• **Date:**

Signature/Companz stamp:

Bone Management

In cooperation with leading scientists and practitioners the developed product line, MEISINGER Bone Management, offers the user a perfectly harmonised aligned system solution which, completely independent from the current implant system in use, provides a controlled optimisation of the bone implant bed. Besides the prosthetic aspects, achieving a minimally invasive character of the surgical intervention and facilitating the implantation in complicated indications played an important role in the development process of this product line. Clearly structured and standardised procedures now offer to a greater number of surgeons, safe means to realize the implant care on patients. Bone Management – by means of controlled and sensitive bone preparation is therefore a key factor for long-term success in oral implantology.
