance theories in western countries and the general development of new urban areas in Chinese cities since 1990s and attempts to build an applicable analytical framework. Then some cases are examined with particular reference to Guangzhou. The study concludes that the local government is not always the premier actor during the development process of new urban areas. Market has played an influential role and the civil society should not be ignored anymore. Rational decision-making on the development of new urban districts depends on better urban governance.

Zhiyong Hu, University of West Florida. Email: zhu@uwf.edu; Wavelet-transform-based remotely sensed image fusion for landscape change detection

Recent years have seen developments in fusion theory and methodology using aerial and space remote sensing data. This paper demonstrates a relatively new technique based on wavelet transformation for fusion of multi-spectral and high spatial resolution images. The objective of image fusion for this study is to achieve higher accuracy of landscape change detection. Shenyang, the fourth largest city in China, is selected as the study area. The city, traditionally a heavy industry center of China, now is on its way to a modern economic center of China, has been experiencing a very rapid urban landscape change since mid of 1990s. First, landscape change is detected using two leaf-on Landsat TM image scenes obtained in 2001 and 2005 using pixel by pixel post-classification comparison method. The change detection achieves an accuracy of only 58.6% due to low accuracies of thematic classification and propagation of errors in a multiplicative manner. Then high spatial resolution IKONOS data acquired on the same year and season are fused with TM imagery using wavelet transformation. Image fusion creates an image incorporating both higher spatial and higher spectral information for each year. The same change detection procedure is applied to the images generated from fusion. The accuracy of change detection increases to 83.0%. Wavelet transformation based image fusion is an effective way to improve land use change detection.

Keywords: image fusion, wavelet, change detection, remote sensing

Zhiyong Hu, Institute of Geographical Sciences and Natural Resources Research, CAS. Email: hzhyong@hkusua.hku.hk; Understanding the Changing Geography of China's State-owned Enterprises: A "New Regionalism" Perspective

The institutional mechanism of transitional socialist economies in general and the growth dynamics of China's state-owned enterprises in particular has been a constant source of stimulation for scholarly enquiry. Competing interpretations from different emphases and theoretical perspectives have been formulated to explain the dramatic change of SOEs' economic performance from pre-reform era to post-reform era. Scholarly debates and controversies have long existed concerning whether the persistence intervention of the state or the gradual expansion of the market is the causal force shaping the changing performance of China's SOEs. Drawing insights from the recently resurgent theories of "new regionalism" in mainstream economic geography, this study offers an alternative perspective to highlight the active role played by region as nexus of traded and untraded interdependencies in affecting the growth and performance of China's SOEs. Based on the analysis of statistical data from the third industrial census, this study finds that SOEs in the regional economies characterized by dense industrial agglomeration, diversified local labor market and dense corporate networks with non-state enterprises are more capable of benefiting from regional external economies and display higher productive efficiency than their counterparts elsewhere. The investigation of SOEs in the Chinese context challenges the perceived notion of region as the passive outcome of political economic forces in China studies and calls for a place-sensitive and path-dependent treatment of the growth dynamics of SOEs. It provides interesting ground for evaluating the validity and applicability of western-based theoretical discourse of new regionalism.

Email: ; Satellite Monitoring of Forest Dynamics - Case Studies in Southeastern United States

Forest disturbance and recovery processes are significant forces modulating atmospheric carbon balance. Quantifying the carbon fluxes due to such processes requires forest changes be assessed with appropriate spatial and temporal details. The Landsat record provides a unique data source for monitoring forest changes over the last 30+ years. Here we present case studies of forest changes using this record at sample locations selected across southeastern U.S. where some of the most dynamic forests in North America exist. For each location, dense time series (quasi-2-year) of Landsat images were used to reconstruct forest disturbance and recovery history using an automatic change detection algorithm. The resultant change products were intensively validated, and were used to evaluate the spatial and temporal patterns of forest disturbance and recovery processes. One of the challenges to satellite monitoring of forest changes is that for many areas, disturbance signals recorded in satellite images can decay quickly as a disturbed forest stand grows back. As a result, some disturbances may become undetectable when available satellite observations are 10 years apart or sparser, which likely will be the case for historical change studies in many regions of the globe. Therefore, it is necessary to quantify the omission errors in forest change

products derived using inadequate satellite observations in order to understand the impact of such errors on applications using those products. We will use the available dense Landsat observations to quantify the omission errors of detected forest changes as satellite images available for the change analysis become progressively sparser.

Ruihong Huang, Northern Arizona University. Email: Ruihong.Huang@nau.edu; Christina B Kennedy, Northern Arizona University. Email: Tina.Kennedy@nau.edu; *Discovering the Geography of Land Values by Hidden Markov Models*

Housing price is affected by a spectrum of locational and structural factors. Attempts to identify the impacts of location on housing price are found in the literature of neoclassic economic studies and traditional hedonic price models. However, there are controversies in the measurement and effects of locational variables and results are sometimes contradictory. This paper introduces the Hidden Markov Model (HMM), a doubly embedded stochastic data mining approach, with applications to the discovery of impacts of geographic space on housing prices. In this research, space is assumed to be a hidden state that underlies housing prices. A hidden spatial state controls the great trend of house prices of a neighborhood while allowing the price of individual houses to vary by structural externalities. Hidden spatial states can be identified from signals in home sale data by hidden Markov models, and the magnitudes of impacts of the spatial states can be derived from classical hedonic models. A case study is conducted in the City of Milwaukee, Wisconsin, in which four effective hidden spatial states are discovered, and the hidden states confirm the social, economic and physical structure of the urban space. The paper demonstrates that hidden Markov model is an appropriate approach to the study of location impacts on housing price since it takes location as an integrated spatial factor instead of a variety of controversial externalities. The paper also indicates that hidden Markov model is an effective spatial data mining approach since it captures both spatial homogeneity and heterogeneity.

Keywords: Hidden Markov Model, data mining, GIS, land value, housing price

Shirlena Huang, PhD, Dept of Geography, National University of Singapore. Email: geoslena@nus.edu.sg; Brenda S.A. Yeoh, PhD, Dept of Geography, National University of Singapore. Email: geosya@nus.edu.sg; *Negotiating terrains of transnational education: China's 'study mothers' and their children in Singapore*

Some 2 million international students are currently pursuing higher education outside their home countries. A large proportion of these transnational migratory flows for education comprise students from Asia, where an increasing number families are sending their children overseas to "western" or more developed Asian countries as a strategic means of enhancing the family's overall well-being and status in the longer term. Our paper examines how transnational education is constructed as social capital, and the micropolitics and social practices of transnational student migratory flows as they are played out at the level of the family. Our focus on the family takes its cue from feminist geographers who have argued that in order to enlarge our understanding of contemporary globalization processes, including migratory flows, scholarship needs to appreciate the processes of social reproduction and consumption (and not just economic production) that take place at this macro-scale. Empirically, our paper focuses on the case of 'study mothers' from the People's Republic of China and the children they accompany to study in Singapore, an aspiring global education hub. It investigates the difficult terrains that have to be negotiated - with left-behind families, unscrupulous agents and a xenophobic host society? by the 'study mothers' and their children in their transnational journeys to achieve their goals.

Email: twizsy@163.com; *Spatial Structures of Pedestrian-only Shopping Streets in China - Case Studies of Wangfujing Street in Beijing and Nanjing Street in Shanghai*

In contrast to the United States, pedestrian-only shopping streets were not introduced to China until the late 1990s. Since then, pedestrian-only shopping streets have gained popularity and experienced a considerable growth. With micro-scale data collected from field surveys of the Wangfujing Street in Beijing and the Nanjing Street in Shanghai, this study examines the business locations and their business characteristics to try to identify an ideal spatial clustering pattern of compatible businesses. Specifically, this study defines three types of spatial relation to help perform mathematic measurements and identify their spatial patterns. These three spatial relations are: (1) symmetry that evaluates the

extent of competition, (2) interrelationship that analyzes the characteristics of a neighborhood, and (3) concentration that derives the business concentration level along a street segment. This paper presents the benefits and limitations of applying these three spatial relations to the case study areas of Wangfujing Street and Nanjing Street. These spatial relations facilitate analyses of business locations and their spatial structures along a pedestrian-only shopping street; however, they fail to consider economic factors and customer behavioral factors that also influence business locations.

Keywords: pedestrian-only shopping streets, micro-location, spatial distribution, symmetry, interrelation, concentration, China

Youqin Huang, SUNY - Albany. Email: yhuang@albany.edu; Leiwen Jiang, Brown University. Email: Leiwen_Jiang@brown.edu; *Housing Inequality in Transitional Beijing, China*

China, formerly one of the most egalitarian societies in the world, is becoming one of the most unequal societies in the world, and housing inequality is one of the most significant and visible aspects of social inequality. Wealthy "gated communities" with multi-million dollar villas and dilapidated "migrant enclaves" with crowded shacks are now emerging side-by-side in Chinese cities. In addition to providing a conceptual framework of understanding housing inequality in transitional China, this paper studies the patterns and dynamics of housing inequality in Beijing, using the 1995 1% Population Survey and the 2000 Census data. We argue that there is significant and increasing housing inequality in Beijing. Both socialist institutions such as the persisting hukou system and market mechanisms contribute to housing inequality, and the latter become more important in 2000 than in 1995 as a result of the market reform.

Email: kliu1@lsu.edu; *Records of Hurricane Ivan and Katrina in the sediment from Weeks Bay, Alabama*

Weeks Bay is a small bay near Gulf Shore which is frequently hit by hurricanes. Major Hurricane Ivan and Katrina swept this region separately in 2004 and 2005. Unquestionably they both left some markers in the area. In order to find hurricane records in this area, tens of cores were taken in marshes and swamp forest around Weeks Bay. Loss-on-ignition is then used to analyze the stratigraphy of the sediment taken. Clear sand layers which can be found in the cores likely represent Ivan and Katrina. In addition, diatom, phytolith and pollen analysis are also applied in detecting the microfossils records caused by abrupt marine sedimentation and interruption. The results also correlate the sand layer deposits very well. Hence, Hurricane Ivan and Katrina, the recent modern hurricanes, can be presented by the overwash deposits. In addition, some paleohurricane records are found in the sediment. It is very valuable to calibrate the paleohurricane reconstruction by analysis of modern hurricane detected by overwash deposit preserved in the sediments.

Email: lbian@buffalo.edu; *Formalizing and Integrating Tourist Attraction Categorizations Using Formal Concept Analysis*

In order to develop tour recommendation systems on the Semantic Web, it is necessary to integrate heterogeneous online tourism information. This paper presents a method of using a data analysis technique called formal concept analysis (FCA) to formalize and integrate different tourist attraction categorizations. The method is guided by attractions and their associated categories in different categorizations. If two categories share a common set of attractions, these two categories are considered equivalent. Attraction categorizations from 10 out of 100 tourism websites for attractions in New York City are selected due to their comprehension and sophistication. 70 tourism attractions in New York City are selected based on their popularity. By using FCA, a concept lattice is produced to identify groupings of attractions with shared categories. The result shows that the lattice can offer a structural description of integrated attraction categories. It can also capture possible hierarchical relationships between attraction categories that are inherent in tourism domain. The generated concept lattice can be directly used for the integration of different online tourism information for tour recommendations.

Phil Hubbard, Loughborough University. Email: P.J.Hubbard@lboro.ac.uk; *Regulating the Naked Body: law, licensing and the spaces of adult entertainment*

In many nations, nudity has been equated with the sexual and erotic, with lewd conduct and indecent exposure laws prohibiting display of the naked or semi-naked body in public. However, exceptions are sometimes made if this nudity is considered justifiable in the name of art/performance or is licensed as a form of 'adult entertainment'. As such, and noting the increased centrality of sites of lap-dancing and striptease in contemporary Western cities, this paper explores key themes in the regulation of adult businesses, suggesting they are subject to tactics of spatial governmentality intended to distinguish acceptable forms of bodily display from performances likely to corrupt and deprave. Noting the difficulties that regulators have when confronted with the naked body, in this paper I accordingly focus on the recent attempts of the state and law to control nudity within licensed premises in Edinburgh (Scotland). In so doing, I explore how regulators have sought to distinguish spaces of sexual commerce from spaces of art/performance, and suggest that 'common sense' legal judgements about the appropriateness of naked bodies in particular spaces are replete with assumptions about venues and their clientele.

Franz Huber, University of Cambridge. Email: fh259@cam.ac.uk; *Going Beyond the 'Thematic Turn' of Relationality? The Scope of Concepts and Methods of Social Network Analysis*

Within recent developments in relational economic geography the significance of (personal and firm) 'networks' for regional development and knowledge dissemination has been emphasized. However, the inflationary use of the notion is often based on rather metaphorical, at worst fuzzy, meanings. Within economic geography there seem to be two main problems which severely limit further progress in network research: firstly, a lack of rigorous theoretical and conceptual frameworks on networks, and secondly, a lack of appropriate relational methods. This paper aims to make first steps to tackle these problems by reviewing and critically evaluating social network analysis. This approach attempts to theoretically conceptualize social networks, and it provides sophisticated quantitative methods. However, I discuss difficulties related with social network analysis - especially the question of meaningful interpretations and causal reasoning -, and I suggest ways to deal with them. I argue that quantitative network measures as such do not have any real explanatory power. Only an understanding of practices and network activities of actors and a comprehension of the dialectic interrelationship between actors and network structures enable adequate interpretations of quantitative network measures and valid explanations. I argue that social network analysis, carefully and critically applied, provides conceptual and methodical perspectives to tackle some of the shortcomings of current research on networks. However, I also point out limitations of quantitative network research and demand for further research.

The San Joaquin Valley of California is a highly fragmented agricultural landscape. However, it is rapidly urbanizing; it is projected to effectively double in population by 2050. A Governor's Executive Order in 2005 created the California Partnership for the San Joaquin Valley whose task is to provide for the creation of a sustainable landscape while accommodating the addition of 4 million new residents to this eight county area. We developed a potential conservation network of high value ecological areas and zones of high connectivity between them. To accomplish this we converted identified conservation priorities to GIS layers which were combined to locate those areas that would help achieve multiple conservation goals. Locations with higher occurrences of these features were designated High Value Conservation Opportunities. A connectivity cost surface was assembled through the combining and weighting of several variables: existing vegetation, urban density, natural areas density, road density, waterway density, and current land management status. Least cost corridors linking the Opportunity areas were identified using this cost surface. Finally the conservation network was overlaid with the results from 7 urban growth scenarios for the planning area. This enabled comparison of effects on future conservation potential of the various planning models for the region. The scenario showing the least overall impact on the network was the Compact

Growth model. However, the various measurements of impact pointed to different scenarios as highest impact. These results can then be used to modify the scenarios in order to ameliorate the effects on conservation value.

Thomas C. Hubka, Univ of Wisconsin- Milwaukee. Email: thubka@uwm.edu; *Contested Geographies of the Shtetl: The Small Polish/Jewish Town, 1700-*

This paper analyzes the spatial and cultural organization of small Jewish towns or shtetls in 17th-20th century Poland. Jewish communities existed in Poland for over eight hundred years before their almost total destruction by the Nazis during World War II. These communities developed simultaneous traditions of separation from and integration with their surrounding Eastern European Christian cultures. Although highly integrated with the economic life of their multi-cultural towns, these Jewish communities were simultaneously separated by their internal social and religious traditions which were further reinforced by restrictions to the Jewish community and the threat of persecutions. One shtetl, Gwozdziec in Ukraine, will be analyzed to represent hundreds of towns with similar patterns of geographic and cultural development. This paper outlines four major factors which structured the cultural and spatial organization of the small Jewish town: 1) An extensive commercial and artisan participation in the local economy coexisting alongside exclusive social and religious traditions, 2) A dense, non-geometric spatial layout of the Jewish districts based on patterns of incremental growth which contrasted sharply with western, geometric conceptions of Eastern European town planning, 3) Jewish religious and social traditions influencing many aspects of daily life which contrasted with the various Christian traditions of living and worship, and, 4) Intensely cosmopolitan patterns of commerce, education, and communications which contrasted with the small town, regional economies and social organization of the surrounding Christian cultures. This research is based on: *Resplendent Synagogue: Architecture and Worship in an 18th Century Polish Community*, Brandeis University Press, 2003.

Andrew James Huddy, University of Connecticut. Email: andrew.huddy@uconn.edu; *Farming Alone - An Examination of Social Capital in the Rural-Urban Fringe*

AAG Abstract 2007 Farming Alone - An Examination of Social Capital in the Rural-Urban Fringe Andrew J. Huddy The University of Connecticut Department of Geography Storrs, CT Abstract General concern in society about the loss of productive farmland to development associated with expansion of urban and residential areas is typified by growing heterogeneity of land use within the rural/urban fringe. Efforts to understand this process have incorporated policy, socioeconomics and environmental factors to study land use but have often neglected to consider that the agent that must ultimately make the decisions concerning disposition of the land is the owner farmer. This research develops the concept that farmer social capital at the household level is critically linked and significantly influences spatial characteristics of land use at the rural urban fringe. Key Words: rural geography, rural-urban fringe, social capital, attachment value, spatial effects

Keywords: rural geography, rural-urban fringe, social capital, attachment value, spatial effects

John C. Hudson, Northwestern University. Email: j-hudson@northwestern.edu; *The Population of North Dakota*

Although North Dakota often is regarded as having a declining population, the state's total population has remained fairly constant, fluctuating in the range 650,000 +/-30,000, since 1920. The lack of an overall trend masks a consistent, long-term decline in the numbers of people living on North Dakota's farms, ranches, and small towns. Rural depopulation is best studied at the largest geographical scale for which data are available. Minor civil division population data were mapped for North Dakota townships for the nine decennial censuses, 1920-2000. Eighty-year population losses on the order of 90% characterize many townships. Population densities lower than two persons per square mile were confined largely to the rugged lands of western North Dakota in 1920 and covered only about 5% of the state, but by 2000 densities this low accounted for 71% of the state's area. A series of township-scale population maps illustrates the changes by decade. Analysis of frequency distributions of population density offers an approach to modeling the rural depopulation process.

Margaret Anne Hudson, University of Texas-Arlington. Email: mhudson@uta.edu; *Situating the Residential Attainment of Los Angeles' Non-Latino White and Mexican Mixed Race Households: Comparisons with Non-Latino White and Mexican Mono-racial and Mono-ethnic Households*

The segregated terrain of America makes neighborhood residential attainment a crucial moment in the life-cycle of mixed-race households because differently racialized neighborhoods constrain opportunities for the formation of family members' racial and ethnic identities. Unfortunately, geographers often do not have a general understanding of how certain types of household-level characteristics relate to the residential attainment of mixed-race households. Nor do they understand how such household-to-neighborhood relationships compare between mixed-race households and their same-race counterparts. Accordingly, this paper examines household-level characteristics for their relationship to the residential attainment of three types of households: mixed-race, non-Latino White/ Mexican-descent (WM) households; mono-racial, non-Latino White households (WW); and mono-ethnic, Mexican-descent households (MM). Using geographically-detailed 1990 census data from 1 in 6 Los Angeles area households, this paper estimates neighborhood residential attainment (defined in terms of census tract percentages and concentration rates of non-Latino Whites or Mexicans) separately for each of the three household types. Model estimation for WM households indicates that household-level characteristics that are positively associated with increases in the neighborhood concentration rates of WW households and are also negatively associated with increases in neighborhood concentration rates of MM households. Specifically, WM residential attainment in neighborhoods of avoidance for WW households increases when: the Mexican-descent partner's race is reported as "other race"; one or both partners is foreign-born; the household's median income is lower than average; Spanish is spoken in the household; and children's racial and ethnic identities are reported as Mexican-white or Mexican-"other race" versus non-Latino, white only.

Paul F. Hudson, University of Texas at Austin. Email: pfhudson@mail.utexas.edu; Alexandra G Myers, University of Texas at Austin. Email: ; *Geomorphic controls on floodplain lake variability on the Texas Coastal Plain*

On large river valleys lakes represent important riparian habitat because most floodplain surfaces have been significantly humanly disturbed. This study examines geomorphic controls on floodplain lake characteristics along the Brazos, Guadalupe, and San Antonio River valleys of the Texas Coastal Plain. High resolution geospatial datasets (NHD, DOQQ) permit floodplain lake characteristics to be examined with respect to geomorphic controls at the valley (width, slope, distance) and watershed scale (streamflow and sediment regime), which were combined with field data (sedimentation, survey transects). Floodplain lakes are classified into several types, including oxbow, chute, abandoned channels, flood scour, and valley side depressions, and further characterized according to their degree of infilling, size, shape, location, and frequency of occurrence. Floodplain lakes exhibit significant variability in origin and morphology because of varying fluvial controls. Valley slope and valley width are important variables in determining lake type and frequency, although floodplain sediments are also important. The identification of key geomorphic factors in controlling sedimentation and rates of floodplain lake change is useful to effective riparian management because of the dependence of aquatic fauna on specific types of floodplain lake environments.

Vanessa Hudson, Florida International University. Email: Vanessa.Hudson@fiu.edu; *Making the World Safe from International Aid? The Patriot Act and Its Impact on International NGOs*

Shortly after the events of September 11, 2001, the Bush administration and the U.S. Congress enacted legislation known as the US Patriot Act. This reactionary legislation designed to increase security in the "homeland" included, for example, provisions for tightening security at borders, providing for victims of terrorism, funding for counterterrorism, extensions of law enforcement powers, coordination, and surveillance, and provisions for fighting terrorist funding through financial channels. While much of the resistance to the loss of civil liberties is associated with the surveillance and law enforcement provisions, it is the anti-terrorist financing provisions that have the greatest potential to affect people and places beyond the US?particularly in the area of international philanthropy and transnational development aid. In this paper, I examine how various new policies and entities associated with the US Patriot Act combine to affect the underlying context in which non-governmental organizations working internationally operate, as well as the reaction of the philanthropic community to these anti-terrorism provisions. Although non-governmental organizations have undergone increased levels of governance over the past two decades, I argue

that these recent developments intensify those trends, and are embedded in, and reproduce, (neo) colonial discourses of spaces and populations.

Keywords: governmentality, transnational aid, postcolonial theory

Donald J. Huebner, PhD, Texas State University-San Marcos. Email: dh48@txstate.edu; *Peregrinations of a Black Cat: one man's journey through the Pacific War*

Beginning with a terse comment about his previous flight log books being destroyed during the "Japanese attack on Hawaii on 7 December 1941," I trace the wartime account and provide a spatial and temporal record of H.D. Allen, USN, VP-12 (the Black Cats). His WW2 naval aviator's log book is a first hand story from Pearl Harbor to the Japanese surrender in 1945. In December 1943 the Black Cats began using their black painted PBY Catalinas to harass and destroy Japanese shipping and positions. Leaving at dusk and returning at dawn and flying with no lights, the crews faced arduous and dangerous conditions, not only from the enemy but from weather and fatigue. His log is also a poignant account of his return to the US for malaria treatment, falling in love at Hutchinson NAS, Kansas, and returning again to the Pacific. On 15 August 1945, another terse comment in the log, "war over this morning," brings a close to this remarkable wartime record.

In 2006 I lived for six months in San Pedro La Laguna, Guatemala. This time was spent engaged in ethnogeographic fieldwork inspired by a research interest in storytelling, sense of place, and sacred specialties. The gendered realms of this research are significant. Sacred specialties particular to women (midwifery) as well as those that can be held by either men or women (shamanism, intuitive healing, bone setting, etc), provide positions of respect for women in this Maya-Tz'utujil community. Paired with increased access to education and new understanding of women's rights, Pedrana women are bridging the traditional with the modern, challenging oppression, and exercising their power with a view to the future.

Keywords: Maya, Guatemala, sense of place, women, sacred specialties

French Tyler Huffman, Ph.D., Eastern Kentucky University. Email: tyler.huffman@eku.edu; *Assessing the Impact of Uncertainties and Errors on Multi-Criteria Evaluation Procedures when using Remote Sensing Derived Land Cover Input Data*

Spatial decision-makers often rely on land cover data derived from remote sensing sources as input into procedures such as multi-criteria evaluations. These land cover input data layers can contain errors and misclassifications in terms of land cover classification categories. The research presented here explores what influence that errors and misclassifications in remote sensing derived land cover data can have on the output from spatial decision-making procedures. Comparisons are made between a BASE layer of land cover for the study region and several comparative land cover data layers encompassing the same study region. The BASE layer is a land cover data layer classified by the author that represents the nearest approximation of the land cover condition in the study region. Land cover classification accuracy is assessed for BASE layer and well as the comparative land cover data layers. This is followed by an assessment of the influence that errors and misclassifications in the comparative land cover data layers can have on site and situational factors. Next, several multi-criteria evaluation procedures are conducted using the BASE layer as input. The output from the spatial decision-making procedure using the BASE layer is compared with the same spatial decision-making procedure that make use of the comparative land cover data layers as input. Differences between the BASE layer and the comparative land cover data layers are then assessed to determine if errors and misclassifications have had an impact on the output of the spatial decision-making procedures.

Gabriele Hufschmidt, Victoria University of Wellington. Email: Gabi.Hufschmidt@vuw.ac.nz; *A dynamic model of natural risk: an example from New Zealand*

Worldwide natural disasters are occurring more frequently, costing more and / or claiming more lives than in the past. This trend reveals that natural risk is dynamic, mainly because of changing hazards, varying elements at risk (e.g. people) and their vulnerability. However, current methods of risk assessment only reluctantly address dynamics of natural risk. Although changing hazards and vulnerabilities are increasingly recognised, they are often treated in isolation. Holistic approaches, synchronising these risk factors, are not available at present. This study, focussing on landslides, aims to develop a model of risk

evolution, based on a period of several decades. New Zealand is chosen because of its short history of dramatic environmental and societal change within a highly hazardous landscape. Implications of suburban sprawl, increasing tourism, and changes in rural land use for landslide risk are analysed. A dynamic model of risk leads to a deeper understanding of the processes and interactions within and between the physical and the social environment. A dynamic risk model can therefore help to prepare for future challenges in risk management and policy design.

Email: n.wrigley@soton.ac.uk; Organisational geographies of corporate responsibility: a UK-US comparison of retailers' ethical trading initiatives

Ethical trade, involving corporate codes of conduct for sites of production, has become a key means through which labour in retailers' global supply chains is regulated. Yet, there is evidence to suggest that retailers vary markedly in their approaches to ethical trade and that such variation is shaped, in part, by the national-institutional contexts in which they are based. This paper explores this insight by evaluating the distinct roles played by multi-stakeholder initiatives for ethical trade in the UK and USA. It is shown that while the UK's core multi-stakeholder initiative encompasses retailers from a variety of sectors and takes a developmental and continuous learning approach to ethical trade, the US multi-stakeholder initiatives are focused more on corporate accountability based on compliance monitoring exclusively in the clothing sector. Given recent organisational attempts to foster transnational dialogue between multi-stakeholder initiatives, though, we argue that the precise ways in which national-institutional contexts shape retailers' ethical trading approaches are fluid and mutable. Conceptually, we contribute to the growing literature on the governance of global supply chains, retailer power and geographies of corporate responsibility by emphasising the political significance of national-institutional environments. However, we draw on recent geographical debate on relational economic geography and regulating globalisation, in order to theorise these national-institutional environments as active and dynamic contexts, and to accentuate the coalitional ways in which nationally-based organisations both evolve in their home countries and go on to shape broader transnational agendas for ethical trade.

Julia Josephine Hughes, Undergraduate, UCLA, Durham UK. Email: j.j.hughes@dur.ac.uk; Holocene Fire Frequency and Climate Variation in the Eastern Sierras, California.

Analysis of microscopic charcoal from lake sediment cores, applied to study the link between Holocene climate variations and fire in the eastern Sierra Nevada of California. The area is prone to prolonged periods of drought and associated enhanced fire regime. It is essential to understand the long-term patterns of drought and fire variability, in order to understand the full range of natural variability. Three questions can be addressed by charcoal analysis. Firstly, has the ecosystem surrounding a lake been significantly impacted by fires prior to the historical period? Secondly, has the frequency of fires remained stable or has it changed over the long-term, since deglaciation of the site. Thirdly, if changes in fire frequency are detected, can they be linked to climatic variations reconstructed from other types of records? Lake sediment cores were collected from high elevation Funnell Lake 3180 meters above sea-level, (356.5cm deep 11,27514C yr BP basal age) and low elevation Kirmen Lake (2174 Meters above sea-level, 270cm deep, 872014C yr BP basal age). Chronologies were established using radiocarbon dating and charcoal contiguous samples were taken every 1cm. Charcoal particles > 125µm in diameter were tallied for each sample using a microscope. The resulting charcoal stratigraphies were transformed to estimates of relative fire frequency. The two lake records do not have similar trends in fire occurrence. The results of this research are compared to other regional studies to determine the correspondence with high and low elevation fire regimes elsewhere and determine potential linkages with large scale climate variations.

Michael L. Hughes, University of Oregon. Email: hughesm@ohio.edu; Lateral movement and planform adjustment of the Umatilla River during and between two sequential flood events

Floods are viewed as disturbances to riverine ecosystems; however, linking ecological responses to flood-forced channel changes has been limited by knowledge of how river process-form relations differ during and between floods. Floods in 1965 and 1975 on the Umatilla River, northeastern Oregon, coupled with pre- and post-flood aerial photos, provide an opportunity to explore

differences in channel change during and between sequential floods and to investigate interplay between lateral movement and planform adjustment of the river. Based on a time series of georectified aerial photographs bracketing both flood and inter-flood periods from 1964 to 1977, I digitized in a GIS active bars, scoured and vegetated surfaces, and wet channels within the active channel, as well as the channel and floodplain centerlines, for nine reaches along a 100-km section of river. In all but one reach, the area of scoured surfaces increased during both flood periods (1964-1971 and 1974-1977) and decreased during the inter-flood period (1971-1974). Areas of bars and vegetated surfaces within the active channel changed inconsistently across reaches during both flood periods, but consistently increased and decreased, respectively, during the inter-flood period. Lateral channel movement was greater during flood periods than during the inter-flood period, but displayed no obvious relationship with change in any of the planform units or channel sinuosity. These results reflect distinct differences in reach-scale planform channel adjustments during flood versus inter-flood periods, but fail to implicate lateral channel movement as the primary driver. Sub-reach process-form linkages between channel movement and planform composition are therefore suggested.

Rachel Hughes, PhD, University Of Melbourne. Email: hughesr@unimelb.edu.au; Womb raider: gaming geopolitics in post-conflict Cambodia

This paper examines how a particular trope ? that of the quest for a powerful, talismanic object ? works through gendered geopolitical practices of inspection and intervention centred on finding and destroying dangerous objects that are most often located in 'uncivilised' places. I trace this trope through video game, film and geopolitical representations and practices, using the highly successful Tomb Raider game series as a starting point. The game's heroine, archaeologist and tool-up tomb raider Lara Croft, must obtain a series of artefacts from various exotic and 'ancient' locales. Lara's success in such quests affords special 'trouble-shooter' status to Lara's 'real-world' embodiment, actress Angelina Jolie, who plays Lara in the film adaptations of the game. Jolie is at once a film star, UNHCR Goodwill Ambassador, and mother to two adopted children (from Cambodia and Ethiopia) and her own biological child (recently the subject of the most expensive celebrity images of all time). Through Jolie, the quest for a talismanic object is transformed into the work of the mother/advocate who acts on behalf of displaced and objectified life: refugees and orphans.

Erin P. Hughey, Department of Geography, University of South Florida. Email: ephughey@mail.usf.edu; The Impact of a Comprehensive Emergency Management System on Disaster Response Within The Bahamas

This research looks at the national response to Hurricanes Floyd (1999) and Frances (2004) in The Bahamas. A comparative analysis was conducted to examine changes in response capabilities as a result of implementation of a Comprehensive Emergency Management System. The National Emergency Management Agency (NEMA), established in 2002, was designed to centralize the coordination of disaster planning, training, response, and recovery activities. Research was undertaken in The Bahamas over a five year period from 2002 through 2006, and is ongoing. Data were gathered through official government documents, interviews with the current and former Prime Ministers, as well as surveys with representatives responsible for disaster response on the Bahamas Family Islands. Research findings indicate improved service delivery as a result of a Comprehensive Emergency Management System, but structural problems still present significant difficulties to response.

Peter J. Hugill, Professor, Texas A&M University. Email: pjhugill@tamu.edu; State Type and Transitions in Hegemony: the Impact of Technologically Driven Geopolitical, Economic, and Politico-Military Boundary Problems

Transitions in hegemony are, historically, of two types, Type I accompanied by major war, Type II by economic war. We can derive a useful historical model from the three Type I transitions in the capitalist world-economy that has developed since the 1400s CE. The one Type II transition poses more problems for the modeler. Transitions depend on the type of polity. Struggles between trading and territorial polities produce Type I transitions, between trading polities, Type II transitions. Within a given state polities struggle to control the levers of state power, usually through strategies of Free Trade or Protection. Internal struggles within a state seriously affect hegemonic transitions. Geopolitical, economic, and politico-military boundary problems tend to dominate periods of hegemonic change. These boundary problems are increasingly driven by technological change.

Keywords: Geopolitics, free trade, protection, state type, polity, technology

Graeme John Hugo, University of Adelaide. Email: graeme.hugo@adelaide.edu.au; Sydney as an Immigrant Gateway City

In classifying immigrant gateway cities Sydney is an “Established” gateway in that for most of the more than two centuries of post European settlement it has been a main portal through which immigrants have entered Australia. However this role must be seen as dynamic rather than static since it has changed dramatically over this period. In the era of globalisation Sydney has reasserted its dominance as Australia’s most significant Immigrant Gateway after a period in which more immigrants settled in Melbourne. This paper argues that the role of migration in the development of World Cities is a complex one. World cities like Sydney are characterized by an increasing numerical and proportionate presence of immigrant settlers and they play an important role in the economic, social and cultural life of the city and in the elaboration of its crucial international linkages and networks. Sydney undoubtedly is the premier gateway for immigrants settling in Australia. However there are also other important migrations shaping Sydney and its role as a World City. In particular temporary migrant transnationals are important players in the World City’s economy. However it is also argued that the World City is not only a gateway to settlers and temporary immigrants but also operates as an outward gateway for Australians seeking to live and work in higher order cities. Finally it is also shown that there are significant links between international migration in Sydney or a World City and internal migration linkages with the rest of Australia.

Allison Hui, University of Alberta. Email: athui@ualberta.ca; Many homes for tourism: engaging with embodied spaces and virtual places within second home mobilities

Though the phenomenon of tourism has long been studied in various forms and through varying frames, recent work has emphasized that tourism itself must be re-conceptualized in light of the mobilities of global populations and the increasing difficulty in limiting examinations of touristic activities to isolated tourist spaces. Though marked and marketed tourist locations are important sites of investigation, tourism must also be considered, as Adrian Franklin argues, as an activity of the everyday. Looking beyond iconic spaces of tourism then, a focus on tourism of the everyday re-directs attention to those activities and roles that may be deemed only partially touristic. Drawn from a study that engages with these issues through an examination of second home mobilities, this paper considers the mobility of touristic practices and places between primary and second homes. Though second home owners do not fit some of the characteristics often ascribed to tourists, their leisure mobilities include touristic elements. It is argued that complex interrelations of embodied spaces and virtual places within second home mobilities not only illustrate the importance of including virtual place as a factor alongside time and space in situating the touristic, but also suggest that comparative studies of multiple sites within touristic mobilities are crucial to engaging with a mobile understanding of tourism.

Draining into Yangtze River in Jiangxi Province, Poyang Lake plays an important role in flood control of the Yangtze River Basin. It reaches its high water level with over 4,500 km² of water coverage during the raining season (summer) when the water level of Yangtze River is high and the Poyang Lake basin receives a large amount of monsoon season rainfall while in the dry season (winter) the lake changes into a river with water coverage of only several hundred km² as the water level drops in Yangtze River. Thus, it creates special scenery of “marshlands in winter, and water body in summer”. However, there is no spatial data describing the rise and fall of water level and the days of water coverage during the year over the lake. Areas surrounding Poyang Lake are one of the most severe schistosomiasis endemic regions in China with over 120,000 people infected each year. Objectives of this study are to map spatial-temporal change of water body with seasonal variation and attempt to obtain temporal process of water inundating marshlands by multi-temporal Landsat imagery in the Poyang Lake basin in a year. The water inundating information will provide important auxiliary information for other research, such as biomass calculation, snail reproduction, prevalence and control of schistosomiasis, wildlife conservation and biological diversity protection, pasture management, flood-inundated areas assessment and water conservancy in marshlands over the Poyang Lake region.

Keywords: Poyang Lake, water body, spatial-temporal, Landsat

Iris Hui, UC Berkeley. Email: iris_hui@berkeley.edu; GIS and Political Science

This paper discusses the potential applications of GIS and spatial statistics in political science. We will discuss two applications in particular. First, how does the changing distance to polling places affect turnout? Second, how can we assess the performance of voting systems and detect voting irregularities? We will also discuss the experience co-organizing a seminar on social science applications of GIS.

Keywords: GIS, election, voting

Mike Hulme, Tyndall Centre for Climate Change Research. Email: m.hulme@uea.ac.uk; Suraje Dessai, Tyndall Centre for Climate Change Research. Email: s.dessai@uea.ac.uk; Constructing future climates for public policy: a critical review of the development of climate scenarios for the UK

Climate scenarios serve a number of functions in the way society manages climate change - pedagogic, communication, engineering design, planning and policy development. A variety of methodologies for scenario construction have been experimented with, all of them to a greater or lesser extent depending on the use of climate models. Yet the development of climate scenarios involves much more than climate modelling. The process of scenario development is one of negotiation between relevant stakeholders ? funding agencies, policy communities, scientists, social actors and decision-makers in a variety of sectors. This process of negotiation involves compromise between the needs of policy, science and decision-maker in relation to, for example, the selection of the scenario(s), the choice of models, the presentation of uncertainty and the presentational devices used. This process of negotiation is illustrated for the case of the UK which has seen four generations of climate scenarios ? published in 1991, 1996, 1998 and 2002 ? and a fifth generation under development. The analysis reveals complex relationships between the interests of UK science, policy and society which have a significant bearing on the way in which these scenarios have been used in public discourse, planning and policy development.

Nancy B. Hultquist, Ph.D., Central Washington University. Email: nancyh@cwu.edu; Geography of the 2006 Washington State Rattlesnake Hills American Viticultural Area

Geography and topographic maps play a significant role in the decision of the U.S. regulations involved in designating and locating the boundaries of an American Viticultural Area (AVA) as recognized by the U.S. Department of the Treasury, Alcohol and Tobacco Tax and Trade Bureau. March 20, 2006 was the official recognition of Washington State’s Ninth AVA, located in south central Washington, southeast of the city of Yakima on the south-facing Rattlesnake Hills. Rattlesnake Hills AVA is a 68,500 acre region enclosed in the Yakima Valley AVA, which is a sub-region of the Columbia Valley AVA. However, in Washington State most new AVAs are using names different from “Valley” changing more appropriately to “Hills”, “Slope”, or “Mountain”. While juice grapes thrive in some of the colder wet-soil valley locations, the own-rooted Vitis vinifera grape plants need better draining soils and the protection from cold air provided by appropriate slopes. This presentation includes descriptive geography about the distinctiveness of place, shows winescapes within the AVA, mentions the petition process and how geography played a significant part, and visits — through photographs — some of the wineries and vineyards in the new AVA experienced in a summer course taught for the past decade as Wine, A Geographical Appreciation.

Tarry Hum, Queens College, City University of New York. Email: Tarry.Hum@qc.cuny.edu; Power Plants, Sex Shops, Industrial Zones, and Minerva: The Politics of Sunset Park’s Renaissance

Once a vibrant industrial waterfront neighborhood, the deleterious effects of massive deindustrialization and Robert Moses’ city building legacy culminated in Sunset Park’s designation as a federal poverty area in the 1970s. Decaying piers, power plants and sex shops dotted Sunset Park’s waterfront and marked its marginal neighborhood status. Sunset Park’s decline, however, contained the seeds for its rebirth including a plentiful supply of cheap housing and weakened resistance to newcomers. While Sunset Park’s revitalization was driven by Asian and Latino immigration and the formation of numerous small ethnic businesses and institutions, the scope and scale of several state sponsored economic development initiatives including waterfront redevelopment represent a critical juncture that underscores both prospects and challenges to immigrant neighborhood development. My paper discusses the rationale and potential impacts of waterfront redevelopment and the centrality of Sunset Park in NYC’s effort to protect manufacturing and revitalize a port economy.

Delbert Geronimo Humberson, B.A. Geography - University of Texas, United States Geological Survey, Mid-Continent Geographic Science Center. Email: dghumber@usgs.gov; Jean Parcher, M.A. - University of Texas, United States Geological Survey, Mid-Continent Geographic Science Center. Email: jwparcher@usgs.gov; CHIPS: A New Way to Monitor Colonias Along the United States - Mexico Border

Colonias, which are unincorporated border settlements in the United States, have emerged in rural areas without the governance and services normally provided by local government. Colonia residents live in poverty and lack adequate health care, potable water, and sanitation systems. These conditions create a degree of health risk to themselves and surrounding communities. By 2001, more than 1,400 colonias were identified in Texas. Cooperation with the Offices of the Texas Attorney General, Secretary of State, and the Texas Water Development Board has allowed the U.S. Geological Survey (USGS) to improve colonia Geographic Information System (GIS) boundaries and develop the Colonia Health, Infrastructure, and Platting Status (CHIPS) tool. Together, the GIS boundaries and CHIPS tool aid the Texas government in prioritizing limited funds for infrastructure improvement. CHIPS's report generator can be tailored to the needs of the user, providing either broad or specific output. For example, a congressman could use CHIPS to list colonias with wastewater issues in a specific county, while a health researcher could list all colonias without clinical access. In order to help cities along the United States-Mexico border manage issues related to colonias growth, CHIPS will become publicly available in an Internet-enabled GIS as part of a joint project with the USGS, U.S. Department of Housing and Urban Development and the Mexican Instituto Nacional de Estadística Geografía e Informática.

Susan Hume, Southern Illinois University Edwardsville. Email: shume@siue.edu; A South African Curios Market as a Micro-scale Global Market Place

While outdoor curios markets may give tourists the impression of representing a local sense of place, this is not always the case. Through the use of photographs and interviews, this presentation illustrates how a curios market in Stellenbosch, South Africa represents a micro-scale market place in the global economy. The terminology of Wallerstein's world systems analysis can be applied to understand this global market place. The curios market attracts immigrant sellers from peripheral sub-Saharan African countries and tourist buyers from countries in the global core. While the commodities are handmade by artisans, little in the curios market is locally produced in South Africa by South Africans. Rather, most of the commodities are imported from sub-Saharan Africa, or made by African immigrants living in South Africa, and destined for households in Europe, North America, Australia, and Japan. South Africa's position in the global semi-periphery (and the regional core) makes this micro-scale global market place possible.

Laurel J. Hummel, Ph.D., US Military Academy. Email: Laurel.Hummel@usma.edu; Use and/or Abuse? The US Military's Relationship with Alaska Natives During the Cold War

The US military and larger defense establishment was a dominating cultural and economic agent of change in Alaska during the Cold War. This power extended in unprecedented ways to affect Native Alaskan culture. This study surveys the various facets of interface between a hegemonic US military and the Native Alaskan community, including Native participation in the Cold War effort as part of the fighting force, environmental degradation of lands owned and used by Natives, the use of Natives as subjects in medical experiments, and other cultural and economic agents of change. The paper then traces the relationship between the military and Alaska Natives forward to their participation in Operations Iraqi Freedom and Enduring Freedom, and deliberates as to the degree the summative effects of their Cold War experience may have informed their contemporary relationship(s) with the US military, which remains a dominant geographic force throughout Alaska.

Mark A. Hummer, University of Kansas. Email: markhum_32@yahoo.com; Salt Lake City: A Sense of Place of an American Religious Homeland

This paper served as an in-depth investigation of Salt Lake City as it is perceived and valued as a unique Latter-Day Saint cultural and religious homeland. In the broadest sense, this study was founded upon earlier research into the physical and emotional cultural landscape of Salt Lake City as experienced by an outsider to this particular place and culture. In a more narrowly contextual vein, this portion of the ongoing study was built upon Nostrand's Homeland concept, and specifically Lowell Bennion's study of Salt Lake City as the Deseret Homeland. The aforementioned research experience established that one of the

most important vehicles for understanding this particular cultural landscape was the recollections and stories of Latter-Day Saints, whose religion is centered there, and other individuals who have lived in Salt Lake City and experienced its landscape and culture. Consequently, the principal thrust of this investigation centered on obtaining such qualitative data from several returned missionaries, currently living in the vicinity of Lawrence, Kansas. This data was obtained through both semi-structured interviews and questionnaires that were administered to the returned missionaries; the results of which were divided into two groups: those who grew-up in Salt Lake City and those who served their missions there. Broadly, this study indicated that while many of the interviewees indicated a collective sense of cultural memory about this landscape, they also indicated a close emotional attachment based on individual experiences.

Jung Hun, California State University In Los Angeles. Email: junghun73@hotmail.com; Improving Crop Type Mapping in the Antelope Valley by Using Temporal Satellite Imagery

Antelope Valley in southern California is a high desert where large-scale farming is made possible by intensive irrigation. Several different types of cash crops are currently being grown and a given crop type is often found in several different growing stages in a same field. Traditional crop type classification based on spectral characteristics of a single date image data has not produced satisfactory results. This study tried to improve the performance of crop type classification by incorporating unique temporal nature of the key crop types in Antelope Valley. A modified field-based image classification technique was used as part of the effort. Landsat scenes of different growing seasons were acquired and analyzed for deriving a better estimate on the cultivated areas by crop types. Field survey data were also collected for evaluating the performance of the improved classification method. It was demonstrated that temporal variations of different crop types are unique and they can be used together with spectral information to improve the accuracy of crop type identification.

Keywords: Antelope Valley, Image Classification, Crop Type Mapping, Field-based Image Classification

Kuang-Chi Hung, Department of History of Science, Harvard University. Email: khung@fas.harvard.edu; Colonization and Localization of the Landscape in Taiwan under Japanese Colonial Rule: Colonial Governance, Modern Science and the Environmental Order of East Asia

Taking Taiwan under Japanese colonial rule as an example, this paper examines how the landscapes of Taiwan and the environmental order of East Asia were shaped within the tension of localization and colonization. As an island with abundant forest resources, Taiwan undoubtedly provided an excellent opportunity for this newly born empire to participate in the international competition for timber since the 1850s. Since Cypress, the most precious and abundant tree in Taiwan, was distributed in the northwest coast of the United States, the Japanese Empire transplanted the capitalist and mechanical way of production in the United States for crafting the colonial production regime. Japanese foresters believed this transplanted model combined with the scientific forestry which was introduced from Germany in the 1870s would help the Japanese Empire join the ranks of forest empires. However, the cost of timber producing in Taiwan was so high that it could not compete with the American timber in the world market. What was worse was that the timber of Taiwan could not meet the need of industrialization and urbanization of Japan. The Japanese Empire was consequently forced to adjust its production regime, accommodate the folk knowledge and practice in the network of production, exchange and consumption of timber for constructing an environmental order which was different from what was deployed in Europe and the United States. This paper concludes with a discussion about the significance of environmental sciences in the enterprise of Japanese Empire and its place in the context of world environmental history.

Ming-chih Hung, Northwest Missouri State University. Email: mhung@nwmissouri.edu; Erik Harper, Colonial Services Board. Email: erikharper@gmail.com; Web-based GIS from commercial software or open-source software

With growing interests in using the Internet for data sharing and dissemination, web-based mapping/GIS also gains interests from the GIS industry recently. Different from conventional GIS, which is based on local computers and network with software and data, web-based mapping/GIS incorporates a client-server approach to delivering GIS applications through customized applications running through web browsers. Limited to the processing speed and available functionality, web-based mapping/GIS is very different from local computer GIS in many ways. Commercial software for implementing web-based mapping/GIS is available, such as ESRI's ArcIMS. Alternatively, open source software also offers solutions

for web-based mapping/GIS. There are pros and cons for either commercial software or open source software solutions. Sometimes a commercial software solution could prove more valuable than an open source software one, and vice versa depending on the problem it is intended to address. A comparison between a commercial software solution and an open source software solution could provide critical information in making decision on how to implement your web-based mapping/GIS.

Yvonne Hung, Graduate Center/City University of New York. Email: yhung@gc.cuny.edu; *The expanding geographical imagination of youth activists: Social justice education and practice*

The geographical imagination was introduced by David Harvey (1973) in "Social Justice and the City" as the awareness of how one's biography is shaped by the geographical context and spatial relations in which one lives. Although the development of this understanding of the world exists in autobiographical accounts of geographers or travelers, our understanding of how geographical imagination develops in young people and its potential utility for youth organizations is limited. This paper will present research conducted at a neighborhood-based youth organization that works collaboratively with African-American and Latino youth to develop a social justice framework from which youth can draw upon in their youth organizing and activism. Qualitative interviews were conducted with 11 youth participants before and after a 4-week education for liberation training session. Participant observation was also carried out in order to capture more naturalistic observations of youth in the various settings and roles. I wish to reveal how young people perceive patterns of power and social relations as related to disparities in their social and physical environment. The analysis of the interviews examines the relationship between different degrees of participation, the ways in which they learn, express and utilize their geographical imagination and how the organization works to support and expand youth political engagement.

Hilary B. Hungerford, University of Kansas. Email: hilaryhungerford@yahoo.com; *Onitsha Market Literature: Modernity in Postcolonial Nigeria*

Nigeria in the 1950s and 60s was marked by extensive cultural, economic, and political changes. Onitsha Market Literature provides a window through which to view Nigeria before, during, and after these changes. The primary objective of this research is to understand the ways in which modernity was negotiated during decolonization in Nigeria. This research introduces themes of modernity, hybridization, and creative resistance to the discussions of Onitsha Market Literature. Onitsha Market Literature reveals the agency of average Nigerians in creating and reproducing new social relationships and cultural meanings in a post-colonial era. I approach these themes by exploring the relationship and co-constitutive link of place and self. Onitsha Market Literature, locally produced and consumed, shows how messages were internalized, transmitted, and reproduced on a local scale, and expresses and reflects the creation of a new place. The Onitsha authors empower their readers by giving them the necessary ideological tools of modernity: individualism, capitalist enthusiasm, and the English language.

Mark Hunter, University of Toronto. Email: mhunter@utsc.utoronto.ca; *Beyond the Male Migrant Model as an Explanation for AIDS in South Africa. New Spaces of Health Inequality after Apartheid*

Between 1990 and 2005, HIV prevalence rates in South Africa jumped from less than 1% to around 29%. Important scholarship has demonstrated how racialized structures entrenched by colonialism and apartheid set the scene for the rapid unfolding of the AIDS pandemic, like other causes of ill-health before it. Of particular relevance is the legacy of circular male-migration?men moving to the gold mines for work and returning home to rural areas—an institution that for much of the 20th century helped to propel the transmission of disease among black South Africans denied permanent urban residence. As AIDS emerged in the 1980s, scholars reinvigorated this model. It fit well with narratives that positioned women as passive, immobile, victims, and those that saw ill-health as a simple legacy of apartheid. Yet remarkably little analysis has gone into examining the emergence of new social and spatial structures in the post-apartheid period, the ways in which these have been molded by the state's turn towards neo-liberalism, how these are racialized and gendered, and their effect on AIDS. As a window into these changes, the article gives primary attention to the country's burgeoning informal settlements?spaces in which HIV rates are reported to be twice the national average?and thereby to new geographical

connections between poverty and disease.

Keywords: Health Geography, neo-liberalism, South Africa, AIDS

Richard Hunter, Louisiana State University. Email: rhunte5@lsu.edu; *Reconstructing the Spatial Pattern of Spanish Land-Granting in the Valle del Mezquital, Mexico*

For over fifty years researchers have engaged sixteenth-century Spanish land holding records at the Archivo General de la Nacion in Mexico City to identify the social and environmental processes of landscape transformation that operated in New Spain during the initial decades after Conquest. This paper relates on-going research that uses these records to reconstruct the historical landscape and spatial pattern of colonial land-granting to try to understand how a portion of the Valle del Mezquital in central Mexico has become a desolate, eroded landscape. The most abundant category of records are the mercedes, or land grants, that the Spanish Crown issued to early settlers. Each merced stipulates to what use the granted land must be put, usually agriculture or pasturage for sheep or cattle. A merced might also describe the land's vegetation, hydrography, erosion (usually obliquely), or other biophysical characteristics that provide glimpses of the landscape at the critical temporal interstice between native and Spanish land tenure. Moreover, the mercedes contain in varying degrees of detail the locations of granted land, which along with fieldwork can allow a fairly accurate placement of these tracts on contemporary maps. By overlaying thematic maps with land grants in a geographic information system, patterns can be sought between the grant locations and elevation, slope, vegetation, et cetera.

William Matthew Hunter, Heberling Associates. Email: whunter@heberlingassociates.com; *Untangling the Metabolism: Urban Political Ecology and the Mill Creek Expressway Project*

The practice of cultural resource management (CRM), long influenced by the work of cultural and historical geographers, is now deploying the work of urban political ecologists to understand the complex urban landscapes that are often its subject of study. The Federal Highway Administration (FHWA) and the Ohio Department of Transportation (ODOT) are proposing to improve a 1950s-era highway, carved through Cincinnati's meatpacking district prior to the advent of historic preservation laws, by adding system capacity and reconfiguring intersections. Ironically, development of the project is now constrained by the presence of public parks and historic properties, fragmented elements of earlier spatial ensembles now afforded special consideration by environmental laws enacted in response to urban renewal and highway construction. Using examples from a recent cultural resource assessment, this paper demonstrates how advances in urban political ecology are put to work to untangle the "dense networks of interwoven sociospatial processes" embedded in the Mill Creek Valley, assessing the historical significance of seven likely historic properties, and considering the effects of the redevelopment project on an already fragmented urban landscape.

Christina M. Hupy, PhD, University of Wisconsin - La Crosse. Email: hupy.chri@uwlax.edu; *Meso-scale Dynamics of the Forest Tension Zone in the Central Lower Peninsula of Michigan, USA: 2,000 Years of Change*

Fossil pollen data from three lakes in the Lower Peninsula of Michigan, Hicks Lake, Cowden Lake, and Morrison Lake, were statistically analyzed to detect shifts in the forest tension zone during the last 2,000 years. The forest tension zone is an ecotone between the eastern broadleaf forests found in the southern portion of the Lower Peninsula and the mixed Laurentian forests in the north. This analysis detected three separate shifts in the location of the tension zone near Cowden Lake. These transitions included a southward expansion of mixed coniferous-deciduous forests during a cool period from 1700 to 1500 cal yr BP, a subsequent movement of the ecotone northward from 1300 to 700 cal yr BP, as indicated by expansion of Quercus-dominated forests towards Cowden Lake. And a final shift southward, marked by the expansion of mixed-forests near Cowden Lake, which was interpreted as a response to the LIA from 700 to 250 cal yr BP. Shifts in the ecotone were primarily signaled by the competitive dynamics of Quercus versus Fagus around Cowden Lake. During the past 2,000 years, the character of the ecotone itself also changed in response to variations in climate. Shifts in the character of the ecotone were detected by the degree of differences between the pollen records of each of the three sites

Keywords: Michigan, forests, fossil pollen, ecotone

Joseph P. Hupy, Colgate University. Email: jhupy@mail.colgate.edu; Reestablishing the link between military geography and geography through field work

Among the sub-disciplines of geography, military geography exemplifies more than most the close ties humans share with the physical environment. Whether that is the effects of war on the environment or the influences of geography on the outcome of battle, military geography covers that spectrum. Just like with so many other teachings in geography, these concepts are often not fully grasped by the student of military geography until witnessed first hand through laboratory exercises or in a field setting. Students in a senior seminar class at Colgate University applied the components of military geography into a field research project. The research project was set up as a game of 'capture the flag', meant to combine many of the geographic skills they accumulated in their study of geography with some of the underlying concepts of military geography. Students engaged in the research were provided the locational coordinates of a square mile parcel of land and were then assigned to analyze the parcel to the best of their abilities using a GIS software package and field survey techniques. Digital data sources included topographic maps, elevation models (DEMs), soil survey data (SSURGO), and ortho photos (DOQs). Other factors such as vegetation, climate, and weather patterns were included in the analysis. Analysis from these data sources were then used to plan out the how best to win the game. Following the event, the students then reevaluated their preliminary analysis as to how much the planning led to the final outcome of the game.

Patrick T. Hurley, College of Charleston. Email: hurleyp@cofc.edu; Which rural quality? Putting conservation subdivision design in context in Oregon and California

Many parts of the rural American West are undergoing dramatic social and ecological transformations related to amenity-related residential and associated commercial growth. In these areas, there is growing interest among scholars and planners in efforts to integrate land conservation features into residential development at the so-called "rural-urban fringe" to make them "more environmentally-friendly." Among the variety of development models advocated, Conservation Subdivision Design (CSD) is seen both as an alternative both to Traditional Subdivision Design (TSD) on the suburban-rural fringe and Planned Unit Developments (PUD) in high amenity areas. Yet, little research has examined variations among residential subdivisions, the range of conservation features incorporated into site designs, and the ways these models are marketed in specific places. Using a case study of Waco and Deschutes counties in Central Oregon and Nevada and Placer counties in the Sierra Nevada in California, this research explores the intersection of local policy and politics, amenity migration, and the differing rural qualities that are seized upon by developers in proposing and developing new subdivisions. The paper examines the diversity of "conservation subdivisions" that are emerging in these areas and their role in producing a diverse set of "nature-society hybrids" or sites of conservation the post-productivist American West. Far from signaling a homogenous set of practices unleashed by broader policy changes from above, these cases suggest a trend toward ecological governance (broadly conceived) that results in a diversity of hybrid conservation spaces and landscapes of consumption.

Keywords: amenity migration, rural change, conservation landscapes

Anne Hurni, University of Western Sydney. Email: a.hurni@uws.edu.au; A good place to bring up the kids: investigating neighbourhood effects on children's development in Sydney, Australia

International research on relationships between urban environments and health suggests that people living in neighbourhoods with higher densities, mixed uses, and well connected street layouts have higher rates of walking and, as a result, better health. Increased physical activity is presumed to account for the lower rates of overweight and obese people. Whether such features of urban form and design have similar health benefits for Australian children is not known. Evidence emerging from the recent Longitudinal Study of Australian Children shows that localities with higher traffic pose a greater risk of injury for children, and that children in disadvantaged areas have poorer health and development. These and other social and physical neighbourhood characteristics may also have a greater influence on children's health and development. The paper presents the results of a spatial analysis of indicators of children's developmental outcomes across a selected set of neighbourhood characteristics in Sydney, Australia as a starting point for an investigation of the influences of the social and built environment on children's health and development.

J.M. Shawn Hutchinson, Ph.D., Department of Geography, Kansas State University. Email: shutch@k-state.edu; Margaret L. Margosian, USDA APHIS PPQ CPHST. Email: Peg.Margosian@aphis.usda.gov; Karen A. Garrett, Ph.D., Department of Plant Pathology, Kansas State University. Email: kgarrett@k-state.edu; Connectivity of the American Agricultural Landscape: A Graph-Theoretic Approach using GIS

Biogeographers, landscape ecologists, and population biologists have been utilizing graph theoretics to study the connectivity of habitat or isolated landscape patches for a number of years. Similar methods are used in this study to analyze agricultural landscapes in a "patchless" context to determine the potential for the spread of agricultural crop pathogens. Analysis was performed at the county-level using a network model in a geographic information system (GIS). The network was formed by connecting county centroids (nodes) to each of its neighboring counties. The potential for pathogen spread was simulated by assigning values for disease transmission to network edges based upon a combination of the individual crop densities in the two "connected" counties. Contiguous areas of connected agricultural patches, or subgraphs, could then be identified by removing edges with values that exceeded threshold transmission rates specific to a known pathogens. Subgraphs can be visualized in geographic space or as a chart similar in style and concept as those used for genetic phylograms. Here, however, these "spatial" phylograms split in response to disease transmission rates, rather than by genetic differentiation. Results reveal that distinct islands of connected agricultural lands exist for different crops (e.g., soybeans vs. wheat). Further, the area, shape, and orientation of these islands change, sometimes dramatically, depending upon the simulated pathogen transmission rate. Identification of connected agriculture landscapes benefits regional integrated pest management activities by informing decisions on the establishment of minimum effective quarantine zones during an actual or anticipated disease outbreak.

Teresa H. Hutchinson, The Ohio State University. Email: hutchinson.82@osu.edu; Linking Fertility and Managed Resources in a Guarani-Kaiowá Community

Recent case studies have shown how Latin American indigenous populations, particularly groups living in neo-tropical lowland regions, are growing at high rates or at least have growth rates that are declining more slowly than the growth rates among rural populations. Despite more than a decade of renewed interest in the dynamics of indigenous demography, however, much remains to be understood about their demographic drivers. In the past, considerable resources focused on understanding proximal causes of high fertility, for example. Recent work seeks robust explanations, particularly for small-scale resource-dependent groups, and so explores distal or ultimate causes of high fertility among these groups. This paper engages survey and interview data gathered during late 2005 field research among one of Brazil's largest indigenous groups. By employing statistical techniques and qualitative insights, I will examine the possible relationships between high fertility rates in a land-constrained Guarani-Kaiowá community of Mato Grosso do Sul (Brazil's central west) and access to resources such as the community's jointly-managed potable water sources that are extracted from the Guarani aquifer. The results of this study will contribute to the nascent body of political ecology of demography research.

Thomas A. Hutton, DPhil, University Of British Columbia. Email: thutton@interchange.ubc.ca; *The Inner City as Zone of Innovation: "Precarious Reindustrialization" and the Services-Production Nexus*

With the collapse of traditional Fordist manufacturing and labour during the height of the postindustrialism era during the late 20th century, it was widely assumed that the inner city's role as zone of industrial innovation and incubation had reached a terminal stage. But since the 1990s a sequence of new industries has established a presence in the inner city. These include 'outlier' business services seeking relief from the steep rent gradients of the Central Business District, and, more recently, industries representative of the technology-driven 'New Economy' and 'cultural economy of the city', suggesting a revival of sorts of the inner city industrial district, manifested by dense, interactive clusters and sites. These new industries, which include Internet and web-design services, computer graphics and imaging, video game production, and new media, may be interpreted as the latest phase in the development of the service sector in advanced cities, or, as others might see it, the reassertion of industrial production in the inner city, suggesting possibilities of theoretical synthesis incorporating services and (cultural) product manufacture in the knowledge economy. This paper offers a review of new industry formation in three selected London sites: Shoreditch, Clerkenwell, and Bermondsey. These cases demonstrate the crucial role these inner city clusters play in innovation processes, but also disclose the destabilizing influences of accelerated industrial restructuring and pressures for residential conversion in the 'new inner city' of the 21st century metropolis.

Niem Tu Huynh, Ph.D Candidate, Wilfrid Laurier University. Email: huyn1912@wlu.ca; *Who's Teaching Teachers GIS: K-12 Education?*

Geography Information System (GIS) is a tool that combines computers with specialized software to provide a new way to visualize and study patterns of space, relationship(s) between places and explore new landscapes. Its usefulness has since been discovered by a growing list of practical and academic fields, Education being one of many, creating a multibillion dollar industry. From a pedagogical perspective, GIS introduce to students spatial concepts in geography by visualization, hands-on experience and analytical skills modeled through real world problems. Despite its teaching potentials, GIS' integration into the classroom is slower than the expectation of GIS advocates and geography educators. Although there are research findings on factors that attribute to the rate of GIS in-classroom use, few focus on teacher candidates and the role of training institutions. This paper examines the social-institutional factor that may hinder GIS teaching in the classroom; the relationship between Faculties of Education and teacher candidates. The working hypothesis of this paper is that the paucity of well trained and skilled teacher candidates is a contributing factor to the slow GIS integration into K-12 stream. This paper also argues that GIS education in K-12 must be supported by both curricula (there is a push for GIS to be taught in the K-12 stream, particularly in Ontario, Canada) and a pool of skilled educators in the Faculty of Education to train future school teachers.

Myunghwa Hwang, Spatial Analysis Laboratory, University of Illinois. Email: mhwang4@uiuc.edu; Simon Appleford, NCSA, University of Illinois. Email: ; Vernon Burton, NCSA, University of Illinois. Email: ; Luc Anselin, NCSA, University of Illinois. Email: ; *Spatially Enabling RiverWeb, a Web-Based Resource for Historical Exploration of the American Bottom*

RiverWeb (www.riverweb.uiuc.edu) is a web-based education and outreach program to promote environmental education and historical awareness about rivers and their watersheds. One aspect of the project is an extensive collection of historical materials pertaining to early settlements in the "American Bottom," a location just south of the confluence of the Mississippi, Illinois and Missouri rivers, near modern-day St. Louis. This also includes a large historical record of the early development of East St. Louis (IL), from its early settlement through the twentieth century, up to and including the most recent census. This paper outlines and illustrates efforts to spatially enable the RiverWeb collection. The outcome is a dynamic web mapping application that forms a browser-based flexible user interface to the collection of historical materials, newspaper clippings, city directories and census information. The system has been built using open source software compatible with Open GIS Consortium (OGC) standards and includes web mapping functionality, a gazetteer and basic geovisualization. The paper describes the design and architecture of the system and the implementation of the linkage between the historical information and its spatial imprint. This is illustrated with a historical analysis of neighborhood change in East St. Louis as a result of redlining policies in the early 20th century. Change in neighborhood profile over time and across space can be visualized and basic exploratory spatial data analysis (ESDA) techniques provide ways to

quantify these patterns.

Sungsoo Hwang, DePaul University. Email: shwang9@depaul.edu; *Why are some cities more segmented in residential settlement pattern than others?*

Residential settlement pattern in urban areas is an interesting topic to a geographer. There is considerable evidence that differences between urban neighborhoods have widened in recent years as income gap has widened. There are numerous studies on what affects spatial concentration of similar social groups within a metropolitan area. On the contrary, there is a lack of study on why the degree of neighborhood differences differs by metropolitan areas. The previous study (on the index of housing market segmentation that summarizes the degree of neighborhood differences among metropolitan areas) allows us to seek answers to why some cities are more segmented in residential settlement pattern than others. The previous study reveals that New York, St. Louis, Seattle, Phoenix, San Francisco, and Portland have highly segmented housing market among 23 sample large metropolitan areas. What would explain high degree of housing market segmentation in these metropolitan areas? We hypothesize that competitive nature of housing market, rate of growth, and racialized process of residential development affect the spatial sorting of housing market. This study examines literatures from residential location choice to superstar cities. Hypothesis will be tested using the index of housing market segmentation and carefully chosen indicators of potential explanatory variables. The study is designed to shed light on processes governing spatial inequality of housing choice through comparative analysis of housing market across large metropolitan areas in the U.S.

Keywords: Housing market segmentation, Residential segregation, Urban form

James A Hyatt, Eastern Connecticut State University. Email: hyattj@easternct.edu; Robert Gilbert, Geography; Queen's University. Email: robert.gilbert@queensu.ca; *Fluvial Erosion & Form Characterization in Bedrock Channels, West Greenland.*

Subglacial and proglacial discharge to 1200 m³ s⁻¹ eroded complex forms into a gneissic bedrock sill near the mouth of Watson River, West Greenland. These forms reflect interactions between bedrock, topography and flow structure. We quantify forms in order to test form classification schemes developed for bedrock-controlled glaciofluvial and fluvial settings, and to identify relationships with flow. Measurements of forms are derived from sub-cm resolution digital maps for sites on the upflow (site 1 > 220 m²), crest (site 2 > 350 m²), and downflow (site 3 > 500 m²) sides of the sill. These maps were constructed by edge mapping individual near-vertical images collected with a 4-m high camera pole. Mosaics were rectified using 2 m grid total station survey data. Sharp and smooth form boundaries were traced, scanned, and imported into medical imaging software for form analysis. The lengths, widths, perimeters, areas, orientations, centroids, and several derived variables were measured for each site (n_{1,2,3} = 1600, 2800, 4100). Raster base maps were converted to vector format, registered, and analyzed in ArcGIS to map groups of forms. Initial analyses for site 3 identify spatial groupings of similar forms related to flow structure. Form asymmetry is generally greater and orientations are more tightly grouped parallel to flow at lower elevations where water depths are greater and erosive discharge events more frequent. Ongoing multivariate analyses suggest that the number of form variables may be reduced without a loss of explanatory power but that statistical clusters may not coincide with spatial groupings.

The bog turtle (*Gleptemys muhlenbergi*) is a federally threatened species, whose northern range falls within the densely populated and rapidly urbanizing east coast of the United States. This study was part of a larger, multi-disciplinary effort to develop a habitat conservation plan for the bog turtle in two rapidly developing counties (Chester County, Pennsylvania and New Castle County, Delaware) in the Delaware River basin. This study built a spatial model for predicting the location of the bog turtle's core habitat. The primary habitat of bog turtles is mucky, seepage wetlands in fairly open canopy. The three tiers of the spatial model were: high probability, moderate probability, and low probability of occurrence of habitat. The high probability model was generated from GIS coverages of: hydric soils, buffered wetlands, buffered headwater streams, breaks in slope, edge of floodplain, and geologic fractures and faults. The low probability

model included: barren lands, highly urbanized areas, persistent row crop, steep slopes, buffered highways, and open water. The moderate probability zone was the balance of the study area. Each of the three tiers of the model was field validated with one hundred randomly generated sampling points. Results of the validation of the model from field visits and known occurrences of the bog turtles will be presented. Additionally, methods for improving the high probability model with potentiometric surface maps, aerial photo interpretation, and historic maps will be presented. Glep

Matthew Hyland, York University. Email: anotherboringaddress@hotmail.com; Unwieldy (e)motions: Pee-Wee Herman and the spatial imperative of effeminacies

In 1993, Eve Sedgwick pronounced the effeminate figure as "the haunting object of gay thought," unacknowledged, if not disavowed, and wholly undertheorized. More than ten years later, the adult sissy arguably remains but a specter in academic literature. This paper takes up this absence and considers possibilities for ameliorating it. Looking at the shortcomings of a small body of literature which grapples with effeminacies as identities, I suggest a move toward the productive possibilities of theorizing effeminacies as spatial-corporeal events. Such a turn, I argue, allows for nuanced attention the cultural, temporal and historical realities of effeminate articulations without implying their evanescence. To illustrate this argument, I draw on the cultural texts of Pee-Wee Herman (a familiar figure in the discourse on sissies). In particular, I explore how considering spatiality as central to effeminacy allows for a more attentive deliberation on the significance of the relationship between Herman's physical loquaciousness and his extended range of emotional utterances. At this intersection, the unwieldiness of these articulations reveal themselves as formative to, if not constitutive of, the effeminate, providing insight into how effeminacy gets figured outside the normative maps of masculinity.

Keywords: masculinities, effeminacies, emotional geography

Glenn G. Hyman, Ph. D., International Center for Tropical Agriculture (CIAT). Email: g.hyman@cgiar.org; Where Are the Poor and Drought-prone Farmers?

The international agricultural research and development community is paying more attention to poor and vulnerable populations hindered by agricultural production constraints, especially drought. Past efforts have placed greater emphasis on increasing overall production at the national scale, with emphasis on environments and farmers with the highest potential for improvement. This study uses global crop, climate and poverty data to identify agricultural regions of high priority for research and development in molecular biology and crop genetic resources. Spatial overlay, drought modeling and descriptive statistics are used to make a global assessment of agricultural regions. Our analysis showed that drought coincides with high levels of poverty in 14 agricultural regions, especially in South Asia, the Sahel, and eastern and southern Africa. Fourteen crops make up the bulk of food production in these high priority areas. A database was developed for use in priority setting for agricultural research and development.

Jennifer Hyndman, Syracuse University. Email: hyndman@sfu.ca; War and Family in Post-Tsunami Sri Lanka

How do a natural and humanitarian (war) disaster destabilize social and spatial relations of order and authority? What are the implications for families? While housing, fishing boats, and schools have all received considerable attention in the wake of the Indian Ocean tsunami of 2004, intangibles such as the tsunami's impact on the war, its differential effects on men and women and their implications on work and family have been largely ignored. The social devastation and physical destruction of the tsunami spatially reorganized social relations, including those of gender. This destabilization put women at risk but also opened up new spaces for them. Based on fieldwork in Sri Lanka in 2006, I argue that protection has declined since the tsunami and construction of temporary shelters in new locations. This is especially true for widows whose social status alone makes them vulnerable. Widowers with young children face less insecurity but more challenges in reorganizing the gender division of labour. As the war in Sri Lanka resumes, links between militarization, disaster, and family are explored.

Keywords: war, gender, displacement

Oliver Ibert, Department of Geography, University of Bonn. Email: ibert@giub.uni-bonn.de; Knowledge Practices in Nanotechnology: Places of Learning and Learning Action Spaces

The paper is concerned with a conceptualization of the time-spatial organization of knowledge practices. It develops contours of a geography of knowledge production that bases on a situated-in-practice understanding of human knowledgeability. This geography consists of two main concepts: · Places

of learning. Engagement with knowledge practices is inherently local, since the related activities have to be performed at a specific location. These locations are referred to as places of learning. Such places provide the material and immaterial artefacts belonging to a knowledge practice (e.g. laboratory equipment and devices), a formal infrastructure (e.g. knowledge management tools) and a multitude of informal occasions of learning. · Learning Action Space. Participation in practice, by contrast, rather than concrete action addresses the practitioners' identity as members of an epistemic community. As such they have access to a greater diversity of places of learning. Processes of innovation-oriented problem solving are not fully localised, rather they connect several diverse, though, interrelated localized practices and utilise this diversity. The corresponding mobility of actors and objects enacts a learning action space. Some elements of these two concepts are substantiated empirically by first findings of an ethnographic exploration of research and development processes in nanotechnology. The paper concludes by discussing in how far the so far less influential practice view might complement the more traditional knowledge-based interpretations of spatial clustering.

Mohamed Babiker Ibrahim, Geography Department, Hunter College-CUNY. Email: mibrahim@hunter.cuny.edu; Rain Harvesting for Urban Areas: The Case of the Gadarif City in Central Sudan

Climate change, population increase and water mismanagement pose a great challenge of providing safe water to the populations of the arid and semi-arid regions of the developing countries; where water deficits will amount up to two thirds of the water requirement. Therefore, water harvesting techniques would be of paramount importance to make water available for domestic, agricultural and industrial use. More important, the involvement and participation of local people in the process of planning, tapping, administration, management and conservation of water systems will enhance the sustainability of safe water to these communities. Moreover, the high illiteracy and constant mobility and migration of some of these communities (pastoral nomads and working groups) contribute to water mismanagement and increase water related diseases. Therefore, programs that integrate drinking water supply with sanitation services and school and public hygiene education are needed to reduce water related diseases and provide local communities with adequate safe water in a sustainable manner. The study will draw some examples from the water harvesting techniques in the city of Gadarif in central Sudan.

Keywords: Rainwater harvesting, urban water supply, people participation sustainable development. Sudan.

Helen Hephzibah Igene, Ms., University of St-Andrews, St-Andrews, Scotland. Email: hephihi@gmail.com; Global Health Inequalities and Breast Cancer

Background: The aim of the study is to provide information on the global health inequality pattern produced by the increasing incidence of breast cancer and its relationship with the health expenditure of developing countries with emphasis on sub-Saharan Africa. It examines differences between the health expenditure of developed and developing countries, and how this affects breast cancer incidence and mortality. Methods: The data collected from the World Health Organisation (WHO) and World Bank were examined, using bivariate analysis, through scatter-plots and Pearson's Product Moment Correlation Coefficient. Multivariate analysis was then carried out by multiple regression analysis. Results: National income, health expenditure, the social context, health behaviour and reproductive factors all affect breast cancer incidence, particularly the differences between the developed and developing countries. However, these factors do not adequately explain variations in mortality rates. Conclusion: Findings from this study contribute to the knowledge of the burden of disease in the developing countries especially sub-Saharan Africa and how that is related to globalization and health inequalities. The study reveals the risk to developing countries of not giving attention to solving the present and predicted burden of breast cancer, currently characterised by late presentation, inadequate health care systems and high mortality.

Keywords: breast cancer, incidence, mortality, health inequalities, developed and developing countries

Akiko Ikeguchi, Nagoya Sangyo University. Email: ikeguchi@nagoya-su.ac.jp; East Asian market and its impact on spatial organization of clam fisheries in the Mekong delta

Recent economic growth in East Asia accelerates coastal development on one hand, and develops consumption of sea food in urban areas on the other hand. This resulted in growing demand of Southeast Asia coastal resources. In the Mekong delta, previous literatures described the expansion of shrimp farming along the coast, which often damage mangrove forest. The researchers often drew on this structure to indicate vicious aspect of globalizing market. However,

different type of food network shows that such framework is simplistic. In this study, I show a different pattern of production change and its impact on the coastal environment by focusing on spatial organization of hard clam (*Meretrix* sp.). The result indicates that the globalization induced spatial division of labor in different eco-regions. Some production organization recently act as a guard of estuary environment with support from government, but local small-scale fishermen, mostly Kumer, are on disadvantaged part of food network. The result implicates a need for new approach to the study of globalizing food and to sustainable resource use.

Keywords: food, environment, Southeast Asia

Risa Ikeya, University at Buffalo. Email: ikeya@buffalo.edu; *Island Ecotourism - Iriomote Island Case Studies*

Ecotourism is a type of nature-based tourism which aims environmental conservation, environmental education and local profit without exploiting nature. It is a nice way of promoting economic development in rural areas and many small islands in Japan are trying to adopt ecotourism. Iriomote Island, a part of Okinawa island chain, is a pioneer in ecotourism in Japan and has been actively implementing ecotourism projects since 1997. Iriomote belongs to subtropics and blessed with exotic ecosystem that is rare in Japan. Recent years' rapid increase in the number of tourists to Iriomote raises a concern of the island's sustainability. Many ecotourism sites are damaged by tourism activities and problems associated with over-use are noticed. In order to avoid further environmental damages, ecotourism on Iriomote Island is required. Upon revision, it should be noted that island ecosystem is unique and a general ecotourism scheme cannot be applied to island ecotourism. A customized ecotourism framework for Iriomote Island that reflects Iriomote's unique characteristics should be constructed and used. Thorough understanding of the unique ecosystem is essential to plan and implement sustainable ecotourism on Iriomote Island. To create a sustainable ecotourism destination, it is important that all the stakeholders be educated and a proper ecotourism operation be carried out.

Keywords: ecotourism, island ecotourism, environmental conservation, environmental education

Shriram Ilavajhala, Faculty Research Assistant, University of Maryland. Email: silav@hermes.geog.umd.edu; Diane Davies, Faculty Research Assistant, University of Maryland. Email: ddavies@hermes.geog.umd.edu; *An Open Source GIS Solution for Delivering MODIS Fire Alerts Globally*

Protected area and natural resource managers need near real-time fire information for strategic fire management. While satellite derived global active fire locations are available via the Internet, providing users with email notification of detected fires in their area-of-interest (AOI) is often a more convenient way of accessing the data. Delivery of detected fire locations by email, or cell phone text messaging in a timely manner is particularly useful where bandwidth limitations restrict the speed of Internet access. The Global Fire Email Alerts system was developed to notify users when fires are detected using data from the MODIS sensor, on board NASA's Aqua and Terra satellites. The email alerts system is subscription-based and allows users to choose their AOI by interactively drawing on the map, along with pre-set zoom levels, or by entering the latitude longitude values. Alerts can be customized with options like output map size, image background, attachment containing fire points, etc. The system employs open source software (e.g., Minnesota MapServer, PostgreSQL, PostGIS, etc) on Linux platform, delivering a very cost-effective, platform-independent solution. The system can be easily customized for the specific needs of organizations that require similar system. The system is currently in a beta-test phase, and will be released soon. The beta version currently has nearly 400 subscribers from more than 50 countries. Further improvements to the system are in progress and include an AJAX-based map interface, and fire alerts by region.

Eerik Ilves, MA student, University of Toronto. Email: ilvese@geog.utoronto.ca; *New-build gentrification and inner city political polarization in Toronto and Vancouver*

Abstract. Many gentrification scholars have associated late-stage gentrifiers with political conservatism, and in turn, the growth of the 'neoliberal' city. This paper examines the relationship between recent condominium construction ('new-build' gentrification), voting patterns, and their policy implications, in Canadian inner cities. Conclusions are based on empirical analysis of provincial and federal election results and census data in Toronto and Vancouver over the previous 25 years at the level of the polling division. This study differentiates the composition of the vote in areas of recent condominium construction from the rest of the inner city, including areas gentrified in previous waves, and provides multiple linear regression analyses of election results with census data to

test what socio-demographic variables are most salient in predicting and explaining political party choice. The proportion of the labour force made up of 'entrepreneurial professionals' is one of the strongest predictors of right-of-centre voting, and such professionals are highly concentrated in areas of recent condominium development. The results are discussed in terms of neoliberal urban governance and the associated ascendance of business and finance professional groups in the city. The shift to the political right of the inner city vote that coincides with new-build gentrification has potentially serious implications for urban policy, as well as politics at broader scales. As inner city demographics change, there may be further strain on social welfare programs, and, more broadly, the results suggest an erosion of the traditional role of the inner city as a site for progressive politics.

Jungho Im, University of South Carolina. Email: imj@gwm.sc.edu; John R. Jensen, University of South Carolina. Email: johnj@gwm.sc.edu; *Hyperspectral analysis of hazardous waste sites on the Savannah River National Laboratory using AISA imagery*

Humans produce large amount of hazardous waste. The waste is generally stored in a safe place (i.e., hazardous waste sites) so that it does not contaminate the environment. The investigation of hazardous waste sites through in-situ measurement using visual inspection and hand-held instrumentation is labor-intensive and time-consuming. In certain cases, remote sensing-based monitoring of the hazardous waste sites may be possible. This study conducts hyperspectral analysis of hazardous waste sites on the Savannah River National Laboratory (SRNL) near Aiken, SC using the AISA imagery over the sites obtained on September 15, 2006. In-situ spectroradiometer data were also measured on that day. This study investigates hyperspectral AISA imagery to determine if it can be used to assess and monitor the condition of vegetation on claycaps on the Mixed Waste Management Facility (MWMF) at SRNL. Various hyperspectral analysis methods including spectral angle mapper (SAM), spectral mixture analysis (SMA), and mixture tuned matched filtering (MTMF) are used to extract the condition of the vegetation. The condition of the vegetation extracted from the hyperspectral analysis can be used in the Remote Sensing and GIS-assisted Spatial Decision Support System for Hazardous Waste Site Monitoring (RSHDSS) for improved hazardous waste site management (Jensen et al., 2006)

Keywords: hyperspectral analysis, hazardous waste sites, AISA imagery

Valerie Imbruce, PhD, City University of New York, Graduate Center. Email: vimbruce@nybg.org; *Demand for Diversity: The Global Expansion of Chinatown's Food System*

New York City presents an enormous and ever-changing market for a large variety of fruits and vegetables. Some products are produced regionally, most come from distant corners of the world. Recent studies on agricultural commodity chains in the United States suggest that homogenization and corporate appropriation are associated with spatial expansion of food distribution. Yet within New York City methods of food procurement are continually remade. Chinese immigrants in Manhattan's Chinatown have developed a diverse and dynamic system to satisfy the demands of East Asian ethnic groups. Although Chinatown's food system has been rapidly undergoing geographic expansion, it displays characteristics apart from other global food systems. Tying together previous studies on the globalization of agriculture, alternative food systems, and studies on agrobiodiversity, this project describes and analyzes the cultivation and marketing of Asian fruits and vegetables on a newly emergent global scale. By focusing on a system broadly distinguished by cultural preferences, this research describes how immigrants not only create new market demands, but concurrently create new systems of resource use to satisfy their demands. Results show trade networks based in social relations, diverse cropping systems, and family owned and operated firms constitute the food system. This understanding is significant in a world of highly mobile people and commodities. This project builds on the tradition of research that looks at the influence of political and economic structures on natural resource use, while taking a new approach that integrates this tradition with research on global agricultural systems.

Rob Imrie, Professor, Department of Geography, King's College London, London. Email: rob.imrie@kcl.ac.uk; Claire Edwards, Geography, Department of Applied Social Studies, University of Cork, Ireland. Email: claire.edwards@ucc.ie; *The geographies of disability and a re-evaluation of the social relations of research production*

Oliver's (1992) paper about the social relations of research and disability suggested that research had done little to change in any significant way the lives of disabled people. His critique of academic research was part of a broader awareness of how research subjects often become part of the objectivist gaze of experts and, in the process, are drawn into exploitative relationships. Disabled

people, in this view, are passive victims, or 'psychological dopes' that feed into the academic production line. Reflecting on 15 years or so of research with/of disabled people, we seek to counter some of the views of Oliver and others and, in doing so, offer an analysis that stresses the positive roles of the academe, the importance of experts and expertism, and the roles and responsibilities that research subjects ought to assume and exercise in the process of research production.

Akiyoshi Inasaka, The University of Tokyo. Email: akiyoshi@ua.t.u-tokyo.ac.jp; Yukio Sadahiro, the University of Tokyo. Email: sada@ua.t.u-tokyo.ac.jp; *Spatio-temporal Analysis of Retail Distribution Classification by Clustering Process in Urban Space*

This paper proposes a quantitative method of analyzing and classifying the dynamic change of retail distributions in urban areas. A wide variation exists in the change of retail distributions. It depends on the type of stores, geographical location, retail strategy, and so forth. The description of such dynamics depends on the scale of analysis, from local to global. This scale variation has been drawing much attention of geographers. However, this kind of analysis has been done in qualitative rather than quantitative ways. The result is, in nature, subjective to some extent and consequently weak in its theoretical basis. Also the spatial scale of the analysis is rather macro scale. To resolve this problem, this paper introduces quantitative methods to describe micro scale spatial dynamics on a theoretical basis. The distribution of retail stores and restaurants are represented as a point data on GIS. In temporal sequence, new store opens which generates new point in the existing point distribution. This study applies buffer around each point to observe the topological relationships and spatial area with the existing distributions. The generated points and its buffer with topological relationship between existing distributions categorize into following four conditions: (1) complete overlap, (2) partial overlap, (3) connecting multiple clusters, (4) topologically and spatially independent. The order of the generating points with the topological classification describes the clustering process for each cluster. The analysis is done by statistical test by comparing with the random order distribution to see for the pattern in the process.

Alan Ingram. Email: a.ingram@geog.ucl.ac.uk; *Domopolitics and disease: HIV/AIDS, migration and security in the UK*

The development of highly-active anti-retroviral therapy has ushered in a new biopolitical mechanism: the power to sustain the life of individuals and populations affected by HIV/AIDS through the provision of anti-retroviral drugs, or to deny it by withholding treatment or failing to make it available. The question of entitlement and access to treatment has consequently become a pressing problem, particularly so in relation to migration and asylum, and the management of this field has become a frontline in the biopolitics of globalisation. In this paper I examine the problematisation of HIV/AIDS, migration and asylum in the UK between 2002 and 2005 through Walters' (2004) concept of domopolitics, which refers to the government of the state as a home. I trace the ways in which putative threats from HIV positive migrants and asylum seekers and people from areas with high rates of HIV infection, or a particular category of 'mobile uninsured species life' (Duffield 2006), were represented, politicised, contested and governed. I suggest that while people categorised in such ways appear to trouble public policy, their management is a field within which the role of the state and the integrity of the nation can be upheld in ways that answer to prevailing governmentalities. I suggest in conclusion that this analysis offers insights into the mutations of racism in planetary architectures of containment.

Mirill Ingram, University of Wisconsin-Madison. Email: mingram@wisc.edu; *On Fermentation and Rot: Considering places of microbial expertise*

The ongoing negotiations of our relationships with microbial bodies is reflected in the pages of mainstream media and also scientific publications where authors debate sources of *E. coli* contamination in food, ways of contending with multi-drug resistant disease organisms, and the health benefits of diverse intestinal microbial flora. Long standing medical and public health commitments to a "contain and control" approach to pathogens are recently being questioned in the face of continued food safety incidents, growing bacterial drug resistance and new technologies redefining pathogenic behavior of microbes. These debates have policy implications, for example, where concerns over food safety have led to restrictions for organic farmers on the uses of compost and compost teas. This discourse indicates a need to rethink current characterizations of human-microbial relationships and the places in which those relationships are realized. Zoos, wilderness areas, city parks, CAFOs, slaughterhouses have been analyzed as

places of containment of nonhumans. Other places such as compost piles, intercropped fields, a jar of kimchi offer different expectations, places where we leave microbes to do their work, places where they are expert. These are also places of "bargaining" and acceptance of risk. This paper examines the technologies of different ways of working with microbes and discusses the implications of the broader, underlying discursive framings of microbe-human relationships. The continued elaboration of ecological, economic, moral landscapes that we co-create with the non-human world is argued for. A conception of animals, even microbes, knowledgeable agents is key to this process.

Keywords: nature-society relations, microbes, animal geographies

Joshua F. Inwood, The University Of Georgia. Email: jinwood@uga.edu; *Sweet Auburn: Contesting the Racial Identity of Atlanta's Historically Significant African American Neighborhood*

In 2004 Big Bethel AME Church, Atlanta's oldest African American church, located on Auburn Avenue, announced the first substantial development project on the street in over sixteen years. Once home to the wealthiest African American community in the United States, Auburn Avenue went through a period of steep economic decline during the 1970's and 1980's and many in the community saw Big Bethel's \$45 million mixed-use project as a turning point for the street. Utilizing a multi-method qualitative approach that included archival research and open-ended interviews, this paper uses Big Bethel's redevelopment project to explore the racialization of place in an African American community, and suggests African Americans on Auburn Avenue engage in place making on the Avenue vis-à-vis a community nationalism discourse. This places Auburn Avenue firmly within the context of the black counterpublic.

Dimitri Ioannides, Professor, Missouri State University. Email: dioannides@missouristate.edu; *The Largest Industry! Myths and Realities about the Tourist Industry*

Much of the research in the field of tourism studies praises the sector's economic importance in a post-industrial society. We are told how this is the world's largest or second largest industry, that tourism accounts for a large share of national, regional, or urban economic wealth in western societies, and that there are numerous jobs created either directly or indirectly by tourism. The problem has been that many of these claims have been unsubstantiated and, it could be argued, this is the fundamental reason why some researchers (including geographers) have regarded the sector with evident skepticism. This paper aims to explore to what extent tourism is (or is not) a major player in the US urban economy. The investigation focuses on 30 metropolitan areas throughout the country. These include cities with obvious links to tourism (e.g., Las Vegas and Orlando) but also urban areas that are normally associated with other sectors of the economy. Part of the analysis involves the use of NAICS data from the Economic Census (for 1997 and 2002) and identifying sectors with obvious links to tourism. Location quotients for these sectors are measured for both years and a shift-share analysis reveals the reasons behind their growth or decline. The paper also explores why policymakers have a boosterist attitude towards tourism despite the lack of hard evidence to prove its economic strength

Keywords: Tourist industry, location quotients, shift-share analysis, boosterism

Vladimir Ira, Institute of Geography, Slovak Academy of Sciences, Bratislava, Slovakia. Email: geogira@savba.sk; *Everyday Life Activities and Sustainable Living: Time-Geographical Approach*

This paper is an attempt to presents a time-geographical approach that enables to investigate human activities of everyday life that have an impact on quality of life and sustainable/unsustainable way of living. The key point of the time-geographical approach is the spatio-temporal record of a rich complexity of everyday life. The individuals (respondents from Bratislava, capital of Slovakia) were asked to keep an open diary. The individual diary writers were expected to define what they experienced when performing the activity - how they assessed the activity from the quality of life and sustainability point of view. The time-space activity budget survey conducted in the city of Bratislava made it possible to investigate how people assess performed activities from the perspective of sustainable / unsustainable way of living and also to identify when and where they considered them as sustainable/unsustainable. The period between 7 a.m. and 10 p.m. was the most frequent time when performed activities (above all bus transportation, riding in a car, watching TV, education/school and work/gainful activities), were perceived as unsustainable by more than 10% of respondents. Households, means of transport, places of services, shops and places of work were the most frequent places where unsustainable activities were performed. The approach presented in this study is an example of how the complexity of everyday life may be treated within time-geography, sustainability and life quality concepts.

Keywords: time-geography, Slovakia, everyday life activities

Email: frank.galgano@usma.edu; *GIS Data Preparation and Model Development to Support Analysis in Military Geography*

Appropriate datasets and analysis techniques must be available to maximize the use of GIS to support military geography studies. This paper describes geographic dataset preparation and the development of analysis models to support the Military Geography course at the United States Military Academy. Datasets were built for the following studies; (1) compartmentalization of maneuver during the Civil War's Chattanooga Campaign, (2) The defense of West Point in the Revolutionary War focusing on line of sight analysis, (3) mobility study of the German offensive through the Ardennes in 1940, (4) the effects of terrain on artillery effectiveness at the siege of Dien Bien Phu, (5) river crossing analysis in Southern Iraq, and (6) a regional study of Afghanistan. The GIS software employed is ESRI's ArcMap 9.1 with various extensions. Major challenges in developing datasets include: georeferencing historical maps, adjusting current datasets to historic values, importing National Geospatial-Intelligence Agency (NGA) data, and developing data models for military unit locations and movement along with events such as battles. Analysis models were developed in ESRI's Model Builder and organized into a Military Geography Toolbox.

Keywords: GIS, Military Geography, Historical Analysis

Christina Irons, University of North Alabama. Email: tina.iron@gmail.com; Lisa Keys-Mathews, University of North Alabama. Email: lkeysmathews@una.edu; *Hurricane Katrina: Damage and Social Impact on Long Beach, Mississippi*

Hurricanes are one of the most dramatic, damaging, and potentially deadly natural disasters that occur in the United States. As they move ashore, they bring with them a storm surge of ocean water along the coastline, high winds, tornadoes, torrential rain and flooding. These factors can be catastrophic to the land area and the occupants in its path. Hurricane Katrina was the eleventh named storm, fifth hurricane and second category 5 hurricane of the 2005 Atlantic season. Katrina made landfall, as a category 3 hurricane, on the Louisiana/Mississippi state line on the morning of August 29, 2005. In essence this is a study of social vulnerability. According to Cutter, Boruff and Shirley, (2003) "Social vulnerability is partially a product of social inequalities?those social factors that influence or shape the susceptibility of various groups to harm and that also govern their ability to respond." (p. 243). The objective of this undergraduate research is to conduct an analysis of trends in structural restoration and reconstruction using satellite imagery then to relate these patterns to the socioeconomic and demographic landscape in the Long Beach, Mississippi area. The predicted findings of this research are that those areas categorized as "more vulnerable" will be the same areas where restoration and reconstruction have progressed the least. This research is sponsored by the Bottimore Undergraduate Student Research Fund from the Department of Geography at the University of North Alabama.

Keywords: remote sensing, social vulnerability, Hurricane Katrina, hazards

Jo-Ann Isbrecht, United States Geological Survey. Email: jisbrecht@usgs.gov; Miguel G. Velasco, USGS. Email: ; Pat Chavez, USGS. Email: pchavez@usgs.gov; *Mapping Coral Reefs Using Digitized Aerial Photography*

The United States Geological Survey (USGS) has been using remotely sensed image data to help map and study the coral reef on the island of Moloka'i, Hawai'i. Digitized aerial photography and airborne digital Scanning Hydrographic Operational Airborne Lidar Survey (SHOALS) laser bathymetry data were used to generate high-resolution digital image maps of the shallow coastal waters. Two sets of aerial image maps were generated having resolutions of 1 m and 0.3 m, whereas an image map generated using the airborne SHOALS Lidar data has a horizontal resolution of 2 m and a vertical resolution of 15 cm. The digital aerial-image mosaics were geometrically controlled using a combined image comprising a shaded relief image of the SHOALS Lidar bathymetry and a USGS digital topography map. An image generated by combining the aerial photo mosaic and a shaded relief of the SHOALS Lidar data has been useful in mapping bottom types and geomorphology on the inner-reef and fore-reef areas. In this image product, bottom features can be seen down to a water depth of 45 m, while features on the aerial photography alone can be seen only to a depth of approximately 20m. The digital georeferenced image maps have been used as a guide for extensive fieldwork, including on-the-ground validation and interpretation of the information seen in the remotely sensed data, and as a geographic base to plot results. Emphasis in this presentation is on the generation of the

digital aerial-photo image mosaics and the digital merging with the Lidar image data.

In this presentation, we report an empirical study of how people understand, evaluate, and use probabilistic seasonal climate forecasts. Students in a professional master's degree program in environmental science and policy participated in the study as prospective policy makers. They viewed a set of currently issued precipitation forecast maps, and answered questions designed to assess their understanding and evaluation of the maps, in the context relevant to agricultural and environmental decision making. Results showed that participants did not necessarily understand the information shown on the maps as the mapmakers intended. In particular, participants had difficulty understanding probability forecast maps correctly, by distinguishing probabilistic three-category forecasts and the amount of precipitation. In comparing forecast and observation maps, most participants evaluated the degree of agreement between the two maps as "agree only slightly" or "agree somewhat," and more than half of the participants were not inclined to use the forecasts in agricultural decision making. On average, they evaluated the forecasts as better, and became more inclined to use the forecasts, as an objective measure of agreement increased. At the individual level, there were large differences in the pattern of evaluation and use. Another group of participants answered questions about how to allocate water for agricultural use by viewing precipitation forecast maps, first individually and then in groups of three, each playing a role of a state officer, a local representative, and a farmer. We discuss how their evaluations and decisions varied depending on the role as a stakeholder.

Kaori ITO, PhD, Department of Architecture, Tokyo University of Science. Email: kaori@rs.noda.tus.ac.jp; *Identification of Business Agglomerations within an Urban Area: A Case Study of Tokyo*

A large urban area consists of various districts characterized with significant business concentration, which form an image of the city. The purpose of this study is; first to develop a statistical approach to identify areas of significant concentration of specific businesses, and secondly to show spatial distribution of characteristic districts in Tokyo in terms of business categories. To identify spatial extent of areas with a significant agglomeration of single or a set of businesses, we develop a spatial partitioning method using a multi-scale tree-structured spatial model and the Minimum Description Length criterion, which is an information theoretic criterion of model selection. Relative concentration of business categories in each area is measured using information entropy. The procedure is applied to the data of Tokyo. We use the yellow pages database in 2000 in Tokyo 23 wards area including approximately 630 thousand shops, offices, services and other businesses. Then the areas of some significant concentrations of electronic retails, used bookstores, small factories etc. are identified as well as the administrative district and major entertainment districts. Major findings from the observation are such as: (1) The major entertainment districts are divided into two groups; one is high concentration of restaurants and the other is a combination of restaurants and clothing retail shops. (2) Agglomerations of small factories are also divided into two groups; one includes a combination of stone and metal products and machinery and the other includes a combination of stone and metal products and chemical, rubber and plastic products.

Keywords: industrial concentrations, agglomerations, Minimum Description Length Criterion, business categories, Tokyo

Adrian Ivakhiv, University of Vermont. Email: aivakhiv@uvm.edu; Brian Miles, University of Vermont. Email: brian.miles@uvm.edu; *What's Clean, Green, Pure, White, Beautiful, and Threatened?: Brand "Vermont"*

In 1993 and again in 2004, the National Trust for Historical Preservation named Vermont one of the "most endangered" places in the United States due to development plans by discount retailer Wal-Mart. The company was thought to pose a grave threat to the character and soul of the mainly rural state and to its town centers and church-steepled villages. The viability of the "Made in Vermont" label—now applied to maple syrup, artisanal cheeses, yogurts, jams,

wood products, art—would stand to suffer if Vermont's image would be blemished by such an intrusion. This paper will look at the "branding" of Vermont as a state of both mind and body that is clean (sustainable, healthy, righteous), green (ecological, 78% forested), pure (GMO-free), white (snow-capped, ski-resorted, and mainly Euro-American), and inevitably threatened (by sprawl, Wal-Martization, et al.). Each of the elements that make up this image has its own history, with the whole not necessarily equivalent to the sum of its parts. In the case of the debate over wind power development, for instance, there is a marked tension between the "green Vermont" envisioned by wind developers and the ecological vanguard and the "beautiful Vermont" of unmarked ridge-lines defended by wind opponents. We will focus on recent debates over Wal-Mart and over wind power development as two sites in which images and visions of Vermont clash and clatter, with divergent voices and interests straddling over ridges of difference between urbanite and ruralite, birdwatcher and bear hunter, second-homeowner and trailer-dweller, "real Vermonter" and "flatlander."

Keywords: nature; branding; Vermont; landscape; wind energy; heritage

Dorothy Ives-Dewey, West Chester University. Email: divesdewey@wcupa.edu; *Constructing an Edge City: Communication, Collaboration and Land Use Planning in King of Prussia, Pennsylvania*

This paper examines the land use planning and development process in King of Prussia, Pennsylvania, an edge city in the Philadelphia region. Edge cities have faced considerable development and change over the past 50 years as they have transformed from agricultural areas to suburban bedroom communities to urbanized areas at a very rapid pace. The foundation for development in King of Prussia was set in the late 1950s. From its early development until today, images of growth and change have characterized deliberations over appropriate development regulation and land use planning processes, for projects big and small. Conceptions of development, and how they are expressed in a multitude of public and private forums, are critical to the land use planning and land development process. Using research data from an intensive case study of development planning in King of Prussia, this paper identifies the nature of communication in the land use planning process and the limits to communicative action and collaboration. The conversations and metaphors reflect how people involved in the creation of suburbia conceptualized their world and how these images and deliberations influenced development outcomes. The paper identifies challenges to discursive practice in the local land use planning process, including the local understanding of place and how it is construed and the way in which local land use processes structure participation.

Keywords: land use, planning, communication, edge city, suburb

Sukari Ivester, PhD, University of California, Berkeley. Email: sukari@berkeley.edu; *Health Inequalities and the Urban Foodscape: Evidence From Alameda County, California*

It is widely understood that diet plays a significant role in the causation and prevention of adverse health outcomes. While diet choices are most likely impacted by a constellation of factors, only a limited number of studies have identified and investigated the built environment as a factor that may critically hinder people's ability to attain a health diet. Using spatial analysis, this study investigates the impacts of neighborhood effects on health as a result of local nutritional environments or 'foodscapes' - food landscapes. More specifically, the study examines the spatial distribution of major chain grocery outlets and fast food retail outlets in relation to neighborhood income and racial characteristics, and neighborhood morbidity profiles. The present study generates much needed empirical data on geographic and economic disparities in retail food access in order to better understand the nutritional-related mechanisms which cause disparate health outcomes. An enhanced understanding of the context in which dietary choices are made has the potential to create more effective programs to decrease nutrition-associated morbidity. This study makes a further contribution in the emerging and interdisciplinary research field combining GIS analysis with more traditional public health/epidemiological methodologies, and offers a powerful visual representation of inequality.

Keywords: Urban, Health

Nicole Jachmann, Freie Universität Berlin. Email: nija@geog.fu-berlin.de; *Belfast - The separated city - "Ready for War, Prepared for Peace"*

This paper portrays the city of Belfast which is segregated due to ethnical and religious reasons. These factors result in (in-) visible boundaries which shape the cityscape as well as the population. Apart from outlining the conflict founded in historical events, the main focus of this paper lies on the depiction of events after the signing of the Good Friday Agreement and its arising effects. At present, no definite trend is discernible. However, it can be said that the Good Friday Agreement has not completely settled the conflict as riots and mutual distrust are commonplace. Another factor is that the continuous rise of the catholic population also has a negative effect on the delicate population structure of Northern Ireland. This paper concentrates on Belfast as this microcosm unites all

problems that prevail throughout Northern Ireland. Catholics and protestants clash in a restricted space, walls separate both religious groups and murals declare which territory you are currently on. This radically shows the extent of the ethnic-religious separation. This paper tells about the origins of this conflict to make its development more comprehensible. Consecutively, with the focal point on Belfast, depictions of other central issues like the development of the city, demography, culture and ethnic-religious segregation are made. Conclusively, on the one hand the main focus of this paper lies on the separated city of Belfast, on the other hand on the Good Friday Agreement which shall outline possible trends to give answer to an important question; In the end, will there be war or peace?

Keywords: religious conflicts, segregation, Northern Ireland, Belfast

Christine Jackson, Ryerson University. Email: ; Maurice Yeates, Professor, Ryerson University. Email: myeates@research.ryerson.ca; *Modeling Commercial Property Values in Outer Suburban and Exurban Locations in the Greater Toronto Area*

Whereas residential property values are reasonably easy to assess with acceptable accuracy, commercial property values are more difficult to estimate with similar precision. Residential property assessment benefits from the extensive research that has been undertaken in hedonic house price analysis, utilizing both global and local multivariate models, and the large annual databases of sales that can be compiled. Commercial properties embrace a wide variety of uses, but in very restricted locations due to zoning; and, there are comparatively few sales, even in the largest of metropolitan areas, in any year. Furthermore, the dynamics of commercial property development in outer suburban and exurban locations are different from those in inner and central cities due to their more recent development in an entirely truck/auto distribution environment, involving, for example, consumer driven mall/big-box/power centre retail systems, and mixed use commercial 'parks'. The task, then, is to develop a model for estimating outer suburban and exurban commercial property values that reflects these contemporary influences. The location for the empirical evaluation of the model are commercial property sales in the outer suburban and exurban municipalities within the Greater Toronto Area (GTA)

Keywords: Commercial property values, Toronto, SAR models, GIS

Paul Jackson, University of Toronto. Email: paul.jackson@utoronto.ca; *Funding Biodefense: Public Health, Bioterrorism, and the Emerging Infrastructure of Biosecurity Research*

The United States, post-September 11th, has been constructed as entering a new phase for both domestic policy and international security. Tom Ridge, speaking as the U.S. Department of Homeland Security Secretary, succinctly summarizes this period: "Terrorism forces us to make a choice. We can be afraid. Or we can be ready." In the current political and cultural climate, specifically in regards to the threat of bioterrorism, how is this fear and preparedness negotiated? No one chooses fear, therefore everything must be centered on "ready". How "ready" is framed, funded, used, and discussed in regards to health will be the focus of this paper. The shifts in politics, economics and urban spaces around bioterrorism and biodefense should be engaged while they congeal. Public health and urban security has become intertwined with discrete technologies, integrated systems, and urban utilities. In this paper the funding of biodefense by the NIH and NIAID was found to indicate a substantial shift in the health and science research communities. Project Bioshield and the Regional Centers of Excellence for Bioterrorism and Emerging Diseases Research illuminate a new national infrastructure or multi-city network of biodefense. Post 9-11 there has been the retrenchment or acceleration of the relationships between science, state funding, and public-private partnerships for technical and pharmaceutical products.

Peter Jackson, University of Sheffield. Email: p.a.jackson@sheffield.ac.uk; Neil Ward, University of Newcastle. Email: neil.ward@ncl.ac.uk; Polly Russell, University of Sheffield. Email: polly.russell@bl.uk; *"This is not just a chicken": the cultural economy of branding*

The business and marketing literature argues that brands are crucial resources for companies and that successful brands embody a company's core values. Introducing new brands involves a complex process of product development, marketing and consumer research. This paper draws on life history interviews to trace the development and marketing of a new brand of chicken: Marks and Spencer's 'Oakham White'. The development of the Oakham brand can be seen as a response to consumer anxieties about the intensification of agricultural production, designed to differentiate Oakham chicken from standard broiler chickens sold by Marks & Spencer's high street competitors. Oakham chickens are slower-growing than standard broilers, fed on a bespoke GM-free diet, reared at lower stocking densities and to higher animal welfare standards without the use of anti-biotic growth promoters. The brand name is intended to encourage

positive associations with the Britishness of the product, with the grower's name stamped on the label as further evidence of provenance and traceability. The paper argues that the Oakham brand is consistent with Marks & Spencer's core values (quality, trust and innovation) and seeks to respond to consumer demand for 'chicken the way it used to be'. The paper also explores the extent to which the branding process was consistent with the brand developers' narrative identities and personal moralities. The paper concludes that a cultural economy of branding must attend to the complex and changing meanings of food as well as to the business of technical innovation, product development and marketing.

Keywords: cultural economy, branding, life histories, food geographies

Clare H Jacky, Macalester College. Email: cjacky@macalester.edu; *Women Agriculturists, Sustainability, and Development in the Highland Region of Ecuador*

The country of Ecuador, while it possesses rich societal and environmental diversity, is challenged by political instability, economic crises, and areas of severe environmental degradation. For many reasons, including global economic flows, agricultural change, and economic collapse within the country, the participation and recognition of indigenous agricultural groups in rural areas of Ecuador has been transformed such that the roles, actions, and goals of women in many rural areas of Ecuador have evolved. This project examines changing agricultural systems in a highland region of Ecuador, focusing on participation and experiences of indigenous agriculturalists, especially the participation and experiences of women in this group. The project considers the sustainability of this region's human/environment relationships and alternative development strategies that take into account changes in agriculture practices and participants.

Keywords: Agricultural change, alternative development, gender, indigenous groups

Neil G. Jacobs, Ohio State University. Email: jacobs.8@osu.edu; *Singing geography: On defining Jewish space in Jewish cabaret*

The beginnings of cabaret are dated to 1881, with the performances at the Chat Noir in Paris. From there, cabaret quickly spread through other parts of Europe, and beyond. In its songs, skits, and monologues, cabaret offered a critique of modern society. Jewish participation in cabaret was considerable; while many of the doors of modern society were still closed to Jews, those of cabaret were frequently wide open. In addition to the Jewish participation in "general cabaret," we may also speak of (Ashkenazic) "Jewish cabaret." This Jewish cabaret may be described by a set of recurring structural features (Jacobs 2003). The present paper examines how Jewish spatiality is expressed in Jewish cabaret performance pieces. Data are drawn from songs and monologues from the past approximately 100 years, as performed in several languages and countries. Among the topics discussed is the reconceptualization of "Jewish turf" in the transition from Europe to America.

Keywords: Ashkenazic, Jewish, cabaret, ethnic, perceptual, turf

Arne Jacobson, Humboldt State University. Email: arne@humboldt.edu; Rebecca Ghanadan, University of California Berkeley. Email: rghanadan@berkeley.edu; *Grounding the High Tech Revolution in Africa: Understanding Access and Social Uses of Solar Electricity in Kenya*

Mainstream efforts to promote sustainable development and poverty alleviation are increasingly focusing on marketing cutting edge technologies to the four billion people who live on less than \$4 per day. This approach, often referred to as marketing to the "Bottom of the Pyramid," (BoP) is based on the idea that private companies can earn profits delivering products and services that improve the lives of the world's poorest people. While poverty alleviation is a laudable goal, our research on market-based solar electrification in Kenya highlights the need for attention to access. Our evidence indicates that solar ownership is dominated by the rural middle class, rather than the rural poor. We also find that some social uses - such as television viewing and entertaining guests - are often privileged, while others - such as domestic work around the gendered space of kitchens or evening-time studying by children - may be marginalized. More broadly, our work indicates that, in addition to the characteristics of the technology itself, the social significance of household solar electric systems is strongly shaped by three dimensions of technology access and use: (i) purchasing power and the distribution of ownership, (ii) intra-household allocation of electricity among competing uses, and (iii) the social organization of space in the home. These findings do not negate solar technology's potential to contribute to rural development, but they do show that the social implications of even a technology with solar electricity's "small is beautiful" reputation are not pre-given or guaranteed.

Keywords: development, Africa, access, solar, energy, technology

Lynette Jacobson, University of Iowa. Email: lynette-jacobson@uiowa.edu; *No Room at the Inn? How Women's Mobility is Impacted by Midwifery Law in the US and Canada*

Birth does not take place within a sterile, muted, or indifferent space, but rather within a complex social and political landscape. This paper will examine how variations in state and provincial midwifery law impact living location decisions and birthing decisions among midwives and among those wishing to have midwife-attended births. The mobility of midwives and of women who have certain birthing goals, or even midwifery-related educational or career goals, is substantially limited. Midwifery and homebirth practice can be understood as a problem of service access as well as an issue of restricted residency options. If health is a human right (and the Universal Declaration of Human Rights indicates that it is), is it permissible that valid choices around our health and the health of our children be spatially restricted? Is this merely a portability of profession complication or are greater issues of power and authoritative knowledge at stake? Those who are not clearly part of the mainstream model of health can become socially excluded, and to some extent, culturally disabled, lacking access to services (rendered on their own terms) that others take for granted. Different rules persist for homebirths and midwives in different places and by looking at American and Canadian law and homebirth/midwifery practices, from both quantitative and qualitative perspectives, it is possible to examine this issue of mobility. How does this mobility restriction affect midwives and homebirthers? How do these women deal with locational and mobility obstacles?

Keywords: midwifery, birth, service access, mobility, health

R Dan Jacobson, PhD, University Of Calgary. Email: rjacobso@ucalgary.ca; *The role of technologies in the inclusion of the blind or visually impaired people in the information society*

Some authors have suggested that disability is entirely socially constructed, that individuals with impairments have been excluded and marginalized from mainstream society, not by the impairments themselves, but by society's attitudes towards them and its lack of inclusive practices. At the other end of the spectrum, researchers striving for ways to include disabled people within society, hold the view that disability can be overcome, mediated, or "cured" through technology. This paper critically evaluates the middle ground between these two polarized positions, exploring the perspectives adopted by geographic researchers seeking to provide technology to the non-visual community to increase their ability to participate more fully in society's activities. The adoption of certain technologies and their related infrastructure has had far reaching implications for the non-visual community. For example, the solution to make computers accessible to non expert users through a system of windows, icons, menus and pointers (WIMPS) and these being universally accepted in operating systems has made computers' inaccessible to blind people who previously navigated through textual interfaces that were read aloud. Later software developments facilitated the navigation of a WIMPs based interface. Parallels have also occurred more recently during the growth of the World Wide Web, the highly graphical nature of many websites have excluded not only non visual users, but those with low band width connections or portable devices with small screen sizes. A large amount of retrofitting to ensure web accessibility has been conducted, often within the United States under the threat of Federal legislation.

Keywords: technology, blindness, mapping, information

Doreen Jakob, Center for Metropolitan Studies. Email: doreen.jakob@metropolitanstudies.de; *Creative industries cluster and urban growth coalitions: From collective production networks to collective promotion.*

The notion of creative industries has moved sharply onto the research agenda of urban and economic theorists in the past years and raised much debate in both scholarly and policy circles about its various meanings and practical applications. Intra-metropolitan creative industries clusters are considered to be an extremely desirable, yet in some ways unpredictable, form of urban development. They generate competitive advantages, are incubators of a specific infrastructure and perceive turf of artistic and economic innovation. Though spatial concentrations of creative activities are not a recent phenomenon, the reasons behind collective action and agglomeration as well as the forces that drive and foster them have changed. Today creative entrepreneurs collaborate with local businesses and policy makers in developing and branding their locations into visible creative industries clusters as a way to better promote and mediate creative goods and services. Artistic agglomerations are more and more used as a collective marketing strategy for creative activities and the promotion of their locations than mere production sites. This presentation is based on an extensive qualitative study of four emerging artist neighborhoods in New York City and Berlin. It analyzes the activities of cluster actors, the formation of networks, and examines their outcomes. The study concludes that investments and support to creative industries in the specific case study areas is often not geared towards fostering the sector itself but aims for the secondary effects of its presence as a

strategy of amenity driven economic growth.

Keywords: Creative industries, cluster formation, urban development

Marek K Jakubowski, University of California, Berkeley. Email: marek@berkeley.edu; Assessing OBIA-Based Vegetation Classification Using AVIRIS Data

Recent studies have shown that segmentation of remotely sensed imagery prior to analysis may result in more fruitful results. Much research has focused on utilizing high spatial-resolution imagery for this purpose, but there has been little emphasis on taking advantage of hyperspectral imagery's rich information content. Particularly, applying hyperspectral imagery in object-based image analysis (OBIA) research has been lacking. This study applies AVIRIS imagery to analyze the effectiveness of hyperspectral data for OBIA in Sierra Nevada region. This talk will compare OBIA classification accuracies of both hyperspectral and high spatial-resolution remotely sensed imagery.

Keywords: Remote Sensing, GIS, hyperspectral, OBIA

Susan L. Jakubowski, University of Cincinnati. Email: jakubosl@email.uc.edu; Tibetan Buddhism in the United States

Tibetan Buddhism has traditionally been classified as an ethnic branch of the universalizing Buddhist system. It is inextricably tied to the culture, politics and people of Tibet, where it has been practiced almost exclusively for centuries. Tibetan Buddhism was spread beyond this region on a large scale only after the political annexation of Tibet in 1959. As of 2006, there were approximately 608 Tibetan Buddhist practice centers in the contiguous United States. While the impetus for the relocation of Tibetan Buddhism outside of Tibet is clearly related to the political situation, the explanation for its continued diffusion is not so evident. Through its portrayal in American popular culture, Tibetan Buddhism has become representative, if not synonymous with the political struggle for independence of the nation of Tibet. This study seeks to examine whether the motivation for the spread of Tibetan Buddhism in the United States is a result of a continued political agenda on part of Tibetans and their supporters or whether it is a cultural phenomena related to the recent and increasing popularity of non-traditional religious alternatives. An examination of the locations of the Tibetan Buddhist practice centers would suggest that its diffusion is a result of American demand rather than the result of any political agenda.

Keywords: Tibetan Buddhism, diffusion, religion

Al James, Dr. Queen Mary, University of London. Email: AJ210@cam.ac.uk; Repositioning the 'business case' for work-life balance geographically: everyday worker experiences in Dublin's IT cluster

Within the New Economy, the desirability and means of achieving an appropriate 'work-life balance' (WLB) has received ever-increasing attention from governments, management, trade unions, academics and the media. 'Defined' as 'the absence of unacceptable levels of conflict between work and non-work demands' (Greenblatt, 2002: 179), WLB has assumed a particularly strong significance in the UK and Ireland where average work hours are the longest of all EU member states. For workers, a lack of WLB can mean increased stress, negative effects on psychological and physical well-being, and increased family and marital tensions. However, many commentators increasingly recognise that employers are only likely to introduce meaningful WLB policies if they anticipate business benefits arising from their implementation. Nevertheless, there remains a dearth of empirical evidence to support the WLB 'business case'. Additionally, significant conceptual and methodological limitations impede firm conclusions from the studies that do exist: not least, the WLB literature is profoundly aspatial, with little or no sense that firms' economic activities actually occur in and across regional, urban and local spaces, themselves embedded in national regulatory and institutional frameworks. Drawing on preliminary results from ongoing research in Dublin's IT cluster, this paper begins to explore the concrete intra- and inter-firm mechanisms through which different WLB practices and policies function to enhance firms' innovative capacities, as experienced by workers across the work-home boundary. In so doing, it seeks to connect the expansive WLB literature with new intellectual developments in the economic geographical regional learning and innovation literature.

Keywords: work-life balance, work, innovation, cluster, region, Dublin

Ann Myatt James, The Pennsylvania State University. Email: amj204@psu.edu; Assessing Alternatives: Examining the Alterity of One Oklahoma Farmers' Market

An increasing number of Americans make use of alternative forms of agriculture, including organic, fair trade, and local food systems. This is driven, in part, by fears of contamination as well as an increased interest in sustainability (Ostrom, 1997). Some of these systems, such as community-supported agriculture seek to "challenge the fundamental commodification of food" (Hinrichs, 2000: 298), while others do not. The farmers' market provides a vehicle through

which to examine the question of the alterity of alternative forms of agriculture. Once an important element of conventional agricultural distribution, the farmers' market has become a space bridging formal and informal economies and conventional and alternative spaces of exchange. This paper presents empirical results from a study of the activities of vendors participating in an Oklahoma farmers' market. Specifically, it focuses on four questions: (1) To what extent do vendors engage in behaviors that prioritize non-economic themes and relationships (e.g. morality, friendships, environmentalism) over goals related to economic self-interest? (2) How are these behaviors demonstrated (explicitly and implicitly) within the space of the marketplace? (3) How are the motivations of individual actors regulated in order to reproduce the alterity of the market? and (4) To what extent do tensions exist due to the differences in the way vendors (re)embed their commodities within the local context? Answers to these questions provide a means of unpacking and assessing the alterity of the farmers' market.

Keywords: alterity, diverse economies, farmers markets, alternative agriculture, Oklahoma

Chaney James, Western Kentucky University. Email: James.Chaney@wku.edu; The Rise of the Hispanic Enclave in Davidson, County

In recent years, the United States has observed a significant increase in the Hispanic population within its borders through immigration. Since the 1980s, there has been a shift in the immigration and movement of the Hispanic population from border states to states in the southeastern United States. Many Hispanics, attracted by the large availability of jobs, have moved into growing metropolitan areas in the southern U.S. In some of these cities, new Hispanics immigrants have created distinct enclaves. These enclaves provide almost all needs for the Hispanic community, such as shopping, healthcare, legal assistance, dining, employment, entertainment, and religion. This study examines the creation and functionality of the burgeoning Hispanic enclave within Davidson County, Tennessee through fieldwork, in-depth interviews with immigrants, volunteer work with Hispanic organizations, and census data. It suggests that the rise of this enclave, complete with Hispanic cultures, businesses, organizations, and churches, is interfering with the assimilation of Hispanics into the local community. Preliminary results indicate that many Hispanics choose to function almost entirely within this enclave and that the enclave creates an environment in which immigrants do not need to intermingle with the host society. While Hispanic enclaves can serve as an important transition tool for newly arrived immigrants, these findings suggest that ethnic enclaves can also have negative impacts on assimilation into the larger host community.

Keywords: Ethnic Enclave

This satellite based study was carried out with the primary aim of understanding how the mangrove ecosystem in the Niger Delta has been altered in the recent past. Specifically, we determined the spatial extent of the mangrove forest in the Niger Delta using remotely sensed satellite data (Landsat TM & Landsat ETM+) and estimated changes in the spatial extent of the forest from the mid-1980s through 2003. Field work was conducted in the study area during summer 2005 to collect data used for accuracy assessments and to document the factors responsible for the changes identified through the satellite analysis. Overall, a total of about 21,340 hectares of Mangrove forest was lost in the Niger Delta over the study period. Fieldwork confirmed that these losses were primarily due to urbanization, dredging activities, activities of the Oil and Gas industries, and the spread of the exotic *Nypa Palm* (*Nypa fruticans*) species.

Keywords: Mangrove vegetation, Remote Sensing, Niger Delta, Land Use/Land Cover.

L Allan James, University Of South Carolina. Email: ajames@sc.edu; Physiographic and Historic Underpinnings of Flood Hazards in the Sacramento Valley, California

This paper evaluates conditions underlying modern flood hazards in the Sacramento Valley, a broad alluvial plain with natural levees grading down to low backswamp basins. Broad areas of this so-called 'Inland Sea' were frequently inundated up through the Anglo-American settlement period. Hydraulic mining delivered massive volumes of sediment causing several meters of channel aggradation, and extensive leveeing in response further transformed channels.

These changes did not alter the reality of low flood-prone basins along the lower rivers terminating in a low inland delta. In the early twentieth century, an innovative channel bypass system was implemented that routes flood waters through broad, ephemeral, channelized floodways. The NFIP further encouraged structural flood control in the Valley, but these developments along with levees re-engineered to protect against the 1%-chance flood fed the mis-perception that lowlands were safe from flooding. Rapid urbanization has accelerated recently with development moving aggressively onto flood-prone basin and deltaic lands, generating large residual flood risks and unprecedented social vulnerability. Densely populated areas such as Natomas in the American Basin are prone to deep catastrophic flooding if levees fail. Flood conveyance systems have proven difficult to maintain and levee decertifications may place large areas within the 100-year floodplain requiring mandatory purchase of flood insurance. Moreover, climate-change scenarios now predict increasing flood variability and larger spring floods. The growing risks raise doubts that structural flood control methods alone can provide adequate flood hazard mitigation. Sustainable planning measures are needed that include limits to development in flood prone lands.

Keywords: flood, hazards, California

Ryan James, University of Cincinnati. Email: jamesrs@email.uc.edu; *The Determinants of Casino Gaming Demand in Indiana*

Over the past two decades, legalized casino gaming as a means of redevelopment and tax revenue has become a hot topic. This stems from shrinking federal funding to local governments, a need for communities to "reinvent themselves", and the ability of a casino to provide new jobs and tax revenue. Currently ten states have legalized gaming, and it has been proposed in several neighboring states attempting to win back lost tax revenue. This scenario is playing out in the Ohio, Kentucky, and Indiana area. An early adopter of gaming, Indiana has eight casino sites, of which five border Kentucky or Ohio. In an effort to bring back lost revenue, the issue of legalizing gaming has been raised in Ohio and Kentucky. The assumption is that a more local option would keep resident funds in state. To test this assumption, a model of gaming consumer behavior in this market must be constructed. As a part of this larger study, this paper examines the determinants of casino demand. A literature review suggests the key variables in determining casino popularity are payback, number of gaming positions, and proximity to consumers. Using data provided by the Indiana Gaming Commission and United States Census Bureau, these variables are tested to determine their significance in the popularity of Indiana casinos. Results indicate that gaming positions and proximity to customers are the strongest variables. These results are then used to argue that a Huff Model approach is the correct approach to modeling gaming consumer choice patterns.

Sarah W James, PhD Candidate, University of Western Sydney. Email: sarah.w.james@gmail.com; *Diversity and the Metropolis: Complicating the Global City Agenda*

This paper explores the diverse claims to space that challenge the primacy of economic and property development in the growth of a global city. With a focus on Sydney, this paper will explore how the co-existence of multiple and divergent indigenous, migrant and settler groups complicate the dominant narrative of urban development. From these diverse presences in the city arise claims that emphasise alternative values in relation to land, beyond solely those of exchange value. In asserting the importance of heritage and of sustainability, in the form of urban agriculture, these groups present counter-narratives of legitimate land use. This unsettles dominant discourses of 'growth' that present land 'release' and property development as the central imperative in Sydney's urban planning. This paper will use these alternative framings of space to map the diverse interests that intersect in growth at the urban fringe, illustrating the cultural complexities that must be negotiated as Sydney expands. Such a mapping raises questions as to what should constitute the very form and fabric of the metropolis. As the metropolitan boundaries expand, the diversities encountered at its edges complicate narratives and agendas of growth. The economic framing of the global city is troubled by the cultural and land use diversity that must now be negotiated as part of, rather than outside, the urban.

Sung-Gheul Jang, University of Illinois at Urbana-Champaign. Email: sjang3@uiuc.edu; Tschangho John Kim, University of Illinois at Urbana-Champaign. Email: tjohnkim@uiuc.edu; *Development of an Interoperable GIS using Canonical Geospatial Concepts and Methods*

Recent advancements in web-based GIS technologies and the vast increase of location-embedded information by the proliferation of economical yet precise positioning technologies significantly increase the need for integration of heterogeneous geospatial resources. The integration, however, becomes a very challenging subject in the geographic information science field since it requires

overcoming inherent impediments due to the use of heterogeneous geospatial information with different structures and meanings across multiple information sources. Through a modeling process for a specific GIS application supporting travelers' decisions in everyday life, a multimodal travel guide service, this study shows how canonical geospatial concepts based upon the ISO 19100 series of international standards for geographic information would feasibly and effectively contribute to achieve the syntactic and semantic interoperability among distributed and heterogeneous geospatial information sources. With its implementation by employing the canonical geospatial concepts and methods of the ISO 19100 series, such as rules for application schema, geography markup language, and specifications for the web-based GIS, this study demonstrates unambiguous geospatial data exchanges between the multimodal travel guide service and its multiple distributed information sources, as well as between the service and its clients. This study confirms that the GIS standards published through the international consensual process provide a pool of canonical concepts and methods to specify geospatial information unambiguously so that we can achieve the full spectrum of interoperability during geospatial processing by using the concepts and methods in a consistent manner. Finally, this study addresses several salient implications of international GIS standards for GIS education.

Piotr Jankowski, San Diego State University. Email: piotr@geography.sdsu.edu; Arika Ligmann-Zielinska, San Diego State University. Email: ligmannz@rohan.sdsu.edu; *A Framework for Sensitivity Analysis in Multiple Criteria Spatial Decision Making*

The purpose of sensitivity analysis in multiple-criteria spatial evaluation is twofold: 1) test the ranking stability of spatial alternatives in response to changes in multiple-criteria evaluation components including criterion weights or criterion scores, and 2) account for uncertainty inherent in the decision situation. In particular, two common approaches to the analysis of criterion weight sensitivity involve simulation of weights within an arbitrarily selected weight value interval (probabilistic approach) or changing the initial weight values up or down, and observing the corresponding shifts in the ranks of spatial alternatives (non-probabilistic approach). Another version of the non-probabilistic approach is to compute changes in weight values necessary for a selected alternative to move up or down in the ranking. These approaches, however, do not address adequately all information needs concerning the stability of decision option ranking and the relevance of evaluation criteria. In this paper, we present a framework, which groups different techniques of sensitivity analysis by components of multiple-criteria spatial evaluation. The framework includes four groups of methods: 1) methods focusing on examination and modification of decision variant list, 2) methods focusing on examination and modification of criteria list, 3) methods focusing on examination and modification of criteria weights, and 4) methods focusing on examination and modification of the ranking of spatial alternatives. We discuss briefly different techniques comprising each group, present their application areas, and comment on their applicability to individual and group-based multi-criteria spatial evaluation situations.

Susanne Janschitz, University of Graz, Austria. Email: susanne.janschitz@uni-graz.at; *An Interactive Information System as a Tourism Marketing Tool - The Example of Two Austrian Communities*

Two former mining towns in Austria took the chance of the EU-Project READY, dealing with rehabilitation and development in mining regions, to restructure their economy and foster on their progress in tourism and/or industry. Since an analysis of tourism marketing instruments showed clearly a lack in spatial representation, the communities decided to install an interactive information system for tourists. The paper will illustrate the conflict between "interactive maps" and "web-based (Geographic) information systems" by a number of pros and cons for both alternatives, and will finally present arguments for the decision to design and implement an "interactive map". Based on the three main principles of a tourist map - to inform, to give orientation and to promote - the steps in the design process will be shown. Starting with the configuration of a basic map, different layers offer the chance to present a wide spectrum of information on a modular basis, multimedia functionality guarantees a user oriented interface. Finally the main challenges for future research steps will be discussed, e.g. additional functionalities like 3D aspects, online reservation etc. Looking closer into more technical approaches, a combination of webGIS with a multimedia authoring program might be fruitful on the way to an easy to handle (and maintain) interactive tourism marketing tool.

Keywords: tourism, web-mapping, information system

David R. Jansson, Vassar College. Email: dj28@cornell.edu; *American Secessionist Movements: the Rejection of Empire and the Retreat to the Local*

This paper will analyze the rise of secessionist movements in the United States and the scalar nature of their agendas. The recent North American Secessionist Convention, held in Burlington, Vermont in November 2006, brought together dozens of secession activists from at least a dozen different secessionist groups such as the Second Vermont Republic, the Cascadian Independence Project, the Alaskan Independence Party, the League of the South, and Christian Exodus. In addition, there is now a secessionist “think tank” in the form of the Middlebury Institute, convener of the convention. This paper discusses the similarities and differences among these groups and considers the role of corporate globalization and U.S. imperialism in providing the impetus for these efforts. Secession as a strategy for creating more responsive and just political entities will be discussed, as well as the obstacles and pitfalls facing this movement.

Keywords: secession, United States, empire, globalization

Johan Jansson, Dr, Uppsala University. Email: johan.jansson@kultgeog.uu.se; Dominic Power, Dr, Uppsala university. Email: dominic.power@kultgeog.uu.se; *Trade fairs in global circuits: polycentric networks of temporary clusters in the furniture industry*

Debates about the future for firm and local cluster competitiveness in the global knowledge economy have postulated an increasing importance of the city-regional scale and suggested a complex interrelationship between the role of major city-regions as nodes in the global economy and their polycentric, multi-clustered spatial form. This paper suggests understandings of economic activities’ complex local and regional anchoring must be linked to understandings of the complex spatial and temporal relations that exist between different markets and clusters within the global economy. Using the example of the knowledge- and image-intensive global furniture and design industry, we attempt to show the complex scales and temporalities that make up the geographies of connectivities of firms within and beyond the city-regional sphere. We argue that local furniture firms and regional clusters journey to the market through intermediary spaces: principally trade fairs. These trade fairs are not simply temporary gatherings but business places linked together in global circuits; circuits which represent microcosms of the industry and function as effective marketplaces. Although fairs are short-lived events we argue their presence in the business cycle has lasting consequences for the organisation of markets, industries and firms. Trade fairs are crucial ‘nodes’ or ‘points of assemblage’ for the markets, innovation processes, and industrial dynamics that firms compete within. The paper is based upon extensive empirical research at fairs in Stockholm and Milan. The paper addresses the theme of polycentricity by focusing on the increasingly polycentric nature of contemporary global industrial and market circuits and spatialities.

Claire Jantz, Shippensburg University. Email: cajant@ship.edu; Scott J Goetz, PhD, The Woods Hole Research Center. Email: sgoetz@whrc.org; Peter Claggett, Chesapeake Bay Program. Email: PClaggett@chesapeakebay.net; David Donato, U.S.G.S.. Email: didonato@usgs.gov; Kyle D Shenk, Shippensburg University. Email: ks8997@ship.edu; *Simulating and forecasting urban land cover change in the Chesapeake Bay watershed*

Declining water quality in the Chesapeake Bay is due in part to disruptions in the hydrological system caused by urban and suburban development throughout the 168,000 km² watershed. Increases in this impervious surface cover alter the hydrological regime and have a negative impact on water quality, but can have differential effects depending on where and how land use change has occurred. Predictions of future land cover are important for a number of Chesapeake Bay Program partners’ goals, including targeting for restoration, assessing the impacts of possible restoration goals and mitigation scenarios, and determining the vulnerabilities of various resource lands to future land conversion. We describe a regional predictive modeling system, based on the SLEUTH cellular automata model, that has been developed to provide regional assessments of future development and explore the potential impacts of different regional management scenarios. We will provide an overview of the model, an assessment of its performance, the results of calibration and spatial predictions, and the relevance of the work in terms of policy formulation and restoration of the Bay and its tributaries.

Keywords: Chesapeake Bay, SLEUTH, urban geography, land cover change

Sarah Jaquette, MA, University of Oregon. Email: sjaquett@uoregon.edu; *Endangering Organ Pipe?: Deploying Nature against Migrants in the Arizona Borderland*

This paper investigates the contested landscape of Organ Pipe Cactus National Monument in Arizona. Organ Pipe is one of several biodiverse parks in the Sonoran Desert along the US-Mexico border that shelters undocumented migrant activity, which has been on the rise since 1990s immigration policies channeled migrants away from urban crossings into the wilderness. As migrants impact vulnerable ecosystems, the case against immigrants is “greening.” This discourse draws on a biological metaphor that casts immigrants as an “invasive species” “endangering” wilderness. Much of the alarmism about this landscape ignores the human history there, coding current use as dirty and ancient use as romantic. But pitting immigrants against a sacred American wilderness landscape is a familiar trope of nationalist discourse in US history. Conservationism has often made nationalism, xenophobia, and racism politically palatable. In this interdisciplinary paper, I will explore the history and rhetoric of this green nationalism, and argue that reviving green nationalism fails to account for the the political-economic context that puts migrants there in the first place. In a post-9/11 world, defending the border’s environmental security is a guise for protecting national—even racial—purity. Combatting green nationalism, as I hope to demonstrate, is as much about language and values as it is a matter of policy and global economics.

Steven Jareb, San Diego State University. Email: jareb@rohan.sdsu.edu; *Videoleters: Talking about place, memory, and identity in the former Yugoslavia*

A great deal of effort has been made by scholars to understand how collective memory and national identities are formed and sustained as well as how they change. Geographers have been especially helpful in analyzing how these fluid memories and identities are inscribed in the landscape. In respect to post-national situations, most academic writing continues to focus on how these new nations are imagined; often overlooking difficult questions such as what happens to a collective memory and national identity once the nation no longer formally exists? Or, where can a collective memory be inscribed or sustained in the landscape when other national identities are normalized? To explore these issues, I analyze episodes of the Videoleters documentary film project, filmed between 1999 and 2004 by Dutch filmmakers Eric van den Broek and Katarina Rejger, who sought to reconnect friends on opposite sides of the Yugoslavian conflict through videotaped “letters.” In April 2005, in an unprecedented event, ten episodes of this project were simultaneously broadcast on primetime television in all of the post-Yugoslav nations. By employing a visual and textual analysis of both the cinematic elements and the dialog between participants, I explore and present thematic issues found within Videoleters that help enhance understandings of collective memory, identity, and place in and through a former nation.

William “Todd” Jarvis, Senior Researcher, Oregon State University - Institute for Water and Watersheds. Email: todd.jarvis@oregonstate.edu; *Knowledge Entrepreneurs as Sources and Solutions to Conflict over Groundwater Resources*

Conflicts over groundwater resources arise due to the plethora of beliefs surrounding the occurrence of water under the land held by the various parties. Individuals involved with land development and geoscience professionals have theories on how water occurs and flows in the subsurface regardless of their technical background. Conflicts over groundwater resources require a holistic approach to address multidisciplinary and multimedia issues because they are often large in scale, broad in impacts, laden with values, and in many cases involve matters of culture, economics, justice, health, risk, power, uncertainty, and professional, bureaucratic, and electoral politics. Good process and improved relationships are the traditional measures of effective mediation in other conflicts but are insufficient for use in water cases. Groundwater science is at the core of groundwater resource issues because the interests and options are not easily defined without the assistance of specialists who can interpret causal chains. However, there are few practicing mediators who are trained in water science and engineering. Likewise, scientists and engineers typically do not receive training in professional communication in their technical curriculums at colleges and universities. This deficiency leads to misperceptions in the roles of the technical professionals in the discussion and solution of a wide range of societal problems, particularly those focusing on water. But this deficiency also leads to conflicts between technical professionals serving as “knowledge entrepreneurs” regarding the discussion and solution of groundwater resource problems. Case studies will underscore the evolving field of knowledge entrepreneurs mediating scientific solutions to environmental disputes.

Keywords: Conflict Resolution, Groundwater, Water Resources

Alex Jeffrey, Newcastle University. Email: alex.jeffrey@newcastle.ac.uk; *Whose Europe? The competing narratives of Bosnian accession to the European Union*

This paper will explore the question of what it means to 'be European' in contemporary Bosnia. As the international organisations created as a post-conflict state architecture in Bosnia are gradually transformed into European institutions, international presence in the country has gained renewed legitimacy. The Stabilisation and Association Agreement, a precursor to accession, set new conditionalities attached to 'becoming European', broadly these have aimed to strengthen the internal coherence of the Bosnian state which was so fragmented following the 1995 Dayton Peace Accords. Drawing on fieldwork conducted in Bosnia over the last three years, this paper will examine the reaction of individuals within civil society groups and political parties in Bosnia to such processes of 'Europeanization'. Rather than enunciating simple resistance or acquiescence, these localized narratives demonstrate the range of political and cultural signifiers invested in becoming European. Drawing on the conceptualisations of Slavoj Žižek and Slavenka Drakulic, I will argue that these accounts comprise an indication of the uncertainties and ambiguities in the European project. This paper will thus provide critical reflection on the process of European enlargement on the Balkan Peninsula and how European subjectivities are reformulated in the context of contemporary Bosnia and Herzegovina.

Jerzy J. Jemiolo, Ball State University. Email: jjemiolo@bsu.edu; Gabriel Popescu, Indiana University South Bend. Email: gpopescu@iusb.edu; *The Airline Industry and the Reterritorialization of the European Space*

The liberalization of air transport activities within the European Union (EU) has resulted in the reorganization of West European international air network from one dominated primarily by links between capital cities to a very cohesive web of routes from hubs to secondary cities, as well as between secondary cities. Such reorganization means that EU's air network has been reterritorialized in a more all-European way, where national borders do not matter much, rather EU borders become more relevant. Some East European countries however, have agreed to adopt the EU's air transport development model only in late 1990s in the context of their prospective EU membership. This research addresses the question whether the international passenger links of Poland and Romania have followed the West European pattern of airline network reterritorialization, as a result of their closer association with the EU. The change is measured by the number of routes, frequencies, and volume of passenger flows, when available. The preliminary results indicate that a revival of East European regional airports is under way. This trend started in mid-1990s when both countries' prospect for joining the EU increased. Since 2004 international traffic at secondary Polish and Romanian airports has skyrocketed. There are already, for example, more daily flights from Krakow to the United Kingdom, or from Timisoara to Italy, than from these two cities to their respective capitals. The network is poised to expand even more in the next years leading to further reterritorialization of the air network within the EU.

Keywords: Europe, reterritorialization, air transport

William Jenkins, York University. Email: wjenkins@yorku.ca; *Parish and performance in early twentieth-century urban America*

Geographers and historians of early twentieth-century North American cities have tracked the increasing partitioning of these cities' geographies between downtowns, industrial zones and residential districts. They have, more recently, grappled with other ways of studying and capturing experiences of urban 'modernity' during this era through the analysis of urban form and representation, material culture, and aspects of public performance. Such modernity did not proceed in a linear fashion without conflicts and struggles, of course, yet discussions of these remain quite secular in their focus. While the anxieties of religious leaders concerning the secularizing effects of such modernity have been noted, theological impulses within their denominations also promoted the organization of new forms of socialization and observance within particular times and spaces. These latter impulses provide the context for this paper's attempt to contribute a religious dimension to these urban modernity studies through the study of emergent geographies and practices of 'devotional Catholicism' in early twentieth-century Buffalo, New York. The newspaper of the Buffalo Catholic diocese, the Union and Times, provides the main source material for reconstructing these past practices within the context of the parish. Regular reports of parish activities provide glimpses of the practical routines structured by men and women that all operated, to various degrees, under the guidance of the Catholic clergy. Improvements in the standard of living for families by the early 1900s provided opportunities for senses of moral and religious conduct to become sharpened while parishes also provided venues for the molding of 'hyphenated'

ethnic identities.

Keywords: religion, identity, practice, parish, performance, urban, America

Hillary Jenks, University of Southern California. Email: hjjenks@yahoo.com; *Contesting and Creating Ethnic Community: The Political Landscape of Memory in Little Tokyo*

The neighborhood of Little Tokyo has long occupied a liminal place in the cognitive map of Anglo Los Angeles despite its proximity to City Hall and the downtown business district. But for Japanese Americans, Little Tokyo was the center of pre-internment community life and is still considered the ancestral or symbolic home of later generations of Japanese Americans in Southern California. It is the landscape through which collective memories of Japanese American experience are expressed, shared, and formalized. Many of the narratives about the past produced by both informal and institutional spaces in Little Tokyo project a narrative of sacrifice, suffering, and redemption in the context of internment and military service, a narrative that articulates neatly with American tropes of overcoming hardship as a process of "earning" citizenship and its benefits. However, such narratives are also contested in alternative interpretations and representations of these spaces that describe a special role for Japanese Americans in making demands of their government, rather than just sacrifices to it. The incorporation of draft resisters and the successful redress campaign into the commemorative landscape of Little Tokyo shares a claim on American belonging with the more traditional narrative of veterans and survivors, but also allows for more progressive visions of community and citizenship. The museum exhibits, memorials, and preservation projects of this landscape reveal a process of debate, disagreement, and sometimes consensus through which Japanese Americans have envisioned their relationship to the concept of America, to each other, and to other communities with shared experiences.

Keywords: memory, ethnic enclave

David Jensen, University of Washington. Email: daj5@u.washington.edu; *Taking the Bus to the Internet: Hidden Geographic Issues of the Digital Divide*

Most considerations of access to the Internet start with the assumption that a person is already seated at a computer. How that person gets to that computer has been little examined; considerations of distance, movement and time, especially at the scale of the individual person, have gone surprisingly unnoticed in study of digital divide. For the poor and homeless in particular, access to the Internet begins, not at the computer, but with a bus ride, or a walk to the local library or other public venue. This is the problem of "access to access." Further, once these groups gain access, they face additional constraints, such as time-limited computer/Internet access, constraints that are not faced by more privileged users of the same space. The poor and homeless are also less likely to benefit from municipal Wi-Fi projects which serve to re-purpose public spaces for those who already have access. I examine Seattle's public library system, the University of Washington library system and the adjoining University District neighborhood in light of how each provides and presents access to the Internet without considering the issue of travel. I also show that this issue also affects nominally privileged middle-class people. Finally, I offer a method to assess the space-time constraints that face those using public access to the Internet.

Keywords: Internet, information, information geography, digital divide, Wi-Fi, libraries, access, poor, homeless, death of distance.

Vierling, Ph.D., Department of Rangeland Ecology & Management, University of Idaho. Email: leev@uidaho.edu; *Comparison of Single Sensor vs. Integrated Data Analysis to Estimate Leaf Area Index Over A Range of Highly Variable Forest Conditions in Northern Idaho*

For coniferous forest systems, leaf area index (LAI) is the ratio of half of the total needle surface area per unit ground area. LAI is an important forest structural characteristic for quantifying biosphere-atmosphere carbon and water fluxes because it largely controls the fraction of photosynthetically active radiation absorbed by a vegetation canopy. Most previous attempts to estimate LAI from remotely sensed data have related field-measured observations with various spectral vegetation indices (VIs) derived from optical imagery. However, in conifer forests, accurate estimation of LAI is not only complicated by variable species composition, but also by the complex spatial structure of forest canopies. In this paper, we (1) compare in-situ leaf area observations with SPOT-derived LAI estimates to identify the functional relationships between LAI and various VIs, (2) quantify the capacity of lidar-derived height metrics generated from discrete-return lidar data to estimate LAI over a range of topographically diverse and structurally complex sample plots, and (3) determine the extent to which

integration of spatial and spectral datasets can more accurately estimate LAI than a single sensor.

Keywords: leaf area index, LAI, carbon, lidar, data integration

Kari Bolstad Jensen, Pennsylvania State University. Email: kbjl12@psu.edu; *Spaces for Working Children's Social Participation in Bangladesh*

Since Bangladesh ratified the United Nations Convention on the Rights of the Child in 1990 there has been a growing interest in creating social justice by increasing children's participation in society. Initiatives like child consultations on government policy and forums for children to discuss their specific problems have recently been institutionalized. This paper explores the legal, political, spatial, and cultural context for child participation in Bangladesh where marginalized children, such as child domestic workers (i.e. servants, mostly girls), are still largely left out of the participation process. Often their opportunities to participate in society depend on the physical environment, such as access to semi-public or public spaces where children are free to share their experiences with other child domestics. With the boom of high-rise residential buildings in Dhaka, most middle-class households now live in apartment buildings without yards, gardens or other open spaces nearby, decreasing the scopes for children and youths to find meeting places for social interaction outside formal arenas like schools. Few young domestic workers go to school. However, many of the high-rise buildings have a rooftop where the domestics can go to hang up laundry, look after their employers' kids and also interact with other young people in similar situations as themselves. I explore the children's use of this semi-public space as a site of resistance. Inspired by Foucault and Soja I discuss the rooftop as a heterotopia or a real-and-imagined space where the young workers can enjoy their childhood away from their employers' gaze.

Keywords: Working children, social participation, semi-public space

Laura B. Jensen, Yale University. Email: laura.jensen@yale.edu; Alex DeWire, Yale University. Email: alex.dewire@yale.edu; *New Hydropower Development in Costa Rica: Best Practice or Hidden Agenda?*

The growing concern over the environmental impacts (namely climate change) caused by the use of hydrocarbons has refocused attention on hydropower development. Although the Golden Age of dam building in the United States has come to an end, less developed countries are turning to hydropower as a means of providing "clean" electricity to accommodate growing demand. Costa Rica, a nation developed beyond its regional peers, already derives approximately 80% of its electricity from hydropower. Costa Rica's plans to construct another mid-sized hydropower dam are justified by a projected growth in demand for electricity due largely to increased immigration. As the dam project progresses, officials are taking measures to minimize the conflict - both environmental and indigenous ? that stymied previous incarnations of this project. They portray these new approaches as a model for sustainable hydropower development. Evaluating these claims from a political ecology focus, this paper examines the distributional justice of the future energy supply of the project, considering projected electricity production capacities versus projected demand due to industrial and population growth, and scrutinizing the project's implications for national energy security and economic growth through electricity exportation. By assessing the costs and benefits of the project to its various stakeholders ? indigenous populations, local communities, the national electricity company, the state, international consultants and financiers, and electricity importing countries ? this paper offers a critique of the impacts of Costa Rica's newest hydropower development project, allowing for a critical assessment of its purported viability as a "best practice."

Keywords: Hydropower, dams, Costa Rica, political ecology

Natalie K. Jensen, University of South Carolina. Email: jensen_natalie@hotmail.com; *Gender in the landscape of home: Growing up in Granger, UT*

To the casual observer, a neighborhood in present-day West Valley City, UT, seems an unremarkable, circa 1970's, middle-class neighborhood. To the people who live here, however, the landscape of the neighborhood is imbued with meaning. To them this is home, a home with a long history that goes back to the original settlement of the areas by Mormon pioneers, who came from Europe seeking a better life among a community of like-minded people. This place, which they call Granger, continues to be home for many members of the Jensen and Bangerter families. It is my intention to show how the patriarchal form of one family has imprinted itself on the landscape. The dominant gender role pattern in the original family household has been reproduced in the homes of their children, many of whom have decided to settle and raise their families in the same neighborhood in which they grew up. The decision of the children, particularly of the daughters, is a reinforcement of the familial order. I rely on personal interviews, photographs (both archival and recent), the unpublished journals of Jensen family members as well as my own remembrances, as the

family under examination is my own.

Keywords: landscape, gender, patriarchy, household, American West, LDS

Ole B. Jensen, Dept of Architecture & Design, Aalborg University. Email: obje@aod.aau.dk; *On the Fluid production of Meaning and Identity*

Cities and urban spaces have for long been described and understood in terms of their form, structure and morphology. However contemporary change in the socio-spatial relation has made it clear that urban analysts are in the need of a new vocabulary and new concepts. Thus an increasing number of urban theorists are turning towards flows and mobility practices as something that cannot longer merely be seen as an 'urban side effect'. Rather, they may be seen as a 'room with a view'. The thesis of this paper is that by shifting the balance between the concepts of 'armatures' and 'enclaves' we first of all get a much more sensible understanding of the contemporary city and the multiple mobilities configuring it. Secondly, it opens up a new agenda for the classic discussion about the city as a political space. By arguing for an understanding of armatures as meaningful spaces of interaction we may come to think of these as 'public domains' rather than just instrumental leftovers from the real city with is predominantly fixed agora as the main political sphere. In an age of increased electronic and mediated communication is makes no sense of thinking of the 'polis' as this bounded space. Rather the new networks and flows reconfigure the city as a networked space of multiple mobilities contributing to a fluid production of meaning and identity.

Keywords: urban mobility, power, place, identity

Wendy Jepson, Ph.D., Texas A&M University. Email: wjepson@geog.tamu.edu; *Political Ecology and Economy*

Recently scholars have examined fundamental concepts, such as ecology, culture, environment, and politics, in political ecology, a dominant subfield in human-environment geography. The introspective analysis and subsequent research directions have demonstrated how practitioners and theorists expanded in new directions beyond the subfield's close relationship with biophysical ecology. Despite these critical interventions, underlying economic assumptions in political ecology, grounded in Neo-Marxist political economy, remain unexamined and unchallenged. I briefly review the "economy" in political ecology, argue for a significant reorientation of economy theory that underpins political ecology research, and outline three opportunities to integrate other economies within the subfield.

Clark Hanna Jessie, University of Arizona. Email: jhc@email.arizona.edu; *Modernizing the Family: Development Strategies in Southeast Turkey*

Following the devastating social and economic effects of a 15 year civil war between Kurdish separatists and the Turkish military, Turkish state focus in the predominantly Kurdish Southeast Turkey is slowly shifting from one of military aggression to social development. In this paper I ask how both Turkish and Kurdish political apparatuses attempt to socially reproduce the modern family in Southeast Turkey through development efforts. Specifically, I look at government influences over marriage, education, and healthcare and investigate ways in which these strategies of self-management are constituted in spaces of state development and how they result in the creation of new social relationships that both coincide and conflict with predominant discourses of modernity. The contents of this paper are based on data collected in the city of Diyarbakir, a traditional stronghold for Kurdish separatist politics as well as a growing target for social reform. Ultimately, I argue that the systematic mapping and restructuring of the family unit are crucial tools for the national integration and modernization project in Southeast Turkey.

Keywords: Political geography, modernity, family, Turkey- Southeast

Nayna J Jhaveri, Colgate University. Email: njhaveri@mail.colgate.edu; *U.S. Petropolitics: Neoliberalism, Globalization, and the Geography of Oil*

Once the Iraq War began in 2003, the relationship between U.S. foreign oil policy and war became a new focus of academic inquiry. This work has mainly clarified how this need for petropolitical control is the outcome of the U.S. economy's intimate oil dependency that began with its increased reliance on imports from the 1970s onwards. While important, there is another more central dimension of this push for global petropolitical control that has been insufficiently examined. This involves deciphering how the United States has pursued the neoliberalization of the global petropolitical system so as to minimize economic chaos by bringing order to the global oil market in a time of increasing economic globalization. Therefore, this is not simply concerned with the need to make America a globally dominant power through secure access to oil but, rather, with reconstructing the globalizing world in the image of American economic ideologies. Indeed, this latter mission began soon after World War II but as the

geography of oil supply took on a new form around the end of the Cold War, this question of political regulation was pursued with intensified mendacity. This paper examines the details of how, with diminishing reserves in the West and key oil sources located in politically “unruly” locations, the American pursuit of petroimperialist control occurred through a combination of militarism and neoliberalist privatization. This paper contributes to a major rethinking of the relationship between natural resource control and American imperialism in both Cold War and post-Cold War periods.

Keywords: neoliberalism, oil, globalization, United States, imperialism

Hong Jiang, University Of Hawaii. Email: hjiang@hawaii.edu; *Critical analysis of environmental and ethnic discourse of China's West*

China's “western region development” program that was launched in 1999 has reenergized the notion of China's west. In its attempt to develop western China, the program, ironically, has highlighted the backwardness of the west. While this “backwardness” has manifested in economic realities, it has also been supported by disparaging environmental and ethnic discourses, which have roots in the imperial time and have only been accentuated by the Chinese socialist state since 1949. This paper explores the official environmental and ethnic discourse of China's west since 1999, taking into consideration historical context. Western China has harsher environments with its many plateaus and deserts; it has also been homes of many minority groups. As in other parts of the world, environmental and ethnic discourses are closely related. This examines two related discourses, each in comparative perspectives. The first is environmental discourse of “ecological construction,” which centers on active human rebuilding of the degraded environment. In contrasting this discourse with the notion of “ecological restoration” in the US, I wish to shed light on the perceptual foundation and practical limitations of “ecological construction.” Second, I will examine the discourse of the minority people in the western China, which, in its implication of the backwardness and cultural insufficiency of the minority people, mimics the discourse of the “third world.” The last part of this paper will consider the connection between environmental and ethnic discourses, and analyze detrimental government policies that are borne of these discourses.

Keywords: China, China's west, ecological construction, ethnic discourse

Ziying Jiang, Clark University. Email: zjiang@clarku.edu; *An Empirical Parameterized Road Extension Model*

Road development is an important proximate cause of deforestation and consequent biodiversity loss. Proximity to roads is therefore often an explanatory variable in land change models. To date most land change models regard road as an exogenous and static factor. In more instances, road development plays an endogenous factor in the land cover change. The interaction between road extension and land use calls for an integration of road simulation into land change model to improve spatial certainty. There have been few attempts to simulate road development to support land change model. This study simulates new roads extending from existing roads. Location of new road is determined through two consecutive steps: defining endpoints, and locating routes. Endpoints of road are systematic randomly chosen, or determined by land cover transition potential. After endpoints are identified, routes linking endpoints and current roads are sought following the lowest cost path. Structural parameters such as average road length and road spacing are employed to control the network pattern during road development. The road extension model is incorporated in the Land Change Modeler for Ecological Sustainability (LCM) in April 2006, as part of the IDRISI GIS. The dynamic integration will improve the spatial explicit and long-term certainty of land change simulation.

Keywords: Land cover change, roads, simulation, model, spatially explicit

Jong-Heon Jin, Seoul National University. Email: metaphor7@empal.com; *The Rediscovery of the Backbone Mountain Range, Paektudaegan, in Korea*

This paper considers changing scientific understanding of the mountain chain-Paektudaegan-that runs the length of the Korean peninsula, and its social and political ramifications. Traditional Korean science, rooted in a broader Chinese environmental theory understood the mountains in terms of pungsoo, the unique Korean version of the Chinese Fengshui. The traditional understanding of the mountains was transformed in the colonial period of the early 20th century by Japanese geologists such as Koto Bunjiro who based his work on the geological concepts of modern European science. The mountains were re-mapped and divided into multiple geological provinces that bore no ‘natural’ connection to the territory of the Korean state. This ‘modern’ scientific representation was accepted by Korean geographers, after independence from Japan. Recent decades have witnessed a popular revival of interest in traditional understandings of the mountains that is closely linked to forms of embodied practice in the mountains, such as watershed walking rather than climbing individual peaks, which eventually aroused scholarly debates. I examine the contested representation of the whole national territory as a symbolic landscape, where the discourse of geography as

scientific knowledge is verified, historicized, and contested in the context of the reworking of pre-modern, indigenous, geographical epistemology. The rediscovery of Paektudaegan emphasizes the role of popular geography, its practice, knowledge, and institution, in the production and circulation of geographical knowledge. The recovery of traditional geographical knowledge, and its contestation with Koto's scientific knowledge, reinforces its discursive nature, while also emphasizing the practical engagement in the construction of geographical knowledge.

Cheatgrass, Downy Brome (*Bromus Tectorum*), is an exotic winter annual weed and has invaded rangelands of the western US. Mapping geographic distribution of cheatgrass abundance will help to combat the cheatgrass-induced debilitation of western ecosystems. In this study, we compared a set of methods for mapping cheatgrass abundance over the region of central Utah. Landsat TM images of two time periods in 2006 were obtained to capture the early phenology (green-up and senescence) of cheatgrass. We used 247 field plots with the ocular estimation of cheatgrass abundance for training and test data. After applying atmospheric and topographic correction of the TM images, different vegetation indices, such as NDVI, SR, SAVI, and EVI, along with the reflective bands of TM data were calculated as explanatory variables, and the abundance of cheatgrass within every pixel was used as response variable. Then four methods including multiple linear regression, logistic regression, regression tree, and neural network were used to predict the cheatgrass abundance. The performance of different vegetation indices and methods in predicting cheatgrass abundance were evaluated based on the error levels.

Keywords: Invasive species, Cheatgrass, Regression tree, Neural Network, Logistic Regression, Landsat

Paola Jiron, Student. Email: p.a.jiron@lse.ac.uk; *Mobile Place-making in Santiago de Chile. The experience of Place Confinement and Place Autonomy*

Places seen as the location of particular sets of intersecting social relations and intersecting activity spaces (Massey, 1985) can be characterised as open, permeable and always in construction, as well as unbound and mobile. Place is constituted through reiterative social practices, one of which is the practice of urban daily mobility, crucial to analysing contemporary urban living. Understood as socially produced motion, mobility implies giving social meaning to the practice of moving from one place to another and suggests the possibility of places being appropriated and transformed during this practice, generating mobile places. Bourdieu (1999) identified confined places as those where people with financial, cultural and social capital have power over space and tend to self-segregate, while people with scarce resources are confined to places they do not choose. Under the mobility lens, this appears as a double exclusion: spatially fixation with agglomerated vulnerability, and limited urban access possibilities, creating parallel cities, where people overlap but never meet. Based on this, this paper will introduce the idea of place confinement and place autonomy in the practice of urban daily mobility, where place confinement relates to the restriction or limitation of individuals to place-making and place autonomy to the freedom of creating mobile places. Using ethnographic research on urban daily mobility practices in Santiago de Chile, this paper will analyse how, despite high levels of mobility in urban areas, there are social, physical, economic, cultural boundaries that contribute to the place confinement or where the experience of mobility generates place autonomy.

Keywords: urban daily mobility, place making, mobile places, Chile

Scott Justo, PhD, Worcester Polytechnic Institute. Email: sjusto@wpi.edu; *US state carbon emissions trends: Variances, policies and politics*

As US states have taken a lead role in developing domestic energy policy to reduce fossil fuel consumption and address climate change concerns, carbon emissions indicators have become increasingly central to the politics, discourses and mechanics of state energy policy development. Sustainable energy advocates use carbon indicators in narratives of accountability and opportunity, competing policy analysts model the costs and benefits of alternative carbon policies and futures, and legislators and regulators enact policies with carbon indicators embedded as metrics of progress. Despite this significance, surprisingly little research has looked at empirical differences in state carbon emissions trends, nor the qualitative relationship of emissions accounting methods to policy develop-

ment. This paper presents a framework for carbon emissions assessment and reports on key differences in emissions trends among states, and discusses the implications of each for state-level climate change policy and politics.

Keywords: Carbon emissions assessment/climate change/states-US/energy policy

Injeong Jo, Department of Geography, Texas A&M University. Email: injeong@geog.tamu.edu; *Aspects of Spatial Thinking in Geography Textbooks*

The present research examines questions embedded in four current secondary geography textbooks to evaluate the degree to which the following three components of spatial thinking are incorporated: concepts of space, tools of representation, and processes of reasoning. A model to assess the questions is developed from the literature on spatial cognition, geography education, and the development of thinking skills. The spatiality of the concepts and skills featured in about 3,000 questions sampled from the geography textbooks was analyzed. The stimuli for spatial reasoning and the degree of use of spatial representations were also measured. Preliminary results indicate that over 30 percent of the questions examined have little to do with spatial thinking. Most questions requiring knowledge about spatial concepts can be answered by knowing only simple concepts such as location and place-specific identity rather than complex concepts requiring the identification of spatial pattern and associations. Questions encourage students to use representations as a stimulus for reasoning, but the level of cognitive skills required is relatively low. Students are asked to recall memorized geographic knowledge rather than to infer, hypothesize, and generalize. The development of questions to help students practice complex processes of spatial thinking is necessary.

Pascale Joassart-Marcelli, Assistant Professor, University of Massachusetts. Email: pascale.joassart@umb.edu; Alberto Giordano, Assistant Professor, Texas State University. Email: a.giordano@txstate.edu; *Does Local Access to Employment Services Reduce Unemployment? A GIS Analysis of One-Stop Career Centers*

The paper uses Geographic Information System (GIS) to investigate (1) the location of One-Stop Career Centers, (2) their level of accessibility to unemployed workers of various demographic groups, (3) their proximity to employment opportunities and (4) the relationship of these spatial characteristics on Census tract unemployment. We build on the nonprofit literature on accessibility to social service providers and on spatial mismatch research that emphasizes the gap between places of work and residence. We argue that One-Stops can play an important role in bridging this gap. We find that, in the southern California, One-Stops are well positioned to serve the unemployed, although accessibility varies by race/ethnicity, age, and location. Access to One-Stops reduces local unemployment, particularly in neighborhoods with limited employment opportunities. This relationship is stronger for groups who experience limited mobility due to gender or race, such as black and female job seekers.

Keywords: Accessibility, Workforce Development, GIS, Spatial Mismatch

Hubert Job, . Email: hubert.job@lmu.de; Ludger Brenner, . Email: brenner@colmich.edu.mx; *Actor-Oriented Management of Protected Areas and Tourism in Mexico*

This paper adopts a political-ecological approach to investigate the management-related problems of nature based tourism in Protected Areas (PA) that occur in developing and recently industrialized countries alike. In the case of different Mexican Biosphere Reserves, structured and semi-structured interviews were conducted with various stakeholders: visitors, entrepreneurs and key informants from governmental organizations and NGOs. Focusing on the interests, strategies and specific actions of the actors involved in PA management and tourism business, different spatial levels are of immense importance. Furthermore, the conflicts involving various stakeholders and concerning the unequal distribution of power among the actors need to be considered. The study results show that with the existence of many actors characterized by conflicting interests and opposing strategies, not only a more participative form of PA management is put at risk but also sustainable development in general. In addition, ill-defined and poorly coordinated activities of governmental stakeholders as well as the competition among actors at local and regional level hinder the successful implementation of tourism projects with local participation. Therefore it is not surprising that PA councils made up of representatives of every stakeholder group did not prove effective. This leads to a new approach by e.g. offering more power to widely accepted NGOs. These then can act as mediators between the conflicting interests of different actors and finally coordinate the development of an integrative management plan trying to foster sustainable development within the reserves.

Email: ; *The Spatial Politics of Homeless Mobility and the Negotiation of Transportation in Long Beach, CA*

This study examines the travel behavior of adults experiencing homelessness in Long Beach, CA. Central to the research is an understanding of how public transit and access to other modes of transportation help or hinder the ability of homeless individuals to negotiate "spaces of containment" - sites in the city that regulate the movement of homeless individuals through social stigma and/or public laws. Additionally, the study identifies how homeless individuals live within and struggle against socially and spatially restricted mobility. This research is based upon two sets of data: focus groups with self-identified homeless men and women at a local service organization and a survey of adult homeless individuals at various sites in Long Beach, CA. Preliminary analysis suggests homeless mobility is affected by shifting costs of travel, transit schedules and route locations, public stigmatization of the homeless, laws governing the use of public space, homeless individuals' self-perceptions of discrimination and their maintenance of social networks. Moreover, gender and (dis)ability further complicate the use of public transit in Long Beach, creating different patterns of mobility among different homeless populations.

Gardar Johannesson, Lawrence Livermore National Laboratory. Email: johannesson1@llnl.gov; *What Spatial Statistics has to Offer in Cases of Incomplete and Misaligned Data*

Geographers and the user of GIS are often faced with incomplete data and data at various scale (misaligned data) in their work. Examples include data missing for some counties in an analysis carried out on the county-scale (incomplete data problem) and data reported on the county-scale while it is needed at the zip-code-scale (change-of-support problem). In the incomplete data case, one needs to estimate (or rather predict) the unobserved county variables. Similarly, in the change-of-support problem, one needs to predict a given variable at a finer scale than it is reported at. In both cases, a variable that is not directly observed needs to be predicted. We give overview of statistical models that can help in this regard. In particular, we focus on areal-based spatial models and the use of external information (explanatory variables) to improve on the fidelity of these models. The models are demonstrated using both synthetic data and spatial data related energy economic models.

This paper addresses the problem of business survival through spatial or non-spatial (e.g., management and operational) changes in the context of foreign direct investment (FDI) into post-socialist, emerging market countries. In the case of former socialist transition countries, FDI inflow was primarily from the west for labor and other factor cost advantages as we have witnessed during the past decade. This research project examines characteristics of surviving FDI firms that were among the earliest to invest in Estonia, Latvia, Lithuania, and St. Petersburg/Leningrad Oblast, Russia. It compares adaptation trends, location change, and reasons for these, with firm characteristics such as size, source country, host setting, and original location decisions. Data from the original survey and company visits in 1995 and 1996, are compared with data for each surviving company ten years later. The paper describes a set of cases selected from a larger study of Nordic FDI firms, and examines the common elements among these firms in their experience since entering the Baltic region. The surviving companies exhibit adaptive strategies that result from changes in local and national economies, and in the case of the Baltic countries, the entry into European Union, along with local development trends.

Keywords: Baltic region, foreign investors, post-Soviet, business survival.

Ola Johansson, University of Pittsburgh at Johnstown. Email: johans@pitt.edu; Michael Cornebise, Eastern Illinois University. Email: mwcornbise@eiu.edu; *Andersonville, Home of the Viking Breakfast: Neighborhood Identity and Marketing in Neoliberal Urbanism*

Ethnic neighborhood revitalization is evident in Chicago's attempt to rethink, rework, and reinvent its ethnic heritage. This process is occurring politically both on the city and the neighborhood level. Chicago is eager to display a cosmopolitan urban environment that is consummate with its prominent status as a world city. In this case study, we explore Andersonville, a

historically Swedish neighborhood that retains its ethnic identity through an active branding process. While this is an expression of commodified ethnicity in an era of multi-cultural and neoliberal ideology, multi-scalar forces such as gentrification, immigration, and demographic change act as constant threats to established patterns of neighborhood identity.

Keywords: Chicago, neighborhood change, ethnic marketing, gentrification, neoliberal cities

Rebecca A. Johns, Ph.D., Univ Of South Florida St. Petersburg. Email: rjohns@stpt.usf.edu; *Assessing the Ecological and Social Impact of Voluntary Simplicity*

More than 50 million Americans claim to be simplifying their lives in some way. The voluntary simplicity movement has gathered strength over the past several decades, and is now widely recognized in popular culture as a group of people hoping to reduce the environmental impact of their lives, limit their compulsion to acquire material things, and increase their emotional, spiritual and personal happiness. As of yet, no rigorous assessment has been conducted of the impact of the movement on either the social fabric of American life or the environmental problems that plague us. This project takes the first step in assessing the ecological and social implications of the simplicity movement by investigating the extent of the behavioral transformation experienced by individuals who profess to be simplifying their lives. By definition, voluntary simplicity attracts individuals of high socio-economic status who wish to willingly reduce their material impact on the environment and restructure their lives in a variety of ways. Through on-line survey questionnaires, we were able to assess the actions of self-identified voluntary simplicity participants to determine if the movement is effecting change in people's behavior, and at what scale and magnitude this change is occurring. This paper will present the preliminary data and discuss further research.

Keywords: simplicity, sustainability, social movements.

Renee Nicole Johns, Geography Student, AAG. Email: reneej@email.arizona.edu; *Valley Fever and Rodent Activity in Arizona*

Renee Johns AAG Poster Presentation Abstract Coccidioidomycosis (Valley Fever) is an environmentally mediated infectious disease endemic to the Pacific Southwest, particularly Southern Arizona. Valley Fever is produced by inhalation of spores from the soil-dwelling fungal pathogen *Coccidioides posadasii*. We link field observations and vegetation indices derived from Landsat Thematic Mapper data to investigate whether rodent populations, thus Valley Fever, rise during times of increased precipitation and vegetation growth. Our research concentrates initially on Pima, Pinal and Maricopa counties in central and southern Arizona, where we hypothesize local rodent activity, predicted by vegetation amount, creates the hospitable organic environment required for fungal growth

Keywords: Valley Fever, Rodent, Remote Sensing, Arizona

Sarah Johnsen, Centre for Housing Policy, University of York. Email: sj510@york.ac.uk; *Criminalisation or 'Coercive Care': The Use of Enforcement Interventions with People who Beg in England*

The activities of street homeless people have been legislated against for many decades, but recent years have witnessed a marked increase in the use of punitive measures intended to combat aspects of 'street culture' in England. Many of the existing powers used by the police to arrest members of the street population derive from the 1824 Vagrancy Act, but authorities have become ever more creative in their use of civil law to deter people from street drinking, begging and sleeping rough in the city. In particular, the recent advent of the Anti-social Behaviour Order (ASBO) has fundamentally altered the conduct and consequences of enforcement initiatives, as the penalties for breaching ASBO conditions are far greater than those imposed for the same offence under criminal law. This paper explores the motives behind this legislative shift and the implications for people who beg, examining in particular the tactics they use to render aspects of their daily lives less visible, the geographical displacement of street activities, and diversion into acquisitive crime. It assesses the degree to which such initiatives serve to criminalise people who beg and/or reflect a desperate attempt of authorities to 'help' them when all other approaches have 'failed', and explores the extent to which the geographically uneven articulation of enforcement reflects contours of tolerance toward the vulnerable other.

Keywords: homelessness, begging, enforcement, criminalisation, revanchism, social exclusion

Brian E Johnson, Indiana University. Email: bejohns@indiana.edu; *Nature, Privacy, and Affordability: What Motivates Exurban Migration?*

Current demographic trends indicate that the 21st century will be one of exurban growth as more Americans seek out countryside home sites and their accompanying lifestyles. What exactly are these exurban migrants seeking in the countryside? Academic research finds three general characteristics in the exurban population shift. First, exurbanites are seeking home sites in close proximity to

natural areas. Second, exurbanites are isolating themselves from shopping, entertainment, jobs, and doctors. Third, exurbanites are drawn to countryside areas because of the affordability of such locations. This paper uses individual semi-structured interviews to support or refute these three commonly held characteristics of exurban migrants. Using snowball sampling, 39 exurbanites were asked why they moved to their current home site to assess the validity of the literature's "conventional wisdoms" concerning exurbanite migration motivations.

Corey Johnson, University of Oregon. Email: cjohns11@uoregon.edu; *The geopolitics of EU regional policy: Evidence from Germany and its eastern neighbors*

In the paper, EU-funded projects aimed at promoting economic and social cohesion in the border region between regions in eastern Germany and their neighbors to the east and south are examined in their cultural and political contexts. Evidence from Saxony (FRG), Northern Bohemia (CZ), and Lower Silesia (POL) suggests that cultural practices and historical legacies in this part of Mitteleuropa complicate the view of regional policy as a driver of economic development, as envisioned both by local and EU elites. Importantly, in light of the ever-charged political discourse surrounding the nearly two-decade-old project of 'rebuilding' eastern Germany ("Aufbau Ost"), attempts at mobilizing transboundary scales in the region are inseparable from domestic consensus in Germany that something must be done to 'fix' a massive regional development project that to date shows too few successes. In this context, media and elite writings of transboundary space offer insights into how the 'east' is viewed from the German perspective. The paper argues that the politics of scale surrounding the largely national project of Aufbau Ost are largely inseparable from the ways in which place and space to Germany's east are viewed.

Donald L. Johnson, University of Illinois. Email: dljohns@uiuc.edu; Diana N. Johnson, Geosciences Consultants. Email: dn-johns@uiuc.edu; *The Global Biomantle: Theory, Exposition, Analyses*

A diorama at Elkhorn Slough Visitor's Center, Monterey Bay, California shows a bird standing in a bucket of slough mud. The caption reads: Millions of organisms lie beneath the feet of this Marbled Godwit as it probes for food. What lives in this much mud? 500 billion bacteria, 500 million diatoms, 50,000 protozoa, 50,027 worms, 5,000 crustaceans, 39 clams. The display epitomizes the biomantle concept as applied to Earth's substrate environments. Our purpose is to demonstrate the breadth and usefulness of the biomantle concept as applied to the global subaerial-subaqueous substrate. Our methods are theoretical, expository, and analytical. The biomantle is the organic-rich, differentiated zone in the upper part of soils produced largely by bioturbation, aided by subsidiary processes (i.e., those emphasized in conventional genetic models — shrink-swell, leaching-precipitation, eluviation-illuviation, etc.). Bioturbation occurs in four process styles: upward biotransfers, biomixing, cratering, and volume increases. These lead to one-layered biomantles — those morphologically isotropic with regard to particle size, where bioturbated particles form a single layer; or two-layered biomantles — those morphologically anisotropic with regard to particle size, where bioturbated particles form two layers, the lower being a stonelayer of gravels. Process vector analysis is a useful device that weights the relative effects and/or rates of two or more coacting processes. Its usefulness is maximized when joined with biomantle principles. We conclude, and submit, that incorporating biomantle principles in our teaching and research strategies automatically opens new doors of understanding on how Planet Earth functions as a bioreactor.

Keywords: biomantle, soils, geomorphology, theory, bioturbation

Elizabeth R Johnson, MA, University of Minnesota - Minneapolis. Email: joh01868@umn.edu; *Is domestic tourism a domestic phenomenon? Development, the state, and global connections in the mountains of Western Sichuan, China.*

In the past 20 years, the creation of a domestic tourism economy has allowed the Hengduan Mountains of Western China and the Tibetan people who live there to gain significance within national narratives. Despite the heightened visibility and stability that tourism has brought to the region, political and economic options afforded to the resident population remain limited. The contradiction begs the question, who does tourism in the Hengduan Mountains benefit, and under what conditions are these arrangements of people, place, and capital produced? To approach this problem, I argue that a focus on domestic processes alone fails to grasp the entire picture. For the state, this commodification of natural landscape and ethnic tradition represents an attempt to preempt threats posed by environmental and ethnic instability and their potential to incite the development of alternative political spaces. However, these solutions put forth to confront these threats cannot be disconnected from

the global processes which enable and drive them. As such, this paper examines how the introduction of global technologies and discourses (specifically, capitalist development, and biodiversity conservation) have fostered the development of tourism in the Hengduan Mountains and, subsequently, allowed the state to secure a claim on its territory.

Peterson, Portland State University. Email: petersonc@pdx.edu; *Imaging Tsunami Deposits in Oregon (USA) Using Ground Penetrating Radar*

To better understand tsunami processes associated with Cascadia subduction zone earthquakes, ground penetrating radar (GPR) transects were collected. Multiple mega-earthquakes, which often create tsunamis, have occurred in the Pacific Northwest of the USA and with increased population in the region, these multiple hazards pose a significant threat to the coastal communities. GPR, a geophysical tool used to image the subsurface, was used at numerous sites to investigate the extent of paleo-tsunami inundation and the magnitude of wave run-up. Six GPR transects were collected in Cannon Beach, OR using 100, 225, and 450 MHz antennae while 14 transects were collected in Seaside, OR using 225, 450, and 900 MHz antennae. These transects ranged from 10 to 690 meters in length and depth of penetration ranged from 0.5 to 10 meters. Laser leveling surveys were carried out to gather topographic data which was used to topographically correct the GPR transects. Both the 1964 (Alaska earthquake) tsunami and the 1700 A.D. Cascadia tsunami were imaged in the project. Both of these tsunamis left extensive sand sheets on the investigated landscape. The internal stratigraphy of the 1964 tsunami deposits was imaged, showing horizontal to sub-horizontal stratification near or on the surface and the 1700 A.D. tsunami deposits, which lie beneath peat and marsh deposits, were imaged. In addition, tsunami pour over fans from the 1700 A.D. tsunami were also mapped.

Jay T. Johnson, PhD, University of Nebraska. Email: jjohnson18@unl.edu; *Place-based learning and knowing: Critical pedagogies anchored in Indigeneity*

For Indigenous peoples, knowledge and science are written onto the landscapes our languages “talk into being” through the “individual and collective consciousness of our communities (Cajete, 2000: 284).” Our landscapes are the storied histories and sciences of those knowledges pushed aside by the ‘gray uniformity’ of globalization and its predecessor, colonization. It is in places that we can still glimpse alternatives to this gray uniformity of globalization which brings with it a rhetoric of capitalism, modernism, Western science and space. It is this rhetoric of space which seeks to erase our storied landscapes, destroying the libraries embedded within toponyms, creating a terra nullius: an empty land awaiting a colonial history. As Paulo Freire has challenged us to see, critical consciousness requires us to “read our world,” decoding the images of our own concrete, situated experiences with the world (1987: 35). A critical pedagogy of place recognizes the concrete experiences of communities through shared histories and challenges based within a politics of place. A critical pedagogy of place seeks to decolonize and reinhabit the storied landscape through ‘reading’ the ways in which our peoples, places and environments have been injured and exploited. Indigeneity is an identity based in a relationship of ‘reciprocal appropriation’ with our storied landscape; one that requires us to continual reinvest ourselves into the places/stories within our libraries. This paper challenges us to read the places in the world as ‘political texts,’ engage in reflection and praxis in order to understand, and where necessary, to change the world.

Kevin Johnson, . Email: kjohn258@gmail.com; Kevin M Johnson, . Email: kjohn258@gmail.com; *Energy Efficiency in San Francisco's Green Business Program*

The goal of this paper is to access the effectiveness of the San Francisco Green Business Program in promoting energy efficiency. Efficiency programs on both the federal and state levels have been instrumental in reducing state energy consumption for decades, but in the development of green businesses lay a large potential to further increase energy efficiency. The San Francisco Green Business Program has been successful in promoting the adaptation of energy saving technologies and practices. What is notable, are the discrepancies between how San Francisco accounts for its energy conservation techniques and how it is done for the utility companies making direct comparisons difficult. Compliance for the San Francisco Green Business Program is based on a hard-to-quantify questionnaire based on three business types: office/retail, restaurant and hotel. The highest percentages of the completed measures were either behavioral (i.e. changing behaviors to increase energy efficiency) or completing measures that incorporate large segments of energy conservation such as using energy star appliances. Where possible, direct comparisons are made between the data provided by San Francisco green businesses and PG&E. This is most prevalent in the lighting segment in switching out incandescent light bulbs with compact fluorescent and using smaller diameter fluorescent tubing. Despite the limited nature of quantifiable data, this is a necessary first step in beginning to analyze the new Green Business Program performance in San Francisco. This program will undoubtedly serve as a model for future green business programs both within California and nationally.

Estimation of crop water use, and associated irrigation demand, is commonly addressed by application of so-called crop coefficients, which express water loss as a proportion of evapotranspiration from a well-characterized reference crop such as grass or alfalfa. For horticultural crops, however, planting date, planting density, variety, and cultural practices can vary widely. It is thus impractical to specify, a priori, a crop coefficient profile that accommodates these potential sources of variability. It is generally recognized that percent canopy cover, as an indicator of intercepted sunlight, is positively related to crop evapotranspiration. Fieldwork was performed in California's San Joaquin Valley to measure canopy cover in support of satellite-based mapping. Radiance-calibrated Landsat Thematic Mapper image data were then converted to top-of-atmosphere (apparent) reflectance and subsequently to normalized difference vegetation index. Over two consecutive seasons, a strong linear relationship ($r^2 > 0.9$) was observed between vegetation index and field measurements up to the point of “effective full cover” (~75%). This relationship was subsequently used to map canopy cover throughout a 20 x 20 km study region. Crop water loss was then mapped by incorporating routine ground measurements of reference evapotranspiration collected at point locations by the California Department of Water Resources. The study results demonstrate the feasibility of using vegetation index imagery for improved, spatially explicit parameterization of crop coefficient-based models in regions of high-value horticultural production.

Keywords: evapotranspiration crop coefficients, horticulture, Landsat, NDVI, San Joaquin Valley

Leigh T Johnson, University of California, Berkeley. Email: leighjohnson@berkeley.edu; *Extraction Frontiers and Climate Change in the Arctic: Accumulation by Degradation*

As human-induced climatic change raises average global temperatures ever higher, the planet will experience major ecological changes and attendant economic and social transformations of world-historical import. This demands an understanding of how institutions of capital function as they encounter and anticipate the effects of global warming. I propose the term “accumulation by degradation” to refer to the process by which institutions of capital take material advantage of the physical consequences of global warming and turn particularly affected regions such as the Arctic into sites for capital accumulation. Bringing recent advances in the quantification of earth's changing radiative balance into conversation with Marxist environmental historians, I suggest that anthropogenic perturbations of the climate system beginning in the Industrial Revolution laid the groundwork for a metabolic rift on a truly planetary scale. Although this rift threatens to generate systemic crises of accumulation in the future, in the short term it is already generating tremendous possibilities for new rounds of capital accumulation. Changes in Arctic ice cover have opened up spectacular

expanses of geographical territory and previously uncommodified stores of raw materials to capitalist development. Chief among these is an expanded commodity frontier for hydrocarbons, which comes fortuitously at the moment that global capital faces an unpredictably fluctuating world oil supply. Symmetry emerges as the previous combustion of fossil fuels by industry generates the geophysical changes that are then instantly exploited in order to identify, extract, and combust additional hydrocarbons.

Keywords: climate change, metabolic rift, accumulation, resource extraction, Arctic

Email: John.Wyckoff@cudenver.edu; *Regional Accounting Of Cumulative Environmental Effects*

A GIS-based approach for regional accounting of cumulative environmental effects was designed to identify the cumulative impacts on the environment which result from the incremental impacts of multiple transportation and other projects, and related urbanization in the Denver metropolitan region. To identify and characterize critical resources we held seven workshops with agency and other environmental professionals which addressed CEA procedures in the various domains including land use change, habitat and threatened and endangered species, water resources, and community impacts. Then we designed and implemented a demonstration project focusing on land use change, habitat and water quality. GIS and remote sensing tools were demonstrated to provide the means for data and models integration, thus providing a technical foundation for characterizing environmental effects. Based on project results, we argue that the GIS-based approach is feasible and will provide valuable support to both project-specific assessment of cumulative impacts and regional transportation planning.

Stream water loadings of nutrients and pollutants to water bodies integrate internal and external processes that vary in both space and time. While land cover dynamics can be assessed remotely, changes in land use practices within a land cover class can be difficult to ascertain. Here we explore nitrate and alkalinity fluxes for 1972-2005 from the Fall Creek watershed, a 326 km² mixed-land use catchment in western New York. Annual watershed loadings were computed for each year and normalized by dividing loading fluxes of water quality constituents by annual discharge. Normalized loadings for both nitrate and alkalinity increased during the 1970s and 1980s, peaking in the early 1990s. Both nitrate and alkalinity fluxes then decreased from 1992 through 2005. In this paper, we explore the driving factors for these trends by looking at internal factors such as changes in land use/land cover, dynamics in agricultural production and fertilizer use, and external factors such as atmospheric deposition. Decreases in agricultural acreage within the watershed during the 1990s is detected in remotely sensed data as well as through farm-level data compiled by the USDA. This change appears to be replaced by regenerating forest cover. The implications for these findings on downstream water quality and carbon cycle dynamics are also discussed.

Keywords: land use/land cover change, watershed biogeochemistry

Tamara M Johnson, University of North Carolina - Chapel Hill. Email: johnson5@email.unc.edu; *Community, Identity, and All That Jazz: An Examination of The Galaxy Jazz club's role within the Coloured Community in Cape Town*

Music and dance have an intensive emotive affect on the listeners and participants involved in the spaces of music production. In times of hardship, such cultural expression becomes critical for communities seeking escape, solace, and commiseration. Cape Town Jazz is a unique form of cultural expression for the coloured community in Cape Town, South Africa. Gaining popularity in the mid-twentieth century, Cape Town jazz is located in the social/political context of forced removals, Apartheid and the struggle against it, and in the challenges of the New South Africa. Throughout this time period, jazz clubs served as spaces of resistance, release, and the (re)creation of a Coloured identity both during Apartheid and in post-Apartheid Cape Town. The Galaxy is a jazz club established in the early 1980s and located in the community of Athlone, a Coloured township outside of the Cape Town city center. This paper traces the role of the Galaxy night club in identity formation and community-building within the

Coloured community both in the most contentious years of the anti-apartheid struggle and into the post-Apartheid era, and interrogates the changing nature of political, social, and cultural identities through an examination of the spaces of collective jazz production and enjoyment.

The economic restructuring of the 1970s presented challenges to economic developers in rural Northwest Ohio. Local factors also impact on local economic development efforts. This is a case study of rural economic development in a postindustrial economy in terms of the culture of economic development. In order to gain a better understanding of the cultural influences on economic development in Defiance County, OH, qualitative data were gathered through in-depth interviews with key economic decision-makers. The results revealed that the culture of economic development in Defiance County could be described in terms of four major themes: the widely embraced economic strategy of improvement of the business climate, a lack of "state vision" in economic development, perception of the need for collaboration between state government and private enterprise, and the process of globalization as a force that had dramatically affected the social and economic fabric of their community. These results suggest that there is a need for the state to foster interpersonal networks across government agencies and private enterprises. However, the perceived unwillingness or inability of the government to collaborate, suggests that continuing to embrace the current economic development framework may be detrimental to progress in local economic development.

Andrew Johnston, Sheffield University Management School. Email: A.Johnston@Sheffield.ac.uk; *Cities and Economic Development in the UK - Centres of Knowledge or Centres of Consumption?*

Cities have long been perceived as the drivers of economic growth; traditionally, in industrialised economies, they were centres of production and manufacturing. However the relative decline of the manufacturing sector in the UK has led to a re-assessment of their role in the economy. There is a large body of work, both academic and policy based, which focuses on cities as centres of innovative activity and 'knowledge hubs,' i.e. the physical manifestation of inter-firm networks. As a result economic development within cities is increasingly centred on developing the 'knowledge driven' economy through encouraging the growth of high added value, high-technology industries in niche sectors. This paper, however, proposes an alternative perspective and examines the proposition that cities in the UK have, instead, evolved into centres of consumption. These cities are dominated by leisure based industries such as retail, hotels and restaurants; thus, altering the urban landscape of UK cities, as industrial sites are transformed into leisure sites, and the economic landscape, as the economy becomes increasingly based on service industries. Using examples from a number of UK cities, this paper aims to highlight this evolutionary process and examine the implications for economic development.

Keywords: cities, UK, economic development, consumption

Lynda T Johnston, University of Waikato. Email: lyndaj@waikato.ac.nz; *Queer geographies of 'Big Love'*

The mutually constitutive relationship between sexuality and space has become an area of considerable interest for geographers. There is, however, one aspect of sexuality that has escaped geographers' attention, that is, love. In this paper I aim to develop some geographical research agendas that examine the embodied emotion of love as an important component of sexualised subjectivity. The first part of the paper highlights some possible reasons why love has been, for the most part, absent from geographical research. I draw together the limited references that geographers have made to love, sexuality and place. In the second part of the paper, the US television channel Home Box Office (HBO) domestic drama about a Utah polygamous family - 'Big Love' (2006) - is used to examine (non)normative expressions of love and sexualities. I argue that love expressed between sister wives carries with it both possibilities and risks. To make sense of this love I utilise feminist and queer theorising that posits love, on the one hand, as a means of subordinating women to men, yet on the other hand, as an embodied emotion with queer and non-normative affects.

Keywords: love, non-normative sexualities, emotional geographies, 'Big Love'

Ron Johnston, University of Bristol. Email: r.johnston@bristol.ac.uk; *Ethnic Segregation in English Schools and Cities*

There is substantial ethnic segregation in the primary and secondary schools of most large English cities. These levels are greater than those for residential

segregation in the same cities, suggesting processes of school sorting that are more intense than those underpinning residential choice. Furthermore, there are suggestions that the segregation is increasing. Using data on the ethnic composition of school entry cohorts over a 7-8-year period, this paper examines that case, concluding that although school segregation remained high there was little evidence that it was increasing substantially.

Brad Jokisch, Ohio University. Email: jokisch@ohiou.edu; Kendra McSweeney, Ohio State University. Email: mcsweeney.14@osu.edu; *Land conflicts and environmental futures: demographic and economic pressures facing Shuar of Eastern Ecuador*

Indigenous societies across lowland Latin America have made impressive political and territorial gains, in part, by emphasizing their stewardship over and attachment to particular rural spaces/landscapes. These gains have been accompanied by persistent or new threats (e.g. colonists, oil development) and significant demographic change. Impressive population growth, urbanization, and international/transnational migration are increasingly common and may appear to undermine territorial claims and conservation efforts. Shuar of Southeastern Ecuador exemplify these trends. They face challenges to their territorial claims and land rights from oil development, settler encroachment, eco-tourism, and perhaps most important, intra-family and inter-community quarrelling over land inheritance and demarcation. Class differentiation is emerging, population growth is rapid, and migration is conceptualized as both a safety valve and opportunity for Shuar empowerment. This paper examines how land use and environmental conservation are embedded in the numerous political economic and demographic stresses that Shuar face. We combine ethnographic work with empirical findings from a large demographic and health survey (n = 1,800 households) conducted with the Shuar Federation of Morona-Santiago, Ecuador in 2005.

Keywords: Ecuador, land conflicts, migration, indigenous

Andrew E G Jonas, Professor, University of Hull. Email: A.E.Jonas@hull.ac.uk; Aidan H While, Dr, University of Sheffield. Email: A.H.While@sheffield.ac.uk; David C Gibbs, Professor, University of Hull. Email: D.C.Gibbs@hull.ac.uk; *Managing infrastructural demands in new economic spaces*

Research on the geography of local economic development has attempted to explain the attractiveness of particular locations for the growth of leading-edge technology industries. Initial research focussed on the attributes of high tech industries and firms, whereas recent studies emphasise the qualities of the local labour market, such as presence of workers possessed with a range of skills and creative talents and sought after by growth industries. These workers, along with employers, have demands for housing and services. As hitherto successful high technology spaces enter into a new phase of growth, such demands have intensified. This paper identifies a spatial politics of collective provision in select new economic spaces. It further considers the different forms such politics takes in different national contexts. Examples from the United States, Europe and Asia are examined, drawing upon primary and secondary sources. The paper considers the implications of the politics of collective provision for existing knowledge of what sustains growth in new economic spaces.

Keywords: new economic spaces, collective provision, state, USA, Europe, Asia

Andrew Jones, Birkbeck, University Of London. Email: a.jones@bbk.ac.uk; *Theorising global economic practices: the ongoing challenge of using an actor-network approach*

The relational and practice turn in economic geography has drawn heavily on the actor-network approach (ANT) over the last decade. However, the use of ANT remains marginal to many key debates about the nature of the global space economy, and critics have argued ANT cannot offer adequate 'mid-level concepts' to explain key transformations. This paper argues that such criticisms misconstrue the core epistemological arguments around which ANT is based, and

that an ANT-based approach can fruitfully address several of the major problems currently faced in theorising the nature of global economic activity. Yet it also argues that Bruno Latour's recent development of the actor-network approach presents significant challenges for economic geographers in applying ANT to global economic practices. It proposes a series of ways to overcome these difficulties which will have to be adopted if the 'practice turn' is to harness the power of actor-network explanation. The paper illustrates these arguments with reference to how an ANT approach might offer a better means to theorise economic practices within transnationalising firms.

Keywords: economic practice; actor-network theory; transnational firms

Benjamin M. Jones, SAIC/United States Geological Survey, Alaska Science Center. Email: bjones@usgs.gov; Steve V. Stehman, College of Environmental Science and Forestry, State University of New York (SUNY ESF). Email: svstehma@syr.edu; Kenneth M. Hinkel, Department of Geography, University of Cincinnati. Email: kenneth.hinkel@uc.edu; *Lake Surface Water Area Changes in the Yukon Basin Unified Ecoregion of Alaska*

The Yukon Basin Unified Ecoregion of Alaska is located south of the Brooks Range in the eastern-central portion of the state and spans 5.6 million hectares. This ecoregion is unglaciated, has gently-sloping terrain along the margins of the basin underlain by continuous permafrost, and has vast expanses of wetlands in the low-lying interior underlain by discontinuous permafrost. Analysis of Landsat ETM+ image mosaic from circa-2000 has revealed 7,356 lakes greater than 1 hectare with a total lake surface water area of 80,456 ha. Comparing these results with a lake classification conducted on a Landsat TM mosaic from the mid-1980s indicates that total lake surface water area has decreased by 1.1%, while the number of lakes has increased by 0.9%, over the 15 year period. The net decrease in lake surface water area with an associated increase in the number of lakes could reflect the disjunction of larger water bodies due to lake level lowering. Further, the changes that have occurred in the ecoregion have not been uniform across the study area. Regression tree analysis of potential explanatory variables are conducted to explore the spatial variability of lake changes as well as potential drivers of change. * Work performed by SAIC under U.S. Geological Survey contract 03CRCN0001

Bryan Jones, University of Colorado - Boulder. Email: bryan.jones@colorado.edu; *Inferring Migration Flows from the Migration Propensities of Infants: The United States*

Beginning with the 2010 decennial census, the U.S. Census Bureau plans to drop its long-form questionnaire and to replace it with the American Community Survey (ACS). The resulting absence of the larger sample provided by the census count will complicate the measurement and analysis of internal migration flows. Additionally, the strategy of averaging accumulated samples over time will mix changing migration patterns. The migration question will refer to a one-year time interval instead of the five-year interval used in the censuses between 1960 and 2000, complicating historical comparisons and the production of multiregional projections based on five-year age groups. Consequently, students of territorial mobility increasingly will find it necessary to complement or augment possibly inadequate data collected on migration with estimates obtained by means of "indirect estimation". This paper expands upon a method, previously tested on American, Mexican, and Indonesian data, that allows one to infer age-specific directional migration propensities at the regional level. The method uses birthplace-specific infant population data to approximate infant migration propensities, and from these infers the migration propensities of all other ages. The method is applied at both a four and nine region spatial scale.

Email: myersj@students.sou.edu; *Modeling Viticultural Landscapes: A GIS Analysis of the Viticultural Potential in the Rogue Valley of Oregon*

Terroir is a holistic concept that relates to both environmental and cultural factors that together influence the grape growing to wine production continuum. The physical factors that influence the process include matching a given grape variety to its ideal climate along with optimum site characteristics of elevation, slope, aspect, and soil. While some regions have had 100s and even 1000s of years to define, develop, and understand their best terroir, newer regions typically face a trial and error stage of finding the best variety and terroir match. This research facilitates the process by modeling the climate and landscape in a relatively young grape growing region in Oregon, the Rogue Valley. The result is an inventory of land suitability that provides both existing and new growers greater insight into the best terroirs of the region.

Keywords: Wine, Climate, Landscape, Terroir, GIS

Jennifer A. Jones, Minnesota Historical Society. Email: jaj319@gmail.com; **Lisa E. Fischer, Colonial Williamsburg Foundation. Email:** lfischer@cwf.org; *People, Buildings, and Space: Recreating Property Boundaries and Land Transfer in Eighteenth-Century Virginia*

For more than eighty years, researchers at Colonial Williamsburg have sought to understand the development of Virginia's eighteenth-century capital by studying the population of the town and the surrounding countryside. Recent research has focused on connecting people and places in an effort to understand the development of neighborhoods and commercial centers and to create new ways to access previously compiled information. In the 1980s, Colonial Williamsburg's research staff transcribed and indexed the surviving York county court records and created a comprehensive biographical database of colonial-era Williamsburg and York County residents. In the last eight years researchers at the Foundation have extended this work by connecting people to specific properties they owned and occupied during the eighteenth century. Geographic Information Systems have been instrumental in this ongoing effort. Documenting and visualizing property ownership across the eighteenth century has proven more complicated than initially expected due to discrepancies in the primary sources. This paper will describe three phases of work Colonial Williamsburg has undertaken to understand aspects of eighteenth-century population and land ownership. The creation of a county tract map for 1704 based on surviving quitrent rolls and deeds provided a process for using documents to recreate historic property boundaries. We applied these techniques to Williamsburg and discovered that the town was not a persistent grid of rectangular lots as suggested by the surviving maps. Most recently we have begun to connect both people and buildings to town property, a process that will result in a temporal GIS for reference and analysis.

Mark C. Jones, University of Connecticut at Hartford. Email: mark.c.jones@uconn.edu; *Survey Results on Teaching Political Geography to Undergraduate Students*

This presentation will share partial results of my doctoral research on the teaching of political geography at U.S. and Canadian universities. Specifically, it will include the data and interpretations of the same from a web-based survey of political geography instructors who belong to the AAG's Political Geography Specialty Group. Survey respondents completed a 25 question survey that asked them about instructor characteristics, curriculum issues, course content, readings, and key issues in teaching political geography. Findings were broadly consistent with my expectations about contemporary practice in the teaching of political geography. Questions asking respondents to define political geography, and to identify key issues in teaching political geography, both produced great variety in responses.

Keywords: political geography, geography education, survey research

Martin Jones, University Of Wales, Aberystwyth. Email: msj@aber.ac.uk; *Encouraging Relational Space to be Dialectical: The Assemblages of Phase Space*

Recent years have witnessed a burgeoning of work on 'relational space'? a perspective that sees spatiality as unbounded and formed through the imbrications of non-territorial flows and networks. According to its advocates, this challenges territorial and scalar readings of space, by insisting on an open-ended, mobile/flat/ internal, and always actor-centred politics of geographic becoming. The paper discusses the importance of, and limits to, this paradigmatic thinking. By opening up a dialogue between relational thinking and 'dialectical critical realism', it then offers a different take by talking about 'phase spatiality'. This acknowledges the relational nature of space but insists on the confined/stratified, internal/external, sometimes inertial, and always contingent nature of emergence. The nuances of, and challenges for, this approach are discussed and debated.

Keywords: Spatiality, Dialectics, Phase Space

Peter D. Jones, University of Bristol, UK. Email: p.d.jones@bristol.ac.uk; *The Political Economics of Scale in the European Union: Supranational Knowledge Economy as Discursive Fix for National Education Reform?*

In this paper, the knowledge economy strategy of the European Union, its Lisbon Strategy, is examined at two scales: the supranational and the national. Drawing on interviews with European Commission officials and participatory observation of the processes of coordinating education policy at the EU scale in line with a knowledge economy strategy, it is argued that the rationale, formation and management of the EU's knowledge economy strategy are conditioned by interactions between European Commission politics and the intergovernmental architecture of the EU and that a knowledge economy strategy provides, at best, a highly unstable discursive fix for EU policy development. At the national scale, a series of interviews with policy makers in Bulgaria, in the run-up to the

European Commission's recommendation for Bulgaria to join the EU from January 2007, places Bulgaria's strategy for reform of the national school sector within the context of both the knowledge economy and EU membership. The viability and significance of EU policy development in pursuit of a knowledge economy is seen as even more questionable in both political and economic terms when viewed at the national scale. In conclusion, it is argued that an EU knowledge economy strategy does not even provide a discursive fix for national education reform for a country on the verge of accession and undergoing a sustained disciplinary monitoring of progress towards meeting EU norms.

Reece M Jones, University of Wisconsin - Madison. Email: reecejones@wisc.edu; *Narrating and Enacting Difference in the Borderlands of India and Bangladesh*

An important aspect of the reproduction of national identity categories is the process of bounding that establishes the perception of distinctions between those who are members of the group and those who are on the outside. This paper investigates the everyday narratives and practices that create, maintain, and break down social boundaries in the Bengali-speaking communities along the border between India and Bangladesh. Borderlands play a significant role in the bounding process because they are often areas where the boundaries between these categories are tested on a daily basis. In Bengal, this process is complicated by linguistic, cultural, familial, and economic connections across the sixty-year-old border, which has only recently become strictly enforced. Employing interview and focus group data, this paper explores how communities living near border narrate and enact the boundaries between group identity categories such as Bengali, Bangladeshi, Indian, Hindu, and Muslim.

Keywords: Borders, boundaries, Asia, performativity, India, Bangladesh

Rhys Jones, University Of Wales Aberystwyth. Email: raj@aber.ac.uk; *Boundaries in nationalist and academic discourse*

For social scientists, one of the key facets of the reproduction of nationalist discourse is the use of boundaries and territories. Boundaries help individuals to position their own national identity with respect to national 'others', while territories enable individuals to connect to both a national past and the state. The importance of boundaries and territories, redolent of a 'regressive sense of place', has increasingly been questioned with the discipline of geography; originally by Massey and latterly by a broader relational school of thought. In this paper I discuss the various tensions that arise when trying to reconcile these two perspectives within academic discourse; in both research and teaching. The use of relational and topological understandings of space can be useful as a way of challenging popularly-held assumptions about the 'naturalness' of national territories and boundaries, and, indeed, nations in general. At the same time, the use of such concepts can also serve to undermine the validity of any type of nationalist discourse or, at least, position it as a regressive and naïve perspective. Moreover, efforts to negotiate a compromise between contemporary understandings of space and some of the geographical underpinnings of nationalist discourse allude in broader terms to the role played by academics in reproducing nationalist discourse, either critically or uncritically. Research on the contemporary definition of national boundaries within Wales, undergraduate students of nationalism, along with some personal reflections arising from my experience of teaching and researching nationalist themes, are discussed in order to elaborate on these themes.

Keywords: Boundaries, territories, nationalism, nationalist discourse, academia

Richard C. Jones, Professor of Geography, University Of Texas at San Antonio. Email: richard.jones@utsa.edu; *Changing Migration Patterns to the U.S. from Villanueva, Zacatecas: a Longitudinal Analysis*

Mexico's recent economic history is a good example of the failure of neoliberalism and privatization to benefit the poor rural sectors in a developing country. Villanueva, a corn and beans agricultural municipio in the dry Mesa del Norte of central Mexico, epitomizes this trend. An analysis of cross-sectional survey and interview data with several hundred families, collected by the author in 1988 and 2002, indicates increases in long-term U.S. migration and inequalities between migrant and non-migrant classes, as well as decreases in agricultural investment. Overall levels of living have apparently improved owing to remittances and their multiplier effects locally, but the permanent out-migration of many families has left the prospects for growth and development in the municipio very much in doubt. This out-migration is to an important degree a result of restrictionist U.S. immigration policies, which as Douglas Massey has pointed out have effectively "walled in" Mexican undocumented migrants in the U.S. and encouraged them to move their families to the United States (since return to Mexico and then re-entering the U.S. is so difficult). Rural central Zacatecas is becoming a landscape of semi-deserted villages, abandoned homes,

older people, and disinvestment? its young working families having moved to California, Illinois, and Texas, and forced to sever many ties to their home.

Trevor Gareth Jones, UBC. Email: tgjones@interchange.ubc.ca;
Nicholas Coops, UBC. Email: ; *Integrating advanced spectral and structural remotely sensed data to improve vegetated terrestrial ecosystem mapping and monitoring*

The Gulf Islands National Park Reserve in British Columbia, Canada, encompasses 61 square kilometers of terrestrial, intertidal, and marine ecosystems spread over 15 islands. Rapid urban development is principally responsible for the area's current status as one of the most threatened landscapes in Canada. In order to ensure current and long-term ecological integrity of the Reserve, accurate and up-to-date information on the structural, compositional, and distributional components of the ecosystems present is required. Information yielded from conventional aerial photography-based Terrestrial Ecosystem Mapping (TEM) provides some of this ecosystem attribute information; however, it is costly and requires significant interpretation making it poorly suited for use in long-term operational monitoring. Satellite-based remotely sensed data offer a viable option for reliable and repetitive ecosystem mapping in a cost efficient manner; however, broad-band data have limited spectral and spatial resolution, making vegetative species discrimination, and changes in forest canopy structure difficult to predict. Recently, the advent of hyperspectral remotely sensed data has been shown to improve vegetative discrimination whilst airborne LIDAR data is increasingly being used to represent 3-dimensional terrain and forest canopy structure. This research investigates the integration of Landsat TM data with targeted high spatial and spectral resolution hyperspectral imagery, and LIDAR, in conjunction with field observations, to derive structural, compositional, and distributional information related to the various terrestrial ecosystems present within the Reserve. The results of combining these complementary datasets demonstrates improvements in ecosystem mapping, and can be used in implementing a long-term operational ecosystem monitoring program within the Reserve.

Keywords: hyperspectral, LIDAR, multi-spectral, terrestrial ecosystem mapping, terrestrial ecosystem monitoring

Ola Jonsson, Lund University. Email: ola.jonsson@keg.lu.se; *Innovation processes and innovation policies - towards a more polarized regional structure?*

Networks of organisations, it is often claimed, have the potential to loosen interdependencies within existing organisational structures as well as within the regional hierarchy in a national as well as transnational context. At the same time several studies in economic geography have shown that more research- and knowledge intensive regional and sectorial innovation systems, seem to strengthen rather than subvert existing spatial structures of the economic landscape. We witness a 'leap-frog' movement that follows established regional hierarchies on a more or less global arena, favouring 'hot spots', excluding neighbour regions on a lower level in the hierarchy. Empirical analyses presented in this paper, indicate that the spatial organisation of innovation processes has a strong tendency to consolidate these structures and strengthen the positions of core regions rather than to open up new windows of opportunity for non-core regions. Increased divergence between core and non-core regions appears as a threat to ambitions to achieve a more balanced regional distribution of economic growth and welfare. National as well as regional growth policies in many countries have during the last decade focused on regional innovation systems as one way to create regional (and national) growth. This paper address the opportunities and problems involved in these innovation policies seen from the perspective of the regional system in general and the non-core regions in particular. Swedish innovation policy and Swedish biotechnology and software sectors constitute the empirical base for the discussions. Concludingly, directions for future regional innovation policies are suggested.

Keywords: innovation processes, innovation policies, knowledge, proximities, regional hierarchies, non-core regions

Stéphane Joost, LASIG, EPF Lausanne & Zootechnics Institute, UCSC Piacenza. Email: stephane.joost@a3.epfl.ch; *GIScience joining with molecular biology: a novel approach of detecting signatures of natural selection within the genome*

Even if many research projects in population genetics and conservation biology collect a quantity of spatially located biological samples, and despite its present predominance in Science and its direct application to concerns of public society (health, food), molecular data were heretofore rarely studied by the GIScience community. Biotechnologies make it possible to measure this growing amount of genetic data, and GIScience holds promise for being one of the appropriate ways to investigate this information from a complementary point of view, which is somewhat unique to the traditional field of life sciences. In this paper, I describe a novel spatial analysis method (SAM) to detect regions of the

genome being shaped by natural selection. This operation is essential as it gives the possibility to understand which genes are involved in adaptation processes. SAM is the first method to tackle this issue from the environmental angle: with the contribution of GIS, environmental variables and molecular data, it applies multiple univariate logistic regressions to test for association between targeted genomic regions and environmental variables. Several applications to animals and plants demonstrated a strong correspondence between SAM results and those obtained with a standard population genetics approach. In the future, such a method may accelerate the process of hunting for functional genes at the population level. Indeed, it permits to identify ecological parameters which will help to interpret the role specific regions of the genome may play, likely to improve our understanding of the genetic mechanisms of evolution.

Keywords: Spatial Analysis, Population Genetics, Natural Selection

Bella Bychkova Jordan, PhD, University of Texas - Austin. Email: belka@mail.utexas.edu; *Oil vs. Diamonds: Sakha Republic (Yakutia) future development dilemma*

In the mid 1990s Russian government signed power-sharing treaties with some of its individual territories, including the Republic Sakha (Yakutia). With Putin's consistent policy of consolidation of 'vertical power', control over the ownership and distribution of mineral resources is being wrested from republic's authority. The Sakha national elite sees the loss of control over its major diamond producing corporation "Almaz Rossii-Sakha" as an end to all of its autonomy. At the same time, the newly emerging middle class of local entrepreneurs and businessmen, less concerned with ethnonationalist projects, is actively pushing for a larger participation in Russia's mega projects, especially the construction of oil and gas pipelines, headed to China, Japan and South Korea. The proposed route for such lines will traverse the southern regions of the republic and allow significant economic development of the resource rich parts of the republic. The regional leaders are faced with the dilemma: continue to insist on its economic sovereignty and isolate itself from a major transnational economic project, or to forgo the stake in the diamond ownership and invest in a promising future development guarantying a successful participation in global economic processes.

Keywords: Sakha (Yakutia), diamond industry, transnational oil and gas project

Lisa Marie Jordan, Florida State University. Email: ljordan@fsu.edu; *Inferring Social Landscapes: An Exploration of Spatial Weighting Schemes for Social Applications*

Spatial weighting schemes, or the way in which statistical models in social research choose to assign importance to location and distance, were originally pioneered by researchers in regional science, quantitative geography, and spatial econometrics. While much of this research was developed with classical statistical techniques, Bayesian approaches have increasingly been integrated into this research. GIScience has made spatial statistical techniques more useful and available to a wider research community by improving methods of visualization and representation of geographic information. However, an important gap remains in the use of spatial data for social research: a synthesis of geographic research on the relevance of location, distance, and proximity for different social and economic measures and how spatial weighting schemes can be chosen to best model social phenomena across space. To promote the integration of GIScience with other social sciences, this paper evaluates the diverse social applications of spatial weighting schemes and provides a set of heuristics to guide social scientists in the use of univariate and multivariate statistical techniques with spatially referenced data.

Keywords: spatial data analysis, spatial weights, social applications

Peter Jordan, Austrian Institute of E/SE. Email: peter.jordan@univie.ac.at; *Consequences of European Union Enlargement for the Ukrainian Border Region Transcarpathia*

After the fall of Communism and the dissolution of the Soviet Union, Transcarpathia as an economic periphery of the Ukraine benefitted from open borders especially with Hungary and from a growing interest of foreign investors due to its West-oriented attitude and multiethnic structure. In May 2004, three out of four countries neighboring Transcarpathia, Poland, Slovakia, and Hungary became EU members. Another neighbor, Romania, will enter the EU in 2007. These developments created and continue to create an entirely new geopolitical milieu for Transcarpathia. The region finds itself at the edge of an integrated economic and political space. The Schengen border regime is to be extended to the new EU members by 2009, preparations for a stricter border regime have already started. What had become a relatively soft border compared to the Soviet period, could once again turn into a hard border, placing Transcarpathia clearly "beyond the limit" and more distant from European integration than it is now. The paper investigates into the effects of enlargement by Poland, Slovakia and Hungary on the socio-economic situation in Transcarpathia, into measures taken

or taken into consideration to mitigate the effects of the Schengen border regime and into future development perspectives in this Ukrainian outpost in the Pannonian Basin.

Keywords: Political geography, borderlands, cross-border co-operation, EU enlargement

Marina Jordan-Viola, University of Southern California. Email: jordanvi@usc.edu; *Signage Strange and Wonderful: Street Names, Landscape, and Cultural Identity in Oxnard*

Streets are typically named for distinct landmarks, topographic or hydrologic features, cardinal points, and other symbols of power and authority. In this, street signs celebrate man's connection to the landscape as well as his influence over the environment. The street signs of Oxnard, California reflect the area's unique cultural landscape by incorporating names from diverse inhabitants, historical periods, and languages. Yi-Fu Tuan has observed that, "to strengthen our sense of self, the past needs to be rescued and made accessible." So the street names in Oxnard's Historic District, contribute to the city's identity by honoring its utilitarian and agricultural past. In contrast, the streets of newer commercial and residential developments market appealing physical features of the central coast, such as the Channel Islands Harbor and nearby beaches. And then there are other elements of the Oxnard's landscape and history missing from street names that may represent an image or identity the city does not want to own. Street names are a direct expression of the city's intricate relationship between space, place, and identity.

Keywords: Oxnard, street signs, landscape

Stacy Jorgensen, University of Hawaii at Manoa. Email: jorgy@hawaii.edu; *Islands as Laboratories for Understanding Spatial Evolutionary Processes*

The study of island biotas has been a traditional focus of biogeographic research, leading to such important ideas as the theory of evolution. In fact, islands remain indispensable laboratories for testing evolutionary biogeographic theories. The Hawaiian Islands provide perhaps the ideal system for studying spatially explicit patterns of genetic diversity and gene dispersal in the coastal and nearshore marine environment. The linear arrangement of these habitats simplifies distance calculations and considerations, and the predominantly east-west orientation of the island chain produces a naturally replicated system across multiple spatial scales in a narrow latitudinal range. Furthermore, there are drastically differing disturbance regimes on north vs. south coastlines due to variations in the source and season of major ocean swells. I am examining patterns of genetic diversity in a number of coastal plants known to co-occur as well as in nearshore marine invertebrates to determine whether differences in wave regimes influence the pattern and amount of divergence among populations, and whether there are concordant patterns within and among the coastal and nearshore marine species. I am also examining whether similar patterns of genetic diversity occur over multiple spatial scales or if differing patterns emerge at different spatial scales. Studies of intertidal organisms, for example, have detected patterns ranging from broad-scale homogeneity to chaotic genetic patchiness, with disparate patterns seen among closely related and ecologically similar species.

Keywords: disturbance, evolution, genetic diversity, island biogeography

Mikko Juho Mikael Joronen, Department of Geography, University of Turku, Finland. Email: mikko.joronen@utu.fi; *Technological metaphysics of globalization. Ontological conditions of possibility in the age of the planetary space.*

This paper treats globalization as a historical understanding of spatiality of being. Working from a Heideggerian perspective, I argue that in order to study globalization, ontological conditions of the possibility for its very existence should have the primacy. As a way of understanding spatiality of being, globalization is a matter of historical ontology and is defined as a particular way of grasping place. This article claims that in order to reveal the metaphysics of planetary space, thinking should meditate on the recognition of anthropocentric instrumentality and leveling essence of the totalitarian gigantisms of technological ontology of space. As such, globalization is a planetary manifestation of modern metaphysics.

Keywords: globalization, Heidegger, ontology, place, technology

Lawrence Joseph, Arizona State University. Email: lawrence.joseph@asu.edu; *Is Direct Competition a Myth? A Geographical Analysis of How Location Factors Affect the Quick-Service Restaurant Industry*

In the United States, quick-service restaurants commonly locate in close proximity to each other. Notwithstanding, these include areas of diverse racial compositions. Does the racial profile of a store's trade area affect store performance? Furthermore, the retailers in this industry also locate in areas with varying location situations. How are sales impacted by varying neighborhood

characteristics? For these reasons and others, this paper empirically examines any potential statistical relationships between the store performance of quick-service restaurants and a list of carefully selected location factors of the associate trading areas. Following such survey, a set of direct competitors are compared for variations. In total, 68 quick-service restaurants belonging to two retailers and their trading areas are reviewed in two counties in northeast Ohio. Previous sales volumes and the attributes of all areas within a five minute drive of each store were input into geographical information system software for analysis. To that end, multiple regression analysis indicates that there may be possible links between the performance of a quick-service restaurant and the location factors of its trading area. Further analysis illustrates that retailers historically considered direct competitors may in fact have immense differences with respect to consumption patterns when analyzed geographically. The results from this paper may suggest the reexamination of location strategies for direct competitors despite similar value platforms and target markets.

Keywords: retail, location, trade area, competition, regression

Miranda Joseph, University Of Arizona. Email: mirandaj@u.arizona.edu; *Dialectics and the Death Drive*

Marx's prediction that capitalism would produce its own "gravediggers" has always been hedged by theories explaining why we don't foment revolution. Meanwhile, liberal theorists and policy makers have spent a great deal of energy in hand-wringing and theorizing over the fact that many people are not good capitalist subjects, don't work, save and consume as they should (the "culture of poverty" discourse is an obvious example). Taken together, the Marxist and liberal discourses point to subjects who neither take up an explicitly revolutionary subjectivity nor the fully responsible entrepreneurial subjectivity solicited by neo-liberalism. This paper will theorize this neither/nor subjectivity by exploring a body of Lacanian theory?Baudrillard's The Mirror of Production; Rey Chow's The Protestant Ethnic and the Spirit of Capitalism; Lee Edelman's No Future: Queer Theory and the Death Drive?that might be read to suggest that the negations offered by this subjectivity are politically meaningful as resistance to a dominant imaginary of (re)productivism. Is it possible to use this work to make meaningful the acts and speech of those whose "undoing" behavior cannot be understood as heroic or revolutionary? Can this anti-progressive theory be aligned with a dialectical reading of capitalism? Is it possible to understand such "undoing" as an antithetical moment, generated by productivism itself, despite the absence of any sign of revolutionary consciousness in those unproductive subjects? Rather than decisively answering these questions, I aim to better understand what people do and say in contemporary contexts of constrained agency and a dominant discourse of personal responsibility.

Keywords: dialectics, queer theory

Colleen Joyce, US Census Bureau. Email: colleen.d.joyce@census.gov; *Small Area Income and Poverty Estimates for States, Counties, and School Districts*

The U.S. Census Bureau, with support from other Federal agencies, created the Small Area Income and Poverty Estimates (SAIPE) program to provide annual, intercensal estimates of selected income and poverty statistics for states, counties, and school districts. Federal, state, and local agencies use the estimates to administer programs and allocate funds. This poster presentation will include some background information on SAIPE and display thematic maps illustrating the 2004 poverty rate estimates, which the Census Bureau is scheduled to release in December 2006. The maps will show geographic patterns of poverty rates for all U.S. states and counties, and for school districts in the Southeast.

Keywords: poverty, school districts, counties

Wenxue Ju, Louisiana State University. Email: wju1@lsu.edu; **Nina S-N Lam, Louisiana State University. Email:** nlam@lsu.edu; *A Genetic Bayesian Approach for Texture-Aided Urban Land Use/Cover Classification*

The traditional spectral-based maximum likelihood classification method is greatly challenged due to the heterogeneous nature of urban environment, especially when dealing with high resolution satellite imagery. This research uses a texture vector (fractal dimension, lacunarity, and Moran's I) aided classification approach, combined with an innovative genetic Bayesian classifier, to improve urban land use/cover classification accuracy, using IKONOS imagery in New Orleans, Louisiana. A genetic Bayesian classifier is proposed to improve the traditional maximum likelihood classifier by optimizing the prior probabilities with a genetic algorithm. Different texture measurements are used together to form a vector to describe multiple aspects of image texture. Texture layers are extracted from the panchromatic band using a moving window technique, then stacked with multispectral bands and classified with the genetic Bayesian classifier. The results show that the proposed genetic Bayesian classifier significantly improves the traditional maximum likelihood classifier in terms of classification accuracy, without sacrificing the robustness and time efficiency. The use of texture vector aided approach outperforms the individual texture index

aided method. The combined study with texture vector and genetic Bayesian classifier yields the highest classification accuracy.

Keywords: Genetic Bayesian classifier, Land cover, Fractal dimension, Lacunarity, Moran's I

Byong-Woon Jun, Louisiana Tech University. Email: bwjun@latech.edu; An Evaluation of a Dasymetric Surface Model for Spatial Disaggregation of Zonal Population Data

Improved estimates of populations at risk for quick and effective response to natural and man-made disasters require spatial disaggregation of zonal population data because of the spatial mismatch problem in areal units between census and impact zones. This paper implements a dasymetric surface model to facilitate spatial disaggregation of the population of a census block group into populations associated with each constituent pixel and evaluates the performance of the surface-based spatial disaggregation model visually and statistically. The surface-based spatial disaggregation model employed geographic information system (GIS) to enable dasymetric interpolation to be guided by satellite-derived land use and land cover data as additional information about the geographic distribution of population. In the spatial disaggregation, percent cover-based empirical sampling and areal weighting techniques were used to objectively determine dasymetric weights for each grid cell. The dasymetric population surface for the Atlanta metropolitan area was generated by the surface-based spatial disaggregation model. The accuracy of the dasymetric population surface was tested on census counts using the root mean square error (RMSE) and an adjusted RMSE. The errors related to each census tract and block group were also visualized by percent error maps. Results indicate that the dasymetric population surface provides high-precision estimates of populations as well as the detailed spatial distribution of population within census block groups. The results also demonstrate that the population surface largely tends to overestimate or underestimate population for both the rural and forested and the urban core areas.

Keywords: Spatial Disaggregation, Dasymetric Interpolation, Surface Model, Population

WANG Jun, University of Hong Kong. Email: salie312@yahoo.com; Lifestyle and Housing Location Choice: A case study of residential differentiation of professionals in transitional Shanghai, China

Chinese cities are experiencing fast-paced and 'fearless' urban restructuring, with the reshaping of residential differentiation since housing reform being one manifestation. Along with the housing privatization process, households are becoming more visible and active actors, making their decisions in the though limited market. However, knowledge in residential location preference is rarely explored, let alone the possibility of developing appropriate urban planning policies based on it. This study aims to investigate the interaction between lifestyle and housing location choice, and the impact on residential differentiation in Chinese cities. Based on surveys to 659 Shanghai professionals in 2003 and 2005, lifestyle dimensions are derived from discretionary activities according to the time-space frame; and then these lifestyle factors are integrated into discrete choice model to test the correspondence between social groups and location options. According to the comparative study of revealed and stated preferences, the interaction between lifestyle and housing location choice is evident. Driven by a particular lifestyle, households prefer living close to a pole, which is defined by a place in the spatial setting that facilitates the given lifestyle. Generally, individual lifestyle, and factors like income and educational level, together determine where the household live with reference to the pole. In a given region, the influential strengths of varying lifestyles also differ, depending on the interplay between individual lifestyles and the prevailing one signified by the regional social order. The study detects the emergence of multiple poles in Shanghai. Meanwhile, huge disparities between expectations and realities are identified in contemporary Shanghai.

Keywords: housing location, lifestyle, Shanghai

Hyun-Joo Jung, Konkuk University, South Korea. Email: jung0072@gmail.com; Between the East and the West: Production of Cultural Hybridity through Korean Wave

The recent boom of Korean pop culture mainly in East Asia and increasingly in other Asian regions and beyond, appears to tackle the cultural imperialism thesis that maintains the sweep of American pop culture in global market and, as a result, the production of a global culture. The popularity of Korean cultural products, reflected in the term, hallyu or Korean Wave, is largely attributable to their hybrid nature, carefully engineered through culture technology of entertainment industry. Their neither American nor authentic Korean characteristics appeal to contemporary Asians who live in between the East and the West. Deconstructing examples of cultural products, the paper not only confronts with the cultural imperialist discourse but also interrogates the emerging body of literature that celebrates hybridity as an emancipatory means against cultural imperialism. The case study illustrates that the entertainment industry produces

hybrid Asian identity to expand its market. Cultural hybridization, particularly in cultural production, is a strategy of cultural capitals in the era of globalization.

Keywords: cultural hybridity, Hallyu, Korean Wave, cultural imperialism

Jin-Kyu Jung, University at Buffalo. Email: jjung4@buffalo.edu; Computer-Aided Qualitative GIS (CAQ-GIS): A New Approach to Qualitative GIS

There have been tremendous efforts by various geographers in doing GIS, which means conducting research using GIS, particularly by pursuing the socially-relevant uses of GIS. Innovative human geographers have started to employ mixed-methods research using both quantitative and qualitative data in GIS, and some feminist scholars recently have shown what non-positivistic GIS looks like based on feminist and social constructionist epistemologies. Further, researchers who are interested in Public Participatory GIS (PPGIS) have tried to find ways to represent and empower marginalized social groups by using GIS as a communicative discourses. These examples are all emerging and innovative ways of conducting research using GIS, and Qualitative GIS is one of this progress happening. I see Qualitative GIS as a growing set of strategies involving a GIS for critical researchers who are exploring the interlocking relationships between GIS and society, and for those who critically question that relationship and also want to use GIS in mixed-methods research. In this paper, I first develop a framework for defining qualitative GIS. Secondly, I place various qualitative GIS practices in a larger perspective so that their cumulative insights can be reviewed. I then explore a new area of the blending of qualitative research with GIS, CAQ-GIS, that I have been working on, creating a software-level approach to integrating mixed methods through linking CAQDAS (Computer-Aided Qualitative Data Analysis Software) to GIS. I suggest that by providing one approach to the challenge of qualitative GIS-this one at software level- new insights may be gained.

Keywords: CAQ-GIS, Qualitative GIS, Critical GIS, Mixed Method, GIS & Society

Namji Jung, Cornell University. Email: nj33@cornell.edu; Source of the Strength a creative industry cluster

This paper investigates causes for a digital content industry cluster's re-emergence as leading digital content industry center in Seoul, Korea, despite its severe economic downturn after the dot com bubble crash in the early 2000s. In particular, this paper analyzes the role of collaborations between creative small firms and resource-rich large firms, and the role that governmental institutions play in balancing the power relationship between them. Evidence regarding large-small firm collaborations shows that they provide opportunities to experiment with new ideas and new technologies, and to test the practical adaptability of new products. In fact, the distinctive strength and capacity of small firms in Teheran Valley is results of strategic governmental policies that aim to promote the small and medium-sized entrepreneur sector as well as ICT industry promotion. In particular, governmental institutions make up for the lack of localized intermediary service firms by providing consulting service for small firms. These services aid small firms in identifying export markets and diversifying distribution. This shows that unlike the prediction that the role of national government will decrease dramatically with the growing importance of fast developing technology and international market transaction, in some regions, national governments still take an important role in shaping and promoting local industry clusters as well as industry sectors.

Keywords: Cluster, Cultural Industry, Government

Jason Jurjevich, University of Arizona. Email: JRJurjev@email.arizona.edu; David A Plane, University of Arizona. Email: Plane@email.arizona.edu; Voters on the Move: Assessing the Importance of Migration on State Partisan Political Realignment

Since the 1970s, waves of Sunbelt migrants have poured out of the Midwest and Northeast for destinations in the South and West. According to recent U.S. Census projections, by 2030, two-thirds of all Americans will live in the South and West, and 30% of Americans will live in California, Texas, and Florida. This large differential in regional growth rates has significantly altered political representation as the South and West have gained seats in the U.S. House of Representatives at the expense of the Northeast and Midwest. This study draws on existing Political Science literature and constructs a model that assesses the relative importance of migration as a factor of partisan realignment at the state level by considering its effect for states with high levels of in- and out-migration. The study combines U.S. Census migration data with National Election Survey (NES) data to also assess the likelihood of migrating based on partisan identification as well as increases in mobility across socioeconomic categories. Using the population geographer's concept of demographic effectiveness, we explore the "political effectiveness" of recent interstate migration streams.

Keywords: Migration, Electoral, Population

Peter Kabachnik, UCLA. Email: petkab@ucla.edu; "Where Can We Put Our Homes?" - Seeking Social Justice for Gypsies and Travelers in England

It is estimated that 100,000 Gypsies and Travelers live a nomadic way of life in the UK. Recent legal changes, coupled with a shortage of 4,500 caravan sites, have criminalized the traveling way of life. Thus, many Gypsies and Travelers are homeless since they have no legally recognized place to put their homes - their mobile homes. I will compare the situation of Gypsies and Travelers in England with the homeless in the US, which will help to highlight the multifarious manifestations of the process of othering. The common link of both groups is that their homes do not fit into the dominant ideal of home, and subsequently there is either no legal recognition of their homes or legal places for their homes. Their discursive construction as "homeless" reveals the normative notion of home in American and British society, not a common sense reflection of their state of being without a home. Both Gypsies and Travelers and the homeless are seen as problematic and deviations from the hegemonic norm by their respective dominant groups, as made evident by the similar strategies employed against the groups. I identify several strategies that utilize geographic narratives which serve to other and segregate Gypsies and Travelers in England, and parallel the circumstances that homeless people face in the US. These themes reinforce negative images of these groups, deflecting attention away from the need for social justice, fulfilling basic human rights, and securing a legal place to call "home".

Keywords: Gypsies, Travelers, Nomadism, Social Justice, England, Homelessness

Lesley V Kadish, Minnesota Historical Society. Email: lesley.kadish@mnhs.org; WebMapping Minnesota's Geography and History

The Minnesota Historical Society has developed an online mapping tool that will integrate the museum's archives and three-dimensional collections with over 200 layers of geographic and historic spatial data. The mapping website is compact. Along with map layers, it contains pre-packaged curriculum for 5-8th grade Social Studies classrooms, live links to related resources, editing and navigation tools, and a repository for uploading or viewing new maps and narratives. This presentation will showcase the GIS website and discuss how historic map resources are being re-imagined by Minnesota's History and Geography teachers and researchers.

Keywords: GIS Historic maps

Robert Kaiser, University of Wisconsin - Madison, Department of Geography. Email: rjkaisel@wisc.edu; Enacting Europe and European-ness at the borders of 'New Europe': The Case of Narva, Estonia

Following Frederick Barth and more recently Etienne Balibar, I argue that the symbolic, discursive and practical enactments of place and identity occur at the borders, where the interior and exterior are continually constructed, contested and configured. Enacting Europe and European-ness are bordering processes, and so one must look to the borders as the sites of their social construction. These enactments are especially visible in Narva, Estonia, which has been defined as 'the easternmost outpost of Europe and the West'. The exteriorizing of Russia and Russian-ness in the enactment of Europe and European-ness in Estonia poses a dilemma for actors representing Estonia and Europe, since the population of Narva remains overwhelmingly Russian and Russian-speaking. The city has itself become an example of what Avtar Brah refers to as 'diaspora space', a nexus where diaspora, dis/location and border intersect, and where not only diaspora identification, but also dominant or normative place-making and identification processes (i.e., Estonia and Estonian-ness, Europe and European-ness) become. In this paper, I explore Narvan activists and their efforts to configure Europe and European-ness in ways that place themselves on the interior, as well as the ways in which Narvans - activists as well as non-activists - transgress the bordering discourses and practices exteriorizing Russia and Russian-ness from Europe and European-ness.

Keywords: enactment, identity, Europe, border, diaspora space

Ronald V. Kalafsky, University of Tennessee. Email: kalafsky@utk.edu; Export Activities of Canadian Manufacturers: Producer Performance and Strategies

Many manufacturers in mature economies see export activity as a way to expand beyond limited local or regional markets. The potential of distant markets is promising, yet exporters often encounter a number of challenges with regard to products, internal processes, and customers. This paper examines the export dynamics of Canadian manufacturers, with a focus on new markets and internal strategies. Many firms enjoy considerable export success, while many producers acknowledge that numerous competitive issues exist, especially for smaller firms.

Keywords: manufacturing, exporting, Canada

Susan Kaleita, University of Arizona. Email: kaleita@email.arizona.edu; The Geography of Medical Tourism

International medical tourism, the phenomenon of people traveling outside their native countries to obtain medical services, is a growing trend. Consumers of medical services abroad tend to originate from developed countries such as the United States and the countries of the European Union. These countries possess some of the most advanced medical facilities and the highest numbers of doctors per capita. However, especially for the uninsured in America, certain medical procedures are often out of reach because of extremely high costs. International medical tourism is one way for patients from the developed world to obtain cheap medical services fast, and in many cases, another draw is the chance to take an exotic vacation at the same time. The rise of this trend has many implications for health care provision in both the developing and the developed world. In this paper, I investigate the scale and scope of medical tourism and consider some of its geographic implications.

Keywords: medical tourism, tourism, medical geography

Adam Justin Kalkstein, Arizona State University. Email: adam.kalkstein@asu.edu; Geographical Variations in Seasonal Mortality Across the United States: Climatic Influences

Human mortality exhibits a strong seasonal curve with deaths in winter far exceeding those in the summer. Surprisingly, this seasonal pattern is evident in all major U.S. cities, seemingly independent of climate. While the pattern itself is clear, it is unknown if the causal mechanisms behind this curve vary across space. This study will examine seasonal mortality across the United States to determine what is driving the seasonal mortality curve in different geographical regions. Furthermore, by examining the frequency of air mass types in various locations, this study will shed new light on what role, if any, climate plays in seasonal mortality across the United States.

Keywords: Climate, Health, Air Masses

Kirsi Pauliina Kallio, University Of Tampere. Email: kirsipauliina.kallio@uta.fi; Performative bodies as political selves: children's agency in everyday life

This paper concentrates on children's everyday life politics, where children and young people are understood as political selves, in reference to Chris Philo & Fiona Smith's (2003) conceptualisation. The everyday life situations, where children do participate in social meaning making and reproduction, are approached from two directions. One the one hand, following my recent study the political aspects of children's agency are contemplated by applying some ideas of Albert O. Hirschman's (1970) Exit, voice, loyalty -model. It is recognised that whether it reflexive or unintentional, children's autonomous political participation mostly takes place in bodily action. Thus, it is difficult to envisage how their own politics could take place in official political arenas. From this point of view, in the second place, the performative aspects of children's everyday life are emphasised. I question whether children's politics can always be put effectively in words: that is, represented. Here, some current works on performativity and non-representational 'theory' are briefly examined in order to bring their ideas into political childhood studies. In conclusion, Judith Butler's statement of "playing differently" and Nigel Thrift's discovery of understanding the world in terms of "effectivity" are suggested to be useful tools in exploring the political and performative aspect of children's everyday lives.

Keywords: childhood, body politics, performativity, non-representational style

Giorgos Kallis, Dr, Post-Doc Fellow, Energy and Resources Group, UC Berkeley. Email: gkallis@berkeley.edu; Michael Kiparsky, PhD Candidate, Energy and Resources Group, UC Berkeley. Email: kiparsky@berkeley.edu; Richard Norgaard, Professor, Energy and Resources Group, UC Berkeley. Email: norgaard@igc.org; Collaborative governance and its limits: the rise and crisis of CALFED

This research sheds light to the rise and crisis of CALFED, "the world's most extensive - and expensive ? water management program". The purpose is to contribute to a better understanding of the advantages and limitations of collaborative environmental governance (CEG). CEG refers to processes of negotiation and coordination between state agencies, private actors and non-governmental organizations directed to the joint realization and implementation of decisions, plans or policies that address an environmental problem. CEG programs proliferate in the U.S., Europe and the rest of the world, as an antidote to the perceived failures of states and markets in environmental regulation. The CALFED Bay Delta program aims to improve the health of the San Francisco Bay/Sacramento-San Joaquin River Delta. While early-CALFED was celebrated as an international model of collaborative environmental management, recent evaluations portray a CALFED in crisis and in need of a major overhaul. This paper uses Jessop's theory of governance failure to explain the problems of CALFED. We hypothesize that CALFED is undermined by: i) inherent contradic-

tions in collaborative governance; ii) limitations in governing such a complex socio-eco-system as the Delta; iii) restrictions posed by the dominant political-economy; iv) failure to address distributive issues by focusing primarily on technical questions.

Daniel Kammen, Energy and Resources Group - UC Berkeley. Email: Kammen@berkeley.edu; *California's Global Warming Solutions Act: Is it a viable solution?*

2006 may well be remembered as the year that, in face of two decades of clearer and clearer science on the risks of global warming. True action began to appear on the global political landscape. In California, AB32, introduced by Assemblywoman Fran Pavley, D-Agoura Hills, and Assembly Speaker Fabian Núñez, D-Los Angeles, imposes for a cap on greenhouse-gas emissions statewide, and a 25 percent reduction by 2020. More important than the target, which is itself dramatic, is the fact that California established emission controls on the largest industrial sectors, including utilities, oil refineries and cement manufacturing, and will use market mechanisms — emissions trading — to find the economically most-efficient ways to reduce global warming. The reach of AB32 is regional, as AB32 also comes with a cap on carbon emissions from power sold in California, thus impacting most western U. S. states as well. Can AB32 work? Will the market opportunities it opens be realized? What technologies — from biofuels to plug in hybrid vehicles, to building integrated solar energy, to carbon sequestration — will be, or will need to be, implemented to make this work? This talk will examine the environmental and economic imperative behind this climate action, and consider the opportunities to move from California's AB32 target of a 25% reduction in greenhouse gas emissions by 2025, to the ecologically demanded 80% or more reduction by mid-century.

Keywords: climate change, carbon emissions reductions, carbon caps

Glaciers are sensitive climate indicators and appropriate objects of environmental and climate change monitoring. Remote sensing techniques allow for monitoring of glaciers in remote mountains where fieldwork is difficult. Furthermore, such techniques allow for a simultaneous monitoring of a larger number of glaciers than would otherwise be possible. Although several glacier mapping approaches exist, the analysis of debris-covered glaciers still bears problems. A morphometry-based glacier mapping (MGM) approach was applied to glaciers at Mt. Everest (Nepalese Himalaya), in the Bernina Group (Swiss Alps), and in the Tien Shan (Kazakhstan/ Kyrgyzstan). While in the Bernina Group and the northern Tien Shan supra-glacial debris exists mainly in the form of medial moraines and also covers the glacier margins, at Mt. Everest entire glacier tongues are heavily covered by debris resulting in diverse forms of "cryokarst". The morphometric analyses are based on DEMs generated from ASTER and SRTM3 data, and for the Bernina Group also by using the Swiss DHM25L2. The MGM includes a cluster analysis combining plane and profile curvatures which allows for an identification of debris-covered valley glaciers in both the Bernina Group and the Tien Shan. The mapping quality depends on DEM resolution and quality. For Mt. Everest, the specific glacier surface characteristics require a more complex MGM approach including slope, elevation, and other statistical parameters, for example standard deviation and

diversity of curvature. Additionally, the thermal ASTER band was used to improve the mapping results. Multi-temporal analyses of ASTER imagery and DEMs demonstrate the MGM's potential in glacier monitoring.

Ranbir Kang, Oklahoma State University. Email: ranbirkang@hotmail.com; Richard A Marston, Kansas State University. Email: ; Daniel E Storm, Oklahoma State University. Email: ; *Geomorphic Effects of Urbanization in an Ex-Urban Watershed*

This project evaluates the impact of imperviousness (roads, buildings, parking lots and sidewalks) on the channel morphology of Stillwater Creek, Oklahoma. Stillwater Creek is an ex-urban stream with mixed land-use (pasture, woodland and crops) lying adjacent to an expanding urban area. Urban growth in Stillwater has paralleled the expansion of Oklahoma State University. This research differentiates upstream-to-downstream changes (channel cross-sections, channel bed materials, channel unit types and riparian vegetation) from changes due to urban run-off and sediment load. Fieldwork was conducted to measure all these elements in 30 reaches of the creek. Aerial photographs taken at different times were used to measure growth of impervious areas. Although the creek receives runoff and sediment from construction and impervious areas, statistical analysis of data revealed no significant impacts of urban growth on channel morphology. The study demonstrated that three factors counter urban impacts on channel morphology: 1) a thick cover of riparian vegetation, 2) highly entrenched channel characteristics and, 3) the nature of bed materials.

Keywords: urbanization, channel morphology, riparian vegetation

Sarah E Kanouse, Southern Illinois University Carbondale. Email: kanouse@siu.edu; *"Marking and Missing: memory-performance and the radical present"*

The widespread impulse toward delimiting memorial space is often expressed through visible gestures of spatial marking: naming a street, building a monument, erecting a plaque. These practices largely seek to "make the past present," often rely on very literal relationships between space and event, and generally must become incorporated into bureaucracies of government and tourism in order to realize their spatial ambitions. However, the performance of memory?understood both as vernacular practices and self-consciously artistic gestures?opens up acts of spatial marking to much more fluid, evocative, and potentially critical outcomes. While cultural geographers have become increasingly sensitive to the role of performance and performativity in the production of space, artists have begun to explore space as a significant conceptual, aesthetic, and political ground for performative works. This paper examines several recent politically-engaged performative memorials, including the author's, to argue for a project of memory-performance that foregrounds how understanding mediation, inexactness, irresolution, and absence is crucial for abiding with and contesting our pasts.

Samantha W. Kaplan, University of Wisconsin. Email: swkaplan@wisc.edu; Benjamin H. Von Korff, University of Wisconsin. Email: bhvonkorff@wisc.edu; *A Multi-Proxy Approach to Questions of Climate and Fire Regime in Northern Wisconsin Using Lake Sediments and Tree Rings*

Germain Hemlocks, in northern Wisconsin, is a 36-hectare tract of old-growth northern mesic forest dominated by hemlock (*Tsuga canadensis*) and white pine (*Pinus strobus*). Field and historical evidence indicate larger white pines were selectively logged from the property in the 1880's, and although new pines were recruited in their place between 1880 and 1910, younger pines are scarce or non-existent. Hemlocks, on the other hand, are regenerating well despite strong deer-browse pressures. Forest managers would like to encourage pine establishment, but need more information on fire frequency and forest dynamics in this area prior to European settlement. Periods of growth release are evident in the hemlock tree rings, and the pines to a lesser extent, particularly in response to logging and following a disturbance in the 1820's. Climatically, warm and damp spring conditions and cool, damp summers, correlate to increased ring width in both the pines and hemlocks, with historical droughts coinciding with narrow rings, especially in the hemlocks. While it is assumed that changes in fire regime, anthropogenic or otherwise, have played a role in the dominance of hemlock versus pine, there is no fire scar evidence to test this hypothesis. Alternatively, we are examining charcoal abundance and pollen ratios in a sediment core from Corner Lake, the smaller of two lakes on the property. Comparison of the charcoal, pollen and tree-ring records will give insight into past forest composition and determine whether canopy-opening disturbances were related to fire, or the result of climate stress or wind throw.

Keywords: tree rings, climate, charcoal, pollen, Wisconsin

Bandana Kar, University of South Carolina. Email: yourbandana@yahoo.com; *Spatial Distribution of Potential Residential Loss from a Storm Surge*

The East Coast of the US experiences numerous hurricanes and storms each year. Recently, the number and severity of hurricanes affecting the US coast has increased. In addition, according to the National Ocean and Atmospheric Administration, as of 2003, more than 50% of the total US population was residing in counties close to the coastline. The risk from hurricane occurrence combined with increasing coastal population contributes to enormous potential financial loss. To protect individuals from storm surge and other coastal flooding impacts, the National Flood Insurance Program was implemented in 1968. However, in 1995, only 25% of the total eligible homeowners were found to have purchased flood insurance. Uninsured homeowners, however, have little protection from other sources. The recent hurricane Katrina (2005) induced storm surge in coastal Mississippi is a good example. Nevertheless, the potential dollar loss due to residential structure damage from storm surge activities has been poorly studied. No study has also been conducted to evaluate the sensitivity of estimated residential damage from storm surges to the geographic scales of analysis. This research investigates the observation scale and modeled loss relationship. Using this relationship, the pragmatic research question will be explored: What is the geographic distribution of potential residential loss from a category 'n' (e.g. IV or V) hurricane storm surge along the East coast? ? Given the same magnitude hurricane, will the modeled loss be similar for cities of similar sizes? ? What cities are at greatest risk and why?

Keywords: storm surge, scale of analysis, property damage, dollar loss

Mehmet Karakuyu, Fatih University. Email: mkarakuyu@fatih.edu.tr; *Application of the Urban Realms Model to Istanbul*

The sprawling masses of cities like Los Angeles, Chicago and Istanbul, driven by car-culture, need a model that accounts for the car, mass transportation and, in Istanbul's case, marine links. Urban realms model provides this descriptive and interpretive framework and replaces the models used to address the characteristically single-centered metropolis of prewar decades. In the urban realms model, these urban realms are large self-contained areas: within which a mix of land uses is such that daily life can be carried on without normal resort to external locations in other realms. There will always be a turning to other realms for some purposes by those living or working near the boundaries between realms. Istanbul is unique because its urbanization rate is higher than almost anywhere else in the world. Human behavior, transportation initiatives, and governmental policy have all been instrumental in their effect on the urban morphology of Istanbul. In this paper, the urban realms model is employed as an analytical framework for Istanbul.

Herman Karl, Ph.D., USGS. Email: hkarl@usgs.gov; Beaudry Kock, MS, Massachusetts Institute of Technology. Email: bkock@mit.edu; *Collaborative process and modelling approaches for addressing value-laden water conflicts*

Basing natural resource management decisions on sound science began at the end of the nineteenth century in the belief that science would provide a means of objective and rational management. Unfortunately, the highly contentious debates that surround complex natural resource issues often marginalize the contribution of science to decision-making. This is in large part due to adversarial processes that are created by and often dominate regulatory disputes. Increasingly, it is becoming recognized that the human dimensions of a problem must be considered in the deliberations that lead to natural resource management decisions and environmental policy. Such decisions are unavoidably based on a range of values and interests of social, political, economic, and aesthetic derivation. Science cannot be separated from these values. Decisions based on sound science should therefore integrate social and natural science as part of the policymaking process. Western water conflicts in particular are value-laden, complex and contentious. In this context, scientific information and models are often not used as effectively as they might be. A failure to incorporate the societal dimensions of resource conflicts into scientific processes and models is often to blame. Consequently, regulatory agencies are beginning to explore consensus-seeking collaborative processes that engage the full range of stakeholders who have a say in or who are affected by a decision, as a way to mitigate conflict and make more effective, wise, and durable policy decisions. We will

describe the framework of a well-designed collaborative process and present preliminary results from research developing a multi-agent simulation model.

Keywords: water conflict, collaborative process, modelling

Abdurazack Karriem, Cornell University. Email: ak11@cornell.edu; *The Rise and Transformation of the Brazilian Landless Movement into a Counter-hegemonic Political Actor: A Gramscian Analysis*

The Brazilian Landless Movement (MST) is acknowledged as one of the most organized, dynamic and influential mass movements in Latin America today. It increasingly engages in counter-hegemonic struggles against neoliberalism, leading conservatives and leftists alike to describe it as a "first class actor" on the political scene. This raises two key questions: Why is a rural movement regarded as one of the most organized and influential in a country that is eighty percent urbanized? And, what explains the move from corporatist struggles for land to broader counter-hegemonic contestations? Most analysts reduce the MST's prominence to conjunctural factors, thus downplaying the agency of its members. This analysis fails to explain why other movements were unable to exploit conjunctural factors. I employ Gramsci's concept of hegemony to argue that the MST's organizational praxis allows its members to practically and ideologically challenge the 'common sense' of hegemonic ideas. For the MST, the struggle for land and agrarian reform constitutes an integral component of a broader project of social transformation or a protracted 'war of position,' which requires alliances with other popular forces to build an alternative hegemony. This paper posits that the MST's emphasis on organization building, political education, the development of its own 'organic intellectuals,' engagement in national-popular struggles, and the forging of rural-urban and national-global alliances explains the MST's rise and transformation into a vibrant counter-hegemonic actor. A Gramscian political economy approach has much to offer for both analyzing hegemonic rule and the shaping of a counter-hegemonic politics of collective action.

Keywords: hegemony, social movements, MST, Brazil, Gramsci

Bonnie Kaserman, University of British Columbia. Email: bonnie_kaserman@hotmail.com; *It's not exactly rocket science: NASA's environmental education as a site of challenging and re-working Cold War politics*

The lingering politics of the Cold War and, as Cynthia Enloe (1993) writes, its "multitude of endings" have provided salient entry points in examining the implications and interconnectivity of nation and empire building on the mundane practices that secure the bodies of citizens. As part of the multitude of Cold War endings, in 1990, one year after the symbolic finale of the Cold War, the US Congress legislated the Global Climate Change Research Program. By congressional mandate, the US National Aeronautics and Space Administration (NASA) has taken a large role in this climate change research effort. NASA, who has historically influenced US education, has established a variety of educational programs to promote climate change science in schools around the world and, primarily, in the United States, where efforts have been executed to include climate change science in individual U.S. states' science curricula. In this paper, I examine one NASA-affiliated environmental education program, GLOBE, in order to explore how GLOBE serves as a site of US nation and empire building. I rely upon NASA and GLOBE documentation as well as interviews conducted with North Carolina public school-teachers who have implemented GLOBE classroom materials. How does climate science education constitute a site of citizenship? How do material requirements and practices of GLOBE delimit who practices climate science in the classroom? In working through these questions, I suggest that GLOBE both re-works and offers challenges to persisting Cold War politics and threats that are embroiled in securing the national body.

Devva Kasnitz, PhD, UC Berkeley. Email: devva@earthlink.net; *Creative Options for Rural Accessible Transportation and Employment*

The lack of transportation is one of the most significant and frequently reported problems affecting people with disabilities who live in rural communities and those who serve them. Historically, federal transit resources have been inequitably allocated between urban and rural areas, with only 6% of resources going to support public transit for the 25% of the population living in rural communities. Some studies estimate that the population living in 40% of the rural counties has no access to any public transportation whatsoever. This study examined the effectiveness of a voucher model of rural transportation for people with disabilities. Ten independent living centers or Indian tribes in ten states operated the voucher program to provide transportation to 588 adults with disabilities. Participants took a total of 92,587 rides covering a total of 1,018,391 miles at an average cost of 39 cents per mile. The rides were used primarily for employment and employment preparation, with 171 individuals securing either part-time or full-time employment through the program. This paper explores the disability research theory and method that underpins these dry facts and how research and demonstration project funding can be used to advance creative public policy. Unexpected findings include participants' adamant priority on micro-employment, the ability to leverage volunteer programs, the variety of transportation options for people who experience different impairments, and the effectiveness of elderly and disability coalitions.

Shlomy Kattan, University of California, Berkeley. Email: shlomy@berkeley.edu; *Anxiety, Family, and Schooling Across Borders: Israeli Emissaries and their Children in the United States*

Based on data collected as part of two multi-sited ethnographies that follow the transitions of Israeli families moving to the United States, one with families of emissaries (shlichim) sent by the Jewish Agency for Israel (JAFI) to New York for two years, and another with a family sent to California as employees of an Israeli bank, this paper looks at how children and their parents transition to their new surroundings while anticipating their eventual return to their country of origin. The paper examines how shlichim cope with the anxieties of transnational dislocation and what role parents consider formal education to play in easing these transitions for the children. More specifically, the paper discusses the competing ideologies held by adults on how children cope with cultural and linguistic shock and how these ideologies figure in family decisions on school and language choice. By focusing on the transition from Israel to the United States, this paper is able to get a view of migration often unavailable to researchers: the preparation for departure and initial arrival to the country of destination. This period of transition is formative in the migrants' experiences as emissaries and in defining themselves vis-à-vis their country of origin and their host country. Data collection for this project has taken place in Israel, California, and New York at the homes of the families, the children's schools, and other settings. Data include videotaped interaction between parents, children, peers, and educators, interviews with study participants, and ethnographic observations of neighborhoods and classrooms.

Cindi Katz, CUNY Graduate Center. Email: ckatz@gc.cuny.edu; *The Child as Spectacle: Cultural Geographies of Childhood in the United States*

Spectacle, according to Guy Debord, is the accumulation of capital to the point of collapse; where capital itself becomes image. As the 21st century picks up speed and settles into place 'the child' has become a form of spectacle—a site of accumulation and even commodification—in whose name much is done. In this paper I ask why and through what means this spectacularization has occurred, examine the consequences of these material social practices for actual children and the historical geographies of their everyday lives, and explore what is accomplished political and socially by these cultural formations.

Brent Zachary Kaup, University of Wisconsin - Madison. Email: bkaup@ssc.wisc.edu; *Negotiating with 'Nature': Neoliberal Cracks and the Constraints of Natural Gas*

Transnational extraction firms would like to fashion Bolivia as just one more supplier of cheap natural gas in their global sourcing regime. However, these firms face a paradox. In their attempts to establish a footloose global sourcing regime, the fact that raw materials are held within, upon, and underneath the earth's subsoil makes these firms dependent upon place. While today's transnational manufacturing firms are able to seek out the most profitable sites of production, nature's reproductive capacities do not give extraction firms the same luxury of choice. In this research, I explore how these transnational firms are, of necessity, plunged into the natural, social, and political messiness of place that their global strategies attempt to avoid. Drawing from ethnographic research

utilizing in-depth interviews, participant observation, and archival analysis, I argue that as today's oil and gas firms seek access to Bolivia's natural gas reserves, they must not only take into account the highly volatile properties of natural gas and the difficult geographic landscape of the Bolivian countryside, but also the shifting social and political realities. In this context, I note that by accounting for both the social and biophysical constraints of natural gas extraction, the cracks within the current paradigm of neoliberal globalization can be further illuminated and widened, thus providing local actors with more entry points and opportunities to influence how neoliberal globalization is touching down in place.

Keywords: Materiality, Neoliberalism, Natural Gas, Bolivia

Navjot Kaur, . Email: dhillon_navu@yahoo.com; *Comparing Spatial Mobility Internationally with GPS data: Tracking Faculty of an Indian University and a US University*

Spatial mobility is an integral aspect of human activity. One way of understanding human spatial mobility is to track movement patterns. The research proposed here is an effort to compare spatial mobility patterns in general, of faculty at University of Nebraska at Omaha (US) and Punjab Agricultural University (India). Using a GPS tracking device and associated software, data will be gathered and analyzed. By comparing these variables, the similarities and differences in spatial movement at an international level will be determined. There is little international research that analyzes differences in spatial mobility patterns between countries. Studies that have examined differences in spatial mobility did not use the same set of variables and collection techniques, so comparison of data is difficult. Part of the significance of this study lies in finding new method and variables to examine spatial movement patterns internationally. It also explores the growing similarities in spatial movement patterns in the two countries. Although GPS cannot collect other demographic and socio-economic data, GPS data in combination with survey or interview method can be used effectively in studying spatial mobility.

Keywords: GIS, Spatial mobility, GPS, Daily mobility, movement patterns.

Mizuki Kawabata, The University of Tokyo. Email: mizuki@csis.u-tokyo.ac.jp; *Modal Accessibility Inequality and Urban Spatial Structure: An International Comparison*

Equity in access is increasingly recognized as an essential component of sustainable urban development and transportation. It is known that in the highly car-dependent US, the number of accessible job opportunities, or job accessibility, is considerably lower for public transit users than for car users. It is also known that job accessibility varies by location. However, the degree and intra-metropolitan variation of inequality of job accessibility between cars and public transit, referred to hereafter as modal inequality of job accessibility, has not yet been sufficiently examined. Neither is the extent to which modal inequality of job accessibility greater in the US than in a less car-dependent area well understood. Selecting the Boston, San Francisco, and Tokyo metropolitan areas as the study areas, I examine the following two questions concerning modal inequality of job accessibility in connection with urban spatial structure. First, to what extent does modal inequality of job accessibility exist and vary by location within the three metropolitan areas? Second, to what extent do the degrees and intra-metropolitan variations of modal inequality of job accessibility in the US metropolitan areas differ from Tokyo, a less car-dependent metropolitan area? The first question is answered by measuring and plotting modal inequality of job accessibility using GIS and spatial data. The second question is addressed by comparing the results of the US metropolitan areas with the results of Tokyo. Our empirical results provide useful data in developing transportation and land use policies to safeguard equity of accessibility.

Keywords: modal inequality, accessibility, US metropolitan areas, Tokyo, GIS

Tatsunori Kawasumi, Ritsumeikan University. Email: kawasumi@lt.ritsumei.ac.jp; *Restoration of Heiankyo using GIS/VR: Kyoto circa 8th-12th Century*

Heiankyo in Kyoto had been the capital in Japan since 794 AD. For the last half a century, in the Heian capital site, large number of historical data has been collected from archaeological excavations and historical documents. Restoration of Heiankyo has been one of major challenges of archaeologists, historians, historical geographers and historical architects using such accumulated data. In this research, firstly, we compiled spatial database of excavation findings to estimate ground surface of the Heiankyo. Second, we digitalized land uses in Heiankyo created by historians and archaeologists. Third, we created CG models of various buildings in Heiankyo using CAD, from blueprints restored by historical architects. Finally, we integrated the above sources in GIS to created virtual Heiankyo in a VR space. The virtual Heiankyo is the digital diorama of the Heiankyo. The purposes of this project are (1) digital archiving of existing historical materials and findings and (2) visualization of historical spatial data in the archive. Our aim at creating virtual Heiankyo has been to use it as a platform

for placing digitally archived materials to be broadcasted as Web 3D GIS, but there are also demands for it to be displayed at museums.

Rebecca Kay, Senior Lecturer, Department of Central and East European Studies, University of Glasgow. Email: r.kay@lbs.gla.ac.uk; *The Invisible Man: Gender, Care and Social Support for Men in post-Soviet Russia*

This paper seeks to explore some of the ways in which gendered understandings and practices of care impact on perceptions of men's needs for and entitlement to social support in post-Soviet Russia. These perceptions affect the attitudes and behaviours of men, women and caring professionals and shape institutional patterns of service provision in ways which often marginalize and exclude men from both formal and informal systems of care and social security both as recipients and as providers. The paper draws on an ethnographic study of the Altai Regional Crisis Centre for Men and its attempts to identify men's needs for social support, to provide appropriate forms of care and to enhance the social security of men in the Altai Region of western Siberia. The specific focus of the Crisis Centre on developing a coherent system of social support for and work with men is virtually unique in post-Soviet Russia. Its work is avowedly experimental and firmly embedded in the context of changing understandings of the role of the state, non-state structures and more informal networks in the provision of social security and support to the population. Whilst the paper focuses on a detailed study of men's needs and experiences in a post-Soviet Russian context, many of the questions raised here are equally significant to wider debates and theorising about the gendered nature of care and its interactions with constructs of gender and power in families, local communities, wider societies and state-led institutions.

Jukka Käyhkö, Department of Geography, University of Turku, Finland. Email: jukkay@utu.fi; Petteri Alho, Department of Geography, University of Turku, Finland. Email: mipeal@utu.fi; Mikko Selin, Department of Geography, University of Turku, Finland. Email: mianse@utu.fi; *Coping with floods - modelling, mapping, adapting and mitigating*

Climate change is believed to have a substantial impact on river floods in the coming decades due to changes in hydrologically relevant parameters such as temperature, precipitation and snow cover. A comparable impact may result from projected changes in catchment land use and river channel management. In order to minimize flood hazards, the societies need to be better prepared for flooding in the future. This can be achieved by production of accurate flood scenarios and flood maps, and by effective dissemination of this information to relevant stakeholders. These include e.g., landowners, planners, public employees, business companies and rescue services. We present the Finnish system for flood damage prevention. This involves hydrologic and hydraulic modelling supported by high-accuracy DEM, involvement of relevant databases for infrastructure and population for the inundation area, GIS techniques for spatial database management, cartographic techniques for visualization, and interactive stakeholder involvement. Key components in a successful flood strategy include 1) cost-efficiency in relation to the data demand vs. accuracy of the final product (to allow mapping over large regions), 2) cartographic design in terms of both printed maps and digital GIS layers (for different end-users), 3) appropriate scales on which the maps will be made public (to give necessary information but to discourage over-interpretation), 4) effective dissemination of the flood risk maps in an appropriate and accessible format to different stakeholders from planners and engineers (long-term need) to rescue services (acute need). The Finnish flood mapping system parallels with the EU flood directive currently under final preparation.

Keywords: flood, modelling, map, hazard, risk

Niina Käyhkö, . Email: niina.kayhko@utu.fi; *Landscape Change Trajectory Analysis in the Assessment of Ecosystem Space-Time Dynamics: Case Study from Zanzibar, Tanzania*

Landscape Change Trajectory Analysis (LCTA) can be used to analyse landscape dynamics and to dissect evidences of the major driving forces of landscape change. The emphasis of the change analysis is on the retrospective relationship between the present-day and the past landscape patterns with the aim of identifying the relevant spatio-temporal processes in the landscape. In this case study, the approach was applied for the change analysis of the coral rag landscapes of Zanzibar Island, Tanzania. There is a growing concern over the sustainability of the natural resources, particularly forests, in the intensifying and dynamic agricultural environments of Zanzibar. The study was based on the land cover/land use information derived from the aerial photographs dating to 1953, 1978, 1989 and 2004. Geographical Information Systems (GIS) were used to construct a combined spatio-temporal database of the separate time slices. Landscape change trajectory analysis resulted with information of the spatial and temporal dynamics of the forest and agricultural ecosystems. It was further

applied to provide spatial indicators, such as forest cover stability, continuity and land use trajectories, for the discussion of the quality and sustainability of the natural resources in the coral rag areas. While change trajectory analysis is retrospective in character, its applicability is clearly forward looking. To be able to argue for ecosystem space-time persistence, their present state needs to be assessed as a function of the past dynamics.

Brenda A Kayzar, San Diego State University and University of California, Santa Barbara. Email: kayzar@rohan.sdsu.edu; *Analyzing Revitalization Outcomes in Downtown San Diego*

My research examines change in downtown San Diego as a result of formalized revitalization efforts. I employed a multi-method approach for this case study and utilized a network framework based on actor network theory to develop a narrative about the city's morphology. Through the narrative I analyzed the dynamics of power relations between actors in various networks of redevelopment activity as economic, political and social contexts changed over time. My analysis suggests the center city's historically minor role in the region facilitates boom and bust cycles of investment due to a lack of attachment to, and confidence in, downtown. The city's planning strategies and policies are aimed at rapid growth however, and thereby produce uneven outcomes since they are continuously employed regardless of the level of investment interest. The result is an incomplete duo-scape of tourist destinations and housing units, which contracts with the city's live, work and play environment envisioned in the downtown community plan.

Keywords: downtown revitalization, urban growth strategies, San Diego

Sheila A Kazar, West Virginia University. Email: sakazar@earthlink.net; *Multitemporal Characterization of Surface Mine Reclamation Sites—a Tasseled Cap transformation*

Debate around the "missing sink" has elevated the terrestrial ecosystem to the top of the list in the search of potential global warming solutions. Current terrestrial carbon research typically focuses on forested land and its current and potential carbon storage. Thousands of hectares of land a year are disturbed by surface coal mining in the United States. Since the passage of the Surface Mine Reclamation Act in 1977 (SMCRA), much of the land transformed by surface mining has been reclaimed. The Office of Surface Mining reports that in 2004, 128,495 total hectares of land were under permit for surface coal mining in West Virginia and 74,971 hectares classified as "disturbed." An additional 1645 hectares were considered revegetated under SMCRA regulations. The purpose of this study is to characterize the multitemporal changes of vegetation growth within reclaimed coal surface minesites in Monongalia County, West Virginia. Spectral signatures of the minesites were analyzed using the Tasseled Cap green vegetation index (GVI), brightness index (BI) and wetness index (WI) for a temporal series of Landsat Thematic Mapper (TM) images. Results of this study will be used in combination with field estimates of biomass to assess carbon storage within reclaimed minesites.

Keywords: Tasseled Cap, surface mine, aboveground carbon

Michael J. Keables, University Of Denver. Email: mkeables@du.edu; Shitij Mehta, University of Denver. Email: smehta3@du.edu; *Kansas Soil Water Budget Climatology Using GIS*

A soil water budget climatology for Kansas was modeled using GIS technology. Using mean monthly temperature and precipitation observations and estimates of potential evapotranspiration for the period 1895-2005, and observed soil water capacities, a local water budget model was constructed using GIS to calculate the water budget climatology for soils at the soil unit level. The model is initialized by assuming the soils are at field capacity at the beginning of the period of record, and then run until soil water is depleted to ensure that the representation of soil water conditions in the model accurately depict the soil hydroclimatology for the period 1950-2005. Spatial patterns and temporal variability of soil water surplus, deficit, utilization, and recharge are presented.

Barbara Kearney, Ph.D., Maryland-National Capital Parks and Planning Commission. Email: dr.kearney@gmail.com; *Using a Residential Capacity Estimate to Evaluate the Effectiveness of Montgomery County Zoning on the Rural to Urban Interface*

In 2004, the Maryland National Capital Parks and Planning Commission issued a "Residential Capacity Study" (RCS), since development capacity is a critical factor in determining the magnitude and location of the forecast this study provided an estimate of the amount of housing that can be built in Montgomery County under current conditions. This estimate of development capacity was based on current plans, regulations, and development practices, and took into account current regulatory and physical development constraints. It

reflected the actual number of units developers typically build on residentially zoned land. This estimate served as a baseline for measuring the need and impact of changes to current plans and in preparing growth forecasts. The RCS found that future residential capacity represented 18 percent of the total of existing and future units, or a 22 percent increase over the 2003 base. The location and density of future housing units conformed to the Commission's smart growth priorities. More than 85 percent of future units are located within designated Priority Funding Areas (PFAs) and a full 54 percent are within a ten-minute walk (half-mile radius) of existing commuter rail stations. In addition, to being a strong tool for policy makers; the Residential Capacity Study has demonstrated the continued effectiveness of county planning policies to direct growth in designated areas and maintain and protect an agricultural wedge, while promoting infill development in more urban areas. This research demonstrates the utility of using a residential capacity estimate for projecting areas of future growth to inform land use policy.

Keywords: community planning, land use, residential capacity, smart growth

Gerry Kearns, University of Cambridge. Email: gk202@hermes.cam.ac.uk; Simon Reid-Henry, Queen Mary, University of London. Email: s.reid-henry@qmul.ac.uk; *Vital Geographies: politics, meaning, life*

The state is involved with the management of life in terms of both the limits and the capacities of lives. This paper explores the geopolitical and geographical dimensions of these issues and reflects upon their moral and political significance. In terms of limits, any theory of justice has to address the geographical luck that birthplace confers longevity. Likewise in terms of limits, a cultural, technological and political geography is created by the styles and contexts in which the beginning and end of life is defined and regulated by and between states. In terms of capacities, we need to reflect upon the ways that biological potential is commodified by state power. Slavery is the most direct version of this but it shades off into various other non-consensual forms of selling the use of bodies in, for example, the pharmaceutical industry. Finally, the capacity of life contributes in geographically variable ways to an understanding of what it means to be human. This is where issues of human rights become pertinent and their suspension in the enclosures of the war on terror become part of a new geography of unfreedom.

Robin A. Kearns, The University of Auckland. Email: r.kearns@auckland.ac.nz; Denise Bijoux, The University of Auckland. Email: dbijoux@orcon.net.nz; *Keeping heads above water: Provider perspectives on activism, partnership and collaboration in the New Zealand community/voluntary sector*

In this paper we draw on preliminary results from the New Zealand component of a cross-national (UK/NZ) study that seeks to examine the importance of place for understanding the interrelationship between government and community/voluntary sector organisations, with particular focus on the notion of 'activists'. We draw on questionnaire and interview data gathered in 2006 to explore the extent to which organisations operating within the fields of mental health and community safety view themselves as activist in intent and how this may have changed over time. We grant particular attention to how these organisations and constituent 'activists' understand the concepts of 'partnership' and 'collaboration', as well as the significance of the spaces in which activism occurs for the future of the sector. We also grant attention to paradox of 'prescriptive partnership' - the way in which the viability and diversity of ethnically-based projects is apparently undermined by a dominant and bureaucratised (Pakeha, i.e. western) set of norms. We explore the apparent curtailment of activism (vis a vis earlier eras) by the discourse of partnership and the ways that the quest to 'keep heads above water' (i.e. deal with questions of funding and security) are inhibiting more sustained collaboration between the state and the voluntary sector.

Keywords: Voluntary sector, place, activism, mental health, community safety, New Zealand

Philip L. Keating, Indiana University. Email: pkeating@indiana.edu; *Understanding the geographic dimensions of forest recovery in the Ecuadorian Andes: problems and prospects*

During the past several decades, Ecuador's montane forests have received increasing attention from geographers, ecologists, and conservationists. After 7000+ years of human occupation, areas above 3000 m elevation include a complex mosaic of agricultural lands, forest and páramo (tropical alpine) ecosystems. In many sections of the Ecuadorian Andes, upper montane forest extends up to 4300 m elevation on the outer flanks of both cordilleras. Within the central valley, however, inter-Andean forests typically occur as small patches or corridors. Collectively, studies of Ecuadorian forests have shown that their composition, structure and disturbance regimes vary tremendously with both

elevation and geographical position. Whereas some authors have suggested that forest removal has largely been unidirectional, irreversible and/or catastrophic, recent evidence suggests that secondary forest cover is now more extensive than what was previously believed. This paper reviews both the current ideas concerning Ecuadorian upper montane forests and the common methodologies used to investigate their regeneration dynamics. Using a series of case studies, I will demonstrate that a wide array of factors have contributed to the spatial distribution and physical stature of forests that exist today. Although environmental history, contemporary disturbance regimes, and protected areas have influenced forest cover, I will emphasize the role of topographic factors in shaping forest recovery. Several quantitative methodologies will be presented, and I will make recommendations for future research.

Jon J Kedrowski, MA, Ph.D. Student. Email: StellarHoops32@hotmail.com; *Assessing Human-Environmental Impacts on Colorado's 14,000-foot Mountains*

This research focuses on documenting and analyzing the factors that affect mountain climbing in the state of Colorado and assessing the potential environmental impacts caused by the growing number of climbers visiting the Fourteeners?the 58 mountain peaks located within the Rocky Mountains exceeding an elevation of 14,000 feet. Key objectives were to: 1) identify factors that have a significant effect on mountain climbing frequency; 2) collect information from physical trail and route evaluation to develop an interim classification index; 3) combine relevant variables to formulate a composite Fourteeners Environmental Degradation Index (FEDI) and use it to evaluate, rank, and compare the 58 fourteeners within the six major mountain ranges; and, 4) examine sensitivity of this composite index based on changing relative importance of the input variables. The FEDI indicated that Mount Evans (Front Range) was ranked highest (highest level of adverse impacts), while Culebra (Sangre de Cristo Range) ranked lowest. The mountain ranges closest to Denver (Front Range and Tenmile/Mosquito) yielded the highest average ranks, while ranges farthest from Denver showed lowest ranks. Sensitivity analyses of the FEDI suggested that rankings were not drastically altered by adjusting relative importance of input factors. The findings provide important insights on identifying preservation needs within heavily visited mountain environments and can be used to guide future protection efforts, trail construction, and maintenance for existing trails and routes.

Sya Buryn Kedzior, PhD Student, University of Kentucky. Email: sya@insightbb.com; *Environmental Movements in India: A Rural-Urban Dialectic?*

Studies of environmental social movements in India often argue that their unifying characteristic is an anti-development orientation (see for example Guha and Martinez-Alier 1998, Karan 1994, Routledge 1993). This is often based on an assessment of Indian environmental social movements that classifies them as peasant struggles for autonomy and livelihood in the face of unjust development policies and programs. Interestingly, most of the studies that share this conclusion focus on movements that take place in rural contexts, where relationships to the environment and natural resources, especially in terms of access and ownership, can vary drastically from those experienced in urban areas. Some scholars, such as Paul Routledge (1993), who uses the term "fourth world colony" to describe the exploitation of certain rural areas as domestic colonies internal to the state, acknowledge the ways in which rural areas are differently incorporated into governmental development policies and programs than their urban counterparts. In this paper, I compare two environmental social movements in India that confront issues related to river water resources: the well-known rural Narmada Bachao Andolan (Save the Narmada Movement) and the urban Sankat Mochan Foundation, whose goal is to rid the Ganges River of pollution, in order to examine how the relationships between environmental movements and water resources are differently constructed in rural and urban contexts. In doing so, I ask whether these relationships lead to different movements perspectives on "development" and whether urban movements in India share the same anti-development orientation as their rural counterparts.

Arn Keeling, PhD, Memorial University of Newfoundland. Email: akeeling@mun.ca; Graeme Wynn, UBC. Email: wynn@geog.ubc.ca; *From Splendour to Desolation: Strathcona Park and the Environmental History of British Columbia*

As a cultural landscape, British Columbia's Strathcona Park embodies not simply the "natural" values associated with wilderness parks, but also the enduring conflicts within B.C. and Canadian society over the preservation or development of natural resources. Decades-long political struggles over the status of the

park?the province's first?as a protected area exemplified the larger tensions within B.C.'s "frontier" society between aesthetic and material values in nature. Set amidst the rugged mountains of central Vancouver Island, the province created the park by special legislation in 1911 "for the benefit, advantage, and enjoyment" of British Columbians, as well as to attract tourists. The planned tourist infrastructure never materialized, however, and Strathcona remained a largely remote, wilderness park best known for outstanding sport fishing. Over subsequent decades, the park's integrity was repeatedly undermined by boundary alterations, resource extraction, hydroelectric projects and industrial pollution. Pro-development provincial governments both abetted and initiated efforts to exploit the material resources of the park. Beginning in the 1950s, conservationists and recreationalists, including the internationally known angling writer and local resident Roderick Haig-Brown, bitterly opposed these developments, citing the importance of preserving aesthetic and "non-material" values in the park. As a contested landscape, Strathcona Park magnified the growing public dissension in the mid-twentieth century over the appropriate use and protection of the province's natural spaces.

Amanda Keen-Zebert, Texas State University. Email: keen-zebert@txstate.edu; Channel boundary forcing in the Upper Guadalupe River, a mixed alluvial-bedrock river

In general, forcing mechanisms control geomorphologic processes to such a degree that they eclipse, outweigh, overshadow, or punctuate processes operating at other scales. Channel bed boundary forcing interrupts longitudinal processes operating in streams. Forcing agents can be anthropogenic or natural in origin. They exert local control on fluvial processes and cause divergence from basin wide trends in erosion or deposition. In mixed boundary rivers, where both bedrock and alluvial reaches alternate downstream, the impact of channel boundary forcing is potentially great. Anthropogenic channel boundary forcing agents include any human built feature that locally influences the channel boundary type. Examples of anthropogenic channel boundary forcing agents include road crossings, small run of the river dams, and human built stream network links, such as channelized drainage paths that empty into streams. Any naturally occurring feature of a stream that locally controls flow and sediment transport rates may be considered a natural channel boundary forcing agent. Examples of obstruction type forcing agents include logjams, large individual boulders, and debris flows. Tributaries might be considered local forcing agents if the flow or sediment load contributed to the main channel is different from basin wide trends. The Guadalupe River is a mixed alluvial-bedrock river in a suburbanizing area of central Texas. Longitudinal effects of forcing agents on the channel boundary type of the Guadalupe River are quantified through field investigation and mapping. Channel boundary forcing in the Guadalupe River is put into the context of local land use and illustrates local geomorphologic forcing concepts.

Julia Keenan, University of Sheffield. Email: j.keenan@sheffield.ac.uk; What's transmitted? Food geographies and transitions to motherhood

The everyday provision of food and meals plays a central role in family life both practically and symbolically. There is also increasing attention paid towards making healthy and ethical food choices. Pregnancy and the arrival of a child(ren) are times when family processes, attitudes, and expectations, including those concerning food consumption may be examined and revised whilst negotiating new personal and familial roles and identities. Research in progress as part of the Leverhulme Families and Food programme suggests that women continue to see themselves as responsible for feeding their families and for inducting young children into eating environments both within and outside of family settings. This paper presents some preliminary findings from longitudinal interviews with 30 women experiencing the transition to motherhood for the first time, and single interviews with 30 mothers in the UK. Through an exploration of the accounts of women holding and catering for a range of ethical,

political and dietary beliefs and preferences, analysis considers whether, and to what degree, maternal understandings about food and related issues are transmitted to children; and the extent to which these are influenced by agents such as other family members and outside influences. Analysis shows that women's thinking about, and responses to, food and its consumption during this transition is shaped by a range of factors such as concerns with being seen to be a 'good' mother, health or body weight and available funds, transport and time.

Keywords: food, family transitions, motherhood.

Erin L Kees, University of Minnesota. Email: erinkees@hotmail.com; Peter Anthamatten, University of Minnesota. Email: anth0021@tc.umn.edu; Susy S Ziegler, University of Minnesota. Email: ziegler@umn.edu; Integrating Three-Dimensional Visualization into Geography Education

In recent years, the combination of new projection technology, low-cost high-performance graphics cards, and fast computers has made it possible for university departments to construct stereographic projection and viewing systems. This technology helps students view images and geographic features in three dimensions (3-D) and can support a broad range of learning styles. Beginning in Spring 2004, the Department of Geography at the University of Minnesota began to integrate 3-D visualization into courses using the GeoWall projection system. Since then, we have developed teaching modules for various classes including a large biogeography lecture, an introductory course on maps, visualization, and geographic reasoning, and advanced cartography and GIS courses. After the initial in-class GeoWall presentation of a topographic contour visualization presentation, we conducted written surveys to determine student reactions to the technology and to evaluate its effectiveness. A majority of students stated that GeoWall helped them stay focused on the lecture and that they would like to see more 3-D visualization technology in future courses. Currently, we are working to improve the contour visualization module and are developing a module to help students understand map projections. The department recently acquired a second GeoWall computer to enable students in the Master of GIS program to design and develop their own 3-D projects. 3-D visualization technology offers an untapped potential in geography instruction at many levels.

Keywords: education, 3-D visualization, GeoWall

James R. Keese, Cal Poly State University, SLO. Email: jkeese@calpoly.edu; Identifying and Assessing Tropical Montane Forests on the Eastern Flank of the Andes of Ecuador

The forests of the mountain topics comprise one of the most unique and bio-diverse of all vegetation regions, but they are also among the most threatened. Threats include colonization, road building, habitat fragmentation, logging, livestock pasturing, and agriculture. However, large areas of tropical montane forest on the eastern flank of the Andes Mountains of Ecuador remain intact, at least for now. This research uses Landsat 7 ETM+ satellite data and field study to identify land covers and land uses between Sangay and Podocarpus National Parks in Ecuador and to identify a potential conservation corridor between the two parks. The analysis reveals that eighty-eight percent of the study area remains in forest or highland tundra (páramo). However, there are three significant breaks in connectivity, and the adjacent areas of the upland valleys and Amazon Basin colonization zone are largely cleared, suggesting that deforestation pressures will intensify in the future. The results of this study demonstrate the benefits and drawbacks of moderate resolution satellite data for identifying, mapping, and monitoring land cover in less developed countries. GIS is also used to analyze relationships between roads, slope, and deforestation. Potential actions by government, NGOs, and local communities are suggested.

Keywords: tropical montane forests, Ecuador, conservation corridor

Artimus Keiffer, Ph.D., Wittenberg University. Email: akeiffer@wittenberg.edu; The "Delivery": Packaging the Future of the Industrial Landscape

As the world continues to evolve into a landscape of consumption, industry has relocated to regions that are more tolerant of the environmental problems it causes. A good example of this change is the United States, where outsourcing has become a buzzword and much of what is consumed is produced in developing and less-developed countries. Although the marketing is fueled by basic economic principles, the burden of the externalities is assumed by the producing areas. Although this may reduce the price of commodities due to exploitation of goods and services, the industrial landscape continues, albeit in a different location. This presentation deals with a surrealistic view of such a place that could be located in any venue that will tolerate pollution in an effort to produce and distribute commodities to other areas that will pay the price. The price, however, does not reflect the long-term damage being done to the environment as we continue to consume and exploit. "Delivery", a short animation by Till Nowak, a graphic designer in Mainz, Germany, provides a metaphysical twist on the

perception of industrial production and a Kafkaesque view of how it could be packaged in the future. Based on this short, award-winning film, a critique will be offered about the changing cultural perceptions of the industrial landscape.

Innes M. Keighren, University of Edinburgh. Email: innes.keighren@ed.ac.uk; The "bogy-lady of a slightly silly concept": rethinking the legacy of Ellen Churchill Semple

2007 marks the seventy-fifth anniversary of the death of Ellen Churchill Semple. For almost three decades at the beginning of the twentieth century she exerted an important influence on the disciplinary development of Anglo-American geography. Although not "written out" of geography's history in the same way as many of her female contemporaries, her contribution is often presented simply as a brief and misguided flirtation with environmental determinism. Semple was responsible, in part, for training a generation of American geographers, for providing the discipline with a novel methodological focus, and for encouraging and promoting the work of women scholars. With particular reference to her 1911 volume "Influences of geographic environment", I consider the ways in which her perspective on environmentalism shaped the practice of geography in the United States and Britain. I hope to explain why Semple's book was read both as a timely manifesto for a scientific approach to geographical research, and also as a text which might damage the discipline's legitimacy. In exploring what I would like to call "Influences'" trajectory of diffusion, I argue that it is possible to chart a geography of its reception - to reveal a spatial particularity in its reading and reviewing. In so doing, I address more general questions relating to the epistemic and methodological bases of book geography, and describe the contribution that geography can make to explaining how knowledge and ideas, in the guise of the book, are communicated and received.

Barry D. Keim, Louisiana State University. Email: keim@lsu.edu; Royce Fontenot, National Weather Service. Email: royce.fontenot@noaa.gov; Claudia Tebaldi, NCAR. Email: tebaldi@rap.ucar.edu; Jennifer Couret, Louisiana State University. Email: jcouret1@lsu.edu; Hydroclimatology of the U.S. Gulf Coast Region under Global Warming Scenarios

The empirical climate of the US Gulf Coast, in addition to climate change scenarios, were examined to assess the past and future temperature and hydrology of the region. The empirical record shows an annual temperature pattern with high values in the 1920s-1940s, with a drop in annual temperatures in late 1950s, which persisted through the 1970s. Annual temperatures then began to climb over the past 2+ decades, but still have not reached the highs of previous decades. Annual precipitation shows a suggestion toward increasing values, with some climate divisions, especially those in Mississippi and Alabama, with significant long-term trends. Over the entire record since 1919, there was an increase in rainfall, and that combined with relatively cool temperatures, led to a 36 percent increase in runoff. To assess future extremes in regional hydroclimatology, the A1B and B1 emission scenarios were examined for the region. Output from an ensemble of 21 regional climate models run with the two emission scenarios indicate a wide range of possible climates out to the year 2050. The models agree to a warmer Gulf Coast region of about $1.5^{\circ}\text{C} \pm 1^{\circ}\text{C}$. Precipitation projections are more convoluted with indications of increases or decreases by the various models, but the models lean slightly toward a decrease in annual rainfall across the Gulf Coast. However, by compounding changing precipitation with increasing temperatures, overall runoff is likely to remain the same or decrease, while deficits (or droughts) are more likely to become more severe.

John D Kelley, New College of Florida. Email: j_d_kelley@hotmail.com; Out in the Woods: Landscapes of Queerness and Community

The experiences of queer people have been described mainly in urban settings. To date, explorations of queers in rural environments have been minimal. This ethnography centers on a radical green community formed in the 1980s to maintain sanctuary for emerging queer culture. I examine the performances of social identity among the twenty residents of the sanctuary, how they assert or deny cohesive identity and how they negotiate their individual experiences. The sanctuary is also a site of convergence and "pilgrimage," where hundreds gather in the fall and spring to engage in a week's worth of saturnalia-style festivities. Gatherings present an opportunity to observe the social performances of these "pilgrims" and their temporary community in "liminal" time and space. Another inquiry involves related communities and households that have developed around the sanctuary during the last twenty years. The multiple levels of community are linked through intersubjective relations. This interplay presents an opportunity to investigate the relationship between genealogies of performances and subjectivities. To understand how these queer

identities play out in the context of this rural space, I draw from poststructural, queer and performance theory. My findings show that although the sanctuary provides the "safety" of queer space, the interplay of community, landscape and experience destabilizes spatial and identity fixity. Furthermore, this unique example of rural queer community resists the confinement of people to homogenized areas and places.

Maureen Ann Kelley, University of Oregon. Email: mkelley1@uoregon.edu; Amy Lobben, PhD, University of Oregon. Email: lobben@uoregon.edu; Route-directions using maps and satellite imagery

Sex differences have been documented in route-direction studies. Females use more landmarks compared to males when giving directions, whereas males use more distances and cardinal directions when giving directions. These previous studies investigated route-direction strategies using line maps with no topographic or photographic base information present. To our knowledge, no studies investigated whether map type influences route-direction strategies. Current Internet mapping services such as Google Maps and Microsoft's Live Local allow users to choose between a line map, satellite image, or photomap. These on-line mapping services are used by many Internet savvy people to generate driving directions. The driving directions in these systems do not use landmarks as key features but use directional turns and distances only. The main research hypothesis is that females use more landmarks than males regardless of map type. An alternative research hypothesis is that map type determines landmark usage regardless of sex.

Charles J. Kelly, Benfield Hazards Research Centre, Univ. College London. Email: 72734.2412@compuserve.com; Life in a Small Dangerous Place: Managing Hazards in Mountain Areas: Experience from Gorno-Badakhshan Autonomous Oblast, Tajikistan.

The potential impact of a hazard is significantly influenced by the environment in which the hazard exists. Mountain environments are characterized by intense exploitation of limited areas. These areas are often under threat of, and in many cases, also created by, hazards such as flooding, landslides, debris flows, rock falls, avalanches, mud flows, severe winter weather and earthquakes. Added to this mix is the fact that human actions can trigger some of these hazards, such as with poorly maintain irrigation channels which lead to mud slides. The presentation will describe a hazard risk management project in Gorno-Badakhshan Autonomous Oblast, Tajikistan, which has linked hazard mapping, risk assessment and community capacity building to reduce the threat of hazards becoming disasters. The project is innovative in its matching of technical field assessments, GPS and GIS, and community participation to define and implement hazard-specific mitigation activities and improve overall disaster risk management.

Keywords: Hazards, Tajikistan, Hazard Management, GIS, Mountain Areas.

John H. Kelly, University of Kansas. Email: jkellyma@ku.edu; Deconstructing PROCEDE Property Maps through Participatory Research Mapping

From 1992 to 2006, the Mexican government, through its PROCEDE program, surveyed over nine million individually-held parcels within social property communities, creating for the first time a single rural land cadastre which will gradually merge with the existing urban and private registry as parcels are fully privatized. The participatory research mapping (PRM) component of the México Indígena project (and First Bowman Expedition), a collaboration among U.S., Canadian, and Mexican geographers, university students from the Universidad Autónoma de San Luis Potosí, and trained community representatives, includes two products from study sites in the Huasteca Potosina region (completed) and Sierra Norte de Oaxaca (in process): community maps, and GIS data layers of property transactions since PROCEDE. Comparing PROCEDE cadastral maps (and legal registry updates) with PRM community maps and property transaction data reveals severe, potentially conflictive discrepancies between the neoliberal model and local knowledge and practice, and between the neoliberal ideal of transparency and the reality of state obfuscation. Mexican indigenous communities continue to demonstrate their historical capacity to adapt to (and proactively define) land tenure change, but they must now adjust their strategies in the post-PROCEDE era of state-directed property standardization.

Philip F Kelly, York University. Email: pfkelly@yorku.ca; Capital and Labour Mobility in a Philippine Locality

This paper examines the developmental implications of intersecting global capital and labour flows in a Philippine locality. In an influential analysis almost 20 years ago, Saskia Sassen suggested that FDI in countries such as the Philippines explained, in part, the increasing numbers of transnational migrants that they were generating. Sassen's analysis lacked empirical depth in such source areas of migration, and while her analysis of world city labour markets has been influential, her attempts to unite an analysis of capital flows and labour flows in the developing world has not subsequently been pursued. This paper takes a contemporary look at the linkages between FDI and migration in the Philippines. Using household survey data from a locality that has seen significant flows of inward national migration, outward international migration, as well as manufacturing FDI and remittances, this study will trace the local developmental implications of capital and migration flows.

Keywords: Philippines, migration, remittances, foreign direct investment

John A. Kelmelis, United States Geological Survey. Email: jkelmeli@usgs.gov; Conducting Geographic Research in Areas of Conflict and Instability

Geographers often work at the interface of social and biophysical domains. At times these areas are socially unstable or fraught with intra or intercultural antagonisms. While this instability can provide a unique opportunity for cultural analysis, it can also act as a complicating factor by frustrating geographers' efforts to accomplish scientific work. Conducting field work in areas of conflict can put the scientist in harms way. While the science can be policy neutral it may not be viewed that way in regions of conflict. At other times, the science can support an agenda of one or other side of a conflict with or without the geographer's knowledge. In still other cases, the scientists can be conducting either basic or applied research to further an agenda. Any of these views can further complicate the geographers' situation. There is no single United States national policy toward scientists conducting work in conflicted areas. There are a number of policies which vary from situation to situation, time to time, and even organization to organization. In this presentation I discuss several types of conflict, the objectives of U.S. foreign policy strategy, transformational diplomacy, and the importance of geographic research to them. I consider several cases involving different nations, different types and levels of conflict, different scientific activities, and some existing policies with relation to scientific activities.

Jo Lynn Kemper, University of New Orleans. Email: jlkemper@uno.edu; Restoring Avian Critical Habitat in the Louisiana Gulf: A Critique of Dredged Material Bird Islands

The barrier islands off the coast of Louisiana in the Gulf of Mexico provide a protective habitat for numerous species of nesting, migratory and wintering birds. However due to severe erosion caused by the natural forces of water currents and wind these islands either completely dissipate or are often left in fragments resulting in a significant reduction of available habitat. I discuss the efficacy of critical habitat restoration using dredged material islands created through the Army Corps of Engineers' Beneficial Use of Dredged Materials Program from 1970 through 2006. I identify successful restoration techniques using aerial photography, remote sensing and the analysis of ecological data recorded by government agencies. Birds are taking to these islands in increasing numbers which indicates that the dredged material program preserves critical habitat and provides future protection for Louisiana's fragile coastline and its inhabitants.

James M. Kendra, Department of Public Administration, University Of North Texas. Email: jmkendra@unt.edu; Tricia Wachtendorf, Disaster Research Center, University of Delaware. Email: twachten@udel.edu; Geographic Aspects of Sensemaking: The Waterborne Evacuation of Lower Manhattan on September 11, 2001

Sensemaking is integral to organizational and collective social experience and as a theoretical framework includes consideration of environmental cues and the construction of environment. We present research on the waterborne evacuation of Lower Manhattan on September 11, 2001, in which several hundred thousand people were evacuated in an improvised fleet of ferries, towboats, tour boats, and various other harbor craft. We find that boat operators and other participants developed their organization around their concepts of New York Harbor as a place and as a community, orchestrated their organization via a shared operational and cartographic knowledge, and indexed it to particular features of the New York Harbor waterfront. In addition to advancing theoretical understanding of sensemaking and improvisation, the research points toward disaster preparedness and response strategies that emphasize developing community-based resources and toward policies for enhancing transportation infrastructure.

Email: i.burnley@unsw.edu.au; Expanding the methods and extending the 'measures' for research on residential segregation

Urban research on residential segregation has been heavily reliant on one method - the use of segregation indices. The Index of Dissimilarity (ID) has been the index of choice since the seminal work of Duncan and Duncan in 1955. Debate about the application of the ID, and other such indexes, has been ongoing. In large part, and from a geographical perspective, this debate has been concerned with the aspatiality of segregation indices, in that such indices do not give the researcher, and the audience, any sense of where segregation is occurring, or of the spatial distribution of a given population group across the city. This paper begins with a review of the debate about the application of segregation indexes and a discussion of some of the limitations to their use. Following from this we connect with the debate about qualitative versus quantitative methods in geography and, in attempting to reduce the dichotomy, propose a mixed method, multi-staged approach to research on residential segregation. The utility of these stages is examined by a staged analysis of the Vietnamese-Australian community in Sydney, Australia, using statistical measures and field based interviews. It is our contention that a mixed method approach to urban geographical research on residential segregation will help to counter the aspatiality of segregation indexes as the supplementation of segregation indexes, with alternative methods, will

enrich our knowledge of the complex urban process, segregation.

Christina B Kennedy, Ph.D, Northern Arizona University. Email: tina.kennedy@nau.edu; *Affect, Images, and Experience: Student Reflections on "Smoke Signals"*.

Films may have a strong emotional impact on an audience and reify or challenge stereotypes of people and place. An audience's background, experience of non-filmic places, and the context within which a film is viewed may affect the degree or type of emotional impact a film has. Students in three courses focusing on geography and media literacy viewed Sherman Alexi's purported comedy, "Smoke Signals". The courses were taught simultaneously in spring, 2006, at NAU, ASU and UA. Students were asked to reflect on the film immediately after viewing it by responding to a series of open-ended questions. This paper explores the reported emotional impact of the film and specific scenes, identification with the film's two main characters, potential relationships between experience with reservations and response to filmic images of reservations, and the context within which the student's viewed "Smoke Signals"

Keywords: film, reservations, Native Americans

Lisa M. Kennedy, Virginia Tech. Email: kennedy1@vt.edu; Amos Desjardins, Virginia Tech. Email: amosd@vt.edu; *Potential for Paleoenvironmental Reconstructions in Coastal Lakes of Eastern and Southwestern Dominican Republic*

We recovered cores from several lakes on the eastern and southwestern Dominican Republic coasts during a pilot study to assess potential for paleotempestology and other paleoenvironmental reconstructions. Sediments from two lakes, Laguna Los Flamencos and an unnamed pond, situated on an uplifted terrace of Pleistocene reef on Isla Saona (~18.14°N, 68.75°W) were shallow (~40-50 cm to bedrock) and AMS dates on plant material from near the bottom of the cores dated to ~1700 and 2200 cal yr BP (respectively). Loss on ignition indicated high calcium carbonate content (30-40%) and relatively low organic content for both lakes. Similar sediments (as yet undated) from Laguna Mala Punta (18.17°N, 68.78°W) on the eastern coast contained a coarse deposit near the surface that we interpret to be from Hurricane George (Category 4, 1998). Nearby Laguna Bavaro, with mainly calcium carbonate sediments about 60-cm in depth, has a wide barrier that probably filters out storm deposits. On the southwest coast, we collected 185cm of sediment from Laguna Alejandro (informally named, 18.31°N, 71.03°W) in the arid Enriquillo Valley region. Three AMS dates indicate that Alejandro is >1000 years old. Sediments contained deposits of organic material, two deposits of sands matching the nearby beach, and a variable distribution of invertebrates. The biotic indicators, such as calcareous Serpulidae tubes and mussels, are helping us piece together lake history at that site. We are continuing analyses of GEOTEK® multi-sensor core logger data and x-radiography on all cores. Several lakes are promising for further paleoenvironmental study.

Patrick J. Kennelly, CW Post Campus of Long Island University. Email: patrick.kennelly@liu.edu; James Stewart, Queens University. Email: jstewart@cs.queensu.ca; *Illumination Models for Cartographic Displays*

Shading and shadowing can add shape and depth cues to cartographic displays by modulating the brightness of the surface. Such variations in shades of gray are typically realized by applying an illumination model to a virtual model of the surface to be rendered. Cartographers, however, generally apply illumination models only to continuous, smoothly varying surfaces such as topography, and then generally use a simple point source illumination model. We used more detailed illumination models to create alternative displays of terrain. Additionally, we demonstrate how these illumination models can be used to shade and shadow statistical surfaces with abrupt edges, such as enumeration units on choropleth map displays.

Keywords: Shading, shadowing, illumination model, terrain model, GIS, choropleth map

Judith T. Kenny, University Of Wisconsin-Milwaukee. Email: jkenny@uwm.edu; *The Moral Landscape of Madras' People's Park, 1860-1890: "Improving" India*

Incorporating the benefits of nature in a city's design and advocating its use for a growing portion of the population was relatively novel in Europe and America during the mid-nineteenth century. Yet in 1859, endorsed by Governor Charles Trevelyan, the Madras Corporation laid out the 116 acre People's Park to the west of the area known as Black Town. Trevelyan recommended its construction specifically as a means of improving civic life and the interaction of Indians and British colonials. This paper interprets the moral landscape of the People's Park as a means of understanding contemporary planning activities in a

colonial city in contrast to park development in Britain. I examine the contemporary discourses of nature and civic life in the context of this park's design, its users' activities, and administrators' expectations of benefit - asking to what extent a public space associated with liberal interpretations of the modern city was transformed in its colonial implementation. I use newspaper accounts, public documents, government records and personal diaries in this analysis.

Keywords: park planning, civic space, India

Julia Kentnor, University of Denver. Email: jkentnor@du.edu; *Juggling Risk and Opportunity: Neoliberalism and Cooperativism in Mendoza's Wine Industry*

This paper explores how neoliberal economic reform in Argentina has presented cooperatives with both potential for success and challenges to survival. The wine industry in Mendoza exemplifies the ways that some cooperatives in Latin America cope with globalization and neoliberal economic reform through centralization of decision-making power. In the wine industry, new standards in quality and consumer trends stress the fabric of these cooperatives trying to serve both the farmers needs and consumer tastes. Many local cooperatives in the district of San Rafael produce basic table wines, even with the best varietals, due to less advanced machinery. They are cautious about making capital investments, weighing market unpredictability against providing more immediate member benefits. Their historical relationship to the wine industry is littered with booms and busts that coincided with national politics and consumer tastes. FeCoViTA, the regional co-op and the marketing and bottling enterprise of the cooperative system, succeeded in pulling its members through the recent financial and consumption crises in Argentina. The increasingly competitive market challenges it to continue to buy from its member cooperatives while providing a quality product to consumers. This research involved in depth interviews with employees and directors of three wine co-ops in San Rafael and at FeCoViTA, as well as numerous community members of varying professions, agronomists and the national agricultural extension agency. Historical data from the national wine institute showed the impact of the historical and political underpinnings of cooperative formation on risk assessment and benefit provision.

Laura N Keogh, King's College London. Email: laura.2.keogh@kcl.ac.uk; *Place, heritage and the construction of sustainable communities: waterfront regeneration in the Thames Gateway*.

The UK Labour government's Sustainable Communities Plan launched in 2003 promotes brownfield regeneration as a sustainable solution to housing shortages and socio-economic decline in Britain's urban areas. Within this plan the Thames Gateway area in the South East of England is highlighted as a major growth area where there is the intention to build 120,000 new homes by 2016. Waterfront regeneration is a key part of the plans with the River Thames providing a focus for many of the developments that are taking place. The emphasis is on the creation of new vibrant 'places'. Within these plans heritage is presented as an important aspect of place-building, in that it is thought to help create communities with a strong sense of identity, vitality and 'sense of place'. It is recognised that waterfront sites can have significant heritage value that can be utilised in regeneration projects, however there is little empirical research which explores the politics and practice of this process. Focusing on the Royal Arsenal development in Woolwich, South London, this paper will examine the role heritage can play in waterfront regeneration and the construction of sustainable communities. The politics of heritage and different understandings of the concept in relation to waterfront transformation will be explored. The paper will also address how a focus on heritage can inform waterfront regeneration and the development of sustainable communities.

Keywords: urban regeneration, community, heritage, waterfront

Noel Keough, PhD, University of Calgary. Email: nkeough@plannet.ca; *Deliberative Policy-Making: From Indicators to Action*

Since 1996 Sustainable Calgary Society, a non-profit community organization has employed sustainability indicator reporting to engage citizens in debate and discussion of critical issues facing Calgary. In 2005 SC embarked upon a Deliberative policy-making process whereby 1000 citizens came together to assess a decade of sustainability indicator reporting and trend analysis, and identify critical issues of importance. Ultimately 12 Priority policies and actions to make Calgary a more healthy, caring and vibrant community were selected and a process begun to realize 'a City Built for Everyone' by bringing together decision-makers, thematic experts and citizens to chart a course for the implementation of the Priority policies and actions. This paper will discuss the lessons learned in moving from indicators to action in Calgary.

Keywords: deliberative policy, sustainability indicators, inclusive city

Sara Beth Keough, University of Tennessee. Email: skeough@utk.edu; Canadian Cultural Policy and Newfoundland Radio Broadcasts: A Study of Music and National Identity in Newfoundland, Canada

As our access to information increases with the aid of communication technologies, there is concern that cultural homogenization threatens to become a reality. Ironically, in the face of globalization in the media, the local often becomes increasingly important. This study explores how Canada's cultural policy, known as the Canadian Content regulations, has helped to foster a feeling of local identity in Newfoundland. I examine how Canadian Content regulations apply to radio, and how these radio regulations influence broadcasting in the St. John's, Newfoundland radio market. Interviews with radio station personnel (DJs, program directors, music librarians, etc.) and radio listeners show that many radio stations in St. John's emphasize local (Newfoundland) music in the face of more popular Canadian and American music. Furthermore, the act of broadcasting local music on the radio in St. John's has allowed radio listening to become incorporated in to several of the listeners' Newfoundland cultural traditions and thus, an integral part in development of a Newfoundland identity.

Keywords: identity, Canada, cultural policy, music, radio

Matthew Kerfonta, Western Carolina University. Email: mkerfonta@juno.com; Extracting Potential and Existing River Cane Sites within Jackson County, North Carolina using Remote Sensing Data

The RTCAR initiative is a multi-year program whose purpose is to assist the Eastern Band of Cherokee Indians to restore the traditional Cherokee balance between maintaining and using natural resources. The goal of this project is to identify existing and potential river cane habitat within Jackson County, North Carolina. To this end, the first objective is to develop a site suitability map of river cane habitat in a GIS. This will identify potential river cane habitat based upon criteria identified through field work. The second objective is to extract existing river cane sites from aerial photographs and Landsat images using a mask based of site suitability. This project requires the use existing data, therefore aerial photographs acquired in 1995 and Landsat images acquired in 1998, 2000, and 2003 are used in the analyses. Aerial photographs were chosen for their spatial resolution but are limited in spectral resolution (blue, green, red). In comparison the Landsat data has a higher spectral resolution, but lower spatial resolution (30 m). The third objective is to map river cane potential and existing habitat. It is expected that the aerial photographs will be of appropriate spatial resolution, however, it may not have a high enough spectral resolution to discriminate native river cane from other evergreen vegetation. It is anticipated that the Landsat data will not be able to detect the smallest fields. But the higher spectral resolution may better discriminate between native river cane and other evergreen vegetation compared to the aerial photographs.

Keywords: Natural Vegetation, River Cane Habitat, Site Suitability Map, Cherokee Native Americans

Simon Kerma, . Email: simon.kerma@zrs-kp.si; Janez Berdavs, . Email: janez.berdavs@zrs-kp.si; Slovenian borders and the European integration: the case of Slovene Istria

Slovenia experienced fast geopolitical transition in the last sixteen years; from being one of Yugoslav federal republics to entering the European-Atlantic alliances four years ago. From 2004 Slovenia is an EU member and the first country among new member states introducing the euro currency. This caused basic change in the nature of its borders: what used to be a borderline between Yugoslavia, Austria and Italy, and also a line of division between two different political systems, is now a boundary between the EU member states. A border regime on borders with Austria and Italy, quite liberal before 1991, has further relaxed since, and will be dropped with Slovenian accession to "Schengenland". Hungarian border experienced even deeper changes: once a strict border with Warsaw pact member state has become an internal EU borderline. Development took opposite direction on Croatian border: once internal border between two Yugoslav republics is nowadays outer border of the EU and with Slovenian accession to the Schengen agreement, border regime will become even stricter. The paper investigates the influence of changes in border regimes on intensity and types of cross-border contacts. Focus is put on the case of Slovene Istria, a region divided by internal and external EU border. Research of border contact intensity will include an analysis of traffic on border crossings, public opinion research; research of EU supported cross-border cooperation programmes, analysis of regional media etc.

Keywords: EU, Slovenia, Slovene Istria, political geography, border regions, borders

Leslie Kern, York University. Email: lkern@yorku.ca; The (Re)definition of Urban Living: Gender, Condominium Development and the Privatization of City Life in Toronto

In Toronto, a massive boom of condominium development over the past ten years has drastically re-shaped the residential landscape of the city, particularly in the urban core. Condominium development, as a unique tenure form and particular lifestyle choice, has tipped the city's tenure structure in favour of home ownership, and has also prompted a re-vision of city life in Toronto, reshaping both urban citizens and urban citizenship. I suggest that condo ownership and the condo lifestyle are both a reflection and source of an increasing privatization of city life in Toronto, where a collective notion of "quality of life" is being re-defined as an individualistic pursuit of "quality of lifestyle." In this paper, I draw on interviews conducted with women condo owners to argue that condos function as a form of neoliberal governmentality, working to produce private subjects in a privatized city. However, the framework of neoliberalism does not allow much space to examine the specifically gendered dimensions of this re-visioning of city life. Thus, I argue that a feminist lens - both methodologically and theoretically ? is necessary to highlight the intersections of gender, class, race and other social relations in shaping and governing subjectivities and lifestyles in the privatized, neoliberal city. This project challenges both the mainstream discourse that suggests that condominium ownership represents a form of empowerment and emancipation for women, and the critical urban literature that relies heavily on the prism of neoliberalism to explain all forms of privatization in the post-industrial city.

Keywords: citizenship, Toronto, gender, privatization, neoliberalism

Hannah Kerns, Indiana State University. Email: hkerns@indstate.edu; Jay Gatrell, Ph.D, Indiana State University. Email: jgatrell@isugw.indstate.edu; School Performance, Educational Attainment, and Socio-Economic Indicators in Vigo County, Indiana

The purpose of this poster is to examine the observed relationship between socio-economic conditions, educational attainment, and school performance indicators in Vigo County, Indiana. The poster demonstrates that indicators of school performance at the building scale for elementary schools co-vary with household educational attainment levels*as well as other demographic variables. Additionally, the poster will consider various poverty indicators obtained from the school corporation (e.g., reduced lunch and free lunch availability) and how these do or do not reflect observed household trends based on census. Finally, the poster will consider how the composition of local schools does or does not necessarily reflect the composition of the communities and neighborhoods within which they are contained. The objective of investigating the observed disjuncture between neighborhood and school building data is to understand the unique challenges facing public schools and the pitfalls of developing place-based strategies to school reforms within the context of larger school structures (such as targeted school programming and residency waivers).

Laura M Kerr, Macalester College. Email: lkerr@macalester.edu; A Cultural and Political Ecology of Hmong Agriculture in the Twin Cities

Over one and a half million Hmong refugees predominately Laos have arrived in the United States since the fall of Saigon in 1975. The Saint Paul and Minneapolis metropolitan area is home to the largest urban population of Hmong immigrants in the United States. Despite their urban location, a significant number of Hmong refugees living in the Twin Cities metropolitan area have chosen farming as both a primary and supplemental source of income. While living in the metro area many Hmong rent and increasingly buy land in surrounding countryside to farm and subsequently sell at local markets. Using a cultural and political ecology framework, this research critically examines this phenomenon. By exploring farming in the context of adaptation of refugees, the socio-economic forces as well as the cultural and historical forces which bring these refugees to farm are uncovered. Additionally, this research reveals the agricultural systems employed by Hmong growers and the structural forces which have impeded these farmers in achieving greater success.

Keywords: Cultural and Political Ecology, Agriculture, Refugees

Ruth Kerry, Brigham Young University. Email: ruth_kerry@byu.edu; Margaret Oliver, University of Reading. Email: m.a.oliver@reading.ac.uk; Why are geostatistical methods not more widely applied in Geography?

Hartshorne in 1959 said that geography is concerned to provide accurate, orderly, and rational description and interpretation of the variable character of the earth's surface. The quantitative revolution followed in the 1960s and many classical statistical techniques were applied to spatial studies of the human and natural world. For example, trend surface analysis to show spatial variation, the analysis of variance to determine whether the characteristics of one area were significantly different from those of another, correlation to determine the

strength of relationships between variables and using regression equations to predict one variable from others. These methods assume that the data are independent, random and unbiased. This means that spatial autocorrelation in the data should not exist. Many geographers ignore these assumptions whereas others adhere strictly to them. Either approach means that spatial autocorrelation is not investigated. Autocorrelation is at the heart of geostatistics, either through the correlogram or the variogram. Geographers have used the correlogram since the late 1970s, yet few have embraced geostatistics with any enthusiasm. They have generally preferred the tools embodied in GIS which provide far less analytical capability than geostatistics. This paper investigates why this might be so. One possible reason is a perception that geostatistics can only be used for interpolation. Case studies illustrating other uses for improving our understanding of spatial phenomena will be presented. These will include investigating spatial variation and relationships, determining probabilities of exceeding critical thresholds, filtering data, simulating data, spatially weighting classifications and determining optimal sampling schemes.

Keywords: Geostatistics, soil, quantitative methods

Joseph J. Kerski, Ph.D., ESRI. Email: jkerski@esri.com; Web-Based GIS Opportunities and Challenges in Education

Using Geographic Information Systems (GIS) technology and methods in education via software and data resident on a personal computer is rapidly changing. Web-based GIS and virtual globes have rapidly matured beyond the ability to make simple online maps to becoming powerful tools that allow for problem-based, inquiry-driven learning. Tools such as ArcGIS Explorer, Scalable Vector Graphics, ArcWeb Explorer, YourGMaps, Batchgeocode, and others allow educators and students to upload their own information and analyze it online. Many of these tools enhance teaching and learning with traditional desktop-based GIS, while others serve as standalone applications that desktop systems cannot match. These new tools present new opportunities for the educator as well as new challenges. As never before, educators have a wealth of geospatial tools at their fingertips, most of which requiring less training than traditional GIS. These tools may hasten the ability of educators to meet spatial learning challenges as identified in the National Research Council's Learning to Think Spatially report. Limitations include data quality, functionality, and distractions due to visual appeal of these new tools. These tools can be used in a variety of ways such as in teaching about spatial measurement, landforms, population, map projections, and analyzing field-collected data. In each application in education, students learn about the processes that are active on our planet, and the reasons why those processes exist?the "whys of where."

This paper analyses state relations of international companies operating in rapidly changing markets. Doing so, we investigate and compare the state relations of Finnish companies in North-West Russia, coastal China, South Korea, and Estonia. The four rapidly developing economies are challenging for foreign investors as they have considerably reorganized their formal institutional framework and the role of the public sector in business. Theoretically, our study contributes to the governance approach (Jessop 1997) in institutional economics, especially to the discussion on formal and informal institutions in the organization of social relations of foreign companies. The study identifies the challenges and problems in state relations in the four host countries. Also, we point to the successful mechanisms of governance, i.e. how problems have been solved in the companies under investigation. Empirically, our analysis is based on the database of interviews with internationalized Finnish companies that represent various company sizes and lines of business. The findings uncover both similarities and differences in the governance mechanisms in the four emerging economies. Also, drawing from the evidence from the four differently restructured economies, the study points to the diverse roles of formal (e.g. rule-based) and informal (e.g. relationship-based) institutions in business.

Lisa Keys-Mathews, University of North Alabama. Email: lkeysmathews@una.edu; Arleen A. Hill, PhD, University of Memphis. Email: aahill@memphis.edu; A Holistic Approach to Exploring Disaster Recovery: Combining Remote Sensing, Fieldwork and Traditional Individual Surveys

Characterization of the recovery process associated with natural disasters is complex. The spatial and temporal characteristics of recovery are dependent on the characteristics of the disruption/event, community resilience, and relief characteristics. Little is currently known about the potential role of satellite imagery for monitoring and assessing the recovery phase of the disaster management cycle. The purpose of this research is to assess the applicability of remote sensing tools and techniques to the documentation of recovery expressed as changes to the human and natural landscape. This work takes an integrative approach using a traditional survey of residents to establish their perception of recovery benchmarks while physical recovery will be documented through imagery analysis and fieldwork. The impact of Hurricane Katrina provides a unique opportunity to explore in-progress recovery using commercially available high-resolution satellite imagery that is optimal for such studies. The spatial, spectral and temporal signatures of the recovery process are currently being explored based on image analysis, field observations, and surveys of residents along the Mississippi Gulf Coast. The fieldwork has two components: Ground truth for image analysis including documentation of damage and rebuilding; and human-based surveying of the residents to obtain their view of recovery and their personal progression through the recovery process. This illustrated paper includes synthesizing the human, environmental and techniques subdisciplines of geography and begins a longitudinal profile of change associated with recovery in the coastal Mississippi region.

Keywords: disaster recovery, remote sensing, surveys, fieldwork

Belayet Khan, Eastern Illinois University. Email: bhkhan@u1.cts.eiu.edu; Trends in Selected Weather Parameters in Bangladesh

Bangladesh, a tropical deltaic country located in South Asia, has been experiencing fluctuations in its weather elements. Seasonal and annual temperatures, precipitation, humidity, and wind speed have shown departures from long term averages. Temporal and spatial variations in weather patterns have also been noted in the region. The prime goal of the current paper is to investigate and identify any significant departure of selected weather elements in the country in recent years from long term averages. Long term data on selected weather parameters representing the entire country will be subjected to statistical analysis to determine any major fluctuations in the weather patterns of Bangladesh. A fruitful outcome of the current research will be utilized as a basis for further research on the topic of weather anomalies in the region.

Keywords: Bangladesh, weather patterns, anomalies

Sriram Khe, PhD, Western Oregon University. Email: khes@wou.edu; An autoethnographic approach to understanding urban sprawl

Urban sprawl has been well covered in the academic literature, which speaks of the importance of this subject. However, nowhere in these publications do we get a sense of how and where the authors live with respect to their workplaces. We do not know how they personally balanced the different variables that households face in order to reach a decision on their respective home purchases. After all, understanding social issues such as urban sprawl is different from, say, research in nanotechnology: unlike with nanotechnology, how I live has an immediate impact on the spatial layout of the town. Given the intricate relationship between the observer and the observed, how do I draw that line between social issues and my own professional and personal life? Through discussion in this paper, which is simultaneously about urban geography and planning, I hope to persuade the reader that (a) autoethnography is an important research method, particularly in topics that have public policy implications, and (b) an autoethnographic research illustrates the complexities of urban planning.

Keywords: urban sprawl, urban geography, autoethnography, planning

Shahram Khosrowpanah, Professor of Civil Eng., University of Guam. Email: khosrow@uog.edu; Michael Park, University of Guam. Email: ; Development of a GIS based Erosion Model for Southern Guam Watersheds

Soil erosion has created several problems for the southern portion of Guam. Excessive soil loss has leads to a gradual degradation of the soil quality and the ability to sustain agriculture, detached soil particles which are transported to local streams and rivers make it highly turbid and unfit for human consumption, and soil erosion is a major source of non-point source pollution. Large amounts of sediments are carried out into the sea where it damages marine biota and coral

reef communities. This paper details the development of a GIS-based soil erosion potential model for the Ugum Watershed, which is located in southern Guam. The two main components used are the Universal Soil Loss Equation (USLE) and a geographic information system (GIS). The USLE computes average annual soil loss by multiplying individual factors that represent the local rainfall, soil types, land terrain, and vegetation cover. GIS software is used as the central framework to create, store, and analyze each of the USLE factors. By combining the USLE and GIS, the digital model can predict soil erosion potential on a cell by cell basis. Model development and how the model can be used for managing southern Guam watersheds will be presented at this conference.

Keywords: Soil Erosion, Guam, GIS Erosion Model, Watershed

Lawrence M Kiage, LSU. Email: lkiage1@lsu.edu; Lawrence M Kiage, Louisiana State University. Email: lkiage1@lsu.edu; Kam-biu Liu, Louisiana State University. Email: kliu1@lsu.edu; Multi-proxy evidence of vegetational change and land degradation around Lake Baringo since AD 1650

Multi-proxy evidence of vegetational change and land degradation around Lake Baringo since AD 1650 By Larry Kiage and Kam-biu Liu, LSU This paper presents the findings of a multi-proxy investigation of the history of vegetational changes and land degradation in the Lake Baringo basin, Kenya, East Africa, during the Late Holocene. 14C- and 210Pb-dated stratigraphic records of fossil pollen, fungal spores, microscopic charcoal, and lake-sediments were used to reconstruct the paleoenvironment in the East African region. More recent changes in the ecosystem are examined using remote sensing imagery. This study provides one of the first high-resolution Holocene pollen records from the semi-arid region of Kenya. The record, based on a 363-centimeter core retrieved from Lake Baringo, reveals a largely dry environment that is punctuated by a succession of centennial- to decadal-scale wet and dry episodes separated by sharp transitions. The lake almost dried up during two intense dry episodes at ca. AD 1650 and AD 1750-1820. The two episodes were characterized by poor pollen preservation and by relatively high percentages of dry-indicator species such as *Podocarpus*, *Olea*, *Euclea*, *Acacia*, *Balanitaceae*, *Gramineae*, and *Cyperaceae*. The extremely high sedimentation rate in Lake Baringo effectively constrains the chronological record of the cores to the last 300 14C yr BP.

Tadesse Kidane-Mariam, Edinboro University Of Pennsylvania. Email: TADESSE@edinboro.edu; Tadesse Kidane-Mariam, Ph.D, Edinboro University of Pennsylvania. Email: tadesse@edinboro.edu; Ethiopia: Regional planning and development discourse and praxis under a Marxist government (1974-1991)

Regional Planning and Development Discourse and Praxis under Ethiopia's Marxist government :1974-1991 by Tadesse Kidane-Mariam, Ph.D Edinboro University of Pennsylvania Edinboro, 16444 I Abstract The desire to create a well-balanced and integrated national development surface has captivated the imagination of policy makers, planners, international development agencies, financial institutions, non-governmental organizations and civil society in both developed and developing countries. This desire is driven by both political and socio-economic objectives and goals as nations strive to improve the quality of life of their populations through sustained mobilization, development and management of their natural and human resources. Unfortunately, the mismatch or disconnect between the rhetoric and development praxis is often greater than the desire and commitment to promote equitable distribution of the benefits of modern development and welfare. The paper examines the multifaceted features of Ethiopia's regional planning and development discourse and praxis under a marxist military government (1974-1991).

Bora Kim, . Email: bkim06@maxwell.syr.edu; The Evolutionary Model of Free Economic Zone: The Case of the South Korea

This research aims to explore how the model of Free Economic Zones (FEZs) has been evolutionary transformed in the South Korea since the 1997 Asian financial crisis. In particular, it focuses on a series of controversies and contestations concerning the 'Incheon FEZ' project in Kyunggi province, South Korea. The South Korean government recently announces its development plan, through which it will create 'global hubs' of international movement of capital and skilled labor in several cities, designating three FEZs (Incheon FEZ, Busan/Jinhae FEZ, Gwangyangman FEZ). This master plan includes several important issues such as labor regulation, deregulation of foreign investment in the educational and medical sectors. Another big issue is that it includes the construction of what is called, 'Ubiquitous City' which is based on the concept of digital city. However, while FEZs have become a truly global phenomenon, most studies regarding FEZs focus narrowly on the theoretical analysis of benefit and cost as well as the economic characteristics and roles of FEZs in developing countries.

Little consideration has been given to when, why and how FEZs are influenced by, or adapt to diverse economic, political, socio-cultural and spatial conditions on an international, regional, national and local scale. Accordingly, these bodies of literature rarely explore the interrelation between political economic logic of urban development strategy, evolutionary natures of FEZs and state sovereignty. Through this paper, I argue that the model of FEZs have been evolutionarily transformed into spaces for 'neoliberalization' and 'new paradigm for urban development strategy' in South Korea.

ChangHwan Kim, Kangwon National Univ.. Email: hillskim@kangwon.ac.kr; HeeJun Chang, Portland State University. Email: changh@pdx.edu; Who is responsible for increasing flood hazards?: The case of Gangwon province of Korea

Flood hazards are increasing around the world. The Gangwon province of Korea is also subject to flood hazards. During recent past years, the province experienced multiple extreme floods caused by heavy rainfalls. Additionally, as cities grow, intensive land use adjacent to floodplains is believed to contribute to flood impacts. We examined the anthropogenic and natural causes of flood hazards in major urban areas in Ganwon province. There are significant upward trends in monsoon season precipitation intensity and heavy precipitation days (50mm>day) in three of the six major cities between 1973 and 2005. Flood damages also generally increased during the same period, particularly during the 1990s and 2000s. Intensive land use in lowlands, including encroachment of humans and industries into floodplain areas, contributed to the increased flood damages downstream. We estimated the number of people that could be potentially affected by a rising river level for each city. Without changes in current flood management systems in these cities, their vulnerability to flood hazards remains and may even increase under changing climate conditions and population pressure.

Daehyun Kim, Department of Geography, Texas A&M University. Email: geokim@geog.tamu.edu; David M. Cairns, Department of Geography, Texas A&M University. Email: cairns@tamu.edu; Jesper Bartholdy, Institute of Geography, University of Copenhagen. Email: jpb@geogr.ku.dk; Spatial patterns and long-term dynamics (1933-2006) of salt marsh vegetation on the Skallingen peninsula, Denmark

The Skallingen salt marsh in Denmark provides a unique opportunity for long-term biogeographical research in that data on plant species frequency along three transects perpendicular to the shoreline have been acquired in 1933, 1949, and 2006. These data enabled us to investigate the changes in species composition and richness under broad spatial and temporal perspectives. Cluster analysis produced four vegetation associations, dominated by 1) *Puccinellia maritima*, *Suaeda maritima*, and *Salicornia herbacea*, 2) *P. maritima*, *S. maritima*, and *Limonium vulgare*, 3) *Festuca rubra*, 4) *Halimione portulacoides*. These associations clearly indicate the temporal dynamics of salt marsh vegetation. Nonmetric multidimensional scaling (NMDS) was used to illustrate dominant vegetation gradients. The first and second NMDS axes correlate with time since the first data were collected and surface elevation, respectively. Species richness increased, decreased, or fluctuated through time depending on the transect considered. This result differs from previous research that has usually reported a decreasing tendency of species richness. In general, the Skallingen salt marsh shows a convergent succession into an ecological state where one key species, *H. portulacoides* dominates. We, however, argue that spatial variation of changes in species composition and richness at a local scale should also be appreciated as a result of site-specific stochastic processes. This aspect is discussed in terms of human activity, retrogressive succession at cutbank edges, and geomorphic history. We suggest that a hierarchical approach is necessary in order to take into consideration different ecological processes operating across spatial and temporal scales in the salt marsh ecosystem.

Keywords: hierarchical approach, micro-scale processes, species composition, species richness, succession

Hwhwan Kim, University of Georgia. Email: kh008@uga.edu; GIS integration of daily commuting movement and population density surface model

Accurate estimation of population distribution in the city at any moment in time is crucial information for transportation planning and emergency response. This research integrates human activity patterns and grid-based population density surface modeling methods to investigate the daily space-time dynamics of population distribution in the Atlanta metropolitan area. This research combines daily commuting data from the Census Transportation Planning Package (CTPP), daily human activities from the survey results of the National Human Activity Survey (NHAPS) and firm-level employment with population census data at the census tract level to generate a grid-based daytime population model

on an hourly basis. To understand the daily dynamics population distribution change, the NHAPS data are used to generate collective diary for each of the distinctive population subgroups. To obtain precise information on the locations where the daily activities are taking places, raster-based high-resolution land use data, point-based business location data, and daily commuting flow from the CTPP data are integrated. The method of grid binary dasymetric mapping using land use/cover data extracted from National Land Cover Data (NLCD) as ancillary data is employed to produce a series of hour-based population density surfaces, which can be analyzed and visualized dynamically. A by-product of this research is a prototype real-time population estimation system that can be used to gather population distribution data of a particular part of the city at a specific time, which can be useful to the government agencies and as an education tool for students to study population mobility in a city.

p-hub protection models for survivable network design

The design of survivable networks is a critical infrastructure issue. Many current network structures have evolved into hub and spoke type configurations, thereby reaping the benefits of economies of scale but at the same time being more vulnerable to the probable malfunction of hubs. These malfunctions can cause critical degradation of the entire network's performance. This paper proposes hub protection models to design hub and spoke networks in terms of reliability theory. The new model minimizes the probability of potential loss of interacting flows by strategically locating hubs and using inter-hub links and back-up routes. Based on mathematical formulations, hypothetical and empirical analyses are presented utilizing telecommunication networks in the United States.

A Comparative Assessment of Remotely Sensed Images and Land Use Parcel Map Data in Analysis of Urban Growth in Local Communities

During the past few decades, uncontrolled urban growth, sprawling development around urbanized areas has significantly influenced urban landscapes in U.S. cities. Many geographers developed GIS-based modeling tools to assist detailed examination of how urban growth patterns change at regional scale. This research aims to examine urban growth at the level of local communities because we need a better understanding of land use/land cover (LULC) changes in smaller areas that are not yet fully understood by the current GIS-based modeling studies and simulation tools using remote sensing data. In this research, we compare remotely sensed image data and land use parcel map data in analyzing LULC changes with diffusion theories and quantitative landscape indices. The research findings indicate that remote sensing data show limitations in detecting land development changes along both the spatial and temporal dimensions at local scale. In contrast, parcel map-based data provide considerably useful information that has significant implications for urban growth modeling and future planning practice. The results of this comparative assessment of two GIS data sets will provide a better understanding of urban growth patterns in local communities and more insights for urban modeling studies.

Neighborhood and school effects on children's academic skills

Part of the differences in children's academic skills may originate from differentials in social contexts including school and neighborhood environments. Studies on neighborhood and school effects have been inconclusive, and have been criticized for methodological limitations including model misspecification and omitted variables. Multilevel modeling addresses critical methodological issues in neighborhood and school effect research by providing conceptually and statistically more appropriate ways to analyze hierarchical data than a single level analysis. However, teasing out potential endogeneity of neighborhood and school choice becomes more formidable when researchers encounter complicated real-life data. Individuals can be classified along more than one social dimension where the dimensions are not neatly nested. For example, a significant number of children attend schools located outside their residential neighborhood. Conventional multilevel modeling cannot handle this situation because it assumes clean hierarchical nesting (e.g., individuals nested in schools and schools nested in larger neighborhoods), which is not always true in real life. This study looks at the relative impacts of family, school, and neighborhood characteristics on children's reading and math skills using the Los Angeles Family and Neighborhood Survey data. Using cross-classified multilevel modeling, it is possible to estimate

the proportion of total variance in children's achievement scores that are attributed to differences in school and neighborhood contexts when children are nested in both dimensions and the two dimensions are in non-hierarchical structure. The results show considerable and robust neighborhood contextual effects across test scores. Little variance in children's achievement scores is attributed to differences in school contexts.

Spatial representation issues in surveillance sensor location modeling

We examine spatial representation issues in the context of siting surveillance sensors in urban environments. The coverage of a sensor, like cameras, is determined by visibility as well as distance from a sensor to a target. While visibility analysis being utilized in current geographic information systems (GIS) and spatial optimization models are discrete, the spatial demand to be observed is generally continuous. That is, we are interested in monitoring an entire region, and not discretized raster grid cells per se. The results of visibility analysis and spatial optimization may be dependent upon a particular representation selected, so evaluation of more general effectiveness is needed. This paper examines how modeling results are sensitive to spatial representation.

The diffusion of green buildings as environmental innovations

The aim of this article is to investigate the diffusion pattern and mechanism of green buildings as environmental innovations through feedback loops between emerging environmentally conscious eco-label scheme and local green building practices. Since the US GBC (Green Building Council) started its LEED (Leadership in Energy and Environmental Design) rating system in 2000, the number of LEED green buildings has grown significantly and LEED become a de-facto standard of green building in the U.S. Despite of noteworthy interests from both academics and practitioners, most works are limited to test the feasibility and potential demand of green building. This article shifts the focus to spatial diffusion patterns of green buildings and the role of codes and standards in that diffusion process. Recent studies in innovation research and ecological modernization shed a light on the gains and risks of 'lock-in' mechanism like standards in innovation diffusion. The key to minimize risks in the process is to create close feedbacks between producers and consumers of innovations, so as to leave rooms to innovate standards themselves through diffusion. After brief history of LEED as eco-labeling scheme, geographical distributions of LEED projects until 2005 will be presented and analyzed. Then, experiences of high-rise green building development and organic maintenance of public parks at Battery Park City and their interactions with LEED will be described as a collective effort to keep the standard flexible enough to adapt further environmentally friendly innovations. Finally, policy implications from the research will be proposed accordingly.

A network flow-based optimization approach to political redistricting problems

A political redistricting plan must satisfy a number of criteria such as population equality, minority representation, contiguity, and compactness. The requirement of contiguous districts has been difficult to formulate. Recent developments in solving land acquisition problems have showed success in addressing contiguity. In this paper, we develop a network flow-based optimization approach based on some recent progress in solution approaches to land acquisition problems. Our approach addresses contiguity mathematically as well as compactness, equal population and minority representation. We also investigate the tradeoff between minority representation and compactness. A set of experiments is demonstrated to the use of our approach based on syntactic datasets.

Neoliberalism, Transnationalism and the Korea-USA Free Trade Agreement

From the streets of Cancún, Mexico, in 2003, to Hong Kong in 2005, the face of the transnational farmers' movement against neoliberalism is, today, Korean. After the demise of the Doha Round, the most significant trade negotiations in the US today concern the proposed Korea-USA Free Trade

Agreement, slated to conclude with an agreement in 2007. By examining the dynamics of the Korean farmers' movement through participant observation in Seattle from September 4th to 9th 2006, we argue that the Korea-USA Free Trade Agreement negotiations and resistances in Seattle reflect (a) elite practices that aim at facilitating neoliberal transnationalism and (b) resistance practices that reflect 'anti-neoliberal' transnationalism. Yet states, social movements, and elites are not transnationalizing in the same ways, through the same practices, or in the same spaces. This is not only because they reflect the positions of different social classes, but also because the 'nation' that they transcend is different, and the practice of transnationalism varies spatially and in ways that reflect global-local articulations.

Keywords: neoliberalism, transnationalism, Korea, free trade

Yeong-Hyun Kim, Ohio University. Email: kimy1@ohio.edu; *Immigration and Integration of Ethnic Korean Migrants in Seoul, South Korea*

This research explores the return migration of ethnic Koreans from China to South Korea. The Korean Diaspora in China, estimated at two million people, was created after a mass migration of Korean peasants during the Japanese colonial period. Since the early 1990s, however, a growing number of ethnic Koreans have returned to South Korea. A reasonable estimate of ethnic Korean migrants, legal and illegal combined, is 150,000 - 200,000. Many work in low-wage jobs in the manufacturing, construction and service sectors in Seoul. Compared to migrant workers from Southeast Asian countries, another cohort of the growing low-skilled foreign labor force in the city, ethnic Koreans have certainly benefited from government policies favoring migrants of Korean decent. However, they still find themselves battling various social, cultural and legal barriers that the tightly knit Korean society has built to differentiate the newcomers from the native-born. Three research questions are addressed: 1) What political and economic factors have fostered ethnic Koreans' return migration to South Korea?; 2) What policies and institutional provisions have been introduced for ethnic Korean migrant workers' settlement in Seoul?; and 3) How have ethnic Korean migrant communities in Seoul changed, geographically and structurally, in the past decade? The research draws on a series of in-depth personal interviews with ethnic Korean migrants clustered in the southwestern part of Seoul. Little has been known about the existence of such a large Korean Diaspora in China, and even less about ethnic Koreans' return to South Korea and their marginalized position in Seoul.

Keywords: ethnicity, labor migration, ethnic Koreans, Seoul

Young-Sik Kim, San Diego State University. Email: ykim@rohan.sdsu.edu; *Investigating Intra-urban Dualism: The Case of Seoul Housing Market*

Urban dualism is a concept that embodies the class-based polarization of the poor and the rich, mainly in the contemporary information society where one's socio-economic status largely depends on her capability of processing information flow. Housing segregation or spatial mismatch is often regarded as geographical representation of urban dualism, and many urban policies aim at mitigating the effects of disparity. This paper examines a polarizing trend of Seoul housing market over the last decade (1995-2005) and investigates relationship between intra-urban dualism and central/local government housing policies in Korea. The paper is based on an exploratory analysis of housing price at Korean administrative unit level (gu and dong), using the open source exploratory space-time data analysis package, Space-Time Analysis of Regional Systems (STARS). Findings suggest that housing policies of Korean government, which has struggled to control housing price and to reduce the socio-economic gap, has failed to achieve its goal, and spatial dichotomy within Seoul metropolitan housing market has rather contributed to the reinforcement of intra-urban dualism.

Keywords: housing market, urban dualism, exploratory data analysis, STARS

Youngho Kim, The Ohio State Univ. Dept. of Geography. Email: kim.1235@osu.edu; *A Space-time surveillance method for crime occurrences*

This study proposes a new method for space-time surveillance. The new method has no restrictions in shape and size of resulting hotspots. Space-time surveillance methods are generally designed to find spatial hotspots in given time periods based upon the assumption of Complete Spatial Temporal Random (CSTR) process. Existing methods, with their dependence on population at risk data to generate expected values under CSTR process, usually have resulting spatial hotspots bounded by administrative census areal units such as census block groups or tracts. This study, however, generates expected values from previous occurrence counts for flexibly changing local areas. Bootstrap permutations of previous occurrences are applied for significant tests. Consequently, the method, without requirement of population at risk, (1) is free from areal restriction, (2) enables more frequent surveillance for continuously updated registry database, and (3) is readily applicable to criminology and epidemiology surveillance. The study applies property crimes in Columbus OH year 2000 for space-time surveillance. In particular, by finding crime hotspots in daily bases, the study enables provision

of updated information in near real-time, so that efficient allocations of police resources are practically enabled.

Keywords: Surveillance, space-time clustering, criminology

Mindy A. Kimball, M.S., United States Military Academy, West Point, NY. Email: mindy.kimball@usma.edu; Allison L. Day, M.S., United States Military Academy, West Point, NY. Email: Allison.Day@usma.edu; *Do Army Family Social Clubs Reflect Army Culture or Regional Culture?*

Almost every Army post establishes informal social groups such as "Wives Clubs" or "Spouses Clubs," akin to book clubs or "coffee" clubs meant for socialization and sharing experiences with others who have common interests. These social clubs are not officially mandated, nor do official Army policies exist concerning how posts establish or maintain these groups. Nevertheless, most posts have these fringe clubs, and family members are encouraged and expected to participate in them. The disparity arises when different posts establish different criteria (including the club name) for who joins and contributes in those social settings. This disparity matters because today's Army has substantial numbers of dual-military couples as well as female soldiers with civilian husbands. By querying all major Army posts in the U.S., we expected to find a pattern to the naming of social clubs consistent with regional culture. Surprisingly, region has little impact on whether posts name their clubs Officers' Wives Clubs, Enlisted Wives Clubs, Combined Wives Clubs, Officers' Spouses Clubs, Enlisted Spouses Clubs, Combined Spouses Club, Women's Clubs, or Community Clubs. This lack of regional pattern may be explained by military families moving frequently, detaching them from ties to regional subcultures and aligning with a broad Army culture. Overall, today's Army does not have gender-neutral family support roles in social settings. With current plans to "life cycle" and "home-stead" soldiers on Army posts, this study may be worth repeating in a decade to look for social club names having closer ties to regional culture.

Keywords: Army, family, regional culture

James Kimmel, Texas State University. Email: jk02@txstate.edu; *Interpreting Rivers*

The general public knows little about rivers, yet many river conservation programs can be effective only if the public appreciates rivers and understands why river conservation is necessary. This paper draws on the theory, principles, and methods of environmental interpretation to analyze and evaluate the potential conservation effectiveness of interpretive programs and materials on the Rio Grande and the Upper Mississippi River.

Environment Justice (EJ) action in the UK is commonly framed as an issue of marginalised and disadvantaged socio-economic groups and their exposure to adverse environmental conditions. To date, most of the UK work on EJ has been characterised by a top-down approach, wherein researchers use geographical datasets and information to analyse a locale's environmental conditions, then either act with the local community to change the situation or publish the results together with NGOs to advocate policy changes. The London 21 project 'A Fairer, Greener London' was conceived as a bottom-up activity, giving six marginalised communities the opportunity to develop their own understanding of local EJ issues and supporting action plans to address them. The project will rely on accessible GIS technologies and available environmental information sources. The use of Public Participation GIS methodologies within the project will allow participants to integrate their local knowledge into a common framework and to share experiences with others. In this presentation, we will cover aspects that have been explored in two pilot studies of this project. The first used focus groups to expose the way one community organisation and the London 21 team differentially frame EJ. In the second study, the way in which available environmental information sources are evaluated by a community was analysed using focus groups and web discussion. Both studies point to a deeper understanding of EJ as it is perceived by London communities, encompassing ideas of empowerment and social capital, and highlighting the crucial role of information.

Email:** He@wmich.edu; **Assessment Of Sediment And Nutrient Loadings In The Davis Creek Watershed, Southwestern Michigan Using The Swat And The AnnAGNPS Models**

The Davis Creek Watershed has been impaired for many years by nonpoint source pollution. A recent modeling research on the watershed simulated both nutrient and sediment movements for the single storm events. This study simulates the movement of sediments and nutrients (nitrogen and phosphorus) in the watershed continuously using both the Annualized Agricultural Non-point Source model (AnnAGNPS) and Soil and Water Assessment Tool (SWAT) for assessing water quality in the watershed. Multiple databases for climate, soil types, DEM, land use and agricultural management practices were used to derive inputs for the two models. Subsequently, the models were run for the period of 1998-2004. Four management scenarios were developed: no till, conversion of agricultural land to urban, expansion of wetland area, and construction of retention ponds in the residential area, were simulated for nonpoint source pollution management. The simulation results from the two models were then compared for any similarities and disparities.

Keywords: nonpoint source pollution, SWAT, AnnAGNPS

At present, management of the Mount Sneffels Wilderness Area by the US Forest Service is based on a limited understanding of the occurrence and dynamic nature of landforms in the area. Because of a lack of knowing what landforms are present, trails, as an example, have been constructed with little regard to dynamic landform processes. Landforms on the south side of the mountain have been mapped, however, the Blue Lakes area on the north side, has not been studied. Although our interest is in the glacial-periglacial chronology of the area, a geomorphic map of the area would provide forest service personnel with a tool to enhance their management strategies in order to preserve the character of the wilderness area. As a first step in understanding the geomorphology of the area, we used traditional field mapping techniques supplemented with high-resolution aerial photography to create a first-approximation geomorphic map of the area. The area consists of series of lateral and terminal moraines and associated glacial forms. Three lakes are situated in a series of compound cirques on the southwestern slopes of Mount Sneffels. Periglacial forms include complex tongue-shaped rock glaciers that cascade down to the lakes, protalus ramparts, active talus slopes, steep cliffs, small debris deposits, and "fluvial talus". In addition, recent landslides, avalanche cones and run outs are present. The streams are characterized with series of step pools, and the lower reaches on the streams are marked with small floodplains.

Keywords: glacial landscapes, mountain geomorphology

Joshua A Kincaid, Glenville State College. Email: joshua.kincaid@glenville.edu; **Joshua A Kincaid, . Email:** joshua.kincaid@glenville.edu; **Structural characteristics and canopy dynamics of Tsuga canadensis in the southern Appalachian Mountains**

I examined the structure and canopy dynamics of four Tsuga canadensis forest stands within the Cataloochee watershed, in the far eastern part of Great Smoky Mountains National Park. I characterized the environmental settings and vertical forest layers, as well as the diameter and age-structures of each Tsuga canadensis forest stand. These environmental and structural data showed that there were indeed differences between forest stands with and without successful Tsuga canadensis regeneration. The two forest stands exhibiting successful Tsuga canadensis regeneration were located above 1000 m in elevation on well-drained, moderately steep slopes, and had the greatest canopy openness. Structural data from these two forest stands indicated a history of more continuous Tsuga canadensis regeneration. I also constructed disturbance chronologies detailing the history of canopy disturbance events and related these to Tsuga canadensis regeneration within each forest stand. T-tests adjusted for unequal variances indicated significant differences in the number of release events per tree between forest stands with and without successful Tsuga canadensis regeneration. While forest stands with successful Tsuga canadensis regeneration were more frequently

disturbed by minor to major canopy disturbances, events of moderate intensity were found to be most significant in terms of regeneration. These data will be of value to land managers maintaining stands of Tsuga canadensis where treatment for hemlock woolly adelgid infestation has been successful. In areas where treatment is impractical or unsuccessful, these data may prove useful for Tsuga canadensis forest restoration after the wave of hemlock woolly adelgid induced mortality has passed.

Keywords: eastern hemlock dynamics, forest structure, tree regeneration, old-growth forests

Garnet Kindervater, University of Minnesota - Minneapolis. Email: kind0080@tc.umn.edu; **Arresting intelligibility: digital law enforcement and the political force of the non-human**

This essay expands upon literatures of critical and social theory that seek to illuminate the role of the non-human in terms of the 'political'. The theoretical positions of its argument are situated around current law enforcement technologies in Chicago, Illinois. Chicago's advanced digital surveillance and archival technologies represent a burgeoning era of technological actors participating in urban politics. This paper thus maps three primary, intertwined conversations. First, it establishes Chicago's surveillance and archival technologies as actors in the larger project of law enforcement by examining the ways that the system intervenes on the normative human-human interaction. Second, following Michel Foucault, the essay expounds on the ways in which abnormality, as a discernable quality, is always already bound up with discursive formations of health and sickness of the populace. Genealogical currents of institutionalized threats to public health have been linked to juridical order, further connecting the security of public health to criminal adjudication. Furthermore, the public health-juridical formula links abnormality to individual bodies, making behavior a category of physical intelligibility for the state. Finally, this paper looks to Gilles Deleuze in an attempt to grapple with various ways that heterogeneous elements may constitute an immanent political assemblage. In elaborating questions of political heterogeneity, this paper will conclude with a discussion of such a theory's implications to understanding a dynamic, nonexclusive politics of the biological and the technological.

Brian King, University of Texas at Austin. Email: brian.king@mail.utexas.edu; **"No One Dies of AIDS": Political Ecologies of Health in Rural South Africa**

The fields of medical geography and public health have increasingly engaged with an expanded set of concerns about human disease in the developing world. While these studies have shed light upon the distribution of health services, gender and disease, and the places of health, there has been less attention directed to the political economy of disease in the developing world. This gap has coincided with a growing interest to understand the reciprocal relationships between disease and environmental change. This paper addresses HIV/AIDS in South Africa to examine the discursive representations of disease by national and provincial governments. It works to build a theoretical framework that examines the political economy of disease and the politicization of health care and treatment. Additionally, it analyzes the relationships between household health and environments in Mpumalanga Province to understand how HIV/AIDS is reshaping social and ecological landscapes in rural South Africa.

Keywords: HIV, AIDS, health, disease, South Africa, political ecology

Dewitt Larselles King, University of Kentucky. Email: magneto110@aol.com; **Does the Man Maketh the Space or Does the Space Maketh the Man? Interrogating Masculinities in the African American Barber-shop**

Hypermasculine, Hypersexual, and Hyperaggressive are all synonymous with the hegemonic imaginary of black masculinity. In this paper, I will examine the construction and performances of black masculinities via the space of the African American Barbershop. The barbershop is a cultural nexus in the African American community. In addition to its function as a space of grooming, it provides a place for black men to commune with each other, reaffirm their identity, and reassert power. I argue that the hegemonic black masculinity is performed and socially reproduced in this space via the conversations that cover a range of topics: local news, sex, politics, sports, and popular culture. In addition, I argue that subordinate masculinities such as the "black male intellectual" and the "gay black male" are either barely tolerated, or divorced altogether from the performances and discourses that take place within this space. By analyzing this unique cultural space, I hope to shatter the monolithic idea of what a black man should or has to be, which is internalized, produced and consumed by African and Non-African Americans alike.

Keywords: Race, Masculinity, Identity

Guy Q. King, PhD., California State University, Chico. Email: gking@csuchico.edu; Analysis of the Daily Hottest and Coldest Places in the Lower 48 States 1995-2005

National Weather Service data published in the newspaper "USA Today" are used to analyze daily hottest and coldest places in the lower 48 states over a ten-year period. The ordinal dataset is restricted by population and elevation. Exceptions are made for places with extreme cold or hot temperatures. Between 1995 and 2005, 264 places in the lower 48 states got the daily hottest record, while 364 places got the coldest record. Death Valley, CA had the highest number of hottest days (803) while Lake Havasu City, AZ was second with 276 days. Stanley, ID had the highest number of coldest days (398) with West Yellowstone, MT second at 337 days. Eight places in the lower 48 had the distinction of being both the hottest and coldest places in the lower 48 states. Places with over 50 days of record (21 hottest and 18 coldest) were climatically compared. The results of this study indicate, not surprisingly, that the climate controls of latitude, continentality, and elevation are very important in determining why places get national daily hottest/coldest records. Another major climate control are local effects, such as cold air drainage in mountain basins. Finally, the results show the importance of daily changes in air pressure and winds as a control of temperatures in the lower 48 states.

Keywords: climatology, cultural geography, United States

Karen M King, PhD., McMaster University. Email: kingk2@mcmaster.ca; K. Bruce Newbold, PhD., McMaster University. Email: newbold@mcmaster.ca; Transitions into Retirement: Differences between the Canadian- and Foreign-Born

Canada is an aging society, with projections suggesting that the population aged 65 and over will double from nearly 4 million in 2000 to almost 8 million by 2026, accounting for 21 percent of the total population. While there is much research on the retirement decision of the older population, there is less known about the retirement transition. That is, how does the older population make a transition from working to retirement? Is this process a gradual movement with a change in work status and income sources into retirement? Does the transition differ between the native-born and immigrants? Utilizing the 1993, 1996, and 1999 six-year panels of the Survey of Labour and Income Dynamics (SLID) Master files, the retirement transition of both Canadian- and foreign-born are examined. The SLID Master files have longitudinal information for six years which will be used to examine the transition from the labour force to retirement. Specifically detailed economic data such as income sources, employment, and labour force status, in addition to demographic data are used to examine the transition from work to retirement. Descriptive and multivariate techniques are applied to examine the differences in retirement migration paths, and determinants of retirement.

Keywords: Canada, Immigrant, Retirement

Paul T Kingsbury, Simon Fraser University. Email: kingsbury@sfu.ca; The Extimacy of Research

Jacques Lacan coined the neologism 'extimacy' (extimité) in order to theorize two interrelated modes of psychical apprehension: first, how our most intimate feelings can be extremely strange and Other to us. Second, how our feelings can be radically externalized onto objects without losing their sincerity and intensity. This paper argues that the notion of extimacy, alongside Freud-Lacanian understandings of desire, sublimation, and the drive, can help guide discussions about the viability and vitality of psychoanalytic methods in geography for three reasons: first, extimacy allows insight into the socio-topological dimensions of participant observation. Here, I elaborate the estimate contours of conducting research in a Jamaican all-inclusive hotel. Second, taking inspiration from the work of Joan Copjec and Slavoj Žižek, as well as the immersive practices of pool volleyball, extimacy can help us illuminate the importance of de-contextualization in our discourse analyses of spatial practices. Third, drawing on the proto-psychoanalytic writings of Petrarch, extimacy can illuminate one of the most overlooked yet crucial pressure points of textual transcriptions: love. The paper concludes with the assertion that the value of Felicity Callard's recent and justified critique of how geographers have 'tamed' psychoanalysis, that is, shied away from working through psychoanalysis's unseemly conceptualizations of politics and subjectivity, can be fully realized via the suggestion that we have also tamed some of psychoanalysis's most valuable theorizations about space itself.

Keywords: Extimacy, Psychoanalysis, Methods, Lacan, Love

Paul Kingsbury, Simon Fraser University. Email: kingsbury@sfu.ca; John Paul Jones, University of Arizona. Email: jpjones@email.arizona.edu; Beyond Apollo and Adorno: Dionysus and Walter Benjamin on Google Earth

This paper argues, following Friedrich Nietzsche, that recent evaluations of Google Earth uncritically privilege the product's Apollonian determinations at the expense of its Dionysian capacities. In other words, Google Earth is routinely understood as a virtual globe composed of surveyed panoramas, sober rationalization, dystopic control, and transparent order rather than an uncertain orb spangled with vertiginous paranoia, frenzied navigation, jubilatory dissolution, and intoxicating giddiness. We argue that these interpretations not only risk foreclosing our theorizations about how Google Earth is actually used in various ways and different contexts, they also reproduce a one-dimensional and conservative reading of technology that can be traced back (at least) to the writings of Theodor Adorno. By drawing on the work of Walter Benjamin (Adorno's critic and pen pal for more than a decade) we aim to 'go beyond Apollo and Adorno' by illustrating the extent to which Dionysian love makes Google Earth go round. To do this, we examine Google Earth's "Spot the Black Helicopter" competitions; the websites "Play Google Earth" and "Ogle Earth"; and the stories about how Google Earth revealed two topless sunbathers in the Dutch city of The Hague, as well as a parked stealth bomber in the deserts of California. We conclude the paper by asserting that the allure of Google Earth, much like Nietzsche's reading of Greek tragedy, involves a topological rather than oppositional enlacement of the God tricks that are Apollo and Dionysus.

Edward Kinman, Ph.D., Longwood University. Email: kinmanel@longwood.edu; Map Art: Contesting Space and Preserving Place

Landscape is transient, always changing. What we see today differs from the past and will evolve into something new tomorrow. Over time people interact with a landscape, and place—a set of associations and characteristics attached to a geographical spot—develops. As places evolve, they become unique and distinct from other locales. But whose place is it? Most areas have numerous parties who interact with the same landscape. They may also bear diverse meanings. This paper discusses Domain, the collaborative artwork of a geographer and artist. Constructed of stoneware, glazes, and steel, the piece consists of panels depicting the contentious relationship between an ethnic neighborhood and a state-supported university in south central Virginia. Collectively, the work presents multiple temporal and spatial perspectives depicting property acquisition adjacent to the university. The fight by the community to preserve place is further nested in the race relations struggle of Prince Edward County, Virginia, where massive resistance to desegregation resulted in the closing of public schools from 1959 to 1964. Since its installation in 2006, Domain has created diverse responses. A number of community residents thanked us for speaking loudly about the eradication of place; others have expressed appreciation for opening their eyes to what already existed, but hidden from view. As the university continues to expand, a number of area residents have sought us to tell of their experiences related to place. These new revelations are being incorporated into a new artwork that will examine diverse community perspectives on race relations.

Kealohanuiopuna Mark Kinney, Keaholoa STEM intern, University of Hawai'i at Hilo. Email: kmkinney@hawaii.edu; Dr. Michael Steinberg, University of Hawai'i at Hilo. Email: msteinbe@hawaii.edu; Investigations of Land Use Change and Development Trends in the District of Puna, Hawai'i

The Puna district of Hawai'i (the Big Island) accommodates unique lowland forests dominated by ohia (Metrosideros polymorpha) of varying ages due to the frequent volcanic eruptions during the past several centuries. While some of the area's forests are young and structurally simple, within this area are representative fragments of old growth ohia forests and associated endemic species. During the 1950's and 60's, prior to any strict zoning laws, large tracts of this lowland forest in the Puna district were divided into a series of colossal subdivisions comprised of relatively small parcels. These unrestrained planning developments amounted to some of the largest unimproved and until recently relatively uninhabited subdivisions in the United States. Between the years of 1980 to 2000 the population of Puna expanded from approximately 10,000 to more than 30,000 people. The pressure exerted by this increase in population has translated into an acceleration of forest fragmentation and an array of associated ecological problems. Given the current zoning laws in east Hawai'i, little protection exists for these forests. This poster aims to demonstrate the extent of landscape change and forest fragmentation in the Puna district using change detection technique, and related remote sensing applications with aerial photography and Quickbird satellite imagery. Preliminary results suggest Puna lowland old growth forests are being increasingly degraded, fragmented, and clear cut due to the

recent expansion of residential and agricultural development. The implications of this data outline a need to evaluate protected area design considerations, land use policy, and Hawai'i environmental law.

Mary Njeri Kinyanjui, PhD, Nairobi University-IDS. Email: marykinyanjui@yahoo.com; Emerging production systems in non-developing states: experiences of the jua kali economy in Kenya

The failure of development is a common phenomenon in Sub Saharan Africa. The non-developing state in Sub Saharan is seen both as a product of local and external crisis. At the local level there are no drivers to move state development. The state in particular characterised by inefficiency, corruption and lack of will power has failed to act as a driver of change. External factors contributing to the failure of the development state is the collapse of international capitalism. Capitalism has failed to regenerate and spur development in Sub-Saharan Africa. Internationalism capitalism supported production activities such as cash crop farming, mining, import substitution failed to survive the economic crisis of the 1970s. Countries heavily dependent on these products experienced poverty and unemployment. Efforts by structural adjustments to revive productive activities have also failed to a large extent. In spite of the capital injected in the projects and the subsequent reforms that accompanied the change. It is illustrated by the case of flower farming and export processing zones. The failure of development occurs within emerging production systems such as jua kali economy in Kenya. The philosophy and institutions supporting these emergent production systems are somewhat different from those upon which the non-developing states are hinged upon. The purpose of this paper is to show how the jua kali economy has evolved from a non-developing state where local and external factors have failed to generate change. The institutions supporting it and the struggles in its survival against those of a non-developing state

Stefan A Kipfer, Assistant Professor, York University. Email: kipfer@yorku.ca; Jayson Petrunia, Planning Alliance. Email: jpetrunia@architectsalliance.com; 'Colonization' and Public Housing in the Competitive City: A Toronto Case Study

Strategies to redevelop public housing districts in advanced capitalist zones have now a long history. This paper focuses on the first large-scale redevelopment of public housing in Canada: Toronto's Regent Park. The redevelopment of Regent Park, which is likely to have major ramifications for similar such projects in Canada, is best understood not only as a form of state rescaling and municipally managed gentrification. One can interpret it as a three-pronged, economic, social and cultural, strategy to re-colonize, in the name of diversity, a long-pathologized, racialized and segregated but potentially valuable central city social space. This project is facilitated by the socio-political consolidation of competitive city politics. Conceptually, the study connects urban forms of regulation theory with Henri Lefebvre's concept of 'colonization' and Frantz Fanon's understanding of racism as modality of colonial spatial relations. From this perspective, the redevelopment of public housing represents one entry point for comparative research on the formation of new territorial relations of centre and periphery. Accordingly, vulgar modernist perspectives of large-scale, hierarchical spatial concentration and separation are supplanted with territorial strategies of spatial control centred on paternalistic social mixing, physical dispersal and decentralized re-segregation. This has major implications for radical political organizing today.

Kurt F. Kipfmüller, University of Minnesota. Email: kurt@umn.edu; Matthew W. Salzer, Ph.D., Laboratory of Tree-Ring Research, University of Arizona. Email: msalzer@ltrr.arizona.edu; Assessing and interpreting twentieth-century growth patterns in five-needle pines in the western United States

Recent research has questioned the reliability of the most recent three decades of history for calibrating climate reconstructions derived from tree rings collected at high latitudes or high elevations. In some chronologies there is a temporal weakening of the growing season temperature signal as one approaches and enters the most recent period. The cause of this weakening has been variously attributed to ultra-violet radiation, changes in snowmelt timing, a CO₂ fertilization effect, or increases in summer temperature to a point that they are no longer the most limiting factor to tree-growth processes. Moreover, many of these chronologies also exhibit considerable positive trends over the most recent period. Identifying the probable cause of this weakening and the mechanism leading to positive growth trends is critical for developing robust estimates of past climate from tree-rings. We used a network of ~50 five-needle pine chronologies across the western USA to examine trends in tree growth and growth-climate relationships. Chronologies were developed from raw ring-widths

after adjusting them to reduce bias associated with tree age and size. Linear trend in each of the chronologies was assessed using correlation and regression analyses. Each chronology was compared with the nearest climate station to assess the temporal stability of the climate-growth relationships. Principal components analysis (PCA) was used to reduce the dimensionality of the data set and the loadings for each chronology were mapped to identify potential spatial patterns in the growth patterns of the chronologies.

Email: broxton.bird@gmail.com; Insolation Forcing of Holocene Climate Change in Southern California.

Lake Elsinore is the largest natural lake in Southern California. As a result, the lake represents a unique opportunity to investigate terrestrial climate on timescales otherwise underrepresented in the region's terrestrial archives. This abstract focuses on two adjacent, decoupled cores, which have been correlated to develop a single composite core. 22 AMS 14C dates on bulk organic matter and one cross-correlated exotic pollen age constitute the composite core's age control. Several methods of analysis, including mass magnetic susceptibility, % total organic matter, % total carbonate, % HCl-extractable Al, and total inorganic P are used to infer climate for the past 9,500 calendar years. Together, these data indicate a wet early Holocene followed by a long-term drying trend. A combination of local (Dry Lake; San Bernardino Mtn. glaciation; San Joaquin Marsh) and regional (Tulare Lake; Owens Lake; Mojave lakes) terrestrial archives support our interpretation. We suggest that over the duration of the Holocene changing summer/winter insolation modulates atmospheric circulation and its associated storm tracks, which alters the region's long-term hydrologic balance. Minimum early Holocene winter insolation and maximum summer insolation act together to increase the region's total annual precipitation by increasing the frequency of winter storms as well as enhancing the magnitude and spatial extent of the North American monsoon, the frequency of land-falling tropical cyclones in Southern California, and regional convective storms, respectively. Gradual decreases in summer insolation and increases in winter insolation produce the opposite effect with maximum drying in the late Holocene.

John A Kirchner, California State University, Los Angeles. Email: jkirchn@earthlink.net; Wenling Li, 2. School of Geographical Science, Guangzhou University, Guangzhou, China. Email: wenling-li@hotmail.com; A Study of Urban Transportation based on the Temporal Map

The problem of traffic congestion, with its potential for urban chaos, has increased dramatically with a growing number of vehicles and the continuing aerial expansion of Guangzhou. Both transit riders and drivers find great difficulty trying to acquire the information necessary for urban spatial movements. Valuable time is lost due to the absence of good transportation information. This paper proposes the design of a new map that better reflects the status of urban communication, and attempts to change the relationship of point to point travel, reducing the amount of time allocated to such, often complex, movements. This essay also points out the obstacles associated with Guangzhou's existing traffic congestion, and puts forward a strategy aimed at better defining the need for linking the temporal map and spatial map of Guangzhou.

Keywords: spatial map, temporal map, urban transportation

Ryan W Kirk, University of Minnesota. Email: kirk0073@umn.edu; Land-use change and natural disturbance effects on carbon budgets in the Southern Appalachian Mountains

This paper summarizes primary results of dissertation research on the combined effects of land-use change, natural disturbance, and forest age structure on carbon pools in the Southern Appalachian Mountains. The study area is Macon County, NC, a 1300 sq km county located in the Blue Ridge physiographic province, which is characterized by steep topographic relief, abundant precipitation, and high primary productivity. The steep terrain combined with the relatively early European settlement has resulted in a unique land-use history, with agriculture expansion, forest harvesting, and development occurring at different periods and pacing than in other North American regions. Between 1900 and 2000, forest area increased from 74% to 90%, and agriculture acreage declined by 90%. Land use data were collected from historic maps, aerial photographs, satellite images, and forest and agriculture censuses. Land use patterns and forecasts for periods without spatial data was estimated using a

spatio-temporal interpolation model, resulting in a logically consistent, decadal land use sequence from 1885-2035. Forest age structure was reconstructed from Forest Service stand maps where available, and estimated for other areas from satellite imagery using spectral classification tools combined with spectral mixture analysis. Accrual curves for key carbon pools for separate land use types and landscape positions were estimated from a search of the literature and analysis of the Forest Service FIA database. Several scenarios were run within a bookkeeping style carbon model to evaluate changes in carbon sequestration over the 150-year period and assess key uncertainties in carbon cycling in temperate forest ecosystems.

Keywords: land use, GIS, carbon cycle, Southern Appalachian Mountains

W. Stuart Kirkham, Ph.D., California State University Stanislaus. Email: SKirkham@csustan.edu; *Some Prospects for Managing Theoretical Complexity*

This paper examines theoretical aspects of linking landscape and ecosystem level processes with social processes. Complexity theory, especially as it pertains to dissipative systems, provides the central organizing framework. A dissipative system increases its internal order and organization at the expense of exporting an equivalent amount of entropy to externally connected systems. In order for dissipation to occur, there must be sufficient connection with other networks to export the cost of organization, while simultaneously erecting barriers to define the internal system. Structure, whether referring to social structure, hierarchy, landscape mosaics, ecosystems, etc, emerges as a property of dissipative relationships. This approach emphasizes the individual agent or actor as the primary mover and creator of interconnected networks. The Unified Neutral Theory of Biogeography and Biodiversity offers an appropriate framework for handling nonhuman agents, in that its emphasis on abstracting at the level of the individual (rather than the species), and its analysis of the interaction of disturbance and other mortality driving factors with the reproductive and dispersal habits of these individuals reflects dissipative complexity. Additionally, the Unified Neutral theory offers a means of connecting landscape-scale phenomenon (such as disturbance) to the agency and processes at the level of the individual. Similarly, dissipative social systems provide a means of linking individual human agency on the landscape (the environment being the ultimate recipient of social dissipation) to broader social networks and events across multiple scales.

Scott Kirsch, University of North Carolina. Email: kirsch@email.unc.edu; Joseph Palis, University of North Carolina. Email: palis@email.unc.edu; *The Worcester Kodak: Ethnology, visual culture, and American colonial state-building in the Philippines*

During the first decade of American administration in the Philippines, the Philippine Commissioner, Secretary of the Interior, and former University of Michigan zoologist Dean C. Worcester produced a collection of 8,000 photographs depicting the archipelago's "wild races." Worcester's portraits?bringing together the exotic, the titillating, and the clinical?contributed, on one hand, to an applied government ethnology, while on the other they provided popular US audiences with a distorted vision of Filipinos and Philippine culture. Our paper explores the production, circulation, and consumption of Worcester's primitives, tracing their emergence amid overlapping and contested discourses of empire, democracy, science, nation and race. Worcester, we argue, hoped to engender a "geopolitics of sympathy" that matched well with goals, among some colonials, for division of the archipelago and annexation of the so-called special provinces. The label of the "Worcester Kodak," however, was invented as an object of critique by anti-imperialists in the US, coinciding with challenges to Worcester's governance among nationalists in Manila, thus pointing us towards a more open politics of visual culture than the God's eye perspective of geopolitical mapping might allow.

Joshua D. Kirshner, M.A., PhD candidate, Cornell University. Email: jdk52@cornell.edu; *Migrant Incorporation and Regional Politics in Santa Cruz de la Sierra, Bolivia*

This paper will examine the incorporation of highland migrants in Bolivia's rapidly growing lowland city of Santa Cruz de la Sierra. Although it began as an isolated frontier town, Santa Cruz now holds a central position in national dynamics. Since the 1950s, Santa Cruz grew with state investment, foreign loans, oil and gas royalties, agrarian booms, and cocaine dollars. This growth, along with state-sponsored resettlement plans, has spurred indigenous Quechua and Aymara migration from relatively poorer Andean regions to Santa Cruz during the past four decades. In the context of the recent intensification of elite-led regional political sentiment calling for departmental autonomy, migrant reception has not always been favorable. This paper will explore forms of integration and social

exclusion that migrants experience in labor and housing markets, in access to public services, political and civic participation, and access to public space.

The purpose of the poster is to present the results of a pilot study conducted for the Massachusetts Forest Monitoring Program (MAFoMP). The long-term research goals of MAFoMP are to assess changes in forest cover and type in the state of Massachusetts from 1972 to present. However, the goal of the pilot study was to test the impact and influence of multi-seasonal Landsat TM data combined with ancillary variables in mapping forest, agricultural and urban land cover. Landsat data from July 1999, September 2000 and October 1999 were combined with environmental variables such as slope, elevation, and surficial geology in a classification tree analysis to produce a series of land cover maps (17 land cover categories). Classification tree analysis (CTA) is a machine learning technique which has been shown to produce more favorable results, when mapping complex landscapes, than conventional classifiers such as maximum likelihood. In addition, CTA reveals the relative importance of each independent input variable used in an analysis. The accuracy of each land cover map was assessed using various statistics, including kappa, overall accuracy, and K_{no}. The most accurate map was produced using a combination of the July and September images and ancillary data (kappa 0.7426), followed by the combination of all spectral and ancillary data (kappa 0.7355) and by the combination of the September and October images and ancillary data (kappa 0.7304). These results are promising in terms of large-area mapping using multi-seasonal data and will be extended to the entire state of Massachusetts.

Keywords: Remote sensing, forest monitoring, multi-seasonal spectral data, ancillary data

Marianne Kjellén, Department of Human Geography, Stockholm University. Email: marianne.kjellen@humangeo.su.se; *The Water Divide: Fragmented but Flexible Water Services in Dar es Salaam, Tanzania*

In Dar es Salaam, Tanzania, only about a third of the households have direct access to piped water. Nonetheless, the majority depends indirectly on piped water, accessed by way of water resellers and distributing vendors. Users are divided along the overlapping features of water access modes, socio-economic status and ecological zones. This produces diverging interests and reproduces the individualized ways of addressing problems of water scarcity, variability and infrastructural barriers to access. Hence, the present socio-technical set-up stems

from many lost opportunities of pooling resources and efforts into a water system that serves the collectivity of users. The present paper argues that the skewed nature of water investments, and the resulting lack of local distribution systems in the city, is the major reason for abstracted water not to reach intended users. The operations of informal resellers and distributors, in turn, develop in response to the inaccessibility and fragmented nature of piped water services. Further, the sensitivity to disruption in the public system, for ecological and technical reasons, is partly compensated for by the flexibility of vending systems, as well as individual investments in water storage among households and final users. This way, Dar es Salaam's greatly fragmented but flexible hydrosocial system manages to function in the face of deteriorating piped water services.

Keywords: access, informality, institutions, privatization, socio-technical systems, urban water management, vending-water

Rachel A Kjos, Student, University of Wisconsin - Eau Claire. Email: kjosra@uwec.edu; Obesity Trends in the US: A State to State Comparison

Concerns with obesity have plagued America for the past decade. Obesity is often seen as a national problem, which it is, however tools to overcome obesity are mostly played out at the state level. In order to better understand obesity and how to mitigate its affects we must first understand what state programs are working to overcome obesity and what environmental factors play a role in contributing to an obese nation. This study will look at Obesity: by Body Mass Index for the United States and DC. Data was collected from the Center for Disease Control and Prevention: Behavioral Risk Factor Surveillance System for the years 1990-2002; both Nationwide and individual state data were used for comparison. Individual states were weighed against national values to analyze which states fell above and below national trends. Focus was given to anomalies that fell high above or below national trends. A comparison was made between different age brackets, allowing us to better see the spatial differences for each age range throughout the United States. Again, particular attention was paid to states that highly differed from national trends, to see how certain age ranges impacted the deviation from the national trend.

Keywords: obesity, United States, body mass index, Center for Disease Control

Suzanna Klaf, The Ohio State University, Department of Geography. Email: klaf.1@osu.edu; Public education in the United States and the neoliberal straightjacket: Problematizing ascribed labels to Schools and Children Left Behind.

The No Child Left Behind Act is the most recent educational reform to be implemented in the United States. The stated goal of this policy is to address the deficiencies and inequalities present in the U.S. public school system. Despite the underlying discourse of social justice, contemporary education reform policy is blanketed over various contexts regardless of local specificity thus placing schools and children in a one-size-fits-all straightjacket. Neoliberal education reform is advanced as working for all students irrespective of access to opportunity and geographic context. Despite the persistence of inequities across education space, schools are held accountable for the performance of their students regardless of their location, the socioeconomic background of the students served, and the availability of resources. Under the current accountability system, schools are identified, defined and labeled. This process leaves schools in the inner city which serve disadvantaged students to be identified as 'failing'. This research attempts to problematize inner city school performance labels by contextualizing schools. The intention is to shed light on the heterogeneity of schools and their respective contexts across the urban landscape. This work unveils the spaces and people identified and defined according to education reform discourse. The research objective is achieved by analyzing official reform documents and mapping out education accountability data, both of which encapsulate the contemporary neoliberal discourse of education reform.

Keywords: school geography, education policy, neoliberalism, inner city, United States

Philip M. Klasky. Email: pklasky@igc.org; The Salt Song Trail: bringing creation back together

I will be presenting the award-winning documentary ("Best Documentary Short" American Indian Film Festival) "The Salt Song Trail: bringing creation back together" about the sacred Salt Songs of the Southern Paiute people who live in thirteen bands in California, Nevada, Arizona and Utah. I will also talk about efforts to document sacred sites in the cultural and spiritual geography of the Southern Paiutes. The film contains interviews of Southern Paiute "culture bearers" as they speak about the relationship between indigenous people, language, song and lands, and a healing ceremony at the Sherman Indian Boarding School where native children were taken by force from their homes and denied their culture, language, families and communities. The Salt Song Trail Project is a "living documentary" as we work with native communities and train native

filmmakers conduct ethnographic field recordings of their sacred sites.

Keywords: cultural geography, indigenous cultural revitalization

Paul Rye Kledal, Institute of Food & Resource Economics. Email: paul@foi.dk; Lucie Sirieix, Agro Montpellier, France. Email: sirieix@ensam.inra.fr; Factors influencing organic urban consumers in developing countries

The main objective of our project is to study the urban economic factors influencing consumer preferences respectively for short versus long procurement systems supplying organic food in three developing countries : Brazil, China and Egypt. It will consist of three tasks : (1) To document the urban socio-economic development of the chosen areas (2) to document the various organic food procurement networks and (3) to study consumers motivations and barriers to buy, and meaning of, organic food. Our presentation will focus on the third task, for which focus groups will be used to : - study consumer conflicts: organic vs convenience and price, organic vs local, organic vs freshness ? - assess under which conditions consumers are ready to buy organic products : grown / produced locally, specific mode of distribution or length of the distribution chain - relate consumers' concern and conflicts with (1) their values, (2) their knowledge about organic products, health, risk, (3) the distribution chains they use (long versus short commodity chains) - assess within developed and developing countries common and specific consumers concerns, attitudes and behaviours related to organic food and its distribution Two Focus groups will be conducted in each case study, with products selected to cover examples of different choice situations such as imported organic products that compete with comparable products of local origin, or organic local products in supermarkets that compete with similar products from other distribution outlets. Our presentation will focus on the Brazilian case.

Keywords: urban socio-economy, organic food procurement network, organic consumer behaviour

Email: Poole.Alan@geoeye.com; Mapping shange in small tropical glaciers: How well can we do it and what do we see?

Acquisition of Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER) and Landsat Enhanced Thematic Mapper (ETM+) images over the small remaining glaciers on Mt. Jaya, Irian Jaya, Indonesia on May, 29 2003 afforded a unique opportunity to assess the comparability of tropical glacier extents mapped from these two common satellite image types. Glacier extents were mapped through visual analysis of color composites and by supervised and unsupervised image classification techniques, spectral mixture analysis and the Normalized Difference Snow Index (NDSI). All approaches were found to be in good agreement, with overall accuracies, as compared to visual mapping of the glaciers on an ASTER color composite, typically exceeding 90%. The tested techniques, along historical glacier extents, have also been used to map glacier changes at several locations in the Tropical Andes since the 1950s. In all areas, tropical glaciers have been found to be in a state of retreat. Time series of glacier retreat developed from Columbia, Venezuela and southwestern Peru are used to illustrate both the potential and pitfalls in measuring glacier retreat from conventional satellite sources.

Margo Kleinfeld, University of Wisconsin - Whitewater. Email: kleinfem@uww.edu; Institutionalizing Caringscapes in the City: Identifying Victims of Human Trafficking in Milwaukee

This paper examines a new federal effort to address human trafficking on U.S. soil and the "caringscape" that is its goal. Since October 2004, the Campaign to Rescue and Restore Victims of Human Trafficking, administered by the U.S. Department of Health and Human Services through its Administration for Families and Children (AFC), has worked to teach a variety of care- and faith-based organizations, along with select municipal agencies, how to identify victims of trafficking in about nineteen U.S. cities. Using the case of the Campaign in the Greater Milwaukee area and its 60+ coalition members, interview data and policy analysis are presented to answer important questions raised by the Campaign and its efforts. For example, what sorts of contributions can Milwaukee make as a node within the existing transnational network of advocacy and care designed to fight human trafficking? What are the advantages and drawbacks of using a victim-centred approach to human trafficking as opposed to programs involving the prosecution of traffickers or crackdown on local businesses benefiting from the coerced employment of victims? How, specifically, does the Campaign differ from projects administered by the four other federal agencies involved in human trafficking (i.e. Departments of State,

Justice, Labor, and Homeland Security)? Answers to these questions and preliminary conclusions drawn will contribute to the burgeoning literature on moral geographies and their effects at municipal, national and transnational scales.

Keywords: human trafficking, advocacy networks, caringscape, U.S. government, Milwaukee

Email: ; Initial Evaluation of Real-time Weather Forecasts for the Beaufort Sea Region, Alaska

Northern Alaska will see increased resource extraction in the near future, including the possibility of offshore oil production. Improved understanding of surface weather conditions, particularly wind fields, was identified as one necessary condition before potential impacts of offshore development could be assessed. In September 2006, a study was funded to explore the capacity of several current mesoscale forecast models to effectively predict and capture weather along the northern Alaskan coast. Three models were either in the process of being modified for use in the region or already implemented. While the final project will involve a number of test case runs of the same scenario in all models against a dataset of observations utilizing all available data on the North Slope, initial model evaluation can begin while the larger dataset is being compiled. Several Automated Surface Observing System (ASOS) sites have been established at airports along the coast, and are providing real-time data. The main focus of this initial project will be the evaluation of daily forecasts generated by the Weather Research and Forecasting (WRF) model against METAR data from Deadhorse and Barrow. Primary interest is on the temperature and wind predictions. Although this study was funded to improve understanding of near-shore winds and their potential impacts on resource development, there are a number of additional benefits. Accurate forecasting would improve the safety and quality of life of North Slope residents, and aid our understanding of land-sea breezes, the Arctic front, and air-sea-ice-ocean interactions.

Peter Klepeis, Colgate University. Email: pklepeis@mail.colgate.edu; Twentieth-Century Land Reform and Ranching in Southern Chile

A prominent theme in environmental histories of Latin America is the impact of land tenure on land use. Research on both colonial and post-colonial periods explores the environmental implications of latifundios (large land monopolies) and minifundios (small landholdings usually in peasant control), although this dichotomy oversimplifies the diversity of land tenure types and is primarily centered on the agrarian sector. Two issues require more attention. First, the 20th-century subdivision of rangelands is a worldwide phenomenon that has important implications for social conditions, economic productivity, and ecosystem structure and function. Second, one outcome of rangeland subdivision is the advent of absentee landholders, often characterized as 'hobby farmers'. In the case of Tierra del Fuego, Chile, the subdivision of economically successful sheep ranches was implemented to encourage colonization to the remote region, promote a larger and more even distribution of the population, and make the region less dependent on large land monopolies, which were dominated by foreign capital and personnel. The subdivision, combined with the effects of an international decline in demand for wool, led to a preponderance of small properties, absentee owners with significant off-farm income, poor land management practices, and the inadvertent introduction of invasive species, the impact of which persists today. The case underscores the importance of shifts in markets, the changing cultural and demographic make up of rural Patagonia, and the political ecology of resource access on land use decision making.

Keywords: Chile, environmental history, ranching, hobby farming

Travis Klingberg, University of Colorado. Email: tklingberg@colorado.edu; Journey to the west: tourist traps, Tibet and the independent tourist in contemporary China

China's post-reform economic growth has changed the practice of tourism on the mainland. With rising incomes and increased leisure time, more Chinese are traveling domestically than ever before. Many of these domestic tourists are choosing to travel independently, avoiding guided group trips to the usual scenic spots, and seeking unique travel experiences on their own. Much existing research has focused on the structural aspects of Chinese tourism, the localized impact of tourism, or some combination of the two. This paper argues that the qualitative study of the attitudes and practices of China's independent tourists is important

for understanding the social and cultural significance of this new form of domestic tourism. This paper explores three social factors closely related to the emergence of independent tourism: the consumer and leisure habits of the emergent Chinese middle class, the continued state management of tourist destinations and cultural resources, and changing geographies of tourism that have reimagined Tibet as a destination for tourism.

Ralph E. Klinger, Bureau of Reclamation. Email: rklinger@do.usbr.gov; John F. England, Jr., Bureau of Reclamation. Email: jengland@do.usbr.gov; Late Holocene Paleoflood History of the American River Basin, Central California

Paleoflood data were developed from geomorphic, stratigraphic, and geochronologic evidence preserved in four study reaches of the American River basin: 1) Lower American River near Fair Oaks, 2) North Fork of the American River at Ponderosa Bridge, 3) South Fork American River near Lotus, and 4) South Fork American River near Kyburz. Fourteen stratigraphic sites, 38 radiocarbon ages and archaeological age correlations in these four reaches provide evidence for late Holocene paleofloods that are preserved at or above the peak stage of the largest historical floods. Age comparisons between the four sites established the regional nature of flooding and placed tighter constraints on the timing of individual paleofloods. Based on data at three of the sites, the American River basin experienced a paleoflood sometime between 1400-1600 years ago that had a magnitude significantly larger than any historical flood. Flood stratigraphy also records at least three additional paleofloods between about 150 and 650 years ago that were larger than historical floods, but smaller than the flood 1400-1600 years ago. At the Kyburz site, there is evidence for an additional paleoflood between about 650 and 1125 years ago that may have been equivalent in magnitude to the paleoflood 1400-1600 years ago. In the past 1600 years there have been at least four paleofloods with magnitudes about 1.3 times larger than the largest historical floods in the American River basin.

Keywords: paleofloods, geomorphology, Quaternary stratigraphy

Sonja Klinsky, B.Sc (hon), MA, University of British Columbia. Email: klinskys@interchange.ubc.ca; Mapping Emergence: An Examination of Global Climate Change Discourse Networks

Investigation of the emergence and diffusion of ideas has a long tradition within the discipline of geography. Recent research has suggested that attention to network structure can help us understand the rate and pattern of diffusion. For instance, in networks characterised by few large hubs and many small ones, those few larger hubs play significantly more important roles than the many small ones. It is suggested that insights about network structure can assist in understanding the emergence of particular environmental discourses and provide clues for future efforts to promote sustainability. This work attempts to map the network structure of climate change online and print media discourse in an effort to understand how discussions of climate change have emerged and where critical hubs might be located. Particular attention is paid to differentiation of distinct lines of discourse within the larger concept of climate change.

Keywords: emergence, networks, sustainability, climate change, diffusion, media

Geoffrey T. Klise, Sandia National Laboratories. Email: gklise@sandia.gov; Carlos A. Aragon, M.S. Hydrology (student), New Mexico Institute of Mining and Technology. Email: carloco@nmt.edu; Using GIS and System Dynamics Software to Model how Changes in Land Use and Cover will affect Discharge in Ungauged Tributaries in the Gila and San Francisco Basins.

As part of the 2004 Arizona Water Settlements Act, southwestern New Mexico has an opportunity to utilize up to 14,000 acre-feet of water annually from the Gila and San Francisco Rivers, with the constraints that stream flows must meet requirements of the Consumptive Use and Forbearance Agreement (CUFA) and comply with the federal Endangered Species Act. To evaluate potential impacts on stream flow from alternative water resource development scenarios, a collaborative team of stakeholders from the region is working with Sandia National Laboratories and the New Mexico Interstate Stream Commission to develop a basin-wide surface and ground water model. Integral to the model is discharge from tributary watersheds, a majority of which are ungauged. Using both geographic information system (GIS) and system dynamics software, we are able to recreate past rainfall-runoff events based on a modified Variable Infiltration Capacity model. Stakeholders on the modeling team would like to see the differences in river discharge as a result of changes in land use and/or land cover. The watershed model will allow users to change the spatial and temporal aspects of land use and cover and see if the projected or altered hydrograph passes or fails the required CUFA tests. The output from this effort will be one of many tools that can then be used by stakeholders to determine how the New Mexico Unit

should proceed with the available water.

Fran Klodawsky, Carleton University. Email: klodawsk@ccs.carleton.ca; *Homes First or Rights to the City for Chronically Homeless Women? Reflections from Ottawa, Canada*

In policy debates that address chronically homeless women's needs, 'the right to housing' is often invoked but not so 'rights to the city'. In this paper, I explore emerging policy innovations that implicitly question the significance of linking these concepts. The women under consideration are typically survivors of violence and are not likely to be found on the streets. Rather, they circulate among various emergency shelters and drop-in facilities, often finding themselves barred from one or more of them while other spaces (such as motel rooms) are temporarily made available. In the context of pressures to 'do more', Ottawa's local government initiated an effort at more effective dialogue and co-ordination among organisations that work with chronically homeless women. A critical examination of the content of these discussions, in relation to rights to housing and rights to the city, is the primary focus of this paper. The idea of first providing these women with permanent housing together with appropriate individualized services was raised as an alternative to rigid 'continuum of care' models. Civil society actors acknowledged that they had contributed to existing service gaps, but their response was not one that directly supported or rejected a homes first approach. Instead, they emphasized the value of myriad efforts that worked towards women's autonomy and their 'rights to the city'. In this paper I reflect on lessons learned from these discussions.

Daniel Klooster, Florida State University. Email: dklooste@garnet.acns.fsu.edu; *Debating Standards, Defining Labels, Constructing Forests*

Standards are central to certified environmental governance, but the way they evolve, and the tensions between rigor, legitimacy, and acceptability remain poorly understood. This presentation contrasts two ways of interpreting recent debates about Forest Stewardship (FSC) standards for certifying tree plantations. First, deliberations may indicate the social inclusiveness and global spatiality of the process. Activists from around the globe directed attention to specific allegations of plantation mis-management in South Africa, Ecuador, Uruguay, Indonesia, and Spain. They used those cases in an attempt to modify a governance structure centered in Germany. Second, the debate might be evidence of environmentalists' token resistance to the rent-seeking behavior of industrial timber producers, wood retailers, and for-profit auditing firms eager to profit by increasing volumes of (certified) commodity-grade wood. From both perspectives, the debate provides a window into the contested construction of hegemony. It brings into focus core issues of forest governance, including the tensions between environmental, social and economic goals, the differential power of specific sets of actors, and the even the definition of a forest. Much is at stake. Criticism could undermine the legitimacy of the FSC system -some Spanish environmental groups have already withdrawn their support to protest certified plantations. On the other hand, high standards could drive forest managers away from the FSC, toward less rigorous certification systems that leverage fewer social and environmental improvements to management. As I write this abstract, the public comment has closed, but the FSC has not yet announced revisions.

The emerging space of flows seems to generate a new round of agglomeration economies that strengthen the already large, well-connected (mostly capital) cities, the so-called global cities. These cities are not only the crucial nodes in global networks, but also the dynamic cores of larger urban regions, the "global-city regions". These more general trends in post-industrial urbanisation are, however, articulated in different ways. First, these general trends are played out in already existing (national) urban systems with their own specific histories. Cities and urban systems have proven to be rather stubborn socio-spatial phenomena?due to infrastructural, socio-economic, institutional and symbolic path-dependencies. Second, the extent to which the core city of a global-city region is able to benefit from the new round of agglomeration economies is contingent on its role in the global urban system. In this paper, we will compare the trajectories of urban systems in several European countries from 1500 to the present and investigate how and why they differ.

Gregory W. Knapp, University Of Texas - Austin. Email: gwk@mail.utexas.edu; *Greenhouse Floriculture: Aspects of an Agricultural Revolution in the Equatorial Andes*

Agricultural practices in the Andes have long been highly dynamic, with a diverse range of crops and cultivation techniques allowing for flexible adjustments to a variety of environmental, economic, and demographic conditions. Agriculture has also often been remarkably productive, especially where irrigation water has been available. Only recently, however, have conditions become favorable for massive exports. American and Andean trade liberalization have been important, but many unpredictable, historically contingent factors have also played a decisive role at a variety of scales. Greenhouse floriculture in Ecuador provides an excellent case example for delineating the cultural, economic and environmental conditions and impacts of this agricultural revolution.

Email: ; *Examination of spectral leaf signature collection methods in a complex upland oak ecosystem*

Remote sensing-targeted fieldwork in a complex forest environment can provide unique logistical challenges. We evaluated several methods for collecting hand held spectroradiometer leaf signatures in an upland oak-hickory ecosystem in the Ozark National Forest. A 55' aerial work platform enabled direct spectroradiometer access to the tree canopy and to cut branches for on-ground analysis. From the ground, a shotgun was also used to excise canopy branches for analysis. A mobile field laboratory employed an artificial light source and a white reference panel to obtain percent reflectance. Also, immediate scanning of samples was imperative to minimize water loss-related alteration of the signatures. Spectral data were evaluated to determine the most acceptable method for collection. The use of on-tree spectral collection eliminated alteration of the sample, and thus provided a base for comparison of other spectra. The boom was only capable of accessing limited parts of the canopy. Cutting was less destructive to the physical integrity of the leaf sample than shotgun excision, but required extensive work to achieve a spatially aggregate sample. The shotgun proved most portable and the quickest collection method. However, the pellets had the potential to damage the sample during collection. The damage, however, was not substantial and was not detectable in the spectra. Examination of spectra collected using all three methods showed less variation among the methods than the standard deviation within any single collection method. Shotgun-collected leaves yielded a viable spectral signature with the best spatial aggregation and the fewest logistical challenges.

Andrew Knee. Email: kneea37@students.rowan.edu; *How Effective is New Jersey's Pinelands Management Plan?*

This presentation reports on the changes in land use in the National Pinelands Reserve in New Jersey. The Pinelands is a 1.1 million acre pine forest in Southern New Jersey internationally recognized for its ecological and cultural significance. Land development in the region has been controlled by the Pinelands Comprehensive Management Plan since 1981. Utilizing Geographic Information Systems, New Jersey land use data from 1986, 1995, and 2002 is analyzed and compared to the Pinelands Management Area data. The analysis tracks the changes in land use in the reserve during the study period to determine if development is occurring in the growth zones and minimized in the protected zones. The results show how effective the Pinelands Commission has been at implementing the Pinelands Comprehensive Management Plan over the last twenty years. The analysis can also be used to identify where efforts need to be made to preserve the New Jersey Pinelands.

LaDonna G. Knigge, PhD, California State University, Chico. Email: lkknigge@csuchico.edu; *Cultivating Community: A Political Economy of Community Gardens in Buffalo, NY*

Processes of uneven development and creative destruction under neoliberalism, while creating economic prosperity in some places, both generate and leave behind marginalized landscapes as capital moves in search of higher returns and new markets. However, while capital is mobile, people are rooted in place, particularly those who are older, poorer, or who have no incentive to

move. Aging, abandoned infrastructure, derelict vacant lots, environmental degradation, and idle workers can be found in numerous post-industrial cities in the United States, such as Buffalo, as a result of processes of deindustrialization, globalization, and neoliberalism. However, even in marginalized landscapes, people's social attachment to place remains as they struggle to maintain their local sets of relationships, interactions, everyday spatial practices and institutions (Brenner & Theodore, 2002). This paper explores complex relations between community members, organizations, activists and local government in relation to socially and geographically uneven processes of globalization and urban restructuring through a study of urban community gardens in Buffalo, NY and seeks to develop an 'organic' theory of political economy that takes into account the volunteerism, sweat equity, civic engagement, community building, and community and social services that are afforded by the cultivation of community gardens on redundant, vacant parcels of land by urban community gardeners.

Keywords: uneven development, neoliberalism, urban gardening

Troy A Knight, University of Arizona. Email: tak@email.arizona.edu; Long term perspectives on drought induced tree mortality in southwestern pinyon-juniper woodlands.

Recent extensive vegetation changes and die-offs in semi-arid woodlands of the American southwest, such as the extensive mortality of pinyon pine (*Pinus edulis*) on the Colorado Plateau during the severe drought of the late 1990s and early 2000s, have underscored the rapidity with which even long lived and relatively drought tolerant conifers can perish under extreme and prolonged drought conditions. Such sudden shifts in vegetation not only concern modern land users and managers, but also must have impacted subsistence patterns of prehistoric peoples. Unfortunately, mass rapid mortality episodes do not lend themselves to easy detection by historical and paleoecological methods, and thus have few analogs in the past. In order to provide a historical context for recent changes, I am investigating the relationship between past moisture availability and variability with woodland tree dynamics in east central Utah using dendro-chronological techniques. Towards this end I intend to (1) develop a robust annually resolved tree ring based climatic reconstruction, (2) extract patterns of mortality and regeneration in pinyon-juniper (*Juniperus* spp.) woodlands using dendroecological methods, and (3) use GIS to characterize spatial patterns of pinyon-juniper population dynamics through time. Initial collection efforts have concentrated on Douglas fir (*Pseudotsuga menziesii*) for use in the climate reconstruction. Thus far, the resulting chronology has been extended back 2000+ years. Initial collections of pinyon pine are currently being dated.

Duncan John Knowler, Simon Fraser University. Email: djkn@sfu.ca; Jesse Wood, Canadian International Development Agency (CIDA). Email: Jesse.Wood@international.gc.ca; Assessing the Prospects for Community Natural Resource Management: Are Social Capital and Leadership Influences Conflated?

Conventional wisdom suggests that more social capital leads to greater cooperation and increased participation in community natural resource management schemes. In this paper, we inquire whether this argument is too simplistic, perhaps ignoring various complexities. For example, social capital's effects on participation in community natural resource management may be conflated with other household characteristics that influence participation. Gaining the support of local leaders is cited as a critical element in spurring community action and, coincidentally, leaders also are likely to exhibit high levels of social capital. However, leaders' support for community natural resource management may be unpredictable; rather than correlate with a high level of social capital, it may rest on a shrewd assessment of self-interest. Indeed, higher household social capital might actually correlate with lowered willingness to participate in community natural resource management, if participation is not sufficiently rewarding or its opportunity costs are too high. To examine this hypothesis, we surveyed households in Khumbu, Nepal and asked about their social capital characteristics. We also asked if households would participate in a hypothetical community natural resource management scheme involving the endangered Himalayan musk deer, given a randomly drawn payoff. We estimate a logit model of participation in the hypothetical scheme and show that leader types are less likely to support the scheme than others, despite demonstrating higher levels of social capital. These results suggest that assessing the prospects for community natural resource management requires careful consideration of the complex interactions between social capital and other community characteristics.

Anne Kelly Knowles, Middlebury College. Email: aknowles@middlebury.edu; What Value an Historical GIS of Transportation?

This paper briefly summarizes a study of regional industrial development in early nineteenth-century Pennsylvania and raises a series of methodological questions inspired by that study. The substantive question is why the iron industry east and west of the Allegheny Mountains developed at different rates and with markedly different degrees of success during the antebellum period. In addition to dissimilar resource endowments, labor, and distance to markets, the paper will show that each region's characteristic terrain and transport infrastructure facilitated or impeded the development of heavy industry. The GIS methods used to answer the research question included digitizing and georectifying historical maps, improving their accuracy in reference to digital ortho quarter quads, and preparing animated maps to display the spatial sequence of construction from 1800 to 1860. Although these methods made it possible to study the spatio-temporal patterns and shifting relationships between transportation and heavy industry, they yielded less information than one would hope given the labor required to build the GIS and produce results. The second half of the paper considers the shortcomings of map animation, the need for better methods of change detection in historical GIS, and the question of whether the time is ripe for a national project to create detailed historical layers of transport infrastructure for use in research and teaching.

Janelle Knox-Hayes, University of Oxford. Email: janelle.knox@ouce.ox.ac.uk; Gordon L Clark, Halford Mackinder Professor of Geography, Head of the Oxford University Centre for the Environment. Email: ; Mapping UK pension benefits and the intended purchase of annuities in the aftermath of the stock market bubble

Many people rely upon personal and employer-sponsored pensions to supplement the basic state pension. As such, the soon-to-retire baby-boom generation will depend on the nature and number of their pension entitlements as well as the performance of global stock markets? a fact of life ignored when market prospects appear on an upwards trajectory but of considerable concern when markets decline. There are increasing concerns about the social and geographical stratification of pension entitlements. Just as importantly, it appears that individual risk attitudes and financial decision-making are associated with the social identity of respondents including their age, gender, marital status, and income. Here, we test whether access to supplementary pension benefits is related to socio-demographic status or region of residence or both. Having determined that social status is the crucial determinant of the number of pension entitlements held by respondents, we test whether the intended purchase of an annuity can be correlated with socio-demographic status or region of residence or both. Based upon a unique and large data base of 50 to 64 year-olds? people with an immediate and tangible interest in their pension prospects? it is shown that respondents' region of residence is significant in explaining the variance in individual's pension-related risk management strategies. Implications are drawn for the map of UK pension benefits and for the existence of regional subcultures of financial decision-making.

Keywords: Annuities, pensions, market volatility, region, socio-demographic status

Contracted with US Geological Survey, Florida Integrated Science Center. Email: anayegandhi@usgs.gov; Remote Sensing of Coral Reef Structural Complexity for Biodiversity Studies

In coral reef environments, the structural complexity provided by large coral colonies is an important part of habitat complexity, which influences the diversity and abundance of many reef-dwelling species. The spatial scale of the structure is of importance because many reef organisms seek refuge from predation in the corals, particularly in large branching coral colonies. Scale is

therefore intimately linked to the body sizes of both predator and potential prey. Using remote sensing to map structural complexity can provide insight into its variability in space and time. Lidar remote sensing has been used to map coral reef structural complexity, and waveform analysis of low beam-divergence lidar data has the potential to do so at the scale of large branching coral colonies. Recent work using waveform data from the Experimental Advanced Airborne Research Lidar (EAARL) suggests that variability of reef structural complexity can be mapped at this scale, with potential use in spatial biodiversity studies.

Daniel C. Knudsen, Indiana University. Email: knudsen@indiana.edu; Charles E. Greer, Indiana University. Email: greerc@indiana.edu; *The Vernacular Becomes Symbolic, the Symbolic Becomes Nationscape: Hverring Estate, Viby Village and the Garden of Denmark*

This paper explores the ties between vernacular landscapes, symbolic landscapes and the creation of “nationscapes” - landscapes that enter the national consciousness as prototypical of national identity. We argue that ordinary places must necessarily be transformed into highly symbolic landscapes prior to their investiture as nationscapes. We specifically examine the area that once comprised a medieval estate on the island of Fyn in Denmark, an island known to the Danes as “the garden of Denmark.” We suggest that the symbolic notion of “garden” and “historic preservation” ignores the very real vernacular landscape of agricultural production and exurbanization of the present and the equally real vernacular landscape of feudal oppression of the past. We also examine the way in which this landscape, as a romanticization of a bucolic rural past, has come to symbolize Denmark by the role it plays in 19th century nationalist literature and art. We conclude that it is the symbolism conjured up by the landscape and not the vernacular landscape that led to the area’s consideration as a critical piece of the Danish nationscape.

Keywords: nationscape, vernacular landscape, symbolic landscape, Denmark

Sarah E. Knuth, UC - Berkeley. Email: sknuth@berkeley.edu; *Partnerships for Climate Change Mitigation: Connecting County Government and Stakeholders in Montgomery County, Pennsylvania*

Local climate change mitigation initiatives increasingly play a vital role in advancing global warming policy in the United States, achieving local greenhouse gas emissions reductions and building public support for broader regulation. Local governments are critical to this movement but must partner with other local and regional stakeholders to achieve their full potential. This study explores methods and prospects for developing climate change mitigation partnerships between county governments and community stakeholders by conducting a collaborative mitigation planning process for Montgomery County, Pennsylvania. The investigator worked with Montgomery County stakeholders to compile a greenhouse gas (GHG) emissions inventory and develop mitigation program elements including alternate emissions reduction targets, ways of framing the mitigation program, and sector-specific emissions reduction strategies. Results from this process laid necessary groundwork for further climate change mitigation action in Montgomery County and produced important insights on county-level GHG inventorying and mitigation planning. Stakeholder partnerships may significantly expand county government power to reduce emissions, and existing programs like smart growth may provide a useful base for participatory climate change mitigation efforts. To work effectively with community stakeholders, however, county governments must overcome problems created by incomplete local emissions data and navigate a complex and time-consuming partnership-building process. By developing innovative mitigation planning tools and protocols, best-practice partnership models, and service-learning approaches, universities may help local governments accomplish these tasks.

Shin Kobara, Texas A&M University. Email: shinichi@geog.tamu.edu; William D. Heyman, Texas A&M University. Email: wheyman@geog.tamu.edu; *Geospatial analysis of Reef fish Spawning Aggregation Sites*

Commercially important reef fish species form transient spawning aggregations at specific times and locations. The multiple spawning aggregation sites previously reported in Belize seem to be located to near shelf edge. Although spawning aggregation sites from many areas in the wider Caribbean have been described and mapped, there is no comparative geospatial analysis of the similarities and differences among them. This paper attempts to provide the geophysical characteristics of the locations of known spawning aggregation sites in relation to shelf break using remote sensing and field-collected position data. Generally satellite-derived images of coral reef environments can receive the bottom reflectance because of clear water. To test our assumption that location of shelf edges could be delineated using satellite images, the positions of shelf edges from field-collected data and shelf edges derived from satellite images are compared. The results show that 11 out of 12 known spawning aggregation sites around Lighthouse reef atoll, Turneffe atoll and Glover’s reef atoll in Belize are located at or near the remote sensing based shelf break. The combination of remote sensing and bathymetry data describes that spawning aggregation in Halfmoon Caye occurred at very close to drop-off.

Keywords: spawning aggregation, shelf break, geospatial analysis, remote sensing

Tetsuo Kobayashi, University of Utah. Email: tetsuo.kobayashi@geog.utah.edu; Richard Medina, University of Utah. Email: richard.medina@geog.utah.edu; Thomas J. Cova, University of Utah. Email: cova@geog.utah.edu; *Visualizing Diurnal Population Change: A Case Study in Salt Lake County, Utah*

There is an increasing need for a simple methodology to represent diurnal population change for metropolitan areas. Understanding diurnal population change is necessary for effective emergency management and risk analysis, as well as for the modeling of contagious diseases and business geographics. Many studies use data that assume a constant population through time and space. Static Census population data are used repeatedly for scientific research because of their availability but have significant limitations. Census data are based on household location, which ignores the dynamic nature of populations within urban ecological environments. Although the U.S. Census now offers daytime population estimates at the city level based on work flow, intra-urban population flow cannot be modeled completely with these data. This paper presents a methodology to generate a diurnal population flow surface for metropolitan areas based on readily available hourly work flow data. Spatial interpolation methods within a GIS are used to create twenty-four (1 per hour) multiple surfaces of population within and between Transportation Analysis Zone (TAZ) boundaries in the larger metropolitan area of Salt Lake County, Utah. The surfaces are representative of diurnal population change for an average work day.

David Koch, Kansas State University. Email: dkoch@ksu.edu; Doug Goodin, Kansas State University. Email: dgoodin@ksu.edu; Shawn Hutchinson, Kansas State University. Email: shutch@ksu.edu; *Hantavirus ecology: analysis with individual-based models.*

Rodents in the order Muridae and Sigmodontinae are the endemic hosts of hantavirus. Humans exposed to hantavirus can get Hantavirus Pulmonary Syndrome, a relatively rare but often fatal cardiopulmonary disease. Hantavirus distributions within rodent communities were modeled using individual based models. Model rodents were given behaviors based on non-spatial models currently used to describe host rodent behavior as well as hantavirus transmission in rodents. Parts of the models were described spatially and the behavior of model rodents and hantavirus transmission were analyzed. These models were developed to further the understanding of which ecological factors may affect hantavirus distributions and will help to more accurately direct studies on hantavirus toward the most important ecological factors that determine its spatial distribution. The models also help demonstrate the importance of incorporating aspatial epidemiological models into spatial models. Understanding how changes to rodent habitat affects the rodent’s populations and distribution of hantavirus within their population should be a key to predicting potential outbreaks of Hantavirus Pulmonary Syndrome among human populations.

Keywords: Hantavirus, individual-based model, landscape epidemiology

John Kochendorfer, PhD Student, University of California - Davis. Email: jkoch@ucdavis.edu; **Kyaw Tha Paw U, Prof., Univ of California, Davis.** Email: ; **Young-San Park, PhD, Univ. of California, Davis.** Email: ; *The Turbulent Exchange of Water Vapor and Temperature Across the Edge of a Crop Canopy*

Eddy covariance is widely used as the primary method to estimate the net exchange of a scalar between a land surface and the atmosphere. The mass conservation and the continuity equations reveal that when the surface near eddy covariance instrumentation is not homogeneous corrections for horizontal and vertical advection must also be included. Restraining the use of eddy covariance campaigns to ideal or even near-ideal locations is neither practical nor possible, but modeled and experimental research on the potential magnitudes of advection within canopies is scarce. In an intensive field experiment a suite of instruments designed to measure advection and vertical fluxes of heat and water vapor was placed at varying distances from the edge of an agricultural canopy (Sorghum bicolor). The magnitude of measured horizontal advection of latent energy and sensible heat is large near the edge of the canopy, often greatly exceeding the magnitude of vertical fluxes. Comparison between observed results and a higher-order closure model of advection across a canopy edge is made.

With record hurricane seasons occurring over the past decade, the question of “why” has yet to be answered. Hurricane frequency and intensity appear to be on the rise and the debate about the cause (“natural cycles” and “global-warming”) continues. Since long-term trends and variability in hurricane occurrence are poorly understood, it is important that proxies are developed to examine past tropical cyclone activity. Multiple proxies in current use include modern instrumental, historical records, as well as natural proxies. Tree-ring proxies are unique because they are exactly dateable and have seasonal resolution. Here, we present three tree-ring (*Pinus palustris* Mill.) isotope time series where hurricane occurrence and precipitation are verified with the modern instrumental record. Trees collected and analyzed are from South Carolina (Francis Marion National Forest, Sandy Island) and Pensacola, Florida. The tropical cyclone events recorded are not limited to direct hits, but include storms within ~200km radius. The only tropical cyclone events not recorded are those in which no rain was reported in the precipitation data. One “false positive” is recorded at Pensacola (1983) and Sandy Island (1982) the cause of which is yet to be determined (El Nino?). An inter-site comparison reveals remarkably similar decadal-trends in both the earlywood and latewood. These sites present a unique opportunity to verify the isotope proxy beyond the instrumental record by working with ongoing historical research in both South Carolina and Florida to extend the record of tropical cyclone activity back into the 18th century.

Gina Koczberski, Curtin University of tech. Email: g.koczberski@curtin.edu.au; **George N. Curry, Curtin University of Tech.** Email: g.curry@curtin.edu.au; *Finding Common Ground: Securing Land in the Oil Palm Frontier of Papua New Guinea*

The oil palm-growing regions of Papua New Guinea attract large numbers of ethnically diverse migrants from poor rural areas. Between 1980 and 2000, West New Britain Province (WNB), the subject of this paper, had an annual population growth rate of 3.7%. At the 2000 census migrants made up nearly one-third of the WNB population. To pursue livelihoods, land-poor migrants are entering into a broad range of informal arrangements with customary landowners to gain short and long-term access to land. These arrangements provide migrants with specific types of access rights to the customary land of their hosts. While these arrangements can provide migrants with continuing and secure access to land, there are many instances of migrants being left vulnerable to eviction and the loss of their access rights. In exploring these issues the paper has three aims: 1) to document the range of land tenure arrangements emerging in these oil palm frontier areas and compare these ‘modern’ forms of tenure with traditional mechanisms of incorporating outsiders into land-holding groups; 2) to assess the degree of livelihood vulnerability and opportunity for migrants arising from land tenure arrangements that regulate the temporal, social and economic dimensions of land rights; and 3) to report on the ways migrants and customary landowners arrive at a common understanding of their respective ongoing rights in these land parcels.

Alexandra Koelle, UC Santa Cruz. Email: akoelle@ucsc.edu; *Crossing the Land, Making the Country: The 25th Infantry Bicycle Corps*

Western American History, including the New Western History, is usually presented as regional history, and focuses on the frontier era as both geographically and causally separate from national events. I argue that the thirty year post-Reconstruction stationing of all four segregated black regiments of the US army at Northern Rockies garrisons played a significant part in how these US territories became states. This historical moment is relevant for understanding how places become racialized and race is read through place, in both the currently hegemonic Lewis and Clark origin narratives of the Northern Rockies and in the contemporary United States as a whole. This paper focuses on transportation corridors and technologies to explore how zones of movement such as railroads and wagon routes function as place-making technologies. Rather than simply connecting preexisting places, I argue that the construction and use of transportation corridors actually create places materially, politically, and conceptually. This paper examines newspaper articles, official army reports, and twenty-first century retellings of a cross-country bicycle trip carried out by the 25th Infantry Bicycle Corps, an all-black group of soldiers, at the close of the nineteenth century. I examine how race and place are discursively constructed through the performance of bicycling over rough roads and through mud. Through the effort of black soldiers testing the bicycle for military use by cycling through Indian reservations, national parks, and small towns, the territories of the Northern Rockies are made into a liminal space that exists both inside and outside the nation.

Natalie Koeplinger, UNC-Greensboro. Email: natalie@prisage.com; *Telecommuting Survey Results From a Fortune 100 Firm*

Much research has been conducted on telecommuting; from productivity, job satisfaction, organizational behavior, and frequency, to its affect on urban sprawl and travel. Telecommuting is variably defined as using technology to work at a home, telecenter or remote location, foregoing a commute to and from the office. Many telecommuters experience endogenous and exogenous effects of telecommuting, such as, feelings of alienation, lack of career connections, and conversely, higher job efficacy, flexibility and greater job satisfaction than traditional employees. Telecommuting has changed the way some people work, and it is further buttressed by advancing information and communications technologies (ICT). This presentation will examine a survey that was conducted for a master's thesis on telecommuting. This research is based on a survey administered to a group of telecommuters and traditional employees of a Fortune 100 firm. The survey will yield strong results on job satisfaction and technical delay of both groups. It will also examine traditional employees with a propensity to telecommute and will look closely at location factors this group. The last part of the survey supports the notion that telecommuting is as much of a lifestyle choice as it is a mode of work.

Matthew T. Koeppe, Association of American Geographers. Email: mkoeppe@aag.org; *Choosing and Evaluating Courses and Internships for a Career in Academics, Government, or Business and Industry*

The EDGE project has collected the views of recent graduates and employers working in academia, government, and for profit and non-profit private businesses on what types of knowledge, skills, and abilities are most important for geographers in each sector. These insights can help graduate students plan a course of study and training that will best prepare them for entering the job market. This information is summarized and interpreted in an online resource that can be used by students as they choose and evaluate courses and internships in preparation for careers in a variety of industries.

Keywords: careers, internships, education

Dieter Franz Kogler, University of Toronto. Email: dieter.kogler@utoronto.ca; *The Geography of Inventors*

The geography of inventors has multiple dimensions. New ideas are primarily created through collaboration, especially with regards to complex technologies. Furthermore, innovation depends on knowledge inputs and prior developments; either from closely related or distant technologies. Although the geographic and relational proximity of these innovation inputs remain vital, a recent theoretical framework has also introduced the importance of the “local buzz”, and “global pipelines” dynamics, which could essentially increase our understanding of the innovation process. In order to investigate these concepts further, and to subsequently validate them through empirical evidence, the present study utilizes patent data combined with advanced spatial and network analysis tools. The scope of the investigation encompasses the optical sector in Canada over the past twenty years. In addition to quantitative measures,

qualitative research was also incorporated. The findings of the study have increased our understanding and comprehension of the geographic scale as it relates to inventors, and consequently has introduced an avenue for further research into the complexity of the innovation process.

Benjamin Kohl, Temple University. Email: bkohl@temple.edu; Juan Arbona, Bryn Mawr College. Email: jarbona@brynmawr.edu; *The Urban Form of Neoliberalism: The case of the La Paz-El Alto Metropolitan Area*

Neoliberal globalization, the increasing reliance on markets to drive economic development, has resulted in a particular set of urban forms in poor countries? a minority of economically successful residents inhabiting increasingly privileged spaces? while the poor are ever more marginalized both economically and socially. At the same time, global trends toward democratization and increased political participation have exacerbated tensions in these cities where the majority faces limited economic options. As Lefebvre reminds us these urban struggles and conflict are about how space is configured and for whom, in a way that simultaneously manifests the negative implications and challenges to the neo-liberal political order. The paper examines the metropolitan area of La Paz-El Alto, Bolivia, which provides an exemplary illustration of how globalization shapes cities and how these particular urban forms, in turn, threaten the political sustainability of neoliberal globalization.

Keywords: Neoliberalism, Urban, Cities, Latin America, social movements, urban form

Nicholas P. Kohler, PhD, University of Oregon. Email: nicholas@darkwing.uoregon.edu; James E. Meacham, University of Oregon. Email: jmeacham@uoregon.edu; *Landform Classification and Environmental Seasonality in Mountain Grassland Environments: Case Studies in Oregon, USA and Bayan Ölgii Aimag, Mongolia*

The increasing availability of terrain models and remotely-sensed data on environmental characteristics has made possible studies linking landform and vegetation dynamics over extensive areas. This paper examines methods of semi-automated landform classification using digital elevation models (DEM's) and tests the resulting landform classifications by examining vegetation dynamics within each landform type. Case studies in the Zumwalt Prairie of northeastern Oregon and in the high valleys of the Altai Mountains of western Mongolia are used to demonstrate the methodology. 10-meter and 30-meter resolution DEM's created by the United States Geological Survey are employed in the Oregon case study, and 90-meter resolution DEM's from the Shuttle Radar Topography Mission (SRTM) are used in the Mongolia case study. Data on environmental seasonality in both cases is drawn from the MODIS sensor, using vegetation greenness indices (NDVI and EVI) collected over 16 day periods and land surface temperature indices collected over eight day periods. Conclusions address the scale-dependent nature of landform classification and the relationship between landform and vegetation seasonality. Results will be used to aid biodiversity conservation efforts in the Zumwalt Prairie, Oregon and cultural site conservation in western Mongolia.

Keywords: Remote Sensing, Grasslands, Vegetation Dynamics, Terrain Analysis

Michal Kohout, California State University, San Bernardino. Email: mkohout@csusb.edu; *US immigration reforms and the contradictions of a neoliberal state*

Gramsci's hegemony rests on the sometimes contradictory boundaries between consensus and coercion within the state. Consensus is shaped by elites who seek legitimacy from those they govern, and who also produce laws and deploy the state's coercive apparatus to enforce them. But, what happens when state coercion undermines the legitimizing consensus? This seems to be the case with recent US immigration reforms exemplified by HR 4437 passed in 2005, which stresses border enforcement and harsh punishment for illegal immigrants and those who employ or assist them. At the same time a Senate bill (S 1033) introduced in 2005 agrees in principle with border enforcement but also insists on a steady supply of labor to critical sectors like agriculture. This paper explores the current debate over immigration reform by analyzing the federal debate on enforcement vs. labor supply. I also look at two cases in Southern California that made national headlines: San Bernardino's proposed ordinance to use local resources to enforce immigration laws, and Coachella's ordinance to make the city an immigrant sanctuary. The key observation is that those groups pushing for strict enforcement without a guest worker program are threatening the US neoliberal consensus, which is based on a constant supply of low-cost labor that maintains a material lifestyle for specific groups of people who legitimize the consensus. Local politics, like those of San Bernardino, are focused on the middle class, which is whipped into enforcement frenzy but continues to demand low-

cost goods that are not possible without low-cost labor.

Keywords: immigration reform, labor, local politics, United States

Herman Kok, . Email: hkok@multi-development.com; *Taking the backseat: the position of retail at waterfront developments*

Waterfronts are among the most attractive and most value adding features in urban development. Being situated on a waterfront often guarantees a stronger market competition, higher returns, and a longer sustainable development product. Waterfronts are often used for multi-functional developments, a mixture of residential, offices and services, combined with leisure. The waterbody itself functions as an important landscape element, providing identity and value to the development product. Retail is often considered in these projects as well. However, the physical positioning of retail within waterfront projects is often subject of debate. Among the problem with waterbodies is the sensitivity to wind and weather. Wind in combination with rain can make waterside environments inhospitable. This paper discusses the integration of retail functions with waterfront projects in The Netherlands. A concept of how to integrate retail functions with waterfront developments based on functional and physical structures of coastal and lakeside resorts will be presented, and several cases will be used to elaborate on conceptual differences.

Keywords: retail, waterfronts

Crystal Kolden, Clark University. Email: ckolden@gmail.com; Peter J Weisberg, PhD, University of Nevada, Reno. Email: ; *Incorporating topography into GIS analysis: A case study of wildfire mapping accuracy in Nevada*

There is little doubt that advances in GIS have been enormously beneficial for land management. One area that still lags, however, is the understanding and integration of how topography affects GIS database creation and analysis. In wildfire management, for example, topography has two very specific influences on Fire GIS. First, the area burned by fires is mapped using helicopters that are often flying in steep terrain with poor visibility, lowering the accuracy of mapping. Second, only the planar area burned is calculated using vector polygons, instead of a surface area calculation utilizing elevation data. Since wildfire managers must have accurate perimeter maps and area burned totals to order firefighting resources, determine fire suppression strategies, and request appropriate funds for post-fire rehabilitation, GIS analysts should strive for more accurate methods of mapping wildfires. In this case study, we examined 50 wildfires in Nevada to determine the influence of topographic variability on mapping accuracy and area calculations at varying spatial scales. We found that topographic roughness was not correlated to perimeter mapping accuracy, suggesting that human error and environmental variables may play a larger role in mapping accuracy. We also found that the correlation between topographic roughness and surface area correction is dependent upon the scale of the fire.

Korine Kolivras, Virginia Tech. Email: korine@vt.edu; *Changes in Dengue Risk Potential in Hawaii based on Climate Variability and Change*

Climate variability brought about by the El Niño-Southern Oscillation has been linked to outbreaks of infectious diseases such as hantavirus pulmonary syndrome, cholera, rift valley fever, and malaria. Additionally, it is expected that climate change will also affect the distribution of diseases, with some regions becoming more or less favorable for the transmission of certain disease agents. Mosquitoes in particular will likely be sensitive to climate change, and mosquito-borne diseases may become more common at higher latitudes and higher elevations. This study examines the potential changes in dengue risk areas in Hawaii in response to climate variability and change using an overlay analysis within a GIS. Dengue is considered to be an emerging disease, and is also the most important mosquito-borne viral disease globally, with almost half the world's population at risk of infection. Previous research has identified mosquito habitat and dengue risk potential areas in Hawaii based on average climate conditions, and this study will incorporate notions of climate variability and change. Dengue risk areas generally contract during El Niño-induced droughts, and expand as a result of increased precipitation received during La Niña events. Future climate scenarios predict warmer temperatures and wetter summers in Hawaii over the next 100 years, which will result in an expansion of mosquito habitat and potential dengue risk areas. The results of this study will aid public health officials in efforts to determine where to concentrate mosquito surveillance efforts, given certain current or predicted climate conditions.

There is considerable interest in the effects of mortality from HIV/AIDS on agricultural production in sub-Saharan Africa where HIV infection levels are high. Despite the increasing availability and potent use of therapy drugs, infection with HIV remains an immense shock to the well being of the household of which the infected person is a part. However, net effects of HIV on agricultural production in these contexts remain uncertain. This paper seeks to advance our understanding of the changes in labor availability, work organization, land transactions and management, and health nutrition status due to HIV/AIDS and HIV-related mortality in the Mayuge district of south-eastern Uganda. We hypothesize that HIV-affected households will experience reductions in both labor and income, leading to a reduction in agricultural area cultivated. These effects may occur during disease progression, before the critical point of the disease, as well as following the death of a household member. Contextual information using qualitative methodologies was gathered through semi-structured interviews with groups and local experts at both district and local levels, conducted in two villages in summer 2006. Our field studies have provided narrative evidence showing declines in income and in agricultural production in most of the households affected by AIDS, widows being displaced from land and clan territory, decreases in skilled labor, and increases in the numbers of orphans and in the level of drop outs from schools. Our findings are being used to develop a Multi-Agent simulation model of labor allocation and agricultural land management for the area.

George Mathias Kondolf, University of California. Email: kondolf@berkeley.edu; *River Restoration in North America: Meandering Channels for All?*

River restoration has become a big business in North America, with over 40,000 projects (costing over \$17 billion) in the US since 1990. Many of these projects involve new, essentially experimental treatments, but there has been remarkably little monitoring and objective post-project appraisal, limiting the advance of the science and practice of river restoration. Among the most imageable river restoration projects are those that involve creation of a new channel, often in a new alignment and generally with dimensions and form different from the pre-project channel. These channel reconstruction projects often have the objective of creating a stable, single-thread, meandering channel. This is commonly the case even on rivers that were not historically meandering and whose sediment load and flow regime are not consistent with such channel forms, and despite research showing that dynamically migrating channels (not stable channels) have the greatest ecological richness. These meandering channels are often specified by the Rosgen classification system, a popular restoration design approach. While most such projects have not been objectively evaluated, available data indicate a high failure rate. Nonetheless, this classification and form-based approach continues to be popular because of its ease of application, its accessibility to those without formal training in fluvial geomorphology, and probably because it satisfies a deep-seated (though unrecognized) cultural preference for single-thread meandering channels, consistent with 18th century English landscape theories that held the serpentine form to be ideal, and satisfying public preferences for tidy landscapes and the idealized trout stream.

Moussa Kone, Department of Geography, University Of Illinois, Urbana-Champaign. Email: kon@uiuc.edu; *Up In Smoke: Biomass Burning and Atmospheric Emissions in the Sudanian Savanna Ecosystems of Cote d'Ivoire*

This poster presents an outline of my PhD dissertation research, which investigates the West African biomass burning in the light of social, economic, political and biophysical processes at the local and regional scales in Cote d'Ivoire. Fire is an important management tool in the farming and pastoral systems of West Africa. The environmental science literature considers biomass burning as an important source of greenhouse gases and aerosols such as sulfur, nitrous oxide, methane and carbon dioxide. The effects of biomass burning on atmospheric composition leads to several concerns about climate change, air pollution, and human health. Environmental literature argues that biomass burning contributes up to 40 % of gross carbon dioxide each year. African savannas are viewed in this literature as the "burn center" of the planet. My research thesis is that the impact of biomass burning on the global climate change has been overestimated and that the land use policies based on climate change literature may be misconceived. I argue that contemporary perceptions and practices in West Africa generate early fires that lead in low fires intensity and bush encroachment. Less frequent and intense fires produce less gas and aerosol emissions into the atmosphere and more vegetation takes up more carbon dioxide than believed. My research takes a political ecological approach to further our understanding of fire periods, intensity, frequency, combustion efficiency in Ivorian savannas and their contribution to global climate change.

Victor A. Konrad, Carleton University. Email: vkonrad@hotmail.com; *The Boundary Between Canada and the United States in the Era of Security Mobilization*

United States replaced an evolving, transnational image of integration at the border. A security imperative has prevailed since then, and a fine balance of trade and security has emerged and has been institutionalized in structures for emergency preparedness in both the United States and in Canada. Moving goods remains the priority and massive investments in border infrastructure have insured that this priority is being achieved in an era of security mobilization. A major challenge remains to expedite passport compliance along the "World's longest undefended border." This paper examines how all of these forces have shaped a new borderlands culture where border image and reality are more aligned, and the juxtaposition of Canada and the United States is more apparent. The geography of the Canada-United States relationship, apparently simple on the map of North America, is a vastly complex set of national and subnational interfaces characterized by prodigious growth, rapid innovation, extreme sensitivity and enigmatic stances of nationalism and transnationalism at the border.

Keywords: Border, Borderland, Security, Transnationalism

Thomas M. Kontuly, University of Utah. Email: thomas.kontuly@geog.utah.edu; *The Relationship between Internal Migration and Employment Change in Germany*

This paper evaluates the degree to which internal migration in Germany can be related to employment change differences during the post-unification period. By doing so it tests the importance of the "regional restructuring" hypothesis of spatial demographic change. Regional restructuring refers to the spatial deconcentration of manufacturing and service employment, and can be thought of as a "people follow jobs" explanation. It views the de-industrialization of the 1970s as a short-term phenomenon, and forecasts new urbanization tendencies for large metropolitan areas that are able to function as advanced private service centers, the location of corporate headquarters, banks, and other financial institutions, and for metropolitan areas that become the location of knowledge-based industries. This hypothesis draws from a wide variety of theoretical traditions such as world systems theory, world city formation, the work on flexible production, and the writings on the informational and networked society. Regional restructuring appeared in the 1980s to explain American and European deindustrialization. It is occurring as the proportion of tertiary and quaternary employment increases relative to secondary employment. Also, the decline in primary employment has almost run its course, so there is a reduction in the stock of potential out-migrants living in rural areas. Older industrial countries have been going through a process of deindustrialization that has had a strong negative impact on larger cities, especially on their central areas, and the deconcentration of jobs was followed by population migration. This paper finds partial confirmation of the regional restructuring hypothesis in Germany.

Sara Koopman, University of British Columbia. Email: skoopman@interchange.ubc.ca; *Growing a New Skin: Moving from activist to activist-researcher (Learning to Study In)*

I came back to academia as a long-time activist, frustrated by how often we struggle for liberation by oppressive means. I came looking for new insights and strategies for changing the world. In that search I engaged in a collaborative theorizing research project with sister activists in the movement to close the School of the Americas (a U.S. military training camp for Latin American military officers). This paper is a reflection on my process of role changing (and juggling), and on how best to dance new moves in, and with, your own social movement.

Keywords: activism, methods

Ludvik Kopacka, Charles University. Email: kopacka@natur.cuni.cz; *Geography of the multiple transformation turbulencies of the Czech economy and industry*

The main aim of the presentation is to show characteristic phases, features, tendencies and results of the post-socialist (post-1989) transformation of economy and industry in the Czech Republic. The paper will use quantitative and qualitative indicators to uncover transformation turbulences, structural changes and deformations, regional inequalities. The changes introduce themselves multilevel and -structural mixture, so that we have to use corresponding mixture of methods and indicators. Emphasis will be given on the long-termed (historical) consequences as well as on the changing priorities, hierarchy and importance of selected factors, processes, subjects. An attempt will be done to compare and locate hitherto realised post-socialist economic and industrial transformation, restructuring, and geographical redistribution in the Czech Republic with (into): long-term historical development and changes during multiply transformations; both geo-political and economic conditions and orientation; old and new member-countries of EU (developed and developing countries); the processes of globalization, explosion of technology, inflow of FDI etc. Economic, energetic, environmental, regional ("market" differentiation instead of socialist equalization) consequences as well as passive and active conditions and resources will be taken into account. The purpose is to prepare geographical synthesis of the post-socialist transformation of economy and industry in the Czech Republic and to uncover main trajectories, tendencies, periods and factors as well as problems face to face to permanently changing role and quality (of a small) Czech space in the frame of Europe (EU) and World.

Keywords: post-socialist transformation; development of economy and industry; Czech Republic

Jennifer Kopf, PhD, West Texas A & M. Email: jkopf@wtamu.edu; *Berlin Celebrations of Difference*

This paper analyzes two Berlin celebrations of difference, which are separated by one century. These are the Colonial Exhibition in the 1896 Berlin Trade Exhibition and the Carnival of World Cultures, celebrated each Pentecost since 1996 in Berlin. Approximately 7.5 million visitors attended the Berlin Trade Exhibit. Held just 12 years after the Berlin Conference announced united Germany's debut as a modern power ready to compete in colonization, the trade exhibit was "the coronation of Berlin as a metropolis" (Barchan 2004). The colonial exhibit at the trade show presented Germany's imperial might as the center of empire. Approximately 100 contract workers, from across the German colonies, performed at the exhibit. Colonial subjects were displayed beside natural products from their home region, along with information on the characteristics and utility of each. The second celebration, the Carnival of Cultures, developed as a response against a "biased and prejudiced view on immigration" in Berlin in the 1990s. "Its [The carnival's organizer, Werkstatt der Kulturen's] aim was, and still is, to provide a culturally and politically non-discriminating platform for artists, intellectuals and independent organizations" (<http://www.karneval-berlin.de/>). I find intriguing similarities between the two celebrations: Both highlight "difference". Both were initiated following German unification, at times when Germans struggled to find a national identity. In both events, differences in race, religion, and gender relations play an important role, as participants view and try on other types of relationships and identities playfully.

Keywords: transnationalism, nationalism, race

Benedikt Korf, University of Liverpool. Email: b.korf@liverpool.ac.uk; *Generosity and the other: Differential geographies and the gift of post-disaster aid*

The term "gift" in German means "poison." This may be a kind of truism if we look at the practices of generosity and charity after the South(east) Asian Tsunami. While the donors in the West were "consuming" generosity, the practising of aid in those places affected by the Tsunami has proven to be much more complicated and has created considerable frustration among people affected by the tsunami as well as aid workers, in particular in Sri Lanka, which experienced a second wave - the one of aid. This contribution will analyse the relational

morality of giving gifts to needy people after natural disasters and will analyse, building on Mauss' and Sahlin's writings on the gift, what this means for the relationship between donors and the other of their generosity, those who receive aid. The practices of giving will be linked with the practices of implementing Tsunami aid at Sri Lanka's east coast. In particular, we will look at the differential geographies of immediate responses, relief provision, housing reconstruction and aid distribution in selected localities. We will argue that those aid practices have transpired in their specific forms due to the practices of generosity celebrated in the donating countries of the West.

Keywords: disasters, generosity, aid, gift

Joseph Koroma, . Email: joekoroma@hotmail.com; Brian Ceh, Indiana State University. Email: sceh@indstate.edu; *Perceptions of Poverty: Perspectives from the Poor in Rural Sierra Leone*

This paper provides an empirical examination of rural people's perception on poverty in Sierra Leone in relation to popular theories on poverty reduction. Three such approaches come from the neo-classical school, structuralist viewpoint and, more recently, multidimensional analysis. Neo-classicalists argue for limited government control of the economy to enhance economic development and reduce poverty. This is the position of the World Bank and International Monetary Fund. Adherents of the structuralist view suggest that government should have considerable influence and should provide welfare for the poor. This view is popular among many international, non-governmental organizations, such as Oxfam. The multidimensional approach, favored by the United Nations Development Program, posits that poverty is rooted in a multitude of factors and that an appropriate combination of neo-classical and structuralist solutions would be beneficial. Many poverty reduction programs in developing countries, however, lack theoretical justification. Sierra Leone adopted the World Bank and International Monetary Fund development model 1977. Meanwhile, the number of people living below the poverty line has increased from 48% in 1981 to 65.8% in 2001. The main purpose of this study is to understand the population's perception on poverty and whether their views are compatible with the policies adopted by government. My hypothesis is that the neo-classical model of development and poverty reduction, adopted by the Sierra Leone government is in disconnect with the population

Axel Kortevoss, . Email: axel.kortevoss@uni-koeln.de; *Access to hospital care under conditions of DRGs*

Since the year 2000 there is a major change in financing hospital care in Germany from day-based fees to a Diagnosis-Related-Groups-System (DRG). The implementation of the DRG-system caused a considerable strain to change the methodology of the hospital planning which is in the responsibility of the 16 federal states. The aspired dynamic sampling of the competition between hospitals can only be achieved by abandoning the usual capacity planning (beds in hospitals). In this context, spatial access to health care becomes more and more important as a planning category. A picture of access to hospital care can be achieved by linking the spatial references of the patterns of supply and demand in a current monitoring system on the basis of offer profiles. These profiles describe for each hospital the dedicated catchment areas on the base of the shortest travel distance from centroids which represent the real population distribution. Within this monitoring system, regional varieties of health care structures can be better described and transferred into planning options.

Keywords: medical geography, access, germany

Hille Koskela, Dr. Email: hille.koskela@helsinki.fi; *Emotional space*

My aim in this presentation is to develop the concept of emotional space. The concept was originally postulated within my research on public urban space under surveillance. Emotional space seems to be internally contradictory, but still possible to comprehend. Being committed to the feminist understanding, I see that there is no such thing as isolated individual: experiences are constructed through power relations. Urban experience and social relations contain various feelings: fear, excitement, love, desire, repulsion, aggression, curiosity, guilt etc. These all contribute in the production of space. Emotional space stands in the constantly changing triangle of (social) power, (individual) experience and (material) space. It is produced in the everyday encounters. While emotions and feelings themselves are personal, emotional space is a social construct. In relation to material space it is so 'social' that materiality almost disappears, but not quite. My purpose is to consider what is left of space at this point; how does this differ from non-spatialised social practices. I argue that emotions 'just there' are different from emotions in general because they become more concrete and more experiential. There are at least three qualities which describe emotional space. Firstly, it is impossible to draw borders around it or measure it. Secondly, emotional space is like a liquid: moving, flowing, resilient, elastic. And thirdly, it is 'weak'; difficult to grasp because it cannot be described in static terms. It

evades definitions and remains 'untouchable'. Nevertheless, there is a need to conceptualise and discuss this kind of space.

Katariina Kosonen, University of Helsinki. Email: katariina.kosonen@helsinki.fi; *Sweet dreams and daily services: the persuasive imagery of Finnish advertising maps*

Advertising maps are popular. They rarely have the regular functions of maps, such as helping navigation or depicting accurate thematic information based on data. Instead, they are set for selling places, consumer goods and services. In this paper, my interest is in the pictorial imagery of maps in Finnish newspaper and magazine advertisements, published mainly during the 21st century. The imagery of these "everyday maps" is colourful. Families and single consumers are persuaded to buy products, food and drink, holidays and other services by creating mental images, wrapped in geography. Certain geographical features, i.e. nature or landscape may be mixed with well-known buildings, symbols and people with stereotyped identities. Services are also marketed by telling how extensive they are, or, how easily accessible. In the world of ad-map, everything is close by and anyplace. A comparison to the advertising maps of the early 20th century proves that both the means and the imagery have remained surprisingly similar, even though the improvements in printing and computer technology have given a total brush up to the quality of images.

Hagar Kotef, Tel Aviv University. Email: hagarko@gmail.com; Merav Amir, Tel Aviv university. Email: amirmayr@post.tau.ac.il; *On Imaginary Lines; Biopolitics, Disciplinary Apparati and Sovereign Violence at the Checkpoints*

The Palestinian Occupied Territories are paved with hundreds of blockages and dozens of checkpoints. Creating a dense grid of limitations upon the movement of Palestinians, fragmentizing both the space and its population, they have become one of the most predominant technologies of the Israeli occupation. Backed by a perplexing bureaucratic mechanism, the regime of movement may be regarded, in Foucauldian terms, as a bio-political system gone astray. Yet, in this paper we would like to go beyond Foucault (while remaining within his framework) to suggest that in these sites bio-power, disciplinary power, and sovereign power are entangled in vexing ways. To understand these relations we examine one mechanism operating within the checkpoints: "The imaginary line". The imaginary line is a technology that seemingly operates within the disciplinary logic: it is a line drawn (metaphorically, in thin air) by soldiers at the checkpoint, delineating the permitted movement of Palestinians. However, while its transgression summons the soldiers' eruptions of violent, it is never visibly marked in the physical space. Thus, a structural failure is embedded into the operation of the disciplinary mechanism, facilitating the appearance of violence, which in itself serves to manifest Israel's sovereignty over these sites and over the bodies within them. This paper outlines this technology of hidden demarcation to demonstrate the convergence, within a bio-political site, of power/knowledge with violent sovereign power.

Francis Koti, University of North Alabama. Email: ftkoti@una.edu; *Putting the Urban Poor on the Map Using Participatory GIS*

There is notable progress in the practice of geo-spatial information technologies for urban practices in Kenya. Most recent literature has identified a concern for mapping land use and land cover change, infrastructure inventory, environmental management and other location-based uses. In these practices, the creation of urban geo-spatial databases has tended to reside in mainstream planning and is mainly characterized by formal data. Consequently, experiences

of marginalized groups have remained invisible on city maps. This paper employs a participatory GIS conceptual framework to demonstrate how local knowledge can contribute to a more robust and inclusive urban geo-spatial database. The study involves building a GIS for Athi River town, Kenya. The Athi River GIS is augmented with community local knowledge in the context of group mental mapping, focus group discussions, GPS-based transect walks, social histories of exclusion, and oral narratives of land use. The research concludes that the creation of urban datasets by city governments in Kenya is increasingly employing geo-spatial technologies. These datasets are however, problematic, as they focus mainly on the built environment and also reify traditional urbanism approaches and standards which disregard informal settlements. From the study, participatory GIS are found to offer an alternative methodology that integrates local knowledge into a GIS as an information layer. The study reveals low-income dwelling spaces not often found in formal planning data for Athi River town.

Molly Kotlen, Fehr & Peers Transportation Consultants. Email: mrkdance@aol.com; *Congestion Pricing: Transportation Pricing Schemes' Effect on Sprawl*

The purpose of this paper is to examine the interrelationship between congestion pricing and economic development with a specific focus on the connection of congestion pricing to location choice. Analysis of two existing location theories, the bid-rent model developed by William Alonso (1964) and the spatial competition model developed by Harold Hotelling (1929), leads to the theoretical constructs of a new location theory that combines the main ideas of the bid-rent model and the spatial competition model into one that might better demonstrate how transportation costs, and more specifically congestion pricing, would affect urban form in a polycentric setting. Congestion pricing's impact on the urban form can be seen through its relationship to land use, travel behavior, mode choice, mobility and accessibility, equity issues, and revenue distribution and policy; a literature review, based on these factors, was used to identify situations in which congestion pricing schemes can have a sprawling effect during development or can spur growth back into urbanized areas, which ties back into the discussion of location choice. The paper concludes with three case studies of congestion pricing schemes.

Boian Koulov, St Andrew's Episcopal School. Email: bkoulov@yahoo.com; *The New Eastern Border of the EU: Barrier and Bridge*

The paper explores the role of the new eastern border of the European Union, created by the accession of Bulgaria and Romania on Jan. 1 2007. It attempts to identify the political, economic, and environmental stakeholders in the Black Sea region and examine how they conceptualize its geographic boundaries. Field studies and interviews, taken over a period of more than five years, will illuminate the rapidly changing landscape of opportunities and limitations, perceived at the global, regional, and local scale.

Keywords: European Union, Black Sea, geopolitics, borders

Jean P. Kowal, University of Wisconsin - Whitewater. Email: kowal@uwv.edu; *Prospects for a successful prairie reconstruction*

In Lake County Illinois an ongoing study examines prairie restorations and reconstructions for signs of short term success in fulfilling their stated design goals and for their prospects for long-term success at establishing sustainable prairie ecosystems. In 1996 a small public park, Arbortheater, opened at the margins of a new business park in the suburban community of Vernon Hills, in Lake County. A part of the park was dedicated as a prairie reconstruction designed to educate the public on the natural history of the region as well as to contribute to the vision of the park as an arboretum. Initial landscaping and planting quickly resulted in a colorful display of native species which were broadly identified by appropriate signage for public education. The changing of management within the overseeing governmental unit resulted in a decline in attention to and understanding of the restoration process. By 2000 the prairie reconstruction area was giving way to weedy species along its periphery, a dirt path through the middle of the restoration had been allowed to grow over with weeds which began to spread into the heart of the prairie and the educational signs had been removed. Management had allowed and encouraged the planting of many oak trees in the center of the incipient prairie by various civic organizations and individuals as part of Arbor Day festivities. The future of this landscape as a successful prairie reconstruction is in serious doubt.

Keywords: prairie, Illinois, prairie restoration

Ranae Kowalczyk, B.A., MSc Candidate, Simon Fraser University, Department of Geography. Email: ranae@sfu.ca; Nick Hedley, M.A., Ph.D., Simon Fraser University, Department of Geography. Email: hedley@sfu.ca; John Clague, A.B., M.A., Ph.D., Simon Fraser University, Department of Earth Sciences. Email: jclague@sfu.ca; Multimodal Geospatial Interfaces for Avalanche Hazard Education

This project explores the potential for using highly interactive geovisualization technologies such as 3D web-based and augmented reality environments in avalanche hazard education. This project seeks to improve computer-based avalanche education tools by exploring how different combinations of geovisualization, interface technologies, education design principles, and interaction design affect user comprehension and risk perception. Avalanche education materials have traditionally relied on static 2D diagrams and images. New web-based tools continue to use them; however such representations may be limited in their ability to convey abstract and spatially dynamic phenomena and processes. It is possible that traditional use of 2D representations in avalanche education may impede understanding of three-dimensional route-finding concepts. This research uses, as its case study, a 2D online route finding exercise from the Canadian Avalanche Association (CAA). This project explores how increased manipulation and different representations affect user comprehension between the current CAA 2D exercises and new alternative 2D, 3D desktop, and 3D augmented reality exercises. In the current 2D exercise users plot a route on a static 2D photograph. The new 2D exercise uses Flash programming that allows users to zoom in and out of the image. The new 3D exercise uses QTVR object models permitting users to explore by zooming in and out and rotating the terrain. The augmented reality prototype permits physical manipulation using their hands. Differences in conceptual understanding and spatial orientation among users are evaluated online using repeated-measure tests.

Thomas Krafft, University of Cologne. Email: t.krafft@uni-koeln.de; German Health Care Reforms: Who Is Left Behind?

The restructuring of the German health care system as a consequence of the manifold and still ongoing health policy reforms has led to spatial inequalities in the access to health care. The accelerating trend of privatizing and merging community hospitals and other health care facilities is expected to result in further spatial inequalities. At the same time unfavorable demographic and economic developments especially in some of the Eastern German states have resulted in a shortage of general practitioners and other health care professionals in some regions. Based on comprehensive data from the statutory public health insurances and other sources the paper will present the recent trends in access to primary and hospital health care in Germany and discuss some of the consequences for future health care reforms also including a European perspective.

Keywords: health care, health care reform, inequalities

Shaul Krakover, Professor, Ben-Gurion University of the Negev. Email: shaul@bgu.ac.il; Eyal Adler, Mr., Ben Gurion University of the Negev. Email: adlerey@bgu.ac.il; From Unicentric to Polycentric City Region and Beyond: The Case of Tel Aviv, Israel

Urban studies published during the 1980s and 1990s ventured to proving the transformation of the unicentric city structure into a polycentric one. The latter decade has seen studies reporting a move to a dispersed city structure, wherein a more homogeneous dispersion of population and economic activities are observed. During the 1970s Tel Aviv metropolitan area was observed as a city region portraying decline in its unicentric structure. This study examines polycentricism in the city region of Tel Aviv both in terms of population and employment concentrations from 1972 to 2000. The results indicate that Tel Aviv metropolitan area reached a peak in its polycentric structure around 1983. During the last two decades, however, the dominance of the metropolitan employment centers has declined. A trend toward the development of a dispersed metropolis is evident. The trend towards deconcentration of population is faster than the equivalent trend found to exist for employment.

Keywords: urban form, unicentric, polycentric, dispersed city, Tel Aviv, Israel

Ellen Percy Kraly, Colgate University. Email: ekraly@mail.colgate.edu; Geographies of Vulnerability and Resilience: The Daily Geographies of the Child Artists of the Carrolup Native Settlement, Western Australia

The goal of this project is to reveal the geographic and environmental influences on the child artists of the Carrolup Native Settlement located in the southwest region of Western Australia. Policies of child removal were implemented in many regions of Australia well into the first half of the 20th century resulting in the "Stolen Generations" of Aboriginal peoples. The Carrolup Native Settlement was one of two government institutions in Western Australia to which part-Aboriginal children were removed from their families. In this particular place during the 1940s, however, a curriculum of art and drawing was imple-

mented. The artistic talents of the boys gained regional, national and international recognition through exhibits and also patronage. Land and landscape were prominent themes of the drawings of the Carrolup child artists as were external influences on Noongar culture such as dispossession from the land, child removal, and institutionalization. Using written records for the school and the legacy of art provided by the children themselves, the following questions will be addressed: (a) What were the daily geographies of the children resident on the settlement and how was space and environment structured for them? (b) What were the relationships between the spatial dynamics of the daily and weekly routines of the school and settlement and connections with land, landscape and environment among the children? (c) How did the geography of the settlement and school shape the artistic expression of the child artists?

Keywords: population vulnerability, indigenous populations, daily geographies

Olivier Thomas Kramsch, Dr., Radboud Universiteit. Email: O.Kramsch@fm.ru.nl; Thirthing Europe's Borderlands

European borders are much more than dichotomous spaces of confrontation between a putative Us and Them. A critical Third inhabits these borderlands, recalling complex geometries of imperial power past and present. Drawing on Ed Soja's richly evocative spatial imagination, and training attention on the interplay between Europe's inner and outer borderlands, this intervention argues that "Il y a toujours l'Autre" at the crossroads of contemporary European borderspace.

Keywords: Europe, borders, critical thirding

Kevin Krasnow, University of Colorado, Boulder. Email: kevin.krasnow@colorado.edu; Fuel Mapping and Determination of SPLATS in Lefthand Canyon Watershed, Colorado

Due to almost a century of fire suppression, the social and environmental costs of wildfire have increased dramatically over the last decade including government expenditures for fire response and mitigation, property loss to individuals, and loss of natural resources and human lives. In recent years, forest managers in Colorado have increased the acres treated for wildfire mitigation and ecological restoration. Accurate mapping of fuel load and composition is critical for improving fire prevention and in determining where strategically placed area treatments (SPLATS) should be located on the landscape. This study maps fuel in Lefthand Canyon Watershed, Boulder County with robust field data and high resolution remotely sensed images. The resulting fuel maps were then used in the fire simulator FlamMap to determine the optimal areas for fuel treatments in the watershed. Data from 300 random stratified field plots were used to map both surface and canopy fuel loads. Classification and regression trees were utilized to create a continuous landscape of fuel characteristics required for fire behavior modeling. Catastrophic wildfire (similar to those observed in Colorado in 2001 and 2002) was then simulated in FlamMap to determine the location and extent of the most efficient fuel treatments using the Treatment Optimization Module (TOM).

Keywords: fuel mapping, fire mitigation, fire modeling, SPLATS, fire ecology, GIS

Jeffrey Krecic, University of Kansas. Email: jeffkrecic@yahoo.com; Competition for Water Resources as a Factor in Pinion Pine Mortality due to Ips Beetle Infestation

Ips beetles are a species of bark beetles that infest pine and spruce trees. This research focuses on Ips confusus a species that predominately attacks piñon pines. Ips beetles preferably attack trees which have been weakened, by such factors as wounding, root disease, drought or other stresses. Due to forest fire control, reduced grazing, and restrictions on chaining, the piñon-juniper woodlands of southern Colorado are much denser than historical records indicate, increasing competition for water resources. This research was done in the Garden Park valley of Colorado, approximately five miles north of Canon City. The subject population was visually assessed and infected trees were compared to healthy trees in close proximity. The study identifies and investigates tree density, tree maturity, soil type, aspect and slope as factors affecting tree stress due to competition for moisture.

Debra Kreitzer, Western Kentucky University. Email: debbie.kreitzer@wku.edu; William P Blackburn, Western Kentucky University. Email: will.blackburn@wku.edu; Internationalizing Higher Education in Kentucky: Western Kentucky University's Efforts to Promote Study Abroad Programs

Some of the many trends that are running through the higher education community include an increased focus on student engagement and internationalization. Study abroad programs bring together both of these educational goals. Therefore several universities are allocating more resources to encouraging their

students to participate in a study abroad program. Western Kentucky University (WKU) has introduced new policies that give students tuition breaks and scholarships for study abroad. This study seeks to find out: 1) if the new policies help the university to meet internationalization and engagement goals; 2) if the new policy has increased both faculty and student participation in study abroad programs; and 3) how the new policies compare to other Kentucky universities.

Keywords: internationalization, study abroad, geographic education

Gary W Krizanich, United States Geological Survey. Email: gkrizanich@usgs.gov; David J Wronkiewicz, Ph.D., University of Missouri-Rolla. Email: wronk@umr.edu; Jeffrey D Spooner, Ph.D., U.S. Geological Survey. Email: jsponer@usgs.gov; Conor M Watkins, University of Missouri-Rolla. Email: cwatkin@umr.edu; Catastrophism Revisited in Missouri: Mapping Exposed Flood Features in the Taum Sauk Reservoir Outwash Zone

In the early morning hours of December 14, 2005, a portion of the northwest wall of the Upper Taum Sauk Reservoir failed, releasing approximately 1.5 billion gallons of water down the western slope of Proffit Mountain (Reynolds County, Missouri). The resulting flood waters had devastating effects on down valley systems. A 2.6 km (1.6 mile) long side canyon draining the western slope of Proffit Mountain was eroded locally of soil, colluvium, alluvium, and bedrock following the breach of the upper reservoir. Initial assessment of these post-failure erosional and depositional features was conducted by a team of scientists from the U.S. Geological Survey and the University of Missouri-Rolla. Field data was collected by traversing the channel and making detailed field notes and sketches using topographic maps and aerial photographs. Waypoints were collected along facies contacts using a handheld Global Positioning System unit. Post-field analysis used waypoint data combined with light detection and ranging (LiDAR) elevation data, and high resolution (15 cm) digital aerial images to compile a draft geologic map. Preliminary results of the investigation suggest that highly variable flow regimes have affected different segments of the valley in different ways. New bedrock exposures include Precambrian felsic porphyries, granitic sequences, a highly weathered mafic unit, a paleoweathered boulder field, and Cambrian-aged basal dolomite and sandstone sediments in unconformable contact with the Precambrian rocks. Other portions of the valley were partially filled with sediment debris derived from the erosion of the previously mentioned units plus debris from the failed dam structure.

Barry Joel Kronenfeld, Ph.D., George Mason University. Email: bkronenf@gmu.edu; Raster-to-TIN conversion for soft classified maps.

This paper examines the feasibility of using triangulated irregular networks (TINs) to model classification uncertainty in soft-classified maps of natural features such as soils, climate and ecoregions. Soft classification has traditional been implemented using raster grids, by assigning membership values to every pixel to indicate affinity to a set of ecological classes. The classes can represent anything, but the technique is often applied to natural regions due to the difficulty of establishing precise boundaries between regions. The primary weakness of the raster data model is extremely large storage requirements due to invariant resolution. This problem is amplified in soft-classified maps, because multiple values must be associated with each pixel. TINs have long been used as an alternative to raster grids to represent elevation and other univariate surfaces, and have been shown to drastically reduce storage requirements especially in mixed homogeneous/heterogeneous landscapes. Here they are extended to depict a constrained multivariate surface that depicts classification uncertainty in ecological regions. To evaluate the efficacy of soft-classified TINs, several soft-classified raster grids of ecological regions are produced from climate and vegetation data for portions of the United States. These grids are selected to span a range of characteristics in terms of spatial homogeneity and heterogeneity. Raster-to-TIN conversion is then performed using a thresholding algorithm based on Euclidean, Manhattan, and other distance metrics with a range of error thresholds. The results are compared in terms of the algorithm's performance time, size of the resulting TIN, and visual quality.

Keywords: uncertainty, TINs, soft classification, fuzzy classification

Sergei Kropotov, Ural CASE. Email: sergei.kropotov@usu.ru; Urban Frontiers and Accumulation of Capital: The Case of Ekaterinburg

My presentation attempts to analyze the particular case of urban governance, in which the escalating conflict between the city's business elites and the citizenry is being resolved by the municipal administration through a quite unorthodox gesture: the investment in a museum complex and accumulation of the city's symbolic capital. Like many other industrial cities, Ekaterinburg is trying today to find its place in the new post-industrial world through active re-codification of its public image. Today's strategies for restructuring the city's imaginary space develop around two major themes. One theme is the city's historic past, specifically the life and death of the last Russian tsar Nicholas

Romanov and his family, all of whom were assassinated in Ekaterinburg in 1918. The second strategy lies in turning the city's downtown into a space for leisure and consumer activities. However, the expansion of merchant and entertainment sectors is not always welcomed by the citizens. In this situation of conflicting interests between the local trade capital and the public, the city's government undertakes a highly controversial gesture: it invests in the reconstruction of the city's museum complex. Among historical myths being enlisted in today's debates the most popular is the myth about the city as a "civilization frontier," which is based on the fact that the city is indeed located on the geographical border (Ural Mountains) between Europe and Asia. The "internal frontier" drawn on the imaginary urban space acquires new economic and cultural dimensions, which needs to be publicly addressed.

Keywords: internal frontier, symbolic capital, imaginary space

Fred W. Krueger, Prof Dr, University of Erlangen-Nuremberg, Germany. Email: fkrueger@geographie.uni-erlangen.de; Linking Poverty, Environmental Stress and Conservation - The Need for New Approaches?

Environmental stress is often caused by social stress. But can conservation measures serve to alleviate social stress, and thereby reduce pressures on social and natural environments? Poor, or vulnerable, people with only limited capabilities to mobilize sufficient assets in order to secure their livelihoods, are often forced to exploit natural environments beyond all levels of sustainability. Inapt conservation schemes may increase, rather than mitigate, social vulnerability and thus render conservation concepts ineffective or even useless in the long run. Models and theoretical actor-oriented approaches such as the Political Ecology concept, vulnerability, livelihoods or resilience frameworks, or conceptions of hazards and risks, describe critical linkages between poverty/vulnerability, degradation, and conservation, but it might be argued that their explanation values are not sufficient to identify adequate entry points for intervention. Do we need new approaches? Rather than providing final answers, this paper is designed as an icebreaker to stimulate discussion on "which (appropriate) ways ahead?"

Keywords: vulnerability, development geography, livelihoods, risk, environment

Stephen Krug, CSUN. Email: slk10130@csun.edu; Using GIS to Map El Nino Southern Oscillation (ENSO) Anomalies along the West Coast

The western coast of North America, as the area of the continent that is first to receive the weather systems from the Pacific Ocean, experiences wild anomalies as a result of the El Nino Southern Oscillation, or ENSO. These anomalies vary mostly by latitude, but elevation, shoreline orientation, and topography play major factors in the intensity and duration of extreme weather associated with this phenomenon. An attempt is made using GIS to locate and map these anomalies and the climatic variables which signal them.

Keywords: El Nino, ENSO, La Nina, Climate, GIS, climatology

Shiloh R. Krupar, University of California, Berkeley. Email: shiloh@berkeley.edu; The Specter of Nuclear: wasting labor, militarizing ecology, litigating the future

For over 40 years, the Department of Energy's Rocky Flats facility near Denver, Colorado produced the plutonium 'trigger' of nearly every nuclear weapon in the US's arsenal and amassed an incomprehensible amount of waste. Purportedly, the site is now cleaned up and will open to the public as a wildlife refuge. Once distinguished for hosting the 'world's most contaminated building' and for instigating the first FBI raid on a federal agency in US history (for environmental violations), Rocky Flats' former protected area superficially appears to be a giant heap of dirt overrun with tumbleweed and prairie dogs. Wiped clean of all former buildings and signs of industrial human labor, the site now serves as a DOE model of environmental remediation applicable to other decommissioned nuclear facilities across the US's former nationally-distributed bomb factory. This paper examines how Rocky Flats' cleanup has dis-membered former workers?their labor power, bodies, environmental knowledge?by violently staging an 'alien still life.' The paper tracks three spectral geographies that haunt the nature spectacle, each guided by a current/on-going bill or court case involving the health and economic security of Rocky Flats neighbors and former Rocky Flats workers. These cases invoke important dialectic conceptualizations of waste/value, militarism/health and body/environment that emerge in environmental justice struggles surrounding the nuclear weapons complex. The paper follows these spectral geographies in/through the landscape, bodies and litigation in the hope that such conjurings might materially-conceptually haunt the dystopic futures of the 'second nuclear age' and Bush's 'Clean Nuclear.'

Keywords: waste, militarism, health, labor, clean nuclear

Bodo Kubartz, University of Oklahoma. Email: kubartz@ou.edu;
Scenting the city. Producing and consuming fragrances in New York and Paris

Fragrances delineate amazing economic geographies. Well-known examples and geographic sites on the productive side are 'laboratories' where new scents are invented by creative perfumers. However, far more complex than that, the development of fragrances is a business of many actors collaborating in concert. In this buyer-driven industry, consumers are seen as critical mirrors for the success or failure of a new perfume. Beyond the microscopic sites, urban centers such as New York and Paris are not only sites of production and/or consumption, but social laboratories of inspiration and representation. They are arenas for the production and consumption of style. Subsequently, different styles spread and reverberate in other areas. The styles are, amongst others, consumed through fragrances. This paper presents outcomes of research on practices of knowing and geographies of knowledge in the international fragrance industry. It will focus on the connections between the productive and the consumptive side and how consumers are conceptualized, recognized, and addressed by the producers. This conceptualization and understanding is a part of the producer's knowledge base and a vehicle for learning episodes. The paper will add value to the discourses on knowledge, creativity, and consumption in urban/economic geography.

Keywords: consumption, urban economies, fragrance industry, perfume

Resolving Conflict on the Colorado River: Adaptive Management as an Inroad to Legitimacy, Fairness and Wisdom

The Colorado River is one of the more developed and regulated rivers in the world. As it winds its way through the mountains and canyonlands of western United States, the river is used in numerous ways to satisfy the needs of a growing human population. Glen Canyon is one of a series of major dams that impounds the river to deliver water to satisfy an interstate compact, to produce hydroelectric energy, and to provide recreational opportunities. Glen Canyon Dam lies within the Glen Canyon National Recreation Area and just above Grand Canyon National Park. Geography and history thus combine to set up conflict over the way the dam is operated and, for some, the dam's very existence. A 1996 Record of Decision on dam operation identified the use of adaptive management as a means of bringing together stakeholders and government agencies to advise the Secretary of the Interior on means to reduce the impact of the dam on downstream resources. The adaptive management program provides a federal advisory committee (legitimacy), a wide diversity of stakeholders having different values and interests (fairness), and an independent science institution to conduct research and monitoring (wisdom). These program elements provide the three factors considered by many practitioners as essential for successful collaboration.

Location Strategies for the Initial Hydrogen Refueling Infrastructure in Florida and Orlando

We investigated refueling infrastructure strategies for the early stages of the transition to hydrogen in Florida. Given the high cost of the initial refueling stations, locating a limited number of stations as efficiently as possible will be a key to early success of the industry. The foundation of the model is a GIS with the road network, traffic analysis zones, and the least-travel-time paths between zones. Then, given a matrix of trip volumes and the driving range of hydrogen vehicles, the model uses operations-research techniques to solve for optimal locations and quantify the tradeoff between the number of stations and how much potential demand can be served. The GIS and operations research models are integrated in a spatial decision support system that decision-makers can use to develop and check data, enter assumptions, analyze different scenarios, evaluate tradeoffs, and map results. We then used the model to explore strategies for the Florida Hydrogen Initiative. We analyzed urban and statewide networks of hydrogen stations and an optimal system of stations for serving a hypothetical hydrogen rental car fleet based at the Orlando International Airport.

Remote Sensing-based Study of Land-Cover Changes Related to Mining and its Impacts on Marine Fauna: A Case Study in Goa, India

Mining is an important part of the economies of many developing countries. One of the costs associated with mining is the potential for environmental degradation. In India, several provinces are home to major open-pit mining operations. In Goa, the two main estuaries, Mandovi and Zuari, have experienced water quality degradation from increases in suspended sediment load over the past 30 years, which has affected the micro-fauna and overall health of the estuary. Time-series satellite data can be used to assess change in mining activities over time and their impacts on waterways. In this study, a temporal analysis using change detection methods was performed from multiple Landsat and Indian Remote Sensing satellite images acquired over Goa between 1973 and 2000. Field data collection drove supervised land-cover classifications, which were used to determine changes in forested land area and to assess other environmental impacts of mining processes. In addition, object-based classifications were developed and compared to the supervised classifications. Results show that there was an overall shift in mining activities from south Goa to north Goa. This shift is associated with changes in the amount of suspended sediment in the estuaries during the study period. The object-based classification was more accurate than the traditional pixel-based supervised classification. Our study demonstrates the usefulness of remote sensing to monitor the impacts of mining and other practices that alter the environment in developing countries.

Multiculturalism and minority group cohesion: pluralisation of identity narratives and their strategic use in the Jewish community of Leeds, UK

In the last few years, multicultural citizenship, once hailed as a solution to national cohesion has faced increasing political and academic accusations of inciting segregation and group divisions. However, multiculturalism has always had multiple meanings, was associated with diverse socio-political arrangements and had different impact on individuals and groups in society. Therefore, an evaluation of past experience calls for thorough academic research into how multicultural practices have impacted on different segments of the population. Using a case study of the Jewish community in Leeds in the UK, this paper argues that national policies of multiculturalism were crucial in validating multiple 'readings' of national and minority identity. They enabled pluralisation of minority identity prompting debates about its private-public expressions. The research draws on a multi-methods approach to reveal how multicultural citizenship has challenged the historically successful model of 'private Jewishness and public Englishness', legitimating alternative visions of Jewish identity and supporting calls for the democratisation of community institutions. The study demonstrates selective and contextualised usages of the multicultural discourse on citizenship in defining 'self', 'us' and 'others', exploring the role of social and geographical positioning within the minority group and the mainstream population in the choice of appropriate narratives.

Keywords: multiculturalism, citizenship, minority identity, integration, assimilation

'Pretty girls' in 'hip neighborhoods': the rehierarchization of sex work in neoliberal cities

While it is widely understood that neoliberal urban policies often strive to reduce the visibility of 'deviant' behavior such as street sex work, little attention has been devoted to the selective tolerance of prostitution as soft location factor. This paper captures the parallelism of both processes, exploring how the treatment of sex work differs according to the form of prostitution and the neighborhood in which it occurs. It presents results from case studies on the re-regulation of street sex work since German unification in two contrasting sites of a major city: a tourist night life center and a marginalized neighborhood. Drawing on semi-structured interviews with key policy actors, residents and sex workers it shows that the spatially selective approaches enforce existing hierarchies in sex work. The framing of higher class street prostitution as urban chic and of lower class street prostitution as barrier to 'development' within the logic of entrepreneurial urban politics is based on the appearance of the workers and not their working conditions. It results in an unintended preference of pimp organized prostitution compared to independent sex work.

Keywords: sex work, entrepreneurial city, soft location factor

Olaf Kuhlke, University Of Minnesota - Duluth. Email: okuhlke@d.umn.edu; *Mapping Narrative Violence: Fascist Aesthetics and White Skin in the (Re)Construction of German National Identity*

In this paper, I explore several aspects of the discursive construction of German national identity, as it has been literally and figuratively put into public place since the reunification in 1990. In many public events and youth culture festivals throughout the 1990s and into the new millennium, bodily metaphors, as textual tropes, have played an important role as genealogical modes of thought in the continuous reinscription of national myths. Here, I demonstrate with the help of several case studies (such as public parades, rock concerts, and modern German film) that bodily metaphors are still used in public discourse to create a distinct form of narrative violence and aesthetics of whiteness that conceptualize the German nation body as a distinctly racialized entity seeking to maintain its line of descent. Ultimately I am arguing here that the socio-cultural construction of German national identity never experienced the "break of 1945" that Habermas identified as the key historical juncture in the formation of collective identity. Despite the establishment of parliamentary democracy after 1945 and the celebration of "constitutional patriotism", culturally and aesthetically the legacy of the Third Reich continues to largely inform German public representations of national unity.

Robert Kuhlken, Central Washington University. Email: kuhlkenr@cwu.edu; Ian Gray, Central Washington University. Email: grayi@cwu.edu; *The Last Straw: Residential Conversion of Irrigated Farmland in the Pacific Northwest*

The Kittitas Valley is a broad basin in the center of Washington state, where a federal reclamation district delivers water to more than 80,000 acres of irrigated farmland. After a century of experimentation, local growers now successfully market forage crops for export, primarily raising timothy hay (*Phleum pratense*), a European bunchgrass that is well-adapted to the valley's high-elevation, cool weather conditions. Overall yields respond favorably to irrigation, and the dry and often breezy summer weather provides optimum curing conditions. But a recent real estate boom caused by new arrivals looking for a place in the country indicates a significant transformation is underway. Irrigated acreage is currently being subdivided and parceled out as residential homesites, resulting in a fragmentation of the rural landscape, and an irretrievable loss of cropland and commercial pasture needed to sustain a local economy that has traditionally been based on agriculture. This poster looks at fifty years of change within a 36 square mile township, where data for 1954 and 2004 were obtained from the county assessor's office and entered into a GIS to create comparative maps of parcel configuration. Aerial photography from these same two years provides an indisputable record of land use change over the past half-century. Comparison of these data sets reveals a threefold increase in the number of parcels, a corresponding decrease in size of parcels, and a marked displacement from agricultural to residential land use. This study calls into question the effectiveness of current zoning regulations aimed at conserving agricultural lands.

Keywords: Land use planning, Subdivisions, Agricultural lands conservation, Pacific Northwest

Werner Kuhn, University of Muenster. Email: kuhn@uni-muenster.de; *Prime Space and Time*

Ontologists in geographic domains have not yet found a convincing answer to the question what primitives to adopt. In practice, many geo-ontologies use geometric primitives like points, lines, and regions, imposing an unsatisfactory representational bias. In theory, upper or top level ontologies like DOLCE and SUMO provide strong foundations, but only weak notions of location and of spatial relations. Do the so-called semantic primes that linguist Anna Wierzbicka has proposed provide a better starting point? The presentation will explore the suitability of the spatial and temporal primes proposed so far as ontological primitives.

Keywords: ontology, semantic primes for space, upper level ontologies, spatial primitives

Michael A. Kukral, Rose-Hulman Institute Of Technology. Email: Kukral@rose-hulman.edu; *The Player Piano in American Ethnic Culture 1912-1930*

The player piano was an extremely popular form of home entertainment in America during the 1910s and 1920s, the peak year of production being 1923 with over 170,000 instruments manufactured. These self-playing musical instruments coincided with a time period when first and second generation Americans from the early Ellis Island era were attaining home ownership and prosperity unknown in the 19th century. Automobiles, radios, phonographs, telephones, and player pianos were in reach of most American households and took off with suburbanization in the 1920s. The player piano was operated with paper music rolls and millions were produced of every conceivable musical form,

including ethnic or national songs. These piano rolls had lyrics printed on them for singing along and demand was high among Germans, Italians, Czechs, and Poles for lyrics to be in their native languages. From Arabic to Armenian, thousands of songs with lyrics were produced by dozens of companies on piano rolls. The quantity of titles in respective languages is an indicator of upward mobility among America's immigrant community at that time. Indeed, the player piano was the most expensive object found in most people's homes prior to the 1940s. In this paper I will discuss the player piano and its music in relation to ethnicity in America.

Dominik Kulakowski, University of Colorado. Email: dominik.kulakowski@colorado.edu; Christian Rixen, WSL Swiss Federal Institute of Snow and Avalanche Research (SLF). Email: ; Peter Bebi, WSL Swiss Federal Institute of Snow and Avalanche Research (SLF). Email: ; *The effects of anthropogenic suppression of avalanches on the subalpine vegetation of the Swiss Alps*

Avalanche disturbances are one of the most important processes in subalpine ecosystems. Although avalanche tracks occupy a relatively small area of the landscape, they exert an important influence on the biodiversity and dynamics of subalpine forests. Over the past decades the natural avalanche regime in the European Alps has been altered by snow-supporting structures and other measures intended to prevent the occurrence of avalanches. We studied the effects of avalanche suppression on biodiversity, forest structure, and landscape patterns in the Swiss Alps. The number of herbaceous species was higher in both active and inactive avalanche tracks compared with undisturbed subalpine forest. There was no difference in the number of species in active versus inactive tracks, but the vegetation composition differed. Inactive tracks were characterized by a narrower range of ecological niches and a shift towards species that are better competitors and those adapted to lower temperatures and lower nitrogen availability. In inactive tracks, tree diameter, tree height, annual tree-ring widths, correlation of ring widths between trees, and correlation of ring-width indices with growing-season temperature were all greater than in active tracks. Suppression of avalanches also changed landscape structure. Between 1950 and 2000 patch density, edge density, and Shannon's Diversity Index of patch types all decreased. Among the major effects of anthropogenic suppression of avalanches are changes in herbaceous composition, which are likely to eventually lead to a decrease in biodiversity as avalanche tracks develop into forests, and a reduction in the natural fragmentation and complexity of landscape patterns.

Ranjith Prasan Kulatilake, PhD Candidate, Faculty of Environmental Studies, York University, Canada. Email: ranjithk@yorku.ca; *'Motherland' vs. 'Homeland' - Territorializations of Space in the Neoliberal Sri Lanka*

How does the experience of globalization and modernity reframe nationalist ideologies in the production of space? How can the recent upsurge of ethno-nationalisms and the civil war in Sri Lanka be understood as a reaction to and as an accomplice of globalization, fuelled by the neoliberal economic policies introduced in 1977? This paper argues that nationalism is a social, cultural and historical phenomenon as well as a powerful means of imagining and capturing the environment as territorialized space. The projection of Sri Lanka as 'motherland' within a Sinhalese Buddhist ideology continues to alienate the non-Sinhalese, non-Buddhists, in a kind of fantasy of the mother-son relationship. The counter-ideology of the 'traditional Tamil homeland' in the North and the East of the country denotes separation from the majority ethnic group as well as marginalizing the minority Sinhalese and Muslims living in these regions. These nationalist ideologies very effectively cause communities to disintegrate both internally and between each other, allowing the bourgeoisie to re-group in a globalized world where, as Marx famously said, 'all that is solid melts into air'. Taking Sri Lanka as a case study this paper explores the unison between neoliberalism and identity politics that captures space in transforming the environment as a commodity for consumption.

Keywords: globalization, neoliberalism, ideology, identity politics, space

Christian A. Kull, Monash University. Email: christian.kull@arts.monash.edu; Haripriya Rangan, Monash University. Email: haripriya.rangan@arts.monash.edu.au; *Plant movements and ecological imperialism: the case of acacias*

Using cases from the *Acacia* genus of shrubs and trees, this paper investigates an alternative to Alfred Crosby's "ecological imperialism" thesis of the environmental history of plant movements. Crosby's narrative focused on the process of settler colonialism and the accompanying one-way onslaught of plants, animals, and organisms from Europe. The history of *acacia* transfers between Australia and other parts of the world, instead, highlight the diversity of plant flow networks - before, during, and after colonialism? and their multi-directionality. They show how the metaphor of imperialism, implying a narrative

of conquest, disruption, and domination, is inappropriate in capturing the diverse experiences surrounding the transfer of these plants and their ready incorporation into new regional economies and identities. The paper shows how different ideologies of the environment over the centuries have influenced the movements of plants and our views of this process.

Three hurricanes made landfall along southern Louisiana in 2005. Category 1 Cindy made landfall in July, followed by category 3 Katrina in late August and category 3 Rita in late September. These storms caused unprecedented change along Louisiana barrier islands, clearly indicating the susceptibility of the region to tropical cyclones. Maintaining the Louisiana barrier systems is critical to preserving existing salinity gradients of the regional estuaries and providing protection to interior wetlands and communities by diminishing storm surges. In an effort to document the hurricane-induced changes and processes of change, post-storm high-resolution bathymetric surveys of several tidal inlets were compared to surveys acquired in June 2005 before the hurricanes made landfall. Within Little Pass Timbalier inlet widening of more than 1 km occurred with a redistribution of a sediment volume that was two orders of magnitude greater than the suggested annual longshore transport volume at this location. The magnitude and type of geomorphologic changes in barrier islands were additionally documented through a comparison of post-storm imagery with historical imagery. Image analyses indicates that between 1855 and 2005 the averaged rate of shoreline erosion along the Chandeleur Islands was 7 m/yr. Between 2004 and 2005 however, the average shoreline change was 200 m, within a range of 100 and 400 m. These results need to be carefully considered for management of this coastal zone, which is already subject to high rates of annual land loss that stem from limited sediment supply, land surface subsidence, and absolute sea level rise.

Frederik Kulpi, Free University of Berlin. Email: fkulpi@zedat.fu-berlin.de; A Summary of the Fourth Assessment Report of the Intergovernmental Panel on Climate Change - Climate Change 2007: The Physical Science Basis

The Intergovernmental Panel on Climate Change (IPCC) has marshaled international scientific talent to define a perspective on global warming that is as close to a global consensus among scientists as is possible. This paper delivers a summary of the fourth assessment report of the IPCC in which more than a dozen modeling centers and scientists from more than 130 countries conducted long-term simulations for the twentieth century's climate and climate change scenarios in the twenty-first century. Their simulations are using output from a range of different scenarios, representing various assumptions about population increase, energy use and economic development up to 2100. The modeling centers applied an overhaul of the physical schema's to incorporate state of the art research results. The warming, however, is expected to continue. Over the last 15 years, it has been 0.2°C. The foreseeable future will be marked by rapid changes globally. One probable result in the continental climates is an increase from forests to grasslands to the present deserts extend poleward from tropical forests to extreme deserts. In the mid-latitudes, gradients toward aridity at any given latitude are, in general, across longitudes toward the middle of the continent. In the lower latitudes an increase in drought frequency and desertification is very likely.

Mika Kumagai, Osaka City University. Email: kumaga02@lit.osaka-cu.ac.jp; Spatial Changes in Residential Segregation, 1995-2000: A Comparative Analysis of the Metropolitan Areas of Tokyo and Osaka, Japan

This study aims to examine the structure of residential segregation in the metropolitan areas of Tokyo and Osaka. The last decade has seen a growing interest in the relationships between global economic restructuring and the social and spatial division of labor. In particular, attention has been focused on the global cities that play a key role in the control and coordination of international capitalism. Most studies on U.S. metropolitan areas have shown how globalization is affecting segregation by class within racial/ethnic groups. In Japan, especially after the period known as the economic bubble (from the late 1980s to the beginning of 1990s), global affairs have exerted direct and tangible effect on

cities via socioeconomic, cultural, and/or political means. Consequently, residential segregation has become a complex and multidimensional phenomenon. In order to examine changes from 1995 to 2000, I employed principal components analysis and k-means cluster analysis as techniques for the empirical classification of neighborhoods, using 75 variables related to occupation, age, marital relation, housing quality, labour force, and other categories collected by census data. These modes of analysis have the distinct advantage of treating proportional change as continuous. Data reduction, and thus descriptive power, is achieved by an empirical classification derived from the patterns found in the dynamics of change. An example is provided using small-area census level from 1995 to 2000. I investigate whether Sassen's social polarization thesis, in both its social and spatial aspects, also manifests in Japanese cities.

Keywords: residential segregation, geodemographics, metropolitan area, Japan

Naresh Kumar, PhD, University of Iowa. Email: naresh-kumar@uiowa.edu; Adina K Batnitzky, PhD, University of Oxford. Email: adina.batnitzky@ouce.ox.ac.uk; Urban Sprawl, Land-Use Type and Obesity/Overweight in Delhi, India

While developing countries continue to cope with the problem of malnutrition, overweight/obesity is emerging as a new burden of disease, particularly in large urban areas. Few studies have addressed the increasing influence of land-use/cover and urban sprawl on overweight/obesity. This article examines the effects of certain aspects of land-use type and urban sprawl on body mass index (BMI) in the Delhi Metropolitan area, which has reported the highest prevalence of overweight/obesity among adult women in the country in recent years. A survey was administered between January and April 2004 to collect data on BMI, SES, and demographic indicators. Data on land-use were estimated using remote sensing satellite imagery, and distance from the city center was used as a proxy of urban sprawl. The analysis of the data indicates that the average BMI is slightly over the normal range, and per capita household expenditure, male specific access land use type and urban sprawl all show a statistically significant relationship with BMI. While a positive association of BMI with SES is contrary to that observed in developed countries, its positive relationship with access to green spaces and urban sprawl is similar to what is being reported in developed countries. This finding suggests that the process of urbanization and scarcity of open spaces coupled with longer commuting times are likely to contribute to the rise in overweight/obesity in the rapidly growing megacities in developing countries unless public health measures are adopted to check this growing epidemic.

Naresh Kumar, University of Iowa. Email: n_kumar17@yahoo.com; Allen Chu, NASA. Email: achu@climate.gsfc.nasa.gov; Andrew D Foster, Prof., Brown University. Email: Andrew_Foster@Brown.edu; Air Quality Estimate in Delhi from Satellite Remote Sensing: Retrieval and Validation

Advances in atmospheric remote sensing offer a unique opportunity to compute indirect estimate of air quality. The present research examines the relationship between aerosol optical depth (AOD) using MODIS data at 5 and 10km spatial resolutions and the mass concentration of fine particulate matter (PM) of the size less than 2.5µm and 10µm in aerodynamic diameter (PM2.5 and PM10, respectively) recorded on the surface during October-November 2003 in Delhi, India, where a series of environmental laws has been instituted in recent years. PM2.5 and PM10 data were collected from July-December 2003 using passive samplers (Met One Inc.) at 113 sites in Delhi and its surroundings. Using radiative transfer model, AOD at 5km spatial resolution were computed from MODIS data and 10km AOD were acquired from NASA. AOD values were then collocated with PM2.5 and PM10 data within ± 150 minute window of the overpass time of EOS Terra at an interval of 15 minutes. Our analysis indicates a strong positive relationship between AOD and PM2.5 after accounting for the effect of relative humidity and sea level pressure; one percent change in AOD explains 0.52±0.202 and 0.39±0.15 percent change in PM2.5 within 45 and 150 minutes intervals of overpass time of EOS Terra, respectively. This relationship will be used to compute air pollution surfaces for back years, which will pave the way to study the time-space dynamics of air pollution in Delhi triggered in response to recent air quality regulations, and its effect on respiratory health.

Keywords: AOD, Air Quality, Air Pollution, Delhi

Sanjeev Kumar, Department of Geography, University of Georgia, Athens. Email: skumar@uga.edu; Constructing Transnationalism: A case of the Indian Immigrants in the United States

The concept of transnationalism suggests that today's immigrants simultaneously occupy the social/ political/ cultural or the economic space of both their host and the source nations, thereby creating a web of linkages through which an individual produces and sustain his/her dual livelihood. While there has been considerable theoretical research in conceptualizing and defining

transnationalism, there is a growing need to document practices and activities associated with the everyday lives of immigrants that provides empirical evidence of transnationalism. We also need to examine the ways in which immigrants “become” transnationals in terms of negotiating their identities as inhabitants of more than one state, and how this process has changed over time. The present paper examines the case of the Asian Indian immigrants to the US. It uses oral narratives to explore the lives of the five Indians who immigrated to Athens, Georgia at different points in time, and demonstrates how the practice of transnationalism has changed over time. It also traces the various factors which have facilitated/inhibited transnational identity formation in different generations

Keywords: Transnationalism, Immigrants, Indian, narratives

Mark Kumler, University of Redlands. Email: mark_kumler@redlands.edu; Nathan McCall, University of Redlands. Email: ; A New World Map Projection onto an Irregular Polyhedron

Using polyhedral approximations of the globe for the purpose of creating map projections is not a new concept. The implementation of regular and semi-regular polyhedra has been a popular method for reducing distortion. However, regular and semi-regular polyhedra provide limited control over the occurrences of the interruptions in the “unfolded”, flat maps that are produced from this process. This paper presents a method for using irregular polyhedra to gain more control over the placement of the interruptions while maintaining the reduced distortion quality found in polyhedra projections. The method presented here uses irregular polyhedra based on gnomonically projected Voronoi partitions of the sphere.

Daniel M Kunches, Hunter College. Email: dkunches@hunter.cuny.edu; A Slippery Slope up the Mountain: The Role of Neoliberalism in a Highway Bypass Project around Sonora, California

In the early 1980's a highway bypass was approved and constructed around the foothill town of Sonora, California, expediting the commute between the San Joaquin Valley and the Sierra Nevada Mountain Range. This expository study examines the spatio-temporal context in which the bypass came to fruition. Originally proposed by a lumber magnate in the early 1960's, the bypass project remained controversial for twenty years amongst the townspeople. Concerns addressed adverse effects they anticipated on the landscape, and on centrally located businesses which had traffic funneled to them by the existing Highway 120 through Sonora. Following construction of the bypass, development uphill from Sonora has exploded, which can be seen by a simple visit. What is examined in this study is the emerging neoliberal condition of the early 1980's that fostered approval of the bypass after twenty years of stagnation, subsequently realizing many of the concerns people had. The method being used is to look at the intersection of the contextual framework of landscape morphology in the Sierra Nevada, with the theoretical framework of neoliberalism as it was proliferating in the early 1980's. The necessity of neoliberalism to compress space and time in order for capital to flow more fluidly, along with its disregard for environmental time, created a soft spot in opposition to the bypass. This soft spot, buttressed by the inherent natural aesthetics of the High Sierra, contributed to the compression space and time through a highway bypass.

Keywords: mountain geography, neoliberalism, Sierra Nevada

Chijeng Kuo, Tunghai University, Taiwan. Email: Kuo.chijeng@fulbrightweb.org; Emergence, Diminishing and Reemergence-A Case Study of Spatial Representation of Shanghai's Middle Class, 1920s-1990s

From feudalism, capitalism, socialism and then to post-socialism, Shanghai has experienced a distinctive path in urban development. In terms of social structure, the distinctive path also manifests itself by the emergence, diminishing and re-emergence of the urban middle class. The article proposed to focus on the correspondence between the production/ transformation of housing and the changing social relationship and to visualize the dialectical relations within them. The article propose to transcend the usual analysis of urban built forms in two ways: by showing that specific choices matter less than some esthetic outlook in general, and by showing, moreover, that the acquisition of an esthetic outlook not only manifest specific class prestige but help to keep the lower orders in line. Therefore, varieties in housing form and the diversified usages of them were presumed to be the aesthetical representation for social distinction. A specific district within Shanghai's French Concession which could feature the emerging middle class with so-called the 'middle landscapes' of the 1920-30s would be chose for case study first. Due to spatial practice of Building By-laws, zoning regulations, and the revitalization/renovation permissions are appealed to a powerful state invariably, in this article housing and the aura of specific district were regarded to be the cultural forms of space which were the outcomes not only of social distinction and cultural competition, but also of state's intervention. Through analyzing different spatial forms of different governance, the transfor-

mation of housing assumed to be the representations of changing social relationship within state's capacity.

Keywords: post-socialism, social distinction, middle class, gentrification, state intervention

Hilda E Kurtz, University of Georgia. Email: hkurtz@uga.edu; Critical race theory in action? Looking ahead at environmental justice research

This paper explores the contribution that critical race theory (CRT) can make to environmental justice research in geography. Critical race theorists challenge racial hierarchies by exposing the social constructedness of race in law and other social arenas. CRT analyses of differential racialization and the intersection of overlapping identities and allegiances offer environmental justice researchers powerful means to conceptualize superficially distinct forms of environmental injustice. At the same time, geographers can contribute to CRT with close attention to the role of a socio-spatial dialectic in the social construction of race.

Keywords: environmental justice, critical race theory

Matthew Kurtz, Open University. Email: m.a.kurtz@open.ac.uk; Subjects of a Visual Economy: A home-economics teacher, her photos, and a friendship in the postwar Arctic

Deborah Poole and Christopher Pinney have introduced the phrase “visual economy” to histories of photography. Eschewing the concept of a visual culture, they suggest that analyses of “visual economies” can better help us understand the circuits and flows of visual materials which enroll people in dispersed relations of meaning, power, and inequality. This paper fleshes out this concept through a study of the unpublished journals and photos of Gladys Knight Harris. Upon her retirement from teaching home economics in California after World War II, Harris headed north as a newly trained photographer. In April 1949 on the northwest coast of Alaska, she began a five-month community documentation project, taking thousands of stunning photographs of the work of Inupiaq Eskimo women. While these images were never published, they challenge traditional visual practices through which select activities are brought into accounts of “the economy”: business receipts, ledgers, statistics, etc. By making the domestic work of women in the Arctic visible, Harris offered a feminist challenge to mainstream economic institutions. But her journals also trace a growing friendship with a young Inupiaq woman named Clara who, for several months, declined to be photographed. I suggest that Clara's reticence may mark a difficult postcolonial tension. That is, in making her work visible, Harris, the camera, and its film also made her subject to the terms of an American visual economy, enlisting Clara in an unequal - and potentially imperious ? process of colonial subject formation through such institutions and relationships between things and people.

Keywords: photography, economy, arctic, postcolonialism

Merje Kuus, University Of British Columbia. Email: kuus@geog.ubc.ca; Discreet militarism: intellectuals and war in Estonia

This paper investigates how militarization — the process by which militarism gains popular and elite acceptance — functions in the making of geopolitical subjects with particular interests and identities. It focuses on how intellectuals participate in this bundling up of militarism and subjecthood. I highlight the discreet, banal, and mundane intellectual practices that legitimize and glorify military force. I argue that most militarization happens in what is labeled as peacetime. It happens not simply in the defence ministries but, more importantly, in schools, cultural organizations, and various other institutions of the civil society. We thus need to be attentive to how military violence is legitimized outside the formal state arena. The empirical examples focus on Estonia. In that country, asserting sovereign geopolitical subjecthood has been is a policy priority throughout the post-Cold War era, and the promotion of military force has been central to this project. We thus have the seeming paradox that Defence Education was instituted as an elective in high schools in 2000, the same year that the National Security Concept declared Estonia to be under no foreign threat. I will argue that the militarization of political life is a part and parcel of Estonian intellectuals of statecraft learning the practices of geopolitical subjecthood. The process operates not only through a top-down execution of state power, but also through diffuse and disparate practices throughout the civil society.

Keywords: state, militarism, subjectivity

Anna-Kaisa Kuusisto-Arponen, PhD, University of Tampere, Department of Regional Studies, Finland. Email: anna-kaisa.kuusisto@uta.fi; *Fractions in the sense of place: the experiences of Karelian evacuees and war children in Finland*

In my post-doctoral research I focus on identity politics, and sense of place in the context created by the Second World War in Finland (1939-1945). I focus on two particular groups of war-time Finland: Karelian evacuees and “war children”. In result of the Continuation War, Finland had to cede areas to the Soviet Union. Therefore, more than 430 000 evacuees, most of which from Karelian district, were forced to leave from their home region and settle within the boundaries of the newly defined Finnish territory. In the course of the war more than 80 000 Finnish “war children” were sent to foster families in Sweden, Denmark and Norway. Empirical material for this research is gathered through 60 in-depth interviews. The data collection was conducted in 2005-2006. Currently these “war time children” are approximately 70 years of age. For several years they had to be silent on their experiences. Interest on studying war-time experiences has grown among several academic disciplines. Moreover these war-time children are nowadays more willing to recall and speak about their childhood experiences than decades ago. Particularly, I analyse and compare the mechanisms of place bound identification processes of Karelian evacuees and “war children”, and assess the importance of age in the formation of spatial identity. Studying spatial identity politics can offer new insights and tools to understand and reflect the behaviour of human communities in the times socio-political crises. This research also contributes to the “discursive map of Finnish identity politics.”

Keywords: Political geography, Second World War, sense of place, Karelian evacuees, war children, Finland

Elena Kuznetsova, . Email: jennifer.giglio@wilsoncenter.org; *Problems And Perspectives Of Urals Region Transport Infrastructure Development In The Conditions Of Expansion Of The Business Links*

In the situation of expansion of the business links the role of infrastructure, especially transport infrastructure, increases. For the Urals Region, which is situated in the middle of Russia, just on the board of Europe and Asia, this fact is a possible signal for development its transport infrastructure for to be ready for increasing volumes of goods flows and quality services. Of course, there are the real and attracting perspectives of this tendency: the increasing of turn-over of trading, the amount of working peaces, etc. There are some problems, which ought to be solved at the nearest time on the level of the Yekaterinburg city, the government of the region (Sverdlovsk oblast), the Urals Federal district. The administrative bodies of those territories ought to be strategic thinking ones for to forecast

Min-Jung Kwak, University of British Columbia. Email: mjkwak@shaw.ca; *Immigrant Entrepreneurship and the Role of NGOs in the Era of Neo-liberal Governance*

Since the 1980s, the arrival of neo-liberal capitalism and the contraction of the welfare state have had notable impacts on immigration policy and urban governance in Canada. Canada's intake for those with human capital and/or business skills and financial assets has increased. By the late 1990s, the annual ratio of economic class immigrants and their dependants has surpassed those coming under family or humanitarian programs. At the local level, the shift towards more entrepreneurial and innovative modes of governance has influenced the ways in which immigrant service organizations operate. Drawing upon a case study of SUCCESS, particularly its Business Development and Training Centre, in Vancouver, this paper examines how the immigrant service agency has become more innovative in assisting immigrant clients and engaging itself with new opportunities in the market economy. I argue that a one-dimensional critique of neo-liberal governance and its impacts on the NGO sector, and immigrants more generally, needs to be reconsidered.

Keywords: Immigrant Entrepreneurship, NGOs, Neo-liberalism

Youngsang Kwon, SUNY - Buffalo. Email: ykwon2@buffalo.edu; *Spatial distribution map of rare species in NY State using spatial interpolation*

Plants are indicators of the quality of the environment. Especially, rare plants, their populations are often important reserves of genetic diversity of the species as a whole and should be protected. Although there is usually a lack of complete information about the complex interactions within specific ecosystems to predict which plants are expected, it is purpose of this study that to develop methods of distribution map of rare species using spatial interpolation. Forest Inventory and Analysis (FIA) data in 1993 were collected. And importance values (IV) of each species on the given plots are calculated to select rare species. The IV is calculated as the average of % abundance (number of species divided by total number of trees) and % dominance (species basal area/ total basal area). In advance of developing methods of creating distribution map, it is important to

explore spatial pattern of sampling sites which should cover the entire forested area. In classical sample-based inventories, it is assumed that individual samples are randomly selected from the population. In deducing the results for the sampled population, the spatial location of the samples is often ignored. Spatial distribution of the rare species in New York State is then expected to be modeled using technique called Sequential Gaussian Conditional Simulation (SGCS). SGCS is used to characterize spatial distributions and to produce estimates of variables at unsampled locations. This mathematical model is then used in a procedure known as kriging to help estimate values for variables at unknown locations.

Keywords: rare species, Sequential Gaussian Conditional Simulation, Kriging, Importance Value

Päivi Kymäläinen, University of Turku. Email: paivi.kymalainen@utu.fi; *Temporary Places of Urban Visuality*

Geography has been regarded as a visual discipline, whose task is to make present something that is absent for spatial or temporal reasons. However, recent conceptual discussions in human geography have posed many challenges to the ideas of visibility. In current interpretations, concepts such as place and space have often been regarded as processes or events instead of seeing them as fixed things or structures. This conceptual change has had only some influence on visual geographies. Despite some efforts to diversify the ways of understanding visibility, visual questions are still often marginalized as being too old-fashioned, masculine or objectifying. This paper asks how places of processes, events and rhythms have so far entered the discussions on urban visibility. My argument is that utilizing recent conceptual changes requires noticing that urban places are only contextually visual: that visibility is all the time re-invented through temporary uses and meanings. My reading of urban visibility is inspired by the Derridean interpretation of chora, in which chora refers to half-way-places that are marked by discontinuity and momentary meanings. Furthermore, in my paper I illustrate the ideas of visual re-inventions and temporary meanings with two examples from European cities.

Keywords: urban geography, visibility, place, chora

Alain L'Hostis, INRETS LVMT. Email: lhostis@inrets.fr; *Metropolisation, high speeds and global space: from time-space shrinking to time-space shriveling*

For a world city, the metropolisation process supposes the development of high speeds, with a priority on air transport but also including high-speed rail and motorways, to reach the other metropolises on a global scale. This is why high speed transport systems play a major role in the development of large urban agglomerations. Nevertheless, if high speed networks continue to develop, previous lower speed networks still exist. In order to represent time-space, geographers usually refer to the idea of a shrinking world, following the development of transport systems and the increase in speed. Nevertheless, if a shrinking movement can be observed in a historical perspective, the deformation of time-space by fast transport modes is not correctly rendered by this principle alone. Indeed, some links are fully concerned by this evolution while the rest of time space remains characterised by slowness. The cartographic representation of a crumpled time-space was introduced by Mathis and L'Hostis in 1997 to show the differentiation of space produced by the co-existence of fast and slow transport modes. Coming after a series of applications at regional and national scales on European cases with ground transportation modes only, the object of the present paper is to develop this method at the global scale with air mode as the fastest way of travel. We propose to build the metaphor of a ‘shrivelling’ time-space. The terrestrial globe would become a ‘passion fruit’ or a ‘chestnut’ with larger global cities gaining an upper visible position while all the remaining space would be rejected.

Keywords: metropolisation, high speeds, time-space representation, shrinking, shriveling

Mazen Labban, University of Miami. Email: mlabban@miami.edu; *The dialectics of imperialism: the struggle with Iran, the struggle for Iran*

The current standoff between Iran and the self-appointed trustees of the “international community” over Iran's nuclear energy program is an inter-imperialist rivalry for Iran as much as a collective imperialist confrontation with Iran. Despite the attempt to produce the conflict as one between the “international community”, and sometimes “the west”, and Iran, the conflict appears increasingly to focus on the inability of the five permanent members on the UN Security Council and Germany to reach a resolution regarding sanctions on Iran, betraying disagreements and squabbles within “the west” (between the US and its European “allies”) and within the “international community” (between the west on one side and Russia and China on the other). The disagreements in the west have increasingly revolved around how to secure China and Russia's agreement to the sanctions proposed by the US—indeed, Russia and China appear at times to be the object of some of the sanctions campaigned for by the US. The concern about Iran's nuclear energy goes farther than the imagined and exaggerated security threats. What is at stake is what US Secretary of State Rice recently

referred to as the credibility and the authority of the international community in the face of Iran's defiance—in other words, the coherence and effectiveness of the collective imperialism of the west in the face of inter-imperialist conflicts emanating from new rivals in Asia and of the challenges emanating from the South.

Keywords: collective imperialism, inter-imperialist rivalry, geopolitics, Iran

Martin Lacayo, BA, Department of Geography, San Diego State University. Email: lacayo@rohan.sdsu.edu; *Integrating Self-Organizing Maps and GIS*

Data are now produced and stored at unprecedented volumes. Converting the resulting abundance of data into useful information and relaying it in a manner that conveys meaning is a persistent problem for computational cartographers. One approach to this challenge takes advantage of the human vision system by spatializing inherently non-spatial information and representing it using a Geographic Information System (GIS). The self-organizing map (SOM), or Kohonen map, is one such spatialization technique that uses an artificial neural network to represent complex data in 2-dimensional space. The SOM begins development in a training stage where data, which has been tokenized into attributes and normalized for counts, scales the interconnectivity between neurons. Once the training stage has been finalized the SOM can "map" the training data or any data based on the original attributes on which it was trained. This paper presents an integration of SOMs and GIS. The main goal of integration is to leverage the tools that are present in a GIS so that data analysis and visualization are more robust. The paper discusses in detail the methodology and implementation of this integration using a module written in the Python language for the computation and visualization of SOMs. Methods for applying standard GIS tools to SOMs, as well as the use and significance of specific features of the module are explored.

Keywords: GIS, self-organizing map, Kohonen map, spatialization, visualization

Email: tuxy01@uga.edu; *A Climatology of Non-Convective Wind Storms Across the Great Lakes Region*

A first-ever regional climatology of cold-season non-convective wind events (NCWEs) for the Great Lakes region has been created. These events are of importance because NCWEs can cause more deaths and/or damage on a yearly basis than tornadoes, hurricanes, or convective storms. This climatology uses hourly wind data for 38 first-order weather stations throughout the Midwest and Great Lakes regions over the months of November–April for 1951–95. The data were analyzed in terms of the two National Weather Service (NWS) criteria for a high wind watch or warning: sustained winds of at least 18 m s⁻¹ for at least one hour and a wind gust of at least 26 m s⁻¹ for any duration. The results indicate a pronounced southwest quadrant directional preference for non-convective high winds in this region. Between 70% and 76% of all occurrences that satisfied the NWS criteria for NCWEs were associated with wind directions from 180° through 270°. Within the southwest quadrant, the west-southwest direction is preferred, with 14–35% of all NCWEs coming from this particular compass heading. This directional preference is borne out in five out of six stations with high occurrences of cold-season NCWEs (Buffalo, NY; Dayton, OH; Lansing, MI; Moline, IL; Springfield, IL). Given the geographic spread of these stations, a non-topographic cause for the directional preference of cold-season NCWEs is indicated. The connection between NCWEs and low pressure systems found in this climatology and in case studies suggests that mid-latitude cyclone dynamics may be a possible cause of the directional preference.

Michael Lackner, University of Toronto - Mississauga. Email: mike.lackner@utoronto.ca; *Use of Ancillary Data in an Object-Oriented Classification of Urban Land-Cover*

A major challenge in classifying urban land cover is the high level of spatial heterogeneity that exists in urban areas. As a result, pixel-based classification approaches are often limited in their ability to accurately classify such complex landscapes. Object-oriented classification techniques, which take into account shape, textural, spectral and contextual information, may represent a better way to generate detailed urban land cover classifications. However, differentiating between roads, buildings and other impervious surfaces can still be challenging in an object-oriented approach. This study completed an object-oriented classification of urban land cover in a southern Ontario landscape, using Ikonos imagery.

The initial image-based classification was compared to two other classifications that included ancillary data representing building footprints and road-centerlines. In each of the three classifications, 17 land-cover classes, including five different building types, were extracted. A complete accuracy assessment was conducted and differences between the three classifications were explored using statistical and pattern metrics. The overall accuracy of the classifications ranged from 68% to 80%, with the classification that included the ancillary road-centerline data having the highest accuracy. A discussion of the benefits and limitation of ancillary data in an object-oriented classification will conclude the presentation.

In August 1999, the National Weather Service (NWS) moved the official downtown Los Angeles weather station to the USC campus, almost 6 km to the southwest of its previous location near city center at the Department of Water & Power (DWP). This move resulted in a significant change in weather records which could influence climatic studies of the city. A comparative study of daily temperatures and precipitation recorded at USC and DWP since the move clearly shows a significant decrease in both temperatures and precipitation. For the 1999–2006 record, maximum temperatures averaged 1.00C (1.80F) higher at DWP, but nearly the same for minimum temperatures (mean values being 0.50C or 0.90F higher at DWP). Greatest temperature differences between the two stations occur in late summer and early fall, while the winter records showed the least differences. Precipitation at USC for the study period averages about 1" (25.4 mm) less than the DWP location. The wettest year on record was also eliminated by the move, while several recent temperature records occurred during a heat wave in July 2006, which were also impacted by the move. Not only was the move relatively far (moving nearly a third the distance to the coast), but it also was greatly altered in land use. The USC weather site is in a grassy, treed environment, while the original downtown location lacked vegetation. The move has produced a discontinuity in the station record and may not represent the downtown environment.

Email: gwright@utk.edu; *Fire History and Forest Stand Dynamics of the Narrows Preserve, Peters Mountain, Virginia*

Fire activity in the Appalachian Mountains declined following the initiation of effective fire prevention and suppression tactics during the mid-twentieth century. Much of the landscape is covered with vegetation, e.g., oak and pine forest, that is thought to have developed under a regime of frequent burning. Currently, the abundance of fire-associated vegetation is decreasing as fire-intolerant species encroach. For this research, we use dendroecological (tree-ring) analyses to reconstruct fire history and explore successional dynamics of oak-pine forests on Peters Mountain in The Nature Conservancy's (TNC's) Narrows Preserve, Giles County, Virginia. The preserve contains the only known population of Peters Mountain mallow, a fire-dependent herb that is endemic to Peters Mountain. The mallow population declined precipitously during the era of fire suppression, and TNC has initiated a regime of prescribed burning to attempt to restore the species and its habitat. Fire scars that we collected from pine trees growing on Peters Mountain indicate that 33 fires occurred between 1867 (the first year with fire recorded on = two trees) and 1972 (the year of the last fire). The shortest fire-free interval recorded was 1 year, and the longest was 13 years. Fitting a Weibull distribution to model the fire-free interval data resulted in a Weibull Median Interval of approximately three years. Age-structure data suggest that stand dynamics over the last 150 years have been influenced by changes in fire regime and land use. Our results suggest that in the past, frequent burning maintained chestnut oak-dominated forest with suitable mallow habitat.

Working With Middle School Science Students to Conduct Stream Channel Assessment

This project tests the accuracy and repeatability of visual stream channel assessments conducted by community volunteers and middle school science students from the Reynolds School District in Troutdale, OR. In the fall of 2006, a stream reaches in the Fairview Creek watershed, in east Multnomah County, was surveyed by the principal investigator (Lafrenz), using standard scientific stream channel survey techniques and equipment, in order to characterize stream habitat condition. The same stream reach was surveyed by two different middle school science classes and community volunteers, using similar geomorphic assessment techniques. This project seeks to establish whether stream condition, as determined by the middle school students, is similar or dissimilar to the condition quantified by the PI, as well as to test whether their visual assessments are similar or dissimilar to each other. The stream reach will be re-surveyed by each middle school class in the winter and spring of 2007 and by the PI in spring 2007 to quantify any changes in stream habitat condition during the study period and to test if the students' assessments detected similar changes in stream channel condition.

Localised learning in a mature regional industry - the case of light metal industry in southern Sweden

Shifting economical circumstances makes it significant to understand the processes of innovation and learning that makes it possible to successfully renew key assets and capabilities within mature regional industry. Recent research in firm clustering and agglomeration indicates that regional specialisation in particular industries has come to be regarded as advantageous in the context of globalisation and competitiveness. This paper focus on a mature agglomeration of light metal companies in the south of Sweden. Within the region approximately 300 companies manufacture products made of light metal, even though there is no raw material present. The agglomeration is studied through a questionnaire, interviews with companies and officials, and an analysis of detailed register data. The paper shows that there are several mechanisms that could help explaining the learning and innovation process of the agglomeration. This is done by focusing on three issues that is important for knowledge creation and diffusion, that also contributes to the creation of trust and embeddedness between the firms in the region. The first issue is about relations and linkages among the companies, both business linkages and more informal connections. The second issue shows that a regional identity is a part of the companies' creation of trust and embeddedness. The last issue examines the labour market mobility and its impact on firms' knowledgebase.

The Fall Of The Fillmore District: Socio-Spatial Differentiation And Urban Renewal In A Multiracial Neighborhood

In the mid-20th century federal urban renewal or redevelopment policies destroyed neighborhoods bordering downtown metropolitan areas in the name of battling urban crisis and blight, displacing residents (largely of color) by the thousands and effectively erasing their neighborhoods from the landscape. One such targeted area was San Francisco's Western Addition district, a multiracial and multiethnic neighborhood containing the city's largest African American and Japanese American communities. Although redevelopment supporters (or imagineers) targeted both communities for redevelopment and designated their spaces as blighted, the outcomes of this spatial policy in the two communities were not the same. This paper examines the attempted erasure of Japanese Americans and African Americans from the Western Addition's landscape and draws from Ethnic Studies and urban geography to argue that the different outcomes in these two communities were the result of a spatialized 'racial triangulation' or socio-spatial differentiation. I examine particularly the completed development of the Japan Center and Nihonmachi Mall in Japantown and the failed development of the Fillmore Center in the African American part of the Western Addition to argue that imagineers evaluated Japanese Americans and their spaces in terms of mid-20th century Orientalism and perceived African Americans and their spaces as disordered and requiring displacement. In other words, these two racially marginalized communities were differentially positioned or 'triangulated' in terms of property and the redevelopment process.

Keywords: Japanese Americans, African Americans, urban renewal, San Francisco, racial triangulation

Systems, power and practices: The building of financial markets in Shanghai

Whether as an idea(l), a system or as economic practice, markets lie at the heart of capitalist societies but they remain one of the most elusive concepts within social sciences. This paper opens the black box of 'markets' by scrutinizing the process of market formation and examining its complexities. The development of Shanghai as an international financial centre can be seen as part of a global process servicing finance capital but this conceals the complex reasons behind why such processes are taking place in Shanghai and at a particular point in time and space. The process of market-making in Shanghai and the actors involved are also spread across scales and much of what is happening within the city is determined by economic, social and political considerations elsewhere on the national, regional and global level. The financial markets in Shanghai are framed, understood and acted upon differently by the Shanghai municipal government, the central government in Beijing, and foreign financial institutions in Shanghai within the wider context of their global operations and strategies. Transnational interests and roles of organisations such as the WTO and other financial centres such as London will also be considered. The construction of a financial centre in Shanghai is thus not only an outcome of its own historical context, economic advantages and development trajectory but also intrinsically bound up with the interests and decision of other agencies acting across spatial scales and negotiated amidst conflicts of interests and power struggles.

Shih-Kung Lai, Department of Real Estate and Built Environment, National Taipei University. Email: lai@mail.ntpu.edu.tw; Interaction between Social and Physical Structures in Urban and Rural Post-disasters Recovery Systems

The objective of the research is to investigate how large scale disasters affect the urban development process in terms of the interaction between social and physical structures and what we can do with it organizationally and institutionally. There is a sea change in modeling urban development from a top-down to bottom-up approach. This new approach takes into account individual spatial behaviors and their interaction to form the emergent urban development process. One of the innovative models of urban development is the spatial garbage can model (SGCM). The SGCM provides a powerful descriptive framework to understand how decision makers, decision situations, problems, solutions, and places interact and how decisions emerge that affect the urban development process. The implication of the SGCM is so rich that it can be applied to explain how the urban development process reacts to large scale disasters viewed as the external disturbances to the system. Grounded on the SGCM, the research constructs a conceptual model of urban development, describes qualitatively how the urban development process in terms of the interaction between the social and physical structures is affected by the external disturbances, and derives hypotheses regarding how recovery strategies and protection plans can be made to restore the functioning of the urban system effectively. Two tentative hypotheses are constructed and examined using the case of Hurricane Katrina: 1) decentralization of decision making is more effective than centralization and 2) resources should be allocated to the nodes of a social-physical network with the most intensive connectivity.

Gita J. Laidler, University of Toronto. Email: gita.laidler@utoronto.ca; Cultural geographies of sea ice use around Baffin Island, Nunavut

Sea ice, covering Canada's northern oceans for six to eight months of each year, has figured prominently in natural science investigations. This ocean ice cover also plays an integral role in the daily life of Inuit communities. However, there is a general lack of interaction between scientists and Inuit to learn from each other about this dynamic and influential component of the marine environment. My doctoral research aimed to learn about Inuit relationships with, and expertise on, the sea ice environment by working collaboratively with three communities around Baffin Island (i.e. Pangnirtung, Cape Dorset, and Igloolik, Nunavut). Four (4) field research trips were undertaken in various stages of sea ice freezing and decay, between 2004 and 2005. Various participatory methods were incorporated, such as semi-directed interviews (including participatory mapping) (84), focus groups (4), and experiential sea ice trips (14). This presentation will outline a subset of the overall findings, with specific emphasis on the uses of sea ice around these Inuit communities. Therefore, cultural geographies of sea ice will be discussed within a regionally comparative context, regarding: i) dangers associated with sea ice travel; ii) means of evaluating ice safety; and, iii) sea ice conditions employed for marine mammal hunting. Improving our understanding of local sea ice use can aid in evaluating the potential implications of sea ice change within a northern community context. It also highlights several key areas of interest that may provide a common focus

for both scientists and community members to begin working together more effectively.

Collaboration has become more common, with research collaboration taking place both between and within disciplines, especially when tackling complex issues. Geography is a diverse field, which makes it a good one to use to study collaboration and collaboration issues. Multiple research methods were used to examine temporal, interdisciplinary, and perceptual changes in collaboration. Data from the Web of Science citation index, using co-authored or multi-authored citations after 1989, were used to summarize temporal patterns of interdisciplinary and intradisciplinary collaboration. Surveys were sent to over 450 geographers, with 108 replies. Respondents were asked to self-report the amount of collaboration as a portion of their total peer-reviewed publications, along with identifying the disciplines with which they collaborated. Respondents were also given the option to provide a brief narrative where collaboration was critical in leading to new understanding in the problem they were investigating. Information from the narrative and interviews was coded using the software program NUD*IST. Most disciplines have had increased levels of collaboration, but the amount of collaboration between Geography and other disciplines has increased at a greater rate than other disciplines. Within Geography it appears that people tend to collaborate more closely among related sub-disciplines. Common themes regarding pros and cons of collaboration were evident in the qualitative data.

Keywords: collaboration, qualitative, quantitative

Sharla Beth Lair, Florida State University. Email: lalair@yahoo.com; *Evaluation of the Compatibility between Applied GIS Program Curricula and Requirements of Potential Employers*

Master's programs designed specifically to provide students with training in Geographical Information Science (GIS) are increasing in the United States. Curricula of these programs are dictated by several factors, including availability of resources, faculty training, as well as requirements of potential GIS employers. The objective of this research is to determine if there is a difference between the education students are receiving and the expectations of employers. We address this question through a series of interviews with: (1) students currently enrolled in applied GIS programs, (2) recent graduates of applied GIS programs, and (3) employers who have hired recent graduates. This paper evaluates whether skills acquired through training provided by applied Master's GIS programs are compatible with what employers are looking for in potential employees. It also assesses whether or not these programs are meeting the students' expectations.

Adam Lake, University of Oregon. Email: alake@uoregon.edu; *Maghrebins in Marseille: Mapping Activity Spaces and Urban Territoriality*

North African immigrants, commonly referred to as Maghrebins, are the fastest growing population in France. The segregation of this population is a hotly debated topic, especially in light of the assimilation-based French immigration policies. Research in Paris and other northern cities indicate that the Maghrebins are concentrated in the suburbs of the cities. They are physically on the fringe of those cities in the same way the people are on the fringe of society. Marseille is different. The city does not follow the traditional French layout of concentric circles and a large percentage of the people that live in the center of the city are immigrants from North Africa. Yet existing research focuses primarily on Paris and other cities that are more traditionally "French." This paper discusses the results of my research in Marseilles mapping activity spaces of North African immigrants compared to ethnic French. Comparison of which public spaces are used or avoided by each group provides insight into the level of integration of the interaction between immigrants and ethnic French as well as any element of territoriality. These activity spaces also affect the cultural and economic landscapes of Marseille's neighborhoods.

Robert W. Lake, Rutgers University. Email: rlake@rci.rutgers.edu; *The Multiple Relational Geographies of Urban Redevelopment*

Urban redevelopment in the neoliberal city is frequently characterized in unitary terms of destatization, privatization, and marketization, producing iconic landscapes of festival marketplaces and gentrified neighborhoods. Against this generalized model, this paper delineates the multiple redevelopment processes simultaneously unfolding in discrete sub-city neighborhoods of Camden, New Jersey, a mid-sized deindustrialized city recently ranked the poorest city in the nation. Redevelopment processes performed in specific downtown, waterfront, or residential neighborhoods can be variously described as state-, market-, or community-driven, but the apparent supremacy of the state, the market, or civil society is less important than the complex network of interrelations among sectors constituting specific neighborhoods. Each of these multiple redevelopment processes entails a distinct set of relations among state, market, and civil society actors engaged in complex webs of interaction situated at multiple scales; and each distinct set of relations in turn produces a highly specific neighborhood landscape that instantiates a particular form of redevelopment at the local scale. The resulting spatial structure of urban redevelopment is often viewed as a Burgess-like horizontal map of neighborhood characteristics arrayed in what Iris Young (2000) has called a logic of identity. An alternative logic of representation, following Doreen Massey in *For Space* (2005), sees urban neighborhoods as continually (re)constructed through an unstable and transitory relational dynamic that offers continuous possibilities for contesting the hegemony of neoliberalism.

Keywords: Neoliberalism, urban redevelopment, relational geography, civil society, state-market relations

Siana Lakhan, . Email: slakhan@fau.edu; *Surface water quality: Affects on Trinidadian society*

The island of Trinidad is highly dependent on surface water as a source for domestic water supply. Many people in this region have limited access to a reliable source of potable water. This study identifies the areas in need of a drinkable source of water, in order to provide the Water and Sewage Authority (WASA) of Trinidad with a better scope of where to allocate budget resources. Increases in industrialization and population are putting more pressure on water resources. People obtain their water from a variety of sources: WASA, rivers and rain. Part of this study looks at how, and from where people in different proximities to the urban core collect and store water. Results indicate that urban areas rely least on rivers and rain, but more on WASA as a water source. The Urban fringe (the area that lies just outside the urban core) relies on a WASA water supply as well as natural sources for water. Rural regions depend solely on a natural water source. In addition, I look at how geographic location affects nitrate and nitrite concentrations in drinking water. I chose to look at nitrates and nitrites, because high concentrations of these chemicals can be indicators of contamination due to agricultural or sewage run-off. Both the geographic location of the water source and how people collect and store water affects the water quality in terms of nitrates and nitrites. This study can help WASA determine how to efficiently service the entire population of Trinidad.

Keywords: water quality, Trinidad, Nitrates, Nitrites

Nina Lam, Louisiana State University. Email: nlam@lsu.edu; Kelley Pace, Louisiana State University. Email: kpace@lsu.edu; Richard Campanella, Tulane University. Email: rcampane@tulane.edu; *Decision Making Among Businesses in Post-Catastrophe Uncertainty: How Economic Geographies Re-Form in New Orleans*

A major obstacle in research on assessing and modeling the economic impacts of disasters is the lack of systematic, empirical data. In particular, very little research has collected time-critical data on how businesses make decisions on whether they remain or relocate after a major catastrophe, especially a catastrophe as wide and deep as Hurricane Katrina that affects an entire metropolis of New Orleans. We are currently working on a project, funded by the National Science Foundation, to collect and analyze time-critical data on what, where, how, why, and when businesses return to New Orleans. The project includes both telephone and street surveys. The street surveys is a complete survey of three major commercial corridors in New Orleans every two weeks, tracking where, when, and what businesses return and survive (or fail). The telephone surveys, conducted for 3 rounds, target businesses throughout the entire city. This paper reports the results of the first two telephone surveys, conducted in December 2005 and June 2006. The survey results are integrated with other GIS data layers to enable a more comprehensive analysis of key explanatory variables on why some businesses are more resilient than others and whether there is significant space-time difference in business decision making. These telephone survey results, coupled with the results from the street survey, will be useful to future impact modeling and policy making.

Theodora Lam, Asian MetaCentre for Population and Sustainable Development Analysis. Email: arileft@nus.edu.sg; *Educating Young Singaporeans Overseas*

Singapore, a small natural-resource scarce city-state, has big aspirations of becoming a global city and the 'Talent Capital' of the New Economy. As part of its strategy to extend the country's economic reach, the government is persistently urging Singaporean firms and Singaporeans alike to venture abroad to form its 'external wing'. With an ever-increasing number of Singaporeans living outside its political geo-body, several issues are fast emerging. First, there is an escalating need to meet the educational needs of young Singaporeans overseas as their parents fear that they will be missing out on Singapore's education during their absence. More importantly, dispersal carries a greater danger since Singaporeans who are not deeply rooted to their homeland may eventually lose their 'roots' as they embark on diverse routes taking place outside the nation. In this light, the paper aims to explore the various efforts in educating and rooting young Singaporeans overseas to their homeland by probing specifically into the roles played by their parents in transmitting Singaporean ideals and citizenship values to them. Seeing that these expatriate Singaporean parents form a distinct group of transnationals, namely the 'transnational capitalist class', the paper also seeks to provide a gendered perspective on their transmigratory behaviour and experiences, delving into the challenges and struggles they faced, as well as the family strategies they employed in the wake of the government's call to 'go regional' or 'go global'. The reservations that Singaporean parents have, especially those pertaining to their children's education, are also examined.

Keywords: transnational migration, education, Singaporean, citizenship

Shannon S Lamb, Delta State University. Email: shannonlamb999@yahoo.com; *The Landscapes of Public Memory Suppression*

This study utilizes the geography of secret wars as a backdrop against which to view the landscapes of public memory suppression that inexorably result. Unlike overt military intervention, clandestine operations call for plausible deniability, hence the phrase "secret war." This secrecy can lead to the suppression of public memory, as shown in the post-conflict landscape of 1980s Honduras. Interpretation of these landscapes can inform us on the social, political and economic after-effects of covert operations on local people and political structures. Using ethnographic notes, archival documentation, private memorials and public protest text, this presentation looks into the covert geographies of Honduras and documents the existing struggle between the Honduran political elite and the families of victims of human rights abuses over the erection of public memory for the disappeared.

David Lambert, Royal Holloway, University of London. Email: d.lambert@rhul.ac.uk; *'Being just arrived in a land of slavery?': White encounters with the Caribbean and the cultural politics of circum-Atlantic mobilities*

The Caribbean has been a crucial site for the production and performance of racialised identities - not only the racialised otherness of the enslaved black subject, but also of white (enslaving) identities. The Caribbean has also been an intense meeting point for differently-embodied mobilities associated with the practices of enslavement and broader systems of trans-Atlantic exchange. Thus, the Caribbean represents an ideal space in which to explore the intersections between articulations of whiteness and various forms of (im)mobility. To do so, this paper focuses on British travellers to the Caribbean in the late eighteenth and early nineteenth century, and on their accounts of the colonial slave societies they encountered. These travellers' textual products would circulate beyond the Caribbean to be consumed by metropolitan audiences. Yet, this paper does not focus on the discourses that animated the debates about slavery during the 'age of abolition'. Instead, by considering such recurrent scenes as visits to the holds of slave ships, meals in hostels and plantation houses, and guided tours of sugar estates, it focuses on the embodied practices involving, and the spatialised relationships between, white metropolitan, white creole, free coloured and black enslaved subjects that can be gleaned from these accounts. In this way, the paper aims to examine not only the co-production of white subjectivities and embodied (im)mobilities, but also the intense cultural politics that accompanied their entanglement during the 'age of abolition'.

Keywords: Caribbean, slavery, postcolonialism, whiteness, mobility, travel accounts

Julie M. Lancelle, graduate student, University of Wisconsin. Email: jlancelle@wi.rr.com; *The Integration of Nature and Sprawl: a look at conservation subdivisions in southeastern Wisconsin*

As populations push ever outward into pastoral territories, rural areas have gradually been integrated into urban landscapes. This is the case in southeastern Wisconsin, where Milwaukee exists as an urban core. Recently, conservation subdivisions have been touted as a happy medium between residential accommodation and preservation of the natural environment. The proposed research will use qualitative and quantitative methodologies to investigate whether some developments in southeastern Wisconsin meet the criteria of a conservation subdivision. An important part of this study will be determining what those criteria are, and exploring whether or not there is consistency between local ordinances, statewide regulations, developer standards, and the generally established definition of a conservation subdivision. Those suspicious of unbridled development have some concern that conservation subdivisions are simply a means of mitigating the guilt some may feel for participating in sprawl. The emerging evidence may conclude that conservation subdivisions can be a beneficial step in allowing people to live in the scenic country landscapes they desire, while keeping disturbance of those spaces to a minimum, so long as the tenets of conservation subdivision design are correctly applied and managed.

Keywords: conservation subdivisions, Wisconsin - southeastern, sprawl, ordinances, planning

Ingegerd Landström, Uppsala University. Email: ingeegerd.landstrom@kultgeog.uu.se; *Towards Collaborative Coastal Management in Sri Lanka?*

In view of seemingly ever increasing and more complex environmental problems and the partial failure of the state to effectively deal with them, it is now widely acknowledged that the state alone cannot handle environmental issues. As a result, the notion of local participation in natural resource management is currently very much in vogue and advocated by environmental organisations, governments and international institutions alike. This paper deals with the efforts in Sri Lanka to bring about a greater degree of local community participation in the use and management of Sri Lanka's coastal land and natural resources, by means of forming partnerships between coastal communities and the Sri Lankan government. Using a political-geographical perspective that highlights the political and spatial dimensions of the shift in forms for governing Sri Lanka's coast, this paper illustrates that, despite an ambition to bring about a sharing of authority and control in coastal management, this has not worked out in practice. Due to circumstances relating to the SAM strategy itself and to the context in which it is implemented, the degree to which coastal communities have gained any influence with respect to the use and management of coastal land and resources remains highly questionable. The study that underpins the paper was carried out prior to the tsunami that hit the Sri Lankan shores in December 2004. However, given the major reconstruction of Sri Lanka's coast that currently is ongoing and the controversy that surrounds it, the issues raised in this thesis are highly relevant.

Michael Landzelius, Dr, Göteborg University. Email: landzelius@icug.gu.se; *'Homo Sacer' Out of Left Field: Communist "Slime" as Bare Life in 1930s and WWII Sweden*

This paper maps ways in which radical left-wing politics in 1930s and WWII Sweden were conceived in medico-biological and eugenic terms that expressed strong de-humanizing sentiments. The paper engages Agamben's and Foucault's thinking on 'biopolitics' and 'biopower', and extensively exemplifies dehumanizing discourse as deployed by leading Social Democratic politicians, leading figures of government within the police and military, as well as by editors of both right-wing and Social Democratic press. Ways in which individuals labeled 'Communists' were spatially managed in terms of extensive surveillance, registration, detainment planning and forms of incarceration are addressed. The paper further addresses state measures that can be seen as elements of a state of exception, some measures implemented against 'Communists', and others against individuals deemed to have undesirable characteristics seen to be hereditary. In employing Agamben's notion of 'inoperosity' in a discussion of a state paradigm of social productivity, eugenic measures in the building of the Swedish welfare state are then related to the dehumanizing framing of 'Communists'. In conclusion, conditions for regaining a place in the body politic are briefly addressed. The article's focus on ways in which the ethnic and racial same was dehumanized within a democracy on political grounds, results from a conscious effort to complement studies of dehumanization as related to colonialism, dictatorial regimes as well as identity politics.

Bradley Lane, Indiana University. Email: bwlane@indiana.edu; *Travel Behavior and Spatial Variation in the Introduction of Light Rail*

Rail transit continues to be a popular alternative for cities as a tool for alleviating automobile congestion and for redeveloping areas into transit and pedestrian-friendly environments. Ideally, rail transit will draw trips away from cars, but the quantitative work that tests this has often been case studies of neighborhoods, in which conclusions are tough to generalize, or city-wide comparisons where important spatial variation is often lost in aggregation. This research attempts to counter that problem by conducting an analysis of rail transit and travel behavior across numerous US cities. Cities are categorized into groups based on the presence of rail transit. Variables assessing economic and demographic factors as well as transit system service characteristics and the overall transport geography of cities are used to predict travel behavior at the Traffic Analysis Zone (TAZ) level for 1990 and 2000. The spatial variance of those factors within cities is also analyzed. Two research objectives are pursued. One purpose is the analysis of the effect of rail transit on commuting trends on a widespread basis, while another is to assess the ability of rail transit improvements as predictors on local changes in commuting behavior. Initial results suggest shifts away from auto commuting are related to the size of the rail transit system, proximity to rail, and by park and ride access to mass transit, and suggest that rail has a positive effect on bus commuting.

Orvis, University of Tennessee. Email: orvis@utk.edu; *Paleolimnological Evidence of Late-Holocene Precipitation Variability in the Dominican Republic and its Possible Impacts on Prehistoric Human Populations*

High-resolution paleoclimate records from the circum-Caribbean region indicate a steady decrease in precipitation throughout the late Holocene with interspersed severe drought events. This precipitation variability has been primarily attributed to a southward shift in the mean annual position of the Intertropical Convergence Zone. The impact of this precipitation variability on Mayan society on the heavily populated Yucatan Peninsula has received significant attention. However, the impact of regional precipitation variability on smaller populations of the circum-Caribbean, including prehistoric island societies, has not been investigated. We have reconstructed a paleoprecipitation record using sediment characteristics, fossil pollen, aquatic macrofossils, and the oxygen isotope composition of ostracod valves preserved in sediment cores from Laguna Castilla and Laguna Salvador in the Cordillera Central of the Dominican Republic. Our paleoprecipitation record correlates well with regional records including those from the Yucatan Peninsula and the Cariaco Basin. The record indicates that the intervals 930-1550 and 1257-300 cal yr BP were two of the most arid periods in the Dominican Republic during the late Holocene. The two most positive oxygen isotope excursions on record punctuate these extended dry periods and are coincident with paleolimnological evidence of human occupation, which was sporadic at the sites. Synchronous shifts in proxy indicators of human presence and extreme drought may indicate population migration into the interior of Hispaniola in search of dependable water sources during severe drought events. Further research is necessary to verify this hypothesis and to place these potential population migrations into archaeological and historical context.

K. Maria D. Lane, Ph.D., Department of Geography, University of New Mexico. Email: mdlane@unm.edu; *High Science: Men, Mountains and the Mapping of Mars*

An interesting episode in the history of science - widespread scientific and popular belief in Martian inhabitants at the turn of the twentieth century? has been shown to have relied heavily on the mapping of canals on the Martian surface. This paper explores one of the ways in which these canal maps gained their authority, focusing on the mountain locations in which astronomers collected their cartographic data. As the first mountaintop astronomical observatories were built in the American West in the 1880s, astronomers began to gain prestige among their peers and in the public eye by emphasizing the isolation and purity of the remote mountains in which they worked. As a result, personal mountaineering experience became a kind of currency among American astronomers in the late 19th and early 20th centuries, allowing the new Western observatories to claim superiority over the established Eastern metropolitan facilities on the basis of their geography. This paper examines the ways that astronomer-cartographers represented their work in mountain locations to their peers and to the public. It shows that astronomers exploited an association of mountain locations with heroic manliness to assert their legitimacy as scientists and cartographers of Mars. Emphasizing the ruggedness and physical challenge associated with working at an observation station in the mountains, these

astronomers reinforced the concept that the best astronomy was being done essentially in the wilderness. They painted themselves as heroic and manly figures, confronting mountain wilderness in the name of science and in the pursuit of cartography.

Robyn J Lane, M.A., RLA, University of Arkansas - Fayetteville. Email: rwilgus@uark.edu; *Spatial Analysis at the Parcel Scale: GIS in Land Development*

The utility of geographic information systems (GIS) in large-scale planning applications is well established, but GIS are underutilized at the parcel-level scales common in land development. Historically, urban land development patterns have focused primarily on economic benefit, while environmental factors that should inform the design process are largely overlooked. As environmental concerns become more pressing, an evaluation of physical factors that potentially constrain site development should be completed before beginning the design process in order to achieve an optimal balance between environmental protection and economic benefit. The history of the Wilson Springs development in Fayetteville, Arkansas, illustrates the importance of such an evaluation. In this research, we adapted McHargian site analysis for use in a GIS to compile and analyze relevant environmental data of the Wilson Springs site in an objective and systematic way. The results of the land use evaluation successfully showed which areas of the site could be developed with minimal environmental impacts and identified areas of concern that warranted further study.

Robert E Lang, Ph.D., Virginia Tech. Email: rlang@vt.edu; Paul K Knox, Ph.D., Virginia Tech. Email: knox@vt.edu; *The New Metropolis: Rethinking Megalopolis*

This paper explores the relationship between metropolitan form, scale, and connectivity. It revisits the idea first offered by geographers Jean Gottmann, James Vance, and James Pickard that urban expansiveness does not tear regions apart but instead leads to new types of linkages. The paper begins with an historical review of the evolving American metropolis and introduces a new spatial model showing changing metropolitan morphology. Next is an analytic synthesis based on geographic theory and empirical findings of what is labeled here the 'new metropolis'. A key element of the new metropolis is its vast scale, which facilitates the emergence of an even larger trans-metropolitan urban structure?the 'megapolitan region'. Megapolitan geography is described and includes a typology to show variation between regions. The paper concludes with the prediction that the fragmented post-modern metropolis may be giving way to a neo-modern extended region where new forms of networks and spatial connectivity reintegrate urban space.

Mark D. Lange, University of Southern California. Email: mark.lange@usc.edu; Bernard O. Bauer, University of British Columbia Okanagan. Email: Bernard.Bauer@ubc.ca; *Patterns of Flow at a Tidal River Divergence, Sacramento River, California*

Flow through diverging tidal river channels have only recently received attention in the literature. A divergence, unlike a confluence, represents a 'decision point' where the flow of water and sediment discharge is distributed among two downstream channels, each with its own tidal signature and hydraulic geometry. While many studies have examined the macro geometry and dynamics of distributary channel networks, this study focuses on the changing pattern of flow within a single divergence system over a tidal cycle to enhance our understanding of the 'decision point' aspect of tidal river junctions. Three-dimensional flow was mapped at the junction of the Sacramento River with Georgiana Slough near Walnut Grove, California, over a variety of hydrologic conditions using a boat-mounted acoustic Doppler profiler and Global Positioning System in conjunction with a temporary tide gage network. Measurements were taken during low flow conditions, when tidal processes were dominant, and during moderate flow conditions when fluvial processes became more significant. Secondary circulation is most strongly developed when the difference in discharge between the downstream branches is greatest, which produces a cross-stream gradient in surface elevation that drives the secondary flow. The dynamics of these secondary flows are related to out-of-phase changes in the water slopes in each downstream branch of the divergence. This phase difference is due to their connection to separate channel networks that attenuate tidal wave propagation at different rates. These results have implications for the distribution and delivery of suspended sediment between downstream branches of a tidal river divergence.

James Langill, Salem State College. Email: rockjim@rcn.com; *A Tale of two fires. A Comparison of the Mann Gulch and Storm King Mountain (South Canyon) fires*

On August 5, 1949, a wildfire overran 16 firefighters in Mann Gulch on the Helena National Forest in Montana. Of the sixteen, only three survived. Some 45 years later, on July 6, 1994 a wildfire overran and killed 14 firefighters on Storm King Mountain in Colorado. Using historical weather data, and GIS analysis techniques, this on-going research will compare the two fires to determine if any clear similarities exist between them. In the comparison, existing GIS datasets, including Digital Elevation Models and Digital Raster Graphs, as well as created datasets showing the location of the fallen firefighters and fuel model types will be used. The comparison will look at geographic features in both fire areas, including: slope, aspect, fuel model type(s) and topography.

Ruth Langridge, University of California, Santa Cruz. Email: rlangrid@ucsc.edu; Juliet Christian-Smith, University of California, Berkeley. Email: ; Kathleen A Lohse, Arizona State University. Email: ; *Access and Resilience: Analyzing the Construction of Social Resilience to the Threat of Water Scarcity*

Resilience is a vital attribute that characterizes a system's capacity to cope with stress. Researchers have examined the measurement of resilience in ecosystems and in social-ecological systems, and the comparative vulnerability of social groups. This paper refocuses attention on the processes and relations that create social resilience. The central proposition is that the creation of social resilience is linked to a community's ability to access critical resources. This proposition is explored through an analysis of how community resilience to the stress of water scarcity is influenced by historically contingent mechanisms to gain, control, and maintain access to water. A framework is developed to assess the construction of social resilience and to examine, first, the different processes and relations that enabled four communities in northern California to acquire access to water, and second, how access contributed to their differential levels of resilience to potential water scarcity. Access is defined broadly as the ability of a community to actually benefit from a resource, and includes a wider range of mechanisms than those derived from property rights alone. The study suggests that, because legal water rights are extremely difficult to alter, strengthening and diversifying a wider range of structural and relational mechanisms to access water can enhance a community's resilience to water scarcity.

Suzanne Langridge, University of California. Email: sml@ucsc.edu; *Contested Views of Restoration: Large-scale Restoration on the Sacramento River, California*

Large-scale restoration of riparian ecosystems has the potential for conflict associated with differing ideas of negative and positive effects of restoration and cultural ideas of land management. In the Sacramento Valley, a large-scale riparian restoration project has led to conflict and tension between restorationists and community members, many of whom believe that the restored habitat is the source of negative inputs, including insect and mammal pests, weeds, and floods. These perceptions of negative externalities have led to efforts by the community within the large-scale restoration project to stop or reduce restoration. However, opposition does not simply fall along restorationist-local community lines, with opposition to restoration varying along the 160km length of river. Actual restoration of riparian forest reflects the support or opposition to restoration within the four counties that encompass the restoration area. This research examines the role of politics, social networks, and ecology in shaping differing visions of large-scale restoration in the Sacramento River restoration project.

Martin Lanzendorf, Dr., Helmholtz Centre for Environmental Research - UFZ. Email: martin.lanzendorf@ufz.de; Henning Nuissl, Dr., Helmholtz Centre for Environmental Research - UFZ. Email: henning.nuissl@ufz.de; *Why are national or supra-national governments funding large-scale transport infrastructures with only regional impact? An assessment of the "City-tunnel Leipzig"*

In urban areas large-scale public transport investments frequently are promoted by a set of typical arguments: Local politicians stress the labor market effects as well as their long-term benefits regarding the improvement of accessibility both for economic activities and for social purposes. Moreover, they argue from an environmental point of view that making public transport more attractive than the private car will lead people to rethink and change their travel modes. However, previous research challenged these assumptions of proponents of large-scale projects. For example the outcome of cost-benefit analysis was questioned by pointing to the typical cost-overruns. The aim of this paper is to analyze by a case study, the "City-tunnel Leipzig" (CTL), why a major public infrastructure investment of approximately 600 million Euros was favored by politicians and planners on national, regional and local scale and how its implementation has been accomplished. Particular attention will be given to the question how local politicians and stakeholders were able to get support (and raise money) from both the national state and the European Union for this project, which will have little impact beyond the regional scale. Given the uncertainty of expected outcomes and the critical role of funding for large-scale transport infrastructures, our analysis focuses on three dimensions: first, the key actors, initiating the planning and accomplishment of the project; second, the justification of the project's funding; and, third, the involvement of stakeholders and the public.

Yong Lao, California State University, Monterey. Email: yong_lao@csumb.edu; *Efficiency Evaluation Using Data Envelopment Analysis and Geographic Information Systems: A Case Study of Monterey Salinas Transit*

Data Envelopment Analysis (DEA) is an optimization-based technique widely used to measure relative efficiencies. However, current literature pays little attention to the spatial aspects of efficiency measurement. Our study aims to combine DEA and Geographic Information Systems (GIS) to examine the efficiency of a spatial organization, in this case, the public transit system in Monterey-Salinas area. We first use GIS to create demographic profiles within the service corridor of each bus line. Then we apply DEA method to compute and analyze relative efficiency scores for each bus line based on the service costs (inputs) and benefits (outputs). In particular, we want to closely inspect the under performed bus lines with low efficiency scores. Finally, we give recommendations on how to improve the operational efficiencies of the transit system based on the local commuting patterns and population characteristics.

Keywords: Data Envelopment Analysis, GIS, transportation modeling

Paul Laris, Ph. D., CSU Long Beach. Email: plaris@csulb.edu; *The 'legacy landscape' of fire and long-term fallow in the savanna landscape of Mali*

Legacy landscapes are the outcome of long term human occupation. Through practices of settlement, land management, and everyday life activities, people shape biogeography and create cultural landscapes through time. The Malian landscape is a legacy of many factors but perhaps none have played so great a role in modifying biogeography as the tandem of farming and fire. Yet little research has explored the complex interactions between long-term patterns of burning, farming and settlement in detail. While recent research has documented complex spatiotemporal patterns of indigenous burning regimes, the implications of these regimes on vegetation recovery after farming have rarely been explored. To address this gap, this study compares the tree cover on abandoned agricultural plots with savanna plots that were not farmed in human memory in an area where burning is a near annual event. Village elders identified study sites located in abandoned hamlets where there was a known boundary between abandoned agriculture plots (over 30 years) and unfarmed savanna. Tree height and girth and species were recorded for a series of quadrats on each plot. The results find that the most striking difference between the farmed and virgin plots is the greater number of tall trees on the fallow plots. In general the trees on fallow plots were straighter and taller, while those on the virgin plots were twisted and stunted an indication that they had been subjected to repeated stress. Oral histories combined with a burned area database covering a 30-year period are used to interpret the results.

Wendy Larner, University of Bristol. Email: w.larner@bristol.ac.uk; *Embodying Neoliberalism? Mike Moore and the WTO*

Former freezing worker, trade unionist, Labour politician and Prime Minister, New Zealander Mike Moore is best known outside his home country for his role as Director General of the World Trade Organization 1999-2003. How did a working-class boy from rural New Zealand come to head a major global institution during such a critical period? How does he justify his support of global free trade? What does his story tell us about the shift in neoliberalism from the domestic politics of particular country cases, to globalizing processes driven by international institutions and actors? In answering these questions, the paper shows that neoliberal discourses and techniques do not always travel in the forms we would expect, or the directions we would anticipate. It argues the need to historicize and spatialize the flows and networks through which neoliberal discourses and techniques have been disseminated, and interrogate the various forms in which neoliberalism has been instantiated and embodied.

Sonya J. Larocque, University of Wisconsin at Whitewater. Email: larocqus@uww.edu; *Dendrogeomorphic analysis and sedimentary signature of slushflows in southeastern Canada*

Only a few slushflows have been documented in the Chic-Choc Mountains of southeastern Canada. Despite the lack of direct evidence, the analysis of dendrogeomorphic and sedimentary data from one location provides a better understanding of the dynamic and frequency-magnitude relationships of such events. Recent occurrences in 1988 and 2006 are described through visual documentation gathered shortly after the episodes. Dendrogeomorphic analysis based on impact scars, reaction wood and traumatic resin ducts, identified two additional slushflow events in 1925 and 1964. The low frequency and high magnitude of these events, linked to exceptional initiation conditions, produce considerable geomorphic and ecological impacts. Slushflows contributed to the formation of a tongue-shaped accumulation of 17,900 m² at the outlet of a first-order drainage basin. The slushflow boulder tongue is composed of heterogeneous-sized, angular and unoriented clasts, which are markedly different from the sediments of an adjacent alluvial fan and from other hillslope deposits found in the region. Although movements were initiated above the altitudinal forest limit, slushflows induced forest fragmentation along the treed slope and greatly reduced the success of colonization by woody vegetation in the accumulation area. Investigations on local and climate conditions show that the drainage basin configuration in combination with heavy snowpack and rain-on-snow weather conditions are important parameters in the initiation process.

Eric J. Larsen, University of Wisconsin - Stevens Point. Email: elarsen@uwsp.edu; *Population dynamics of the Southern Royal Albatross on Campbell Island, New Zealand*

The Southern Royal Albatross (*Diomedea epomophora*) ranges widely in the high latitudes of the southern hemisphere. However, its breeding range is constricted almost exclusively to Campbell Island, New Zealand, where 99% of all Southern Royal Albatrosses nest. A study of the population dynamics of the Southern Royal Albatross was initiated in January 2005. We conducted intensive ground searches for Southern Royal Albatross nests on Campbell Island from December - February during the years 2004-05, 2005-06 2006-07, to census and analyze population trends. Data from the past 3 years indicates that a recent upward trend in Southern Royal Albatross breeding populations (1950-90's) has now leveled off. Data from the current census was compared to historic nesting data. A second objective of the research was to remove or replace the metal leg bands on breeding albatrosses. More than 35,000 of Campbell's Southern Royal Albatrosses were banded from 1941-96, and a portion of the bands have caused injury to the birds. Data from the past 2 years indicates that 8% of the banded albatrosses have been injured by their metal leg bands, with approximately 2% suffering permanent damage to their leg. Most commonly, the permanent damage was a fusing of the ankle joint due to the penetration of the metal band into the leg.

Keywords: albatross, New Zealand

Henrik Gutzon Larsen, Aalborg University. Email: hgl@plan.aau.dk; Anders Lund Hansen, Lund University. Email: anders.lund_hansen@keg.lu.se; *Gentle gentrification? Urban renewal policies and socio-cultural transformations in Copenhagen*

This paper contrasts the stated intentions and actual outcomes of the publicly initiated and supported urban renewal of the Vesterbro (West Bridge) district of Copenhagen. Vesterbro is located near the central railway station and has for years been known as the red-light district of Copenhagen with a high concentration of socio-culturally 'vulnerable' people. Apart from a physical upgrading the building stock, some of the central aims of the urban renewal policy were to include the inhabitants in the decision processes and to prevent

displacement of people from the neighbourhood. Did the policy succeed in creating a socio-culturally inclusive urban transformation? Or is the case of Vesterbro rather an example of 'gentle' gentrification - a Scandinavian articulation of state-led, neo-liberal 'general' gentrification?

Keywords: Gentle gentrification, urban renewal, Scandinavian urbanism, neo-liberalism

Kristian Larsen, BA, The University of Western Ontario. Email: klarsen2@uwo.ca; Jason Gilliland, PhD, The University of Western Ontario. Email: patucker@uwo.ca; *Assessing the walkability of urban neighborhoods for children and youth*

Less than half of all children in North America today are active enough to achieve the well-known health benefits of physical activity. The most common (and convenient) form of physical activity for people of all ages is walking. Previous research suggests that neighbourhood factors such as traffic, built form, land use mix, and crime rates (real and perceived) may influence decisions regarding a child's mode of travel to school. Using a multi-method approach this ongoing research project examines 'walkability' in the local environments of children and youth in London, Ontario, Canada. In this paper, we present the results of a systematic literature review to determine the environmental (social and physical) characteristics that influence walking behaviors among children and youth, and then incorporate these variables within a GIS to identify 'walkable' neighborhoods in London. By validating our GIS-based analysis using questionnaire data from a detailed survey of the walking behaviors of elementary school students, we will identify objective measures of environmental features that influence a child's trip to school. The ultimate aim of our study is to provide city planners and policy makers with a user-friendly tool that can help them design healthier communities that promote physical activity among children and youth.

Keywords: walking, built environment, children's geographies, GIS, urban geography

Soren C Larsen, University of Missouri. Email: larsens@missouri.edu; *Constructing Community Forests in British Columbia: Results From Ethnographic Fieldwork*

The community forests program in British Columbia provides local organizations with temporary, renewable tenure over a tract of forestland that is used to support a variety of social programs and economic initiatives in the area. Scholars are just now beginning to assess the impact of this initiative on the social sustainability of forest-reliant areas in BC, and until recently, systematic, comparative ethnographic work had not been conducted on the topic. The focus of six weeks of fieldwork in summer 2006 was to determine the specific criteria used by stakeholders to define sustainability, the ways in which stakeholders conceptualize the forest, and how these stakeholders feel the forest has affected quality of life and equity within the community. The broader significance of the project, however, was to explore how stakeholders are constructing these forests as distinctive places in their communities. They are, in effect, creating a new industrial landscape that responds to contemporary developments in North American forestry involving negotiations among government, labor, capital, indigenous people, and environmental groups.

Evan R Larson, University Of Minnesota. Email: lars2859@umn.edu; *The Status of Whitebark Pine in the Lakes Basin Area of the Eagle Cap Wilderness, eastern Oregon*

Whitebark pine is a vital component of subalpine ecosystems throughout the west. This species has experienced dramatic declines over the past century due to natural and anthropogenic causes. Much of the research investigating the decline of whitebark pine forests has been conducted in the Northern Rocky Mountains. This research has done well to inform management activities in this region, but whitebark pine is broadly distributed along multiple environment gradients. The diverse biophysical settings whitebark pine inhabits likely lead to the development of unique communities and forest dynamics across the species' range. These potential differences limit the appropriateness of one-size-fits-all management strategies based on data collected from limited environments. My research addresses part of the gap in our understanding of whitebark pine ecosystems by describing the structure, composition, and disturbance regimes of whitebark pine forests in a relatively unstudied part of its range - the Eagle Cap Wilderness in eastern Oregon. Whitebark pine represents the dominant species in my study area with respect to basal area and continues to reproduce in the presence of later-successional species. However, subalpine fir exceeds whitebark pine in the frequency of saplings and trees. Blister rust is relatively limited in this area, but evidence of past mountain pine beetle activity is abundant. Fires are relatively rare, and it is unlikely that modern fire suppression has influenced

forest succession in my study area. My research may describe a unique example of an intact whitebark pine system in which the mountain pine beetle was the historically-dominant disturbance agent.

Joel Larson, Macalester College. Email: jlarson@macalester.edu; Reaching the limits: food insecurity and hunger mitigation strategies for households in Minneapolis and St. Paul, MN

Food security and hunger are issues that continue to prove difficult to eradicate, even in developed nations. Many studies have attempted to measure and model communities that might be at risk for food insecurity, particularly in urban areas. In previous research, I undertook a similar project for the greater 7-county metropolitan area of Minneapolis and St. Paul, MN, identifying several neighborhoods that had a high risk of food insecurity. Through the use of qualitative research methods, this study intends to discover strategies and behaviors that help households and individuals mitigate the effects of hunger and food insecurity. Focusing on two ethnically distinct areas, one dominated by Southeast Asian and East African immigrants and the other by African-Americans, this ongoing research attempts to determine if there are differences in coping strategies for domestic and foreign-born minority groups, allowing for better targeting of food aid and broad programs that help eliminate food insecurity.

Kelli L. Larson, Ph.D., Arizona State University. Email: Kelli.Larson@asu.edu; Residential Landscaping Patterns and Practices in Metropolitan Neighborhoods of Phoenix, Arizona

Residents' landscape preferences and practices have implications for both water demand and water quality, in addition to other environmental impacts. In the arid western U.S., water conservation programs have recently shifted focus from indoor to outdoor uses, with particular attention to converting wet (mesic) grass landscapes to relatively dry (xeric) alternatives. Research in the southwest illustrates the potential water savings from xeriscape yards; however, the actual amount of water used depends not only on the type of groundcover and plants in a landscape, but also on technological and behavioral aspects of irrigation practices. While water may be saved by landscape conversions, the use of herbicides may increase due to the persistence of grass blades that rise up through the crushed stone groundcover of xeric landscapes. This poster presents research aimed at understanding residential water and pesticide use in relation to various landscape types in metropolitan Phoenix, Arizona. In addition, cognitive, normative and social-structural variables are evaluated as hypothesized drivers of landscaping practices. A case study approach focused on four neighborhoods, ranging from low to high income and varying in other unique ways, allows qualitative consideration of how place-specific factors influence landscaping patterns and associated drivers.

Paul R. Larson, PhD, Southern Utah University. Email: larson_p@suu.edu; A New Technique for Teaching the Koppen Climate Classification

Climate classification is a common activity in introductory physical geography courses. The purpose of this activity is to make sense of the geography of climates in terms that the typical college freshman can understand and apply. The Koppen system, often in a modified format, is the most common classification system used in introductory physical geography texts. The Koppen system is perhaps not the best or most complete system, but it is straightforward and easy to apply, and it works well toward achieving this goal. Students encounter several problems while applying the Koppen system, including mixing the codes of different categories, determining whether and when a dry season occurs, and distinguishing between humid and dry climates. The technique described in this paper addresses these problems and simplifies the classification process.

Keywords: Koppen, Climate Classification

Scott Larson, Graduate Center, City University of New York. Email: slarson21@hotmail.com; The Geographic Fixing of Panama's Emberá

For generations Panama's Emberá limited their exposure to outsiders, living semi-nomadic lives in the remote jungles of Darién Province, one of the least-developed regions in Latin America and home to one of its largest remaining rain forests. But over the past half century land grabs by ranching and timber concerns, the initiation of multilateral development projects and the establishment of environmental reserves have introduced new notions of land use and value that have helped redefine Emberá relationships to their traditional lands.

Confronted by encroaching modernity, they have increasingly settled in permanent communities, abandoning their subsistence practices in order to engage with the global economy. The proposed paper aims to assess the degree to which these new spatial realities, fueled by powerful global forces, are geographically fixing the Emberá and thereby transforming their conceptions of space and time. Through a critical reading of state, multinational organization and development bank policy papers and a review of related literature it traces the manner in which the land policies and conservation programs being pursued in the region contribute to the Emberá's evolving perceptions about land, its economic functions and the mix of opportunity and conflict that such shifts inevitably invite. Ultimately, it asserts that by sedentarizing the Emberá through the promotion of private property rights and the creation of "protected" lands where their activities are restricted in the name of conservation, a range of outside actors hope to institutionalize the logic of the market.

Claus Lassen, CL, . Email: claus@plan.aau.dk; Networking, Knowledge Organisations and Aeromobility

This paper explores work and travel in two international knowledge organisations placed in Denmark. It shows that such knowledge organisations are organised through networks on different scales. The paper argues that such networks activities can not be understood separate from aeromobility (aeromobility is defined as airborne mobility). In relation to business air travel, a core of obligations can be identified where the employees, though culturally embedded expectations, are expected to be present in relation to events, places and people. International work travel by air planes functions as an instrument to be at the right place at the right time to socialise with others and to share moments of co-presence and face-to-face communication. However a number of more individual orientated mechanisms for international air travelling are identified, e.g. the possibility to combine work and pleasure, to develop a cosmopolitan identity, to play at new places etc. The paper therefore concludes that more air travel in knowledge organisations does not necessary mean an efficient knowledge production. This means that the knowledge organisations can benefit from establishing an 'aeromobility management' concept that can balance the use of air travel and virtual communisations.

Keywords: Aeromobility, Knowledge Organisations and work-related travel

Unna I. Lassiter, PhD, California State University Long Beach. Email: lassiterui@gmail.com; Creating a new place for animals in Iran

When Reza Shah ordered that all pictures of camels and donkeys be destroyed, his intention was to set in motion the new image of Iran as a modern country. With this order, the Shah also recognized the power of representation that is bestowed on animals. Today and in the context of a fauna that is highly endangered and often neglected in Iran, what new representation of animals is necessary for Iranians to more fully concern themselves with animals, endangered or otherwise? This question is complicated by the undeniable fact that the people of Iran suffer hardships, making it particularly problematic to raise awareness about animals and nature there. And yet this is happening. More Tehranis share their homes with companion animals. And air pollution, the decline in caviar producing Caspian sturgeon, and international concerns regarding the extremely rare Asiatic cheetah have helped galvanize an Iranian environmental movement. This new movement fits squarely in the Republic's Revolutionary Constitution that states that protection of the natural environment is a 'public obligation.' The endangered Asiatic cheetah and sturgeon can thus stand for a better tomorrow that does not overlook the past, but instead helps shape a new, and thoroughly Iranian, post modernity. This case study offers an opportunity to better understand the interface of political ideology and the diverse and sometimes contradictory representations of animals.

Keywords: political geography, Iran, animals

Ann Laudati, University of Oregon. Email: umhleki@hotmail.com; The Encroaching Forest: Gorilla and Human Conflict in Bwindi Impenetrable National Park, Uganda

Presently listed as endangered under the IUCN red list, the mountain gorilla exists in just two small isolated populations in the Virunga Volcanoes on the borders of Rwanda, the DRC, and Uganda and in the Bwindi Impenetrable National Park in southwest Uganda. In 1979, the first mountain gorilla conservation initiative was formed, based on the early work of George Schaller and Diane Fossey. Since then, organizations working on behalf of the gorillas have focused on three main strategies for gorilla conservation: park security, conservation awareness, and tourism. In response to concerns that conservation subsequently address the costs associated with parks which are currently shouldered by local communities, tourism has emerged as the main conservation strategy. While the arguments for development of gorilla based tourism as the main strategy for conservation are persuasive there is as yet insufficient research concerning the full effects of tourism. There is clearly a risk of disease transmission, stress,

behavioral modification, and greater conflict between gorillas and people, yet there is little discussion of the actual effects the increased interaction between people and wildlife has had. Using a case study of Bwindi Impenetrable National Park, this talk introduces how increased human visitation in the region has affected gorilla behavior and examines how such changes have impacted the daily lives of local people, raising critical questions about the role of ecotourism as a sustainable strategy for conservation.

Nina Laurie, Newcastle University UK. Email: Nina.laurie@ncl.ac.uk; *Workfare and the partial geographies of technocratic learning*

When workfare came to the UK in the mid 1990s it was championed as a successful example of the newly emerging trend towards international policy transfers. As a result, neoliberal social welfare travelled to the UK from the Wisconsin USA as well as Australia and Sweden. The international travel usually associated with trade missions became firmly established in welfare -policy-making as MPs went on 'fact finding missions' to amass evidence to replicate best practice in the UK. A decade on from the UK's Employment Committee's report 'the right to work/workfare' (published in February 1996), and a surprising amount of work by geographers on neoliberal workfare, there is still little reflection on the geographies of learning involved. While we know much about how Australian, Swedish and US experiences have shaped UK workfare, we know little about similar welfare policies in 'other' parts of the world. For example, Workfare and Emergency Employment Programmes were functioning in Latin America long before their Northern counterparts, yet we hear little about the fact finding missions that took place to these parts. What can we learn from the partial geographies of such untold stories? What experiences can and can't be talked about? Is there an iconoclast history of welfare policy making, if so who are the players? Are they still relevant?

Keywords: Workfare, technocrats, UK, Latin America

Miri Lavi-Neeman, Department of Geography, UC Berkeley. Email: mirilav@berkeley.edu; *Beyond the Concrete: The Place of Urban Environmental Educators in the Israeli Desert*.

In the past two decades, the Israeli Negev desert—Israel's last land reserve—has become a region seething with geo-political pressures. Ever since the Israeli declaration of independence, the desert has been a landscape of great symbolic and material importance and the hub of Zionist environmental educators, predominantly of Western European origin and of upper middle class, who drew mostly on rural romantic Zionist trends. This preliminary ethnographic study examines how, with the dismantling of the Zionist project and the rise of neo-liberal policies, symbolic and material meanings of the Israeli desert are contested and changed through environmental education practices. The paper follows the practices of residents of a marginalized industrial southern "Development Town" that traditionally considered the desert the crux of their continuing oppressions and now attempt to recreate their relationships with the desert. The emerging environmental education movement of the development town has been highly inspired by discourses of minority rights, feminists, New Social Movements and indigenous Bedouins. This study however, questions the role of nationalism and Zionism in framing their presumably new strategies, terms, and understandings of place and identity. It shows how environmental education, a mechanism central to sustaining the Zionist hegemony, has become a central terrain where multiple identities (class, national, ethnic and gender) are contested, reworked, and rearticulated—and where Zionism is reinvented. It also marks these environmental educators as prominent meaning makers whose influence might reach beyond their localities and bear new possibilities and challenges for regional social change.

Jean Lavigne, PhD, College of St. Benedict/St. John's University. Email: jlavigne@csbsju.edu; *Dangerous Liaisons: The Wild Life and Strange Death of Steve Irwin*

In September of 2006 Steve Irwin, better known as Australia's wildly popular "Crocodile Hunter," died in a freakishly unusual encounter with a non-human animal. Swimming off the Great Barrier Reef, Irwin was struck in the chest by the barb of a stingray, a normally placid creature; because the barb pierced his heart, Irwin died within minutes. Ironically, Irwin was at the time taking a break from filming a new episode of his show "Ocean's Deadliest." Although the manner of his death was not inconsistent with the dangerous nature of his life's work, responses to the event were intriguingly varied, both in attitude and in physical expression. Similarly, while Irwin wowed millions with his 'up close and personal' encounters with dangerous and clearly non-charismatic fauna, a skeptical few found his approach fundamentally flawed in its masculinist anthropocentrism. The basic premise of this paper is that a critical analysis of Irwin's incredible popularity during his lifetime and of the varied responses to his death can reveal important ambiguities in the way that Anglo-American society

conceptualizes, represents, and encounters the non-human world.

Kevin Law, Marshall University. Email: law14@marshall.edu; *Key Factors in Atlantic Rapid Hurricane Intensification Prediction and the Differences between the 2005 and 2006 Atlantic Hurricane Season*

A statistical hurricane intensification model was developed to forecast the 24-hour wind speed increase. The premise of this model is that hurricanes of different intensities will intensify differently and that different factors will be responsible for intensification. Therefore, different types of intensification models were developed for major and minor hurricanes, and also based on how close the hurricane is to its rapid intensification period (RIP). A discriminant function analysis (DFA) was performed to help predict which storms will eventually become major hurricanes or only achieve minor status (Category 1 or 2 on the Saffir-Simpson Scale), thereby helping select the correct model to use. In addition, the DFA was used to help predict how close the storm was to its RIP. Therefore, the DFA helped select the correct model to predict the 24-hour wind speed increase, but the DFA also had a predictive quality in itself. The DFA was able to distinguish the key predictors between major and minor hurricanes, and the key predictors at different stages in relationship to the RIP. The 2005 Atlantic hurricane season was extremely active with 15 hurricanes of which 7 were major hurricanes. The 2006 Atlantic season has been noticeably calmer with only 5 hurricanes of which 2 were major. The key factors in hurricane intensification produced by the DFA were examined for both the 2005 and 2006 seasons. These predictors were used to explain the dramatic difference in hurricane activity between the two seasons.

Email: stuart.foster@wku.edu; *Temporal Shifts in Seasonal High (Peaks) and Low (Dips) Diurnal Temperature Range*

This project focuses on the daily diurnal temperature range or DTR for the eastern United States. The DTR has two maximums and two minimums in the eastern United States, east of the 100-degree West meridian and displays a pattern; it peaks in the spring, dips in the summer, peaks in the fall and dips in the winter. It peaks in the early spring because of increasing solar radiation, but very little evapotranspiration. In the summer the DTR dips because of abundant evapotranspiration, in the fall it peaks again because of diminishing evapotranspiration and in the winter it dips again because of significant daily cloud cover. What is being proposed is that these maximums and minimums have been "shifting". We tracked the DTR using USHCN (United States Historical Climate Network) data, smoothed the data and tracked the DTR over several decades to discover when these peaks and dips were occurring and looked for any trends. Since the spring peak is associated with the growth of vegetation the spring DTR can be used to get an estimate on the start of "spring." Some stations are indicating an earlier onset of the spring season.

Keywords: Temporal Shift, DTR

Henry W. Lawrence, Edinboro Univ of Pennsylvania. Email: hlawrence@edinboro.edu; *The early development of street tree planting in American cities, 1780-1820*

Street trees are a common feature of urban landscapes in the United States. How and where did this arboreal urban landscape form develop? My research looks at a crucial forty-year period after independence when many people began to plant street trees in American cities and towns. European precedents were influential but not determining forces. French cities had various forms of linear promenades, Dutch cities had tree-lined canals and British cities had green residential squares. But the American pattern of city trees began with individuals planting trees in front of their houses. The most important early plantings appeared in areas settled first by the Dutch — New York City and Albany — by the middle of the eighteenth century. Soon after independence people in other cities along the east coast began to plant street trees. By the middle of the nineteenth century most cities had street trees and they were becoming a ubiquitous feature of the American urban landscape. The American elm and the Lombardy poplar played crucial roles as pioneer species in the urban landscape and paved the way for other species later. This poster uses archival material, city maps and views to document this process.

Megan Lawrence, University of Oregon. Email: mlawren5@darkwing.uoregon.edu; Amy Lobben, University of Oregon. Email: lobben@uoregon.edu; *Tactile Map Use and Spatial Abilities: A Neurological Approach*

Cartographers have been interested in how people cognitively process cartographic representations for years. More recently there has been an increased interest in how blind and partially sighted map users process map information and use tactile maps. But, cartographic researchers are only beginning to understand potentially key components of blind and partially sighted map use, including spatial abilities and how they relate to tactile map use and comprehension. While behavioral research has been the back-bone of the emerging research in tactile map use, spatial abilities and blind navigation, new brain imaging techniques will allow us to move beyond behavioral data such performance and reaction times as a measure of the cognitive processes that define behavior. The growth of modern brain imaging techniques, such as functional magnetic resonance imaging (fMRI), has allowed cartographic researchers' to investigate the neurological patterns of brain activation, and therefore the cognitive processing that accompany spatial abilities and the neural underpinnings of complex high-order cognitive tactile map reading tasks. Functional MRI may reveal the spatial abilities used to solve tactile map reading problems, the strategies employed while engaged in tactile map reading activities, and differences in how individuals cognitively process tactile cartographic representations. This paper will present results from a project designed to investigate neurological brain patterns associated with completion of both general spatial ability and map-related tasks.

Keywords: cognitive cartography, tactile maps, blind map use, neuropsychology

Patrick L. Lawrence, University of Toledo. Email: patrick.lawrence@utoledo.edu; Kevin Czajkowski, Department of Geography and Planning, University of Toledo. Email: KCzajko@UTNet.UToledo.Edu; *Organizing Spatial Data for Watershed Planning in the Maumee Basin, Ohio*

In recent years several projects that apply GIScience techniques and technology to assist regional watershed planning efforts have been developed by faculty, staff and students affiliated with the Geographic Information Science & Applied Geography Research Center (GISAG) at the Department of Geography and Planning, University of Toledo, Ohio. The Maumee Basin in northwest Ohio is the largest watershed with direct drainage into the Great Lakes. The watershed is comprised of approximately 70% agricultural land cover resulting in significant water quality concerns related to surface runoff and sedimentation into streams and rivers. Rural residential development, industrialization and urban growth are also important land use trends that present numerous watershed planning concerns such as flooding, toxic contaminants, and wastewater discharges. In partnership with regional and state agencies including US EPA, USDA NRSC, Ohio EPA, Maumee RAP, and the ACOE, geographic information science and remote sensing have been utilized to examine land use changes, agricultural practices, spatial and temporal trends in water quality indicators, the organization of environmental and human use data, and application of conservation tillage methods. The work has been undertaken with public consultation and an aim towards improving community awareness and understanding of the issues and concerns within the Maumee watershed, which has included the development of spatial and GIS data base delivery via the web by use of ArcIMs and other tools. The paper will provide a review of results to date for these projects and an evaluation of the challenges and opportunities presented by this work.

Philip Lawton, Trinity College Dublin. Email: laton@tcd.ie; *Public Space and the so-called Urban Renaissance: Case Studies from London Dublin and Amsterdam*

This paper is aimed at examining the role of public space in urban change during the last decade in three European cities - London, Amsterdam & Dublin. In each city three spaces were selected that were part of, or central to, an urban renewal project during the last decade. So as to allow comparisons and contrasts to be made within and between the selected cities, these spaces were also selected based on three typologies: 1); Civic spaces of iconographic significance in terms of both the city and nation ? Trafalgar Square, London, Dam Square, Amsterdam, and O'Connell Street, Dublin; 2); Spaces that are central to distinct urban quarters or 'villages' ? Peckham Square in South London, Mercatorplein in The Baarsjes area of Amsterdam, and Smithfield Square in Dublin; 3); Spaces central to designated business areas ? Paternoster Square in The City of London, Zuidplein in the Zuidas area of Amsterdam, and Mayor Square in the IFSC business quarter of Dublin. The aims of the paper can be summarised as follows; A;) To examine the degree to which the design, management and overall delivery of public space is becoming standardised within cities and throughout cities across Europe; B;) To examine who the main beneficiaries are from re-vamping and re-imagining of public space; C;) To examine the knock-on effect of these changes on everyday

life, in terms of public reaction and usage. Overall, the paper will seek to address the role of public space in terms of the so-called 'urban renaissance'.

Helen Lawton Smith, Birkbeck University of London. Email: h.lawton-smith@bbk.ac.uk; *R&D Activities in Foreign-owned Firms in the UK: Strategy, Power and Globalisation*

One of the central concerns for both the European Union and at the member state level is how to retain R&D capacity in foreign-owned companies in the face of growing competition from developing countries such as China, India and Russia on the one hand, and the US with its major markets on the other. This paper reports on the findings from five interviews with R&D intensive multinational companies in the Oxfordshire region. These form the UK component of a current eight country European Commission Framework 6 study which is concerned with factors that drive locational decisions on R&D by internationally operating firms. The three issues investigated in interviews are: locational determinants ('why are you here'), organizational structure ('how are your activities linked to other parts of the firm'), and regional linkages ('how are your activities embedded in local institutions and business environment'). Analytically the study is concerned with power - the extent to which senior managers in individual sites have autonomy to make decisions and determine practices relating to intra- and inter-organisational networks - e.g. with local universities. The study shows that in the short-term there are geo-historical reasons why companies will maintain core activities in Europe, while in the longer term, the pattern of relocation of R&D to countries which have supplies of the kinds of highly skilled people that are diminishing in Europe will escalate. Thus the link between structure and agency is examined in relation to both centrifugal (consolidation) and centripetal (dispersal) forces within international R&D activities.

Email: lewis.owen@uc.edu; *Dendrogeomorphological reconstruction of an avalanche track in the Lahaul Himalaya, northern India: a framework for predicting snow avalanching in the Himalaya*

Snow avalanches substantially impact the landscape morphology and human infrastructure throughout the Himalaya; however, there is a paucity of event documentation for the region to assess the magnitude and frequency of events and to determine the causal factors. A dendrogeomorphic study was therefore undertaken in the Lahaul Himalaya of northern India during the summer of 2006 to provide a framework for future research to quantify the factors influencing and to determine the impact of snow avalanches throughout the Himalaya. The preliminary investigation defined the frequency and magnitude of snow avalanche events at a well-vegetated track near the village of Ratoli. This provided a chronology for avalanche events over the last few hundred years. The approximate minimum number of events is used as a proxy to show that climate variability is the major factor in controlling avalanche activity. This tree-ring record of snow avalanche activity will be expanded in future studies in the adjacent regions of the Lahaul and Garhwal Himalaya to aid in the prediction of snow avalanching.

Yanfen Le, Northwest Missouri State University. Email: le@nwmissouri.edu; *Discrete time in base geographic data: representation, implementation, and visualization*

Spatio-temporal representation and visualization are research challenges identified by University Consortium for Geographic Information Science (UCGIS 2004). This paper studies the representation, implementation and visualization of discrete time in base geographic data, including boundary, and elevation. Since space can be represented in objects or fields, we argue time should not be restricted to one model. Based on the continuous-discrete dichotomy in space and time, we extend representations from space to space-time. The feature-based temporal model is introduced for objects, and the layer-based model for fields. The latter can be further divided into sequential snapshots and changes-based, such as current-state-with-changes (CSC). We recommend CSC for fields with little change, and sequential snapshots for fields with considerable fragmentation across space over time. The feature-based temporal model can be implemented in an object-relational (OR) database. A record in an OR table describes a temporal feature, which may have multiple temporal spaces and themes. Since OR features are not supported by existing GIS programs, we develop a temporal GIS to visualize temporal geographic data stored in OR database. Different spatio-temporal models are integrated in the temporal GIS based on common spatial area and temporal period. In other words, geographic data are displayed in the map window only if they are within the same study area and are valid during same time period. In this temporal GIS, we can display a status or visualize a history by

animation. This paper contributes to add the time dimension to base geographic data.

Philippe Le Billon, University of British Columbia. Email: lebillon@geog.ubc.ca; Resources, Identities, and Territorialization: Kirkuk's Oil Fields and the Kurdish Question in Iraq

This paper engages with arguments linking natural resources, identities and territorialization, using the case of Kirkuk's oil fields in southern Kurdistan/northern Iraq. The control and exploitation of oil reserves in Kirkuk has been a major point of contention in processes of territorialization and state formation in Iraq. It resurfaced most recently through Kurdish territorial claims, populations movements, and military activities seeking to incorporate Kirkuk into an autonomous Kurdish region. Building on a review of the literature on the 'resource curse' and the particulars of the case of Kirkuk, the paper takes a historical approach to questions of identity, territoriality and governmentality around Kirkuk's oil fields. It suggests that oil undermined state formation and consolidation, notably through the symbolic codes of identity associated with its territorialization.

Mathias Le Bossé, Kutztown University of Pennsylvania. Email: lebosse@kutztown.edu; D-Day Tourism: Sites and Paths of Memory

In this poster I will survey and discuss the place of tourism and related activities in the commemoration of "D-Day". Besides official ceremonies and other forms of public remembrance, "cultural tourism" has emerged as an important element in the constellation of practices that perpetuate the legacy of a major world event and the memory of its participants. The poster will primarily focus on World War II tourism in Normandy, the original site of the Battle of 1944, while suggesting comparative forays into the phenomenon elsewhere, especially on this side of the Atlantic.

Keywords: memory and commemoration, cultural tourism

Richard Le Heron, University of Auckland. Email: r.leheron@auckland.ac.nz; Co-constituting spaces and scales of food governance: the examples of the globalising New Zealand dairy and kiwifruit agri-food chains

One of the most interesting features of recent developments in global agri-food activity has been a fundamental shift in the basis of international competition, further separating out and differentiating the globalising elements of the world food system. This development has been broadly associated by many international researchers with a shift in power from the production to the retail end of the agri-food system and changes in the geo-economic and geo-political regulatory environment. The paper explores the genesis of two different regulatory approaches to food governance in the New Zealand agri-food context. The specific New Zealand conditions are shaped by the insertion of New Zealand's neo-liberalising agri-food actors and commodity chains into different regulatory frameworks around the world. Agri-food activities in New Zealand are now highly concentrated, at the farm, processor and marketing levels, though with quite different production and marketing organisations, cultures, strategies and aspirations. Dairy and Kiwifruit provide distinctive examples for the interrogation of the emergence of different scales of governance and their multiple and interactive effects at different geographic scales and temporal horizons. The paper considers recent developments in dairying, with reference to the domestic and international strategies of Fonterra, the 5th ranking global dairy corporate headquartered in New Zealand, and, in the case of kiwifruit, the emerging relationship between EuropGap and Zespri, the New Zealand kiwifruit marketing organisation.

Keywords: Globalisation, governance, geographic scale, agri-food chains

Jennifer Lea, University of Glasgow. Email: jennifer.lea@ges.gla.ac.uk; Investing in the body

The human body is increasingly being framed as an object of anxiety (Bauman 2005), and as such it is a lucrative site for economic engagement. We are being called to make cultural investments in, across and through our bodies, making and remaking them at the same time as our bodily registers are being cultivated and populated by a variety of capitalist forces. One response to this bodily anxiety has been the use of a number of corporeal technologies and techniques that are based in the realms of the performative, or the non-cognitive (Thrift 2006). This marks a move towards a 'control society' (Deleuze 1995) in which bodies are organized, constituted and defined in ever more intimate ways: power runs through the depths and across the surfaces of bodies as they perform the world into being. This paper looks at one of these corporeal technologies which serves to both define the body in particular ways, and also is a tool with which we can initiate bodily becomings. Rooted as it is in the experiential register, yoga highlights the importance of such realms as the affective, the

virtual and the visceral for consumer society. The paper firstly asks how yoga (as a philosophical and spiritual project) defines spaces of corporeal action, in order to constitute yogic bodies. The paper then moves to interrogate how the practice of yoga materially constitutes individual bodies, perhaps offering a proliferating range of possibilities for the relational constitution of human life.

Keywords: Body geographies, corporeal technologies, yoga, consumer society

Michael Leaf, University of British Columbia. Email: leaf@interchange.ubc.ca; Southeast Asia's New Urban Frontier: Regulatory Informality and Periurban Change in Indonesia and Vietnam

This paper discusses three propositions: (1) that ongoing urban transitions throughout the nations of Southeast Asia will mean that significant proportions of new urban growth will occur in the periurban zones of the region's major metropolitan areas, and therefore periurbanization represents a new urban frontier for many of the countries of Southeast Asia; (2) that periurbanization is better understood through a set of interlinked processes of socio-spatial change rather than in terms of distinct territorial units; and (3) that the interaction of these processes presents new challenges and constraints for local governance and regulation, particularly with respect to the oversight of land use and environmental changes within Southeast Asia's metropolitan regions. An examination of these dynamics in metropolitan regions of Indonesia and Vietnam indicates how persistent and reconfigured practices of regulatory informality, in tension with formal structures of local governance and planning, shape the socio-spatial outcomes of urban growth and change in these locales.

James L. LeBeau, Ph.D., Southern Illinois University Carbondale. Email: lebeau@siu.edu; George Rengert, Ph.D., Temple University. Email: grengert@temple.edu; The Impact of Ethnic Boundaries on the Spatial Movement of Illegal Drug Dealers

Abstract: Geographic profiling commonly uses a metric that predicts an anchor point (such as the home) of a serial offender to be located near the center of a point pattern of their offenses. These routines commonly do not account for barriers to the spatial movement of the offender. These barriers include physical barriers such as rivers and expressways as well as psychological barriers such as boundaries between ethnic groups. The impact of ethnic boundaries is explored in this analysis. It is determined that the impact of an ethnic barrier is to spatially displace the predicted anchor point of the offender in the direction of the ethnic boundary.

Alexandre Lebel, Centre for Research in Regional Planning and Development, Laval University. Email: alexandre.lebel@crad.ulaval.ca; Robert Pampalon, National Institute of Public Health, Quebec. Email: robert.pampalon@inspq.qc.ca; Marius Theriault, Centre for Research in Regional Planning and Development, Laval University. Email: marius.theriault@crad.ulaval.ca; Geography of obesity in Quebec, Canada

The interest for the geography of obesity in Canada is recent and most of the effort remains descriptive. Usually, rates of obesity are simply mapped or presented over a single set of large administrative areas. In this study, we expand our understanding of the geography of obesity in the Canadian province of Quebec, by taking into account two geographical levels, simultaneously, and by introducing various individual and ecological variables into an explanatory framework of obesity. Data come from the 2003 Canadian Community Health Survey. About 25,000 respondents are nested into their local area ($n = 1,500$) and regional area ($n = 60$) of residence. The response variable is a binary version of the Body Mass Index ($BMI < \text{or} = 30 \text{ kg/m}^2$). Predictors include individual variables such as age, gender, income, educational attainment and physical activity as well as various contextual variables such as fast food restaurant's density, mixed land use and area deprivation, measured at both the local and the regional levels. In the forthcoming analysis, a first set of logistic multilevel

models will be performed to ascertain the existence of local and regional variations in obesity, after accounting for individual attributes. Furthermore, a second set of multilevel models will be carried out to examine the association between contextual variables and obesity. Results, including the construction of the geographical units, will be presented and discussed during the conference.

Scott Lecce, East Carolina University. Email: lecces@ecu.edu; Robert T. Pavlowsky, Missouri State University. Email: ; Gwenda J. Schlomer, Missouri State University. Email: ; Mercury Contamination of Floodplain Sediments from Historic Gold Mining in Gold Hill, North Carolina

Although mercury is the most common contaminant of aquatic ecosystems worldwide, its sources, pathways and toxicity-controlling processes are complex and relatively poorly understood. One source of mercury contamination is gold and silver mining where use of the mercury amalgamation process has led to the release of unprecedented amounts of mercury to the environment. The first documented discovery of gold in the U.S. occurred in 1799 in the Piedmont of North Carolina, leading to the nation's first gold rush between about 1830 and 1860. Although North Carolina led the nation in gold production until 1848, and produced more gold than any other state in the southern Piedmont gold belt, few studies of mercury contamination associated with this mining exist. The purpose of this study is to determine the magnitude and explain the distribution of mercury contamination in floodplain sediments more than 100 years after large-scale gold mining ceased in the region. This paper presents preliminary data suggesting that floodplain sediments are highly contaminated downstream from the Gold Hill mining district, one of the most intensively mined areas in the North Carolina gold belt. Maximum background Hg concentrations in 25 samples collected from source area soils is about 0.1 ppm. Samples collected from exploratory floodplain cores show that about half are contaminated above 0.1 ppm and 25% had more than 5 times the maximum background concentration. Well-defined peaks in mercury concentrations in overbank deposits are used to assess historic rates of floodplain sedimentation.

Robert M. Leddy, U.S. Census Bureau. Email: robert.m.leddy.jr@census.gov; Use of Satellite Imagery to Distribute Populations to Inhabited Places for Population-at-Risk Assessments

In response to a natural or human-induced disaster that has impacted one or more countries, the U.S. Census Bureau staff that analyzes international population data may be called upon to provide current population estimates of the specifically affected local areas. However, for many countries in the developing world, reliable census populations at the place level - cities, towns, and villages ? are not readily available. The Census Bureau therefore is developing methodologies to estimate populations of discrete inhabited places by (1) using medium- and high-resolution satellite imagery to identify and characterize the structures within their built-up areas; and (2) distributing provincial or district populations, available from most national censuses, to those places based on their structural footprints. These methodologies will be illustrated in this presentation, and validations of the populations by correlations with census numbers in areas where the latter are available also will be discussed. Numbers produced from these methodologies for assessing populations at risk in local areas with no available census data, anywhere in the world, would be invaluable.

Samuel Thomas Ledermann, University of Florida. Email: sledermann@gmail.com; Agricultural Export Strategies Revisited: A Cross-Country Analysis of the Impact of Agricultural Exports on Development and Inequality in sub-Saharan Africa

Over the past decades, global measures of income inequality have become a focal point in analyses of development. While a vast amount of global studies have supported the popular belief of a rise in both within- and between-nations' income inequality over the past century, fewer studies have dealt with an in-depth analysis of income inequality in sub-Saharan Africa. A plethora of studies on the other hand have investigated patterns of growth, finding that increases in trade resulted in increases in growth. This presentation attempts to bridge these two bodies of work by focusing on agricultural export production and its impact on development and inequality in sub-Saharan Africa. The presentation provides first an overview of some applicable theories and literature on development and income-inequality, agricultural export strategies and trade liberalization in the sub-Saharan African realm. Second, using the most recent UN-WIDER database on World Income Inequality, the author presents an empirical cross-national analysis of agricultural exports' relationship with development and inequality measures at the national scale. Finally, by highlighting specific case studies of sub-Saharan African nations, the author discusses policy implications of the findings

for agricultural-exporting nations, especially in the context of the continuing World Trade Organization's (WTO) Doha Round negotiations and their proximate impact on agricultural trade and liberalization.

Byoungjae Lee, University at Buffalo. Email: bleec4@buffalo.edu; Capturing Near Boundary Behavior of Moving Object through Spatially Extended Topology

There are many cases in which a sense of oppression or moral pressure is felt when we cross the boundary of a region. To cross a boundary, it is understood that a minimum level of effort or cost is required. Here, the boundary of the region can be described as a threshold line with a critical limit needed in order to cross. Thus, crossing the boundary can be significant signal to activate spatially embedded intelligent system such as emergency management system. To represent the behaviour of moving object near the boundary of the region, a new formal approach about the scope of influence for an object is described. A scope of influence is defined as the conceptual area where there is a possibility of a phenomenon or event occurring because of this object. Such an object can be considered a spatially extended point (SEP) by considering its scope of influence in conjunction with its location. The formalism is based on a topological data model and uses a 12-intersection model to represent the topological relations between a region and the SEP. Fourteen topological relations are described in the formal model. Compositions of gradual changes between topological relations show how to represent the qualitative spatial behaviors of a SEP objects near the boundary of the region. These qualitative spatial behaviors will hold the potential for enhancing spatial decision support system by providing more refined description of object movement near the predefined region.

Chang Ho Lee, Dr. Alan MacPherson, SUNY - Buffalo. Email: chlee3@buffalo.edu; Technology acquisitions and spillovers in US pharmaceutical industry

This study explores technology acquisition and spillovers in US pharmaceutical industry. It shows how companies in pharmaceutical industry acquire key technologies from what specific source and why. Integrating resource-based view, the study examines the mechanism of technology acquisition and spillover effects between the firms and the sources of their R&D. Surveys and interviews with selected firms will be used for the research method.

Keywords: technology spillover, technology acquisition, R&D, pharmaceutical industry

David Lee, PhD in Geography, Florida Atlantic University, Florida Atlantic University. Email: Dlee@fau.edu; Charles Roberts, PhD in Geography, Florida Atlantic University. Email: croberts@fau.edu; The Napa and Sonoma Valleys Compared: Contrasts in Land Use Texture

Both the Napa and Sonoma Valleys of California are renowned for growing grapes for wines of international reputation. Popular media describe the Sonoma Valley as smaller (correct) and more rustic and varied in character (not self-evident). This study uses a variety of cartographic and imagery inputs to determine the texture of land use in the two valleys. The objective is to identify vineyard polygons on Digital Orthographic Quarter Quadrangles, to map the size

and shape of vineyards vs. non-vineyard land, and to arrive at a rational description and visualization of the textures of land usages in the two valleys. We conclude that the Napa Valley pattern is one of nearly constant, contiguous cultivation of grapes interrupted occasionally by riparian vegetation, oak forest on slopes, settlement forms, and (rarely) other agricultural land uses. The Sonoma Valley has a smaller percentage of the land in grapes, individual vineyards are smaller, and the non-grape uses are more widespread. This technique permits the mapping of vineyards using remotely sensed imagery and could be used as a first step to create a topology of viticultural patterns beyond these test regions.

Keywords: Wine, viticulture, land-use, geovisualization, cartography, Sonoma and Napa Valley, California

Elizabeth Lee, University of British Columbia. Email: liz_lee@interchange.ubc.ca; Geraldine Pratt, University of British Columbia. Email: gpratt@geog.ubc.ca; *Transnational Lives and Gendered Immobilities*

We draw upon empirical studies of two migration experiences: those of Mexican women who travel between Mexico and the United States delivering remittances to family and friends in their hometowns in Mexico; and those of Filipinas who come to Canada as domestic workers on temporary work visas and later sponsor family members' migration to Canada. In both cases, we examine the chronic persistence of the migration process in migrants' lives, how a 'single' migration experience radiates through the generations, such that migrancy continues as a destabilizing way of life. We examine how migrancy, often never quite completed, nonetheless creates many types of immobility? geographically, economically, and politically? in part, through the radical deskilling of future generations. Rather than a celebration of migration and mobility, we draw attention to the play between mobility and immobility in migrants' lives.

Keywords: migration, gender, domestic workers, migrants

Effects of land cover change over the Indian subcontinent during the preceding March through May (MAM) on early Indian summer monsoon (ISM) rainfall were examined using the Normalized Difference Vegetation Index (NDVI) and Global Precipitation Climatology Project precipitation for the period of 1982–2003. MAM NDVI anomalies have increased significantly in western and northern India. NDVI anomalies are correlated with the decreasing trend of early ISM rainfall. Decreasing rainfall originates from the decreased land-sea thermal contrast, which is due to the decreasing trend of July sensible heat flux in central and northern India. This is related to the increase in the preceding MAM NDVI anomalies because early ISM rainfall is significantly and negatively correlated with the standardized principal component of the first leading empirical orthogonal function for the preceding MAM NDVI anomalies. Also, composite differences of early ISM rainfall for the five years of highest and of lowest MAM NDVI anomalies demonstrate that early ISM rainfall is significantly less for the years of highest MAM NDVI anomalies. Composite differences of wind vectors and divergence in the upper level also support the conclusion that the weak early Indian summer monsoonal circulation is due to the increase in land cover during the preceding spring, which would promote an increase in latent heat flux and a decrease in sensible heat flux thereby favoring a reduced horizontal temperature gradient.

Keywords: Indian summer monsoon rainfall, Land cover change, Land-sea heat contrast

Gunhak Lee, Center for Urban and Regional Analysis and Department of Geography, The Ohio State University. Email: lee.2584@osu.edu; Alan Murray, Center for Urban and Regional Analysis and Department of Geography, The Ohio State University. Email: murray.308@osu.edu; *Municipal wireless broadband network design: facility location-network design approach*

Many U.S. cities and counties are attempting to build wireless broadband networks for their own communications infrastructure and services in their communities. The reason for this is that local governments are willing to provide broadband services to their communities at a lower cost and in wider areas to meet economic, social, and public needs. Such a 'wireless movement' is followed by the emergence of wireless mesh technologies such as IEEE 802.11x (Wi-Fi) and 802.16x (WiMax). Each access point of wireless mesh networks can forward and receive data to nearby nodes as a wireless router and thus only a few access

points are required to be connected to existing wired infrastructure. Therefore, wireless mesh networks are highly reliable, flexible, and low cost extensions of wired infrastructure. In this work, we address a facility location-network design problem dealing with Wi-Fi equipment siting and wireless backhaul network design simultaneously. We focus on an empirical study in the city of Dublin, Ohio.

Harry F. Lee, Department of Geography, The University of Hong Kong. Email: harrylee@hkusua.hku.hk; *Climatic Change and Chinese Population Growth Dynamics over the Last Millennium*

Climate-population relationship has long been conceived. Although the topic has been repeatedly investigated, most of the related works are Eurocentric or qualitative, thus the relationship remains ambiguous. In this study, we employed fine-grained temperature reconstructions and historical population data to test quantitatively a hypothesized relationship between temperature change and population growth (i.e., cooling associated with below average population growth) in China over the past millennium. Results were: (1) Geographically, long-term temperature change significantly determined the population growth dynamics of China. Besides, population growth in Central China was shown to be responsive to both long- and short-term temperature changes; wherein in marginal areas population growth was only sensitive to short-term temperature fluctuations. (2) Temporally, the temperature-population relationship was clouded in some periods, yet it was attributable to the factors of drought and social buffers. In summary, a temperature-population relationship was mediated by regional geographic context, the aridity threshold, and social factors. Subject to the upcoming threat posed by climatic change on human societies, this study seeks to contribute to a better accounting of climatic effects on human societies.

Jae Yong Lee, Department of Geography, Ohio State University. Email: lee.2187@osu.edu; *Space-Time Activity Measure Focused on Individual Space-time Path and Social Network*

Space-time activity analysis based on the time geography concept has received more attention in recent year, as the analysis is sensitive indicators of individual activities in space and time. Increasing availability of individual-level data and improvement in the capabilities of Geographic Information System (GIS) make be more feasible than ever. Space-time path based on time geography concept provides information about the individual's activity space and the influence of fixed activities. Space time path is also suitable to explain the relationship with other people or with society because repeated process of coupling and uncoupling path with other paths for specific purposes or the daily process of forming "activity bundles" devoted to various forms of social interaction. Conceptually, "activity bundles" can catch the social interaction. But, practically, this "activity bundles" is not suitable because "activity bundles" contains "whole network" concept. "Whole network" assumes that the entire actors and their relationships are known. This assumption is often impractical, especially in large area. Even though space-time path itself is often impractical to show social interactions, the concept of space-time path is powerful. Conceptually, space-time path can show each individual's activity and interaction with other individual or society based on space and time. Therefore, it is necessary to develop more suitable measure for investigating both activity pattern and social interactions based on space and time. In this presentation, more suitable measure for social interactions at specific time and space will be discussed.

Keywords: Time Geography, GIS, Social Network, Space-time

The Llano Estacado region of West Texas and Eastern New Mexico contains tens of thousands of small playa lakes. These ephemeral water bodies, essentially, are the only wetland environments for local and migrating wildlife species. Mapping and classifying playa lakes for the National Wetlands Inventory using a soils database (SSURGO) and photointerpretation provides a data set to investigate the degree of human-induced modification of these wetland resources. We compare two areas. Hale County is dominated by irrigated agriculture and 1238 playas were mapped in our study. Deaf Smith County has more varied land uses, mainly irrigated agriculture, dryland farming and rangeland and has 318 mapped playas. This study is concerned with direct modification of the playas

themselves, including plowing the playa surface, draining and ditching, excavating, and diking and impounding. In Hale County, 25% of the mapped playa area is plowed for crops. This, obviously, removes the wetland vegetation and alters the surface characteristics of the clay soils. Three percent of the playa area is drained or ditched, 2% is diked or impounded and 1% is excavated. These last three modifications significantly alter the hydrology of the playas, reducing the area that is water-covered. For Deaf Smith County, 7% of the playa area is plowed, 10% is drained or ditched, 3% is diked or impounded, and 1% is excavated. Also significant, but not measured here, is farming in a playa's drainage basin but not plowing the playa itself. This increases sedimentation into the playa, thus reducing its water storage capacity.

Keywords: wetland, playa

Jiyeong Lee, University of North Carolina at Charlotte. Email: jlee68@unc.edu; *Defining 3D Spatial Neighborhoods for Topological Analyses using a 3D Network-Based Topological Data Model*

After 9/11 there are special interests in 3D models to represent internal structures of micro-scale urban areas, in order to understand and analyze human movements in micro-levels. Spatial analyses such as optimal evacuation route or fire spread analyses within the building need to define spatial relationships among rooms to describe how individual spatial units interact - termed "spatial neighborhood". 3D searching operations should deal with complex geometric computational problems involved with defining spatial neighborhoods between the 3D target object and well-formed 3D objects in a micro-scale urban area (rooms in a building). Therefore, this study is motivated by the need of a new method to define the spatial neighborhoods among the 3D objects for analyzing human behaviors in micro-space, such as a relative accessibility measurement for people with different abilities, or an evaluation of neighborhood pedestrian accessibility. This study presents an algorithm to define spatial relationships based on network-based neighborhoods for 3D topological analyses in micro-scale urban areas. The approach utilizes the algorithm to find a minimum spanning tree (MST) in a connected and undirected graph. Because the dual graph topological model G is a network representation having geometric properties, well-known algorithms for finding minimum spanning trees in graphs can be applied to defining 3D spatial neighborhoods. In other word, the algorithm can generate a minimum spanning tree from a node n_i of the network G, and then the network segments within a certain distance from the node n_i can be identified from the MST.

Jongwon Lee, Ewha Womans University. Email: jongwonlee@ewha.ac.kr; *Development of Spatial Skills Test*

The Association of American Geographers is currently developing a Teacher's Guide to Modern Geography (TGMG). The project is funded by FIPSE (US Department of Education). The primary aim of the teacher's guide is to improve the preparation of pre-service teachers. A spatial skills test has been developed to assess teachers' mastery of the Guide's content and skills. The 16-item standardized test measures performance on a variety of tasks based on aspects of spatial cognition, including orienting oneself on a street map, comparing map information to graphic information, choosing the best location based on several spatial factors, imagining a slope profile based on a topographic map, correlating spatially distributed phenomena, overlaying maps, and recognizing spatial data types (point, line, or polygon) based on verbal descriptions. The two equivalent forms of the spatial skills test have been developed to be used for pre- and post-test research design. 470 undergraduate and graduate students from 9 different universities in the US took the test. The preliminary results based on the test data will be discussed at this presentation. The sample test items of the spatial skills test will be shown at the same time.

Keywords: Spatial Ability, Spatial Skills, Test

Richard P Lee, University of Newcastle-Upon-Tyne. Email: R.P.Lee@ncl.ac.uk; *The Political Economy of Food Security and the Everyday Practices of Food Sovereignty*

Over recent decades the growth in international agricultural trade has led to increasing interest in the notion of food security. In the post-war developed nations, productivist frameworks prioritised national self-sufficiency but these have been eclipsed with the construction of more highly integrated and international food supply chains. In states which are home to high levels of under-nutrition and hunger, food security strategies are also being shaped by trade considerations. I argue that a new mode of food security is emerging as a consequence of the WTO Agreement on Agriculture, with different implications for different places. I first examine recent work on food security by the UK's Department of Environment, Food and Rural Affairs (Defra). As a response to new, trade-driven notions of food security, an international social movement is emerging to promote food sovereignty rather than security. The food sover-

eignty movement, comprising a network of NGOs, demands the removal of agriculture from the international trade system and rejects agricultural biotechnology and industrial agriculture in favour of localised food production and the protection of rural livelihoods across all nation-states. Drawing upon interviews and participant observation work, I investigate the everyday political practices and moral economies of those involved in the food sovereignty movement and relate these to the current international political economy of food security.

Keywords: Food Security; International Agricultural Trade; Food Sovereignty

Sang Lee, PhD Candidate, University of California, Berkeley. Email: salee@nature.berkeley.edu; *Migrant Women in the Global South: Nicaraguan women working in the nontraditional agricultural export industry in Costa Rica*

The expansion of nontraditional agricultural exports (NTAE) resulting from neoliberal agricultural policies promoting an export oriented economic development, have changed the shape and structure of rural economies in the global south. This study focuses on how changes related to NTAE production determine where and how women work in the agricultural industry. While a number of studies demonstrate an increased labor demand in women's participation in NTAE production and post harvest processing, there is a dearth of literature examining the relationship between international migration and export agriculture. This study uses the case of Nicaraguan migrant women working in pineapple and cassava post-harvest industry in north-central Costa Rica to examine the relationship between international migration and NTAE production, more specifically how legal status and gender shape women's work options and its structure. Informed by in depth interviews, surveys and participant observation the study shows that international production norms for export required by purchasing countries, namely the European Union, is the most significant factor for segmenting the labor pool between documented and undocumented women migrant workers. Furthermore, women absorb the challenges of fresh crop production and export, such as irregular demands and perishability through their work structure and piece rate wages in both pineapple and cassava packing plants. At the broadest level, this study seeks to understand the relationship between international development and international migration in the global south, illuminating how the process of economic globalization unravels on the ground for the most marginalized workers in the global economy.

Taesoo Lee, SUNY-Buffalo. Email: taesoo@buffalo.edu; Chris S Renschler, SUNY-Buffalo. Email: rensch@buffalo.edu; *Community based integrated watershed management and modeling in Cattaraugus Creek Watershed, NY*

The 1,500 km² Cattaraugus Creek Watershed, NY, covers five counties and is a major contributor of discharge and sediments to Lake Erie. The watershed provides various recreational activities, fishing resources, and excellent biodiversity. The gorge area has been identified by EPA as best remaining forest landscape in the region in terms of biological integrity and diversity. Recent decades, human induced landuse changes and poorly designed land management resulted in water quality degradation. The negative impacts are caused by intensive agricultural landuse, residential sprawl, stormwater, and toxic sites including superfund and radioactive waste management sites. Moreover, poor coordination and communication among the municipalities, inefficient information and data, and financial and technical resources unavailability are responsible for the problems deterioration. This study introduces the recently launched Cattaraugus Creek Integrated Watershed Management Project to develop strategy together with local stakeholders for soil and water conservation, biodiversity, and recreational sources. This project consists of two major elements. First, scientific research part in the project including data acquisition, sampling, and modeling provides basic understanding of watershed conditions, spatio-temporal dynamics of runoff and sediment discharge, and the impact of future landuse change to design an integrated watershed management plan. The modeling for runoff and sediment yields will be conducted based on historical and grab sampling data using the Soil and Water Assessment Tool (SWAT). Second, watershed protection plan and the modeling effort will support community based collaboration in watershed management including problem identification, community education, and guideline and regulation development.

Wook Lee, Texas State University-San Marcos. Email: wlee@txstate.edu; A disaggregate analysis of accessibility

This paper explores accessibility patterns and its changes for the tri-state area including Indiana, Kentucky, and Ohio. Locational accessibility is differentiated by type of workers, as a way to measure the growth potential of employment or residential development. Utilizing the information minimization (IM) model developed by O'Kelly and Lee (2005), balancing factors of each occupation are employed as surrogates for accessibility with respect to residential and employment locations, respectively. Locational accessibility is examined for 6 occupational groups and visualized in 1990 and 2000 at the county level for the tri-state area.

Keywords: commuting, accessibility, disaggregation

Yong-Sook Lee, National University of Singapore. Email: geolys@nus.edu.sg; An Unhappy Coupling between Competitiveness and Balanced Development?: Unpacking the New Regional Policy in South Korea

This paper examines the new regional policy under the Roh Moo-Hyun administration and its impacts on regional development in South Korea. The new regional policy aims at achieving more balanced regional development through the construction of regional innovation systems. For this goal, the Special Act for Balanced National Development was enacted in 2003, and several projects have been pursued. The projects include 'a new administrative capital', 'innovation clusters', 'regional strategic industry', 'transfer of public institutions to local areas', 'establishment of regional innovation system' and so on. Problematising the rationale behind the new regional policy, this paper debunks the "innovation-oriented balanced development", which is characterized by an unhappy coupling between the contradictory policy goals (enhancing competitiveness through innovation vs. achieving more balanced development). We examine the socio-political contexts under which the two contradictory policy goals have been combined in South Korea and evaluate the feasibilities and the limits of the new regional policy.

Keywords: regional policy, regional development, innovation, South Korea

Youngmin Lee, Ewha Womans University, Korea, and Ohio State University. Email: ymlee@ewha.ac.kr; Youngmin Lee, Ewha Womans University, Korea, and Ohio State University. Email: ymlee@ewha.ac.kr; Transnationalism "unspeakable": A Globalizing Change of Los Angeles Koreatown

Globalization across the Pacific is bringing new patterns of urban-social change into the western coast of North America. Traditionally the coastal urban centers have drawn Asian immigrants seeking to achieve the American dream, taking advantage of the inner ethnic town as a stepping stone to mainstream society. Los Angeles Koreatown is such a place, having played an important role for Korean immigrants to make "go east to the U.S." history. Recent decades, however, have seen L.A. Koreatown re-territorialized into a newly identified multi-ethnic place as well as a nodal point of Korean transnationalism. Global-scaled South Korean transnationalism, which has increased in parallel with her rapid economic growth, has brought a huge influx of Korean capital and concomitantly led many undocumented migrant workers of many backgrounds into L.A. Koreatown. This study examines the nature and process underlying this spatial and economic transformation in, and cultural re-ethnicization of K-town in the era of globalization. Korean and Korean-American newspapers and other media data are examined to identify the strengthening global connection of K-town with the outer-world. Also, L.A. mainstream newspapers and government-issued documents are examined to identify the mainstream perspective on, and the redevelopment plan for, downtown and inner ethnic town, including K-town. Semi-structured as well as informal interviews are being conducted with key informants from the hegemonic actors above, to the undocumented laborers at the bottom. The activities of K-town based NGOs also are examined, so as to present the dynamic interplay of transnationalism and the local politics of place.

Keywords: Koreatown, transnationalism, re-territorialization, politics of place

Ronnie D Leeper, WKU. Email: vergungen@hotmail.com; Rezaul Mahmood, WKU. Email: rezaul.mahmood@wku.edu; Stuart Foster, WKU. Email: stuart.foster@wku.edu; Kenneth Hubbard, University of Nebraska-Lincoln. Email: khubbard1@unl.edu; Increase in Near Surface Atmospheric Moisture Content Due to Land Use Changes

Land use change can affect soil moisture, surface energy, and near-surface temperature and moisture content. During the 20th century portions of the North American Great Plains have experienced introduction of irrigated agriculture. It is expected that land use change from natural grass to irrigated land would increase moisture content. Modeling studies have shown enhanced rate of evapotranspiration from irrigated areas. This study analyzes dew point temperature (Td) to assess the affect of irrigated land on near surface moisture content. This provides an opportunity to use Td data from the Automated Weather Data

Network. Td data from six non-irrigated and eleven irrigated locations were analyzed. Daily time series were developed with their length as the factor in selection. Comparison of Td between non-irrigated and irrigated locations showed higher growing season Td over irrigated areas. Average growing season Td at irrigated sites can be 4.74 °C higher. Moreover, individual monthly Td at irrigated sites can be 5.43 °C higher during growing season. The results conclude that land use change in the Great Plains has modified near surface moistness.

Keywords: Evapotranspiration, Land use change, and Great Plains.

Loretta C. Lees, King's College London, Dept. Of Geography. Email: loretta.lees@kcl.ac.uk; Gentrification and social mixing: towards an inclusive urban renaissance?

Twenty six years ago now Holcomb and Beauregard (1981) were critical of the way that it was assumed that the benefits of gentrification would 'trickle down' to the lower classes in a manner similar to that hypothesized in the housing market. Nevertheless, despite fierce academic debate about whether or not gentrification leads to displacement, segregation, and social polarization, it is increasingly promoted in policy circles both in Europe and North America on the assumption that it will lead to less segregated and more sustainable communities. In keeping with a longstanding strand of research that has identified the liberal desires of the new middle classes for difference and diversity in the city as key to the process of gentrification and to the creation of a more diverse and tolerant city, the benefits of functionally as well as socially mixed urban communities have become something of an unquestioned gospel in policy discourse. But there is a poor evidence base for this policy of 'positive gentrification'. For as the gentrification literature tells us despite the new middle classes' desire for diversity and difference they tend to self-segregate and far from being tolerant, gentrification is part of an aggressive, revanchist ideology designed to retake the inner city for the middle classes. In light of this I argue that New Labour's policy of social mixing requires critical attention with regards to its ability to produce an inclusive urban renaissance and the potentially detrimental gentrifying affects it may inflict on the communities it intends to help.

Laura Leete, Willamette University. Email: lleete@willamette.edu; Manuel Pastor, University of California, Santa Cruz. Email: mpastor@cats.ucsc.edu; For Richer or Poorer? A Regional Comparison of Labor Market Intermediaries Serving Higher- and Lower-Income Workers

In this paper we examine differences in labor market intermediary (LMI) usage among higher and lower-income workers in two different regional economies. In previous work (Benner, Leete and Pastor, 2007) we find that the pattern of LMI usage is different in the Silicon Valley region of California and in Milwaukee, Wisconsin, with more LMIs in Silicon Valley serving white-collar and higher income workers. Here we probe this difference. We examine how the LMI sector reflects differences in the economic structures of the two places and whether LMIs provide different services and have different implications for different classes of workers in the two locations. We also test whether the relationship between LMI use and social capital differs in the two locations for higher- and lower-income workers. This work will draw on a unique set of survey data collected on over 1,000 workers in the two regions in 2001 as well as on case studies of LMIs in both locations.

Keywords: regional economics, workforce issues

Stephen Legg, University of Nottingham. Email: stephen.legg@nottingham.ac.uk; Stephen Legg, . Email: stephen.legg@nottingham.ac.uk; Race, sexuality and scale as problematisations of colonial governmentality: interwar and international regulation of Indian prostitutes

The social hygiene movement of the early 20th century addressed the biopolitical realm from its controversial heart, the sexual politics of reproduction, to the more mundane practices of public health. Across these epistemological and material spaces were intertwined questions regarding race and sexuality: who should reproduce; who threatened future generations; who was safe to be where; and which race could bear the liberal burdens of a life of social/civil hygiene. This paper will trace the negotiation of these questions by the colonial Government of India with regard to the question of prostitution. The question was posed both internally and internationally. The Association for Moral and Social Hygiene was emboldened by a radical tradition and worked from the local level in India to shame and expose the government into action to clamp down on regulated or tolerated brothels. In contrast, the League of Nations, after initial social purity inclinations, adopted hygienist campaigns, with the help of various international organisations, including the British Social Hygiene Council. The League, however, was forbidden from intervening in "domestic" or "national" affairs, and thus initially confined itself to international trafficking. The undeniable role of licensed brothels in sustaining this traffic led, however, to bolder calls for national and local action to tackle this global problem. This

provoked a serious debate about scale, authority, race, and sexuality which threw into question the imperial geographies of the long nineteenth century in contrast to the international and globalising geographies of the twentieth.

Keywords: Governmentality race sexuality scale india prostitution

Carl J. Legleiter, Department of Geography, University of California Santa Barbara. Email: carl@geog.ucsb.edu; *Quantifying the spatial variability of river morphology and hydraulics in natural and restored gravel-bed rivers*

Current research at the interface between geomorphology and ecology emphasizes linkages among geomorphic complexity, habitat heterogeneity, and the diversity and productivity of aquatic ecosystems. River restoration seeks to reestablish these connections by rehabilitating fluvial processes that create and maintain habitat and thus sustain viable populations of critical species. Achieving this goal will require a spatially explicit approach to quantifying variability in channel morphology and hydraulics. Geostatistics provides an appropriate, stochastic framework for this characterization, summarizing variance at different scales based on the dissimilarity between pairs of observations separated by a range of lag distances. Although Euclidean distance is not an appropriate metric for meandering channels, transformation to a channel-centered coordinate system allows variations along and across the channel to be described in an intuitive frame of reference. This approach to quantifying reach-scale spatial variability is demonstrated using field data from pristine and restored gravel-bed rivers in Yellowstone National Park and California's Central Valley, respectively. For example, variogram models fit to depth and velocity measurements collected at different discharges summarize the stage-dependent spatial structure of the flow field, and comparison of variogram models from different reaches illustrates the relationship between disturbance history and reach-scale spatial variability. For the recently restored river, geostatistical tools are used to characterize morphologic response to a period of sustained high flows: point bar development, bank erosion, and modification of the constructed pool-riffle geometry. This type of spatially explicit description efficiently and quantitatively summarizes the evolution of geomorphic complexity from the simple initial conditions of restored channels.

Keywords: fluvial geomorphology; river restoration; spatial variability; geostatistics; gravel-bed river

Ann M. Legreid, Ph.D., Central Missouri. Email: legreid@cmsu1.cmsu.edu; *Space and Place in the Nordic-American Experience*

Nordic immigrants in America read, analyzed, and cognitively mapped their environments in innumerable ways, maps that were influenced by a host of factors such as age, gender, worldview, and Old World experience. The New World meant new spatial forms and modifications of old ones. Nordic-American perceptions of space were shaped largely by four intertwining forces, i.e. personal experience/cognition, mass produced cartography, school geography, and the National Geographic Society, a widely available source of information and images about American and world cultures. The world view of an immigrant was a collage of cognitive and factual maps. It was shaped by national atlases, county platbooks, values, attitudes, and experiences, a blending of the Old World and the New. Immigrants navigated their environments with a set of interrelated visual cues influenced heavily by kin and social relationships. They were attached to spaces at different scales, from dwelling to neighborhood and ethnic community. The study utilizes immigrant letters and memoirs that expressed an evolving sense of place in the immigrant mind.

Keywords: space, perception, cognition, immigrant

Ute Lehrer, Assistant Professor, York University. Email: lehrer@yorku.ca; Jennefer Laidley, York University. Email: jlaidley@yorku.ca; *Waterfront Developments as Megaprojects: The Post-Industrial Promise?*

Starting from an analysis that posits large-scale urban waterfront redevelopment as exemplary of a 'new megaproject' in a post-industrial, 'post-modern' context, this paper examines the promises made by proponents of these redevelopments, focusing particularly on the discourses which frame waterfront redevelopment as a "public good". Significant criticism was leveled against 'old megaprojects' for their inability (or unwillingness) to deliver on the modernist promise of urban equality. As such, adequate evaluation of the 'new megaproject' requires a comprehensive understanding of the promise that it holds in a significantly different economic and cultural context. As part of a larger project examining Toronto's current waterfront redevelopment project, this paper will present the results of a textual analysis of a range of official documents as well as newspaper articles and will offer a variety of preliminary conclusions about the efficacy of the 'new megaproject' as a conceptual category for urban waterfront analysis.

Keywords: megaproject, waterfront, public good, urban redevelopment, post-industrial morphology, neoliberal urbanism, discourse analysis

Ute Lehrer, Assistant Professor, York University. Email: lehrer@yorku.ca; Patrick Gamsby, York University. Email: pgamsby@yorku.ca; *Gentrification, neo-liberalism, and the condo boom in Toronto*

Using the case of Toronto, Ontario this paper will explore the 'condo boom' that is currently taking place in Canada's largest metropolis. We argue that the ideology of neo-liberalism is propelling the rapid construction of expensive condominiums in Toronto, while concurrently constraining the potential for affordable housing projects. We, therefore, wish to shed light on the confluence of power that is utilizing the city of Toronto's official plan to privilege the expansion of middle class housing over working class housing, thus resulting in gentrification. It is our position that a tripod of gentrification, neo-liberalism, and the condo boom are altering the makeup of the city, and serve as mutually reinforcing entities in the discourse of Toronto's condominium explosion.

Keywords: gentrification, condominium boom, urban policy, neo-liberal urbanism

Jonathan Leib, Florida State. Email: jleib@fsu.edu; *Plates and Politics: Banal Nationalism, Geopolitics, and Identity in the Automobile Era*

In the automobile era of the 20th and early 21st Centuries, the most visible expression of a person's place of residence is found on the license plate attached to their vehicle. While the first automobile registration numbers were assigned in Europe in the 1890s, it was in 1903 that the U.S. state of Massachusetts issued the first standard license plate with the location of the place of registration clearly marked. Within several decades of the first issuance of license plates, localities began to use these devices for advertising purposes, such as promoting local economies and tourism through pictures and slogans. By the middle to late 20th Century, however, some countries and localities started to use the license plates they issued to promote nationalist ideology, as a way of trying to establish a measure of sovereignty, and to pursue geopolitical claims to territory. Using Michael Billig's concept of 'banal nationalism', this presentation uses numerous examples to illustrate how some authorities use such a banal signifier of place as the license plate to further nationalist goals (as in slogans found on Quebec and Panama license plates), seek to legitimate claims to independence and sovereignty through the issuance of new license plates to vehicles in breakaway regions (such as Katanga, Serbian Krajina, and the Transdnister), and further states' claims to neighboring territory (such as Iraq's claim to Kuwait, and Venezuela's claim to the western part of Guyana).

David S. Leigh, University of Georgia. Email: dleigh@uga.edu; *Human Influence On Floodplain Sedimentation Along The Upper Little Tennessee River, Southern Blue Ridge Mountains, USA*

This research examines human-induced geomorphic transformation of the Upper Little Tennessee River valley within a 363 km² catchment of the Southern Blue Ridge Mountains. Objectives focus on measuring late prehistoric and historic overbank floodplain sedimentation rates and deriving ungaged flood records from sedimentology. Stratigraphy, particle size, and geochronology (radiocarbon and cesium-137) data were measured at three mainstem floodplain sample sites from cores and outcrops. Particle size was measured in continuous down-column overbank sediment samples (1-3 cm increments). Results indicate that late prehistoric sedimentation rates were less than 1 mm/yr, whereas historical sedimentation rates are an order of magnitude higher (5 to 17 mm/yr). Furthermore, the most rapid historical sedimentation rates of 13-17 mm/yr occur after 1960. These latest high sedimentation rates correspond to a time period of gentrification in the region characterized by second home construction, road construction, and other erosive land uses related to population and infrastructure growth. Comparison of particle size data with post-1945 stream gage data indicates that the percent of particles larger than 0.25 mm is a good indicator of the frequency of large overbank floods, but that little information is provided about flood magnitude. Particle size data indicate that the highest frequency of large floods occurs after 1960, relatively few large floods occurred circa 1910-1960, whereas many large floods occurred during the peak time of timber harvest in the region circa 1875-1910. Ongoing research concerns the importance of wet versus dry climatic periods on sedimentation versus changes in land use.

Gun Control in Local Economic Development

H.J. Rubin's now classic 1988 article characterized the practice of economic development as "Shoot anything that flies, claim anything that falls." Little has changed about economic development practice in the nearly 20 years since his article was published. But during the same time period, the academy has engaged in critical debate over "economic development equals economic growth" perspectives, as well as what challenges the larger movement towards sustainability poses for the theory and practice of local economic development. After reviewing the debate, this paper discusses some promising strategies that may coax economic development practitioners into putting down their traditional weapons and engaging in the real business of local economic development planning. The widening inequality and environmental degradation that is the legacy of traditional economic development makes it critical that they do so, and that the gap between economic development theory and practice is bridged.

Spatial variation of heat mortality according to gender, age and day in the New York City heat wave of 1901: a GIS approach

The June-July, 1901 heat wave was the most deadly weather-related event in New York City (NYC); nearly 700 lives were lost due to the intense heat and humidity of that heat episode. Using data from a vital statistics and newspapers, this study examines the spatial variation of heat mortality in regard to age, gender and spread of the heat wave, by day from the first day to the last. The daily pattern of the mortality is sporadic at first, but by the third day is linearly distributed along Third Avenue on the east side. On the peak day, heat mortality spreads throughout the west side and into lower Manhattan and then into Brooklyn. No clear spatial pattern exists with gender, except more male deaths are noted on the west side. Unlike present day heat waves, the 1901 episode has more deaths evenly distributed throughout the age cohort, even in the 20-40 division, a group that usually had the fewest heat deaths. Most heat deaths in the elderly cohort seem to be located on the west side, ranging from about 20th street to the forties

James Kurt Lein, Ohio University. Email: lein@ohio.edu; Karis L Day, Palmer Engineering. Email: kday@palmernet.com; Assessing the Growth Inducing Impact of Infrastructure Development in Appalachian Ohio

Within the context of environmental impact assessment, growth inducing impacts describe a project's potential to foster spatial, economic, or population growth in a geographic area. Although typically viewed as an adverse consequence of land use change, examples can be noted where the investment in infrastructure was used to promote growth and encourage beneficial changes to a region. One example of this intent can be found in Appalachia with the Appalachian Regional Commission's program to construct the Appalachia Development Highway System (ADNS). Initiated in 1965 to address the severe economic disparities in the Appalachian region, the success of the ADHS program remains unclear. The purpose of this study is to examine the spatial expression of growth along the Ohio portion of the ADHS (Corridor D/State Route 32) for the period 1976 to 2005. Using a combination of remote sensing and GIS techniques, the result of this study reveal a detectable pattern of change with respect to the highway corridor and provides a methodology to spur additional research within the broader Appalachian region.

Adoption of E-commerce Strategies by U.S. Manufacturing Firms and the Role of Customer Initiated Demands

There has been much speculation about the impact of the Internet on the production and distribution process as well as the spatial organization of firms and industries and the changing roles of suppliers and customers. Based on a mail/web survey conducted in 2006, this paper explores the major forces which propel E-commerce strategies and how these strategies are being adopted by U.S. manufacturing firms. We focus largely on the motivations behind the innovative use of E-commerce and particularly the extent to which it is being driven by customers. Preliminary interviews with firm managers indicate that customer initiated demand is an important factor in its adoption. The detail and creativity of the applications clearly vary by firm size, ownership structure, and industrial sector. Also considered is the extent to which other factors (internal dynamics, suppliers, etc.) are affecting E-commerce adoption.

Alaskan Perceptions of Global Warming

Americans generally perceive climate change as a geographically and temporally distant problem, with significant consequences for marginalized people and places (e.g., small island or poor tropical countries), but not for the United States (Leiserowitz 2005). Climate change, however, is already having severe impacts on the U.S. state of Alaska. Alaska's climate has warmed about 4°F (2°C) since the 1950's and 7°F (4°C) in the interior during winter. It has already experienced significant impacts including dramatic loss of sea ice, shifting ecosystems, permafrost melting, infrastructure damage, and forest fires. This presentation reports results from a representative statewide survey of the Alaskan public (n=1018) conducted in 2006 to investigate whether Alaskans have detected these changes, attribute them to anthropogenic climate change, perceive climate change as a significant threat, and what mitigation and adaptation measures they support. The Alaskan results will also be compared against recent national survey data to examine the role of actual experience in climate change risk perception and behavior.

The Impacts of Hurricanes Katrina and Rita on Public Safety in Louisiana - A Spatial and Temporal Analysis of Reported Crimes

The natural disaster that took place on August 29, 2005 (Hurricanes Katrina and Rita) in Louisiana has created a historic opportunity to evaluate our understanding of the impact of massive population displacement and resettlement on crime, community and the criminal justice system. This research assesses the impact of massive displacement of people (non-criminals and criminals) on crime rates both within Louisiana and selected urban areas outside of Louisiana (Houston, Atlanta). Within Louisiana certain parish populations have dramatically increased in a relatively short period of time, including Baton Rouge, Shreveport, and many rural parishes. Three different types of data are used in this analysis. As denominator data to calculating crime rates, population counts were collected from the US Census Bureau and from applicants for the FEMA Individual Assistance (IA) program. Reported crime data used in this research represent the seven index-crimes that define Part-I criminal offences: Murder, rape, robbery, aggravated assault, burglary, larceny theft, and motor vehicle theft. Part-I offences were provided by the Louisiana Commission on Law Enforcement for the years spanning 2000-2005. Crime data for 2006 will also be collected, if they become available in time. Finally, socio-economic data were collected from the US Census Bureau. Methods include exploratory spatial and temporal data analysis, including co-maps; detection and mapping of crime hot spots and their changes over time; and spatial regression models to analyze the relationships (and their changes) between crime and other demographic and socio-economic data believed to be associated with crime.

Dave Lemberg, Western Michigan University. Email: lemberg@wmich.edu; Feasibility of Improving Aid to Heart Attack Victims with CPR-Trained Volunteers

The dispatch of Emergency Medical Services (EMS) has been a longstanding problem in Geography. EMS response times to calls have been reduced to 5-6 minutes through location-allocation and routing approaches. To reduce response time by ambulances would require larger numbers of vehicles and crews that would stretch the economic viability of the service providers. On the other hand, there are potentially many people trained to give Cardiopulmonary Resuscitation (CPR) within a minute or two of many heart attack incidents. If they could be contacted and dispatched to incidents on a voluntary basis, initial aid could be started minutes before the EMS team arrives, with a significant improvement in survivability. To explore the feasibility of this approach, travel diaries will be completed by a group of CPR-trained subjects to overlay travel patterns and activity spaces on a set of geolocated heart attack incidents to determine potential coverage. Surveys will also explore issues and perceptions of CPR-trained volunteers participating in a program using spatial technologies to call for emergency aid.

The distribution of Antarctic sea-ice thickness, and its response to climate change, has been evaluated using a variety of climate models, often producing conflicting results. Such studies may be limited by poor model physics and the lack of continental-scale, sea-ice thickness observations for model validation. From 1995 to 1998, the National Ice Center (NIC) produced weekly, operational sea-ice charts using a variety of remotely-sensed imagery, from which sea-ice thickness estimates have been derived for the entire Southern Ocean. Antarctic sea-ice thickness estimates derived from remotely-sensed imagery were compared to in situ ice-thickness observations and determined to be suitable for use in model validation. The Antarctic ice-thickness distribution derived from the NIC charts were then used to validate the Antarctic ice-thickness distribution produced by the National Center for Atmospheric Research (NCAR) Community Sea Ice Model, Version 5 (CSIM 5.0).

Josh Lepawsky, Memorial University of Newfoundland. Email: jlepawsky@mun.ca; Clustering as anti-politics machine? Economic development and political expediency in planning Malaysia's Multimedia Super Corridor.

High-tech industrial clustering is increasingly being adopted as a policy panacea for local and regional development in newly industrializing countries. This paper addresses the formation of an 'intentional cluster' in Malaysia called the Multimedia Super Corridor. Drawing on Ferguson's notion of development projects as 'anti-politics machines' the paper demonstrates how notions of clustering are mobilised by state stakeholders to literally reshape the political-economic landscape of the country while nullifying political opposition to those plans. In this sense, the paper 'theorizes back' to mainstream economic geography literature that tends to treat clustering as an exclusively economic phenomenon.

Timothy F Leslie, Arizona State University, Tempe. Email: Timothy.Leslie@asu.edu; Economic Subcenters in a Postmodern Urban Area

Centers of economic activity within urban areas have fascinated scholars and led to a wide range of conceptual frameworks and theories to explain patterns of development and interaction. This paper sets forth a method to define urban centers within a spatial-economic framework. Phoenix is used as an exemplar city, growing by over a factor of thirty between 1950 and 2005 and labeled as one of the largest of the fastest growing metropolitan areas in the United States. My analysis combines previous methodologies to define centers, and follows with an investigation of their economic and employment properties. Both employment and establishment patterns are critical to my definition of centers. Smoothing provides the distributions used to generalize center locations. Following the identification of centers, I develop a binary choice model to assess the factors that drive establishment location in a center. In order to show temporal change in this rapidly growing metropolitan area, centers are identified

and their structure investigated in 1995 and 2004.

Keywords: urban structure, subcenters, clustering, industrial location

Agnieszka Leszczynski, Simon Fraser University. Email: aleszczy@sfu.ca; Quantitative limits to qualitative discussions: Critical GIS, GIScience, and the philosophical divide

Historically there has been a disjuncture between the discourses of Critical GIS and GIScience, associated with the inability of the critical establishment to leverage their critiques in a language relevant to the technical community. While much attention has been given to early debate, this paper examines postmillennial exchanges and appraises what, if anything, has changed. Although critiques have moved beyond emphases on positivism, poststructuralist interpretations of GIS continue to privilege epistemology as a basis for deconstructing the technology. Stemming from competing understandings of ontology and epistemology, poststructuralist critiques misapprehend the realist commitments latent in GIS' foundation in computing. Whereas poststructuralism positions epistemology as the basis of inquiry and thereby the antecedent of ontology, GIScience interprets ontology to be a fixed universe whose contents are epistemologically encoded into existence. These differences are philosophical, and are subject to Richard Rorty's observation that any two discourses separated by such divergent ontological and epistemological commitments are ultimately incommensurable. If these discourses are to communicate, a mechanism must be identified to articulate critique in tractable terms. These arguably exist in the form of the Semantic Web, which is engineered to enable nuanced knowledge representation. Formal ontologies - domain-specific conceptual models? constitute flexible means of mapping between philosophical and informatics interpretations of ontology. Because they represent partial accounts of reality, formal ontologies effectively situate knowledge at the level of the machine. While formal ontologies operationalize a new vocabulary for representation, they do not bridge the philosophical divide. Critical GIS and GIScience may remain irreconcilable discourses.

Chi Kin Leung, California State University, Fresno. Email: cleung@zimmer.csufresno.edu; Yehua D Wei, University of Wisconsin at Milwaukee. Email: weiy@uwm.edu; Wangming Li, Zhejiang University. Email: ; Economy, Institution, and Location: Foreign Investment in the Yangtze Delta Region, China

Based on an investigation of foreign manufacturing establishments in four cities (Shanghai, Nanjing, Hangzhou, Suzhou) in the Yangtze Delta region, this paper examines the relative importance of economic and institutional factors in the location decisions of multinational companies (MNCs) in China. The paper finds that unlike their location decisions in developed host economies, MNCs generally pay more attention to institutional factors when placing their investments in the Yangtze Delta region. The range of institutional factors MNCs consider includes the administrative level or affiliation of Chinese partner(s), transparency of local regulations, and quality of local government agencies. The range of economic factors MNCs consider includes market size, operation costs, and land availability. MNCs generally place their investments in Shanghai or Nanjing if their ventures involve state-affiliated Chinese partner(s). These joint ventures tend to situate in the existing sites of their Chinese partner(s) in old industrial districts in inner city areas; they tend to have a stronger host market orientation. By comparison, MNCs undertaking wholly-owned investments usually place their establishments in Suzhou and in the new industrial districts in the outer city areas of the four studied cities. Early foreign wholly-owned investments in the region tend to have a lower, and recently newly established ones a higher, host market orientation. Operation costs (such as wages and various fees) and land availability are common economic considerations of MNCs for their investments in the region.

Delphis Levias, University of Delaware. Email: dlevias@udel.edu; Steven Quiring, Texas A&M University. Email: squiring@geog.tamu.edu; Assessment of student learning in a hybrid PBL capstone seminar

Successful assessment is key to the learning process. Instructors need to provide students with appropriate, explicit and timely assessment to optimize student learning. Despite the potential benefits of problem-based learning (PBL), some may be reluctant to formulate PBL activities for their classes because it would require a new set of rubrics and assessment practices. In PBL curricula, assessment should be used to encourage and reward student participation. This talk presents an analytical rubric developed for diagnosis of student learning via formative assessment in a capstone environmental impact analysis course. The use of the analytical rubric in student grading is also explained. It is hoped that this rubric provides a template for how student learning can be assessed in other courses in geography curricula that employ a similar student-centered approach to learning.

Keywords: geography education, assessment, problem-based learning

Arielle Levine, University of California - Berkeley. Email: alevine@nature.berkeley.edu; Staying Afloat: State agencies, local communities, and international involvement in marine protected area management in Zanzibar, Tanzania

As funding for international conservation initiatives has shifted away from directly supporting developing states towards privatization and decentralization in natural resource management, developing countries are working increasingly through international NGOs and private sector organizations to support protected areas. The government of Zanzibar has come up with an innovative system to guarantee access to international funds through its Environmental Management for Sustainable Development Act. This Act strategically enables external organizations to be designated as protected area managers while maintaining a role for the state as an intermediary in reaching local communities. While this system allows protected areas to be established when government resources are limited, it sets up a convoluted relationship between the Zanzibari state, international agencies, and local communities that is not conducive to fostering sustainable programs. In the case of Zanzibar's marine protected areas, this results in many challenges and obstacles including confusion over the links between conservation and development objectives, the limitations of ecotourism as a development strategy, the uneven concentration of program resources, the peripheralization of the Zanzibari state, and the negative implications for local capacity-building when the state is threatened by a strong civil society. More attention must be given to promoting a supportive role for the Zanzibari state, as well as strengthening local initiatives for natural resource protection.

Yael Levitte, Cornell University. Email: yl343@cornell.edu; Sharmistha Bagchi-Sen, SUNY-Buffalo. Email: geosbs@geog.buffalo.edu; Global Pressures on Learning Regions/Clusters: Time Series Analysis of Biotech Firms

New economic geography theories, particularly Porter's Cluster theory and Florida's Learning Region theory, are instrumental to understanding the role of spatial proximity for actors in high-tech, knowledge-based industries. Successful innovation and economic success in these industries is often credited to geographical agglomeration. Increasingly, however, critics of such conceptualizations label them 'chaotic' or 'fuzzy,' questioning their emphasis on local interaction and their utility for policy makers (e.g. Martin and Sunley, 2003; Bathelt et al, 2004). Alternative conceptualizations suggest a more complex geography of global and local economic networks. Empirical evidence to support these new ideas is still quite sparse. Studies of the biotechnology industry, however, highlight the utility of both local and global networks to innovation and economic growth. We argue that the maturation of the biotech industry provides an opportunity to revisit New Economic Geography theories. In this paper, we employ a time-series analysis of two surveys of biotech firms, from 1998 and 2004, to bring out changes in economic practices as the industry matures. Empirical data help reformulate some controversial ideas, contributing to the critical controversy. We conclude by suggesting how a consideration of the ways maturing biotech firms alter their practices leads towards a more nuanced articulation of the ideas under critique.

Adam Levy, University of Colorado-Boulder. Email: adam.levy@colorado.edu; From Bakery to Brothel: Re-territorialization and exploitation in urban Turkey

Turkish slums - or *gecekondus*— have evolved considerably since they first emerged over 30 years ago. Following the resurgence of Kurdish separatism and the manifestations of structural adjustment, competing forces have exposed the *gecekondus* to re-territorializations of their social and economic spaces. Domestic development priorities, negotiated within this context of post Cold War neoliberalism and a messy counterinsurgency, have yielded distinctive urban and political geographies including new spaces of exclusion. Explicitly, these consequences are visible where urbanization and mobility patterns have fragmented and altered traditional social networks to reveal new rural-urban migration and exploitation trends. "Natashas", or women from the former Soviet Union engaged in prostitution, have typically served as the most notorious markers of regional changes. Recent findings suggest Turkish citizens are also trafficked and exploited internally as indicated by shifting uses and controls over slum spaces; neighborhoods too poor to support bakeries are finding brothels emerging behind these same facades. Drawing on a 2005 pilot study of internal Turkish trafficking, this paper incorporates theoretical perspectives about spatial scales and social networks using both quantitative and qualitative methods to produce more geographically sensitive development research. Through ideas about the hyper-differentiation of space and the uneven impacts of neoliberal urbanization, the conventional divide separating domestic versus international human trafficking research is also reconsidered. The findings and conclusions provide support for a typology of spaces of exclusion and exploitation while paying special attention to urban and peri-urban slum processes.

Alan A. Lew, Ph.D., Northern Arizona University. Email: alan.lew@nau.edu; Web 2.0 Virtual Travel-escapes

Blogs, podcasts, instant messaging, user reviews, photo sharing, mashups, wikis, multiplayer virtual worlds, open source, interactive Ajax-based websites, social bookmarking, tagging (folksonomy), social networks, and other forms of social software are all aspects of Web 2.0, which is generally defined as a more user participatory and emersive web environment than was Web 1.0, which was more of a one-way, web-as-information-source. Travel and tourism websites, primarily focused on destination promotion and travel agency sales, were (and continue to be) a leading segment of the first wave of Web innovation in the 1990s. Web 2.0 applications in travel and tourism have, so far, been relatively limited. However, what is currently under development can provide considerable insight into the future of tourism promotion, destination development, and the travel experience. Areas, for example, that will have particular resonance for how people conceive and experience travel destinations include niche market development, online community building, and user-generated content. These have the potential to create new destinations and change existing destinations in ways that are difficult to predict.

Geoffrey Lewis, University of Michigan. Email: glewis@umich.edu; High-value wind power: spatial and temporal correspondence of wind speed and electricity LMP in Michigan

Renewable sources are currently responsible for a small fraction of the electricity generated in the U.S., only 2.4% in Michigan. There are 4 wind turbines now operating in Michigan with 2.6 MW of combined capacity, much less than the estimated 16,560 MW of Class 3 and above wind resource available (Class 3 wind speeds are greater than 6.4 m/s at 50m height). There is clearly a large unrealized wind resource in Michigan, but which areas are the most desirable for locating wind generators? This presentation discusses work addressing this question. By examining the relationship between the wind resource in Michigan and wholesale electricity prices (measured hourly as locational marginal prices

(LMP) at 7380 generator nodes across the state), we can develop an understanding of which areas offer the greatest economic value. This examination specifically focuses on how wind speed and LMP vary in space and time and how they are correlated. LMPs include the effects of congestion and so tend to be higher at times of peak demand and in areas with marginal transmission capacity. The use of LMPs allows us to differentiate between areas with favorable wind resources, which can be found using wind speed data alone, and areas with the greatest economic value, which have high LMPs as well as favorable wind resources. Historical data are used to explore where and when favorable wind resources coincide with high LMPs, highlighting those places and times deserving of closer scrutiny for siting wind generators.

Jason M Lewis, School of Geography and Earth Sciences, McMaster University. Email: lewisjm@mcmaster.ca; Susan Vajoczki, School of Geography and Earth Sciences, McMaster University. Email: vajoczki@mcmaster.ca; Monitor and Quantify Shoreline Change between Playa Guiones to Playa Ostional, Guanacaste, Costa Rica

The study area consists of four beaches separated by rocky headlands located along the Pacific coast of the Nicoya Peninsula, Costa Rica. Although the beaches are concurrent along a 12 km stretch of coastline each is characterized by a unique combination of: beach slope, length and shape; sediment composition, size and mineralogy; and vegetation. It is anticipated that the active tectonism in the region combined with the distinct wet/dry seasons will result in dynamic beaches with distinct morphology. The four beaches each have discrete land uses: Playa Guiones is a tourist beach that is experiencing a rapid increase in development; Playa Pelada is the only beach in the region that is suitable for boat access; Playa Nosara and Playa Ostional, although less developed, is an important Olive Ridley turtle nesting site. The first objective is to quantify the influence of wet/dry climate on seasonal shoreline position. The second objective is to quantify longer term temporal changes through analysis of air photos and satellite imagery from 1940 to 2005. It is anticipated that this time series will provide evidence of the influence of tectonism on shoreline position. The analysis involves a comparison of Digital Elevation Models (DEM) created from real-time kinematic GPS data collected in June 2005 and January/February 2007 with aerial photography and satellite imagery from 1940-2005. Preliminary results from this analysis will be presented in this poster. These results will provide further understanding of past temporal changes; thus, assisting future coastal management decisions along this section of coastline.

Joseph Lewis, Ohio State University. Email: lewis.844@osu.edu; States Beyond Borders: Sovereign Overreach and Extraterritoriality in the Israel-Palestine and Israel-Hizbullah Conflicts

This paper examines the differing modes of sovereignty exercised by Israel upon neighboring populations, and problematizes these layers of sovereignty as responses to non-state threats. Prior to the July, 2006 Israeli incursion into Lebanon, the Palestinian Territories were subject to a project of patchwork extraterritorial sovereignty perpetrated by the Israeli Defense Forces (IDF), as well as formally and informally through the creation and growth of Israeli settlements outside of the internationally-recognized borders of Israel. The imposition of a new border (despite Israeli government rhetoric to the contrary) in the guise of the "Security Barrier" formalized not only the abandonment of the Israel-Palestine peace process, but also re-created notions of sovereignty beyond Israeli borders. The winding route of the Security Barrier concretized the patchwork of Israeli sovereignty in the Palestinian Territories that had previously centered on concentrations of Israeli bodies—that is, the settlements. The events of July, 2006 introduced a new wrinkle to the imposition of Israeli sovereignty outside its borders. As Israel's bombing campaign and re-invasion of southern Lebanon was tacitly accepted by the international community, it was cast as a state response to a non-state threat, and justified on these terms. The extension of Israeli sovereignty over its northern border, however, came at the expense of another state—Lebanon. As a result, though the IDF has pulled out, Lebanese sovereignty over its own bounded territory has been compromised.

Nancy Davis Lewis, PhD, East-West Center. Email: LewisN@eastwestcenter.org; Unraveling the Millennium Ecosystem Assessment: Implications for the Geography of Health and Disease

Completed in March 2005, the Millennium Ecosystem Assessment (MA) was a massive five year undertaking involving over 1,360 experts from 95 countries. The objective of the MA was to "assess the consequences of ecosystem change for human well-being and the scientific basis for actions needed to enhance the conservation and sustainable use of those systems and their contribution to human well-being". The total bill was \$17 million with an

additional \$7 million of 'in kind' support. The bottom line of the MA is that human activity is straining the planet's ecosystems to such a degree that sustainability for future generations can not be taken for granted. Human-well being was a central concept in the MA and human health (largely but not entirely in relation to infectious disease) was directly addressed in three chapters as well as in a Synthesis Report, "Ecosystems and Human Well-Being: Health". There was also an "afterthought chapter on the implications of the MA for achieving the Millennium Development Goals (MDG). Disease ecology has been a cornerstone of medical geography. While medical geographers (and geographers in general) were by and large not key players in the MA, the challenges raised by the MA would certainly benefit from the conceptual frameworks, theories and methods of geographic analysis. The MA process is briefly explored and other new initiatives, e.g. the journal *EcoHealth*, the International Society for Ecology and Health, etc. are discussed with a view to the potential contribution of medical geography to these interdisciplinary endeavors.

Nathaniel McAllister Lewis, M.A. student, George Washington University. Email: nlewis@gwu.edu; Adaptation and Accommodation: Immigrant Acculturation and the Response of Receiving Communities in National Minority Regions

From a geographic perspective, the second half of the 20th century was characterized by two major trends in the organization of people on the earth's surface. One is the increasing interaction of societies and cultures through the growth of transnational migration. A second is the tendency for non-state actors to seek greater self-determination through the pursuit of cultural autonomy and re-definition of the cultural landscape. This paper examines the confluence of these two trends in Quebec and other societies. Although findings reveal that transnational migration and minority self-determination can coexist through the emergence of multicultural systems and careful policy management, many societies?Quebec included?demonstrate tensions related to race, immigrant status, and questions of political independence.

Internationalising education is seen by entrepreneurial economic agents (including universities) and state actors as an economically significant industry. Other commentators are beginning to recognise it as a force for transformation in the production of knowledge, but geographers have been slow to examine it as a political, educational or economic phenomenon. In articulation with the neoliberalisation of tertiary education and the promotion of the knowledge economy, the internationalisation of education is implicated in transforming the practices of universities, the political work that they perform, and the forms and spatialities of knowledge production. These transformations have implications for the structuring of post-foundational knowledge spaces and state projects in education, and for resolving the enduring educational problematic of what gets taught to whom and by whom, and the question of how is this decided. In this paper, we trace the emerging imaginaries and transformative practices associated with a maturing industry of international education in New Zealand. We draw on multiple data sources including interviews with those responsible for international education strategy and operations in fifteen of New Zealand's 30 tertiary education institutions. We reveal a diversity of practices and responses to the imperative to internationalise and identify key contradictions between the impetus to raise revenue and various educational interests and between domestic and international policy. We highlight the implication of internationalisation in the remaking and rescaling of tertiary education.

Robin A. Lewis, University of Arizona. Email: ralewis@email.arizona.edu; Interdiscursivity and the politics of expertise: Certifying sustainable forest management in Malaysia

This paper explores how recent discourses surrounding ecological sustainability serve to transform forestry politics in Malaysia. With its economy strongly tied to the exportation of timber and timber-based products, Malaysia simultaneously faces international pressure to produce certifiably sustainable timber originating from 'well-managed' forests. In 1992, the Malaysian Timber Certification Council (MTCC) was established to address these very issues. MTCC, however, faces continuous criticism regarding its forest certification standards, as outlined by its 2001 Malaysian Criteria and Indicators for Sustainable Forest Management. Since February 2004, Greenpeace International (GPI)

published a series of reports challenging the sustainability and legality of the MTCC scheme. MTCC responded through rebuking GPI's claims in its subsequent press releases. Using critical discourse analysis, to evaluate this series of publications, my work (1) investigates how MTCC and GPI conceptualize the term 'sustainability,' (2) explores instances in which broader environmental discourses are invoked and subsequently challenged by each organization; and (3) identifies the key foci of contention underlying the MTCC-GPI debate. Results indicate that MTCC and GPI draw upon conflicting notions of sustainability, suggesting that the broader discursive practices shaping each institution's argument are incongruent yet strategic. In identifying two very different forms of interdiscursivity being displayed in the MTCC-GPI debate, this study serves as a poignant example of the ways in which international discussions surrounding sustainability have successfully infiltrated policy discussions across a variety of spatial scales.

Andrew Leyshon, University of Nottingham. Email: andrew.leyshon@nottingham.ac.uk; *The software slump: code and the crisis of the recording studio sector*

The music industry has been radically transformed by software, perhaps to a greater extent than many other contemporary businesses. Software formats such as MP3 and the rise of Internet 'piracy' have had significant impacts upon intellectual property rights and distribution within the industry. This paper explores another part of the musical economy which has also been radically transformed through code. It traces the roots of the use of software in the recording studio sector which encouraged a vertical disintegration of production in musical agglomerations from the late 1970s on. In so doing it helped leading recording centres to strengthen their hold on the market for recording budgets. However, the impact of software since the mid-1990s has been less benign for such centres. The rise of more affordable digital recording rigs and easier programming protocols represents a democratisation of technology, making available a process that was once only accessible through the facilities and skills provided by a recording studio. Software and code has made possible a regime of distributed musical creativity, which is having significant impacts on the organisation of the musical economy. The recording studio sector is in crisis which has produced a spate of studio closures, redundancies and underemployment within musical agglomerations. The 'institutional thickness' of key recording centres has been significantly depleted in recent years. The paper draws on research undertaken by the author in the UK professional recording studio sector between 2005 and 2006.

Michael Leyshon, Dr, University of Exeter. Email: mleyshon@ex.ac.uk; *De-coupling from the rural: Young people's bodies, social exclusion and identity formation in the countryside of the UK and USA*

In this paper I extend our understanding of the ways in which young people in rural areas experience their identity. Through a close ethnography of the leisure activities of 7 groups of young people, 4 from the south west of England and 3 from New Jersey, USA, this paper shows how pubs, clubs, bedrooms and other informal spaces such as 'behind the village hall' or on the sidewalk provide performative arenas in which identities are constructed, negotiated and reproduced. In particular this paper explores the significance given by rural young people to their discursive leisure practices and the extent to which these practices lead to inclusionary and/or marginalising experiences. Eschewing conventional notions of the body, by recognizing the body as malleable, porous and an unfinished product, subject to socially produced alteration, this paper teases apart the different lived experiences of rural young people by arguing that much of their behaviour in public and private space(s) can be seen in terms of acts of spectacle, compliance and challenges to disciplinary frameworks. To illustrate this point I discuss how rural youth employ various embodied strategies to move between spaces to experiment with alcohol, sexuality and alternative femininities/masculinities and 'do' gender, thereby contesting acceptable rural gender roles and expectations and decoupling from the rural. Through shedding light on informal leisure practices, I reveal how this experimentation affects their sense of their body, gender identity, belonging and their current and future prospects in the countryside.

Bailiang Li, Texas A&M University. Email: libl@geog.tamu.edu; Douglas J. Sherman, Texas A&M University. Email: sherman@geog.tamu.edu; *Temperature and pressure corrections for aeolian sediment transport experiments*

Air density and kinematic viscosity are commonly treated as constants in aeolian sand-transport experiments and modeling. However, they are not universal constants, and will change gradually with air temperature and pressure. The typical range of temperatures that we find in nature or in wind tunnels is large enough that these effects can substantially impact results. For example, if the air temperature rises from 0°C to 40°C and the atmospheric pressure is fixed at 1 atm, the air density decreases by 12.8% and kinematic viscosity increases by 25.8%. On the other hand, density increases when pressure rises, but decreases with increased pressure. Specifically, if the pressure drops from 1 atm to 0.7 atm (associated with high altitude arid regions, for example) and the temperature is fixed, the density will decrease by 30.0%, kinematic viscosity will increase by 42.9%. As air density and kinematic viscosity are significantly changed under different conditions, two equivalent dimensionless-parameters (free stream velocity and grain size) are recommended to standardize the reporting of aeolian sediment dynamics under different temperature, pressure. Here, we use dimensionless mean flow velocity and dimensionless sediment grain size. From the above two parameters, the free stream velocity and grain size under different conditions can be converted to an arbitrary reference condition (here we use dry air at 1 atm and 10 °C). Dimensionless analysis can help to correct the temperature and pressure influence, which may reduce the errors.

Bin Li, Central Michigan University. Email: bin.li@cmich.edu; *Geographic Strategy of China's Overseas Direct Investment*

China has surpassed Japan as the country with the largest amount of foreign reserves. Its economy has been booming for the last two decades. To secure the supply of raw materials and energy, and to find new markets for its commodities, China has systematically carried out a geographic strategy to invest in foreign countries directly. This paper examines the geographic patterns of direct investments from China. We attempt to address two groups of questions. (1) How do China's overall overseas direct investment change geographically and structurally in the past 10 years? Which sectors and counties have China been investing in the same period of time? (2) What are the impacts of overseas investment on domestic economy and regional development? What are the potentially challenges for Chinese multinational enterprises to invest overseas? In this paper, we present our preliminary findings through analyzing data published by the Chinese government, the World Bank, and host countries.

With the development of spatial data infrastructure, there are growing interests in synergism of multi-source data. For resources sharing and collaborative computing, various inconsistencies in terms of temporal datum, geodetic datum, data format, accuracy, and semantics need to be dealt with. Based on the proposed method for representing spatial data and information, the spatial information multi-grid (SIMG), this paper describes a scalable grid-based strategy for integrated processing of multi-scale data in a grid computing environment. The core of SIMG is to divide global and national grid into hierarchical sub-grid layers according to latitude and longitude. Each grid cell is located by the latitude and longitude at the central point, with items recorded, such as latitude and longitude, geo-central coordinates, and coordinates in different projections. Each object located in a grid cell has its relative distance to the central point in a specific coordinate system recorded. The grid cell size is dependent upon the level of economical development and density of objects, with coarse grids used for sparsely distributed objects, while finer grid for densely distributed objects, making SIMG adapted to local natural and social characteristics. The data conversion and transfer between SIMG and conventional spatial databases will be discussed, with the positional accuracy of affine transformation as opposed to rigorous transformation between SIMG coordinates analyzed. Geostatistics for spatial data conflation will be explored. The applicability of SIMG at different levels will be elaborated on.

Keywords: spatial information multi-grid, scale, grid computing, spatial databases, conflation

Dingmou Li, Ohio State University. Email: li.662@osu.edu; Ningchuan Xiao, Dr., Ohio State University. Email: xiao.37@osu.edu; *Topology-Preserving Vector to Raster Transformation: Experiments and Algorithms*

The vector and raster data models have been widely used in geographic information systems. It is a common practice to convert a vector dataset into a raster format. For some applications (e.g., corridor analysis), it is important to maintain topological relationships such as connectivity. However, traditional rasterization algorithms are typically designed to maintain area or other non-topological features. As a result, topological relationships between spatial objects may be lost during the conversion process. In this paper, a number of computational metrics are used to measure the topological characteristics of the raster data created using different rasterization algorithms. For each rasterization algorithm, the scale effect will also be examined. Finally, we develop rasterization algorithms that can be used to preserve topological characteristics of a vector when it is converted to a raster; we also compare the performance of our algorithm with existing methods.

Jia Li, . Email: rebecca_ljia@hotmail.com; Jia Li, Department of Geography, Hong Kong Baptist University. Email: rebecca_ljia@hotmail.com; *Function Division in Nature Reserve*

Nature Reserve represents a special land use type with the protection of wildlife species, ecosystems of natural relics as the main objectives. But the success or failure of conservation depends on the effectiveness and sustainability of Nature Reserve management, which is the fundamental guarantee of the healthy development of Nature Reserve. However, people are harming the Wolong Nature Reserve, China's largest protected area for giant pandas. To a certain degree, the fate of Wolong Nature Reserve represents the success or failure that Chinese government and international organization have made. The researcher Hardin made a major contribution to economy by firstly developing the "Common" approach to the understanding of the interaction between social interests and common resources in environment destruct causation. As a kind of social and common resources, Nature Reserve is of "Common" characteristic. Two serious consequences that are directly brought by "Common" characteristic of Nature Reserve are crowded tourists and dense facilities. Obviously, there is a close relation between tourism and environment. To avoid conservation being destroyed by tourism activities as well as divert tourists for optimal utility of resource, Nature Reserve should be functional divided. As a special Nature Reserve for panda conservation, Wolong is different from others. Tourism could only be developed in restricted area. The reserve should be divided into six functional zones: natural maintenance and core zone, buffer and control zone, experimental and utilization zone. Furthermore, exact range of area and percentage should be defined.

It has been estimated that 34 million individuals in the highland areas of East Africa are at risk of malaria. In the last two decades, an increase in severe malaria cases was observed in this region. Malaria outbreak in Kenya Highlands occurs almost annually from May to July. This seasonal pattern of malaria outbreaks is associated with the availability of mosquito larval-habitats. An understanding of the seasonality of habitat availability is critical for malaria control. Due to the complexity of mosquito reproduction process, there are two primary challenges for adding the seasonal aspect to a spatial larval-habitats model. The first challenge regards to the incomplete knowledge of the mechanism regulating the seasonal fluctuation of mosquito population. The second challenge is that information is limited for describing the seasonal difference in the spatial distribution of habitats. A method which is flexible and capable of dealing with the incomplete knowledge and information is needed. To cope with these challenges, we coupled two methods to build spatial larval-habitat models which explicitly take seasonality into consideration. One method is Dempster-Shafer theory, a probability theory of evidence. Another is Weight-of-Evidence method, which is a data-driven method and used for preparing evidence for the Dempster-Shafer theory. This integrated method identifies unique spatial patterns for habitats at different seasons. Our study also identifies areas which are sensitive to climatic changes. The uncertainties associated with the habitats models are quantified to support more rigorous mosquito-control decision making.

Li Li, . Email: susieqksl@gmail.com; *Spatial Differentiation and Driving Mechanisms of Urban Sprawl in Shenzhen*

Abstract. Since the economic reform was initiated in 1978, urbanization in China has been accelerating and most cities have experienced rapid expansion. Yet spatial differentiation and driving mechanisms of urban sprawl in China are not well understood. Based on the analysis of the urban land use changes between 1994 and 2001 in Shenzhen, this paper aims to examine the amount and intensity of urban sprawl and shed light on the defining characteristics of its spatial differentiation using Shannon's information entropy measure. Using the hierarchical clustering classification approach according to the amount and the entropies of the urban sprawl, we can detect four spatial patterns of urban sprawl in Shenzhen: compact congregation pattern, administrative-center congregation pattern, traffic-center congregation pattern, and low-density sprawl pattern. Conceptual and policy implications of our empirical results will be discussed in detail.

Keywords: Urban sprawl, information statistics, Shenzhen

Linna Li, Penn State. Email: lul123@psu.edu; Alan M. MacEachren, Penn State. Email: maceachren@psu.edu; *Supporting Geocollaboration Using Map-based Discussion*

Traditionally, GIS has been designed to support individual work. However, many important decisions are made by teams using geospatial data, and the members in a team are often from various disciplines in different places. The need for different-place collaborative work with geospatial data has escalated recently due to events such as natural disasters like the Katrina hurricane and concerns over risks such as avian flu. Advances of GIS and the Internet make communication between team workers easier. Geocollaboration is an emerging area that investigates how to support team-based decision making using collaborative visualization in a geospatial context. This research studies how geocollaboration can be facilitated by map-based discussion among a group of participants. It provides a communication platform, supporting immediate contact, map annotation and message sharing. Software designed for this study will help users build group awareness to help negotiation. A profile of participants will be provided for the purpose of common ground establishment. Users can attach the comments to a specific position or object on the map and the entire group can be aware of others' perspectives and activities. In addition, the history of discussions through time can be tracked.

Scientists, land managers, decision makers and regulators require more effective and efficient tools to find and compile knowledge for use in plans, reports, analyses, models and assessments. GRIP (Geospatially-Reference Information Portal) is developed to meet this need and to support spatially-enabled knowledge management applications. It has an open service oriented architecture (SOA) that supports distributed geoprocessing. GRIP functionality addresses several challenges including searching against heterogeneous data formats (documents, images, etc) and data sources (local files systems, network databases, web search engines), and improving the relevance of retrieved data in relation to the user query. In this paper we present the architecture of GRIP, as well as a prototype application which adopts an ontology-driven approach to spatial information retrieval. We will present the OWL ontologies that we developed to facilitate spatial information retrieval in the application domain of desert tortoises science, and we will show how these ontologies can be used (1) to index geospatial data in project databases, and (2) to invoke the appropriate geospatial analysis operations based on the spatial relations specified in the user query. We will demonstrate the workflow of the spatial information retrieval process, including the ontology-guided user query formulation, spatial analysis and reasoning, and the clustering of search results based on the structure of the ontology.

Shujuan Li, Texas A&M University. Email: shujuan@geog.tamu.edu; Shenzhen's urban planning: Review and evaluation

Rapid urban development in China attracted abundant research while relatively few enquiries focus on the urban planning. Few studies have been done to examine the relationship between urban planning and the built environment. This paper provides a review and demonstrates a quantitative evaluation of Shenzhen's urban planning which will provide enlightenment for urban planning for other Chinese cities. During the short urban development history of Shenzhen, three master plans were established in 1982, 1989, and 1996 along with numerous revisions. Instead of guiding urban development, master plans seem to try every effort to catch up with the rapid pace of urban development. The quantitative evaluation of Shenzhen's third layout plan was conducted with land census data of 1996, 2000, and 2003. The result shows that newly built up area was primarily located out of area planned rather than within its originally proposed boundaries. Proposed ecological reserves were seriously threatened by urban growth. It is quite questionable whether master plan plays its role.

Si-Ming Li, Hong Kong Baptist Univ. Email: lisiming@hkbu.edu.hk; Changing Job and Housing Distributions under Marketization in Chinese Cities: A Study of Guangzhou

In China, under the work-unit system, workers used to live in the work-unit compound where they worked. Yet with the economic and housing reforms, the work-unit system has undergone fundamental changes. Many work units have relocated the production plants to the suburbs and redeveloped the former work-unit compound in whole or in part to capitalize on rising land prices. Others may not survive the increased competition and have gone out of business. The almost perfect match between job and housing distributions is being torn apart at an increasingly rapid pace. The need for commuting is on the rise. Especially caught in the massive urban transformation are the low-income manual workers. The factories they used to work in have moved out to the suburbs or simply disappeared. Yet they still have to reside in the old dilapidated housing provided by the work units. Unemployment is on the rise, although in some cases the work units the workers formerly worked in would still allow them to occupy the old and dilapidated work-unit housing in the former work-unit compound. A situation not unlike that of the spatial mismatch phenomenon in American cities (Kain, 1968; Houston, 2005) probably has emerged. Based on large-scale surveys conducted in Guangzhou in 2001 and 2005, this paper tries to examine the extent to which the separation between residence and workplace has increased and whether the spatial mismatch hypothesis holds in the Chinese case.

The interdisciplinary team consists of geographers, Asian- and African-Americanists, language specialists, a nursing scientist, sociologist, and historian with complementary analytical and language skills. The study area is located in the easternmost New Orleans residential subdivisions that boasted an almost equal distribution of Vietnamese Americans and African Americans. The research addresses 1) the pre-Katrina socio-spatial configuration of the Vietnamese American and African American communities in the study area, and what damage Katrina caused to these communities; 2) if previous experiences of involuntary geographic displacement of evacuees, especially among Vietnamese Americans, as well as gender, cultural, linguistic, legal status, geographic, and socioeconomic differences affect their perceptions of risk and uncertainty, their access to emergency relief services; and what similarities and differences between the two communities are evident and how did each community negotiate evacuation and access to emergency relief services, relocation assistance and rebuilding funds through existing racial/ethnic and/or faith-based community networks, as well as their adaptation to temporary or permanent resettlement or of their community and business rebuilding efforts in New Orleans; 3) the similarities and differences in physical and psychological vulnerability between the two groups of interests after the disaster and what are the critical factors contributing to their physical and psychological outcomes. This timely study will evaluate the mental and organizational decision-making process by the two study groups in the face of uncertainty and produce policy recommendations to better serve the needs of such communities during the recovery period and to better prepare for similar disasters in future.

Keywords: African Americans, Vietnamese Americans, Katrina, community

Weidong Li, Department of geography, Kent State University. Email: weidong6616@yahoo.com; Chuanrong Zhang, Department of Geography, Kent State University. Email: czhang2@kent.edu; A Markov Chain Random Field Algorithm for Conditional Simulation of Categorical Variables from Random Point Samples

Quantitative prediction and simulation of categorical variables from limited samples are crucial for cost-effectively acquiring exhaustive area-class maps. However, conventional methods usually cannot meet all of the requirements for class simulation in incorporating interclass relationships and generating polygon features. This study develops a random-path sequential simulation algorithm based on the Markov chain random field (MCRF) theory. The objective is to find a suitable method for predictive area-class soil mapping from irregularly distributed point samples, and thus extend Markov chains into practical nonlinear geostatistics. The algorithm is used to simulate soil type maps conditioned on three different sample datasets, and compared with the widely-used indicator kriging simulation algorithm - sequential indicator simulation with ordinary indicator kriging (SISoik). Results show the algorithm works well with both dense and sparse random samples in reproducing all classes and input statistics. Compared with SISoik, the algorithm indicates the following advantages: (1) it more effectively captures complex patterns of soil classes and obeys their interclass relationships; (2) it generates less spatial uncertainties and more accurate realizations; for example, the relative increases in average PCC (percentage of correctly classified locations) values of realizations for the sparse, medium and dense datasets are 5.0%, 9.9% and 8.5%, respectively; (3) it generates polygon features in realizations in accordance with the style of area-class soil maps; and (4) it can generate classes missed in sampling but confirmed by experts. It is concluded that the algorithm provides a practical spatial statistical tool for prediction and simulation of categorical soil spatial variables.

Email: ; Object-based Classification and Height Extraction of Urban Vegetation with Multi-source High Spatial Resolution Imageries

High resolution imageries bring opportunities and challenges for image processing to obtain highly detail urban landscape information. In this paper, we develop a comprehensive approach to automatically extract both vegetation cover and height information, which are further used to model view-blocking effects of urban vegetation. This approach is an integration of object-based image classification, GIS spatial decomposing, geometry computation and overlay analysis. It is designed to handle multi-source imageries, i.e. airborne orthoimage (.3 meter) and spaceborne QuickBird multispectral standard imagery (.6 meter) in this case, and ancillary GIS data. First, we use an automatic registration algorithm to geometrically align the unorthorectified QuickBird imagery to airborne orthoimage. Next, we conduct image segmentation and object-based classification on above-mentioned multi-source data in Definiens software. A hierarchical classification schema is designed to increase the overall performance of classification. Within this schema, we select a group of prioritized classification features from spectral features, textures, thematic layers, and geometric features to obtain best classification results of vegetation features and their shadows. Vector format of classification results are then processed in ESRI ARCGIS environment. We calculate and assign height for vegetation objects through shadow modeling, an integrated method of spatial decomposing, geometry computation and overlay analysis on shadow objects. Finally, the view-blocking effects of vegetation are modeled based on their density, height, connectivity, and spatial relationship. The above approach is successfully tested in neighborhoods within different levels of vegetation cover in City of Oakland, California. The accuracy of the approach is assessed with field survey data.

Xia Li, Sun Yat-sen University. Email: ; Anthony G Yeh, University of Hong Kong. Email: ; Xiaoyue Chen, University of Hong Kong. Email: cupemcxy@hkusua.hku.hk; Fast Detection of Urban Land Use Change

Land use change detection has great importance to urban planning and urban studies. But most studies focused on a long-term analysis due to the limitations of satellite images with optical sensor such as Landsat TM and SPOT. Synthetic Aperture Radar (SAR), which is for all weather conditions, seems to be the best option for monitoring land use changes in a more frequent basis. Yet confusion problems in satellite images, especially SAR images, have not been fully resolved, although many scholars and experts have contributed their effort in these problems. Soil moisture and seasonal changes of vegetation is the two main sources of confusion problems. Soil moisture could have great impact on radar remote sensing images. Prior knowledge and field data would be collected for creating a knowledge base for error correction of rainfall and soil moisture. An expert system would be set up for the classification and detecting the land use changes. The study focuses on Pearl River Delta in southern China. A series of Radarsat data will be used for training and monitoring the land use change. Finally, knowledge-based approaches would be used to link the field data, local knowledge and Radarsat data to generate the land use change.

Xiaoxiao Li, . Email: xli@clarku.edu; Estimating the Land Transition Matrix Based on Erroneous Maps

This article presents methods to estimate a land cover transition matrix based on maps from two points in time. The land cover transition matrix indicates the amount of land that transitions from each category at time 1 to each category at time 2. Observed differences between the two land cover maps can be due to change on the ground or error in the maps. This paper offers methods to distinguish between these sources of differences. If the maps were perfectly correct, then the observed differences would indicate true land transition on the ground. This paper's methods consider the situation when the maps are not correct, and a confusion matrix indicates the structure of the errors in each map. We consider three different methods to estimate the land cover transition matrix while taking into consideration the error in the maps. Each method considers a different way to interpret the errors. The three methods provide a lower, middle, and upper estimate for each possible land transition. For situations where formal confusion matrices are not available, we perform sensitivity analysis to show how the suspected error in the maps influences the estimates of the land cover transitions. We illustrate the technique using land cover data from 1971 and 1999 in the Plum Island Ecosystems of Northeastern Massachusetts, which is a Long Term Ecological Research site of the National Science Foundation. Ultimately, the method produces maps that show the probability of any particular land cover transition, given the observed data and the confusion matrices.

Precipitation data is critical to many hydro-meteorological applications. The National Weather Service's Next Generation Weather Data WSR-88D (NEXRAD) has the capability of capturing both the spatial variation and dynamic nature of rainfall and has the potential to provide better spatio-

temporal precipitation data as the technology advances. This study will develop a set of GIS tools which make directly accessible various NEXRAD precipitation data products in a GIS data format, visualize the NEXRAD precipitation data, and perform spatial and temporal zonal analysis. In addition, the research will also use an example application to demonstrate how hydrological models could improve their performance by using NEXRAD precipitation data.

Keywords: GIS, NEXRAD, Precipitation, Hydrological Modeling

Yingkui Li, University of Missouri-Columbia. Email: liyk@missouri.edu; Yonggui Guo, Rice University. Email: ; Charles M. Onasch, Bowling Green State University. Email: ; Automated grain boundary detection using GIS raster analysis

The recognition of grain boundaries from thin-section images is critical in many geo-science studies such as fabric analysis of sediments / rocks in determining paleo flow/strain directions. However, current work in this perspective was mainly based on labor-intensive manual digitization of grain boundary information. Here, we propose a GIS-based method to automatically detect grain boundaries and construct a grain boundary map and database in which the shape, orientation, and spatial distribution of identified grains can be quantified and analyzed in a reproducible manner. The proposed method includes a series of raster operations and functions to identify grain boundaries, reduce noise, and construct the grain boundary map and database. These processes are integrated into a GIS model using ArcGIS Model-builder; thus, little or no operator intervention is required to perform the whole analysis. The method was tested using thin section photomicrograph images taken from three sandstone samples. Initial results indicate that the proposed method can correctly identify > 70% of grain boundaries without any intervention and is especially suitable for analyses where large numbers of grains are required.

Keywords: Grain boundary detection; Thin section; GIS

Zhe Li, Clark University. Email: zheli@clarku.edu; Neurocomputational measurements of spatial uncertainty

Both the Self-Organizing Map (SOM) and fuzzy ARTMAP neural network are trained based upon competitive mechanism and use the "winner-take-all" rule. This paper proposes non-parametric measurements for these two recurrent computational neural networks to handle spatial uncertainty in remotely sensed imagery classification. These soft algorithms are neuron-triggering/committing-frequency based and are grouped into two types, i.e., Commitment and Typicality, expressing in the first case the degree of commitment a classifier has for each class for a specific pixel and in the second case, how typical that pixel's reflectances are of the ones upon which the classifier was trained for each class. Two measures are designed for each of the two neural network models, i.e., SOM Commitment (SOM-C) vs. SOM Typicality (SOM-T) and ART Commitment (ART-C) vs. ART Typicality (ART-T). To evaluate these proposed algorithms, soft classifications of a SPOT HRV image around Westborough, Massachusetts were undertaken. Conventional soft classifiers such as Bayesian posterior probability classifier and Mahalanobis typicality classifier were used as a comparison. Principal Components Analysis (PCA) was employed to explore the relationship between these different measures. Results indicate that great similarities exist among the ART-C, SOM-C and the Bayesian posterior probability classifier, and significant similarities exist among the ART-T, SOM-T and the Mahalanobis typicality classifier. ART models distinguish themselves from all others due to its special features.

Keywords: The Self-Organizing Map (SOM), Fuzzy ARTMAP neural network, commitment, typicality, spatial uncertainty, soft classification

Zhijie Li, Geography, GIS, LSU. Email: zli4@lsu.edu; Using Bayesian Network Theorem to Describe Regional Economic Structure of Louisiana Based on Geographically Weighted Regression

Regional economic structure is usually expressed in tabulated aggregate data such as GDP digits by economists. In such list, the structural relationship between economic factors is ambiguous. On the other hand, economic factors are affected by unequally spatial distribution among the regional economic system. The spatial distribution of regional economic structure is seldom discussed by researchers or economists. This makes the decision-makers hard locate and analyze economic development in a spatial vision. In this research, regional economic structure will be analyzed by the methodology combining Bayesian network and geographically weighted regression. Bayesian network is proved to be a feasible method to describe the structure of multiple factors. It can uncover the unknown structure and probabilistic relationships between factors. Geographically weighted regression is a powerful geo-statistical method to explore spatial relationships among economic factors. The results then can be visualized in a GIS by integrating with other relevant spatial data. Bayesian network has been popularly introduced into spatial analysis, for example, population spread, crime analysis and disease mapping. Its scoring function and structure searching can be helpful in knowledge discovery of spatial database. In research, census data of

2000 will be collected for all counties in Louisiana State. These data will include a number of factors relative to economic, social, health, and environmental aspects. Directed acyclic graph of Bayesian network will be generated as result of data mining. Accompanied with geographically weighted regression analysis, last outcome will be visualized in choropleth maps.

Keywords: GIS, Bayesian Network Theorem, Geographically Weighted Regression

Email: gabrook@uga.edu; *A Holocene record of environmental change in the Southeastern USA from DeSoto Caverns, Alabama*

Speleothems are one of the most valuable archives of high-resolution climatic data available for study. Entire stalagmites are typically removed from caves for scientific analysis with resulting damage to the cave. In many caves the longest records of climate change are in fact preserved in very large stalagmites that are far too big to be removed. To limit damage to caves and to access the long records preserved in large stalagmites, we have developed a drilling device that can remove vertical cores, up to several meters long and 5 cm in diameter, along the growth axis of a stalagmite. To test the drill we have obtained a 1m long vertical core from an active stalagmite in DeSoto Caverns, Alabama. This core has provided a detailed record of climate change in the Southeastern U.S.A. during the Holocene. ICPMS U-series dating has established an accurate chronology for the record. Variations in petrography, growth rate, oxygen and carbon isotopes, gray color, and UV-stimulated luminescence suggest that the later Holocene was drier than the early and middle Holocene and year-to-year variations were more marked. We interpret these changes as being partly due to the onset of more prominent ENSO conditions in the Eastern Pacific around 4 ka. This study demonstrates a successful application of the vertical core-drilling approach to stalagmite research. If this approach is widely adopted by the scientific community, it should be possible to obtain long, high-resolution climate records from many regions of the world without significantly damaging cave environments.

The spatial and temporal distribution of solar radiation is a primary variable for important atmospheric and vegetation systems. The surface net radiation is required by many land surface process models. Estimating the surface radiation budget using satellite data has proven to be a promising avenue for research in recent years. We will describe the methodologies for estimating surface radiation budget components from Moderate-Resolution Imaging Spectroradiometer (MODIS) and Geostationary Operational Environmental Satellite (GOES) data, including total shortwave net radiation, incident total shortwave radiation (insolation) and photosynthetically active radiation (PAR), surface broadband albedos, and total longwave net radiation. There are two algorithms for estimating all-sky shortwave net radiation: direct estimation from top-of-atmosphere radiance and calculation from insolation and surface broadband albedo. There are two corresponding algorithms for calculating longwave net radiation only for clear-sky conditions. The MODIS standard products of albedo and skin temperature are used in this study and the spectral emissivities of land surfaces are converted to broadband emissivity. The results from different algorithms are compared, validated with ground measurements from FLUXNET and other networks, and also compared with other satellite products. The temporal scaling from instantaneous estimates to daily average will also be discussed.

Keywords: remote sensing, radiation budget

Wei Liang, Louisiana State University. Email: wliang1@lsu.edu; Xiaojun Qin, Louisiana State University. Email: xqin2@lsu.edu; *Integrating Remote Sensing with Areal Interpolation to Improve the Spatial Filter*

When using spatial filter to get the population inside the surrounding area, we always use the number of census block group centroids fall inside the circle, and add all the populations of these centroids together to represent the population of this given point. However, the centroid is too coarse and inaccurate to represent the residents living location in the census block group. The improved method will use the remote sensing images to get the resident and nonresident

areas. Create evenly distributed points above the resident area to substitute the centroid, and each point has the population attribute. The remote sensing classified image may misclassified the whole area of some census blockgroups as nonresident area, the centroid may still be used to maintain the data integrity. Using these substitute points to do the spatial filter can certainly improve the result accuracy. Using this improved method, this paper will try to find out the hot spot of the death location caused by Hurricane Katrina in New Orleans.

Ke Liao, University of South Carolina. Email: liao.keke@gmail.com; *Location-Allocation-Optimization with Constrained K-Means Clustering*

The allocation of facilities with capacity constraints is a spatial decision problem and has many different applications. This research develops a constrained K-means clustering method to solve a special type of capacitated facility location problems, which is to find an approximation of optimal locations of a finite set of facilities to satisfy the demands of a large set of fixed locations. The allocation is constrained by facility capacities, which limit the total demands (and thus the number of fixed locations) that each facility can serve. Different facilities may have different capacities and one demand point can only be served by one facility. The proposed constrained K-means clustering method uses unique similarity measures to indirectly optimize the allocation quality and considers capacity constraints during the cluster refining process. The objective function to minimize is the demand-weighted distance from point locations to their assigned facilities. The proposed method can deal with two different situations: (1) the total capacity of all facilities is sufficient to meet all demands; and (2) the total capacity is insufficient (thus there are uncovered regions). This clustering-based location-allocation method is evaluated against a Genetic Algorithm (GA) with a variety of different data distributions and capacity constraints. The overall allocation quality is measured using the demand-weighted distance from point locations to their assigned facilities. The computational efficiency is evaluated based on the actual running time. Evaluation results show that the clustering-based method achieves more satisfactory allocation results with much less running time than the GA method.

Keywords: Capacitated facility location problem, location-allocation, clustering, K-means, Genetic Algorithm (GA)

Johan Liebens, University of West Florida. Email: liebens@uwf.edu; Kristal Flanders, University of West Florida. Email: Kwalsh@uwf.edu; *Associations between spatial patterns of air emissions and morbidity*

The incidence of some health outcomes is statistically significantly higher in NW Florida than in demographically, economically, and socially similar areas elsewhere in the state. Northwest Florida also has high rates of water and air pollution. Health outcomes have been shown elsewhere to be affected by environmental factors. This study examined if the spatial patterns of some of the health outcomes with high incidence in NW Florida are spatially associated with patterns of air emissions. The study also assessed the sensitivity of the results to the inclusion in the analysis of various types of air emission sources. Emission patterns were linked to the health outcomes with an index for the proximity of census blocks to emission sources. The proximity index was used unweighted, weighted with total source strength emission data, and with benzene equivalent emissions for Toxic Release Inventory (TRI) sites. The resulting three indexes for the census blocks were summarized by census tract or ZIP code as required by the pre-existing health data. Results show that various national and state government emission databases are inconsistent and have spatial information of greatly varying quality. Morbidity for specific respiratory illnesses such as pneumonia and asthma are associated with patterns of air emissions for some of the emission database/proximity index combinations. Cancer morbidity shows little influence from emissions. Racial inequity in exposure to air emissions is very small in the study area and does not affect health outcomes appreciably.

Keywords: air pollution, GIS, morbidity

Ingo Liefner, Leibniz University of Hanover. Email: liefner@wigeo.uni-hannover.de; *Innovative linkages of high-tech firms in Shanghai and Beijing*

During their innovation process, high-tech enterprises depend on interaction with other companies and public research organizations to get access to new knowledge. The exchange of tacit knowledge requires direct communication between people and is, thus, much easier to facilitate through local interaction. Therefore, the set of cooperation partners that is available at the local level determines a company's potential for intensive cooperation. This presentation concentrates on Beijing and Shanghai, two of China's leading cities as far as knowledge and technology-driven economic development is concerned. It discusses the results of a quantitative survey of 489 high-tech companies in Pudong (Shanghai) and Zhongguancun (Beijing). The investigation has been carried out in 2003 and 2004 as a joint effort of the Department of Economic Geography, Hannover, Germany, the East China Normal University, Shanghai, China, and the Chinese Academy of Sciences, Beijing. Results show that regional

differences affect the cooperation patterns of high-tech companies in both cities: High-tech firms in Beijing cooperate more frequently with universities and public research institutes whereas high-tech firms in Shanghai cooperate more frequently with foreign-invested and foreign enterprises, thereby reflecting the strengths of both cities.

david.lier@postgrad.manchester.ac.uk; *Resistance in Neoliberal State Spaces in the Global South: Municipal Workers in Cape Town, South Africa*

A striking manifestation of neoliberalism in Africa has been the drive to make states reduce their social spending, followed by the introduction of cost-recovery principles in public sectors such as water, electricity and waste removal. By putting services out to tender, establishing public-private partnerships and opening for wholesale privatisation, countries have allowed market forces to make heavy inroads into the sphere of service delivery. The outcome of these policies remains a hotly contested issue on the ground. In particular, grievances have been articulated from two quarters: municipal workers defending their jobs and communities fighting for accessible and affordable basic services. This paper examines the politics of municipal services in Cape Town, South Africa. In spite of a pronounced commitment to redistribution before the 1994 democratic elections, the African National Congress (ANC) has favoured growth-centred macroeconomic policies since they swept into office. At a local level, processes of deracialisation and development have been accompanied by (and are sometimes hard to separate from) the unfavourable effects a neoliberal model of growth. The public sector unions have participated in the local state restructuring, but have also been the sharpest critic when New Public Management reforms have been followed by job losses, reduced job security and aggravated working conditions. By using the case of the metropolitan branch of the South African Municipal Workers Union, this paper examines how organised workers juggle their opposition to privatisation of service delivery, on the one hand, and their political solidarity to community members, on the other.

Keywords: Neoliberalism, New Public Management, local state restructuring, public sector workers, community unionism

mliesch@wisc.edu; *Late Nineteenth Century Panoramic Maps of the Gogebic Iron Range Landscape*

Situated on the southern shore of Lake Superior, the Gogebic Iron Range of Michigan and Wisconsin was home to a mining boom. During a few frenzied years, 1884-1887, people, ideas, and money rushed to the Gogebic and fundamentally reworked its landscape. Hope and optimism reigned throughout these fledgling communities until numerous mining scams were uncovered. Representations of place influence human behavior. Panoramic maps, also known as "bird's-eye view" lithographs, were one popular way of representing places and landscapes during the late 1800s. Created during 1886, maps of three mining towns, Hurley, Ironwood, and Bessemer, capture a snapshot of the Gogebic Range landscape. By comparing these representations to archival evidence, we can uncover discrepancies between the lithographs and reality. Newspaper accounts, fire insurance maps, and historic photographs may be used to reveal the myriad of ways in which panoramic map representations are deceiving. Overall, architectural details are fairly accurate, whereas other elements of the built environment are misleading: for example, the quantity and quality of roads are exaggerated. Gogebic Range landscapes have been portrayed to give a narrative of industrial progress and display a sense of sophisticated community. The idea that panoramic maps could foster images of a civilized, economically vibrant town, that might enhance its reputation in the eyes of residents and outsiders alike, is not a new concept. However, the importance of the mining economy makes lithographs of mining towns far different than views of port cities and agricultural centers, even by the same lithographers.

liffmann@sfsu.edu; *Food Insecurity among the Bedouin in the Negev Region, Israel*

Food insecurity, defined as a periodic or chronic deficiency of calories or nutrients that leads to hunger and malnutrition, is a major concern in areas of the world and most prominently found in marginalized or disenfranchised communities. The growing pervasiveness of this problem is often tied to changing environmental, socio-economic and political conditions that displaces traditional agriculturalists from the land or curtails access to resources necessary for food production. Markets may disappear or become inaccessible to food producers and purchasers alike in an increasingly cash driven economy. This study explores food insecurity among the Bedouin population in the Negev region of Israel.

Researchers examining food security among school children around the city of Be'er Sheva revealed concerns over caloric and nutritional deficiencies within the Bedouin community (Segal and Kaufman 2002, 2004). Traditionally the Bedouin engaged in crop agriculture and pastoralism, living a semi-nomadic lifestyle dictated by water and forage availability as well as cultural norms. Today most Bedouin are sedentary, relying on a shrinking land base with limited access to grazing areas, cropland and water. In addition, the primary trading and selling markets in Gaza and the West Bank have been cut-off since the Palestinian uprising or Intifada of 2000. Lack of jobs and cash to purchase food, and inadequate means to produce their own crops, exacerbates food insecurity among the Bedouin population of this region. This on-going research examines the underlying conditions leading to food insecurity, as well as viable options to address this growing concern.

jon.comer@okstate.edu; *Reliability of Interview Data for Monitoring and Mapping Groundwater*

Groundwater levels are falling in many areas of the world, though we often lack data showing where the decline is slight and where the problem is severe. Monitoring wells may keep track of these changes but are not always available where needed. Users of traditional wells are familiar with local aquifers and can provide details where monitoring data are absent, but are these data reliable for groundwater assessment? In this research, the accuracy of interview data is assessed by comparing details reported by users of traditional wells to data recorded independently by hydrogeologists using nearby monitoring wells. Uzbekistan was selected for testing the program because of the ubiquity of traditional wells, paired with a good network of hydrological monitoring wells installed during the Soviet era. Seventy-five sample sites included a variety of aquifer types and depths spread across three oblasts in central Uzbekistan. Details recorded at each site included well location (using GPS) and depth to the water table for 1985, 1995, 2000, and 2005. Statistical analysis included correlation and regression. In all cases, the correlation between well water depths is at least 0.9 and the regression coefficient is between 0.797 and 0.867, indicating that estimation of depths to the water table can be reliably made based on reporting from traditional wells in the absence of scientific, hydrological well monitoring. With confidence in the accuracy of interview-derived data, we can employ these data to monitor groundwater resources in regions which lack the immediate capacity to implement a monitoring well network.

lightfeet1@cox.net; *Creating School Bus Routes: Integrating GIS into the Public School Classroom*

Growth in GIS programs has revolutionized the university curriculum in geography and science but has mostly bypassed the secondary schools, and is rarely employed in rural school districts. The Rural Alliance for Improving Science Education (RAISE), funded by the National Science Foundation through its Graduate Fellows in K-12 Education (GK-12) program, offers educational outreach to help rectify this situation. The RAISE program goals are to enrich the 6th-12th grade learning environment for both teachers and students, to improve science and math test scores, and to disseminate model curricula to teachers in schools throughout the U.S. This study reports on a bus route project, undertaken by 10th-12th grade students at Morrison High School, a small school in north central Oklahoma. Until this project was undertaken, bus route information was contained in the form of lists on hand-written sheets of paper, and there were no maps of school bus routes. At the request of the school superintendent and the High School Principal, students were tasked with entering the school's bus route information (including bus stop addresses) into a GIS, creating maps of the various bus routes, and finally, analyzing the 6 different routes for routing efficiency. Students created a project in ArcGIS 9.1, geocoded bus stop addresses, created maps of each route, and made suggestions for improving bus routing.

Arika Ligmann-Zielinska, San Diego State University. Email: ligmannz@rohan.sdsu.edu; *The impact of risk-taking attitudes on urban land-use pattern: results from an experiment*

Agents act upon environment on the basis of limited, partial knowledge, where the perception of spatial alternatives varies from individual to individual. Hence, one of the biggest challenges in modeling residential development is a theory-driven representation of human behavior. We report on an agent-based modeling experiment which tests different conceptions of risky decision making motivated by prospect theory from the psychology of choice. The decision rules used in the model are representative of risk-taking and risk-averse attitudes. The goal of this experiment is to assess spatial consequences of employing different attitude utility functions. These nonlinear functions reflect people's simplified psychological frames of reference for land use decision-making. The experiments are performed on an artificial landscape, which is being developed by competing agents equipped with several land-related objectives and utilizing a number of configurations of risk-taking attitudes. The subsequent land arrangements of abstract townships are compared based on land use contiguity and compactness principles. The results of the presented research suggest that attitude to risk taking may significantly influence the sustainability of landscape patterns. We argue for further investigation of psychological drivers that stand behind land development decisions affecting land use change. Such knowledge is the first step towards gaining higher social and economic acceptance of anti-sprawl land use arrangements.

Emergency service location problems are generally solved for a stationary set of demands, but this has a limitation in that it does not consider dynamic change of demands. This paper focuses on emergency vehicle relocation planning with time varying spatial demand patterns. To find appropriate times for relocation, significant change points of spatial patterns of demands are detected by using a method combining network nearest neighbor statistics with a cumulative sum statistic. Each of the periods divided by change points is defined as a scene object, with multiple attributes such as global spatial pattern values, a number of local clusters, and so on. The K-means algorithm is applied to divide all scene objects into groups of similar objects. The elements of each group are analyzed to determine whether a similar spatial pattern for a certain same time period is observed over the entire set of tested years. If a significantly representative spatial pattern is detected for a specific time period, emergency vehicles are re-located by solving the static mathematical model for this time period. This research evaluates the performance of the suggested relocation solution by comparing it with a stationary location solution through the simulation program that assesses emergency response time.

Keywords: relocation planning, spatial pattern, change point analysis, K-mean algorithm

Hyunwoo Lim, University at Buffalo. Email: hwlim@buffalo.edu; *The Impact of Sales Demand on the Structure of Physical Distribution Network for Business-to-Consumer On-line Shopping*

Success in on-line shopping business depends on the seamless performance of the physical distribution network including central warehouse, terminals, and distribution centers. On the other hand, accomplishing economies of scale by having enough customer demand around destinations is critical for less-than-truckload (LTL) and parcel carriers to reduce logistics costs and to make enough profits to maintain their business. This paper suggests a near optimal strategy for designing physical distribution network for a carrier serving a fixed region with increasing customer demand density, and how the performance of the network would be reflected on the overall logistics cost and output service level. Innovative reduction in overall physical distribution cost of on-line shopping is expected to vitalize B2C E-commerce, which would contribute to the local economies by connecting on-line shopping customers and vendors distributed over space.

Christopher J Limburg, MS, University of Wisconsin-Madison. Email: cjlimburg@wisc.edu; *Place, Nature, and Knowledge: Towards a Spiritual Ecology of the Kathmandu Valley*

This paper will propose a methodology for understanding the way that naga serpent spirits mediate the relationship between people and environment in Nepal. From ancient aquifers and the texts that mythologize their history to contemporary debates on health, pollution, and falling water tables, people in Nepal have looked to nagas to represent their environment. Today, what was once thought of as a stable and spiritually endowed ecosystem is faced with increasing pressures from rural-urban migration, international refugees, and foreign tourism. Different emerging notions of nature, place, and spirituality interact, coexist, and occasionally conflict. My research will explore these relationships, their effects on the religious and ecological networks in Nepal, and the spiritual ecologies they produce. My primary question is: How are people's ways of knowing the world materially emplaced in the world? Further, how do knowledge systems, as materialities in the world, interact with natural processes? Specifically, do Buddhist beliefs in nonhuman spirits and meditative mind training affect people's interaction with the natural world? How does this relationship manifest itself in the Himalaya where traditional and modern ways of knowing the world are in sharp relief? Furthermore, if we look at Nepal's variety of Buddhist knowledge systems as modern ways of knowing, what kind of natures will these ways of knowing reveal to us?

Keywords: Spiritual Ecology, Place, Nature, Knowledge, South Asia, Buddhism

Ester Limonad, Prof. Dr., Universidade Federal Fluminense. Email: ester_limonad@yahoo.com; *Nothing's gonna change my world? Far beyond the big agglomerations, across the Brazilian cities universe*

In opposition to the famous Beatles lyrics, the world is changing faster and faster. In addition to altering the organization of production, the III Industrial Revolution produced a new social space in order to satisfy the needs yet imposed by the different spheres of social reproduction (family, labor force and means of production). Not only are contemporary cities qualitatively different from former ones, urbanization forms have changed in ways that give new shape to urban agglomerations. Decreasing demographic growth rates, migration shifts and variations in Brazil's cities' participation in the GNP are strong indications that something changed in the country's regions, outside its metropolitan areas and huge urban agglomerations. Against the embedded belief that urban metropolitan areas would grow endlessly and continuously, medium cities have presented the highest demographic growth rates in the last twenty years. Another kind of urbanization has flourished, featured by scattered and dispersed agglomerations in agricultural regions. For instance, this extensive form of urbanization includes almost a million inhabitants clustered in the northeast of Santa Catarina State, and almost five million in a hundred mile radius around Brasilia in central Brazil. The goal of this paper is to look beyond metropolitan areas to verify what is going on in Brazil's medium and small cities, and why. Regional maps, social and economic data as well as census data will be analyzed to demonstrate that there are two prevailing complementary urbanization patterns: a metropolitan concentration and territorial dispersion and diffusion.

George C S Lin, University of Hong Kong. Email: gcslin@hkucc.hku.hk; *Scaling Up Regional Development in the Pearl River Delta: Local Capital Accumulation, Land-Centered Politics, and Reproduction of Space*

The resurgence of regionalism after the globalization fever has shifted attention to some regionally specific relational assets as the sources of dynamic, innovative, and competitive regional development. Recent research has suggested, however, that extra-regional linkages have played a role as important as, if not greater than, that of internal relations. This article critically evaluates the perennial debate over endogenism or exogenism in the study of regional development. It draws on theoretical insights from political economy and Third World political ecology to analyze the causes and consequences of recent regional development in China's Pearl River Delta. A study of the cases of Guangzhou, Foshan, and Dongguan has identified a common process in which municipalities engaged in a forceful annexation of rural counties and expulsion of peasants as a means for capitalization. Intrusion of global capitalism and reshuffling of the socialist political economy have given rise to the adoption of a local strategy to scale up the urban region and reproduce the needed space for locally controlled development. The subsequent gain in regional developmental capacity and competitiveness has been accompanied by widespread social discontents, increased inequality, and environmental degradation. The study closes with a plea to take more seriously the social and political origins of regional development apart from the economic and technological sources that have attracted so overwhelmingly the attention of regional development specialists.

The Health Disparity of Childhood Respiratory Diseases in Houston

Exploratory and confirmatory data analysis were used to investigate the spatial distribution of childhood respiratory diseases in urban Houston from June to September 2001. The spatial pattern of local hot spots statistics Z(Gi) was hypothesized to be associated with independent variables of socio-economic status (SES) and ozone exceedances at the unit of census block group. SES variables include African American percentage, Hispanic percentage, median income level, and population density. Descriptive statistics, map overlay, and multivariate regression analyses were employed to explore the spatial association. The ordinary least square (OLS) and the spatial regression model were used to conduct global modeling, and Geographical Weighted Regression (GWR) was used to examine local modeling. Map overlay shows that about half of the disease hot spots fall into low-income and high African American percentage areas, and less than half fall into low medium-income Hispanic percentage areas. Results of global OLS and spatial lag model show the impacts of African American percentage, Hispanic percentage, and income level disease patterns. Local association of GWR shows the existence of non-stationarity among all five independent variables. However, median income level dominates west Houston and African American percentage dictates east Houston. Results of all analyses point out that the health disparity of childhood respiratory diseases are prevalent among low-income African American and medium-low income Hispanic populations along the intersections of major highways within the inner city. The locations of hot spots and the results of spatial association can guide the policy makers for mediating the most affected communities.

Keywords: childhood respiratory diseases, health disparity, hot spots, spatial regression

Fieldwork: Making Sense of GIS Construction in a Non-Western World

Critical GIS research calls for GIS practitioners' critical examination of GIS-related practices in a reflexive way, constantly challenging the practitioners' presuppositions. In light of such discussions, my paper attempts to explore the methodological challenges of conducting critical GIS research in a non-Western setting, particularly through my investigation of GIS practices in local government of urban China. This investigation intends to critically examine the complex interrelations and interactions between GIS practice and local urban governance in China through an in-depth case study that is underpinned by Burawoy's extended case method. In Burawoy's view, fieldwork is not a mere process of collecting data, but consists of a continuous process of reconstructing pre-supposed theories with observations and information from the field. More specifically, three qualitative methods (in-depth individual interviewing, document analysis, and participant observation) are utilized to investigate GIS construction in China's urban governance. Qualitative methods are suitable in examining the relatively unknown evolution process of GIS construction in China. Moreover, employing multiple methods provides an opportunity for data triangulation, as well as unraveling multi-facet perspectives and forces in shaping GIS practices. Meanwhile, there are always struggles, negotiations, and compromises both within the field and in analyzing the data in order to better understand situated GIS practices and their implications. Thus in this paper, drawing upon my fieldwork experiences in China, I will discuss the benefits and challenges in incorporating multiple methods in my research, which attempts to make sense of GIS construction in a non-Western setting.

Geomorphic and hydrologic connections between floodplain springs and the Sprague River, Oregon.

The Sprague River is important spawning and rearing habitat for two species of sucker listed under the Endangered Species Act, as well as other aquatic and terrestrial species. While the river does not meet state water quality standards, artesian springs within the floodplain provide an important influx of cool water

that supply critical spawning habitat and thermal refugia. Most of the springs are connected to the river channel by a spring brook even at low flow, so access to the springs is viable. Understanding how these connections are created and maintained, and the relative roles of spring flow and river flow, is important for habitat restoration. All springs are inundated by the river at bankfull flow or lower. Spring pools either create their own complex network of brooks to the river channel or they are set in abandoned meander channels that control the form of the connective brook. For some, the abandoned channel and the spring remain influenced by fluvial river inflow. For others, the upstream portion of the meander scar has been filled by deposition such that inundation occurs only during over-bank events or seasonal high water back-flow. Discharge from the springs is substantial enough in all but one spring to flush out fine deposits and maintain a medium-to-coarse sand and gravel substrate in the pools and brooks. There is concern about river migration away from some springs and some active restoration projects have been done to maintain spring-river connections.

Screening the City: TV, Mediation, and Public Space

New technologies are driving rapid change in the traditional broadcast media model. As proliferating cable and digital formats enable consumers to bypass advertising, advertisers and media companies are increasingly turning to cities as spaces for media. At the same time, revenue-challenged city governments are seeking to raise their profile through images of vitality and public engagement. This paper will look at ways that local news organizations are incorporating the urban into their broadcasts by examining why a Twin Cities news station has opened their newsroom onto a public mall. While the mediation of urban space has often been viewed as commodification or privatization, I will ask whether there are ways in which mediated urban space opens up a dialogue for traditionally voiceless media consumers by reviewing how avenues of criticism and control have developed within this relationship. Finally, I will examine the implications for urbanism as consumer culture becomes more reliant on the mediated public event, and look at how investment in modes of urban spectacle will be crucial for future urban development.

The Geography of Contemporary Christian Music

Contemporary Christian Music (CCM) comprises popular styles of music such as alternative rock, singer-songwriter, R&B and hip-hop that feature evangelical Christian lyrics. CCM is one of the fastest growing forms of popular music in the U.S., and is quietly converging with the parallel 'mainstream' music industry. In the past decade, CCM sales increased 80%, and sales at non-Christian outlets doubled. The astonishing growth of the CCM industry has coincided with the rise of megachurches, the emergence of nondenominational evangelical Christianity as a force in U.S. electoral politics, and popular music's simultaneous concentration through media conglomeration and democratization through new technologies. I examine the record companies, radio stations, Christian bookstores, grassroots political organizations, audiences, and live venues that are crucial to the growth of this burgeoning market in the U.S. I investigate Christian niche marketing, challenging the notion of 'independent' and 'sacred' companies by explicating various organizational relationships. I explicate the geographical pattern of CCM record companies, record sales, concert venues, summer festivals and radio stations. I also analyze notions of 'Christian,' 'mainstream,' 'CCM' and other taken-for-granted distinctions that are discursively produced and reinforced through musical practices. Most of the research done on CCM has been in the popular press or from within the industry itself; its geographies, contradictions, and political subjectivities have been largely neglected until recently.

Biopolitical Ecuador: Race and Nature in the Formation of Nation

A growing body of literature explores the ways in which nation and national identity are constructed and produced, and the inclusions, exclusions, and violence these processes inevitably entail. While categories such as race, ethnicity and gender have been central to such analyses, nature - surprisingly? - has remained relatively unmarked. This paper argues, to the contrary, that nature is fundamental to productions of nation. Drawing primarily from Michel Foucault's notion of biopolitics and Giorgio Agamben's notion of the biopolitical fracture, the paper explores the ways in which geographies of nature are deeply implicated in the production of nation in Ecuador, and argues that nature is both constitutive of, and constituted through, these contested processes. The paper maps techniques of state biopolitics, aimed at bringing the biological under state control, in contemporary Ecuador. The case illustrates the ways in which the state, in its projects of nation building, has sought to transform and control

nature just as much as populations and national identities. In struggle over the nation, the state and Ecuador's indigenous populations mobilize competing geographies of nature and modes of political qualification in complex and mutually constitutive ways. For each, nature is a fundamental element in nationality and political existence, though for different reasons and in different ways. In turn, nature is produced in and through these contested processes in ways that render it inextricable from struggles over biopolitical order and productions of nation.

Peter S. Lindquist, University of Toledo. Email: plindqu@utnet.utoledo.edu; The Great Lakes Maritime Information Delivery System

The Great Lakes Maritime Information Delivery System is a comprehensive data repository and information clearinghouse for the maritime industry in the Great Lakes. The system is designed to serve as a centralized resource for diverse interests within the industry in support of promoting sustainable maritime transportation in the region. The system was developed to facilitate the acquisition, storage, management, analysis and exchange of data between research analysts and decisionmakers within the industry. The main features of the system include: 1) A detailed data repository for vessel movements, port functions, commodity flows, economic activity and environmental impacts, etc.; 2) A GIS data viewer for advanced users to view and analyze a variety of data; 3) An information delivery site for maps, tables, graphics, text and other features; 4) A data exchange to support user inquiries and furnish information on demand; and 5) An information clearinghouse for the industry that provides links to government agencies, trade organizations and firms operating in the region. Maritime industry officials' response to the project thus far have largely focused on the use of this system as a resource for public policy and for providing the means to document the link between the maritime industry and the economic viability and environmental quality of the region.

The National Aeronautics and Space Administration (NASA) routinely receives large volumes of key Earth science data from its satellite instruments, along with airborne, and in-situ-based sensors, deployed by the NASA Earth Science programs program. Data and information products developed and produced by experts in the NASA community via grants and contracts continues to populate an active archive containing many petabytes of science-quality data readily used by our research communities and a broad range of other users. The collection of these data has been achieved in parallel with the development of information technologies that have made formerly difficult tasks of data storage and management increasingly easier. NASA's observation assets and their attendant distributed and heterogeneous data systems have been a key resource for the diverse land science research and user communities. We provide information on how to access and use these resources for land science research. The presentation highlights some of the near-term technical goals for our science data systems and how these improvements will further aid the multiple research communities. The relationship and organization of both NASA's core data system components with those deployed by Earth science communities of practice is a key piece to this overall data system strategy. We also provide highlights of pertinent information system research for the land sciences research communities resulting from NASA's information system programs. Improvements to these data systems will enable easier access to key land observation data and land cover research products and provide needed data services specific to this research community.

Morag Lindsay, Oxford Brookes University. Email: dmlindsay@brookes.ac.uk; Katie Williams, Dr, Oxford Brookes University. Email: kwilliams@brookes.ac.uk; Does shared outdoor space contribute to neighbourliness?

This paper presents the results from a three year research project investigating the influence of outdoor space on privacy and neighbourliness in sustainable housing developments in England. Neighbourliness is one of many factors said to contribute towards a sense of community and cohesiveness in sustainable communities. Increasing the amount of shared space within housing developments is thought to increase positive interactions between neighbours. However, little is known about how successful this relationship is and whether privacy is affected. The home is a private space, coveted by occupants as an alternative to public space. A decrease in the amount of external space in the home may have a detrimental effect on the occupants' privacy. This could lead

to a negative effect on neighbourliness, the exact opposite of the design intentions. Twelve case studies of new developments in England, including flagship projects such as the Greenwich Millennium Village, were surveyed to determine the relationship between space, privacy and neighbourliness. Different types of outdoor spaces are represented in the case studies. These include private gardens and balconies, communal gardens and play areas, and public parks. A site survey checklist (one for each case study) and a household questionnaire (over 680 responses) were used to gather data on the outdoor space and real and perceived privacy. The data has been analysed to establish the effect of outdoor space on privacy and neighbourliness. It suggests that shared outdoor space can lead to higher levels of neighbourliness if it is provided alongside private outdoor space.

Betty Lininger, University of Florida. Email: lininger@ufl.edu; Religious Practices Before and After Migration: A Case Study of Female Somali Muslims

The increasing numbers of Muslim refugees and immigrants into Western nations has brought many Islamic cultures into greater contact with secular Judeo-Christian societies. This has caused some groups to reinterpret or intensify their practice of the Muslim religion within these new and often hostile landscapes. One group, the Somalis, primarily composed of refugees, have been arriving in Western countries since the early 1990s and are creating communities within major cities such as London, Toronto, and Minneapolis, Minnesota. These refugees experience adaptation to their new environments in varying ways in relationship to their Islamic practice. This can include a greater determination to adhere to Islamic practices (such as covering and prayer), yet also result in a discarding of some perceived Islamic requirements (such as female genital mutilation). Somali religious and cultural traditions have increasingly come under this process by migrants in response to difficult host environments as well as the use of traditions to maintain both identity and as a comfort being a minority in a foreign society. This paper examines the reinterpretation of Islamic practices of Somali females residing in the United States as contrasted to those practiced before the resettlement experience.

Dave Linthicum, US Dept. of State Office of the Geographer and Global Issues (INR/GGI). Email: linthicumdh@state.gov; Boundary Recovery: Use of Colonial and Treaty Maps, Imagery, and Elevation Data in a GIS Environment

"Recovery" of international boundary lines to accurately align with their treaty-specified features remains a challenge for USG cartographers. "Boundary recovery" methodologies have been developed in the U.S. State Department's Office of the Geographer and Global Issues (INR/GGI), which works with colleagues at the National Geospatial-Intelligence Agency (NGA.) The application of GIS tools has been paramount in refining these methods and incorporating imagery and elevation data in an effective manner. Findings include ° discovering that boundary misalignment in the range of hundreds of meters to several kilometers is the norm for most lines worldwide on even the best USG maps and datasets; ° realization of the utility of old treaty, colonial, and Russian maps: their detailed topographic and planimetric mapping overcomes outdated geodetic control; ° awareness of how cartographic atrophy over decades and recent examples of cartographic aggression must both be considered in the boundary recovery process; ° awareness of problems presented by arbitral rulings which in some cases are arguably constructed within a vacuum of international boundary geographic expertise. Several case studies will be presented.

Jamie Linton, Ph. D., . Email: jlinton@ca.inter.net; Water as a Geographical Solution

In 1931, Sir Halford Mackinder proposed "the hydrosphere to be considered as the central theme of geography." As a physical process relating geological, biological and social phenomena, Mackinder saw water as an ideal means of articulating his overarching vision for geography as a discipline bridging the natural and the social sciences. "It is in the water", he asserted, "rather than in the rocks that we must look for salvation." Although this proposal was almost completely ignored by contemporary and subsequent geographers, the disciplinary ideal of holding nature and society under one conceptual umbrella has persisted — albeit not without controversy — in what David Livingstone calls "the geographical experiment." In this paper, I argue that recent theoretical developments in both human and physical geography compel a renewed and positive interest in the geographical experiment. With this interest in mind, the paper critically re-examines Mackinder's idea of water as a unifying geographical theme. Mackinder's proposal, I argue, was doomed to founder on a dualistic view of the nature of water and society. Recent efforts by geographers to rethink the nature-society dualism however suggest the possibility of experimenting with the idea of water as something whose nature changes in relation to its social

engagements. Such a relational understanding of water provides a novel means of conducting the geographical experiment; one that I believe suggests further possibilities for an undivided geography.

Nenad Lipovac, Professor, University of Zagreb. Email: nlipovac@posluh.hr; *Historic Maps and their Importance in City and Regional Planning*

In City and Regional planning process an accurate topographic map of the region or the town is very important. It should provide a planner with most important infos upon existing environmental conditions: topographic and natural features. Although contemporary maps are very accurate, they cannot display something that is of a great value for preserving the Identity of Place: historic, cultural and built elements that serve as the source of Identity. That's why it is necessary to capture urban story revealed by proper reading of archive graphics, plans and maps representing the Place appearance through Space and Time, something known as urban cartography. The hand drawn maps produced by European military cartographers in situ in the second half of the 18th century, are undoubtedly a masterpiece of human perception of Space in Time, and are best examples of "maps from the head", as for most of the time it was dangerous and technically impossible to draw a map on a site. They could do only several sketches, while the final map was done somewhere in safety. These maps had to provide solid information about terrain and easy to recognize landmarks - they were results not only of perception but of cognition and scientific knowledge of that time. This paper is here to draw the planners' and architects' attention to understanding the need for proper professional and scientific reading and evaluating of historic graphic and cartographic documents relevant for urban history of several Places in Croatia that should be used in contemporary planning.

Christopher D Lippitt, San Diego State University/University of California Santa Barbara. Email: lippitt@rohan.sdsu.edu; John Rogan, PhD, Clark University. Email: jrogan@clarku.edu; *Machine Learning for Subtle Forest Change Mapping*

Forest-cover monitoring programs are currently being established in an effort to better understand multitemporal conversions and modifications over large areas. Large area programs use complex change mapping techniques and require processing and interpretation of large volumes of remote sensing and ancillary data. Machine Learning Algorithms (MLAs) offer the potential to process large volumes of data with minimal human intervention and reduced processing time when compared to conventional methods. The recent development of MLAs for remote sensing applications, and the transparent (i.e. non-black-box) manner in which many of them have been identified to operate, necessitates investigation into their operational characteristics and capabilities. This study utilizes multitemporal Landsat TM/ETM+ imagery of a forest reserve in western Massachusetts to assess the performance of three Artificial Neural Networks for mapping selective timber harvest: Multi-Layer Perceptrons (MLP) network using back propagation (BP) algorithm, Fuzzy ARTMAP, and Self-Organizing Map. Comparisons are based on the following evaluation metrics: (1) impact of training set size, (2) sensitivity to noise and outliers (3) map accuracy, and (4) relative transparency of the classification process. Results indicate that Self-Organizing Map is less sensitive to the presence of noise and to variations in training data than Fuzzy ARTMAP and Backpropagation Neural Network, producing timber harvest maps of 5-19% higher map accuracy. SOM produced change-map accuracies of 81%, while Fuzzy ARTMAP and Backpropagation Neural Network produce slightly lower accuracies (75% and 64% respectively); a significant difference in overall map accuracy. The combined three algorithms produced an average map accuracy of 65%.

Jennifer Lipton, Central Washington University-Ellensburg. Email: liptonj@cwu.edu; *Conservation with Climate Change: Patterns and Process of Change at Huascarán National Park, Peru*

The amount of area contained within Peru's Protected Area system increased dramatically over the past 10 years. While areas recently put under some form of environmental protection are predominantly located in the Amazonian lowlands, a few locations are in the densely populated Andean highlands, such as the Cordillera Huayhuash, adjacent to the existing boundaries of Huascarán National Park (HNP). Located in the central Andes of Peru, Huascarán National Park is undergoing land use and land cover change (LULCC) at a steady pace in both the core of the National Park and within the Buffer Zone. Using geospatial techniques that combine detailed field data with satellite imagery and aerial photographs, the LULCC of this montane national park reveals a trend of socio-economic land use change coupled with the consequences

of climate change. Integrating historical accounts provided by informants with resulting land cover data, specific elevation zones are demonstrating greater land cover change. With the trajectory of climate change affecting tropical mountain regions, HNP and the Cordillera Huayhuash are subject to long-term impacts. The use of geospatial techniques may be useful for examining the potential of conservation corridors for specific land cover communities and to foster social-environmental networks intent on conservation between HNP and the Cordillera Huayhuash.

Jane E. Lister, University of British Columbia. Email: jlister@telus.net; *The Role of Private Environmental Governance in Emergent Sustainability Mechanisms*

Voluntary corporate sustainability efforts are becoming increasingly institutionalized through global private environmental governance standards. These private standards encourage the improvement and harmonization of sustainability performance by leveraging global market forces - in particular the procurement and investment practices of multinational corporations through their global supply chains. Although these private standards have been labeled "non-state mechanisms" or a form of "governance without government", in fact, governments are actively engaged and in some instances even mandating these private codes. The distinction between public versus private governance is not black and white but blurred. Through an examination of government response to the most well developed private code - forest certification, this paper argues that emergent co-regulatory arrangements are fundamental to our sustainable future. Firstly, these private-public arrangements encourage greater street-level multi-stakeholder discourse and secondly, by embedding a tension between dynamic private innovation and stabilizing public regulation, they are resulting in adaptive governance approaches that encourage the emergence of responsive and hopefully effective global sustainability solutions.

Soil moisture is a measure of the water content in a soil that is dependent upon precipitation, evapotranspiration, runoff, drainage, and irrigation. Nebraska is one of the few states in the country that maintains a weather data network that measures soil moisture. Daily soil moisture observations from depths of 10, 25, 50, and 100 centimeters were analyzed from May through October of 2005, after being grouped into datasets of weekly, bi-weekly, and monthly observations. These datasets were imported into a Geographic Information System (GIS) and the Ordinary Kriging method was applied for spatial interpolation. The interpolation parameters were set to create output surfaces of 4 x 4, 16 x 16, 32 x 32, and 64 x 64 kilometer grids for analysis of their variations. As expected, it is found that soil moisture content is higher in southeastern Nebraska and lower in the northwest. Changes in the grid size render small scale variations, however, the general pattern of estimated soil moisture distribution does not change.

Keywords: soil moisture, hydroclimatology, interpolation

Jani S Little, University Of Colorado. Email: jani.little@colorado.edu; Andrei Rogers, University of Colorado. Email: andrei.rogers@colorado.edu; *Age-Specific Migration: Methods for Enhancing the American Community Survey*

Age-specific population estimates at the state level are quite accurate in the ACS, as are the measures of total immigration, outmigration, and immigration. However, ACS estimates of the age structures of these migrating populations are generally unstable with large standard errors. Previous findings show that age-specific profiles of outmigrants can be inferred from the age composition of the population (Little, Rogers, 2006). The earlier findings are based on the Census 2000 long-form survey and the migrating population over a five-year interval. This paper makes use of the same relationship, but infers age profiles of state outmigrants over a one-year interval, 2003-2004, and the results improve the ACS estimates of age-specific state outmigration for the same period. The proposed methods rely initially on the regularities of migration age profiles, which are captured by the Rogers-Castro model migration schedule (Rogers, Castro, 1983). In addition, the paper establishes that there is an inherently strong association between the age compositions of in and out migrants. Therefore, a well estimated age profile of outmigrants can be used to estimate the age profile of immigrants. Finally, the paper demonstrates how the proposed

methods generate smoother, more stable, and more probable in-migration and out-migration profiles than those obtained from the observed ACS data.
